PIMD's education projects for underserved rural communities in Sri Lanka are unsustainable in the long-term due to financial constraints. Donations are essential for its survival. As a volunteer-based not for profit organization, PIMD's reliance on a donative financial model to support its programs is untenable. The development of a new approach to achieve long-term financial sustainability and independence without compromising the core social mission and jeopardizing the social capital building projects is a matter of urgency and survival. Contributions to the third sector literature from academics and practitioners emphasize the imperative for the sector to adopt entrepreneurial and innovative business strategies and models and to leverage technology (Dart 2004b; Dees & Economy 2001: 1-18) which is supported by Hansmann's trust approach which rationales for nonprofit entrepreneurship

Organizations such as PIMD should adopt the social entrepreneurship (SE) model which will enable the creation of shared value. It was suggested that PIMD should therefore adopt an abductive research

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

methodology in order to formulate an entrepreneurial sustainability strategy and innovative business model for the creation of shared value with the stake holders to provide a pathway for PIMD to achieve long-term financial sustainability while maintaining the core mission objectives. The literature review served as a starting point to help formulate the key questions for the PIMD case study.

It needs to be acknowledged that the PIMD case is focused exclusively on a single aspect of –financial sustainability which is part of a much wider sustainability strategy. While the social enterprise business model is the beginning of the journey to commercialization of PIMD, other elements of the transformational process such as organizational, stakeholder and volunteer strategies will require the organization to also address social, cultural, economic and socio-psycho issues.

Future research will explore and scrutinize varied social entrepreneurial models which are in existence and operating successfully to deliver continuous growth to a region and benchmark these to develop a best practice and customized cross cultural model suited to wide-ranging environments. SE models from different regions of the world need to be compared in terms of their firm specific factors, external environment, orientation of the owner manager and their current regional growth and sustainability contribution. The aim is to get an understanding of the different existent models of social entrepreneurship and investigate the success factors of these models and recommend a customized regional best practice model suitable to adapt with in a not for profit organization.

Chapter 64
Social Commerce Benefits for Small Businesses:
An Organizational Level Study

Ludwig Christian Schaupp
West Virginia University, USA

France Bélanger
Virginia Tech, USA

ABSTRACT

Small businesses represent an important element of many western economies. However, they often struggle with resources needed to succeed, and small business owners often have to perform many, if not all, roles in their organizations. One of the key functions that small businesses need to excel at for business success today is social commerce since much of their business is migrating towards the use of social media for business. In this study, determinants of social commerce benefits for small businesses are explored. Using survey data from 60 small companies, this research identifies stakeholder pressure and partner pressure as the most significant factors in determining social commerce benefits for small business. Implications of these findings and provide suggestions for future research are discussed.

INTRODUCTION

There is no doubt that small businesses represent a core number of organizations in many countries. In fact, the Office of Advocacy of the Small Business Administration in the United States claims that small businesses have created more net jobs in 2011 than large firms, a pattern that has existed since 1992 (SBA, 2012). However, small businesses often face unique challenges in terms or skills and resources and small business owners must perform themselves all job functions, such as accounting, marketing, and employee management (Schaupp & Bélanger, 2014). Yet, they are also challenged with lack of technical skills needed to handle Internet-based requests. Hiring of technologically trained employees

is expensive, and often beyond the reach of many small business owners. A solution for small business owners faced with these challenges is social commerce, which allows them to use social media to reach new markets and potentially gain competitive advantages (Zhou, Zhang, & Zimmermann, 2013). Social commerce refers to using Web 2.0 in e-commerce (Kim & Srivastava, 2007), including user-generated content and sharing of content via social media (Huang & Benyoucef, 2013).

Social media is "the use of a technology platform to develop a community of stakeholders to collectively create, know, like, and trust relevant matters of the business entity" (Schaupp & Bélanger, 2014). A survey reveals that 66% of small business owners strongly agree that social media is important for their businesses (Stelzner, 2011). Social commerce for sales and marketing involves building relationships with individual consumers. While these relationships are superficial by their very nature, they can lead to substantial brand awareness; and, when customers are in the market to purchase the small business' product, it becomes the best option because it is the customer's "friend" (Wirthman, 2013). Indeed, advantages of social commerce for marketing include increased business exposure, increased traffic, and improved search engine rankings (Stelzner, 2011). Indeed, 74% of marketers believe Facebook is important for their lead generation strategy and social media generates almost double the marketing leads of trade show, telemarketing, daily mail, or pay-per-click (Anonymous, 2013). Not surprisingly, social media is now the top Internet activity, with Americans spending an average of 37 minutes daily on social media, a higher time-spent than any other major Internet activity, including email (Bendror, 2014). As of May 2013, 72% of online adults were using social networking sites (Brenner & Smith, 2013).

For small businesses, therefore, social commerce presents one possible means of obtaining business benefits by reaching a broader market and conducting sales and marketing efforts at reduced costs. Social commerce can help increase exposure and site traffic at a fraction of the cost of traditional marketing since the main cost is the time it takes to realize the benefits of the effort put forth (Schaupp & Bélanger, 2014). There are, however, a number of obstacles such as skills, regulations, and resources. This paper explores the factors that can lead to small businesses deriving benefits from their involvement in social commerce, which helps answer the call for "rigorous empirical work using business data" (Lang & Li, 2013, p. 5). The research is guided by the following research question: *What factors influence how small businesses perceive the benefits of social commerce for sales and marketing?*

From a research perspective, this study explores the use of social commerce from an organizational unit of analysis, which requires the use of potential adoption theories beyond the traditional individual level models, such as the Technology Acceptance Model (TAM) and Theory of Planned Behavior (TPB) used in other studies of social commerce (e.g., Hajli, 2013; Shin, 2013). This research uses and extends the Technology-Organization-Environment framework to the domain of social commerce benefits for small businesses. Few social commerce studies have focused on small businesses, which is one of the contributions of this study. The research model is tested with survey data from 60 small businesses in a variety of industries engaged in social commerce. This is another important contributions of the study as most prior studies have focused on social commerce use by individuals (e.g., Heinrichs, Lim, & Lim, 2011; Scott & Orlikowski, 2012; Shin, 2013) instead of by businesses.

The paper is organized as follows: First, theoretical foundations and relevant literatures used to develop the research model are presented. The methodology and data analyses are then presented. The paper ends with a discussion of results, including implications for research and practice, suggestions for future research, and concluding comments.

BACKGROUND

Social Commerce as a Sales and Marketing Tool

As social media has entered the mainstream as an efficient tool for socialization and information sharing, it has also created a new form of e-commerce called social commerce (Liang, Ho, Li, & Turban, 2011). Social media combines user-generated content with social networking features to allow users to create, initiate, and circulate information within online social networks (Tang, et al. 2012). Social commerce, on the other hand, is the use of social media for commercial transactions and activities primarily driven by social interactions and user contributions (Liang et al., 2011; Wang & Zhang, 2012); although a number of different definitions do exist (Lang & Li, 2013; Liang & Turban, 2011). Social commerce can occur through networking sites (SNSs), blogs, micro-blogs, Wikipedia, social shopping sites and other content sharing sites, such as YouTube and Flickr (Liang et al., 2011; Ng, 2013). Social commerce goes beyond simply doing business via social media (Zhou et al., 2013). Social commerce allows for customer engagement and a platform to attract new customers through word of mouth (Liang & Turban, 2011; Ng, 2013). In fact, in an analysis of social commerce and the "tragedy of commons," Kim (2013) concludes that word of mouth is still the most recommended approach for leveraging social commerce. In fact, 70% of people trust recommendations from unknown users online (Burmaster, Lee, & McGiboney, 2009).

Social commerce is rapidly becoming a driving force in western economies. For example, it is expected to reach US$ 30 billion in the USA in 2015 (Anderson, Brusa, Price, & Sims, 2011). The interest in social commerce has culminated in several special issues in academic journals (e.g., Lang & Li, 2013; Liang & Turban, 2011; Zhang, Zhou, & Zimmermann, 2013; Zhou et al., 2013). Marketing and sales remain the most important uses of social media (Askool & Nakata, 2011; Looney & Ryerson, 2011). For example, the recent Nike 2014 World Cup ad, featuring Real Madrid star Cristiano Ronaldo, was seen by 78 million people in four days. This is before it went to television (Ricadela, 2014). Nike stated that its World Cup TV ad buying is declining while it increases its social media spending on Facebook, Twitter and YouTube to reach fans in a battle with Adidas AG for supremacy in the global soccer-products market (Ricadela, 2014). Not surprisingly, Adidas also spent more on Internet promotions than on television for the 2014 World Cup (Ricadela, 2014). In a recent survey, 86% of marketers state that social media is important for their business and 89% state that increased exposure was the number one benefit of social commerce marketing (Stelzner, 2013).

Most social media statistics and research conducted has focused on large organizations, which stand to gain substantially from their investments. Size of an organization and the region in which it operates were found to be significant determinants of the extent of social media usage for financial institutions in Europe, the Asia-Pacific region, and the Americas (Bonsón & Flores, 2011). Yet, small businesses represent an important sector of most economies. For example, they represent 99% of organizations listed in the European Union, generating more employment than large organizations (Nieto & Santamaría, 2010). While the Small Business Administration considers small businesses to be organizations with less than 500 employees, most IS researchers use a cutoff of less than 100 employees when studying small businesses (DeLone, 1988; Thong, 1999). In this study, this more restrictive number is used, which is consistent with the definition of small business employers in Australia defined as less than 15 employees by Section 23 of the 2009 Fair Work Act (Fair_Work_Commission, 2009).

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Small businesses often lack resources or competencies necessary to implement social media (Wamba & Carter, 2014). In fact, Looney and Ryerson (2011) found that only 37% of small businesses believe they are competent enough to deal with social commerce; most state they need more training (32%), have just enough skills (20%), or are totally lost (11%). Others have argued that there are four main challenges for small business use of social commerce: lack of time, inability to measure value, difficulty integrating social media with other business activities, and lack of budget (Bendror, 2014).

Theoretical Foundation

According to Liang and Turban (2011)'s social commerce framework, the four main social commerce activities are social media marketing, enterprise management, technology and support integration, and management and organization. The present research focuses on the first of these: social media marketing, and develops a theoretically-based model of social commerce benefits for sales and marketing. Given that this research focuses on an organizational perspective of social commerce, the theoretical foundation for this research is the Technology-Organization-Environment (TOE) framework (Tornatzky & Fleischer, 1990). The model has been used in other e-settings, such as m-business (Picoto, Bélanger, & Palma Dos Reis, 2012; Picoto, Bélanger, & Palma Dos Reis, 2014), e-government (Srivastava & Teo, 2009), e-business (Kuang-Wei & Yan, 2010), and social media (Schaupp & Bélanger, 2014).

The TOE framework suggests that three types of factors influence organizational usage: technology, organizational, and environmental factors. These factors serve as both enablers and constraints to use of technology innovations (Tornatzky & Fleischer, 1990). Examples of factors explored in prior research include technology competence, process integration, firm size, degree of formalization, managerial obstacles, the legal environment, availability of technologies, competitive pressure, etc. In the context of m-business, Picoto et al. (2014) use the TOE framework to identify determinants of usage and value and find that a variety of technological, organization and environmental factors impact m-business usage. In a review of social commerce articles published between 2005 and 2011, Wang and Zhang (2012) identify people, technology, organization, society and information factors discussed and found significant in social commerce research. Combining these TOE and social commerce research findings, this study proposes that the most relevant factors impacting small business owners' perceptions of social commerce benefits include: the quality of social media technologies available (technology and information factors), the availability of social commerce rules and regulations (society factors), organizational constraints and competitive pressure (organization factors), and stakeholder pressure (people factors).

Quality of Social Media Technologies

The quality of social media technologies relates to both the technological features and the human factors associated with technology usage (Basole, 2005). The Web 2.0 environment to which a small business belongs can influence the adoption and usage of social media. Many small-businesses pass on social media, particularly if they reside in seemingly low-tech industries; however, social media use in industries that are slow to adopt can create a competitive advantage (Jantsch, 2010). In fact, network economics, when applied to social media, suggest that a critical mass of users is essential for success. For small businesses, this means that the more there are users of social media, the greater the potential value of social media.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Customers interact with the social media platform through the technologies available to them, which helps form their opinions of the firm (Parboteeah, Valacich, & Wells, 2009). As a result, the quality of social media technologies available to the organization not only reflects the objective technology independent of the customers, but also the subjective properties perceived by customers (Jiang, Chan, Tan, & Wei Siong, 2010). Zhang, Lu, Gupta, and Zhao (2014) found that technological characteristics available in the social commerce environment leads to increased customer participation.

H1: The quality of social media technologies is positively associated with perceived social commerce benefits for small businesses.

Availability of Social Commerce Rules and Regulations

The regulatory environment in which a business operates is an important determinant of technology adoption (Zhu & Kraemer, 2005; Zhu, Kraemer, Xu, & Dedrick, 2004). This can include policies, rules, and regulations. For example, prior research has shown that telecommunication policies affected competition and the reorganization of the mobile telecommunication sector (Dholakia, Dholakia, Lehrer, & Kshetri, 2004). Another example is the Paper Reduction Act in the United States, which forced government agencies to transact solely in electronic commerce by January 1997. It forced small businesses to adopt Electronic Data Interchange technologies to conduct business with federal agencies (Kuan & Chau, 2001). In a social commerce context, protection of privacy rights of consumers, security of purchase transactions, and legal protections of consumers in general can be critical to the success of a social commerce implementation. An environment with clearly defined regulations can provide guidance to small businesses on what is acceptable or not with respect to their online marketing efforts.

H2: The availability of social commerce rules and regulations is positively associated with social commerce benefits for small businesses.

Stakeholder Pressure

Pressure from stakeholders impacts technology adoption (Hart & Saunders, 1998). For small businesses, they may feel pressured to adopt a new technology if, for example, customers recommend this technology or request it from the small business (Kuan & Chau, 2001). Stakeholder pressure can involve customers or other relevant stakeholders in the small business' domain (Schaupp & Bélanger, 2014). Depending on the level of bargaining power their stakeholders have, they can pressure the small business to implement social commerce (Teo, Wei, & Benbasat, 2003). In fact, Kim (2013) argues that social commerce has emerged due to the collective bargaining power of Internet users. This is consistent with the view that social commerce emerged from improvement in Web 2.0 technologies and the bargaining power of consumers (Ng, 2013). In small business research, it is "easier for the management to make a decision if someone they know has it or is getting it" (Askool & Nakata, 2011, p. 212). Since small businesses need to respond to stakeholder demands, it is likely that more pressure from clients will increase their social commerce efforts.

H3: Stakeholder pressure is positively associated with social commerce benefits for small businesses.

Competitive Pressure

External pressures exist for small business to adopt technologies that sometimes have nothing to do with the technology itself or even the business as a whole. These competitive pressures, defined as "the degree to which an organization is affected by competition in the market" (Schaupp & Bélanger, 2014), can influence adoption of technologies because of the perception that an organization needs to adopt similar technologies in order to remain competitive (Kuan & Chau, 2001). Pressure from competitors has been found to be an important factor in adoption of social media (Askool & Nakata, 2011; Schaupp & Bélanger, 2014), e-business (Zhu & Kraemer, 2005), and m-business (Picoto et al., 2014). In the context of social commerce, low barriers to entry may be a key factor leading to greater social commerce usage, and to increased competition in this domain (Kim, 2013). As social commerce is evolving rapidly, researchers have suggested that firms using social commerce need to spend an increasing amount of money in their efforts to face competition from other businesses (Kim, 2013). Therefore, it can be expected that for small firms, use of social commerce by competitors impacts their perceptions of social commerce benefits for sales and marketing.

H4: Competitive pressure is positively associated with social commerce benefits for small businesses.

Organizational Constraints

While the constructs discussed before are enablers that can help the small business reap benefits from social commerce, there are also barriers or constraints that may inhibit the ability of the small business to get those benefits. These are labeled organizational constraints. Prior research has shown that obstacles such as lack of top management support or difficulty integrating new technologies with one's current business systems is negatively associated with usage of new technologies (Liang, Saraf, Hu, & Xue, 2007; Picoto et al., 2012; Picoto et al., 2014). This is not surprising since top management support, for example, is needed for successful technology implementations (Basole, 2005; Liang et al., 2007). In the context of social commerce, Kim (2013) points out that human resources and manpower are critical to successfully implement and use social commerce. This is even truer for small businesses, which as was discussed before, often lack both human and financial resources. In the present study, one of the most important barriers to social commerce usage by small businesses identified in prior research (e.g., Schaupp & Bélanger, 2014) and the trade press (e.g., Bendror, 2014; Looney & Ryerson, 2011) is their ability to manage social media technologies. Indeed, Looney and Ryerson (2011) find that 65% of small business owners attempt to manage social media without the necessary competence. In a study of social media adoption, Askool and Nakata (2011) also specifically identify technology infrastructures, applications, system integration, and employee training as required for adoption.

H5: The more there are organizational constraints in the small firm, the less the small business can recognize benefits of social commerce for sales and marketing.

Figure 1 presents the research model and hypotheses presented in this section.

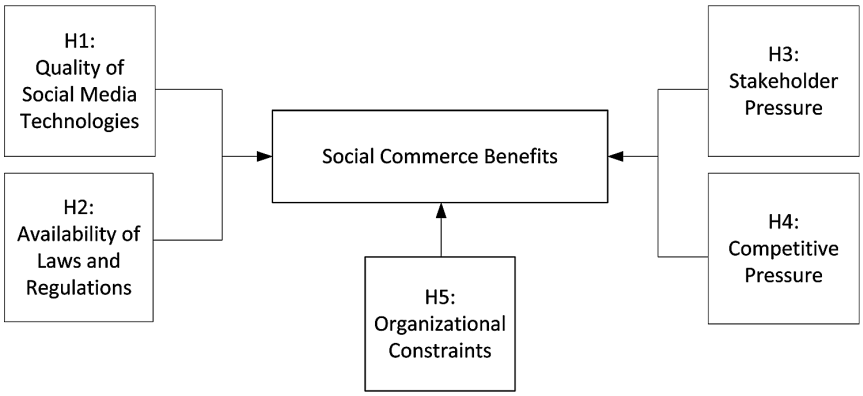
Figure 1. Research model



METHODOLOGY

To investigate determinants of social commerce benefits for small businesses, we surveyed small businesses that use social commerce for sales and marketing. The instrument was developed by compiling questions from validated constructs (Moore & Benbasat, 1991). Wording was modified to fit the social commerce context, and resulting items were included in a random order on the instrument. Each question was measured on a 5-point Likert-type scale, ranging from 1 (strongly disagree) to 5 (strongly agree). Academics and practitioners pre-tested the instrument, identifying ambiguous or poorly worded items. The instrument was then pilot tested with undergraduate students. Final items are presented in Appendix A.

Study Sample

To provide a realistic investigation of social commerce benefits and its antecedents, several small businesses from different geographical areas were solicited to participate in the survey. Of the 123 small businesses contacted, 60 (49%) completed the survey. Upon survey completion, respondents could enter a drawing for an iPad. Respondents included owners, general managers, marketing managers, and other key personnel who were the primary person in charge of social commerce efforts at the business. They represented a wide variety of industries, there were slightly more male respondents (52%), and there was a wide spread of age groups. In addition, the majority (52%) of respondents did not use their personal social media accounts for business. Demographics are summarized in Table 1.

DATA ANALYSES AND RESULTS

The research model was tested using Partial Least Squares (PLS) as implemented in Smart PLS (Ringle, Wende, & Will, 2005). It is imperative to ensure sample size is large enough to support the conclusions (Marcoulides & Saunders, 2006). In this study, the sample size of 60 meets the generally accepted rules of thumb since the computational efficiency of the PLS algorithm allows the estimation of large complex models containing hundreds of latent variables and thousands of indicators with minimal sample size ranging from 30 to 100 (Chin & Todd, 1995).

Table 1. Demographics

Age (years)	21-24	30%
	25-30	25%
	31-35	25%
	36-40	5%
	41-50	5%
	50+	10%
Gender	Male	52%
	Female	48%
Use of personal social media account for business	Never	52%
	Once a month	15%
	Once a week	15%
	Daily	18%
	N/A	2%

Measurement Model Testing

Convergent and discriminant validity were assessed first. Convergent validity is assessed with three ad hoc tests recommended by Anderson and Gerbing (1988). Appendix A lists the standardized loadings, composite reliabilities, and variance-extracted estimates. The loadings are highly significant. Composite reliabilities, similar to Cronbach's alpha, range from 0.66 to 0.85. Variance-extracted estimates are measures of the variation explained by the latent variable to random measurement error (Netemeyer, Johnston, & Burton, 1990) and ranged from 0.56 to 0.82, all exceeding the recommended lower limit of 0.5 (Fornell & Bookstein, 1982). All tests support convergent validity of the scales.

Discriminant validity was first assessed by looking at item-total correlations (Appendix B) (Anderson & Gerbing, 1988). The correlation pattern shows that an item posited to form a given sub-construct has a stronger correlation with it than another construct providing further evidence of discriminant and convergent validity. An additional discriminant validity criterion is that the variance shared by a construct with its indicators should be greater than the variance shared with other constructs in the model (Appendix C). A construct is considered to be distinct from other constructs if the square root of the average variance extracted for it is greater than its correlations with other latent constructs (Barclay, Higgins, & Thompson, 1995). All constructs pass this test.

Finally, internal consistency was assessed using Cronbach's alpha and composite reliabilities. All but two constructs have alphas above 0.70 (Nunnally, 1978): quality of social media technologies and availability of rules and regulations had alphas of 0.66 and 0.68. Given their high composite reliability of 0.85 and 0.86, and their closeness to the cut-off point, the internal consistency of these items is acceptable. In addition, their items have strong loadings above 0.79. In summary, the tests of the measurement model show strong evidence that the constructs demonstrate good measurement properties.

Structural Model Testing

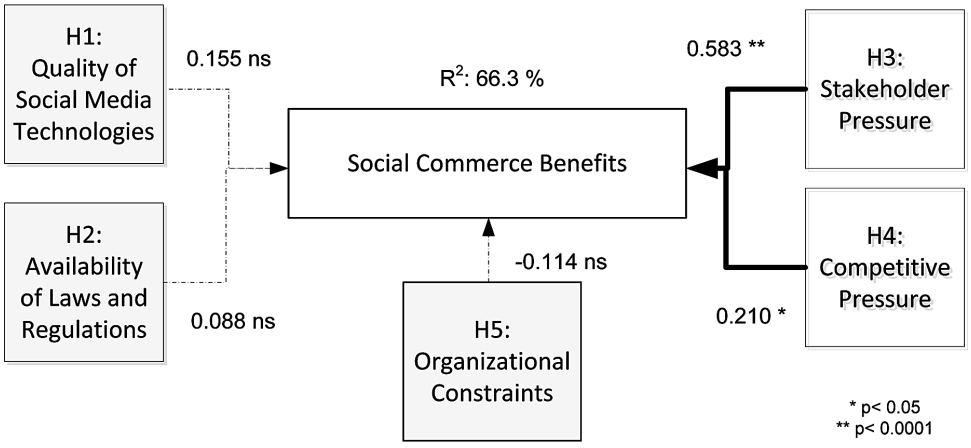
Results of the PLS analysis (done with 1000 bootstrapping sub-samples) are presented in Figure 2. Two of the specified paths in the research model are significant: stakeholder pressure and competitive pressure significantly affect perceptions of social commerce benefits for small businesses. One indicator of the predictive power of a model is the variance explained in the endogenous variables, as measures by R-squared (Barclay et al., 1995; Chin & Todd, 1995). For the social commerce benefits construct, 66.3% of the variance is explained. Therefore, while there are only two significant paths in the model, they have strong predictive power for social commerce benefits for small businesses with a parsimonious model. The strongest path in the model is between stakeholder pressure and social commerce benefits.

DISCUSSION

In this research, we explore antecedents of social commerce benefits for small businesses. Elicited from surveying 60 small businesses utilizing social commerce marketing, two dimensions were found to be highly significant. The results of the analyses confirm that the factors identified as pressures (stakeholder and competitive) are strong predictors of social commerce benefits for small businesses. Thus, the research contributes to the existing literature by testing a conceptual model to measure the antecedents of social commerce benefits in a small business context. In the following discussion, we answer the research question and discuss implications for practice and research. We also recognize several limitations to the study.

What factors influence how small businesses perceive the benefits of social commerce for sales and marketing? Based on the technology-organization-environment (TOE), small business, and social commerce literatures, we identified several potential determinants of social commerce benefits for small businesses, and found through the empirical study that two of them have a positive impact on social commerce benefits: greater stakeholder pressure (H3) and greater competitive pressure (H4) impact social commerce benefits for small businesses.

Figure 2. Research results



EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Social commerce provides benefits when used as a tool for nurturing relationships with previous and current customers. Perhaps, social commerce's greatest advantage is that it facilitates communication with customers, which in turn leads to increased convenience and satisfaction for customers. This may explain why H3 was not only significant but was the strongest path in the research model. Respondents identified that their customers expect them to participate in social commerce with the goal of improving communication channels to the customer. As consumers immerse their social networks into their daily lives, they begin to realize benefits from social commerce offerings and are likely to increase the pressure on organizations, including small businesses, to offer such tools.

Social commerce provides the small business with a low-cost and direct interactive link to the customer. A critical success factor for small businesses is their ability to market themselves efficiently and cost effectively. Reducing/eliminating marketing costs is vital to many small businesses' ability to advertise at all; social commerce provides the means by allowing more direct control over marketing objectives, i.e. target audiences. Social commerce also provides flexibility since marketing efforts can be realized immediately as opposed to the delay in traditional media outlets (Zhou et al., 2013). If social commerce is leveraged appropriately to facilitate and enhance social interaction, sales and marketing benefits can be realized. Organizations often believe that the ultimate measure of success is a positive impact on sales. Social commerce has the ability to expand a small business's geographic sales region by providing information about products and services, with the potential of sales, to prospective as well as existing customers outside of the local area. In addition, social commerce has the potential to improve existing products and services through customer feedback. If utilized correctly, social commerce provides a tool for small business by providing direct customer service channels, enhanced marketing abilities, and opportunities to increase sales.

Competitive pressure (H4) is a significant determinant of social commerce benefits by small businesses. Respondents indicated that competitors' social commerce initiatives largely influenced their use of social commerce. This is an important finding as competitive pressure has rarely been used in IS studies of innovation adoption. Yet, this study indicates that in the context of small businesses, an analysis of the competitive environment is important in understanding small business behaviors. Respondents noted that competitors influence other small businesses mainly in the local market. The local environment may be more important to small businesses as opposed to large organizations. This insight needs to be further explored in future research. Because the sample included respondents from various industries, it was not possible to do industry comparisons. However, it would be interesting in future research to study many firms in fewer industries to provide a comparative analysis of the impact of competitive pressure on social commerce usage between industries, such as low-tech versus high-tech industries. This is important because prior social commerce research has identified industry as an important determinant of social commerce adoption by small businesses (Wamba & Carter, 2014).

Several hypotheses were not supported. The quality of social media technologies in the environment the small business operates in was found to be a non-significant factor in achieving social commerce benefits (H1). This is not surprising as the current state of technology in the geographical regions surveyed is that social media technologies are widely adopted. This would result in limited variance in the level of such technologies available. Similarly, the availability of rules and regulations did not impact social commerce benefits (H2). The construct represents rules supporting usage of social commerce and consumer protections in place to safeguard purchases. The lack of regulations specific to social media might have

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

impacted this result. Interestingly, increasing regulations are expected in various areas regarding both social commerce and Internet sales. Therefore, future research is likely to find different results regarding the regulatory environment. One way to test this would be to conduct a study with organizations doing business in regions that exhibit diverse regulatory environments. Finally, organizational constraints was also identified as a non-significant antecedent of social commerce benefits (H5). Constraints included lack of staffing, non-sufficient support from management, and difficulties with integrating social media initiatives into the overall marketing strategy of the business. This is a surprising finding, as we would expect small businesses, in particular, to struggle with these constraints in implementing their social media marketing efforts.

Implications for Research

Taken together, these results have important implications for research. The two significant constructs represent external factors (pressure from competitors and other stakeholders), while the non-significant factors are both internal (organizational constraints) as well as external (quality of social media technologies available and the regulatory environment in which the business exists). A potential explanation for these interesting findings is that small businesses implement social commerce because they are pressured to do so even when they are not ready. As such, they feel overwhelmed by the organizational constraints that exist even though they can see the benefits of social commerce for sales and marketing. These pressures can exist internally, such as a manager or business partner recommending the use of social commerce. These perceived pressures may also be a result of the business's own customer base. External pressures are the result of the external business environment. Competitive pressure referred to the level of social commerce in the firm's industry and of its competitors. Competitors in the industry may also pressure a firm into adopting the technology out of feeling a need to stay competitive. For IS researchers interested in technology usage at the organizational level, these findings suggest that they need to consider external factors, such as stakeholder pressure, in addition to the traditional technology or innovation factors such as usefulness, relative advantage or ease of use.

An additional major contribution of this research is the use of the TOE framework to understand organizations' perspective on social commerce, as opposed to the individual perspective taken by most research (e.g., Heinrichs et al., 2011; Kim & Park, 2013; Liang et al., 2011; Ng, 2013; Scott & Orlikowski, 2012; Shin, 2013). In addition, the research focuses on social commerce benefits, as opposed to an individual's intentions to use social commerce, one of the most studied dependent variable (e.g., Kim & Park, 2013; Liang et al., 2011; Ng, 2013).

Implications for Practice

For practitioners, this research provides a tool to guide and evaluate small business initiatives. For small businesses to be able to capitalize on the potential benefits of social commerce, our results suggest that the technological features and the impact of those features on customer experiences should be managed and fully understood by the firm. Second, our findings suggest that stakeholder pressure is the best predictor of social commerce benefits. Stakeholder pressure can include business partners within the firm as well as the customer base itself demanding the technology.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Social commerce technologies provide small businesses the ability to integrate ratings and reviews into product pages. By creating a social experience for customers, and leveraging the unique components of social commerce from a technical, application and strategic perspective, retailers have the ability to create brand and product advocates. In turn, this creates a more interactive, and more effective online experience for customers with the hope of increased sales. As shoppers have adopted social commerce, merchants and manufacturers have responded by providing features such as ratings, reviews and integration to SNS. Companies are innovating the shopping experience with social commerce technologies that provide integrated social campaigns. Social commerce has allowed small businesses to evolve beyond e-commerce.

Limitations

The survey approach resulted in a lack of direct control over subjects while taking the survey, which was distributed via e-mail to potential subjects. The subjects were able to click on the link provided to them, which directed them to the survey posted on the Internet. Once the users accessed the survey, it was up to them to complete the survey at their own pace in a place of their choosing. While the time that each respondent spent completing the survey was monitored, the respondents could not be observed. The sample size could also be considered somewhat small for the analyses performed. However, the rules of thumb of PLS analysis suggest that the sample was sufficient for the analyses performed, and there remained several degrees of freedom when the analyses were performed.

CONCLUSION

The objective of this research was to examine the antecedents of social commerce benefits for small businesses. The model explains 66.3% of the variance in social commerce benefits for small firms, which provides a strong foundation for future research on social commerce. The resulting model is parsimonious yet explanatory. As small businesses are likely to face increased demands for social media from customers and other business partners, this research provides a first step towards an understanding of how they can better utilize social commerce and realize their potential benefits.

Chapter 65
Smart Tourism Development: The Case of Halkidiki

Spyros Avdimiotis
Technological Educational Institution of Thessaloniki, Greece

Irene Tilikidou
Alexander Technological Educational Institute of Thessaloniki, Greece

ABSTRACT

Halkidiki is a district embedded in Central Macedonia, Greece where tourism has been the most significant pillar of development; however, the sharply declining economic performance of the recent years, clearly indicates the need for structural changes and the development of an ambitious long term regional strategy plan, in order to face economic challenges, explore new market opportunities and robust the existing regional competitive advantages. The purpose of the chapter is to introduce smart tourism development model, which is based on three distinctive development tools: 1) Smart Specialization Strategy Methodology, as the pillar to determine and support specific priorities; 2) Quality Policies, as a pillar of stakeholders commitment to provide superior quality products and services, mostly though Local Quality Agreements; and 3) Social economy entrepreneurship, as the third pillar upon which local population and social entities will be engaged and involved. Smart tourism development model aims to establish a new tourism development perception, closely linked to the existing local market opportunities and simultaneously contributing to the enhancement of the competitive advantages of as many as possible of the other sectors of the regional economy.

INTRODUCTION

At a time when a significant number of the European Union member-states are dealing with the detrimental effects of the ongoing economic recession and the refugees' issue, the E.U. has defined, in the Europe 2020 Strategy Framework, a new "smart" vision for a social market economy, deeply rooted within the three interconnected priorities of Smart, Sustainable and Inclusive Development.

Defining "smart", we need to delve into the EU Strategy for regional development, as it was referenced in the Europe 2020 declaration. According to that definition, the actual meaning of the term is

the intention of the European Union to enhance development by activating and customizing all possible strengths of EU regions, towards a feasible, mature and focused productive goal in order to enhance significantly the level of competitiveness in the global market (Gomez & Nunez, 2014).

Focusing on the area of interest, Halkidiki is a district embedded in Central Macedonia, Greece where tourism has been the most significant pillar of development at least during the last three decades; however statistical data regarding the period 2008-2014, issued from the Greek Tourism Confederation, bring out that earnings, employment ratings along with income and investment multipliers are sharply declining, indicating the need for structural changes (SETE, 2015).

Given the fact that Smart Specialization Strategy (3S) is the leading benchmark for development in Europe, the purpose of the study is not merely to highlight the alignment of a smart specialization strategy within the tourism sector, but to elaborate a holistic *smart tourism development model* in the region of Halkidiki Greece, using three distinctively functioning, nevertheless conceptually cooperating, development tools: (i) Smart Specialization Strategy Methodology, (ii) Quality Policies, and (iii) Social economy entrepreneurship. The expected final outcome of a smart tourism development model is twofold: to contribute to the establishment of a new tourism development perception, closely linked to the existing local market opportunities, and simultaneously to contribute to the enhancement of the competitive advantages of as many as possible of the other sectors of the regional economy, using in parallel as catalysts, the notion of quality and the initiative of social entrepreneurship in order to gain active involvement of local communities and stakeholders.

BACKGROUND

First Development Tool: Smart Specialization

The concept of Smart Specialization was developed at the end of the previous decade by a group of experts-academics as a new approach for increasing the efficiency of European investment in research, innovation and entrepreneurship (Forey, 2014).The concept is based on the understanding that it is not possible for all regions to perform equally well in all areas of science and innovation, as they do not have the necessary critical mass of basic factors, such as enterprises, knowledge and research centers. In fact, more often than not, regions do not have sufficient prerequisites to ensure an effective collaboration between innovation factors, which are necessary for gaining larger market shares at a global competitiveness level. Smart Strategy is a regional initiative seeking to explore and discover existing and potential technological and market advantages in order to establish a robust competitive opportunity, upon which related development policies will be conceptually based and implemented (Forey & Goenega, 2013).

Hereby, it is important to clarify that Smart Strategy is not a doctrine that requires a region to specialize in a particular set of industries. Instead, the strategy espouses the element of "vertical and non-neutral" intervention, implying a bottom- up, multidimensional and broad development mechanism of economic transformation, able to support the European Commission vision of "smart, sustainable and inclusive growth" (Avdimiotis et al., 2015).

Under this outline and in terms of strategy implementation, the European Commission requests regions to join forces and resources in order to support specific priorities, instead of diffusing their investments in a wide range of economic activities. Therefore, each region is encouraged to establish a set

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

of priorities-based on particular comparative advantages and strengths to maximize focus and reinforce its competitiveness in the global economy.

It is to be noted that the, so called, Research and Innovation for Smart Specialization Strategies (RIS3) has become the dominant norm in Europe 2020 vision aiming to ensure a rational and effective use of public funding. The European Council has underlined the meaning of RIS3, as a concept where "each region relies on its own strengths to determine priorities for national/ regional strategies for innovation, as well as for cross-border collaboration". The Council called for the EC "to guide member-states towards the right direction for improving the performance levels of national innovation systems through the implementation of RIS3"(Peter & Frietsch, 2009).

In terms of actual implementation, Smart Specialization evolves in a meticulous and distinctive six-step-bottom-up methodological approach aiming to actively involve as many as possible social, economic, innovation and research stakeholders (Muscio et al., 2015).The six-step methodology was developed in the original Guide to Research and Innovation Strategies (European Commission, 2012). The initial, first step refers to the analysis of the actual economic structure of the region. The second step focuses on governance since the effectiveness of smart specialization to nurture "innovation-driven growth" is severely affected by such capabilities. The next, third step refers to the establishment and declaration of a common-shared vision for all stakeholders. The fourth step refers to selection of limited number of priorities for regional development, the fifth step entails the construction of an action plan, serving the coherence of players and domains, whereas the final step monitors and evaluates the accuracy of all undertaken policies.

Second Development Tool: Social Entrepreneurship

The term *Social Economy* is used to determine a certain part of the economic system: a whole set of organizations, such as cooperatives, non-profit organizations, unions/federations and, recently, institutions. The driving force of social economy is the *social capital*, which is the essential issue for any economic activity. Social capital involves socialization relationships among the members of a community, trust building, reciprocity, common rules, official and unofficial social networks and effective communication channels, which are ready to be activated by individuals or groups of a community as economic entities.

Moreover, another concept within the Social Economy framework, is that of the *Social Innovation,* which is understood as a combination of "new ideas and measures for resolving societal challenges, widely accepted and applied from the social groups which will present an interest" and usually include services, rules, processes and social practices (OECD, 2016).The working definition of Social Innovation adopted in the framework of the 2000 Forum on Social Innovations stated that "it can concern conceptual, process or product change, organizational change and changes in financing, and can deal with new relationships with stakeholders and territories". Social innovation seeks new answers to social problems by (OECD, 2016):

- Identifying and delivering new services that improve the quality of life of individuals and communities.
- Identifying and implementing new labor market integration processes, new competencies, new jobs, and new forms of participation, as diverse elements that each contribute to improving the position of individuals in the workforce.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Social innovation can therefore be seen as dealing with the welfare of individuals and communities, both as consumers and producers.

Social Entrepreneurship, which according to the European Economic and Social Committee (2012) employs 6% of the European workforce and represents 10% of all European firms, is also viewed as one of the main tools to achieve welfare, sustainable development and generate new job opportunities. Social Business Initiative(SBI) has been inaugurated on 2011 and represents the wider EU initiative that aims to support the development of social enterprises across the continent. Within the SBI text, the Commission has placed the social economy and social innovation at the core of its interests, in terms of both territorial cohesion and search for new solutions to social problems. Social entrepreneurship is meant to target in solving social problems, such as the protection of the environment, education, health service, poverty, energy, water sources etc. The solution of the each time targeted problem should be set in the center of the social enterprise activities and should arise through the implementation of innovative approaches (European Commission, 2013). This perception aims to be in line with the Europe 2020 vision, which understands social economy as the basic sufficient structure to face severe social problems, such as social exclusion, poverty etc. (Campos & Avila, 2012).

According to European Commission (2013), the lively character of the social mission of social enterprises is that the profits made by a social firm (regardless of its legal form of profit or nonprofit) are primarily reinvested in the organization and used for the accomplishment of its mission. The restriction on the distribution of profits and assets is often called "asset lock" and it is established in the company's statutes or requisitioned by law. This main characteristic of the social enterprises in many European countries mainly aims to ensure that the assets will remain in the company and will continue to be available for the public interest that the organization has set.

Acknowledging that there have been many arguments, which dispute the effectiveness of social private entrepreneurship, it is argued that the most essential feature of any social activity is the collective action of people and social networks. Social innovations arise and depend on alliances between different partners; hence the outlook of any social innovation depends on the existence of social networks and social capital. Through the objectives of the networks social economy might become more achievable. Of course, such a direction requires certain economic, law and institutional, both national and European, prerequisites. These are the necessary conditions for any attempt in the area of social economy that might aim to create social and economic value, develop and expand new innovation potentials. On the other hand, it is strongly questionable if regional development could be achieved based only on private initiatives without any social economy effort. In this study it is suggested that social networks, social innovation and regional (smart) development are strongly inter-related (See Figure 1).

In Greece, the 4019/11 law established the institutional framework of Social Economy. A new legal form of Social Enterprise was introduced while certain conditions were set for the recognition of the existing legal forms, social economy organizations and entrepreneurship. According to this framework the Social Economy is defined as "all economic, entrepreneurial, productive and social activities, which are undertaken by legal entities or associations, whose statutory purpose is the pursuit of collective benefit and the service of general social interests". Focusing on the area of interest, the last decade, social economy undergoes a constant transformation from mainly agro-cooperatives, to social entrepreneurship expanding synergies and incorporating stakeholders from other sectors, creating social networks and clusters (Reid et al., 2012).

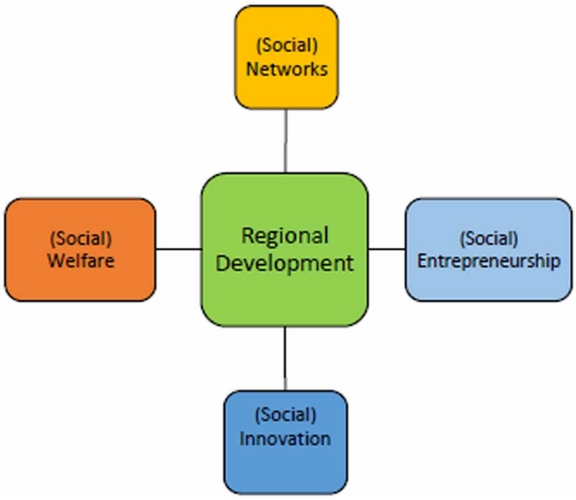
Figure 1. Social regional development



Third Development Tool: Quality

There have been many arguments creating an impression that the conquest of Development and the assurance of Quality at a local and/ or regional level, are by nature competing objectives, one putting obstacles in the way of the other. A key factor in creating this negative and inhibiting image is the prevailing, fuzzy or distorted perception of the content of those two concepts. This is especially apparent in the concept of development, which for decades was understood as synonymous with the concept of growth. Most approaches of development, have usually one-sided, devoid of quality elements, selectively focusing on some of its aspects, especially on the financial development (CQGRD, 2011).

On the other hand, there are some completely different points of view; that not only there is no inherent antagonism between the development and quality goals but on the contrary, the gradual achievement of the first one is a prerequisite for the promotion of the other one. Of course, this is not an easy task to follow, as the strategy for the simultaneous pursuit of development and quality should be built on the clarification of concepts, on the search of links between them and on the elucidation of the required commitments in each one, in a way sufficient to ensure a framework of harmonious and coordinated collusion(CQGRD, 2011).

A fine example of the coordination and synergy between development and quality is the development process of local products. Local products are able to contribute in the development of a region by the creation of a qualitative "identity" of the place, creating links between products, human resources, landscape and culture (Jarvis et al.,2003)

In recent years, a remarkable shift in consumer behaviour towards local products is evolving (Blythe, 2009). In general, local products are those goods or services that are produced or provided by different companies in outdoor areas and can be identified by a recognizable socioeconomic identity (Libery & Kneafsey, 1999). Local products are considered to be the traditional, specialty products, which are very often of high quality, compared to the conventional, mass products. The reasons for the aforementioned consumer shift might be found among the following ideas (Deloitte, 2015):

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

- Food crises and anxiety about the quality and safety of food products
- Rising environmental concerns
- Residents' removal from rural areas and the lack of "authentic" products
- A certain consumer target holding relatively higher incomes, which is seeking for high quality in products and services that are related to tradition, inheritance and culture of a region

All of the above provide increased demand for such products and services and constitute a potential economic opportunity for regions capable to properly diversify their products, as well as an opportunity for the endogenous dynamics of disadvantaged areas towards their own development path. Especially in the case of Greece and the so-called Mediterranean diet, there have been globally recognized research results relevant to public health and life expectancy (Psaltopoulou et al., 2004).

Of course, the narrative that local performance should be always linked to "good quality" and the global or mass performance to "bad quality" is clearly in danger to collapse unless accompanied by actual quality. On the other hand, the quality of a product is a socially constructed concept with different meanings and forms depending on the products, the countries or regions and the social context in which it has been developed and evolved (Libery & Kneafsay, 1999, Morris & Young, 2000, Jarvis et al., 2003).

There are some rather formal criteria that link the quality of a product with its attributes and characteristics that make it able to fulfill the consumers' needs and wants (Christmann and Taylor, 2006). These criteria are:

- The actual quality of the product, which usually regards the quality of the material used in the production process, the recipe, the technology involved, the nutritional value of the product (if it is a food product) etc.
- The certified quality, which is derived from various certification systems. The certification refers to two separate and distinct processes: the first one certifies the origin and / or production process giving specificity to the products, while the second one refers to the quality markings of raw materials or to the guarantee of the production process and to the product safety (e.g. organic label, certification systems ISO or HACCP, integrated management, etc.).
- The symbolic quality, which refers to the quality attributed to a product due to specific cultural, ideological or symbolic relations developed between the product and the consumer. For example, cultural heritage, tradition, mythology, values, the "way of life"might become available to and obtained by consumers through certain products or services.

It is to be noted that a differentiation in the price of these products is usually necessary as the cost of production, in less favored or disadvantaged areas, is by definition higher; in most cases local products cannot compete in terms of price with similar conventional products coming from advantageous areas, especially if the local products are undifferentiated and unspecialized.

In all cases, the combination of actual quality, certification and symbolic quality may result in higher value-added product. Of course, this prerequisite does not imply automatic benefit of local producers, as the question of which link, in the production and distribution chain, enjoys in practice the added value is open and depends on local conditions, especially on the consumption rate on the spot.

In any case, there is no doubt that certain opportunities arise for producers, processors and providers of services in the remote areas. In the long term, if these disadvantaged, so far, areas were oriented towards following certification processes in their traditional, qualitative products and/or services they

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

might evolve in proportionately cheaper, hence competitive market entities. At the same time, the production of local products could be established as the cornerstone of synergies between different economic sectors. This requires local synergies, collaboration between producers of raw materials, finished goods producers, retailers and service providers in smart and flexible procedures that are able to create positive externalities. This coexistence may contribute to the development of these regions by raising the productive activities and employment, encouraging entrepreneurship, and strengthening the economic structures and social cohesion (Tsartas et al., 2010).

Current Situation Analysis

In line with the aforementioned tools, the initial step of the economic structure analysis is able to provide the basis, on which all following steps can be structured and evolved. In order to implement this highly important stage of analysis, as thoroughly as possible, the following benchmarks were pursued in this study, adopted, after minor amendments, from a European Commission funded study by Technopolis Group & Mioir (2012):

- Map all economic activities of the region
- Record all the technical and business innovation infrastructure
- Record and analyze the current synergy network on a national and international level
- Outline the friendliness of the business environment towards innovation and business detection
- Investigate the Research and Development current support and funding policies
- Ensure the necessary amendments, to reinforce competitiveness dynamics.

Map All Economic Activities of the Region

Halkidiki is situated in the northern part of the Aegean Sea. Thermaikos bay lies on the west of Halkidiki and the city of Thessaloniki on its west-northern side. Geomorphologically, the southern part of Halkidiki consists of three scenic, same in size peninsulas, namely: Kassandra, Sithonia and Mount Athos, the autonomous monastic territory, where "the bell tolls only for men" indicating that the Mount Athos area is not accessible to females. The region took its name from the town of Halkida, in EviaIsland (Greece), which alongside with the city of Eretria, were the first ancient cities to establish colonies in the region. According to another view, the name is generated by the word "copper" (halkos in Greek), due to the abundance of valuable metals in the subsoil of the region.

The Demographics of the Prefecture

The number of permanent residents of Halkidiki totals 105,950 people, with strong population variations mainly during the summer months, representing 0.98% of the population of Greece, 5.65% of the Region of Central Macedonia, achieving a positive average population growth over the last decade, at a rate of 0.90. Regarding the residential network, the region is polycentric, without any urban center in the conventional sense. Halkidiki has a wide dispersion of inhabitants over more than 210 settlements, of which only four have more than 4,000 inhabitants, while 57.7% have fewer than 150, explaining the argument that the residential synthesisis directly connected to multi scattered attributes and wide dispersion of local economy (Halkidiki Hotel Association, 2014).

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

At the social level, Halkidiki seems to have strong family ties, following the standards of the Region of Central Macedonia. 55% of residents are married, 8% widowed and divorced is the 1.8% of the total population. With regard to the conditions in households and families, the nuclear family model is followed, with the number of children to decrease significantly. Regarding education level, 67% of the citizens are primary, secondary and post-secondary school graduates, 20% are graduates of higher education institutions, and 13% of the population is illiterate, mostly spotted in the above of 65 years of age group (Hellenic Statistical Authority, 2015).

Current National and Regional Economic Juncture Overview

Evidence from the Hellenic Foundation for Economic and Industrial Research (2016), the Greek economic environment remains unstable and marginal; unfortunately the European level of development is weak too, as the whole edifice of the European Union faces the most severe crisis of all times. In Greece, although the national macroeconomic indicators reflected recently a stabilization of the economy according to the Hellenic Ministry of Finance (2015), all business indicators (liquidity, profitability, capital structure, sustainability investment indices, etc.) remain still at disappointing levels (Foundation for Economic and Industrial Research, 2016). In addition, the classification rank of the country in the Global Competitiveness report of the year 2014 seems extremely low (91st in total 144 countries) in comparison to pro-crisis eras. In overall, it seems that the whole country and of course the business domain, particularly the SMEs' sector, is still struggling to restrain recession. Almost two out of three of small and very small businesses are declining without emerging recovery prospects, while for the first half of 2016, the valuation of prospects remained negative. Focusing on Central Macedonia, the data published by the Hellenic Statistical Authority (2014) indicated that the overall growth rates keep hindering since 2004, even before the official starting point of the economic crisis (late 2009).

Nevertheless, it has to be mentioned that the larger share of destruction fell on people's shoulders. Almost one out of three in overall and six out of ten young citizens is unemployed; the population portion below the poverty limit is close to 25% (Hellenic Statistical Authority, 2014), while the wages and salaries have decreased by 50% average since 2009.

The Primary Sector

Halkidiki is largely hilly - mountainous and geographically fragmented. Only 21.6% of the total area is flat and it is mainly located on the coastal zone of the Kassandra peninsula and the area of Ierissos in the east part. It has a large coastline and extensive woodland. The combination of rich vegetation and coastline creates a noteworthy landscape that gives the area a significant competitive advantage. On the other hand, the territory relief creates difficulties in agricultural activities. The area of cultivated agricultural land is about 23% of the total area, pastures account for 1.6% of the total area, while the forest land, covers about 73.4% of the region. According to the Hellenic Statistical Authority (2014) there is a considerable large variation of average altitude of the total cultivated area,, approximately 52% is cultivated with cereals 32% with tree cultivation, 2% with vines and 9% are fallow, while 33% of the area is rented to farmers. It is significantly important to note, that only 0.5% of the total land, is systematically cultivated having a severe impact on standardization of production and generated income.

Due to the large forest cover, there is a very significant timber production. The total of the pine forests and evergreen broadleaf also offer significant exploitation potentials for the development of alternative

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

forms of tourism. Furthermore, greatly important is the contribution of forests to the local economy through beekeeping. The geographical boundaries of the municipality, collected a notable amount of production making beekeeping strategic advantageous.

Regarding fisheries, the number of employees is declining, while the over-exploitation of marine wealth, is becoming threatening. Fishing catch is primarily absorbed by the market of Thessaloniki, but the export efforts in countries of Central Europe gain in importance. The professional vessels operating in the region reach the number of 250, of which 15 are trawlers or purse seines and the rest fall into other types of coastal fisheries. The overall number of direct and indirect employees recruitment, reaches the 1200, while the amount of the catches which was transferred to the markets reaches 550 tn (Municipality of Aristotle, 2015). Taking into account the overexploitation of the sea spices, in the gulf of Ierissos, the reinforcement of the biodiversity was endeavored with the establishment of a technical reef.

With concern to the livestock sector, the most important areas are those of Arnea and Ierissos, where almost 29.000 sheep and goats, 1000 cattle, 1220 swine and 1070 cows are breed, sufficiently supplying the local meat market and creameries (Municipality of Aristotles, 2015).

In the municipal district of Taxiarchis of Polygyros municipality one of the most important agricultural activity is the cultivation of spruce trees to be sold as Christmas trees. The climatic conditions of the region make it unprofitable to any other crop, except spruce trees. It is to be noted that 75% of the national demand for Christmas trees is covered by the Taxiarchis region.

The fruit and vegetables production is rather small, quite unplanned, highly scattered, designated for the local market covering an insignificant percentage of the hotel demand.

In conclusion, during many decades, growth in the primary sector has been unplanned, based on randomness, without taking into consideration the concept of carrying capacity, which resulted into negative effects in almost all domains, particularly in the fisheries sector. The analysis revealed the dramatic absence of strategic planning in the region, which is essential to interconnect individual production activities, set priorities for development, and thereby ensure the stability over time in the production, long-term maintenance of profits and finally social cohesion and prosperity.

The Manufacturing Sector

The structure of the manufacturing industry in Halkidiki is entirely consisted of micro and small enterprises (about 97%), employing fewer than ten people, having mainly family character (Ministry of Environment and Climate Change, 2013). During the recession, processing notes significantly keep declining mainly because a) the primary production sector continues to shrink b) there is an overall shift of the growth model towards services, where the investment required is considerably smaller, and c) a significant number of companies transferred their headquarters in countries with more favorable taxation.

During the last years the manufacturing sector, is mainly supported by the oil and olive process units. Halkidiki's "green olive" has become the trademark of north and central region, achieving exports in several countries, while extra virgin olive oil is also exported as a wholesale in several countries. The overall contribution of oil and olive oil process industry to employment is more than 1500 workers (Halkidiki Hotel Association, 2014).

The region is also an important location of the wine routes of Northern Greece, attracting a significant number of wine loving tourists. The route begins at St. Paul and Nea Gonia, from the winery of Evangelos Tsantalis, nearby the "cave of ancient man" in Petralona and continues to taverns and restaurants of Kassandra. In Sithonia, the route includes the vineyards of Porto Carras and the tasting facilities on

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

the slopes of Mount Meliton. In the area of Mount Athos, the vineyard in dependency of Chromitsa and winery Mylopotamos can be found. Further north, in the mountainous Chalkidiki, in Polygyros, the winery of the estate Claudia Papagianni is founded. Almost 50% of the overall production of wineries is worldwide exported. The remaining 50% is allocated in the Greek market, a small percentage of which remains to be consumed in the local market.

The Tertiary Sector

During the past few decades the Greek economy evolved into a service oriented economy, with tourism, commerce, and banks, acquiring the lion's share of the GNP. Nevertheless, it is to be mentioned that although Greece is able to provide services of excellent quality, the tertiary sector, as a whole, appears to be unstructured, lacking thorough, detailed and long term planning.

In the same pattern, the tertiary sector in Halkidiki plays an imperative role having a significant impact on a wide range of other sectors. In thick lines, the structure of services consists of 20% tourism businesses, 30% commerce (whole and retail), 5% transportation, 15% leisure and recreational businesses, while the remaining 30% includes other activities such as financial intermediates, education, management, marketing services etc. (Ministry of Environment and Climate Change, 2013).

It has been mentioned previously that tourism industry is dominant while several domains and other activities notably develop according to the extent of tourism development (Halkidiki Hotel Association, 2014). For instance, the sectors of transportation, financial intermediaries, retail and wholesale commerce, logistics, restaurants, recreation, entertainment and other activities are substantially depended on tourism. Although tourism has become the cornerstone of development, influencing almost the whole local economy, yet, it remains randomly developed and unstructured, strongly depended on tour operators and (at the same time) is vulnerable to exogenous factors.

Employment

Halkidiki, seems to stand below the national average rate of unemployment and seasonal employment of Greece. Evidence from the Hellenic Statistical Authority indicate that the general structure of employment remains seasonal and roughly mixed, with a slight emphasis on the tertiary level of production, including a wide spectrum of ages, both genders and educational level. The grid of employment is directly connected with the current production model, which involves mainly tourism and partly food processing, agriculture and fishing.

Table 1. Employment structure

Main Settlements of Halkidiki	Productive Population 2011 (15-64)	Agricultural Level -Unemployed or Seasonal Employed-%	Secondary Level -Unemployed or Seasonal Employed-%	Tertiary Level -Unemployed or Seasonal Employed-%
Ierissos	5.273	21,38%	31,88%	34,25%
Polygyros	10.748	14,79%	24,74%	41,18%
Moudania	5.525	16,22%	26,19%	40,61%

Source: (Ministry of Environment and Climate Change, 2013).

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Investments

Despite the unfavorable economic environment, Halkidiki has become receptor of major investments, particularly in tourism, and recently in the field of copper and gold mining. More specifically, in the area of Ouranoupolis, a luxury hotel chain, extends its existing infrastructure in an area of 15000 square meters, while in the area of Canistroin Kassandra peninsula, a luxury hotel- spa and marina construction investment is realized. Both investments will offer more than 500 direct and indirect jobs. At the same time, the recently in full extent completed investments of newly established hotels in Neos Marmaras and Gerakini are about to establish a dominant role in Halkidiki hospitality infrastructure. Finally, the strategic partnership of a major domestic hotel chain and a significantly important fund, create appropriate conditions of further investments in tourism and the overall improvement of infrastructure in tourism sector (Halkidiki Hotel Association, 2014).

In the field of copper metallurgy and gold, a consortium of domestic and Canadian companies, established an extensive, nevertheless controversial, mining investment in NE Halkidiki, which is at a considerably insecure state due to strong reactions on behalf of the local community and professional associations with reference to the negative environmental footprint of the activity (Halkidiki Hotel Association, 2014). In the area of manufacturing, investments are restricted to olive oil and wastewater treatment processes.

New Technology and Innovation Capabilities

New technologies are one of the necessary requirements to achieve, in order to maintain and improve the region's comparative advantages. Although in Halkidiki, the new technology absorption is found to be at acceptable standards, at least to some extent, it has to be clearly stated, that this is by no means a region innovator of new technologies.This could be related with the insufficient connection of Universities and research centers with the active industry, the currently existing structure of the local economy, which is largely depended on Small and Very Small Enterprises and finally to the discouraged economical juncture and the subsequent heavy taxation policies. All factors, together could have an apparent influence on production costs and the time which is required to incorporate innovation. Towards this direction it is necessary for the government to address the issue and establish lower taxation rates of innovation integration. Furthermore, the Smart Tourism Development Model - that this study aims to suggest - could be a landmark of innovation enhancement and further incorporation of new technology, as a result of well designed, focused, targeted and extensive production.

Record Technical and Business Infrastructure

On the issue of infrastructure the region shows an uneven distribution and marginal efficiency, especially during summer period. The electricity grid covers only marginally the increased demand mostly in the peninsulas of Kassandra and Sithonia. Concerning transportation network, the whole range is quite unsatisfactory, inadequate and very dangerous, having as direct consequences the inability of the region to support mass transportation during tourist period towards Kassandra and Sithonia (both important tourist destinations) and the exclusion of east Halkidiki from the international road of Egnatia Odos s.a., due to the very low standards of the vertical connection to Ouranoupolis (Municipality of Aristotle, 2015). Port and docking infrastructure is also inadequate to support the safety of passengers and vehicles,

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

undermining the development prospects of marine tourism in the region. As for the water supply and irrigation network, significant deficiencies and problems were found despite the sufficiency of groundwater. There are, for example, major delays in implementing the Havrias dam in Ormylia and Petrenia dam in Gomati, to facilitate the water supply of the local population and irrigation of agricultural land.

It is to be noted that the European Union Funding Framework 2007-2013, which provided the necessary financial basis, where on important works of infrastructure were established such as the reconstruction of road networks, the slaughterhouse in Arnaia, the marine terminal in Ouranoupolis, the Port of Nea Moudania. Beyond infrastructure elements, a great number of SME's were funded to expand and rebuilt, improve and renovate their equipment. Tourism sector extensively employed the opportunity to upgrade existing infrastructure, absorbing almost the total of tourism related funding programmes.

Record and Analyze The Current Synergy Network on a Local and Regional Level

Halkidiki is divided into five municipalities, Aristoteles, Kassandras, Neas Propontidas, Polygiros and Sithonia. It is commonly accepted by all stakeholders that the small financial size of the region restricts the potential of large-scale economy. Therefore, there have been previous suggestions that the optimum direction should have been the establishment of business networks (either horizontal or vertical) in order to reinforce synergies, set common strategic targets and policies, ensure joint quality standards and hopefully obtain large-scale benefits(Municipality of Aristotle, 2015).

There are already significant co-operatives, associations and networks in the area, which however lack in links and bounds between and among them. In the primary sector, there is a dominative cooperative, named "Sithon", in the honey production, which was established in 2005 and is permanently succeeding to control the cultivation and distribution of the total honey production. There is also the "Agriculture Cooperative Union" while there are ongoing procedures to create a co-operative among producers of herbs. In the field of olives and olive oil production, there is the "Agriculture Association Union", which handles a major part of production. In the secondary sector, an important established network is the social company of "Aristotles Land", which since 2013, has become a major stakeholder in food process and standardization.

In the tertiary sector, the "Halkidiki Hotel Association" and the "Association of Rental Rooms and Apartments" were established in the early 2000 playing currently an imperative role in synergies development. In 2007, the "Halkidiki Business Network" was established, as a social entrepreneurial initiative, aiming to collect all the productive forces towards the direction of continuous cooperation. This network established in2011 the "Local Quality Agreement", in an effort to set the quality standards in a wide spectrum of SME's. The Local Quality Label is currently supported by a notable number of companies, shaping the quality standards in oil production and olive labeling, also in taverns and restaurant service, quality service of accommodations etc. (Municipality of Aristotle, 2015).

Business Friendliness Environment

As it was aforementioned, the local economy of Halkidiki is characterized by the existence of many micro, small and medium enterprises. Under this structure, for many years Halkidiki accounted as an investment center of reference, particularly in the tourism sector. However, this procedure was disrupted by the recession and the restructuring of the banking sector since 2010 and onwards. As it was previously

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

highlighted the financial sector holds the most particularly important role in shaping the future business environment. Greece has been in the era of "Memorandums", which are agreements between a country member of EU and its partners-lenders. The strict, restrictive both fiscal and financial measures have strangled all productive forces, the working people most of all, nevertheless any business investment plans. However, the EU institutions and Greek Governments expect that the consolidation of the banking sector and the removal of restrictive measures are expected to eventually restore stability, raise the volume of deposits at satisfactory levels and gradually reduce the cost of borrowing.

Private investment fell by 30 billion Euros during 2007 – 2015 period of years, which is the 65% of its initial value (Melas, 2015). Regarding startup procedures, they were found to be rather complex, overdemanding, time consuming and bureaucratic, so far. Alongside with startup insufficiencies, the issue of heavy and unstable taxation remains significantly important towards the realization of an investment (Hellenic Institute of SMEs, 2014).As from September 2013 the institution of the Investor Ombudsman was established through Enterprise Greece, aiming to unblock bureaucratic Public Services (Greek Investment and International Trade Company, 2016)

Research and Development Funding Policies

All four of the country systemic banks operate through numerous branches throughout the region. However, there are certainly serious deficiencies in funding innovative ideas and schemes, furthermore research and development initiatives. Traditionally, the funding support of innovative ideas had been strictly limited to public expenditure, a policy which was terminated due to capital controls. Restrictions in funding should be also attributed to the nature and the structure of the vast majority of the SMEs in the region, which suffer from low prioritization, or insufficient budget or even total absence of research and development departments.

Nevertheless, financial organizations address with great reticence almost any innovative venture scheme, mainly due to the general negative economic and business environment. It could be postulated that the whole framework of current economic context, does not contribute to the development of innovation driven investment culture (Halkidiki Hotel Association, 2014).An imperative hope for the recovery of the banking system and the Greek economy as well, remains the new programming period 2014-2020 of the national financial reporting framework of the European Union. Towards this direction, among other regions, the region of Central Macedonia, to which Halkidiki belongs, prepared the Strategy of Smart Specialization, in order to achieve sustainable, inclusive and flexible development, on sectors with existing or potential competitive advantage (Reid et al., 2012).

Necessary Amendments towards Reinforcement of Competitiveness Dynamics

The outcomes of the preceding analysis (which was attempted through the prism of the smart specialization concept in conceptual collaboration with the social entrepreneurship and quality concepts) revealed weaknesses and strengths of the region with regards to the three sectors of production and the so far development model of the area. First of all, it was understood that the most advantageous cluster of the region is undeniably tourism. Nevertheless, it was found that tourism growth itself, although profitable, has been randomly developed and unstructured, strongly depended on tour operators, isolated from the other sectors of production and the social evolutions and dynamics of the region. Secondly, it was found that there is significant production of qualitative products with apparent competitive advantage such as

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

oil, olives, honey, fish, fruits and cereals, which are not usually being processed and/or consumed within the region. Moreover, unlimited margins of further increase of the production of qualitative, traditional, local products were revealed. On the other hand, the whole primary sector, more specifically agriculture and livestock are heavily threatened by the general economic and political evolutions, such as taxes and funding difficulties among others. In addition, the analysis clearly indicated that although the social innovation initiatives of EU have been rather neglected so far, there is a considerable social capital in the region and some good examples of social networks, too.

In overall, the analysis supports a simple, however misunderstood and neglected, idea: that it is neither very clever for the tourism sector to fulfill its needs by buying products and services either from other regions or from imports,nor for the productive enterprises of the region to deliver their products in outlets outside the region. In conclusion, the analysis highlighted that the reinforcement of competitiveness dynamics of the region could be built upon the following points:

- Sustainable and flexible development.
- Support of entrepreneurship–innovation and networking between enterprises in a vertical and horizontal manner.
- Development of strategic sectorial plans that will create the foundation for future development.
- A step-by-step process of monitoring in order to establish continuous feedback and control.

Solutions and Recommendations: The Smart Tourism Development Model

The region of Halkidiki stands before the threshold of a new, post crisis era, seeking to shape and establish a multi core, innovative and smart development model. The preceded analysis indicated that Halkidiki is a vital, multidimensional and dynamic unity, whose inherent advantages though have been either neglected or irrationally exploited, so far. Therefore, any future development model should be carefully designed, targeting to sustainable and inclusive development utilizing as many as possible environmental, cultural and economic resources. A prerequisite, towards such a vision, is the cooperation of the other sectors "around tourism", the relevant creation of local sustainable synergies among public, private and alternative institutions and networks as well as the optimum exploitation of the social capital and the actual participation of citizens; the relevant processes shall eventually formulate a development quadruple helix.

Towards the handling of the aforementioned concerns, the *Smart Tourism Development Model* was elaborated, based on the rationale of coordination and connection between and among the stakeholders of the existing economic structure of the region. The Smart Tourism Development Model aims to the transformation of Halkidiki towards a sustainable, smart and inclusive community, where local economic sectors are working together, as cogwheels around tourism, targeting common goals of prosperity and welfare.

The Employed Tools

As described in the first section of this chapter, the evolvement of the suggested model was based on three conceptually cooperating development tools: the Smart Specialization Strategy, the Social Entrepreneurship and the Quality concepts, which were purposefully chosen to act in line with the future vision of Halkidiki. The effort to understand better and present briefly these tools in this chapter revealed that

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

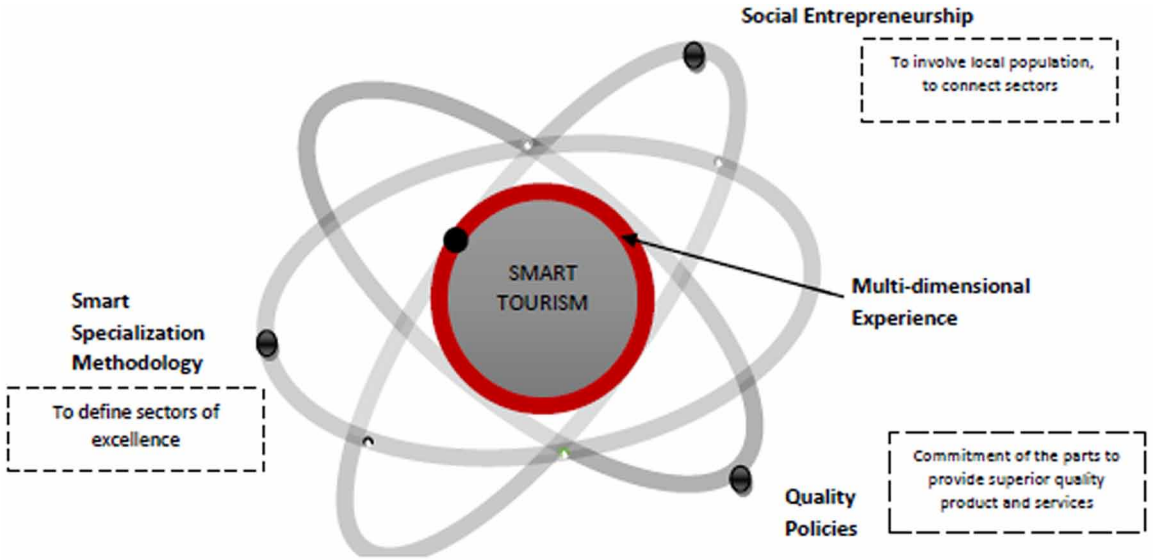
they are extensively adequate for the case of Halkidiki, as they are specially conceptualized and designed to reinforce the sustainable and inclusive development by acknowledging and facing the economic and environmental challenges of a region.

Indeed the tools were found very useful to identify the existing zones of development in the region, to spot the advantages and the excellences of certain areas when at the same time to acknowledge limits and weaknesses in structures, functions, planning and implementation of the past. The simultaneous employment of the three tools served well the bottom-up approach, which aimed towards a production process that should be able to highlight and evolve the existing advantages, heal weaknesses and overcome threats by involving as many as possible synergetic sectors in the model.

In specific, the outcomes of the employment of these three tools generated the conceptualization of the model itself, as they revealed that there is a "smart" opportunity to connect the agri-nutrition sector with the industrial processing sector in order to serve tourism with local, high quality products and services, produced and delivered by social enterprises and consumed on the spot while making a productive use (even economies of scales) of the thousands of tourist visitors in the region.

More specifically, the methodological approach of smart specialization identified the existing areas of excellence, which formulated four zones of excellence in specified sectors of competitive advantage, revealing at the same time a certain spectrum of further investment opportunities able to guarantee effectiveness and efficacy. It was clearly indicated that tourism is and will be the undeniable leading spearhead of the development effort, when there are wide untapped margins of development in the other sectors, if business effort is re-arranged around tourism. Social entrepreneurship demonstrated the synergy opportunities, the existing citizens' and/or business networks, their weaknesses and strengths. Most of all, it revealed the rising opportunities if these networks decided to collaborate all together targeting mutual and not competitive goals. The "Halkidiki Business Network" should be the central axis of the region synergies effort and the "Local Quality Agreement" could be the tool to achieve initiating collective actions increasing members' negotiation and purchasing capability.

Figure 2. Smart tourism development model



EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

On its turn, *Quality* identified the opportunities lying on the qualitative development of local, traditional products and services. The necessity and the crucial role of a local "Quality Agreement" was highlighted and a relevant suggestion is offered to the stakeholders of the region. The Halkidiki Quality Agreement means to encompass mainly the social entrepreneurship networks but it can also be inclusive of any type of business in the region. Actually, the extensive compliance of the local community with the Quality Agreement might immediately result in a multiple-fold positive effect on a)integrated actual, certified and symbolic quality of local products and services, b) wider absorption of local production within the local market against imported products and increase of the consumption rate on the spot of production b) inspiration and support of long-term planning procedures for the agricultural, livestock and fisheries production, c) stimulation of new entrepreneurial activities and synergies.

The Four Zones of Development

Considering the objectives of the model, Halkidiki, was divided into four distinctive *development zones* of excellency, having each one of them a foremost productive characteristic, and not merely a geographical orientation. Under this consensus, as Map 1 indicates, it is feasible for a settlement to belong - in a quite flexible manner - in more than one zone(s), giving the opportunity to the local community, to exploit the combined sum of the existing competitive advantages. The productive characteristics that have been formulated by the preceding analysis and were taken in consideration in the formulation of the zone are: tourism (intensive, mild), agriculture/livestock, fishery and industrial process. Consequently, the determined four zones are the following:

1. The zone of intensive tourist development (ZITD),
2. The zone of mild tourist development (ZMTD),
3. The zone of intensive agricultural, livestock and fishing(ZIALFD),
4. The zone of industrial processing (ZIP).

Geographically, the *Zone of Intensive tourism Development* (ZITD) includes the peninsulas of Kassandra and Sithonia, West and South West region of Hakidiki; its reference center is the settlement of Nea Moudania. The most important destinations in this zone are the villages of Nea Skioni, Polyhrono, Nea Potidaia, Siviri, Nikiti, Toroni, Sarti, and Neos Marmaras. In ZITD, the main tourist activities are related to the "sea and sun model", including seaside activities, diving centers, yachting, etc. The existing infrastructure is considered to be sufficient and satisfactory with regards to the needs of the many luxurious hotels and hotel chains located on the above mentioned settlements and the beaches across the coast.

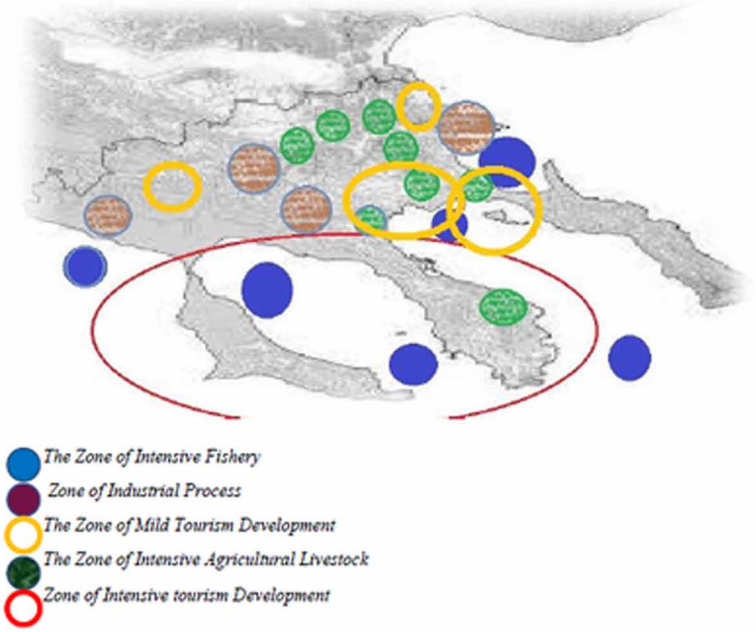
The *Zone of Mild Tourism Development* (ZMTD) includes the area before Mount Athos region, and the area of Ancient Stagira, Aristotle's birthplace, in the East and North East region of Halkidiki. The reference center of ZMTD is the settlement of Ouranoupoli. The other most important places that can be included in this zone are the villages of Nea Roda, the island of Ammouliani, Ierissos, Pirgadikia, Olympias and Arnea. The main tourist activities are related to cultural and ancient civilization tourism, pilgrimage tourism, ecotourism, agrotourism, walking and biking and also some sea activities, such as diving, yachting etc. Within ZMTD, there are coastal and mountainous routes, connecting *the monastery of Zygos* in Ouranoupolis with *the canal of Xerxes*, in the settlement's edges of Nea Roda, and with the *Ancient Stagira*, in Olympias region. The required infrastructure regarding luxurious hotels in the area before Mount Athos is considered sufficient, while in the area of Stagira is rather degraded.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

The *Zone of Intensive Agricultural Livestock and Fishery Development* (ZIALFD) could be geographically divided in three subzones. The agriculture subzone situated in the Lowlands of East and Central Halkidiki, the livestock subzone, which is located in the mountains of Kakavos (East region) and Holomontas (Central region) and the fishery subzone, located in the gulfs of Ierissos, Mount Athos, Kassandra and Moudania. The agricultural subzone center is the settlement of Ierissos, including the lowlands of Akanthos. The most important settlements are Nea Roda, Gomati, Pirgadikia, Megali Panagia, and Zervochoria. The most significant cultivations are cereals, olive trees, fruit, vine and beekeeping. The livestock's subzone center is the settlement of Polygiros, including the settlements of Arnaia, Taxiarhis, Agios Prodromos Neohorion, Palaiohora and Palaiohori, breeding goats, sheep, cows and beekeeping. As mentioned above, there is a significant cultivation of trees and timber production in this place. In the fishery subzone, the center of reference is the Nea Moudania town and an extensively wide spectrum of catch species.

The *Zone of Industrial Process* (ZIP) is mainly located in the west region of Halkidiki including food processing industries (olive and olive oil factories, beekeeping and honey firms, slaughterhouses etc.) The reference center of the zone is the settlement of Ormilia, including also the settlements of Stratoni and Stratoniki, Metagitsi, and Lakkoma. There is another, secondary, part of ZIP in East Haklidiki, where the plants of establishments of metallurgy are located in Skouries. There has been a serious issue related to this area as long protests have been many times organized by citizens of the local households against the Canadian gold-mining firm, responsible for the environmentally contentious gold mining project. The citizens' movement is sometimes directed against consecutive Greek Governments too, which allowed over time the over-exploitation of the mineral wealth of the region without taking measures to protect the natural environmental inheritance and reserve the economic interests of the country. The relevant movement has made the place famous as several march protests have been also organized all over Europe, expressing in this gesture their solidarity to the residents of Skouries.

Figure 3. The four zones



EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

The idea is to inspire citizens, authorities and network to advance synergies towards optimum exploitation of the excellences of each area, productive use of the agglomeration of resources at their spot, production of local, qualitative products and services to be delivered, at raised rates, within the boundaries of the region. Tourism offers the adequate market or local products to be consumed, while the local households' market should not be ignored too.

The Zone of Intensive Tourism Development can still be focused on tourism based on the "sea and sun" model, utilizing all existing infrastructure, while the Zone of Mild Tourism Development had better concentrate on alternative forms of tourism, emphasizing on culture and archaeology. Both intensive and mild zones could function like "communicating vessels", awarding tourists with unique experiences and excellent infrastructure. The Zones of Intensive Agriculture, livestock and fishery should target to support the establishment of a competitive environment towards production of supreme, local, qualitative products, while the Zone of Industrial Process may offer the means to local economy to activate and benefit from already existing infrastructure, while targeting to new investment, innovative initiatives and expansion efforts.

Aristotle's Menu

A pilot implementation of the above presented ideas is the paradigm of *Aristotle's Menu*, which has been already presented and very well accepted in the Municipality of Aristotle in the NE region of Halkidiki. The implementation of the model begun with a helping hand from the ancient Greek- Macedonian civilization. Aristotle has always been a dominant figure in Halkidiki and a significant point of interest for domestic and incoming tourist population. Driven by the need to incorporate elements of the cuisine of Ancient Greece in the contemporary local cuisine, the Chefs Club of Thessaloniki, in connection with the Hotel Association of Halkidiki, composed *Aristotle's Menu*, which is widely accepted, taking already a noticeable place in hotels, taverns and restaurant a'la cart menus. The basic ingredients of *Aristotle's Menu* are olives, olive oil, wheat, oat, honey, vinegar, mostly fish than meat, raisins, lettuce and fruits. the *Aristotle's Menu* initiative, comprehend the momentum to mature, flourish and at the same time produce critical benefits on local economy, mainly through the acceleration of income, investment and employment multipliers (Figure 4). Simultaneously a new tourism product is being formed, providing a strong experience on domestic and incoming tourist population.

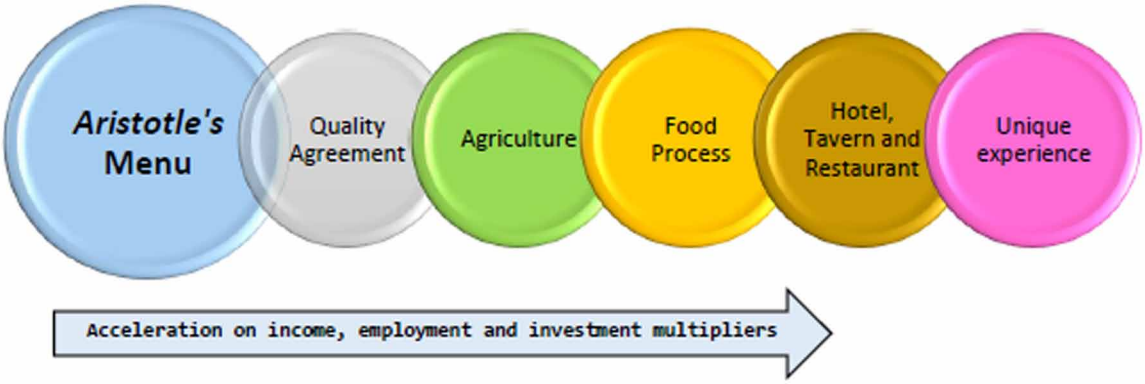
All of the Aristotle's menu products are currently produced and processed in Halkidiki. However, the expanded demand of the specific products, could trigger irregularities, regarding the regular supply of the market and the whole sale and retail prices. The occurred abnormalities could be answered through synergies between associations, cooperatives and the local business network, within the framework of adherence of the Local Quality Agreement, according to which, stakeholders could strategically plan cultivation and production, setting under control production, prices and supply.

CONCLUSION

In contemporary turbulent times, where regional and national economies are facing recession, European Union, provides all necessary mechanisms to reform structures and stimulate regional competitiveness. In line with this, the Smart Tourism model incorporates EU stemming mechanisms contributing to the

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 4. The idea of "Aristotle's Menu"



achievement of the overall targets of Europe 2020 policies while it is expected to significantly increase levels of income redistribution, employment and investment multipliers.

More specifically, the implementation of Smart Specialization strategy -that will allow policy makers to acknowledge, define and appropriately exploit sectors of excellence and built upon them a significant and long lasting competitive advantage- along with the definition of spatial zones of development and the commitment to common Quality Agreements, safeguards synergetic attitudes, focused, standardized and competitive tourism policy, towards innovation and rejuvenation.

Moreover, social economy and social entrepreneurship, which are key factors of Smart Tourism model holding an imperative role, should expand limits of production and simultaneously lower (production) costs. In overall view, the implementation of the model contributes to the provision of notably important benefits to all parts of the local economy, while the expansion of synergies should additionally support competitiveness improvement. Considering the purchasing power of tourists that remained barely exploited so far, the implementation of the model is expected to increase the "per tourist" expenses, adding value to other local economy sectors, such as retail and wholesale market, logistics and transportation. However, Smart Tourism model could be influenced by some minor limitations, referring to the fact that the study was largely based on secondary research, which are not always sufficient and updated. Furthermore, Smart Tourism has not (yet) been implemented in other destinations as a model, hence any actual implementation has not been a subject of scientific research and evaluation.

Managerial Implications

The implementation of Smart Tourism development could create a number of managerial opportunities and implications, to all sectors that are directly or partially connected to tourism activities, setting opportunities for domestic and international capital investments.

Starting from the primary sector, Smart Tourism stimulates the need to re-organize production, within spatial zones of development, and set up networks to facilitate knowledge exchange flow, setting at the same time the framework of scale economy in production. However, a very important part of the model stands to the capacity of process units to efficiently manage the provided agriculture production, generating the need to establish high performance process units equipped with "state of the art" machinery, operated by qualified personnel within a thoroughly designed production management plan. Towards

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

cost and price restraint, production plans should be carefully designed, using methods to enhance quality and reach scale economy production, at the same time. The point of balance between both factors could be determined through Quality Agreements and production management methods, such as Lean Management.

In the case of Halkidiki, the early implementation of Smart Tourism model initiated positive effects on the local economy. The prompt urge from hotel establishments, restaurants and taverns to include Aristotle's menu, seems to positively influence local production and process capabilities, reinforcing at the same time destination's marketing strategies and promotion of the tourist experience in the region.

FUTURE RESEARCH SUGGESTIONS

Last but not least, acknowledging the difficulties and limits generated by the economic crisis and the aggravation of the refugee issue and besides the national, European and global conflicts and deadlocks, it is argued that the ideal expected benefit of the model is to contribute to the development of a sustainable, worth living, community, which tourists will be attracted to visit and citizens will be willing to live and work, presently and perpetually.

The actual implementation of the model would require further research efforts to understand better the perceptions and attitudes of shareholders, either citizens or business, followed by strategic plans, and consequently detailed action plans and techno-economic studies. An adequate set of such studies would be able to guarantee the re-arrangement, organization and systemization of production, delivery and merchandising of qualitative products and services, specially designed to fulfill advanced needs and wants of both the local population and the thousands of visitors in the region.

KEY TERMS AND DEFINITIONS

Aristotle's Menu: A menu based on dietary habits of Hellenistic Period.

Halkidiki: District in Central Macedonia region.

Smart Specialization: A strategic approach to economic development through targeted support to Research and Innovation (R&I). It is the basis for Structural Fund investments in R&I as part of the future Cohesion Policy's contribution to the Europe 2020 jobs and growth agenda.

Smart Tourism Development Model: Tourism Development model based on the Regional Strategy of Smart Specialization, Quality and Social Entrepreneurship.

Chapter 66
Social Media Use by Chambers of Commerce and Industry (TCCI) in Turkey

Ali Acilar
Bilecik Şeyh Edebali University, Turkey

Muzaffer Aydemir
Yıldız Technical University, Turkey

ABSTRACT

This chapter empirically investigates the Turkish chambers of commerce and industry's social media usage. Specifically, the research explores the prevalence, types, frequency, reasons, and the most importantly effectiveness of social media usage among the Turkish Chambers of Commerce and Industry (TCCI). A web based survey conducted to gather data from the TCCI. The chapter consists of five main parts: Introduction, social media as a modern business imperative, survey about social media usage in Turkish chambers of commerce and industry, and conclusion.

INTRODUCTION

Information and communication technologies have become an important part of our life. Especially the Internet and the Web together have deeply affected our lives from education to communication, from business to entertainment for the past decades. But that was not the case at the beginning of the Internet. In the early years of the Internet, web sites were static, according to Tim Berners-Lee "read-only" websites (Shivalingaiah & Naik, 2008), did not have interactive content and allowed its users to have unilateral communication (Acılar, 2015; Acılar & Mersin, 2015). This first phase of the World Wide Web (WWW) is called as "Web 1.0". The earliest Web sites provided little opportunity for two-way communication, presumably at best providing contact information such as mailing address, e-mail, or phone number (Andzulis, Panagopoulos, & Rapp, 2012).

Since it was invented in 1989, the WWW has evolved greatly through the years and it continues to grow and evolve. Today, in addition to static content, Web sites enable people to collaborate, share information, and create new services and content online (Laudon & Laudon, 2012: 272). This stage of WWW is called as "Web 2.0". Web 2.0, also known as read-write web, is defined by O'Reilly (2007) as **"**the network as platform, spanning all connected devices; Web 2.0 applications are those that make the most of the intrinsic advantages of that platform: delivering software as a continually-updated service that gets better the more people use it, consuming and remixing data from multiple sources, including individual users, while providing their own data and services in a form that allows remixing by others, creating network effects through an "architecture of participation," and going beyond the page metaphor of Web 1.0 to deliver rich user experiences." Unlike Web 1.0, Web 2.0 allows more interaction with less control (Aghaei, Nematbakhsh & Farsani, 2012). Web 2.0 can be defined as a collection of second generation online technologies and services that enable users to communicate create content and share it with each other via communities, social networks and virtual worlds more easily than before (Jussila, Kärkkäinen & Aramo-Immonen, 2014). The concept of "Web 2.0" was born with a conference brainstorming session between O'Reilly and MediaLive International (O'Reilly, 2005) according to a common acceptance in the literature. Web 2.0 has four characteristic features: interactivity, real-time user control, social participation, and user-generated content (Laudon and Laudon, 2012, p. 272). Web 2.0 includes technologies and services such as blogs, really simple syndication (RSS), wikis, mashups, tags, folksonomy, and tag clouds (Aghaei, Nematbakhsh & Farsani, 2012).

Social Media

According to Kaplan and Haenlein (2010) Web 2.0 can be considered as the platform for the evolution of social media. Social media can be defined as "a group of Internet-based applications that build on the ideological and technological foundations of Web 2.0, and that allow the creation and exchange of User Generated Content" (Kaplan & Haenlein, 2010). Social media consists of a wide range of a new generation of Internet applications and encompasses tools that allow individual and collective publishing; sharing of multimedia such as images, audio and video; and the creation and maintenance of online social networks (Constantinides & Stagno, 2011; Bennett et al., 2012). Social media describes online platforms that allow for user-generated content, interaction and collaboration. It is a relatively new phenomenon, linked to the emergence of 'web 2.0' and the move from a static to an interactive internet (Dormey, 2016). The broad term, social media, have been used to apply to a variety of technologies, such as wikis, blogs, microblogs, social networking sites, virtual worlds, and video-sharing sites (Kane, Alavi, Labianca, & Borgatti, 2014). In other words, social media are a group of Internet-based applications which allow the creation and exchange of user generated content through online social networks (Kaplan & Haenlein, 2010; Constantinides & Stagno, 2011; Bennett et al., 2012). Social media help to convert monologue into dialogue, gives free access to almost all types of available information, to transform Internet users from mere readers to creators of online content and to interact in the online world so as to form new personal or business relationships (Holotescu and Grosseck, 2013).

Rapid developments on mobile devices such as smart phones, tablets and notebooks have also opened new avenues for social media. Today's mobile devices and the use of social media presented new opportunities for interaction, provided opportunities for collaboration, allowed users to engage in content creation and communication using social media and Web 2.0 tools with the assistance of constant connectivity (Gikas & Grant, 2013). Today, social media applications in the Internet have been integrated

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

into the daily practices of many users worldwide, supported by different websites, tools, and networks (Oberer & Erkollar, 2012). As the penetration of smart mobile devices and Internet increase, so does the use of social media application in these devices. Smart mobile devices provide the opportunity for people to post and share anywhere and anytime.

Accordingly, today "social networking" has become very popular and occupied an important role in most people's lives (Zaidieh, 2012). "Social Network" can be defined as "a network of relationships between different information processing entities such as people, groups, and organizations" (Hosny & Fatima, 2012). According to Boyd and Ellison (2008) social network sites are "web-based services that allow individuals to (1) construct a public or semi-public profile within a bounded system, (2) articulate a list of other users with whom they share a connection, and (3) view and traverse their list of connections and those made by others within the system." With providing tools on the Internet for posting messages, sharing photos, creating personal pages and groups, social networking sites, such as Facebook, Twitter, Instagram, LinkedIn, etc., bring people together and allow them to communicate by making new friends, exchanging ideas and engaging in similar interests (Hosny & Fatima, 2012).

The emergence of social media has brought numerous opportunities for interpersonal and organizational communication (Lovejoy & Saxton, 2012). The rapid diffusion of social media all around the world is creating new era of possibilities for organizations to communicate with their stakeholders such as stockholders, employees, customers, suppliers and the general public (Lovejoy & Saxton, 2012). Since most of the internet users have at least one social media account and social media use is widespread worldwide, it is natural for the companies to use it as a marketing channel too (Kovacs & Wensley, 2015). However, it is often a painful process for organizations to adopt and use of new technologies, social media also create some obstacles for organizations (Kuikka, M. & Äkkinen, M. 2011).

Technological developments such as social media are gaining popularity and are increasingly used for personal and business purposes. However, the study of social media use in organizations is in its infancy. (Treem & Leonardi, 2012).

SOCIAL MEDIA AS A MODERN BUSINESS IMPERATIVE

In today's rapidly changing business environment social media are indispensable. In other words, social media are modern business imperative for many organizations, including start-ups, small, medium-sized, and large private organizations as well as public and nongovernmental organizations. In this part, social media usage of organizations is discussed thoroughly. Namely "social media usage in organizations", "factors affecting acceptance and adoption of social media", "social media plans / policies", "social media professionals, training and development of social media users", "potential benefits of social media usage for organizations", "risks of social media usage for organizations", "barriers of social media usage", "performance evaluation of social media usage", and finally "recommendation for effective social media usage."

Social Media Usage in Organizations

Social media are suitable for all kinds of companies from public to private sectors, from service to manufacturing industries, and all can gain something from their use. However, they are probably more useful for SMEs, since these companies have greater difficulties in reaching the market. 61% of the SMEs are

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

making formal use of social media. In terms of SMEs' social media usage, the leading countries are United Kingdom (90%), Netherlands (79%) and Latvia (75%). (Batikas & Bavel, 2013).

The use of social media has grown exponentially in the last decade. Currently around one employer in two makes use of a social media tool. Use of social media is largely focused externally on marketing and engaging with customers. Fewer employers – only around one in six – use an enterprise social network internally to engage with employees and promote employee voice. Larger organizations and certain sectors such as information and communication are more likely to use social media in this way. Whereas three in four employees use social media in their personal life, just one in three do so as part of their work. Nevertheless, the high levels of personal usage might be driving the organizational take-up of social media in the form of enterprise social networks (Dormey, 2016).

There has been an explosion in the popularity of social media sites such as Facebook, MySpace, Twitter, and LinkedIn in recent years. Their popularity has transcended languages, borders and cultures, and it is probably no exaggeration to say that we are witnessing a social media revolution. Facebook alone currently has over 500 million users, equating to roughly 1 in every 13 people on this planet. It is estimated that over 50 per cent of these users log on to Facebook every day. By anyone's standards, these are staggering figures and yet they relate only to one social media site. It is therefore no surprise that social media are beginning to permeate almost every aspect of our lives, whether it be on a personal, social or professional level. Many businesses have been adept at harnessing the power of social media to their advantage. Others have been less so, but they are catching on (Abate et al., 2011).

Perhaps the defining characteristic of social media is the speed at which they develop. It is therefore difficult to predict the future of any given tool – in five years' time, the sites which are currently household names may have been supplanted by media that have yet to be invented. One thing that seems likely, however, is that an increasing amount of social media traffic will go through mobile devices such as smartphones and tablets. Overall, it is clear that the use of social media for recruitment purposes is increasing, as companies experiment with new tools like LinkedIn, Facebook, Twitter and the rest (Broughton et al., 2013).

Nowadays, consumers prefer to use companies' Facebook and Twitter accounts instead of official websites. Social media platforms are especially creating good sales opportunities for companies in fast consumptions products and services sectors (Ying, 2012).

Several studies investigated social media use in Turkish organizations. Yılmazel (2011) conducted a research with 233 charitable foundations in Turkey to analyze how these foundations use Web and Web 2.0 technologies in terms of public relations realm. Research has focused on 124 charitable foundations that have Web pages. Web pages and social media (Facebook and Twitter) web pages of these foundations were examined by the help of content analysis technique. Research findings showed that Turkish charitable foundations do not use Web pages effectively enough. Furthermore, only a bunch of foundations use Web 2.0 technologies. Only a few foundations have Facebook and Twitter accounts. Specifically, 11 foundations have Facebook account; 4 foundations have Twitter account and 2 foundations have blogs. Only 26% of these foundations communicate with their members through Facebook and only 9% of these foundations communicate with their members through Twitter. Besides most of the charitable foundations have not yet completed their Web pages integration with Web 2.0 technologies such as RSS, blog, Facebook and Twitter.

Aslan (2014) conducted a research with 12 labor unions and three labor union confederations (TÜRK-İŞ, DİSK, and HAK-İŞ) in Turkey. Aslan has classified these labor unions into three different groups according to their attitudes and behaviors towards social media usage: Avid, reluctant, and forced. First

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

group consists of big and well organized labor unions. Management teams of these labor unions are very eager to use modern technologies. These labor unions are using social media very effectively to communicate with their members and other stakeholders as well. Second group of labor unions who are reluctant about using social media do not believe the benefits of social media. Furthermore, they do not have necessary technological infrastructure and human talents to use social media. The most importantly this group of the labor unions have old fashion management styles; bureaucratic, centralized and less democratic. Therefore management teams of these labor unions are not eager to use social media and do not encourage others for using social media. This group has some reservation about the drawback of social media such as cyber-attacks. The last group of labor unions which is called "forced to use social media" has some management and organization problems. Therefore they feel that they have to use modern technologies like social media to overcome those problems. They believe that they can attract more members and supporters by the help of social media. In addition, they favor social media to lessen budget problems. This group do not hire specialist for social media operations. Instead they use current personnel for these purposes too. Overall, most of the labor unions have problems developing quality content for social media platforms.

Onan (2010) analyzed 5 well known environmentalist nongovernmental organizations' social media practices in Turkey. Those organizations are TEMA (The Turkish Foundations for Combating Soil Erosion for Reforestation and the Protection of Natural Habitats), WWF - Türkiye (World Wildlife Fund), Greenpeace Akdeniz, Doğa Derneği (Doğa is the partner of BirdLife International), ÇEKÜL (The Foundation for the Protection and Promotion of the Environment and Cultural Heritage). According to the research findings, these organizations have got most of the benefits of social media usage such as creating awareness about nature, gaining recognition from society, increasing communication channels and quality of communication between the organizations and their stakeholders, increasing the amount of donations from public etc.

Uzunoğlu and Kip (2014) analyzed the Turkish environmental non-profit organizations' Websites to determine dialogic potential, including social media adoption. However, 23 of 50 websites examined failed to meet half the criteria for building relationships. Of 19 sites with connections to social media, 16 used new media potentialities, however only four met all social media adoption criteria. In other words, environmentalist NPO websites in Turkey fail to fully meet the dialogic communication features, particularly with regard to providing direct social media links.

Factors Affecting the Acceptance and Adoption of Social Media

Organizations' technology competence, pressure from clients, and characteristics of the mobile environment significantly affect the acceptance of social media usage (Schaupp and Belanger, 2014). Organizations with defined public relations departments are more likely to adopt social media technologies and use them to achieve their organizational goals. In addition, public relations practitioners are more likely to use social media tools if they find them credible. Social media techniques will become more abundant as public relations practitioners become mindful of their effectiveness in regards to reaching target audiences, promoting a specific cause, and further developing communication strategies (Curtis, at all, 2010).

Social media applications, however, are slowly diffusing across all levels of government. The organizational dynamics underlying adoption and use decisions follow a process similar to that for previous waves of new information and communication technologies. First, agencies experiment informally with social media outside of accepted technology use policies. Next, order evolves from the first chaotic stage

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

as organizations recognize the need to draft norms and regulations. Finally, organizational institutions evolve that clearly outline appropriate behavior, types of interactions, and new modes of communication that subsequently are formalized in social media strategies and policies (Mergel and Bretschneider, 2013).

Support from employers and top level managers are also important factors for usage of social media in organizations. Survey evidence illustrates that use of social networking sites by employees has grown significantly in recent years. However, some small-scale survey evidence shows that among higher skilled workers, only slightly fewer than 15 per cent have access to social networking sites at work. This may indicate that employers are prohibiting use of such internet sites to avoid having to manage any negative consequences. Especially younger generations who are more conversant with social networking sites are more prone to use them less careful. Inattentive employees may easly post something inappropriate on a social networking site and it can create serious problems (Broughton et al., 2009).

Business organizations can only leave and prosper by the help of their customers, employees, shareholders etc. Likewise nonprofit organizations survive through grants and donations. As society progresses into the technology age, it is important for nonprofit organizations to follow suit and become more technologically adept. The days in which donations were obtained through direct mailings, phone calls, and emails are fading. In order to stay current with the most donors, nonprofit organizations need to have a presence on social media websites, and should explore the use of social media and text-to-give campaigns for the solicitation of donations. Therefore, reaching supporters, volunteers and members and persuade them to contribute to the organization is very important reason for the adoption of social media. According to Schwedel (2013) research all organizations that participated in his research have a significant presence on social media websites and most of them have experience with receiving donations through mobile applications (Schwedel, 2013).

Social media are also used for recruitment. There is a wide variety of practice in the use of social media tools for recruitment. Use depends on factors such as company size and sector as well as the type of employee whom the employer is trying to reach. Many organizations are experimenting with these tools, which, being relatively new, are moving forward on a trial and error basis. Triggers for using social media for recruitment include: operating within an environment in which competitors are using these tools (e.g. retail); wanting to target particular groups of people, particularly in the case of senior jobs; and linking the use of social media to brand and awareness-building. Social media tools are usually used in combination with more traditional recruitment strategies rather than substituting for these (Broughton et al., 2013)

According to Zincir (2014) socialization, information gathering and dissemination, personal brand creation, business network development and collaboration are five common purposes for Turkish managers' social media usage.

Social Media Plans / Policies

There is an increased use of social media and social networking sites by organizations. Organizations social media usage approaches can be classified as passive or active, proactive or reactive, and tactical or strategic uses (Sinclaire and Vogus, 2011).

Strategic approach to the social media usage brings fruitful results for organizations. In a survey conducted by Batikas and Bravel (2013) 61% of the users claimed to have a planned strategy for their social media use. A greater percentage of those who had a formal strategy considered that their financial situation has improved, compared to those who did not have a formal strategy. However, none of the

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

participants interviewed used metrics or incorporated externally collected data to their strategy. The main reasons given were lack of time and lack of human or financial resources (Batikas & Bavel, 2013).

In addition to the strategic approach to social media use, having a social media policy is also very important. However many organizations are missing critical social media use policies and implementation strategies. At best, they are not leveraging the potential power of social media, at worst, they are exposed to social media related risks and inappropriate use by their members (Barkan, 2011). Despite strong interest in social media, the lack of strategy, policies, guidelines for employees, training, monitoring, and evaluation in relation to social media are decreasing the effectiveness of these tools (Macnamara & Zerfass, 2012).

A good and clear policy on what constitutes an unacceptable use of social media will help both the employer and the employee to understand where the boundaries between acceptable and non-acceptable use lie. It is advisable to carry out some type of research beforehand, involve all stakeholders. This will make the policy much stronger and more widely accepted. The joint development of a policy may also enable the parties to strike a balance between individual freedom of speech and actions that could have a negative effect on the employer (Broughton et al., 2009).

Well prepared social media usage policy will guide all the related parties. Especially younger generations who are more conversant with social networking sites are more prone to use them less careful. Inattentive employees may easily post something inappropriate on a social networking site and it can create serious problems. Education and reminders to staff on these types of issues should therefore be a key part of any policy on the use of social media. Social networking sites tend to blur the boundaries between public and private life. Therefore employers should make clear to all the employees what is acceptable and what is unacceptable on social networking sites. Employees should be informed about posting sensitive information on social networking sites such as personal and financial information etc. (Broughton et al., 2009).

Social media plans, policies and strategies should also be regularly reviewed and developed. Because the world of social networking and online media are moving at a fast pace (Broughton et al., 2009). Ethical and legal sides of social media usage should be updated properly.

Social Media Professionals, Training, and Development of Social Media Users

Social media usage requires expertise about information and communication technologies, social media platforms, ethical and legal issues related to the social media usage etc. Therefore organization should hire social media professionals and / or train and develop current personnel responsible from organization's social media operations.

Usage of social media effectively requires more skills and resources. Especially managing the organization's presence in different channels effectively necessitates abilities of coordination and control (Batikas & Bavel, 2013). Training and education of PR and corporate communication practitioners in social media practices, not simply the technologies, is an important step towards achieving that balance in organizational social media engagement (Macnamara and Zerfass, 2012).

In the vast majority of organizations, no one person is being made responsible for social media which creates lack of accountability. Social media is being assigned to staff without removing any existing responsibilities because of personnel shortages. In 90% of the organizations surveyed the social media effort has no dedicated budget or staff resources. ROI and objectives are either not defined, or are not

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

being measured which results from lack of a coherent strategy. Nevertheless organizations are struggling to both measure and to grow engagement in their social media communities (Barkan, 2011).

Many employers have been quick to use social media to recruit staff. Others have been adept at allowing employees to use social media in the workplace to develop business and commercial relationships. Some employers have simply been keen to use social media as a better way of engaging with its staff and fostering a more collegiate environment. However this casual approach to social media is not ideal one. Therefore many organizations will be familiar with the news stories of employees misusing social media at or outside of work to the disadvantage of their employer (Abate et al., 2011).

Potential Benefits of Social Media Usage for Organizations

Social media are business imperative for modern organizations. Organizations in private, public and nongovernmental sectors use social media for marketing, advertising, employee recruitment, and overall communications with their employees, clients, and partners. Organizations utilize social media to create brand image, recruit new employees, and obtain information about people, products and services in the marketplace (Schultz et al., 2015). Social media are seen as a cost effective tool to enhance understanding about markets, customers, and competitors (DiStaso et al., 2011). Social media are not only a communication platform; it is a huge marketplace too. Plenty of organizations use social media to market organizational activities, remain relevant to key constituencies, and enhance community awareness (Campbell, et al., 2014).

The most important perceived benefit of social media for SMEs is their effectiveness for marketing. SMEs who have a planned strategy appreciate the benefits of social media more than those who do not have a planned strategy (Batikas & Bavel, 2013).

Social media have the potential to change a wide variety of management practices in nonprofit and public organizations too. Technological developments such as mobile devices and social media are causing an ongoing transformation in the nonprofit sector as well as in private sector. Aforementioned developments change the nonprofit organizations from the way supporters engage with their favorite nonprofits to the way organizations fundraise, market, and manage information. Tremendous opportunities exist for nonprofit organizations using the technology to deliver their messages and accomplish their goals and objectives effectively. Social networks such as Facebook, LinkedIn, and Twitter provide access to networks of potential donors, volunteers, members, alumni, patrons, and supporters (Westmoreland, 2014). In other words, social media become important channels to communicate between non-profit organizations and community (Attouni and Mustaffa, 2014).

The social media explosion has significantly impacted how organizations communicate with their various publics through sites such as Facebook and Twitter. However, research has found that most nonprofits are not taking full advantage of social media. Moreover, the organizations that did use social media typically employed one-way communication strategies primarily on information dissemination (Sisco and McCorkindale, 2013). According to Waters et al., (2009) although nonprofits are open and transparent with their Facebook profiles, they are not using the sites to their full potential to inform others and get them involved with organizational activities. Nonprofit organizations overwhelmingly prefer to use their website to cultivate relationships with their stakeholders. The results of Waters and Feneley's study (2013) demonstrated that the organizations' websites were used significantly more often than their organizations' official Facebook pages for these efforts. After analyzing 4655 tweets, Lovejoy et al., (2012) found that the United States' largest nonprofits are not using Twitter to maximize

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

stakeholder involvement. Instead, they continue to use social media as a one-way communication channel. Findings indicate that the use of social media is scarce, particularly pertaining to content related to fostering stakeholder involvement. Moreover, the factors "network activity", "internationalization" and "experience in social media" are significant predictors of the use of this tool as a channel for communication and dialogue (Galvez-Radriguez et al., 2014). Campbell et al., (2014) examined social media use among nonprofit organizations and country departments involved in the delivery of human services in a six-county area in South-central New York State. The study found that a modest number of non-profit organizations were using Facebook, and few were using other forms of social media.

Although YouTube is just one of many social media tools a nonprofit can use to expand its audience, it is an important one for any organizations to consider given its popularity and its ability to strengthen an organization's identity and brand. According to the research of Waters, and Jones (2011) nonprofit organizations primarily use their YouTube videos to inform and educate viewers about their missions, programs, and services. While the videos also occasionally discuss the organizations' advocacy, volunteering, and fundraising efforts, nonprofit organizations were not living up to their potential in terms of engagement through direct appeals for involvement.

Social media and social networking sites can have specific benefits in the employment relations context. For example, by allowing employees to blog organizations can have a chance to present the human face of a company, allowing employees the freedom to use social networking sites can therefore be a positive step towards goo employer-employee relationships (Broughton et al., 2009). In other words, social media may help to create more human business environment and help to create close touch with employees and customers. Social media can enhance trust among employees too. In return trust may enhance knowledge exchange in the workplace. Specifically, according to Cao et al., (2012) social media enhance knowledge transfer by fostering trust among employees, thus leading to better work performance. According to Barkan's study (2011) people from all age groups are using social media to a high degree to meet a portion of their professional networking, information sharing and professional development needs today (Barkan, 2011).

There are a range of benefits available to employers using social media for recruitment purposes, centering on cost and time savings. Organizations that use tools such as LinkedIn for recruiting to senior and strategic positions instead of using agencies or head-hunters are finding that this results in significant cost savings. Furthermore, social media can help organizations to target their recruitment more accurately, present a realistic picture of their workplace, and reach a wider range of potential candidates. This combination of reach that is at the same time wider and more targeted is very interesting for recruiting organizations. Social media can also help companies to increase brand-awareness and two-way communication with potential candidates, fostering realistic expectations on the part of potential candidates. It can also mean that some individuals can be deterred from applying at an earlier stage, as they are able to gain a realistic impression of an organization before starting the application process. This saves time and money for both the individual and the company (Broughton et al., 2013). Social media are widely used for job searching in Turkey. %64 of people who search job use social media. LinkedIn is the most used (%53) social media for job searching (Adecco Group, 2014).

Organizations can enrich their communication channels and instruments with social media platforms. Social media are an important element of an overall communications mix. However they are not yet in a position to replace traditional communications channels. Email remains a prime communication tool and should be used in tandem with your social media campaigns. Search Engine Optimization (SEO) is another critical element that should be reflected in organizations' overall communications planning and

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

activities (Barkan, 2011). Treem and Leonardi (2012) uncovered four relatively consistent affordances enabled by social media for organizations: visibility, persistence, editability, and association.

Some employers are making use of social media to promote and access employee voice. Use of social media is largely focused externally on marketing and engaging with customers. Fewer employers – only around one in six – use an enterprise social network internally to engage with employees and promote employee voice. Larger organizations and certain sectors such as information and communication are more likely to use social media to promote employee voice. Enterprise social networks are potentially a very powerful tool for employee voice. There is certainly evidence that more needs to be done to promote voice, with just one UK employee in three saying their managers are good at allowing them to influence decision-making. Some types of enterprise social networks can potentially help to promote a richer employee voice, allowing organizations to go beyond monologue and one-way communication to two-way and indeed multi-directional communication. Using such networks for employee voice provides the opportunity for organizations to drive insight and innovation. It also has immense potential to support collaboration, allowing employers to access 'the wisdom of crowds' – where, rather than an individual, groups of people work together to reach a solution or an outcome (Dormey, 2016).

Risks and Barriers of Social Media Usage for Organizations

Using social media may create some rewards as well as risks. Therefore organizations should develop policies and strategies to minimize risks related to social media usage in the workplace. Given the growing use of social media in the workplace and the associated risks, organizations should consider a proactive approach to ensure that social media use does not damage the organizations. To accomplish this, employers should stay informed and current about evolving laws and rules affecting social media use in the workplace. Clear social media policies and procedures are required to effectively manage the issues emerging from social media usage (Schultz et al., 2015).

Using social media professionally requires some amount of costs. There is the actual cost of dedicating resources to social media sites, as traffic can be significant and unpredictable. There are also issues surrounding the accuracy of the information gained by the use of social media tools – there is no guarantee that the information that individuals, or others, post on their SNSs is accurate. There are also issues around the depth of the applicant pool that social media tools can access, giving rise to potential problems around diversity and discrimination, particularly in terms of reaching older candidates and those who are not as comfortable with using computers. This means that there are a number of legal aspects that employers should consider when thinking about using social media tools for recruitment. These include difficulties arising from HR decisions based on inaccurate information, issues related to employee privacy, equality and diversity and the use of standardized information about candidates. Furthermore, given the diversity of information about individuals available on social networking sites, it is difficult to see how this can be fairly compared (Broughton et al., 2013).

Misusing social media by employees is another risk for organizations. It is now clear that employers and employees both need to consider how social media sites may affect employment. Many organizations will soon be all too familiar with the news stories of employees misusing social media at or outside of work to the disadvantage of their employer. Some stories have featured employees who have been dismissed after posting inappropriate comments about colleagues or their employer. Quite often, the legal issues that lie beneath these stories are overlooked. For example, is it lawful to vet job applicants using social media sites? What legal risks arise when permitting employees to use social media at work? How

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

can an employer manage the risks that arise. Although the risks that arise from the use of social media sometimes vary, the solutions that have been recommended to manage these risks are more or less the same (Abate et al., 2011). Having a social media usage policy, monitoring the usage of social media regularly and giving training and education to all related parties are the common solutions.

Potential risks and barriers block to collect all the benefits from social media in organizations. In other words, employers are far from exploiting the full potential of enterprise social networks and social media. Some of these barriers are as follow: Many employers and employees do not yet see the relevance of enterprise social networks in the workplace. In addition to this, many managers are concerned that using these networks at work could lead to time-wasting and impact on productivity negatively. There are big concerns around the potential misuse of social media at work. The perception of a fear of loss of control seems to be a concern to employers, as enterprise social networks allow for interaction between staff and fewer opportunities to control the conversation. Some employers are also skeptical about the demand for enterprise social networks within organizations and the extent to which it would be used (Dormey, 2016).

Contrary to the general expectation, the lack of financial resources is not a barrier to adopting social media. Users who are in a better financial situation do not think that lack of financial resources, lack of control and risk of inappropriate posting by employees are barriers (Batikas & Bavel, 2013).

Performance Evaluation of Social Media

Organizations from government departments and corporations to small businesses are increasingly adopting social media for strategic corporate and organizational communication and public relations. This is seen by many as a positive development because the openness of the Web 2.0 environment potentially democratizes voice and affords participation, dialogue, and community-building. However, optimistic views of the benefits of organizational social media communication fail to adequately take account of potential conflict between the philosophy of openness that characterizes Web 2.0 and organizational strategy and management processes. However, organizational social media communication is most often undertaken without clear objectives and it is not integrated with other organizational communication, and not evaluated against objectives and Key Performance Indicators. This is most likely a result of the relative newness of social media (Macnamara and Zerfass, 2012).

Companies should take certain steps to harvest the fruits of social media. Authentic and trustworthy leaders should help those people develop social media skills. Leaders should support to build social media communities that emphasize authenticity, pride, attachment and fun. In other words, leaders should build emotional capital. Without developing emotional capital in organization, it is not realistic to expect instrumental benefits such as improved information exchange, motivation, morale, reduced turnover etc. The role of social media in building emotional capital became apparent. Executives whose social media initiatives had increased emotional capital for their company reported that social media made it easier to communicate both across hierarchical levels (vertical communication) and functional units (horizontal communication). However, companies where social media had not increased emotional capital found that social media had little impact on the ease of communication in the company and in some cases even aggravated existing problems (Huy and Shipilov, 2012).

The use of social media enhances business capabilities and business performance. The impact is not due to one social media tools only, but due to successfully combining the several social media tools into one effective social media ecosystem that enables coordination between internal and external business

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

processes. A combination of inter-linked social media forms a social media ecosystem that enhances business capabilities. In other words, Empirical evidence supports that the use of social media enhances business capabilities and enhanced business capabilities lead to improved business process performance (Smits and Mogos, 2013).

Recommendation for Effective Social Media Usage

Harvesting the benefits and limiting the relevant risks of social media require certain precautions to be taken. Following are worth to be mentioned:

Organizations should have an internet / social media use policy that sets out clearly and explicitly the organization's expectations of and definitions of acceptable and unacceptable behavior. Policies should advise employees to assume that everything they say on the internet could at some point be made public and to think about whether, for example, the comment they are about to post on a social networking site is something that they would want a colleague, their boss or a senior manager to read. The policy on internet/social media use should be drawn up in consultation with staff, either through their representatives, if present, or directly, if no representatives are present. A prior survey of employee awareness of issues can help to achieve buy-in to future policy. Consultation with staff on the actual policy will help to ensure that it is fair. This participative process will help to build employee commitment to the policy and raise awareness of the fact that a policy is being formulated, which may be important for dissemination. A policy on internet use needs to be communicated. Managers need to ensure that individuals understand the policy and may need to think carefully about how they explain and justify it, which may need to vary between staff groups (Broughton et al., 2009).

Organizations should explain acceptable and unacceptable behavior, as well as the consequences of violation. (Broughton et al., 2009) Social media policy should underline disciplinary actions (Abate et al., 2011). This means being open to a loss of some control, trusting staff and resisting the temptation to restrict the conversation. Senior leaders play an essential role in helping to create the culture of employee voice, by promoting the tools, encouraging employees to use them, and by using them themselves. Having champions across the organization that encourage others to use the technology can also be effective. Using an enterprise social network is most effective when its goals are explicit and it is clearly seen as a tool for work related discussions. For this to happen it needs to be designed to improve organizational performance and working life. However, permitting some non-work usage can be helpful in encouraging use and building a sense of community (Dormey, 2016).

Organizations should make sure that there are adequate mechanisms for employees to raise formal and informal grievances (Broughton et al., 2009).

Employees and customers should be encouraged to involve social media interactions. Employees may write blogs etc. (Broughton et al., 2009). Employees should be encouraged to speak up and their views should be listened to and, where possible, acted on (Dormey, 2016).

Employers should keep up to date in developments in employment law relating to social media such as privacy. It is advisable to consider potential legal issues, particularly those surrounding data protection and privacy, even if these have not as yet been an issue to contend with (Broughton et al., 2009). it is recommended that social media policies be put in place, appropriate training be provided to employees and appropriate confidentiality clauses and post-termination restrictive covenants be incorporated into contracts of employment (Abate et al., 2011). Cyber-bullying is something that is linked to the rise of social networking tools, although the evidence in terms of workplace cyber-bullying is scant. Neverthe-

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

less, employers should work on developing strong anti-bullying policies that are updated in the light of new kinds of technology, and need to bear in mind the fact that that cyber-bullying can occur outside the workplace to a much greater extent than conventional bullying, making it harder for employers to deal with easily. It will probably be the case that cyber-bullying will largely be covered by existing policies on bullying, and so policies or guidance on the use of social networking sites just need to refer employees back to the organization's bullying policy. (Broughton et al., 2009).

Employers need to consider reviewing policies on internet use/social media on a regular basis. Regular policy reviews involving all key stakeholders will ensure that policies address the organization's main concerns. (Broughton et al., 2009)

If you are using social media for recruitment practices, it is necessary to verify information on applicants' SNSs through other means. It should be borne in mind that the information there may not be accurate – at the least, it may be a site created by the applicant for job application purposes etc. (Broughton et al., 2013).

Do not over-invest in social media tools It is wise to adopt a fairly cautious approach in terms of investment in social media tools, as it is difficult to predict which tools will become popular and which will become obsolete. Close monitoring of trends is advisable. Social networking tools cannot entirely replace face-to-face contact. (Broughton et al., 2013).

Always search cost effective approaches to social media usage. Social media creates financial and personnel costs etc. (Broughton et al., 2013).

Provide training and information for those involved in using social media applications and technologies. (Broughton et al., 2013).

Do not lose control of the security of SNSs It is easy for organizations to lose control of media such as Twitter – it is possible for individual employees to hold access codes that no other company representative has. It is therefore advisable to put into place protocols relating to passwords and accounts so that individual employees are not the sole guardians of security information. Organizations should remember that social media are an informal medium and its use is relatively relaxed. In this context, innovation and an open mind are crucial –organizations wishing to use social media should not be afraid to engage (Broughton et al., 2013).

In order for enterprise social networks to be effective, there needs to be an organizational culture that supports employee voice. An enterprise social network will not change the culture of an organization on its own, but it does need a supportive environment to work effectively. Organizations should go with the grain of the technology (Dormey, 2016).

Organizations should have a robust social media policy – developed with staff involvement – which sets expectations for use. This should be based on common sense, clearly communicating to staff that the same rules apply online as offline. Such policies can help prevent misuse and protect employers in rare cases where this does happen. An enterprise social network should be integrated with other voice platforms rather than being used to replace them. Having a variety of voice channels will suit different circumstances and different personal preferences. Enterprise social networks are very promising tools which offer huge potential for employee voice. They could help transform how organizations communicate with staff and access their voice, how they involve them, how they collaborate and innovate. But this potential seems to be largely under-used. Few employers are using social media internally – in the form of an enterprise social network -for voice, and where they are, success has been limited. There are strong signs that where employers are using enterprise social networks, they are doing so in a way which doesn't go with the grain of the technology. They are using a modern tool, designed for networking and

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

open-communication, bottom-up, user-generated content, in a more traditional way, which is top-down and controlled. If employers wish to get the best out of social media and unleash its potential, they should use it in a way that matches the technology's capabilities, and ensure it is part of a wider approach to supporting voice at work. (Dormey, 2016).

In the coming part, social media usage practices and habits of Turkish Chambers of Commerce and Industry will be discussed. Turkish Chambers of Commerce and Industry is a semi-public institution. There is no empirical study about the social media usage of Turkish Chambers of Commerce and Industry in the literature. Therefore this research is first in this area.

METHODOLOGY

An online survey was conducted with members of the Union of Chambers and Commodity Exchanges of Turkey using the Bilecik Seyh Edebali University's online survey system. The Union of Chambers and Commodity Exchanges of Turkey (In Turkish is TOBB) is the highest legal entity in Turkey representing the private sector and today, it has 365 members in the form of local chambers of commerce, industry, commerce and industry, maritime commerce and commodity exchanges, operating in 81 provinces and 160 districts in Turkey (TOBB, 2016). There are 181 chambers of commerce and industry, 57 chambers of commerce, 12 chambers of industry, 2 chambers of maritime commerce and 113 commodity exchanges connected to TOBB in Turkey. This study includes only 252 chambers, excluding commodity exchanges.

An online survey was conducted between March 31, 2016 and May 31, 2016. An email with the link to the online survey was sent to total of 238 chambers. Since we could not find e-mail address of 14 chambers, they are excluded from the study. During this period, a reminder e-mail was sent three times to participants who had not responded to the initial request. We received 61 completed and 72 uncompleted survey questionnaires.

Questionnaire items related to perception of benefits and barriers are adopted from Batikas & Bavel (2013) and items related to reasons for not using social media are adopted from Rhoads (2012).

DATA ANALYSIS

Respondent Characteristics

The distribution of respondents by gender and education reported in Table 1 reveals that 19.7% of the respondents were female and 80.3% male. As for the education level, majority of the respondents (83.6%) has a university degree (associate or bachelor degree), 8.2% of the respondents have a secondary education (high school) and 6.6% of the respondents stated having a postgraduate degree.

Characteristics of Participant Chambers

Characteristics of participant Chambers are provided in Table 2. Most of the participant chambers (55.7%) established after the year of 1950. Participant Chambers are distributed according to the num-

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Table 1. Respondent characteristics

	n	%
Gender		
Female	12	19.7
Male	49	80.3
Education		
High school	5	8.2
University	51	83.6
Postgraduate degree	4	6.6
Missing value	1	1.6

ber of their members as follow: 14.8 percent of the participant Chambers have less than 500 members, 27.9 percent has between 501 and 1000, 21.3 percent has between 1001 and 1500, and remaining has more than 1500 members. Turkish Chambers Accreditation System was introduced by TOBB in 2001. Majority of the participant Chambers are accredited. There are only eight Chambers reported that they are not accredited by TOBB. 24.6 percent of the participant Chambers accredited as "A" class, 32.8 percent accredited as "B" and 29.5 percent accredited as "C" class. Number of personnel employed in Chambers varies. Majority of the participant Chambers (72.1%) employ between 1 and 10 personnel, 16.4 percent employ between 11 and 20 personnel, 4.9 percent employ between 21 and 30 personnel and only 6.6 percent employ more than 30 personnel.

Website and Social Media Use by Chambers

Vast majority of the participant Chambers own a website (98.4%) and use social media officially (95.1%). There is only one Chamber reported to not have a website and three Chambers reported that they were not represented in social media officially (Table 3).

The Reasons for Not Using Social Media Officially

In the questionnaire, we asked the reasons for not using social media officially to not users. Two answered this question as "Fear of liability or malpractice concerns" and one answered as "Too much work" (Table 4).

Social Media Platforms Used by Participant Chambers and Frequency

Facebook and Twitter are the most popular platforms. All the Chambers using social media use Facebook (58 Chambers), 42 Chambers use Twitter and 13 Chambers use YouTube. Two Chambers reported that they use six social media platforms listed in Table 5, one Chamber reported one, two Chambers reported two social media platforms and 15 Chambers reported that they use only one social media platform which is Facebook listed in Table 5.

Possible Outcomes of Social Media Experiences

We asked to participants that overall, how you would rate your Chamber's experience with social media. The Chambers we surveyed generally rated positive. 36 Chambers (62.1%) rated as positive, 20 Chambers (34.5%) rated as average and only one rated as negative.

Overall Usefulness of Social Media Usage

We asked to participant that how you rate how useful social media for the Chamber. Most of the participants agree that social media is useful for the Chamber. 30 Chambers (51.7%) rated as "Very useful", 16 Chambers (27.6%) rated as "Very much useful". Only one rated as "Not at all useful".

Necessity of a Training Program for Social Media Usage

36 participants (62.1%) think that the Chamber does not need training for social media (Table 13). It seems that most of the participants underestimate social media and they do not believe that social media usage requires special training.

Recommendation of Social Media Usage to Other Chambers

All of the social media user Chambers recommend the use of social media to the other Chambers and institutions (Table 14).

Evaluation and Control of Social Media Usage

We asked whether you assess the official use of social media for the Chamber. Most of the participants (65.5%) answered as "Yes".

Problems Faced by Chambers in the Use of Social Media

We asked a non-compulsory open-ended question "What are the problems your Chamber face in the use of social media?". 12 responses are received for this question. Responses to this question by the partici-

pants are listed in Table 16. Main problems faced by Chamber in the use of social media are as follows; negative comments or inappropriate posts, the use of social media among members and lack of personnel.

Perception About the Benefits of Social Media Usage

Both social media users and non-users participants were asked about the perception of benefits of the use of social media. The question was asked as follows: "To what extent do you agree with each of the following statements about the benefits of using Social Media for business purposes". The questions and the distribution of responses to them are presented in Table 17.

Vast majority of the participants agree (agree and strongly agree) with "Social media increases effectiveness of communication and public relations of the Chamber." (100.0%), "Social media increases the speed of accessing knowledge, (It increases speed to access knowledge)" (95.1%), "Social media reduces communication costs." (90.2%) and "Social media reduces communication and public relations costs of the Chamber." (90.2%) as the benefits of using social media. These participants disagree (disagree and strongly disagree) on "Social media is better than any other type of media for the purposes of the Chamber." (19.7%) and "Social media reduces communication costs." (9.8%) as the benefits of using social media.

Barriers of the Social Media Usage

Both social media users and non-users participants were asked about the barriers of the use of social media. The question was asked as follows: "To what extent do you agree with each of the following statements as being a barrier (or risk) for the use of social media for business purposes". The questions and the distribution of responses to them are presented in Table 18.

Approximately half of the respondents agree (agree and strongly agree) with "Legal issues that may arise related to social media." (50.8%); "Concerns about employees gets distracted by social media." (45.9%); "Lack of strategy for the use of social media." (45.9%) and "Lack of demand and willingness

Table 16. What are the problems your Chamber face in the use of social media?

Not well-intentioned comments to posts.
Since we are a trade body, we have to be careful in communication. Therefore, it can be difficult to prepare content
Political or offensive negative personal comments leading to argument and spam users comments
Invitation from fake accounts and inappropriate comments.
Members cannot be accessed enough because some members do not use social media.
In my opinion, social media is not very useful and it may be used for out of institutional objectives.
Lack of attention for the posts from audience.
Members sometimes show no interest towards posts. Their performance in the using social media is poor.
Lack of social media usage habits among members except Facebook. In particular, the use of Twitter in our city is very rare.
There are some members who do not have social media habits.
Reaching smaller number of audience.
Because of personnel shortages, we cannot assign personnel solely for social media.

to use social media in the Chamber by members of the Chamber." (42.6%) as being barriers of the use of social media. On the contrary, these participants disagree (disagree and strongly disagree) on "Lack of incentives to use social media for employees." (62.3%), "No strong business case to use social media because of the nature of our business." (60.7%), "Lack of financial resources for social media" (59%) and "Costs of the software applications in using social media." (57.4%) as being barriers of the use of social media.

CONCLUSION AND DISCUSSION

An online survey was conducted with 238 members of The Union of Chambers and Commodity Exchanges of Turkey. Only 133 members answered the questionnaire. Following findings are noteworthy to be underlined:

- Most of the participant chambers (55.7%) established after the year of 1950. Majority of the participant chambers are accredited. Majority of those (72.1%) employ between 1 and 10 personnel.
- Vast majority of the participant chambers own a website (98.4%) and use social media officially (95.1%).
- Facebook and Twitter are the most popular platforms. 58 chambers use Facebook; 42 chambers use Twitter and 13 Chambers use YouTube.
- Vast majority of the participant chambers (94.9%) reported that they have been using social media officially for more than one year.
- 32 chambers (55.2%) reported that they have a clear official social media use policy / plan and 38 chambers (65.5%) reported that they have a department responsible for social media.
- 36 chambers (62.1%) reported that there is only one personnel responsible for social media in the chamber.
- The chambers surveyed generally (%62.1) rated positive their social media usage experience. 34.5% of chambers rated as average and only one rated as negative.
- Most of the participants (79.3%) agree that social media is useful for the chamber.
- 36 Participant chambers (62.1%) think that the chamber does not need a training program for social media usage.
- All of the chambers which use social media recommend to the other chambers and institutions to use social media.
- Most of the participants (65.5%) evaluate and control the social media usage / performance.
- Most of the problems related to the social media usage seem to be reparable in nature with proper training programs.
- Vast majority of the participants believe that 1) Social media increases effectiveness of communication and public relations of the chamber. 2) Social media helps to increase the speed of accessing necessary information. 3) Social media reduces communication and public relations costs of the chamber. 4) Social media increases the chamber's member satisfaction. 5) Social media helps to increase the speed to access external experts when needed by the chamber. 6) Social media is great for engaging with members of the chamber.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

- Major barriers that block the usage of social media for business purposes are as follow: 1) Legal issues that may arise related to social media. 2) Lack of strategy for the use of social media. 3) Concerns about employees may get distracted by social media. 4) Lack of demand and willingness to use social media in the chamber by members of the chamber. 5) Concerns on loss of data, privacy in social media. 6) Lack of control of social media / risk of inappropriate posting by employees.

In conclusion, as semi-public professional organizations the Turkish Chambers of Commerce and Industry has a good performance about social media usage. Almost all the participant chambers use one or several social media platforms. However, there are some skeptics about the necessity and the usefulness of social media. The Turkish Chambers of Commerce and Industry should hire professional social media experts and keep them up to date with appropriate training programs.

Chapter 67
How Social Commerce Emerged: The Role of Social Word of Mouth – Social Commerce

Nick Hajli
Newcastle University, UK

ABSTRACT

Individuals perform social interaction with others through online communities, which support their decision behaviour on the Internet. These abilities are mostly due to the rise of social networking sites through the recent development in Web 2.0 technologies such as social media. The increasing popularity of social media and social networking sites has developed e-commerce to social commerce. Social commerce is a new stream in e-commerce, in which consumers use social media in their purchasing journey. In this social climate, the social commerce era, consumers provide social support for the network by not only persuading consumers to have more interconnectivity with their peers, but also by giving a number of unique opportunities to firms. In this chapter, the author discusses the way social commerce has been emerged. As social word of mouth is one of the key constructs of social commerce, social word of mouth as well as the applications of social commerce and social support theory in business context have been explained in detail in chapter.

INTRODUCTION

The increasing popularity of social media has been attracting many individuals to join social networking sites (SNSs) to have social interaction with peers (Liang, Ho, Li, & Turban, 2011). These interconnectivities have different values for firms seeking to improve their performance in the market. Social media, as a new media in contrast to paid media such as TV advertising, is accessible for free to the business sector (Onishi & Manchanda, 2012), thus increasing their popularity. SNSs are facilitating social interaction of users, while providing an important and valuable tool for firms (Hartmann et al., 2008). For instance, businesses may use it for new product development (Pitta & Fowler, 2005).

Users of social media, such as members of online communities, are not only communicators who interact with peers, but also they are marketing agents by their development of Word of Mouth (WOM) (Kozinets, de Valck, Wojnicki, & Wilner, 2010). They are supporting businesses through co-creation of value (Zwass, 2010) for a new product development, for instance. Social media empowers consumers to generate content and share their knowledge and experiences with peers through social interactions within a network. Consumers with more need for social interaction have more engagement in Electronic Word of Mouth (eWOM) (Wolny & Mueller, 2013). Engagement of consumers and ideas generated through online communities persuade organizations to adopt this support for open innovation (Paul M. Di Gangi & Molly Wasko, 2009), for example. Therefore, social media is playing an important role in developing eWOM. The value of social media in this context is that it facilitates social interaction of consumers; this information generated online influences the decision of users (Wu & Gaytán, 2012). These users may not have experience of a new product and will seek a buyers' view of a product. Some users participate in idea generation for business such as experts who participate in the open innovation community of Microsoft (Kaiser & Müller-Seitz, 2008) or Dell's community of innovators (Paul M Di Gangi & Molly Wasko, 2009) or maybe in an open innovation community of a software company (Dahlander, Frederiksen, & Rullani, 2008). As such, social media enables social interaction of consumers in online platforms and offers different marketing values for firms (Rapp, Beitelspacher, Grewal, & Hughes, 2013). Businesses can develop social media strategies to establish trust, deliver their information to consumers or provide enjoyment to consumers through their participation in online communities. With the advancement of Web 2.0 technologies, individuals now use social media such as SNSs to connect to each other. To join SNSs, they need to develop a profile indicating their identity and circumstances; this brings credibility to the information they provide. As identity is a key issue in online WOM that influences the credibility of eWOM (Dellarocas, 2003; Forman, Ghose, & Wiesenfeld, 2008), online communication of consumers through social media can impact on the reduction of uncertainty and enhance credibility in the network (M. Adjei, S. Noble, & C. Noble, 2010). Therefore, firms perform WOM marketing through online communities and blogs to increase the credibility of customer to customer WOM (Kozinets et al., 2010). In addition, consumers use social media by participating in reviewing or recommending a product to other users; these activities further increase the usefulness of a platform (Kumar & Benbasat, 2006). These opportunities attract individuals to online communities and it facilitates their involvement with peers in online travel communities. In addition, social involvement is one of the motives that drive individuals to adopt the information produced through online word of mouth (Khammash & Griffiths, 2011). Social interaction of consumers using social media produces social support (Obst & Stafurik, 2010) as they share their knowledge, experiences and information with peers. As the voice of consumers is strong on the internet (Kaplan & Haenlein, 2010), this voice has supportive value in the form of informational and emotional support.

Social Media and Word of Mouth

Consumers in an online context have different restrictions such as touching or smelling a product, which is available in traditional or offline shopping. Therefore, e-vendors develop their online platforms by providing some opportunities to consumers to share their evaluations about a product (M. Huang, Cai, Alex, & Zhou, 2011). The content provided in these platforms is important for customers as it provides indirect experiences of a product (Do-Hyung, Jumin, & Ingoo, 2007), indicating the value of eWOM for online marketers. Online word of mouth has been developed by the emergence of Web 2.0 technologies

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

and the rise of social media. Enabled by social media, consumers can exchange messages through online communities (Zhang & Watts, 2008), producing valuable information as a result. Information produced by individuals through social media, such as online consumer reviews, is quality information presented by customers who have experienced the product; it includes their evaluations and experiences, introducing a new form of eWOM communication (Do-Hyung et al., 2007), social word of mouth (sWOM). Social word of mouth is the evaluation of consumers about a product using social media.

Consumers in online communities process available information produced in the networks in a contextual manner; this can be useful for the functionality of the tools in the community (Zhang & Watts, 2008). This information is more influential than market generated information, forming word of mouth (Bickart & Schindler, 2001) as product know-how is facilitated (Johann, Bartl, Ernst, & Hans, 2006). This can develop into an efficient new product development strategy (Füller & Matzler, 2007), particularly, when online WOM has high quality and relevance; it can have more influence on acceptance through WOM information (M. Huang, Cai, Alex, et al., 2011), which it can form through Social WOM (sWOM). In addition, it can be used to increase credibility of information produced in these communities as an important factor in WOM adoption by individuals. Information produced through the social interaction of individuals facilitated by social media establishes trust for customers; the influence of this information is greater than that offered by a company.

Although the available literature in eWOM discusses the impact of this marketing tool to enhance the performance of a firm, there has been little research carried out to discuss the values that social media can provide through online social support and to enhance credibility and usefulness of information produced in online travel communities; this helps travellers to adopt word of mouth in an online context given the proliferation of social media. With recent technological innovations, the tourism industry has seen great changes in the online communication channels between travellers and service providers (Matzler, Grabner-Kräuter, & Bidmon, 2008). This industry is seen as an information-rich sector and potential travellers rely heavily on this source of travel information for their trips (Fodness & Murray, 1998).

Electronic Word of Mouth

The literature on consumer behaviour has been researched extensively, covering the power of interpersonal relationships through WOM contacts and online communication (Herr, Kardes, & Kim, 1991). The findings in this area indicate that consumers perceive WOM as a factor influencing their trustworthiness more than other traditional channels such as TV or print ads. This influence has been facilitated with the worldwide availability of the internet, with the theoretical background of WOM now developed to electronic WOM (eWOM). However, the emergence of Web 2.0 technologies has provided an extensive area in the interconnectivity of users through social media (C. M. K. Cheung & Lee, 2012); this now needs theoretical development to examine the influence of social media on eWOM.

The concept of traditional WOM is broadly the same as eWOM but there are some differences between them, although both of produce useful information for individuals. Traditional WOM and its influence is limited to a local network of people (Li & Hitt, 2008), while the information produced through online platforms has no geographical restrictions and can be accessible worldwide (Do-Hyung et al., 2007). In eWOM there is no need to exchange information at the time when correspondents are present (Karakaya & Barnes, 2010). It can be available online for any convenient time that consumers may need it. A good example of this is Amazon.com. Consumers can search for eWOM produced by other customers at previous times and use it at a time when they decide to buy a product. In addition, textual information

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

provided through eWOM communication is accessible for an open-ended period of time; this capability is not available in traditional form (Park & Lee, 2009). Consumers can also search for different pieces of information produced by different consumers at different times, further increasing the usefulness of eWOM. Therefore, the improvement in communicator identification can also provide credibility to the information provided through eWOM.

From Electronic Word of Mouth to Social Word of Mouth by Social Media

Electronic word of mouth is a virtual communication between consumers in an online context (Gruen, Osmonbekov, & Czaplewski, 2006; Park & Lee, 2009). These communications are strategic and cost effective marketing tools for business. However, the recent advancements on the internet and emergence of Web 2.0 have expanded this marketing strategy. In this era, customers have been empowered to generate word of mouth in online communities to assist firms in new product development (Fuchs & Schreier, 2011). While WOM was always an import element in marketing, as shown in many pieces of research, the scope of this marketing tool is limited to a network where individuals know each other and have social interaction based on previous contacts. The emergence of Web 2.0 technologies and the growth of social media have erased this limitation. As a result, sWOM has emerged with broad accessibility and the capability to be evaluated and measured by other consumers. For instance, consumers have the facility to rate and review products or read comments on the experiences of other customers who have evaluated a product. When a customer experiences a new product, such as the new IPad, and shares this experience with other users, other peers can comment on this post. Hence, this evaluation not only gives more choices and information to the network of customers but also gives an opportunity to firms to use these social interactions to improve a new product. In addition, this gives the opportunity to the firm to develop open innovation; other researchers describe this as democratizing the innovation (Von Hippel, 2005).

Social word of mouth has a unique advantage of referability, where support can be available from all around the world by a large number of individuals for an unlimited period of time. The information produced through social platforms by customers will remain online till other customers need and refer to it. The development is not limited to these users alone, but credibility of the source of WOM can also be improved by others through sWOM. Individuals use social media and online communities such as Facebook or Twitter to connect to these networks, providing contributor profile to the network; this gives more source credibility to the evaluation and participation of individuals. These advancements bring a new paradigm change to eWOM and introduce sWOM, which this research empirically examines.

Social Word of Mouth and Online Social Support

The time when there was a link between the lack of interpersonal relationship and the longer time an individual spent on the internet has been overcome by the emergence of Web 2.0 technologies. The attraction of social media and intercreativity of users in SNSs have introduced a new communication tool to individuals to have social interaction worldwide with no cost involved. There is extensive literature discussing the value of online communication of individuals in online communities (Rhoades & Eisenberger, 2002; Rosenfeld, Richman, & Hardy, 1989; Wangberg et al., 2008). The other contributions in this

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

area highlight the social value of the social interaction of users in online communities and the production of social support within these networks (Hwang et al., 2010; Kraut et al., 2002; Obst & Stafurik, 2010).

Online social support as a new theoretical lens in the study of eWOM can be theorized based on the advancements on the internet as follows. With the availability of online social support in online communities such as TripAdvisor as an example of a travel forum, Microsoft or Dell open innovation communities or any other online communities, consumers engage in social interaction to support each other; it has become beneficial and natural for members to share their information, experiences, knowledge or provide feedback. This supportive climate can be applied to new product development or become part of a customer's decision making journey to buy a product. Enabled by social media, individuals share their information; this then shapes social word of mouth in the form of informational or emotional support for the online communities. Users' perceived usefulness in terms of caring and offering support through useful information, make it essential for others to seek and share commercial information within the online communities (Crocker & Canevello, 2008). Hence, sharing commercial information and empathizing with the issues of other members of the community is likely to produce credibility and trust in the network and the adoption of social word of mouth; this may lead to the purchase intention. This supportive atmosphere may also be used for open innovation and new product development (NPD). Therefore, the author can make a path between social support and information usefulness to eWOM credibility.

Social Word of Mouth Adoption

Information adoption can be defined as the process of engaging purposefully in consuming information (C. M. K. Cheung & Thadani, 2012). Information support provided through social interaction of individuals in online communities can be in the form of ratings, reviews, recommendations or referrals. This information may be useful for potential consumers who have not experienced a product and need independent information provided by other customers. Therefore, when consumers search for information provided by other users on online communities to make a better decision for their purchasing (Pitta & Fowler, 2005), they are adopting information. This part of literature argues that social media provides more opportunities to the individual to adopt WOM as more useful and more credible. Therefore, informational usefulness and credibility of information are two important factors in this section.

Informational Usefulness

Community content, a natural product of interconnectivity of users, is an important and useful means of attracting members to share information in online communities (Zhang & Watts, 2008). This also provides benefits to the members for their participation. Perceived usefulness of information provided in online forums and communities will increase information adoption (Liu & Zhang, 2010; Sussman & Siegal, 2003). Research shows that information usefulness has a strong impact on the decision of users to adopt WOM provided in the online communities (C. M. Cheung, Lee, & Rabjohn, 2008). However, the quality of information is one of the most important factors influencing online WOM adoption (M. Huang, Cai, Alex, et al., 2011). Once individuals perceive more value, they are more likely to become involved in online WOM (de Matos, Rossi, & Vargas, 2008). Perceived usefulness has become increasingly important with the growth in the number of SNSs and the opportunities that social media provides.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Social Word of Mouth Credibility

Lack of credibility in information provided to customers results in negative beliefs about firms amongst their customers (Umit Kucuk & Krishnamurthy, 2007). Therefore, credibility of the information and trust in the online communities has a significant value for the success of an online community. Recent studies in this area argue that trust within the network has significant influence on online WOM activities (de Matos et al., 2008). Trust also influences the adoption of information produced by different individuals, particularly in globally dispersed teams such as social networks of users for NPD (Muethel, Siebdrat, & Hoegl, 2012). Trust is a challenging factor in an online context (Gefen, Karahanna, & Straub, 2003) as customers cannot always experience a product or service online (Lee & Lee, 2009) and they need to explore online WOM. In particular, the information produced through social media, which shapes eWOM, is reflecting a mechanism to reduce uncertainty (Park & Lee, 2009) and provide credibility of the information. Additionally, the higher source credibility of messages perceived in online communities provides a higher level of information adoption (Zhang & Watts, 2008). Credibility of content provided through social interaction of individuals in online forums and communities makes it more influential (Bickart & Schindler, 2001). In fact, distrust towards information produced in online forums and communities influence consumers to avoid using such information (Liu & Zhang, 2010). Research shows that source of information credibility in an online community influences perceived usefulness of users (C. M. Cheung et al., 2008) and that higher credibility sources of information provide information usefulness (Ko, Kirsch, & King, 2005).

Impact of Electronic Word of Mouth on Social Commerce Era

The increasing popularity of social media provides new opportunities for business to develop their marketing strategies based on social media developments. The literature of WOM has developed the motivation to perform eWOM and the factors involved drive customers to use it. However, the present literature examined how social media developed eWOM to social WOM and how consumers are motivated to spread its use and derive benefit from it. This will help firms to use social media to attract more customers and facilitate their social interactions to produce social word of mouth for their products. They may develop their marketing strategies based on a social media perspective to distribute their information along a different route to their customers. This information has more influence than other sources such as a website or eWOM since before using social media; customers need to establish a credible profile. This identity, a critical point of eWOM, can be achieved by social media. This gives a new marketing strategy using social media to develop sWOM to increase the credibility of information produced through online communication. Credibility is an important factor as customers can not experience the products and services in an online context. Therefore, sWOM can produce credible information for the network. E-vendors can develop online communities to attract individuals to come online and perform social interaction with their peers. In the case of new product development, businesses can use social media to facilitate social interaction of consumers, especially those who have experienced a new product. These customers may detail their experiences, information and knowledge about a new product, a valuable source of information for non-experienced customers. This supportive environment provides informational support and emotional support, establishing information credibility and usefulness leading to sWOM adoption. Finally, this study identifies a deeper understanding of online travel communities, as travellers now seek improved and better quality services. Social media provides them with the tools to do this.

THE APPLICATIONS OF SOCIAL COMMERCE IN BUSINESS CONTEXT: THE ROLE OF SOCIAL SUPPORT ON SOCIAL COMMERCE DEVELOPMENT

In this section, the research discusses the applications a key construct that form social commerce. As social support is one of the key constructs of social commerce and this construct is new in business studies, the applications of social support theory in business context has been explained in detail in the following section.

Context

The proliferation of the internet has given the opportunity to consumers to use social media, from email to Twitter and Facebook, to have social interactions with other users without meeting them (Gruzd, Wellman, & Takhteyev, 2011). Consumers are now content generators on the internet by using new technologies (Phillips, 2011), which offer new opportunities for both businesses and consumers. The use of Facebook, Twitter and LinkedIn as leading social networking sites (SNSs) has increased, with their popularity creating new routes for e-vendors, called social commerce (Liang & Turban, 2011). YouTube and Facebook are among the most popular SNSs (Corrocher, 2011), which increasingly attract individuals to SNSs, mostly because of individuals perceived usefulness (Lin & Lu, 2011). In recent years, SNSs and online communities have been growing quickly (Cachia, Compañó, & Da Costa, 2007; Lu & Hsiao, 2010). SNSs have different values, such as relationship marketing and relationship quality (Jung, Ineson, & Green, 2012) and these social networks offer a suitable environment in identifying emerging social behavioural changes (Cachia et al., 2007). Identifying emerging social behavioural changes is important due to the fact that development of e-commerce to social commerce is a behaviour change (Liang et al., 2011). The concept behind social commerce is that social media benefits commercial transactions of vendors by developing closer relationships with customers, enriching the quality of the relationship, increasing sales and encouraging loyalty to the business. To reach these aims, a business may use a social media tool such as Facebook or Twitter to gain access to social platforms. Because social media now influence marketing activities (Kim & Ko, 2012), consumers who use social media communicate with brands (Cova & White, 2010; Hollenbeck & Kaikati, 2012; Zaglia) and generate a positive effect on brand evaluation (Naylor, Lamberton, & West, 2012). Companies can now apply social media strategies to influence (M. T. Adjei, S. M. Noble, & C. H. Noble, 2010) and increase their sales (Agnihotri, Kothandaraman, Kashyap, & Singh, 2012; Lu & Hsiao, 2010). Therefore, it is useful to understand how people use social media for communication to form new forms of social interaction (Gruzd et al., 2011; J. Huang, Baptista, & Galliers, 2013) and find out about consumer behaviour in an online context. In addition investigating social commerce intentions and drivers for social commerce may make the market familiar with the influence of technological advancements, particularly Web 2.0 and its effects on consumer's behaviour in the social commerce era. Social commerce is facilitated by technologies such as social media for consumers to have interactions and to gather contributions by individuals to gain information about buying a product or service (Liang & Turban, 2011). Social commerce, social media and Web 2.0 technologies demand new issues and the development of new theories in this area and may be one of the most challenging areas of information systems (IS) and marketing research in the coming decade (Liang & Turban, 2011).

Research shows that customers like to share their shopping experiences with other friends (Liang et al., 2011). These experiences are important for consumers, especially when they receive information

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

from friends and this influences their shopping behaviour (Trusov, Bucklin, & Pauwels, 2009). It is argued that consumers in an online context are most influenced by word of mouth (WOM), which is the high-flying feature on the internet (Trusov et al., 2009) and has ripple effect (M. Huang, Cai, Tsang, & Zhou, 2011). WOM occurs when consumers share their experiences about a product or leave their views with other consumers (Romaniuk, 2012).

Social interaction and relationship of individuals in the online context is mostly based on shared interests (Wellman et al., 1996) and produces information richness in the transaction environment (Yadav & Varadarajan, 2005) leading to better customer understanding. Being in a group and having social interaction with other members is a human need; this is now facilitated by Web 2.0 applications such as social media. Online communities such as SNSs are new web services to provide both personal experiences and information sharing in a business context (Lu & Hsiao, 2010).

In this part of the literature, the author refers to his recent publication to investigate the social interaction of cosumers on the internet in social commerce era. In particular, this will investigate social support to explain the effects of social factors on relationship quality and social commerce intention. This research will extend theory to online social support based on the relationship of individuals on the internet. Therefore social support in terms of relationship quality can result in better understanding of both customer loyalty and adoption.

Theoretical Background of this Track

Customers are partners and part of a value creation chain in a business (Hennig-Thurau, 2000; Pongsakornrungsilp & Schroeder, 2011). Therefore, businesses need to understand their customers (Rauyruen & Miller, 2007) and building marketing relationships with them is necessary. Relationship quality as an important factor in relationship marketing literature is related to different factors; this can influence loyalty toward a business (Curty & Zhang, 2011; Rauyruen & Miller, 2007). Relationship quality can be defined in various categories. However, it is mostly focused on trust, commitment and relationship satisfaction (Rafiq, Fulford, & Lu, 2012; Rauyruen & Miller, 2007). Relationship quality in an online context can be categorized to characteristics and behaviour of the vendor (Rafiq et al., 2012). In the online context, an e-vendor promotes relationship quality in different ways including investment in the relationship with customers, customer relationship management, social support, etc.

Relationship Quality

Relationship quality refers to relationship closeness or strength and it is one of the key determinants of customer loyalty (Hennig-Thurau, 2000). Relationship quality is a key concept in relationship marketing. Research shows that relationship quality has mainly three facets; trust, relationship satisfaction and relationship commitment (De Wulf, Odekerken-Schroder, & Lacobucci, 2001). Therefore, in this research the author assumes that better relationship quality is accompanied by these indicators.

Trust is a central issue in most economic and social transactions, especially in an online context where there may be lots of uncertainty (Pavlou, 2003). Trust also is a central issue in social commerce. Trust in a business shows that an e-vendor is honest and benevolent (Gefen et al., 2003). Benevolence and credibility are seen as two distinct types of trust (Ba & Pavlou, 2002). Credibility based trust, which usually is impersonal and relies on reputation information, refers to the belief that the other party in a transaction is reliable and honest; benevolence, however, refers to repeated seller-buyer relationships (Ba

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

& Pavlou, 2002). Relationship commitment refers to an individual's desire to continue a relationship with a retailer (De Wulf et al., 2001). Commitment is a main factor for a long term relationship (Garbarino & Johnson, 1999). This indicator of relationship quality shows the importance of the relationship with service provider that maximise the efforts to guarantee the relationship (Gustafsson, Johnson, & Roos, 2005). Relationship satisfaction, the other indicator of relationship quality, refers to the affective state of people from their complete evaluation of the relationship they have with other people (De Wulf et al., 2001). Investment in a relationship with consumers has a direct and great impact on intention to buy in consumers and also in customer retention (Palmatier, Dant, Grewal, & Evans, 2006). The strength of this relationship or relationship quality is a key concept in relationship marketing (Rauyruen & Miller, 2007). This relationship is dependent on the vendor service quality and how it builds the connection with consumers.

CONCLUSION

Social relationships of consumers on the internet, through the popularity of social media, have seen the emergence of a new concept entitled social commerce. Drawing on social support theory from social psychology discipline, relationship quality form marketing track, and social media perspective from information systems, a research has been developed to investigate consumer behaviour in this era of social commerce. The goal is to find the commercial values offered by Web 2.0 technologies for both businesses and consumers. The proposed model reports on social constructs and the ability to increase relationship quality in business, leading to an impact on an individual`s social commerce intention.

Consumers use social media to share their knowledge, information and experiences with other peers in their groups and communities. These advancements make consumers part of a value creation process for business through the social support they provide on the internet. The research reveals that their social support contains informational and emotional support. It has been empirically tested and results show that social support has a positive effect on relationship quality. These supports also significantly affect relationship quality.

This investigation indicates that the social interactions of consumers have different advantages for business. Consumers join online communities or use social media and generate textual information about a product or service. This information can increase relation quality in a business, leading to increased loyalty. Therefore, the valuable information created on the internet has many advantages, relationship quality being one of them. The co-creation environment engages consumers in a value creation process for a business.

Another valuable result of the above mentioned research concerns the positive effect of relationship quality on social commerce intention. Relationship quality, measured by commitment, trust and satisfaction, has the potential to enhance social commerce intention. Relationship quality is seen as a foundation in marketing literature and is important for shaping customer loyalty; this is influenced by social support. In fact, social support can increase commitment, trust and satisfaction, leading to improved customer loyalty. This is a key finding for businesses to adopt social media strategies to establish an environment for their consumers to develop social support, which in turn can enhance customer loyalty through relationship quality. Firms in social commerce era are facing huge challenges by technological advancements on the market. Researching and investigating these kinds of issues may shift these challenges to opportunities for firms to adjust their business strategies. The results of this study highlight

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

the importance of online communities and social networking sites, which offer a supportive climate for consumers. This supportive environment has different values, of which this research investigates the relationship quality. Improving relationship quality through trust, commitment, and satisfaction influence social commerce intention and make social networking sites a valuable place for businesses. Forecasting consumer's behaviour in social commerce era, therefore, is a contribution for this research.

The contribution of the research is to apply social support theory and integrate it with relationship quality from marketing discipline to gain a better understanding of what drives social commerce and what are the commercial values of social media for business marketing strategies. This has been shown in the model through social support and relationship marketing. Proposing social support in the online environment in the model and examining its influence on relationship quality shows that theories from both information systems and marketing need to be investigated with a view to application in social media.

In conclusion, adding this application of social support to the literature review chapter of this thesis intent to show the significant role of social interaction of consumers in social platforms provided by Web 2.0 in social commerce era and applications of social support theory. These social interactions produce different values for business, which in turn encourages companies to apply social media strategies, for instance, to adjust their business plans to meet the present social environment. It also highlights the role of active consumers and how they can help business to have a better understanding of customers' needs. Finally, this study looks at future of e-commerce and predicts consumer's behaviour in social commerce era. Forecasting consumer's behaviour in social commerce may provide a foundation for firms to develop their social media strategies and adopt new technological advancements.

KEY TERMS AND DEFINITIONS

Credibility: Credibility is an important factor as customers cannot experience the products and services in an online context.

Electronic Word of Mouth: It is a virtual communication between consumers in an online context.

Online Social Support: Online social support as a new theoretical lens in the study of eWOM can be theorized based on the advancements on the internet.

Online Word of Mouth: Online word of mouth has been developed by the emergence of Web 2.0 technologies and the rise of social media.

Social Commerce: Social commerce is a new stream in e-commerce enabling consumers to use social media in e-commerce platform.

Social Word of Mouth: Social word of mouth is the evaluation of consumers about a product using social media.

Traditional WOM: The concept of traditional WOM is broadly the same as eWOM but there are some differences between them, although both of produce useful information for individuals.

Chapter 68
Defining the Role of Social Media as a Contemporary Local Area Marketing Technique in Franchising

Geoffrey Webster
University of Southern Queensland, Australia

Margee Hume
University of Southern Queensland, Australia

ABSTRACT

Literature on Local Area Marketing (LAM) and social media engagement techniques for franchise businesses is scant, with Direct and Online Marketing the primary focus. It is important for franchise businesses to have a qualified understanding of social media to integrate its use as a LAM technique in their business. Problems facing franchise businesses include confusion over how social media functions within local area marketing strategy, a unified perception over how social media can be used to develop their business, and the lack of a basic theoretical model for social media engagement and LAM guidelines. This chapter examines the role of social media in LAM. It explores the franchise business attitude on new technology adoption including the use of social media. It presents a coordinated framework for the application of social media to increase awareness and enhance franchise business success, providing an important contribution to the franchise industry sector.

RESEARCH RATIONALE

This research is significant in that it is exploring not only the engagement of social media as a LAM technique but also the extent to which social media as a technology tool has been used to market franchise businesses. This chapter will highlight the current and past perceptions of social media as a marketing strategy. There has been quite a lot written about the perceived benefits of social media and LAM tech-

niques but mainly by consultants and marketers who have a vested interest in the franchise industry. The researchers have identified problems that they seek to research with the book chapter. These problems are as follows:

Problem One

Lack of objective investigation into how franchises view social media as a marketing strategy: Often franchisees are given poor quality training into marketing their local area. Investigations only really begin when sales budgets fail to be consistently reached.

Problem Two

Lack of objective reporting into franchises using social media to develop their business: Individuals tend to be reported as a 'mouthpiece' for the franchisor. The evidence or substance as to the extent that social media has developed their business is not usually reported.

Problem Three

Lack of theoretical framework or model for the engagement of social media as a LAM technique: The approach from marketers to franchises about using social media as a LAM technique appears to be haphazard resulting typically in a customised LAM strategy.

RESEARCH METHOD

A qualitative approach was considered appropriate as this line of research would help to define the problems the researchers are seeking to investigate (Boyce, 2002). The research objective involved conducting exploratory research to determine if it was worthwhile to undertake a more thorough investigation and to increase the researcher's familiarity in the problems highlighted earlier. (Kumar, 1996). To collect data on the topic, *"Social Media in Franchising"*, two techniques were utilised, a literature review and a structured observation. Kumar also outlined that a literature review provides clarity and focus to the research problem as well as broaden the researchers' knowledge base in the research area. With the literature review, two sources of information were used: academic business journal databases and the internet.

The researchers searched academic journal databases using key word terms including, *social media*, *social crm* and *social networks*. The researchers also used the search engine 'Google' to locate additional information including news as well as magazine articles, advocacy group websites and industry survey reports using key word terms, *social media in franchising*. A structured observation was undertaken in the form of a website review. The structured observation technique was adopted as a strategy because it reduces the potential for observer bias as well as increases the reliability of the data (Kinnear & Taylor, 1988). To identify which franchise business websites to review, a convenience sampling approach was adopted for the study. Convenience or 'accidental sampling' is best used in exploratory research circumstances as it is quick and easy to administer, given the timeframe required (Zikmund, Ward, Lowe

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

& Winzar, 2007). The data analysis conducted related to a 'descriptive analysis' as defined by Kinnear & Taylor, which was suitable given the research objective involved portraying the online social media characteristics and determining the frequency of their occurrence.

INTRODUCTION

In 2005, franchise business revenue in Australia was $96 billion, approximately 14% of Australia's GDP (Wilkie, 2014). By 2011, this had grown to just under $129 billion, around 9.2% of Australia's GDP (ABS, 2012). Given that Australia was experiencing a mining boom up to 2011, the revenue growth is significant. In Australia, franchising is also a growth industry, however with franchising, the onus is on individual franchisees to manage their own LAM. Franchise agreements often have clauses stating that a certain proportion of the franchisees turnover contributes specifically to LAM.

The concern is that many franchisors do not adequately provide their franchisees with the skills and tools required to become effective local area marketers (Ciniglio, 2014). With LAM for a franchise, their biggest asset is their reputation. The time, effort and perseverance to build a franchise brand could be destroyed quickly with the internet and social media if it is not managed properly by the franchise. Every day, search engines looking for fresh material publish smears, lies, distortions and rumours to fill blogs, websites and forums with these postings being usually at the top of their results list. Once it's posted, it's just about impossible to remove. Even trying to refute these allegations could enflame the situation even more for a franchise. (Socialmediafranchising.com, 2009)

Australian public relations specialist Rebecca Stalker (2010) describes social media as a type of media that centres on proper conversations and how people interact online. She states that social media has become for a significant proportion of the Australian population, their online lives. Stalker also suggests that there are a relatively small number of franchise businesses using social media, with most of those being in the retail food business sector, but a relatively few effectively using it. In contradiction to this assertion by Stalker, Frazer, Weaven & Bodey, (2012, p.74) in their Franchising Australia 2012 report, state that 94% of franchise businesses they surveyed used some form of social media as opposed to 10% of small businesses and 18% of medium businesses using social media. The defining question is, how well is it being used by franchise businesses? Research by the US iFranchise group noted that for most franchise businesses using social media had hardly any measurable increases in their revenue sales. Only a small percentage seemed to have achieved positive results. (Franchisewire.com, 2011). According to Cooper Smith from Business Insider (2014), only 23% of marketers in a recent survey stated that their promotional social media efforts were effective. Negative results such as adverse social media comments could be catastrophic for a franchise business. Franchise businesses need to be weary as negative social media comments stimulate further discussion on social networks, (Corstjens & Umblijs, 2012, p.441).

This chapter will highlight the current perceptions of social media as a marketing strategy and the reasons and causes for franchise business successes using social media. A better understanding of how franchisees view social media will provide valuable insight into how franchise businesses brands can better use social media as a contemporary LAM technique in their business.

The objective is to define the role of social media as a contemporary LAM/community based technique through the use of technology with the emphasis on an integrated approach to the franchise business attitude of adopting new technologies.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

The intended contribution to the franchise industry is to provide a coordinated framework for the application of social media as a LAM and community based marketing technique to increase awareness and ultimately enhance franchise brand social media presence success. The three key measures of social media presence success that matter according to Business Review Weekly (BRW) include: increased sales, better brand recognition and being perceived as an employer of choice. (Dent, 2012)

BACKGROUND

In Franchising, there is the perception that the role of social media is not well defined, especially as a contemporary LAM technique. Local Area Marketing as a phrase literally means 'marketing within a specific location or region'. Lidia D'Opera, Marketing Manager for the Snap Printing franchise group defines LAM as a tailored promotional program adapted to suit local community conditions. The essential element of LAM for franchisees is using their local knowledge to communicate with their customers on a personal basis in order to build trust and locally relevant community credibility (Topfranchise.com.au, 2012). Conversely, franchise consultants claim that the franchise industry data suggests social media is only useful in enhancing traditional media techniques rather trying to replace them. They view social media as an integral part of the arsenal of media options available but not critical (Franchisewire.com, 2011). Paul Segreto (2010), an American franchise consultant even had this to say about it, "social media is most effective when it is a fully integrated part of a comprehensive multi-media strategy".

The reported franchise social media success stories don't consistently reinforce this viewpoint. When comparing media reported franchise business social media success stories, few highlight an integrated multi-media strategy. For example, there is the success story about a LED lighting supplier who conducts a contest through Facebook and has followers judge the contestants (Libava, 2013). Other social media success stories relate to the enhancement of only one social media tool, Facebook connecting to business webpages for the purpose of trying to increase revenue (Markitsharebuilders.com, 2013). Further social media example success stories, highlight one, maybe two social media tools being enhanced (Mershon, 2012). This is little evidence for an integrated approach.

Social Media is still very much a new phenomenon beginning around 2006/07. Social media is a form of online media that elicits conversations and allows participant interactivity (listening/viewing/reading) in content creation, development and sharing (Ward, 2014). Jones (2009) defined social media more simply as "a category of online media where people are talking, participating, sharing, networking, and bookmarking online. Most social media services encourage discussion, feedback, voting, comments, and sharing of information from all interested parties." He suggests that the nature of social media is about two-way conversations using various conduits such as 'social news' where people read and vote on news topics and articles, 'social sharing' where people can create, upload and content such as videos and photos, 'social networks' where people can connect and remain in contact with friends, family and associates and social bookmarking' where people can flag content and information of interest and share this with others.

Social media's appeal is it's real dynamism. It's alive and exciting and is always changing and organic as it continues to evolve through new platforms and tools. As an example, it is also being used in ways few people could have imagined just a few short years ago (Libava, 2013). Teixeira (2011) an American franchise consultant believes that with the increased use of social media, there will be the development of more applications and more creative as well as innovative marketing programs for franchise businesses.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Libava (2009), likens social media to an express train about to leave the train station and has been encouraging franchise businesses to embrace this trend to be more transparent. One of these ways includes incorporating social media as a LAM technique in franchising. According to Stalker (2010), for franchise businesses, a social media presence can increase and enhance brand awareness as well as provide strong word-of-mouth recommendations. According to BRW this is one of the three key social media presence success measures (Dent, 2012). The other two success measures include increased sales revenues and returns on marketing investments. For those franchise businesses that have adopted social media they are asking questions such as:

- How do we measure our conversions?
- How do we calculate our social media return on investment (ROI)?
- How do we increase our social media coverage? (Libava, 2013)

Calculating social media ROI for franchise businesses is similar to attempting to quantify human conversations and interactions that are inherently qualitative by nature. It is suggested measurement of ROI is less important that the act of disseminating the message (Libava, 2009). Franchises are not adopting social media fearing the loss of brand reputation and brand recognition through negative comments and cite this as a strong reason for avoiding adoption. Others suggest the perceived time and costs involved for initial set-up and ongoing maintenance as the deterrent (Segreto, 2010). The Chamber of Commerce and Industry Queensland (CCIQ) (2012) as part of their annual Queensland Digital Readiness Study investigated, 'Reasons for Not Using Social Media' and these findings are discussed further later in this chapter.

It can be suggested that the role of social media in promoting franchise business awareness as a marketing promotion technique is quite evident through the volume of online articles available; however its application appears to be inconsistent when it comes to an integrated multi-media strategy. There appears to be no model or framework to use as a basic guideline, only the specialist advice of digital marketing and public relations specialists. The focus of the remainder of this chapter is to define the role of social media as a contemporary local area marketing technique in the context of Franchising.

LAM TECHNIQUES

So what are LAM techniques and how do franchises differentiate between traditional and contemporary methods? Firstly, these techniques relate to marketing within a specific geographic location but the keyword phrase does vary between countries. In Australia, the predominant keyword phrase is 'local area marketing' (LAM) and it is the identification as well as implementation of local community marketing opportunities through the collaboration and engagement of local media, businesses, organisations, groups and individuals. (Kelly, 2013) The common keyword phrase describing this type of 'grass roots' approach to marketing is 'local marketing' in the United States of America. It is interesting to note in the U.S.A., one out of every twelve businesses is a franchise with many operating in highly segmented competitive local geographic markets. (Polite, 2011) Similarly, in the United Kingdom, the typical keyword phrase is 'local marketing' as well. (Franchiseperformance.net, 2013) This chapter is considering the keyword phrase in the Australian context.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Before the distinction between traditional and contemporary LAM can be made, it is important to know what activities make up a typical modern LAM program. For a franchise, this often includes a direct mail campaign (database development), customer loyalty program (email marketing program), community sponsorship program (consumer promotions) and franchisee outlet website (local advertising campaigns). (Tickyes.com, 2012) According to Matthew Bywater (2012), an Australian franchise consultant, other LAM program activities can include as well, local media campaigns (public presence), customer awareness (in-store promotions), customer acquisition (networking events), and customer awareness/acquisition (mobile marketing). This indicates a mix of traditional and contemporary LAM techniques. Lidia D'Opera from the Snap Printing group describes the traditional LAM techniques as being typically direct mail campaigns and unaddressed mail (brand awareness and lead generation). (Topfranchise.com.au, 2012)

In the past, traditional LAM techniques were viewed as being the primary domain of the franchise industry. As a marketing strategy, it received very little notice from mainstream marketers. (Tickyes.com, 2012) Recent times however have seen the rise of contemporary LAM techniques due to continued growth and popularity of the franchise industry as well as marketing/cost efficiency benefits mainly through technological advances. This has enabled franchise businesses to form more profitable relationships with their customers. These technological advances have also allowed for more personal consumer engagement especially via the internet (email, mobile phones, wireless, CRM software, and social media) and digital printing. (Bywater, 2012)

Based on these technological advances, Table 1 compares both traditional and contemporary LAM techniques and has been compiled as a heuristic guide (Aboutsensis.com.au, 2014).

Table 1 depicts the various promotional marketing techniques used to target prospective customers or retain current customers. Many of the traditional techniques listed are considered Direct Marketing techniques as well because they can be directed toward individual customers. Similarly, a number of the contemporary techniques can also be directed toward individual customers. Mainstream marketers didn't take traditional LAM too seriously because many of the techniques typically were viewed as "Direct Marketing". Direct Marketing is defined as "organisations communicating directly with target customers to generate a response or transaction." Organisations like Amway, Nutrimetics, and Tupperware solely distribute using independent contractors to sell their products straight to customers (Belch, Belch, Kerr & Powell, 2009, p.47). This is also how franchise businesses operate. The Franchise Council of Australia describes franchising as a business relationship between the franchisor (the business owner who provides the product or service) and independent people (the franchisees) whereby they are given the authority

Table 1. LAM techniques comparison

Traditional	Contemporary
Direct Mail	Email marketing
Loyalty (cards/VIP clubs, etc)	Mobile – marketing/advertising/reviews/websites
Sponsorship	Online ads
In-store (events/samples, etc)	Online forums
Business website (static)	Search engine marketing (Google/Yahoo, etc)
Yellow Pages	Online directories
Media releases	Blogs

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

to promote and distribute the franchisor's products or services as well as use their business brand name for a set time period. (Franchising.org.au, 2014)

Direct marketing has four characteristics that set it apart from other marketing techniques. Direct marketing is 1. Non-public (personal), 2. Immediate, 3. Customised (specific) and 4. Interactive (two-way dialogue) (Kotler, Brown, Adam, Burton & Armstrong, 2007, p.633). The essential function of a direct marking program is to generate a measurable response that will result in an immediate or final profit. (Stone & Jacobs, 2001, p.7) Stone and Jacobs (2001, p.5) define Direct Marketing as "the interactive use of advertising media, to stimulate an (immediate) behaviour modification in such a way that this behaviour can be tracked, recorded, analysed and stored on a database for future retrieval and use." Considering these descriptions, there appears to be two core elements, a) interactive communication and b) database information. Stone and Jacobs (2001, p.5), believe that two-way interaction as an essential ingredient of direct marketing. According to Belch et al (2009, p.175), databases have allowed organisations to keep in touch with their customers and form relationships with them. This has evolved into customer relationship management (CRM) and with that the continued growth of direct marketing.

Factors influencing direct marketing attractiveness include availability of consumer credit cards making purchases more easy, advent of specialist direct marketing information service specialists, changing societal structure such as dual incomes and more mobile families, technological advances especially in computers and electronic communication as well as more organisational transparency and accountability (Belch et al, 2009, pp.465-6). These technological advances often referred to as the 'digital revolution' had a major influence on Australian society to the point that having personal access to the internet providing choice with increased competition. Hence the terms 'online' or 'interactive' marketing to describe this evolution (Belch et al, 2009, pp.478-9). Digital Marketing is about using various digital media, such as email, mobile phones and social networks for promotional purposes (Inwise.com, 2011). As a form of Direct Marketing these modes would be deemed 'contemporary' in nature.

Before identifying what contemporary LAM techniques constitute 'Social Media', it is important to clarify the nature of social media. Social media is a form of two-way social communication. Social media can include such categories as 'social news', where people read and vote on news topics and articles, 'social sharing' where people create, upload and then share their creations such as videos, photos, podcasts, for example, 'social networks' where people connect and stay in touch with friends, relatives and colleagues, and 'social bookmarks' where people find, flag and share online information and 'wikis' where people add or edit articles. (Nations, 2014) How these categories relate to customer loyalty strategies is outlined in Table 2. Social media adoption guidelines need to have a customer-centric emphasis.

Table 2. Social media customer loyalty strategies

Social Media Category	Customer Awareness	Customer Acquisition	Customer Retention/ Service	Customer Loyalty
Social Media	√	√	√	√
Social News		√	√	√
Social Sharing				√
Social Networks	√	√	√	√
Social Bookmarks			√	√
Wiki's				√

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Table 2 depicts the application of social media categories to the relationship marketing process. According to Kotler et al (2007, p.11) the relationship marketing process is about creating, maintaining and enhancing customer relationships. Sometimes described as "customer-focused marketing", the key elements to this process is understanding customer retention economics as well as developing and building customer loyalty (McColl-Kennedy & Keil, 2000, p.685). By focussing on customer outcomes through achieving customer satisfaction and loyalty is a customer-centric approach (Kotler et al, 2007, p.43).

Using Social Media is a personal and interactive experience. Similarly, Direct Marketing is "customer-centric" and being driven by technology allows businesses the freedom to identify, differentiate and engage with their customers and develop personalised communication for them. (Stone and Jacobs, 2001, p.49) Contemporary LAM techniques are part of this process. There are still unanswered questions such as: How much should franchise businesses spend on LAM and social media? Is there a magic figure?

Spending on LAM

Successful franchise businesses are active and proactive with their LAM programs. It is what drives their businesses. The key is in knowing how much to spend on LAM. Kelly (2013), an Australian journalist and PR specialist with more than 20 years' experience in franchising corporate communications summed it up this way: "The rule of thumb in franchising is that franchisees are expected to pay anywhere between 1.5 – 3 per cent on local area marketing, over and above their national marketing contribution, which can sit anywhere between five and 10 per cent, depending on the franchise." This effectively means a total advertising budget spend of between 6.5 – 13 percent. Included in that figure would be the expected spend on social media.

So how much should a franchise businesses spend on Social Media? According to ZenithOptimedia, in 2012 internet advertising surpassed that of newspaper advertising expenditure in the USA. Internet advertising equated to 19 percent of total advertising expenditure. It is predicted that by 2014, internet advertising would nearly be a fourth of all US advertising spending. (adage.com, 2013, p.9) Also in the USA, in 2013, digital media usage surpassed time spent watching television. In terms of internet usage (including social media), this was about 13.9% (adage.com, 2013, p.11). On the basis of usage and related expenditure, overall this would calculate to 2.64% approximately for internet advertising expenditure it could be assumed. But is this an accurate approach?

It may be useful, but there are a number of other factors to consider when calculating social media costs. Depending on the social media to be used, there are costs for such things as design, set-up, creation, content, management, monitoring, reporting, training and consulting. (Collier, 2012) According to Australian Mark Garner, principal of 'Make Them Click' it is over $200,000 a year which for many businesses in Australia is not practicable. Though setting up and using social media may be inexpensive, it's the promotion, monitoring and reporting costs that are considerable, anywhere from hundreds to thousands of dollars per month. This can be a significant cost even for even a medium sized business. The issue then is about justification as an expense and the production a measurable result, i.e. some quantifiable return on investment. (Garner M., 2013) This also might help explain why a moderate proportion of Australian businesses including small to medium size franchise businesses do not have a social media presence. The likely reasons are that they don't have the resources or the profitability to maintain a sustainable social media presence.

In a separate study conducted by the Australian Interactive Media Industry Association (AIMIA) in conjunction with Yellow Pages, it was found that in 2013, 39% of small businesses, 18% of medium

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

businesses and 20% of large businesses did not spend any money on social media engagement within their organisations. Given how engaged Australian's are with the internet, the researchers considered this a significant lost opportunity for all of those businesses. (emarketer.com, 2013)

SOCIAL MEDIA ENGAGEMENT

Australia remains one of the most internet connected countries on the planet with a staggering internet penetration rate of 88.8%, or nearly 9 in every 10 people as compared to the USA where there is only a 78.1% rate. (Internationaldigitalhub.com, 2013) Sixty-eight percent of these internet users will access social media websites at least once a month in 2014 it is estimated. The percentage of internet users that accessed social media websites increased from 30% in 2011 to 45% in 2013. The increase in Australians using mobile devices to access social media websites in the last two years has been exceptional. Social media access using smartphones increased from 34% in 2011 to 67% in 2013 and with tablet devices social media access climbed from 4% in 2011 to 35% in 2013. In relation to accessing social network websites in 2013, Australians spent 18 minutes per visit on Facebook, 10 minutes on LinkedIn and 9 minutes on Twitter on average. The incentive is there for Australian businesses to get more active and use social media. (emarketer.com, 2013) The question for marketers is, on what basis?

In a US survey conducted by eMarketers (Garner, 2013), marketing executives were asked to rate what they considered were the main benefits of organisations using Social Media. The table below summarises their findings and groups them by perceived level of importance. The purpose is to identify if there are any correlations between business and user perceptions. Noteworthy is the fact that the top four perceived benefits related to customer engagement and communication. Only just over 50% thought that 'Low Cost' was a benefit.

The most notable social media benefit as perceived by organisations as shown in Table 3 is 'Customer Engagement'. This will be discussed in more detail further in the chapter.

FRANCHISE TYPES

Franchising covers a broad range of businesses so it is necessary to clarify the various types of franchises. Several franchise consultants and specialists have endeavoured to do this (Perrigot, Kacker, Basset & Cliquet, 2012). In the annual Franchise Australia survey conducted by Griffith University Asia-Pacific

Table 3. Main benefits of social media

Benefit Perception Tier	Social Media Benefits
1	Customer Engagement (85.4%)
2	Direct Customer Communications (65%), Speed of Feedback (59.9%), Learning Customer Preferences (59.1%)
3	Low Cost (51.1%), Brand Building (48.2%)
4	Market Research (42.3%), Credibility of the "crowd" (40.1%), Reach (37.2%)
5	Great Lead Generation (21.2%), Customer Service (17.5%)

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Centre for Franchising Excellence, franchise businesses were categorized by the product or service industry they mainly operate in. These industries were aligned along the Australian and New Zealand Standard Industrial Classification (ANZSIC) coding guidelines. Sixteen industries were identified in the survey. (Frazer, Weaven & Bodey, 2012, p.22). This is different to the business categories discussed in the website review. According to the Franchise Council of Australia, "In Australia today there is a franchise operating in almost every type of business category, with varying levels of complexity and cost." (Franchise.org.au, 2014)

The Franchise Council of Australia business directory website under the 'Franchise By Type' heading, offers 28 different franchise business categories listed (Franchisebusiness.com.au, 2013)

To add to the complexity of categorizing franchise types, in a French study of social media usage the franchise businesses were divided by either retail or service industry category types (Perrigot, Kacker, Basset & Cliquet, 2012 p.548). A simpler approach to identify the different types of franchises is to consider the type of work being undertaken in operating the franchise business. This method can be easily classified into five different categories, management, retail, single operator (manual), single operator (executive) and investment.

A management type franchise essentially is involved with business-to-business activities, i.e. mainly dealing with businesses selling a product or service with a heavy emphasis on personal selling.

On the other hand, a retail type franchise is typically selling a product or service to the end user, dealing with the general public, primarily 'walk-in customers. A single operator (manual) type franchise, sometimes referred to as a 'job' franchise usually takes the form of a trade supply, selling and delivery business of products and services. In the majority of cases, they are mobile (i.e. van based) and deal with both the general public and businesses. They need to market locally in order to generate business. Similar to the single operator (manual) type franchise is the single operator (executive) type franchise, sometimes referred to as a 'service' franchise type because it essentially supplies a service. It can either be mobile, home-based or operate out of a small office but is typically 'executive' by nature. This type of franchise mainly deals with businesses and sometimes the general public. Like its manual counterpart, it also has to market itself locally to generate business. Lastly, there is the investment type franchise where a financial capitalist would invest into a franchise such as hotel and engage a separate management team to operate the business. (Whichfranchise.net.au, 2013)

Franchise Businesses Website Review

In this section, data is presented about Australian Franchise businesses and their webpage social media content. The variables used in this study are described in Table 3. These variables are similar to the ones used by Perrigot et al, (2012, p.554) in their online review of franchise businesses facebook pages. In describing the method for data collection, the source for obtaining a list of franchise businesses was the 'Franchise Business' directory (Franchisebusiness.com.au, 2013) which is the official directory of the Franchise Council of Australia, Australia's peak body representing franchises. They advise that there are more than 1200 franchise opportunities in Australia. Under the 'Franchise Systems' heading, there are 28 categories of franchise businesses and a total number of 3334 franchise business listings. Some franchise businesses are listed in more than one category. It was decided to consider franchise businesses by how they were operated for sample selection purposes (Whichfranchise.net.au, 2013).

One of the key issues is that only a small number of franchises are using social media. This is mainly in the retail food business sector. To confirm this hypothesis, a preliminary qualitative research inves-

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

tigation covering a cross-section of 38 franchise businesses across four of the five franchise types was undertaken. The franchise types categories included retail, management, job (single operator – manual) and service (single operator – executive). The protocols used to differentiate between the four franchise business categories were; a) for the management franchise business category, customer emphasis: business-2-business (personal selling); b) retail franchise business category, customer emphasis: consumer (walk-in); c) job franchise business category, customer emphasis: trade supply (mobile/van based); and d) service franchise business category, customer emphasis: executive/managers (mobile).

Within each of these categories, a cross section of franchise businesses was selected as a sample. The sample selected not only represented a diverse range of business operations within a category but also a mix of lessor known as well as familiar franchise brands. From this research, a sample of the 38 franchise businesses was obtained. Table 4 describes the variables that relate to the franchise business as well as social media content on the websites. These variables can be broken down into four separate categories, industry type, internet, involvement and encouragement. The variables descriptions are similar to the ones used by Perrigot et al (2012, p.554) in an online study of Facebook content.

The variables descriptions formed the basis for the website review questions. One of the chapter authors Geoff Webster, undertook the website review over a five day period after conducting an online search for individual associated franchise business website addresses. Table 5 depicts the tabulation of these website review findings as a summary count.

Table 4. Description of variables

Category of Variables	Variables	Description of Variables
Industry Type	Industry Sector	A description of business industry is present on website (count)
Internet	Online Presence	A dedicated organisational website is present on the internet (yes/no)
Involvement	Social Media Presence	Social media icons are present on website (yes/no)
	Social Media Platforms	Number of social media icons present on website (count)
	Social Media Platform Preferences	Description of social media platforms present on website (list)
Encouragement	Social Media Engagement	Specific tags to encourage social media engagement are present on website (yes/no)
	Social Media Comments	A list showing the number of social media comment postings is present on website (count)

Table 5. Website review findings

Table 5 shows the website review of the 38 franchise businesses sampled, indicated that 25 of them, or approximately 66% (two-thirds) had a social media presence though in varying degrees. This correlates quite closely with a 2012 Chamber of Commerce and Industry Queensland (CCIQ) digital readiness business survey that indicated 61.4% of the businesses they surveyed had adopted social media in their business. (CCIQ, 2012, p.19) The CCIQ survey, surveyed over 700 Queensland businesses. From the website review, the retail sector had the highest level of social media presence with 80% with the average number of platforms being above 4 (4.25). For the management sector, it was 4 (4.0), service sector just over 3 (3.2) and the job sector under 3 (2.6) social media platforms.

From the website review, there is a distinct delineation when looking at the frequency of the number of social media platforms identified in every franchise type category. For example in the retail franchise type category, 50% had 4 or more social media platforms with the remaining 50% having 3 or less. This appears to be the case across all four of the franchise type categories. This appears to be also reflected in the 2012 CCIQ Digital Readiness survey (p.19) with over 50% of the businesses they surveyed had at least 3 social media platforms.

In a detailed examination of the website review into how many of these franchises actually encourage social media engagement, in the retail franchise type category, only 25% of those with an online presence did. The management franchise type category was only marginally better at 28.6% for those surveyed encouraging social media engagement. The service franchise type category was on a par with retail at 25% with the job franchise type category the lowest at 16.7%. This would appear to support Rebecca Stalkers comments in 2010 that only a small number of franchise businesses effectively use social media. To clarify, "encourage social media engagement", in this context, it's considering things like, including the number of comments, followers or subscribers as well as whether people were directed to: 'subscribe to my newsletter, follow me on twitter, fan me on facebook, watch me on YouTube, join my google circle, get my rss or connect with me on Linked In', for example.

The website review also examined those franchises using social media for their specific preferences and variations across the franchise type categories. In reviewing the social media platforms used by the Australian franchises, certain franchise types appear more likely to use a variety of social media platforms. In Table 6 it can be seen that the retail franchise type category has the highest percentage of social media platform preferences, followed by management, job and the service franchise category type with the smallest percentage.

Table 6 reveals preference percentages, the standout social media platform is 'Facebook'. According to the 2012 CCIQ survey (p.19), the key platform to dominate was also Facebook with an 89.1% score. A French study into the early adoption and use of social media networks by franchisors in France also concluded that Facebook had the greatest social media presence amongst franchise businesses in the retail industry (Perrigot, Kacker, Basset & Cliquet, 2012, p.552).

From the website review, 'Twitter', 'YouTube' and 'Newsletter (Email)' social media platforms appear to have similar preferences ranging between 48-56%. The same can be said for 'Linked In', 'Google +' and 'Website Blog' social media platforms ranging between 32-40%. Completing the preference lists are 'RSS Feed' and 'Pinterest' on the same percentage (8%). Both 'Share +' and 'Refer-a-friend' also had the same percentage (4%) to round off the review.

A similar pattern emerged from the 2012 CCIQ survey (p.19), with 'Twitter' and 'Linked In' being in the 50-60% preference range, 'Google +' and 'Blogs' in the 15-25% preference range. Under the 10% preference range included the social media platforms such as 'Flickr', 'Tumblr', 'Pinterest', 'Salesforce Chatter' and 'Yammer'.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Table 6. Social media preference levels

Social Media Preferences	Franchise Type Category				Percentage
Social Media Platform	**Management**	**Retail**	**Job**	**Service**	**Total**
Facebook	16%	32%	16%	12%	76%
Newsletter (Email)	20%	24%	8%	4%	56%
Twitter	16%	24%	8%	4%	52%
You Tube	20%	16%	4%	8%	48%
Linked In	16%	12%	12%	-	40%
Google +	12%	16%	4%	4%	36%
Website Blog	8%	8%	8%	8%	32%
RSS feed	-	4%	-	4%	8%
Pinterest	-	8%	-	-	8%
Share +	4%	-	-	-	4%
Refer-a-friend	-	-	-	4%	4%

Alice Le Huray (2013) from Frank Media reported that for all Australian businesses they surveyed, 'Facebook' was the stand out social media network website at around 87%. Next was 'Twitter' with just under 42%, 'LinkedIn' at just over 27%, 'YouTube' slightly just above 13%, 'Google+' around 12% with 'Blogs' at just over 7%. Sensis in their 2013 business survey (2013, p.43) reported similar findings for 'Facebook' with 93% of businesses, however percentages for the other popular social media networks were lower, i.e. 'Twitter' 28%, 'LinkedIn' 17%, 'YouTube' 7%, 'Blogs' 4%, 'Google+' 2% and 'Pinterest' 1%. Others making up the remaining 9%.

These findings suggest a hierarchy of social media platforms, not too dissimilar to the findings of both the website review and the 2012 CCIQ Digital Readiness Study as well. 'Facebook' is also the dominant platform, across all three different sizes of business, with 'Twitter' next then 'Linked In'.

A possible hierarchy for franchise businesses could be something like the one proposed in Table 7.

Additional information including how social media is used and the reasons why franchises are reluctant to use social media will refine this hierarchy. This would form the basis for ongoing research.

The perception about the role of social media requires greater consideration. Understanding how social media is used could provide some vital clues. Stalker (2010) reports that the current focus and use for franchise businesses is about increasing and enhancing brand awareness and providing strong word-

Table 7. Social media platform hierarchy: Australian franchise businesses

Hierarchy Platform Tier	Social Media Platform
1	Facebook
2	Newsletter, Twitter, YouTube
3	Linked In, Google +, Website Blog
4	RSS, Pinterest
5	Share +, refer-a-friend

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

of-mouth recommendations. Understanding how social media is used and should be used by business is important. This question was only asked in the CCIQ survey (CCIQ 2012, p.20). The question options in the CCIQ survey for the question, 'How Social Media Is Used', included:

- Communication with clients
- Communication with suppliers
- Research/Information gathering
- Marketing
- PR
- Communicate internally.

Over 70% of respondents to this CCIQ survey question chose 'Communication with clients' and 'Marketing' with 'Public Relations' 55%, 'Research/Information gathering' at 40%. 'Communicating with suppliers' and 'Communicate internally' each rated around 20%. In this CCIQ survey question there was no option provided about social media making a measurable increase in revenue sales. The assumption drawn from this omission was that CCIQ didn't think that social media was effective in this regard. In the 2013 CCIQ Digital Readiness survey now being conducted, it includes a question asking businesses to rate their views on whether 'social media has made a real difference to my businesses revenue' (Cciq.com.au, 2013). The responses to this question should be of significant interest in relation to the iFranchise group comments reported at the beginning of this chapter.

Understanding the reasons why franchise businesses are not using social media is another area to be explored. Segrato (2010) an American franchise consultant proposed that the main reasons given by franchise businesses in the United States related to costs in setting up and maintaining their social media presence as well as the lack of perceived revenue benefit. Libava (2013) another American franchise consultant echoed similar comments especially about the perceived lack of revenue returns from investments in social media. Another reason suggested by Segrato (2010) was the fear of receiving online negative feedback that in turn could tarnish brand reputation. Libava (2009) too raised this point.

The results from the 2012 CCIQ Digital Readiness study question (p.20), asking businesses who don't use social media about their 'Reasons For Not Using Social Media', just under 45% of respondents thought it was 'Not relevant to my customers'. Just over 35% of respondents indicated 'Time and resources' whilst just under 25% indicated they 'See little value' in using social media. Just over 15% highlighted their reason as 'Don't understand social media' and only 10% responded to 'Fear of negative exposure and feedback'. These results appear to agree with these consultants' comments about the perceived worth of a social media presence and its lack of revenue benefit. This further supports the understanding those businesses that do have a social media presence of them using it for primarily communication and marketing purposes.

It should remembered that 38.6% of the businesses in the 2012 CCIQ Digital Readiness study did not have a social media presence, which equates to 1 in every 2.6 businesses. That is a quite significant statistics warranting future investigation.

The variance in percentage findings for social media presence that has been observed across the website review, 2012 CCIQ Digital Readiness Study, Sensis 2013 e-Business Report and the Franchising Australia 2012 Report could be attributed to the different size of businesses.

According to Alice Le Huray (2013), in Australia during the three years 2011-2013, medium size businesses have been showing continued growth in the adoption of a social media presence. Table 8

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Table 8. Social media presence: Adoption growth by Australian businesses

Percentage Increase	Small Businesses	Medium Businesses	Large Businesses
2011-12	13%	9%	29%
2012-13	3%	13%	0%

shows the comparison in social media presence for small, medium and large size Australian businesses. In relation to actual social media presence, in 2013 79% of large business had a social media presence whereas only 47% of medium businesses had an online presence and a mere 30% of small businesses had an online presence (Le Huray, 2013). Given the difference in social media usage between the different size businesses being quite apparent, is this a reflection on their customer focus and engagement? For franchise businesses, how can this be translated to customer and online engagement?

CUSTOMER AND ONLINE ENGAGEMENT

Customer engagement more recently refers to the engagement of customers with each other, businesses or products. It can also refer to the steps people take as they interact with a specific product. This can be initiated by either a person or a business. (Spiritus.temporis.com, 2004)

So how does this relate to online customer engagement? According to Porter, Donthu, MacElroy and Wydra, (2011, p.85) to nurture and maintain customer engagement online involves a three step process, that being; 1) identifying customer needs and motivations; 2) promoting participation; and 3) motivating cooperation. They identify these customer needs and motivations as relating to either undertaking a search for information, seeking to build a relationship, achieving self-identity/self-awareness, volunteering to help others, receiving a sense of enjoyment, achieving a sense of attachment and developing a sense of pride and influence.

Identifying Customer Needs and Motivations

Customer-centric organisations place a high emphasis on identifying and meeting customer needs. (Cole, 2005, p.483) To understand the reasons for online engagement, it's crucial to understand the motives for it. Motives are factors that drive people to take particular actions. (Belch, et al, 2009, p.130) These online engagement motives appear to align closely with David McClelland's 'Three Needs Theory' as well as McGuire's 'Psychological Motives', in particular external, social motives (Neal, Quester, Hawkins, 2002, pp.238-9). His theory proposed that there are three major motives that drive people, the need for 1) achievement, 2) power and 3) affiliation (Robbins, Bergman, Stagg & Coulter, 2003, p.450). Porter et al (2011, p.82) believe those businesses that make it easy for customers to fulfil their online engagement needs are also more likely to experience increased motivational support from customers.

Table 9 provides a list of identified needs that users need to fulfil in a virtual community, as well as examples of how the needs are likely to be achieved through online engagement and possible motives behind the achievement of these needs. Considering the needs as identified above by Porter et al, (2011, p.81), these also suggest some type of hierarchy of needs beginning with the most basic need, i.e. a search for information and ending with a status/influence need typical of a self-esteem need. The interactive

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Table 9. Online engagement needs

Identified Need	Online Engagement	Motive
Information	Search for specific information	Knowledge
Relationships	Seeking personal interactions	Collaboration
Self-identity	Individual self-expression	Entity
Helpfulness	Volunteering to help others	Achievement
Enjoyment	Rewarding experiences	Satisfaction
Belonging	Contributions respected	Affiliation
Status/influence	Informal local authority	Power
Source: Porter et al, (2011, p.81),	Source: Porter et al, (2011, p.81),	Theorists: Maslow, McClelland, McGuire

communication culture provides members with a sense of belonging, status and influence. Abraham Maslow with his Hierarchy of Needs theory proposed that human needs be arranged in a hierarchy from most concerning to least concerning. (Kotler et al, 2007, p.244)

Promoting Participation

The question that needs to be asked here is, "what makes customers continue to be engaged online"?

It's when they have enjoyable online experiences. They are having fun, being totally absorbed, feeling satisfied and are in control of their experience. The outcome has been positive one and the attitude is a favourable one. For franchise businesses and indeed any business, the key is to create enjoyable experiences with social media that users find extremely relevant to satisfying their needs. Part of this satisfaction is that they have also learned something they didn't know before. Social media techniques that can be adopted for promoting online participation can include encouraging content creation, cultivating new connections and creating 'fun' experiences. Through innovative participation ideas, users will instinctively customise their experiences by it being personal. (Porter, et al, 2011, p.91) An example of sharing a personal experience could be a user recording a video on how they used the business's product.

Motivating Cooperation

So what makes people want to tell other people, including potential customers about getting engaged online? This is about using social media to embed experiences online. The idea is it allows people to be empowered to invite people they know and trust to share in their experiences. From a business perspective, people will only want to do this if they feel a high sense of attachment and fit with the business, for example having a positive attitude about the business.

For a franchise business, such examples would be; a) as a 'v.i.p. member', having exclusive access to certain information and privileges that non-members wouldn't get; b) rewarding a customer for their enthusiasm and willingness through them exhibiting proactive behaviour, by asking them to cooperate in new product development (designing a new range of pizzas); c) being an advocate for the business by communicating the values and culture of the business to 'newbies' through forums and postings. With

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

them being an 'advocate' they would be additionally rewarded by the business. This technique is used to get people to stay loyal to a business. (Porter, et al, 2011, p.93)

Harridge-March and Quinton (2009, p.176) describe such level of engagement with social media as a ladder. Those consumers who wanted to observe the culture of a social network prior to engaging were described as 'lurkers'. Slightly higher up the ladder, those people who had just began posting their thoughts and comments were referred to as 'newbies' or 'tourists'. On the next rung are 'minglers', those people who irregularly and infrequently post. The top rung consists of a number of different groups. These include 'devotees', enthusiastic community members who regularly contribute who are also creating deeper social ties within the network. There are also the 'insiders', who other community members view as topic experts. They like to initiate online discussions and already have established their social community network connections. This group has also been described as 'celebrities'. Within this group is a sub-group of elite or 'lead members' otherwise described as 'evangelists' who have considerable influence and are highly activity with the social community.

Charlene Li of Forrester Research (forrester.typepad.com, 2007) when explaining their 'Social Technographics' report describes six levels of online social involvement. 'Social Technographics' refers to the analysis of people's social computing behaviour according to their levels of social engagement. At the bottom are the 'inactives', people who are not or presently not active using social media. A rung up is the 'spectators' or those people who read, watch and/or listen to other people's content, conversations or comments. On the third rung are the 'joiners', those people who actively use social networking websites. 'Collectors' are on the fourth level and these are people who are to use and absorb other peoples input. One rung up on the fifth level is the 'critics' who comment, rate and review. At the top of the ladder are the 'creators', those people who create and publish original content and materially input into social networking.

A simpler form of the social engagement ladder is the one proposed by Dr. Bryan Vartabedian. (33charts.com, 2012) His ladder consists of just four rungs. The bottom rung he describes as the 'observation' level where people watch other people's online conversations or content comments before getting involved themselves. The next rung up he refers to as the 'conversation level' where people have the ability to comment on or respond to other peoples input. As for his second highest rung, Dr. Vartabedian describes it as the 'curation' level where people collect and selectively share other peoples content input. The highest rung he explains is the 'creation' level where people develop, create and publish their own content for conversation or comment.

Lawrence Ang (2011) when discussing the concept of Community Relationship Management to reflect what people did in online communities, proposed a 4C's Model to describe four pillars of 'Social Media', these being 'Connectivity', 'Conversation', 'Content Creation' and 'Collaboration'.

'Community Relationship Management' (CoRM) is based on the premise that social media users are groups of people who share some common interest and are not specific business customers.

The first pillar, 'Connectivity', Ang (2011, p.34) believes is the key to social networking growth and sustainability. Essentially, 'Connectivity' encompasses the social media platforms that people use to 'connect' with each other online. Smart 'technologies', now allow people to further build on their social networks.

Online 'Conversation' is the second pillar and occurs through connectivity. Topics of conversation in an online community context typically relate to changes in peoples personal lives. In other words, for communication, it's about the change in exchange of information.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

There are people who like to be seen and heard online. This form of motivation fuels content creation in these people, generating what is described as user generated content. This is the third pillar, 'Content Creation'. Unique or quality content can often attract significant 'buzz'. Only between 5 – 10 percent though of people who use social media actually contribute content. 'Collaboration' is the fourth pillar and refers to multiple users contributing online to a project or cause. The four pillars described by Ang indicate different levels of social media usage which also suggests a ladder concept.

In 1999 Peck, Payne, Christopher and Clark outlined a customer relationship model in the form of a customer loyalty ladder. There are similarities between these levels of progression and the ones proposed for social media engagement. In describing each of the levels, a 'partner' is someone who has a well established relationship with a business. An 'advocate' is someone who actively recommends and markets the business to prospective customers. A 'client' is someone who likes the business and is happy to passively support the business. This level is sometimes referred to as a business 'supporter'. The next level is the 'repeat customer' which is someone who does business with an organisation on a regular basis whose attitude is primarily neutral towards the business. Below this level is the 'first-time customer' who is a once off purchaser. On the next level is the 'prospect' who is someone a business believes could be persuaded to purchase from the business. At the bottom of the ladder is the 'suspect' which is someone who is aware of the business but not necessarily about its products and services.

For business, modern marketing centres around how they can retain their most profitable customers. The loyalty ladder categorises customers by the relationship (or not) they have with a business. The aim for any business is to try and retain customers. This is achieved through Customer Relationship Management (CRM) and covers all aspects of the process from acquisition, through retention and expansion. (Kotler et al, 2007, p.49) Given the nature of social media and social networking in particular, it is important to see if any parallels exist between the levels of customer loyalty and how people engage online in a social networking context.

Table 10 is a comparison of the four social networking engagement ladders and how they might compare with the customer loyalty ladder strategy.

Table 10. Loyalty ladder comparison

Customer Loyalty	Social Network Contribution	Social Technographics	Social Engagement	4C's Model of CoRM
Partner	Evangelist, Celebrity/ Insider, Devotee			Collaborator
Advocate	Evangelist, Celebrity/ Insider, Devotee	Creator	Creator	Creator
Client	Mingler	Critic		
Repeat Customer	Mingler	Collector	Curator	
First-time Customer	Newby/Tourist	Joiner	Converser	Converser
Prospect	Lurker	Spectator	Observer	Connector
Suspect	Lurker	Inactive?

Hawkins and Vel (2013) highlight five key reviewing customer loyalty and social media drivers to customer loyalty, these being value (trust), satisfaction, high switching costs, delighting customers (emotional bonding), and large investment costs (Hawkins ibid, p.128) As social media is a 2 way communication tool, they believe for building relationships, it's use is technically feasible. Hawkins and Vel proposed that if social media contributed to just three of these key drivers (trust, satisfaction and emotional bonding), then there was the potential for building customer loyalty.

Trust involves showing equitability and fairness by delivering on promises that can be relied upon. This means using social media to create beneficial and consistent two-way exchanges over time. A business can achieve this through understanding personal preferences and ensuring a high level of personalisation to interactions and exchanges. (Hawkins ibid, p.137) As well, social media would need to have the ability in responding by addressing any negative comments (public relations issues) as well as address specific one-to-one communication issues.

To create satisfaction using social media, means delivering a series of satisfying encounters with consistency and reliability. (Hawkins ibid, p.136) Emotional bonding can be created through two-way exchanges over time with social media. The one-to-one personalised interactive communication needs to be based on behavioural details as well as preference information collected by the business. The tangible benefits as a result of being engaged with the business enhance such emotional bonding (Hawkins ibid, p.138). So how can communication satisfaction be embedded in the selling and sales process?

Social Media in the Sales Process

Businesses need to be aware how social media is evolving. Websites have changed to now learn about their customers and purchase behaviours, to then offer "value added recommendations. For example, when a person books an airline flight online, within minutes of receiving confirmation they will receive information about available accommodation at their intended destination. Websites such as Amazon have been providing this type of information for years. Social media is developing the same way. It will have the ability to affect all areas of a business's selling and sales management processes. Andjulis, Panagopolous, and Rapp (2012 p.307) believe that as businesses and customers transition to the latest technologies, their relationship demands escalate. With this escalation, businesses will need to adopt social media at every aspect of their sales process. Andjulis Panagopolous and Rapp (2012, p.307) outline what they believe will be the process evolution of social media within the sales process. It consists of set of phases as indicated in Table 11.

Table 11. Social media in sales process evolution

Phase	Social Media Engagement Level	Information Flow	Social Media Contribution	Sales Strategy Integration
1	SM presence established	Business-Customer	Nil	No ties to sales strategy
2	Active encouragement of customers and prospects to SM pages	Two-way	Nil	No ties to sales strategy
3	Considered an added or primary sales channel	Customer generated, two-way	Customer interaction	Transformation of sales strategy
4	Primary and secondary sales channel	Customer enacted and generated, two-way	Value co-creation Real-time pricing and service	SM engaged to facilitate organisational learning

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Table 11 lists these four phases and how they relate social media engagement, information flow, social media contribution and sales strategy integration. Each phase has an increase in the level of customer engagement. This will require success measures. Obviously success factors will differ from business to business, however it's critical important to understand the customer and what they value (i.e. ongoing brand equity, trust and goodwill).

According to Andjulis, Panagopolous, and Rapp (2012 p.310) some of the critical questions that need to be asked should include:

- *What does the customer get from the equation?*
- *Will the customer's favourable opinion of the firm business increase or decrease from the social media presence?*
- *Does the customer advocate the brand?*
- *Does the prospect get the information and positive reinforcement they need to make a decision about building a relationship with this business?*

Measuring the social media impact will require a rethink of metrics if actionable data is to be obtained for social media effort improvements. Interestingly the concept of social customer relationship management (SCRM) has been introduced in the literature and considers the process of integrating social media and traditional customer relationship management (CRM). This integration between social media and CRM allows for the use of customer-centric technologies to more easily monitor and track conversations because of the online environment. With these online tracking methods, businesses can identify key influencers with the virtual community. Once these people have been identified, they can be nurtured using their CRM's and customer-centric technologies to keep them engaged. (Ang, 2011 p.35)

Customer-Centric Technologies

The role of online users has evolved to include information sharing and creation. Users have been empowered to actively participate in content co-creation. Universal adoption of social media technologies has led to businesses cross-referencing this social data with their customer databases leading to the term "Social CRM". (Trainor 2012, p.317) Social CRM is defined as "the integration of traditional customer-facing activities including processes, systems, and technologies with emergent social media applications to engage customers in collaborative conversations and enhance customer relationships." (Trainor 2012, p.319) Trainor sums up social media technologies as being customer-centric (2012, p.321). Social CRM technologies are those processes, capabilities and social applications that provide the conduit for interaction between customers and their contacts. Improvements in these technologies have led to higher community connectivity expectations including with business contacts. (Trainor 2012, p.319) To understand the relationship between these social CRM technologies, their specific differences, and how they might evolve in the future, it's vital to be aware of their emphasis context.

Table 12 adapts the various social CRM technologies identified by Trainor (2012, p.320) with their relative emphasis. It depicts the area of emphasis for building loyalty and what technologies serve that purpose. Understanding the emphasis is vital for developing loyalty strategies in an online environment. Social CRM technologies provide the linkages to develop these strong relationships. These relationships are formed by those people who contribute online, i.e. through forums. It is this shared communication that underpins relationship marketing (Harridge-March et al, 2009 p. 175).

Table 12. Social CRM technology emphasis

Social CRM Technologies	Emphasis
Social networks	Customer Relationship
Interactive dialogue	Customer Communication
Customer oriented connecting business processes with external communities	Technology Use
Knowledge co-created through interaction between customer and business	Organisational Learning
Dual co-creation of customer experiences and innovation, collaborative support and service	Value Creation
Information created through customer interaction	Data Sources
Customer information integrated with customer-centric social applications	Information Processes

So where is this leading to with defining the role of social media as a contemporary local area marketing technique in Franchising? The next section of the chapter will propose a social engagement model that incorporates the identified concepts of LAM techniques, social media preferences and engagement levels, loyalty ladder, SCRM and customer-centric technologies.

PROPOSED SOCIAL MEDIA ENGAGEMENT MODEL

Each of the concepts discussed earlier in this chapter help provide a guideline for franchise businesses to consider when selecting and implementing their contemporary LAM techniques. As social media is essentially online interactive communication, for this approach to be meaningful, their LAM technique choices have to be customer-centric.

The proposed social media engagement model (Figure 1) is an adaptation and modification of previously discussed social media framework models Forrester Research (2007), Harridge-March and Quiton (2009), Lawrence Ang (2011) and Bryan Vartabedian (2012). The newness of this model is in its applicability to the franchise sector. As a guideline, the model provides a franchise business (or for that matter any business) an outline to their social media development. For first part of the model, the 'Social Networking Staircase' merges the research works of Forrester Research (2007), Harridge-March and Quiton (2009), Lawrence Ang (2011) and Bryan Vartabedian (2012) to standardise on a generic set of social networker categories, these being 'Lurker', 'Connector', 'Converser', 'Collector', 'Critic', 'Creator' and 'Collaborator'. These categories also compare similarly to those categories identified in the customer loyalty ladder developed by Peck, Payne, Christopher and Clark (1999) in terms of level of engagement. The second part of the model, the 'Sales Process Phases' integrates the concept of social media evolution as proposed by Andjulis, Panagopolous, and Rapp (2012). It portrays the phases businesses go through for their social media levels of engagement development.

Trainor (2012) informs the third component of the model, the 'SCRM Technology Emphasis' incorporating the work of where social media technologies can be used to improve business performance. Finally, the 'Customer Strategy Stages' brings context to the model through the alignment of the various customer strategy stages with the social media levels of engagement.

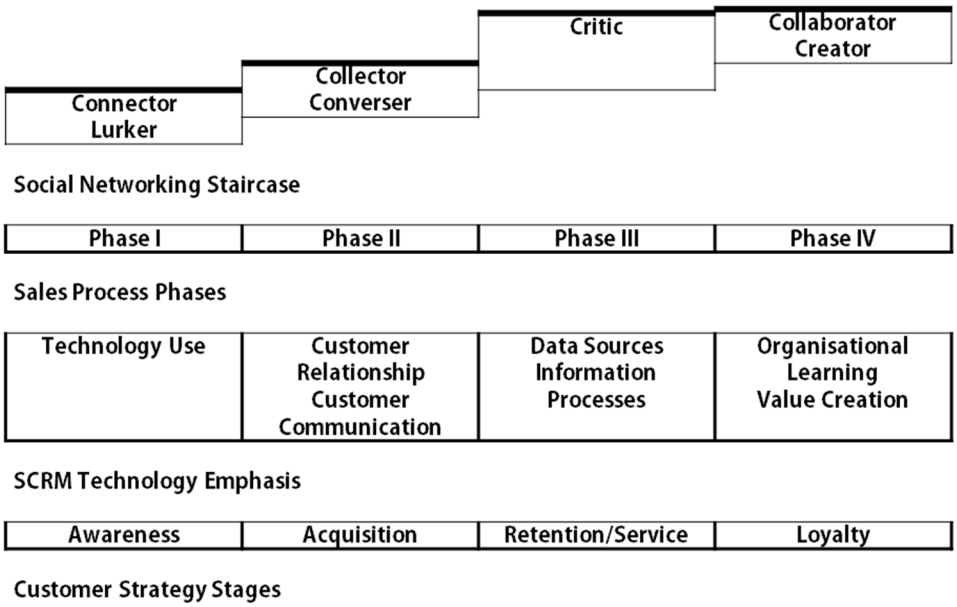
Figure 1. Proposed social media engagement model
Source: Webster and Hume, 2014



The model will provide the basis to identifying suitable contemporary LAM techniques for franchise businesses depending where they are in their adoption of social media as a sales and business process.

This model is a conceptualisation of the factors required to support the franchise sector. This conceptual model is to be subject of future research.

Contributions of This Model

As there is limited academic material on LAM and social media engagement techniques for franchise businesses, this study has been broad in its scope. It considered such aspects as the classification of franchises and how they could be categorised, LAM techniques and the distinction between traditional versus contemporary, the various aspects of social media including the areas of usage, engagement, benefits, sales process fit and connectivity with relationship management systems. A social media engagement model has been proposed that integrates levels of engagement, sales process phases, relationship management emphasis and customer strategy stages into a simple set of guidelines that a businesses can follow. A comparison between traditional and contemporary LAM techniques undertaken identified that traditional techniques related to use of traditional forms of media coming under the “

‘direct marketing banner’ whilst contemporary techniques related to ‘online’ direct marketing strategies. Even direct marketing has a strong emphasis on measurable outcomes, the research into social media as a contemporary LAM technique suggested confusion over how it could be measured. Expert opinion appeared to be divided over the matter. Contradictions were noted over the level of social media engagement amongst businesses and franchise businesses even though no specific reasons were identified. Research indicated that social media engagement techniques enhanced traditional methods, but the evidence on it’s successes in the business environment was spasmodic.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Undertaking this study has contributed to broadly defining the role of Social Media as a contemporary Local Area Marketing (LAM) technique. It also found knowledge gaps in the understanding of social media usage especially for small to medium size businesses. The Social Media Engagement Model (Webster and Hume, 2014) highlights the destined convergence of Social Media with Customer Loyalty through the integration of four separate concepts. It also reinforced the concept of reciprocity, in that the model provides direction on not only how business can connect with the online community but also equally how the online community can connect with business through interactive communication.

Limitations and Future Research Directions

There were several limitations that should be considered in reading this chapter. First, qualitative research was restricted to online website reviews of randomly selected franchise businesses as well as publicly available material including franchise industry, business industry survey reports and academic journals/ conference papers. Second, interviews with franchise owners and manager not conceivably possible due to end of year shutdowns for the holiday festive period.

Apart from these limitations, the model is in the conceptual model and will require validation in future research, in particular in contextual application in several franchise types. Investigation into the mapping contemporary LAM techniques to the proposed social media engagement model, exploring the link between size of business and level of social media engagement and undertaking an international study on social media platform preferences will all assist in validating the research and conceptualisation. International comparative studies and examination of franchise behaviour between countries and cultures will also be of value. . Considering emerging customer-centric oriented relationship management systems such as SCRM and CoRM and their emphasis on social media engagement will elaborate the understanding in this field. Finally, studying the newly developed Franchise Social Index (FSI) by Vende Social that bases how well franchise industry brands are performing on the social media sites Facebook and Twitter.

A website review was undertaken to determine online presence and level of social media engagement amongst thirty-eight randomly selected across four franchise business category types, management, retail, job and service with these results being compared against a franchise business study and a general business study. Two-thirds of franchise businesses reviewed with an online presence had vehicles for social media engagement. At least half of these social media engaged franchise businesses used at least three platforms. Only 25% of them however were actively encouraging social media engagement. These studies suggested that a hierarchy of social media platforms existed with Facebook being the most popular. The make-up of the rest of the hierarchy varied according to the different report findings. Research identified that the three most common purposes for social media engagement by business was; to communicate with clients, marketing and public relations. The two most common reasons given by businesses surveyed for not using social media were, that they considered it not to be relevant to their business, and because a lack of resources.

Research indicated that spending on LAM was around 1.5 – 3% on average. Online advertising spending research led to questions being raised over the cost justifications for contemporary LAM as well as the use of social media. The main issue was over engagement results being unable to be linked back to ROI. A social media engagement comparison was undertaken to derive a social engagement hierarchy. This mirrored the traditional customer loyalty ladder. As people transition to the latest technologies, so their online relationship demands increase. Businesses will have to integrate social media strategies into

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

their sales process in a more controlled way using step-by-step phases. Customer-centric technologies are being used to interface user generated social media data with relationship management systems.

Further research will need to be done to discuss the ongoing evolution of this area and the implications for business. A social media engagement model has been proposed that integrates four specific areas; 1) levels of social media engagement; 2) sales process phases; 3) relationship management technologies; and 4) customer strategy stages into a simple set of guidelines that can be adopted by businesses and franchise businesses alike.

This research has contributed to the discourse on the role of local area marketing techniques, social media and small business with an emphasis focus on franchise businesses in particular.

CONCLUSION

The following conclusions can be made from this study. There is no uniform approach in identifying franchise types. One study used the ANZSIC classification system whereas an international study categorised franchise businesses simply as 'retail' or 'service'. This study classified franchise types by the type of work being undertaken to operate the business as this was considered to be a more appropriate and relevant approach. However, there was no differentiation made between small, medium and large franchise business. Even though there is evidence of widespread population acceptance of social media, businesses appear to lack the competence and understanding to engage with communities that include potential and target customers with social media. The chapter identified that research into online presence expenditures including social media advertising for businesses suggest an upward cost trend and many small business raise the question about affordability for small and medium size businesses. This chapter shares research-in-progress in a field that warrants attention. The way social media is currently used is evolving and how communities engage through social media is also changing. Any future research into social media engagement should also consider such issues as business size, ROI contexts, mobile device patronage, and user motive preferences.

KEY TERMS AND DEFINITIONS

Community Relationship Management: Managing what people do in an online community, e.g. connect, converse, create and collaborate (4 C's).

Local Area Marketing: Marketing in a specific geographic regional location.

Local Marketing: A comprehensive plan to drive potential customers to bricks and mortar businesses.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Social CRM: The use of social media services, techniques and technologies by organisations to engage with their customers.

Social Media: The interaction between people where they create, share, discuss, modify and exchange user-generated content in virtual communities and networks.

Social Media Marketing: A form of internet marketing that uses social media networks and applications to spread brand awareness or promote particular products.

Social Media Monitoring: Where organisations watch social media networks for relevant mentions about their products, services or branding and respond accordingly.

Social Network: A collection of contacts, social interactions and personal relationships from connections with individuals.

Chapter 69
Social Media for Business Model Improvement

In Lee
Western Illinois University, USA

ABSTRACT

This chapter reviews some of the major business applications of social media and discusses how social media applications are used to support business model improvement. Social media offers business organizations an array of innovative ways to interact with their employees, customers, partners, and other stakeholders. Consumers have easy ways of interacting with companies and their employees in real time with various social media embedded devices. Managers are realizing that social media affects a wide spectrum of business activities from building product or brand awareness to after-sales services. Therefore, it is crucial for companies to analyze their social media applications, develop a plan to continually monitor their advancements, and quickly respond to the social media needs of customers. For practitioners, this chapter provides managerial guidelines for social media applications for business model improvement.

1. INTRODUCTION

Recently, the Web paradigm shifted from a business-centered focus to user-centered one. This paradigm shift has become known as "Web 2.0", coined by Tim O'Reilly in 2004 (O'Reilly, 2007). Web 2.0 refers to a website that has evolved beyond Web 1.0 and features user-created-content and online communities that allow website visitors to interact dynamically with the site. While technological distinctions between Web1.0 and Web 2.0 are often not clear in some areas, the social and technological environment for positive user participation and interactivity epitomizes Web 2.0.

Social media embodies the principles of Web 2.0 and is continuously evolving and offers business model improvement tools and support business processes, knowledge management, customer relationship management, and partner relationship management. Despite the lack of a comprehensive framework for the use of social media applications for business improvement, businesses are eager to use them. Managers are already active users of the various social media technologies such as social networks and blogs.

Managers are realizing that social media affects a wide spectrum of business activities from building product or brand awareness to after-sales services. For example, investing in social media applications will enhance relationships with customers and provide the opportunity to better understand the customer needs. Therefore, it is crucial for companies to analyze their social media applications, develop a plan to continually monitor their advancements, and quickly respond to the social media needs of customers.

The main purposes of this chapter are to explore emerging social media applications and to discuss social media applications for business model improvement. This study proceeds as follows: Section 2 presents a literature review on social media and business models. Section 3 explores social media applications for business model improvement. Section 4 discusses managerial guidelines for social media applications for business model improvement.

2. LITERATURE REVIEW

2.1 Types of Social Media Tools

Companies are beginning to capitalize on social media tools in a variety of ways. Many businesses integrate a variety of social media tools into their core business processes to achieve competitive advantage. Users contribute to the development of content through writing comments and recommendations on Google, Yahoo, and Facebook, submitting videos on YouTube, co-designing games like The Sims, creating avatars in virtual environments like Second Life, or developing open source codes for Linux. High-profile companies, from P&G to GM to IBM to Cisco, have all adopted social media tools, and exert to derive strong competitive advantages from it.

Many companies are expanding social media efforts to capture customer data and leverage it to generate instantaneous, custom-tailored customer experiences (Bughin et al., 2008). For example, Amazon uses data generated from site visitors in order to provide targeted product suggestions to other site visitors. For a potential purchaser who is interested in a certain product, Amazon lists products that other purchasers of the same product also looked at or may be interested in. Netflix aggregates and analyzes subscriber movie preferences in order to provide accurate online movie recommendations. Businesses can leverage social media technologies in order to dynamically collaborate with customers and partners in efforts to generate new design innovations (Brown, 2008). This section introduces five types of social media tools for businesses.

2.1.1 Social Networking Services

Many companies leverage social networking services (SNS) such as Facebook and Google+ to increase productivity in the workplace. SNS are web-based services that allow individuals to (1) construct a public or semi-public profile within a bounded system, (2) articulate a list of other users with whom they share a connection, and (3) view and traverse their list of connections and those made by others within the system (Boyd & Ellison, 2007). SNS facilitate recruiting and connecting potential contributors for distributed innovation processes. As recruiting tools, SNS enable recruiters to view the manner in which candidates behave in an online setting and the type of people they socialize with. Job seekers use SNS such as LinkedIn to network with professionals for internship and job opportunities. Companies can also use SNS to engage in direct market research and maintain a positive relationship with customers.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

LinkedIn's new service, Company Groups, allows a company's employees to participate in a single internal web forum where they can talk to one another, share ideas, and ask company-related questions.

2.1.2 Collaborative Platform

Collaborative platforms allow users to post, delete, or update contents via a web browser. Internal corporate wikis can be used as a collaborative platform tool to tap the expertise of a large group. For businesses, wikis serve as an excellent collaborative platform for collective intelligence and can facilitate innovations (Tapscott & Williams, 2007). For example, Nokia has been using internal wikis for engineers to solve product-design problems. Internal wikis are increasingly used by companies such as Adobe Systems, Amazon.com, Disney, Intel, Pixar, and Microsoft. External corporate wikis enable companies to have the opportunity to derive collaboration from the public that participates in wiki-based projects. By allowing consumers to contribute ideas revolving around the company's products, the company can not only develop a core consumer base, but can also create values for any consumer that can benefit from the collaborative works. Sun Microsystems' Sun Wikis is a directory of wiki spaces where contributors inside and outside of Sun Microsystems can share information with each other and contribute ideas to the wikis.

Social media has also led to collective intelligence. For example, prediction markets tools can help aggregate a vast amount of information from employees within organizations to better guide company actions. An example of this is the sales forecast at HP through prediction markets (Chen & Plott, 2002). HP pioneered prediction markets in sales forecasting and expanded it to several business units. HP is working towards a commercial launch of the implementation of it as a product. Procter & Gamble, through its 'Connect and Develop' platform opened to inputs from company alumni, current employees, and even customers, has successfully secured a large stream of new product innovations (Huston & Sakkab, 2006). While Procter & Gamble's best innovations had come from connecting ideas among employees, after analyzing the performance of a small number of products they had acquired from external sources, they realized that external connections could produce highly profitable innovations as well. Its 'Connect and Develop' platform taps into the creative ideas of innovators and others from the outside would.

2.1.3 Blogs

Blogs (short for weblogs) are online journals that are characterized by short entries and regular updates. Blogs are inherently flexible and can be used for a variety of purposes, ranging from posting personal opinions to corporate knowledge management initiatives and customer relationship management. Personal or public blog sites are used to host blogs and the posted messages can be distributed to other sites or readers via RSS (Really Simple Syndication). WordPress is a popular blog hosting site available to individuals and companies.

One of the most useful features of blogs is the functionality that allows readers to comment on each post often called an open thread. This feature enables readers to engage in an open dialogue for every post. The collective comments and links on blogs form a clustered network termed the blogosphere. A variety of public blogging services are available to individuals and companies. For example, Twitter is the most popular social networking and microblogging service firm. Members of Twitter post text-based messages of up to 140 characters displayed on the author's profile page and delivered to the author's subscribers who are known as followers.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

The publication of a blog enables the company to interact directly with consumers. Leading companies like Intel, IBM, P&G, Ford, and Cisco are all early adopters of corporate blogs. While the blog can be used for public relations, it can also be used to promote new products and receive consumer feedback to products and services. Senior management can also utilize internal and external blogs to make announcements and seek inputs from various stakeholders. Internal corporate blogs offer a communication channel for individual employees to express themselves, ask advices from colleagues, and discuss ideas with each other. Internal blog sites can be used as a knowledge repository to store key information, expert knowledge and experience, and as a connection point among employees.

2.1.4 Social Bookmarking

Social bookmarking is the process of adding, annotating, editing, and sharing bookmarks with others via social bookmarking websites. An empirical analysis of the complex dynamics of social bookmarking has shown that a consensus around stable distributions and shared vocabularies emerge, even in the absence of a centrally controlled vocabulary (Halpin et al., 2007). Companies are increasingly using bookmarking sites like Delicious, Reddit, Digg, and StumbleUpon to promote new products and services and also to save, organize, and remember the web pages users find interesting on the web. Social bookmarking utilizes tagging to collectively classify and find web pages. For example, at Digg, users can "tag" web pages, labeling their name, which in turn allows the company to catalog shared tags of users.

2.1.5 Media Sharing

Media sharing is a social media application that enables users to create, store, and share their multimedia files (photos, videos, sounds) with others. Media sharing websites allow users to upload their photos, videos, and sounds to the sites that can be accessed from anywhere via web browsers. There are the main two forms of media sharing sites: videos and photos. Instagram, Pinterest, and Flickr are popular photo-sharing sites. YouTube is a powerful video sharing site that companies can utilize to create their own video publication channel. YouTube also offers free analytics that can provide information on users' viewing habits and their demographics. YouTube has become the second largest search engine only next to Google since 2013.

2.2 Business Models

Mayo and Brown (1999) argue that a company should design key interdependent systems that create and sustain a competitive business. Many successful ventures have been created based on innovative business models that provide unique values to customers. A business model should be reasonably simple, logical, measurable, comprehensive, and operationally meaningful (Morris et al., 2005). In the literature, a business model is defined as a statement (Stewart & Zhao, 2000), a system of interdependent activities (Zott & Amit, 2010) an articulation (Teece, 2010), the organization (Timmers, 1999), a representation of management thinking and practice (Chararbaghi et al., 2003), and a method (Afuah & Tucci, 2003; Rappa, 2004).

A number of studies have presented the logically interrelated components of a business model. For example, Morris et al. (2005) suggest six fundamental components: value proposition, customer, internal processes/competencies, external positioning, economic model, and personal/investor factors. Johnson et

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

al. (2008) propose four interlocking elements: customer value proposition, profit formula, key resources, and key processes. Like the definition of the business model, there exists no general agreement on the required components of a business model. Table 1 summarizes various definitions and components of a business model developed by the prior studies.

In sum, all these definitions share a common idea: it concerns what is produced and sold, how, and to whom it is sold. How is the value of the product or service derived? To derive essential components among the business models, we categorized the various components into groups based on their underlying similarity and identified six major categories: value proposition, organizational governance, market scope, networked activities, resources, and sustainability.

Many previous studies analyzed the business model in a relatively static point of view. However, the static view has limitations in describing the evolutionary nature of the business model. Business model evolution is viewed as a fine-tuning process involving intended and emergent changes both between and within its core components (Demil & Lecocq, 2010). In the dynamic view of the business model, the business model transforms itself over time and manifests its evolution with the dynamic adjustment of

Table 1. Definitions and components of a business model

Study	Definition	Components
Timmers (1998)	An architecture for the product, service and information flows, including a description of the various business actors and their roles; a description of the potential benefits for the various business actors; a description of the sources of revenues.	Business actors and their roles, benefits, and sources of revenues
Amit & Zott (2001)	The content, structure, and governance of transactions designed so as to create value through the exploitation of business opportunities	The content, structure, and governance of transactions
Chesbrough & Rosenbloom (2002)	The business model is the heuristic logic that connects technical potential with the realization of economic value.	Value proposition, market segment, value chain structure, revenue generation and margins, position in the value network, and competitive strategy
Dubosson-Torbay, Osterwalder, & Pigneur (2002)	A business model is nothing else than the architecture of a firm and its network of partners for creating, marketing and delivering value and relationship capital to one or several segments of customers in order to generate profitable and sustainable revenue streams.	The products and services, the relationship capital, the infrastructure and the network of partners, and the financial aspects
Afuah & Tucci (2003)	The method by which a firm builds and uses its resources to offer its customers better value than its competitors and to make money doing so.	Customer value, scope, pricing, revenue sources, connected activities, implementation, capabilities, and sustainability
Morris et al. (2005)	A business model is a concise representation of how an interrelated set of decision variables in the areas of venture strategy, architecture, and economics are addressed to create sustainable competitive advantage in defined markets.	Value proposition, customer, internal processes/competencies, external positioning, economic model, and personal/investor factors
Shafer et al. (2005)	A business model is a representation of a firm's underlying core logic and strategic choices for creating and capturing value within a value network.	core logic and strategic choices for creating and capturing value
Johnson et al. (2008)	A business model consists of four interlocking elements that, taken together, create and deliver value.	Customer value proposition (CVP), profit formula, key resources, and key processes
Teece (2010)	A business model articulates the logic, the data and other evidence that support a value proposition for the customer, and a viable structure of revenues and costs for the enterprise delivering that value.	The design or architecture of value creation, delivery and capture mechanisms

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

the components in interaction with the environments. Different types of accumulated resources interact with each other and with other parts of the firm's infrastructure, thereby creating unique combinations that will vary within the firm, and which produce and determine the firm's idiosyncratic set of capabilities (Kor & Mahoney, 2000). With a new set of capabilities, the company can build new value propositions and tap new markets.

3. SOCIAL MEDIA FOR BUSINESS MODEL IMPROVEMENT

While there exists an abundance of studies on the classifications, theories, and operations of business models, little attention has been given to a social media's impact on the business model improvement. We identified the six logically related business model components categorized in the previous section: value proposition, organizational governance, market scope, networked activities, resources, and sustainability. Many companies utilize social media tools to strengthen their existing business models. Understanding how social media applications can improve the value of existing businesses is a prerequisite to successful social media development. Specifically, we discuss how social media can be used to improve each component of a business model. Various real-world examples are provided to illustrate the use of social media for business model improvement.

3.1 Value Proposition

Value proposition refers to a description of the customer problem and needs, the solution that addresses the problem and needs, and the value of this solution from the customer's perspective. Social media is changing the value proposition dynamics between the company and customers. Customer-centric social media enhances the company's ability to offer better valued products/services by engaging customers in the value creation process as well as in the value consumption process. The customers are equipped with various online social networking applications and investigative knowledge and tools about products and services. Furthermore, customers' expectations for better value of the products and services are ever increasing due to increased competition among sellers. In this business environment, sustaining any value proposition at a long term is a difficult task and listening to customers' changing needs is a necessity business activity.

To enhance value proposition to customers, companies began to use social networking services (SNS) in a variety of ways. First, SNS are used to solicit feedback on customers' product experiences and assess their preferences. By creating a social network with customers and seeking innovative ideas from customers about the company's products, a company can find ways to enhance the value proposition. Second, SNS connect employees with customers to provide customized value to individual customers. According to Lynch (2009), Texas Instruments (TI) noticed a problem in its customer service department in 2004, the main customers of which are engineers who buy and use some of the company's most technical products. To respond to customer questions more effectively, TI decided to build "E2E," which stands for engineers to engineers. Launched in 2008, E2E became a private social networking site where TI engineers interact with customer engineers. E2E proved to be a transparent portal where customer engineers and TI engineers could share best practices that help enhance TI's value proposition to customers. Opening the innovation process to final customers is a new variant of Open Innovation (Chesbrough,

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

2003) and is a potential source of value proposition. For example, Nokia hosts a corporate wiki forum where users are free to express their views about Nokia products. Nokia uses the ideas contributed by the users in developing their new value proposition which is a next generation product.

3.2 Organizational Governance

Governance is formally defined as "systems and processes that ensure the overall direction, effectiveness, supervision and accountability of an organization" (Cornforth, 2003). Organizational governance typically decides the size of the organization, the type of the organizational structure, and organizational policies. There is no one-size-fits-all type of governance structure. The members of the governance structure may include internal stakeholders such as staff and owners and external stakeholders such as community leaders and government officials. It is expected that governance structures evolve over time with changing environments.

Social media is increasingly recognized as an essential tool for governance by the senior members of an organization. According to a 2012 IBM study of over 1,700 CEOs in 64 countries, CEOs see social media as a tool for collaboration and relationship-building in the service of innovation and the creative exchange of ideas. The senior management's responsibility is to ensure that its company develops a comprehensive social media strategy and policies. The senior management needs to raise the right questions concerning the company's approach to the issue, test management's assumptions, and ensure that management creates and implements an effective social media strategy, policies, and practices (Chaher & Spellman, 2013).

According to 2012 Social Media Survey conducted by Stanford University's Rock Center for Corporate Governance in conjunction with The Conference Board (Larcker et al., 2012), nearly two-thirds of respondents (65%) of the executives and board members use social media for personal purposes, and 63% for business purposes. Of those who use social media, 80% have a LinkedIn account and 68% have a Facebook account, indicating top managers are familiar with social media. However, only 24% of senior managers and 8% of directors receive reports containing summary information and metrics from social media. These results show that more proactive roles are still required at the top management.

The executives and board members set the overall tone for social media development. Since social media is widely used for business and communication activities of the individual employees, it becomes important for the executives and board members to build clear and transparent guidelines to encourage creative and productive use of social media. They needs to analyze any major incidents involving publicly disseminated complaints, allegations or other negative comments about the company, as these increasingly appear to have an impact on corporate value (Katz & McIntosh, 2013).

3.3 Market Scope

Market scope determines specific market segments for the products or services that have appealing value propositions to the target groups. The market scope will be determined by a number of factors such as the particular social mission, needs of the market, competition in the market, and human and financial resources. A precise market segmentation study can be conducted by geography (e.g., cities, states, regions, and counties), demographics (e.g., age, income, gender, family size, occupation, education, and ethnicity), and psychographics (e.g., lifestyles, beliefs, values, interest, activities, and attitude).

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

SNS can be used in a variety of ways to promote products and services in the target market. For example, Coca-Cola developed a section called MyCoke at the virtual world There.com. This section features large promotional displays, Coke-branded virtual clothing, and activities for consumers (Nasco et al., 2010). Procter and Gamble launched a "My Talking Stain Tide Commercial Contest" inviting consumers to create new ads for their product. McDonalds uses Twitter to offer giveaways such as T-shirts in an effort to market their fast foods. McDonalds also uses Twitter in order to communicate with customers. All these social media activities help the companies reach target customers effectively.

3.4 Networked Activities

A corporate value network is concerned about improvement of any network activities among suppliers, manufacturers, distributors, and retailers that add value to products/services. The significance and weight of value network partners are measured based on the magnitude of their value addition to products/services in different stages towards the final products. That is, the higher value the partner generates, the greater the role that partner plays in the network. The high-value partner needs special attention in value network management.

The difficulty of managing networked activity lies in the fact that it is heavily focused on the external processes, while having little visibility and/or control of these external processes. Social media enables value network partners to share information in a timely, interactive, and visible manner. Therefore, the process visibility increases and network process control is better managed. Furthermore, social media is more human-centric than traditional applications. Social media adds a human element to the technical network activities by engaging employees in multiple businesses in a more interactive manner. A company-owned private blog site enables the company to interact directly with partners, enhancing the power of the human element in the processes.

Social media enables companies to extend their boundaries. For example, Groupon is partnering with multiple merchant reputation sites such as Yelp and TripAdvisor. By expanding the networked activities with the strategic partners this way, their sales potentials increase significantly. Social media also brings small and medium-sized enterprises into the value network, which otherwise would not have been possible without social media. Easy-to-access social media tools lowered technological and resource barriers for many small and medium-sized enterprises, and their activities in the value network have become more visible. The visibility of global network activities is also more enhanced as social media enhances global communications and information sharing.

3.5 Resources

This component provides a conceptually grounded framework for assessing sustainable and developmental resources, and enables these resources to be examined in terms of the opportunities and threats for establishing sustainable competitive advantages. From a resource-based view, every firm has a unique set of resources that the firm can leverage to exploit opportunities and counter threats (Wernerfelt, 1984). Since not all resources are equal in creating sustainable competitive advantages, many researchers focused on identifying advantage-creating resources. Barney (1986, 1991) suggested that the advantage-creating resources must be firm-specific, rare, and difficult to imitate. In a changing environment, a company

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

must continuously invent and upgrade their resources if they are to maintain a competitive advantage and growth.

Social media helps develop financial, technical, and operational resources in organizations. Social media facilitates creating, storing, refining, and sharing informational resources. Knowledge management, training, ERP, research and development, and human resources are areas where social media applications can be used to enhance various resources. Senior management needs to use social media to empower employees. Social networking services are used to support recruiting activities and connect potential contributors for distributed innovation processes (Cash et al., 2008). For example, social media is involved in the co-creation of new products with customers. According to Bughin et al. (2008), one in ten participants in the online community Second Life are already involved in co-creating with companies in different ways (testing prototypes or participating in design of new products), and 60% of the participants in this community say that they are willing to experiment with co-creation.

3.6 Sustainability

Sustainability is concerned with the development of the ways a company can gain a sustainable competitive advantage in the market. This component lays a ground work for how a company will attempt to develop a sustainable competitive advantage and use it to improve its competitive position in the market. Since 2010, sustainability has been widely implemented in businesses due to increased environmental awareness. Sustainability is becoming an integral part of a business model in a drive to achieve long-term corporate growth and profitability and fulfill environmental and social responsibilities at the same time.

Businesses have embraced social media for their sustainability initiatives and it is likely that more businesses will incorporate social media into their sustainability initiatives. Social networking services and blogs have already been used to promote corporate sustainability to their employees and solicit ideas from outside. For example, IBM's Smarter Planet is a website devoted to communicating its sustainability initiatives. General Electric is using social media to find innovative solutions to sustainability dilemmas. Starbucks brought its BetaCup Challenge to a website that crowdsources ideas from the public in order to find a sustainable solution to the coffee cup.

Social media is often used by consumers to speak out against business practices and the speed of information dissemination in social media is stupendous. Businesses that ignore their social responsibility can quickly become a target of the Consumer Watchdog. In April, 2012, to protest the hike of healthcare rates in California, supporters of Consumer Watchdog used Facebook and blogs to sign the petition to demand the justification of health care rates. It is now imperative for manufacturers of environmentally hazardous materials to keeping track of social media sites to monitor consumers' uptake on social and environmental issues.

4. GUIDELINES FOR SOCIAL MEDIA APPLICATIONS FOR BUSINESS MODEL IMPROVEMENT

Based on the survey of social media practices, this section presents guidelines for social media implementation to achieve business model improvement.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

4.1 Social Media Should Not Just Be a Part of Marketing Strategy, but a Part of an Enterprise-Wide Business and IT Strategy

It should be noted that social media affect the entire spectrum of business functions beyond just marketing. Social media is an integral part of IT strategy as well as marketing strategy. Lederer and Mendelow (1989) suggest that alignment of IT with strategy increases the likelihood of developing systems more critical to the organization. As the role of IT in business strategy development increases, the alignment will lead to a more competitive and profitable organization (Galliers, 1991). To enhance the potential benefits of social media, it is critical to analyze the impacts of social media on the entire organization and develop a coherent set of unique applications for their business strategy, since there is no uniform set of social media applications to all businesses.

4.2 Develop a Change Management Plan

Managing organizational change is a difficult task, but essential to make a new social media implementation successful. There is a chance to fail in the social media endeavors if not carefully developed and managed. Skepticism exists as to how social media for businesses can truly be exploited, either because the technology is too complex, or because major organizational bottlenecks of hierarchy and control exist (Davenport, 2007). High profile cases of failures of social media adoption exist. For example, Cambrian House failed in its crowdsourcing model. While operating a fully open architecture for collaboration, no one in the company had taken the full responsibility for idea development, leading to limited business development opportunities. This case shows the importance of communication and employee participation in the social media projects.

To facilitate the change management process, a company needs to appoint managers who can champion social media initiatives, to gain senior management support, to set achievable social media goals, and to communicate the change management to employees. The establishment of an appropriate change management program will minimize the failure rates or disappointing performance of social media adoption. In addition, investments in staff training are necessary to develop the competence of employees. It is generally assumed that training leads to improved competence. In addition, an appropriate work load assessment needs to be conducted in order not to burden employees in using and managing job-related social media applications.

4.3 A Well-Planned Enterprise-Wide Social Media Architecture Needs to Be Established for Content Development and Management

As social media becomes part of business strategy, companies are being challenged to support a variety of high-volume bandwidth-intensive social media applications. For companies, the architecture needs to address which media to use, how often to monitor and audit them, what contents, and who are the creators and consumers of the contents (e.g., employee or customers, potential customers, or general public). Companies need to redesign their website to improve the usability, aesthetics, and interactivity (Constantinides, 2004), and develop mechanisms to seamlessly integrate social media into existing business processes.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

4.4 A Well-Planned Social Media Metric Needs to Be Established for Performance Measurement

Many companies integrate social media into their business operations, but ignore the use of social media metrics to measure the performance. It is imperative to identify key performance metrics, establish the target values, and generate periodic performance reports. It is also important to prioritize key performance metrics. In order to establish target performance of various social media applications, competitors' performance metrics can be benchmarked. Key performance metrics include the number of social connections and followers, the number of reviews and review scores for products, the number of posts and reposts at blogs, the number of comments, response time to comments, social media development costs, and conversion rates (e.g., email subscriptions, and downloads).

4.5 Maintain Security Standards and Control Content Exposure

In seeking to gain value from social media endeavors, companies must be aware of the risks associated with these technologies. While social media inherently connects employees within the company and may connect the company to outsiders, companies must maintain tight security standards in order to prevent unauthorized access or the spread of harmful computer viruses (Dinger & Grover, 2010). Companies need to be aware of the data security issues, legal issues related to unintended disclosure of company data, and privacy issues. Recently, the US Securities and Exchange Commission (SEC) said it may file a law suit against Netflix and its CEO Reed Hastings over a post the CEO made on Facebook in July, 2012. In July, Mr. Hastings posted three lines stating that "Netflix monthly viewing exceeded 1 billion hours for the first time ever in June." This post raised the issue of whether it was privately disclosed information or not. Some claim that the SEC is in essence saying that Facebook is not a "public" website. SEC's Regulation FD, adopted in 2000, requires public companies to make full and fair public disclosure of material non-public information. The SEC believed that figure was material information that should have been disclosed in a press release or regulatory filing. This case illustrates the potential legal ramification of content posted on the social networking sites. In order to encourage proper access and usage of social media applications, companies need to establish social media security and usage policies and requires users to understand them.

KEY TERMS AND DEFINITIONS

Business Model: A decision-making framework for developing logically coherent activities to support value creation and formulating strategies to sustain competitive advantages.

Governance: Systems and processes that ensure the overall direction, effectiveness, supervision and accountability of an organization.

Media Sharing: A social media application that enables users to create, store, and share their multimedia files (photos, videos, sounds) with others.

Social Bookmarking: The process of adding, annotating, editing, and sharing bookmarks with others.

Sustainability: The development of the ways a company can gain a sustainable competitive advantage in the market.

Value Proposition: A description of the customer problem and needs, the solution that addresses the problem and needs, and the value of this solution from the customer's perspective.

This research was previously published in Integrating Social Media into Business Practice, Applications, Management, and Models edited by In Lee, pages 276-289, copyright year 2014 by Business Science Reference (an imprint of IGI Global).

Chapter 70
Organizational Memory:
The Role of Business Intelligence to Leverage the Application of Collective Knowledge

Isabel Ramos
University of Minho, Portugal

Jorge Oliveira e Sá
University of Minho, Portugal

ABSTRACT

Nowadays, the major challenge to organizations managers is that they must make appropriate decisions in a turbulent environment while it is hard to recognize whether information is good or bad, because actions resulting from wrong decisions may place the organization at risk of survival. That is why organizations managers try to avoid making wrong decisions. In order to improve this, managers should use collective knowledge and experiences shared through Organizational Memory (OM) effectively to reduce the rate of unsuccessful decision making. In this sense, Business Intelligence (BI) tools allow managers to improve the effectiveness of decision making and problem solving. In the light of these motivations, the aim of this chapter is to comprehend the role of BI systems in supporting OM effectively in the real context of a crowdsourcing academic initiative called CrowdUM.

INTRODUCTION

Managers are facing a huge challenge of making right decisions in face of turbulent social and economic conditions. Sudden changes in markets, together with the production of big amounts of information inside and outside the organization, make the task of selecting and evaluating information quality hard. Nevertheless, decisions have to be made and the resulting actions will lead the organization to be in a thriving or declining market position (Barrows & Neely, 2012; The Economist, 2009).

Walsh and Ungson (1991) have proposed one of the first models to conceptualize how knowledge that supports organizational decisions is created and shared. According to these researchers, knowledge is stored in organizational bins forming a shared memory called Organizational Memory (OM). The model focuses on locations and contents. Information for decision-making is then stored as:

1. Experience in individuals;
2. Shared experience in culture;
3. Integrated sets of practices guiding transformation of inputs into outputs;
4. Structural configurations connecting formal roles played by individuals; and
5. Physical arrangements of workplace.

These bins, together with information stored in computer-based repositories, shape the kind of decisions organizational agents can make.

OM concept has evolved to account the distributed and reconstructive characteristics of shared memories. Morgeson and Hofmann (1999) proposed a functional view of OM in which the structure of OM evolves by continued interactions between organization members supported by memory artifacts. OM structure is usually linked with interactions, roles, tools, units of memory (individuals and groups), forming a web of resources, processes and connections able to hold past experience and bring it to present organizational activities. Organizational interactions are embedded in processes of probing and sense-making that result in recall past experiences. To support them, OM must display certain functions including:

1. Adaptation;
2. Goal attainment;
3. Integration; and
4. Pattern maintenance.

Other authors have worked the integrative albeit distributed nature of OM (Kruse, 2003; Feldman & Feldman, 2006; Rowlinson et al., 2010; Schwarz, 2007). This social constructionist view of OM addresses the subjective experience of remembering. The view posits that humans and organizations reconstruct past experience from records and recreate it to deal effectively with present conditions that may be very different from past events. This is not seen as a problem to be avoided but as a core characteristic that enables development of creative solutions for new problems.

OM is the root of collective intelligence (Malone et al., 2010). Collective intelligence in organizations represents: process that will articulate and optimize individual performance (the source of expertise and agents who convey the mission); formal and informal networks; methods of communication; norms; and cultural artifacts. Organizational intelligence is the collective ability to mobilize knowledge of organizational interior and environment to create and make favorable decisions as well as to promote innovation (Boder, 2006).

In this context, Information Systems appear as connectors and supporters of the meaning processors in organizations (humans) operating in specific cultural and political contexts (Stein & Zwass, 1995; Cegarra-Navarro & Sánchez-Polo, 2011).

Business Intelligence (BI) is one of the technologies developed to help decision makers elicit meaning from huge amounts of information to which they have access. BI is an architectural, managerial concept

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

and a set of tools that allow creation and maintenance of a large database, retrieval of information, and the use of information to make effective decisions (Timothy et al., 2009; Turban et al., 2010; Chaudhuri et al., 2011).

This chapter focuses on the role of BI systems to support OM and is an attempt to answer the following question: Can BI systems improve OM to achieve Organizational Intelligence?

To answer this question, this chapter will be structured into three sections:

- **Section 1:** Presents concepts about OM and OM Information Systems (OMIS);
- **Section 2:** Describe concepts about BI, BI for OMIS, and BI architecture to support OM / OMIS; and
- **Section 3:** Presents a description of integration BI with OM in a real context initiative of crowdsourcing called CrowdUM.

Finally, conclusions are presented.

ORGANIZATIONAL MEMORY

OM concept has been developed for several decades, with contributions from various disciplines, such as Psychology, Sociology, Organizational Behavior and Information Systems (Argote, 2013; Casey & Olivera, 2011; Hodgkinson & Healey, 2008). The objective of this section is to describe this evolution and relating it to the evolution on conceptualizations of OMIS.

OM concept emerged out of the notion that organizations need to use past and present knowledge in collective and individual decisions and actions, and also to do projections to future. To do this, organizations need to preserve present knowledge and to identify gaps that must be addressed through learning (Kransdorff, 1998).

One of the first widely accepted OM conceptualizations is described in Walsh and Ungson's (1991) model. Their model synthesizes many of the previous scientific insights developed about how organizations store and retrieve knowledge. OM is viewed as an aggregate of information useful for decision-making and is stored in organizational bins. This is, therefore, a static conception of shared memory that focuses on locations and contents. Information for decision-making is then stored as: experience in individuals; shared experience in culture; integrated sets of practices guiding transformation of inputs into outputs; structural configurations connecting formal roles played by individuals; and physical arrangements of the workplace. The goal of the Walsh and Ungson's model is to present a comprehensive conceptualization of OM together with guidelines for developing empirical research.

The Walsh and Ungson's model came to support the research efforts in Information Systems field (Nevo & Wand, 2005). The basic idea is that information technology can be used to create a uniform, complete, consistent, up-to-date and integrated pool of knowledge that can then be made available for decision processes at all levels of the organization, this is denominated OMIS.

OMIS started as large databases of complex information and have evolved to more distributed systems developed according the principles of Transactive Memory Systems (TMS) (Brandon & Holligshead, 2004; Lewis et al., 2005; Lewis & Herndon, 2011). In this latter approach, Information Systems is a tool to link repositories of information to individuals seen as repositories of knowledge, and in this way interconnecting distributed repositories across an organization into an integrated memory system. TMS focus structural aspects of OM and ignores cultural and political dimensions of OM. In both approaches,

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

OMIS are extensions of human abilities to capture, represent, communicate and maintain knowledge. OMIS is a framework to define processes of acquisition, retention, maintenance, and search & retrieval knowledge in a faster and more accurate way.

Recognizing limitations of static view of OM that the described approaches endorse, the concept has progressed to include dynamic features. Morgeson and Hofmann (1999) proposed that the structure of OM is defined by continued interactions between members of an organization, supported by memory artifacts. The OM structure is usually linked with interactions, roles, tools, units of memory (individuals and groups), forming a web of resources, processes and connections able to hold past experience and bring it to present organizational activities. The organizational interactions are embedded in processes of probing and sense making that result in the recall of past experience. To support them, OM must display certain functions including: adaptation, goal attainment, integration, and pattern maintenance.

This view of OM as having structures and functions, brings in the notion that OM should be seen as a process that enacts memory contents distributed inside and even outside organizational environment. This view is an extension to OMIS concepts and frameworks. The focus is no longer on storing and retrieving large amounts of information but also on supporting interactions, making them easier as well as informing and supporting by automatic feedback.

Authors working in this more recent view of OM tend to focus on political, communicative, and cultural dimensions of the organizational remembering, as well as the (re)constructive activities by which organizational members give rise to organizational identity (Hirst & Manier, 2008). OM is conceptualized as being present in all activities of the organization and with different levels of influence (Assmann & Czaplicka, 1995; Barnier et al., 2008; Hirst & Manier, 2008; Ricoeur, 2004; Halbwachs, 1992). It integrates resources, practices and technologies that are necessary for organizational actors to understand their activities, the business that renders those activities meaningful and the organization's role in markets where it operates. The process of remembering becomes more important than the content handled in this process.

OMIS are required to retrieve structured and non-structured data, processing it into meaningful ways to the user and bring the results in highly readable formats such as data visualizations. OMIS should support the quick understanding of situations, promote the construction of scenarios, enable integration of different users' manipulations and contributions, all of this to support collective intelligence required to solve complex problems and develop innovative practices (Malone et al., 2010).

INTEGRATION OF BUSINESS INTELLIGENCE WITH ORGANIZATIONAL MEMORY

The term BI was firstly used by Luhn (1958). Dresner of the Gartner Group in 1989 coined and promoted a definition of BI as an umbrella term to describe concepts and methods to improve business decision making by using fact-based support systems (Power, 2007).

BI functions focus mainly on using intelligent information technology tools to support organizational members to making better and faster decisions (Cody et al., 2002). The purpose of these systems is to improve the availability and quality of complex information for decision including strategic decision.

BI tools not only enable managing a large amount of documents within multidimensional views over extended time-frames, e.g., Extraction, Transforming and Loading (ETL), Data Warehousing (DW), Online Analytical Processing (OLAP) cubes, but also facilitate searching and sharing past information among

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

organizational members to support solving new problems or tasks using OLAP and Query-by-Example (QbE) tools and discovering knowledge by analyzing data from different perspectives and summarizing it into useful information by using Data Mining (DM) algorithms. BI tools support the creation of insightful information from stored data. In this way BI tools improve the ability of an organization to remember its past and make sense of its future. This is the main role of memory, namely the OM.

Using DM algorithms such as classifier and clustering DM algorithms, organizational members may function as meaning "processors" of organizational network intelligence. This presents a high potential of classification and mapping suitable information (e.g., documents, projects, comments, feedback) into relevant groups and participants inside organization, for example by using DM's classifier algorithms an organization can provide intelligent solutions for finding and mapping relevant information to suitable users. Users can then integrate that information with their personal information and their past behaviors that have been captured from social network (e.g., Facebook or Twitter) in order to create a deep understanding of how knowledge is created inside organization and how its members nurture internal and external relations.

The BI system can play an important role in supporting a large scale OM functions, which spread from knowledge Acquisition, Retention and Maintenance functions to Search & Retrieval functions. It should be noted that when mentioning the role of BI tools, we are referring the process of storing information, the production of more complex information for decision support and the monitoring of changes in stored information.

Information is the foundation of knowledge creation and Humans when working in organizations produce organizational knowledge with the goal to share it and institutionalize it in organizational routines. OM emerges from this continuous interplay between information and knowledge enabled by using technological tools that mediate action, interaction, co-creation of meaning and decision making in organizations. From this point on, all of those technological tools will be called OMIS and OMIS includes BI tools.

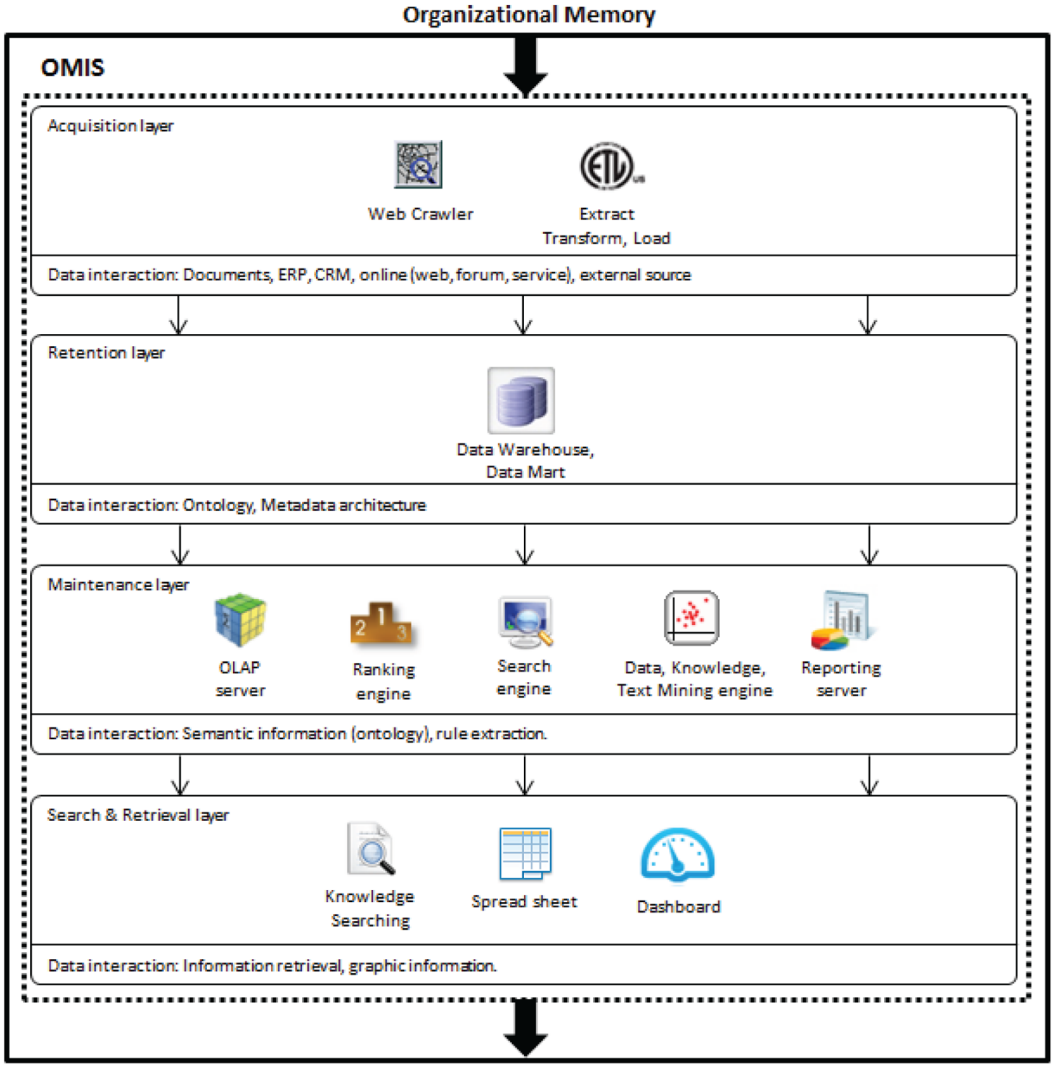
The architecture model, see Figure 1, which is called the BI to OMIS integrated model, is a combination of relevant tools of BI system envisaged as an OMIS component in order to support OM by improving knowledge sharing and effective decision making.

The main BI tools that are used in this proposal will be classified into four layers. These layers correspond to the four main functions of the mnemonic layer of OMIS framework. Consequently, the descriptions about BI tools for each layer of the BI to OMIS integrated model will be described as follow:

- **Acquisition Layer:** Plays an important role in capturing and adapting data as well as information from many resources within OM. There are two tools to enhance acquisition: *Web Crawler* - collects data from web sources such as forums, web sites, online services, etc. Hence, web crawler is an appropriate tool to integrate web data and search relevant information about competitors, customers' trend, and markets segment; *ETL* - extracts, transforms, and loads data from many data sources and classifies, normalizes, and loads data into an organizational repository (e.g., Operational Data Store, DW, data mart) based on defined structures (e.g., meta-data, ontology structures).
- **Retention Layer:** This layer has the responsibility of managing the capability of organizational repository. Thus, this layer mainly focuses on database tools. Moreover, one of the main problems of retention is to store a large historical data over many years. DW and Data Mart are compatible repositories to manage organizational historical data.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 1. Framework BI to OMIS integrated model



- **Maintenance Layer:** In this layer, BI tools will be adapted to enhance, analysis, and classification of stored data, which are stored in organizational repositories such as DW. Like a metaphor of intelligent engine for BI to OMIS integrated model, this layer includes five components of BI system to help the maintenance of information and knowledge in an effective way: *OLAP server* - this allows users to interact with DW. Consequently, information might be filtered, aggregated, and drill-down through multidimensional views. This also allows users to reorganize and calculate massive historical data quickly based on OLAP cubes functions. Users could use OLAP cubes to create their own star schema in various dimensions to speed up the retrieval and query processing from large amounts of data stored in OMIS. *Ranking engine* - this is a database tool to enhance search engine retrieval performance (Fan et al., 2005). Through the ranking function research, authors concluded that "the retrieval performance of these newly discovered ranking functions has been found to be superior to the performance obtained by well-known ranking strategies in

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

the information retrieval literature." In general, the ranking in BI-OMIS system can be assessed by all members of an organization to refine the usefulness of past information stored in the OMIS. *Search engine* - this function supports employees to search past knowledge. Based on structured data stored in knowledge repositories such as: email searching, document searching, task searching, and best practices finding. Moreover, this function also allows users to retrieve history of data modified via the time line of the document. Thus, this is an effective method to help users to retrieve past knowledge throughout highlight new updated contents, as well as identifying who performed the document. *Reporting server* **-** provides suitable mechanisms that enable definition, efficient execution and rendering of reports (Chaudhuri et al., 2011). Allows managers to export information from an OLAP cube in dynamic forms or templates, which will facilitate operations of managers in creating, modifying, and presenting a number of reports such as balance sheet, product reviews, or annual financial report without requiring extensive database knowledge. *Data Mining and Text Mining engine* **–** enable to analyze complex and unstructured problems such as classification, knowledge learning, problem solving, heuristics, etc. Mining methods use algorithms to deduce and propose new knowledge beyond what were saved in DW and OLAP. In addition, data mining engines provide ability for OMIS to forecast new knowledge relies on intensive analysis and synthesis historical data. Text analytic engines helps understand large amounts of text-data contained in organization's documents like business contracts, customer information, annual reports, customer reports, etc. Most popular functions of text mining are to (Turban et al., 2010, p. 289):

  - **Information Extraction:** Identifying key phrases and relationships of text;
  - **Topic Tracking:** Predicting relevant documents based on user's profile;
  - **Summarization:** Proposing the main content;
  - Categorization;
  - **Clustering:** Grouping similar documents;
  - Concept Linking; and
  - Question answering.

- **Search and Retrieval Layer:** This layer is composed by user interface methods to create an interactive channel. User can operate with all functions in the third layer of the BI-OMIS model via these components. This layer includes the following tools: *Knowledge searching*- this improves the basic search by using e.g., rules and case based reasoning. It gives to the user a friendly interface with search fields and conditions to help users find out the most appropriate information for solving problems. *Spreadsheet* **–** this is still a useful environment for users to manipulate analytic data (OLAP) and allow users to retrieve data quickly from various dimensions and present it in a drill-down view. *Dashboard* - gives a graphical interface for indicating Key Performance Indicators (KPI's) for OMIS. In addition, dashboard enables decision makers to keep track of the current status of organizational environment with a simple visual view.

BI WITH OM IN A CROWDSOURCING INITIATIVE: CROUDUM

In recent decades, the Internet gradually is becoming the organization's backbone, not only connecting people closely throughout time and locations, but also keeping our workers up to date by immediately sharing their own information.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

With the main objective to use internet advantages, appears the idea to connect online community of people, denominated a crowd network, with requesters of services, ideas, or contents in the purpose to enhance the working performance, as well as gaining more profits for participants in the crowd.

The term 'crowdsourcing' is derived from the business area to indicate the process of connecting a large crowd together via Internet, then allows seekers to address large projects by using crowd's creativity and talent. For this reason, these projects usually require a large amount of people who have a moderate ability such as students, normal employees, or local residents all over the world.

In a definition, Howe (2006) concluded that "crowdsourcing is the act of taking a job traditionally performed by a designated agent and outsourcing it to an undefined, generally large group of people in the form of an open call." This definition focuses on discriminating traditional job from the crowdsourcing. The author emphasized the role of large groups in selecting jobs through the open call instead of dealing with specific customer directly. As a result, crowdsourcing could create solutions more quickly and cheaply than traditional methods.

Throughout the evolving time of crowdsourcing as well as based on the purpose of each crowdsourcing group, the crowd is often classified into six categories (Bell, 2009; Brabham, 2013) as follows (examples presented are better explained at Additional Reading Section):

- **Crowd Wisdom:** Crowd wisdom focuses on collecting innovations via asking the crowd, inside and also outside the company, to solve problems, forecast future, or propose a strategy for a specific environment. Then, the best solution is selected. In this way, simExchange, Iowa Elections Market, and Hollywood Stock Exchange are examples of crowd wisdom.
- **Crowd Creation:** Crowd creation has a little bit difference from crowd wisdom. In this purpose the crowd and requester have to work together to co-create new information/knowledge. For example: NASA's Clickworkers and InnoCentive.
- **Crowd Voting:** Voting is a method of inquiry opinions of the crowd to collect their ideologies about designs, campaigns, and trends of a product, technology or something else. The result supports company to modify products before they turn to bulk production. For example: American Idol and Threadless T-shirt company.
- **Crowd Funding:** The crowd funding main objective is to aggregate a group of shareholders, who will build up the funding of projects or creation of assets. The outcome and responsibility of the crowd in this type of crowdsourcing is higher and more important than other types of crowdsourcing. For example: Kiva and Sellaband companies.
- **Crowd Democracy:** This kind of crowd mainly focuses on participants who give decisions of local, regional and national governments.
- **Crowd Review:** Crowd review pays attention to available objects such as products, services, or events from requesters (e.g., companies or manufacturers). The crowd shares reviewers' information about their activities while using it, for example: while visiting a monument, while eating at a restaurant, while watching a film, or while trying a service. These reviews then support companies in having a better understanding about the quality of their products.

Crowdsourcing has advantages in various areas based on the potential of crowd that could reduce the cost and time in solving problems. On the other hand, the crowdsourcing shows several pitfalls that prevent the expansion of crowdsourcing:

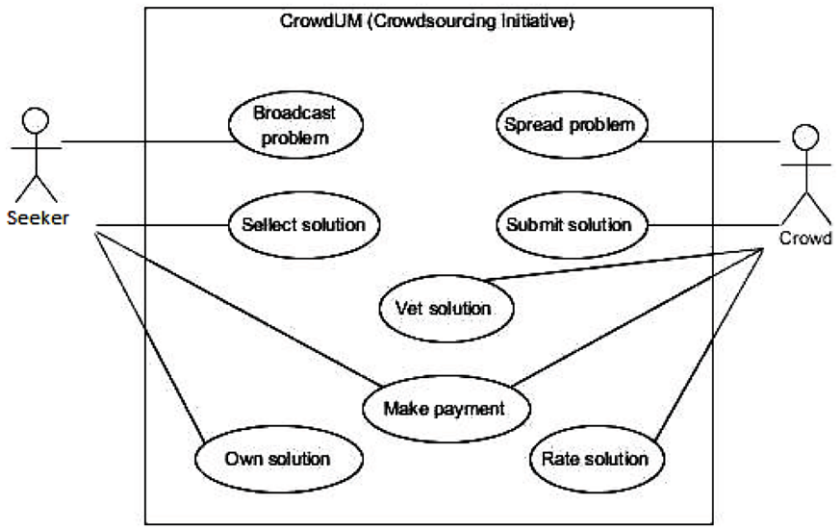
EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

1. Managing a large scale of crowd in order to ensure a big participation of wide variety of experiences coming from jobs, cognitive styles, contact networks, etc.;
2. Assessing a large numbers of results/solutions returned from the crowd;
3. Ensuring high quality of work; and
4. Fostering cooperation among crowd members to solve projects.

To make clear the features of crowdsourcing in a real context, Figure 2 indicates the use-case diagram of CrowdUM that relies on the fundamental structure of crowdsourcing. In general, CrowdUM plays a main role in the crowdsourcing model as a brokering service or intermediary. CrowdUM is designed for organizations (the seeker) such as companies, personals, or agencies that have ideas, problems, and requirements that need to be accomplished through simple but creative activities. The crowd (the solver) are able to gain experience, create knowledge and become more entrepreneurial, they are almost the current students and former students of University of Minho. Moreover, this is a dynamic group that could propose more creativeness's in exploring solutions regardless their nominal cost. The third component in CrowdUM appears as a service broker (the intermediary). The intermediary pays attention to finding requirements from seekers, and then spreading them to appropriate solvers. For more detail, Figure 3 represents the main functions of crowdsourcing initiative in the form of action diagram to help us comprehend CrowdUM's process. The initiative aims to promote an approximation of entrepreneurs, and potential employers, to academic environment in order to foment a better understanding of skills that students in various disciplines are developing; it also aims to constitute itself as a learning tool in that it favors the development of students' knowledge and skills by solving challenges for real organizations.

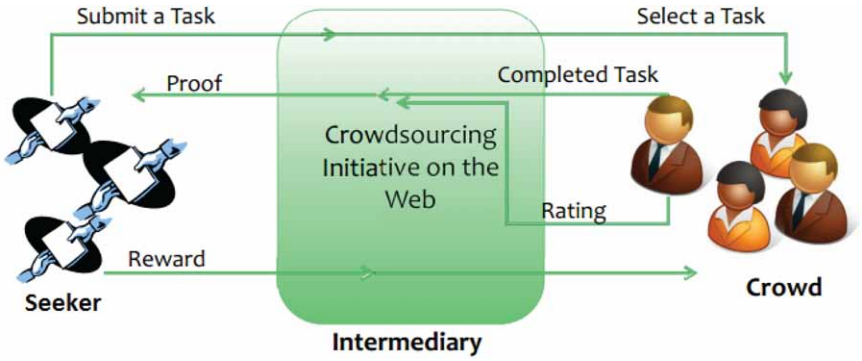
With the aim to creating intellectual assets and providing creative solutions to existing problems, CrowdUM allows seekers and solvers access to a wide range of skills and collective knowledge via web base platform as an intermediary. Moreover, CrowdUM is a tool for innovation, which if used properly can generate new ideas, reduce time to research and develop projects, lower costs and create direct re-

Figure 2. The CrowdUM use-case diagram



EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

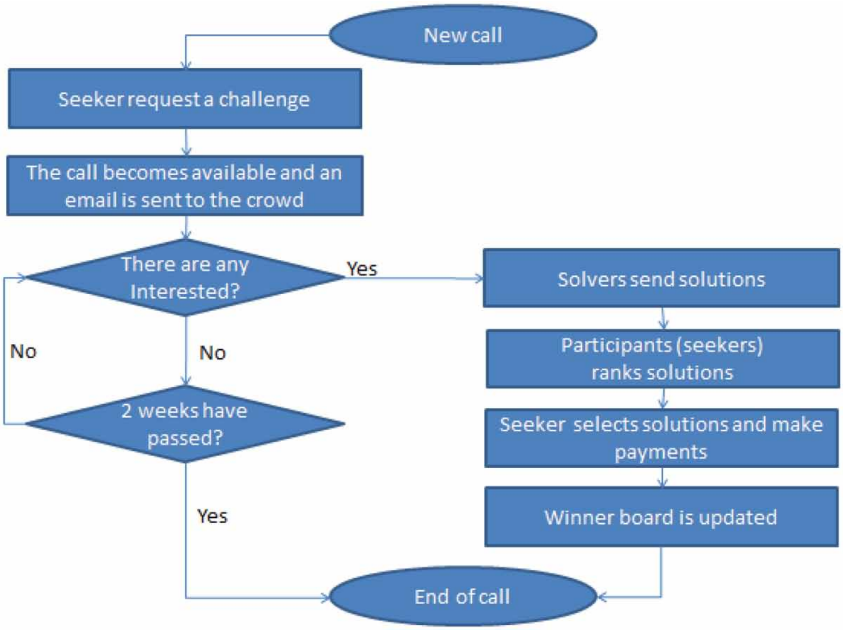
Figure 3. The CroudUM active diagram



lationships between seekers and solvers. This phenomenon arose from the perception that many small contributions linked together are more relevant and effective than a single large contribution.

The process execution of CrowdUM is modeled by a workflow diagram. At the beginning, the seeker describes project's requirements with time-limit and budget for the challenge and awaits solutions from solvers. All information is sent by email to every solver registered on CrowdUM. The challenge will be available on CrowdUM for a defined period of time. When a solver chooses a challenge, the solution can be submitted to CrowdUM website from anywhere and anytime. Meanwhile, seekers are available to give indications in order to help solvers to improve quality of final product. The crowd (seekers and solvers) rate and choose the best solutions. Finally, the best solution is selected from all solvers submissions. The best solution owner, the solver, will receive incentives. The major incentive would be a social recognition given by other contributors (the crowd). See Figure 4.

Figure 4. CroudUM workflow model



EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

With maturation of project scale and the increase of the crowd size over time, CrowdUM showed a lack of an effective management approach to:

1. Help crowd to be notified of new projects more intelligently based on crowd members' hobbies;
2. Enhance quality of solutions; and
3. Manage more effectively projects, solutions, documents, and also business of CrowdUM.

To solve these issues and with incorporation of BI tools to support OM, six useful aspects in this solution arise:

- Using BI enables CrowdUM to manage guides, documents, and relevant information produced in the context of continuous interactions among crowd members and between members and the initiative; BI also supports users to share their knowledge with other members. This helps crowd members to use past knowledge for solving new problems. To develop this feature, ETL will extract and load data and documents content from the CrowdUM database into DW at scheduled time, next the DW and OLAP cubes play a significant role to classifying documents in various dimensions, for example: Time, Geography, Project, Customer (seeker), Problem, Solution, Document and Crowd. These dimensions facilitate users to navigate in the cube, i.e., slice and dice, roll-up, drill-down, etc.
- Finally crowd members could find relevant documents via dynamic interface of the QbE system to select desirable dimensions, which are based on their demands and priorities. QbE system gives users an ability to search documents by defining filters, for example: Type - 'Urgent', Category - 'Web sites', and Status - 'Finish'. Results could be grouped, for example by Geography dimension as Country or City. Users cans save the query result in order to share with other crowd members.
- Using DM to classify the crowd enables supporting the intermediary (CrowdUM Managers) to find a better awareness about user's skills and allows finding the right members in the crowd by classifying user's groups, who have maximum similarity based on their personal information and their usage behaviors. After this is done, appropriate jobs/tasks are sent to suitable groups automatically. BI to OMIS system enables CrowdUM system to comprehend user's demand more accurately by spreading new projects from customers to proper crowd members. Moreover this feature will reduce irrelevant rate of invitation's letter which are automatically send to subscribers when a new project appears.
- Supporting seekers to find the most feasible solution. BI to OMIS support decision in refining the large amount of solutions provided by crowd by improving user's ranking and comment classification. User's ranking focuses on the number of votes from crowd members at each solution. The comment classification is developed from the DM classify functions (e.g., J48 Decision Trees, Naïve Bayes, Support Vector Machines, among others), that classifies comments in each solution into two classes as good assessment and bad assessment, allowing seekers to quickly recognizing the value of the solution based on its good and bad rating. In this way, seekers can reduce cost and time associated with developing a solution and help improving quality of the solutions offered by crowd.
- Members (newbies or not) needed a direct inquiry for special information or difficult issues that are not supported in OMIS. To solve this issue is relevant classify the category of feedback by identifying who do feedback (e.g, supervisors, masters, older workers, etc.) and send answers to

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

members. The role of BI-OMIS system is to classify messages from users and then create a direct connection between members with older CrowdUM workers, who have an important historical knowledge for decision-making support by using DM classify functions.

- Putting in place effective incentive mechanism by using Dashboard component of BI to OMIS model to update the list of best crowd members in each category, i.e., frequent participation and raking by number of award-winning solutions. Incentive mechanisms will promote excellence and encourage members to engage in further projects; incentives also increase motivation for new members to participate in projects. Dashboard component manage several KPI's:
  - Revenue indicator shows the total revenue per year;
  - CrowdUM Status indicator allows managers see the number of documents in CrowdUM's OMIS, total current problems, answers, projects, and crowd members;
  - Incentive mechanism relies on two next indicators to show the most dynamic solvers, and also the most valuable seekers in the CrowdUM. In that, the first indicator shows top five crowd solvers with decrease sort order on their total revenue. And the second indicator shows top five companies (knew as seekers) by their highest payment to CrowdUM. By this way, CrowdUM's managers could put in place effective incentive mechanisms with solvers as well with seekers;
  - Managing project's status is the last feature of the OMIS dynamic dashboard. Via three indicators, status of project is presented in three types for instances: (1) total finished project indicates managers how many projects were finished successful, the KPI fluctuate from high to low value of total finished projects. (2) Besides, the total failure project indicates unsuccessful risk of CrowdUM's projects, the value fluctuate from safe to risk value. Risk value indicates there are some urgent problems that need to be fixed right away. (3) Finally, the total ongoing project indicates the number of projects that ending soon.
- Using web platform to support and manage a large scale of crowd members from various places and time. Web platform was connected with a group created on Facebook, through an application designed for this purpose. Therefore it was possible to automatically collect information about members of the crowd registered on Facebook, if they permitted. This information was then used to redirect e-mail alerts to members of the crowd with interests close to those needed to solve a new challenge. By this way, CrowdUM can use a huge resource from social network (Facebook) to collect users' information like hobbies, introduce the concepts for newbies and facilitate sharing the CrowdUM concept trough the social network friends via various methods (e.g., posting on user's wall, sending message, sending invitation, etc.), and finally encourage them to be registered at CrowdUM.

The platform was tested for 3 months. Solvers were asked to help the study by answering real and fake tasks (micro-tasks). This enabled to increase online activity and interaction. Information automatically gathered was then analyzed to determine how solvers interacted with each other and what pages were most seen.

Although the initiative is still in its infancy and tools described above are only now beginning to be used, it is possible to verify that the solvers can establish contacts with colleagues from other disciplines more easily by identifying challenges. It also became easier to call solver's attention to new challenges and seekers are now more aware of job profiles that are being developed in several areas of the university.

FUTURE RESEARCH DIRECTIONS

A better integration of Data Warehouse and Data Mining technologies is needed to empower the retention and retrieval features of OMIS. Data Warehouse was used to save documents' information, meanwhile Data Mining was used to classify and link relevant documents together via classification functions. A solution could be a semantic web definition to enable a creation of a large network space of linked documents that keeps track the relationship between documents throughout multidimensional views of Data Warehouse (e.g., geographic, key terms, categories, or time dimension). With this purpose, OMIS will allow users to easily expand search results with nearby documents on different dimensions, which will be adapted from visual graphic interface of semantic web tool. Besides, documents' correlation coefficient will be analyzed by Data Mining functions to decide the relationship between one document and others' documents.

A first study to evaluate the effectiveness of the proposed framework to understand the role of BI tools to improve OMIS was made by integrating those tools in the crowdUM initiative web platform. Some improvements in the crowd and seekers knowledge and decision were detected. However further studies are required to explore how BI tools can be used to improve collective and distributed functions of OMIS.

CONCLUSION

This chapter proposed a conceptualization of BI tools as components of an OMIS. OMIS is seen as a broader concept which assumes that the computer-based systems of an organization have an inherent role in support organizational memory. Organizational memory emerges from interactions needed to accomplish organization's mission. This collective and distributed memory holds the memory functions of acquisition, retention, maintenance and retrieval of organizational knowledge. Although organizational memory exists because of individuals that constitute the organization, it transcends and expands individual memories and persists after individuals leave.

In this chapter it is assumed that knowledge is created by Humans and requires the existence of information, namely the one that is transmitted in dialogues. It was also assumed that too much information inhibits knowledge creation since Humans have limited capabilities of information processing. BI tools expand this capacity by pre-processing information in a way that makes the resulting information closer to the needs of knowledge creation which support organizations' intelligence. OMIS that integrate also BI tools holds functions of Information Acquisition, Retention, Maintenance and Retrieval. BI tools enhance in particular functions of information acquisition and retrieval. BI play an important role in supporting OM by automatically collecting and updating knowledge, identifying the useful information for decision making, and thus providing an effective support to OM.

KEY TERMS AND DEFINITIONS

American Idol: The public (the crown) votes to elect the best artist, there are three applications to support community: Idol Nation, Idol Nation Fan Wall with forums, polls, social all-stars, social scene, and finally Forums with a lot of topics been discussed (AmericanIdol, 2013).

Business Intelligence (BI): A key enabler for increasing value and performance to organizations and it is a process that includes two primary activities: getting data in and getting data out (Watson and Wixom, 2007).

Clik Workers: NASA Clickworkers was developed to help scientists and researchers build an extensive database of landforms from data captured by Mars Reconnaissance Orbiter's (MRO) High Resolution Science Experiment (HiRISE). It began as a pilot study in 2000 to determine whether or not online volunteers would be interested in contributing, and if they could produce good data that can be used to answer interesting science questions. As a clickworker you will learn about various landforms on Mars (and on Earth), how they are formed, and what scientists can learn from them. You can experience firsthand what it's like to be an active participant in the scientific process (ClikWorkers, 2012).

Collective Knowledge: A complex and difficult notion, but there are three conceptualization of collective knowledge (Hecker, 2012): as shared knowledge; as complementary knowledge; and as knowledge embedded in collective artifacts.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Crowdsourcing: This term is derived from the business area to indicate the process of connecting a large crowd together via the Internet, which allows seekers to address almost large projects by using crowd's (solvers) creativity and talent to solve these challenges. Howe (2006) define crowdsourcing as an act of taking a job traditionally performed by a designated agent and outsourcing it to an undefined, generally large group of people in the form of an open call.

Hollywood Stock Exchange® (HSX®): HSX is the world's leading entertainment stock market. At HSX, visitors buy and sell virtual shares of celebrities and movies with a currency called the Hollywood Dollar®. The Company's Virtual Specialist® technology allows an unlimited number of consumers to trade thousands of virtual entertainment securities in a fair and orderly, supply and demand based market. HSX syndicates the data collected from the Exchange as market research to entertainment, consumer product and financial institutions and as original content to radio, television and print media. HSX was founded in 1996 (HSX, 2012).

Iowa Electronic Markets (IEM): IEM are operated by faculty at University of Iowa Henry B. Tippie College of Business as part of researching and teaching mission. These markets are small-scale, real-money futures markets where contract payoffs depend on economic and political events such as elections. It intends to use markets in classes as a pedagogical tool by gaining experience with real-world markets. As a research tool, the markets provide an unparalleled laboratory in which study individual trading behavior as well as market level performance (IEM, 2012).

InnoCentive: InnoCentive is the global leader in crowdsourcing innovation problems to the world's smartest people who compete to provide ideas and solutions to important business, social, policy, scientific, and technical challenges. Using a global network of millions of problem solvers, proven challenge methodology, and cloud-based innovation management platform combine to help clients transform their economics of innovation through rapid solution delivery and the development of sustainable open innovation programs. For more than a decade, leading organizations such as AARP Foundation, Air Force Research Labs, Booz Allen Hamilton, Cleveland Clinic, Eli Lilly & Company, EMC Corporation, NASA, Nature Publishing Group, Procter & Gamble, Scientific American, Syngenta, The Economist, Thomson Reuters, and several government agencies in the U.S. and Europe have partnered with InnoCentive to rapidly generate innovative new ideas and solve problems faster, more cost effectively, and with less risk than ever before (InnoCentive, 2012).

Kiva: Kiva is a non-profit organization with a mission to connect people through lending to alleviate poverty. Leveraging the internet and a worldwide network of microfinance institutions, Kiva lets individuals lend as little as $25 to help create opportunity around the world. All 100% of every dollar lend on Kiva goes directly towards funding loans. The Kiva process has four following steps. Step 1: Make a loan on Kiva. Step 2: Get updates, throughout the life of the loan, Kiva informs of progress by email. Step 3: Get paid back, as the borrower repays the loan, the money becomes available to borrower. This is called Kiva Credit. Step 4: Repeat the process, i.e., the borrower can now fund another loan, donate it to Kiva, or withdraw it to spend on something else (Kiva, 2013).

Organizational Memory (OM): An intellectual asset that is unique to every company - probably the most important constituent of any institution's durability (Kransdorff, 1998). Walsh and Ungson's (1991) viewed OM as an aggregate of information useful for decision-making and stored in organizational bins.

Organizational Memory Information Systems (OMIS): Enables to retrieve structured and non-structured data, processing it into meaningful ways to the user and bring the results in highly readable formats such as data visualizations. OMIS should support the quick understanding of situations, promote the construction of scenarios, enable the integration of different users' manipulations and contributions,

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

all of this to support the collective intelligence required to solve complex problems and develop innovative practices (Malone et al., 2010).

Seeker: The sponsor of the initiative, which aims to see solved an issue.

Sell a Band: Sell a Band works through seven following steps. Step 1: discover music by browsing the site, looking at the Charts, using the Search or listen some songs. Step 2: support your favorite artist by buying a part and helping them to raise the funds for a new music project (a new album, tour or the promotion of their music). Step 3: "I'm with the band" by be connected with your favorite artists on their way to reach their funding goal. Promote them, stay in touch with them and help them. 4. Change your mind, before the Fund raising goal has been reached it is possible to withdraw money from a Music Project and move it to another project. Step 5: Artist reaches target, once an artist has reached his/her goal the doors are closed, meaning that no new "Believers" can come on board and it is no longer possible withdraw money. 6. Make magic happen, the artist will use the funds raised to complete his/her Music Project. Step 7: Get rewarded, receive free downloads and other goodies artists might offer like exclusive CDs, t-shirts, free lunches etc. And artists might even let the "Believer" get a cut of their revenues (Sellaband, 2013).

SimExchange: The SimExchange uses the wisdom of crowds to predict the upcoming bestselling and top rated video games. The SimExchange works like a stock market for video games and uses virtual money. The crown use this virtual money to buy stock in games that they believe will sale more than currently predicted and they can sell stock in games that they think will sell less than predicted (SimExchange, 2006).

Solver: The crowd able to participate in the initiative with creativity, talent or resources.

Threadless: Threadless T-shirt company fosters artists from around the world to submit original ideas and designs to products, like a t-shirt, hoody, iPhone case, or any of our other products. This is a hardest part to do, but the artist could use Threadless Forums to collaborate with others artists on improvement a design or asking for a critique. The Threadless community scores each design for seven days and the best of the best are printed and sold, the most successful artists on Threadless are encouraged to submit more designs, even they received negative comments, they can use them as constructive fuel to make their designs even stronger. New designs are chosen for print every single week and the winning artists see their name up in lights, and they are paid handsome royalties and they take at home big cash prizes (Threadless, 2013).

Chapter 71
Business and Technology Trends in Social CRM

Anteneh Ayanso
Brock University, Canada

ABSTRACT

Social media technologies have transformed the traditional CRM applications landscape in many ways. Apart from extending the traditional customer touch points, social media technologies play a critical role in integrating the activities involved in operational and analytical CRM. This chapter explores the business and technology trends in social CRM and examines current social CRM solutions and their capabilities in the analytical and operational (sales, service, and marketing) efforts of organizations. The chapter also discusses the technological and managerial challenges organizations may face in embracing social media technologies in their customer relationship management processes.

INTRODUCTION

The operational as well as strategic advantages of CRM systems have long been understood by many organizations. CRM systems enable both small and large organizations to focus on their customers and generate value through long-term relationships. Royal Bank of Canada's early adoption and success with CRM technologies in the banking industry (Khirallah, 2001), and Harrah's dramatic achievements in customer service and profitability in the casino industry (Loveman, 2003) are few of the success stories. Social media technologies have further enhanced this value creation process by extending the scope and functionalities of CRM applications both at the analytical and operational fronts. Industry surveys indicate that the vast majority of today's customers rely on social media for information related to a company's product or brand (DEI Worldwide, 2008; Accenture, 2009). Social media tools and applications extend the traditional boundaries to create and maintain complex social interactions on a much larger scale. As a result, they empower organizations to be more effective and productive in the formulation of marketing strategies as well as in their execution in the sales, marketing, and service fronts. Social CRM leverages a new wave of social tools (e.g., RSS, social networking, videos, widgets, wikis, social analytics, etc.) and enables marketers to effectively interact with customers and gather information for actionable insights.

In its 2012 report on Magic Quadrant for Social CRM, Gartner defines Social CRM as "a business strategy that generates opportunities for sales, marketing and customer service, while also benefiting the online communities" (Gartner, 2012; p.1). Gartner's report highlights that to be successful in social CRM, companies should focus much less on how an organization can manage the customer, and much more on how the customer can manage the relationship. In other words, social CRM applications should encourage many-to-many participation among internal users, as well as customers, prospects, and other partners, capture and share user-generated content, provide varying levels of autonomy and engagement levels to the community, and demonstrate a mutual and balanced purpose for company and community use (Gartner, 2012). Greenberg (2009) also highlights that social CRM is not a replacement for CRM; it is a change primarily on how communications take place. While conventional CRM strategies focus on one-on-one customer interactions by leveraging integrated data and business processes across multiple touch points, social media channels, by contrast, make information freely available in order to shift influence to the community and power to the consumer (Tobey, 2010). These descriptions emphasize that social CRM complements traditional CRM, but brings several advantages and strengths to the CRM teams both in the analytical and operational roles. For example, service teams can broaden their understanding of the customer and her/his service expectations through conversations on social platforms. Social CRM enables service teams to redefine their roles and proactively indentify issues before they become problems (Accenture, 2009). Similarly, sales and marketing teams can take advantage of the wealth of social media technologies and content to develop more effective strategies and marketing campaigns.

The social Web brings new opportunities as well as challenges to how organizations acquire and manage customers. This includes how companies view consumers and embrace social media as a more robust and increasingly intricate channel of communication and relation building. Social CRM programs rely on conversations taking place at the various social media sites. Managing activity on social channels and the contents users generate can make already complex tasks even more challenging (Business-Software, 2010). Sales, marketing, and customer service teams need to manage and produce structured and actionable information from the social Web in order to take appropriate and timely business actions based on the conversations and relationships they engage in. Mining social media data requires efficient and scalable tools and analytics in order to effectively monitor and filter online conversations and manage new forms of data related to campaigning and relationships.

Unlike the traditional CRM environment, customers have relatively more control and power in social CRM. According to Forrester's survey, nearly 50% of users rank information from other consumers as more important than information from marketers (Greene et al., 2009; Accenture, 2009). Thus, social CRM represents a fundamental shift from a predominantly company-to-consumer dialogue to consumer-to-consumer dialogue (Accenture, 2009). Furthermore, due to the big data revolution and the nature of data companies deal with in the social media environment, tracking and measuring CRM performance is becoming increasingly challenging. The 3Vs of big data: *volume, variety and velocity* (Laney, 2001; McAfee & Brynjolfsson, 2012) show the CRM implications of big data challenges. For example, the volume dimension of big data emphasizes the infrastructural readiness (i.e., hardware and software capacity and scalability) of organizations to maintain and analyze the large amount of data that is coming from the various CRM touch points. In addition, the variety and velocity dimensions emphasize the ubiquitous nature and speed of unstructured data in today's CRM environment and the challenges organizations face in their data pre-processing and model building efforts.

The social CRM environment is also characterized by the explosion of metrics and the growing efforts by social media gurus and consulting firms to create a framework that can be effectively utilized

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

organization-wide (Etlinger & Li, 2011; Owang & Lovett, 2010; Awareness Inc., 2012). Social CRM requires companies to change their analytics culture and adopt solutions that integrate techniques such as text mining, web mining, social network analysis, and spatial-temporal analysis with existing DBMS-based systems. Awareness Inc. (2012) defines social analytics as "an evolving business discipline that aggregates and analyzes online conversations (industry, competitive, prospect, consumer, customer) and social activity generated by brands across social channels" (p.4). This definition emphasizes the ever changing nature of this discipline as the technology, data, and market environments change. Social analytics involves the aggregation, segmentation and analysis of streams of social and web data to drive actionable business insight (Awareness, Inc., 2012). Owyang and Lovett (2010) of Altimeter and Web Analytics Demystified also define social marketing analytics as "…the discipline that helps companies measure, assess and explain the performance of social media initiatives in the context of specific business objectives" (p.5). Their definition emphasizes that social marketing analytics provides firms with a measurement standard for assessing their efforts and applying a pragmatic system of management based on data.

A major trend on the analytics front is the increasing focus on predictive modeling and the incorporation of unstructured data analysis (i.e., text mining and natural language processing (NLP)). Davenport (2006) identifies predictive modeling as the primary strength of analytics competitors today which utilizes historical and current data (demographic, life style, transaction) to predict future customer behavior. Text analytics techniques have been actively pursued in several emerging areas, including information extraction, topic models, question answering (Q/A), and opinion mining (Chen, Chiang, & Storey, 2012). Social media has created tremendous opportunities for businesses in understanding the opinions of their customers regarding marketing campaigns, brands, and product preferences, and text mining and NLP allow meaning and context to be captured and analyzed from these unstructured data.

Social CRM Strategy

Social CRM should not be a standalone initiative that eliminates existing customer strategy. However, adopting social CRM requires organizations to augment or redefine their overall CRM program to support new customer interaction models as well as the culture of internal and external collaborations (Greenberg, 2009; Wang and Owyang, 2010; Attensity and Chess Media Group, 2010). In the first of their two-part series on social CRM, IBM's Baird and Parasnis underscore that a successful social CRM strategy should facilitate collaborative experiences, offer tangible customer value, and exploit the power of the social community (IBM Institute, 2011a, p. 12). In order to lay the foundation for this, they recommend that organizations need to recognize the unique features of the social media channel in relation to other customer touch points as well as the power position of the customer in the social media environment. Furthermore, they emphasize the importance of integrating the social channel with other customer-facing initiatives and the use of monetary incentives to enhance customer engagement.

Effective social CRM strategies require an organization to leverage existing CRM strategy and processes in a way that is both efficient and scalable to take advantage of social media resources. This means that activities and processes related to sales, marketing, and service should strategically utilize the extended collaboration and relationship opportunities provided by social media technologies. Social CRM is more than just the tools and the people hired to deal with social media channels. Simply using social media technologies does not automatically bring organizational benefits. Organizations should adopt a social CRM strategy in order to touch customers at multiple points and early in the buying process (Accenture,

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

2009). Wang and Owyang (2010) of Altimeter Group, based on interviews and consultations with several organizations, leading market influencers, and solution vendors, report that most organizations start their social CRM initiatives by laying out foundational (baseline) processes and deploying a customer insight program. After these initiatives, Wang and Owyang (2010) emphasize that organizations should focus on real business values across several categories of social CRM use cases.

Social CRM Deployment Options

Advances in Web 2.0 technologies and cloud computing have expanded the development and deployment options for enterprise applications. In addition to fueling the rise of the on-demand CRM applications, this technology trend has created a more flexible development environment for on-premise CRM applications. *On-Premise CRM* involves the deployment of CRM applications on the premises of a client organization where the servers, connections, access, and data are all controlled by the organization and housed internally. "On-premise CRM, also known as licensed, on-site, or in-house CRM, is a CRM that is housed at a client's location, and managed by its own employees" (Business-Software.com, 2012, p.3). On the other hand, with the *On-Demand CRM*, also known as hosted CRM, data, servers, and applications are made available via the web, housed by the application vendor. "With hosted CRM, all hardware and software components are purchased, installed, tested, and maintained by a third-party hosting provider at a remote site. The hosting service provider also stores and manages all customer-related data" (Business-Software.com, 2012, p.2). This section discusses the CRM development and deployment alternatives that are available for organizations and examines some of the challenges in integrating new applications with existing capabilities via on-premise versus on-demand delivery model.

Among the key considerations in the CRM selection and deployment options are user empowerment, investment timeline and total cost of ownership (TCO), data sensitivity, availability of internal IT resources, and integration (Sage Software Inc., 2008). First and foremost, the operational requirements of the CRM solution at the sales, marketing, and service processes are critical to enhance the flexibility as well as availability of the CRM application. Thus, user's empowerment, which embodies the functional requirements of the CRM application, configuration and customization needs, as well as accessibility, is one of the key areas of consideration when choosing the deployment alternative that is suitable to an organization (Sage Software Inc., 2008). Moreover, understanding the total cost of ownership (TCO) associated with a particular CRM deployment, customers' security issues on third-party hosting of their data, the capability of an organization's IT staff and other resources, and the degree of integration required between the analytical and operational fronts are the other important considerations when choosing between on-demand and on-premise options for CRM deployment (Sage Software Inc., 2008). Benlian, Hess, and Buxmann (2009) also examine the main drivers and inhibiting factors of SaaS-adoption for different application types and show that social influence, pre-existing attitude toward SaaS-adoption, adoption uncertainty, and strategic value are the most consistent drivers. Their empirical analysis shows that the patterns of decisions on SaaS-adoption depend on the application type, implying that vendors should address application-specific drivers to increase SaaS adoption. For example, applications with a high level of standardization, less strategic relevance, and lower technical and economic risks, tend to have a higher degree of adoption in a SaaS delivery model. These findings have several implications for organizations when evaluating on-demand versus on-premise options for CRM because they need to understand the operational requirements of CRM in the customer service, sales, and marketing

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

processes, and the associated benefits and risks involved when migrating the data and applications supporting these processes.

Traditional drivers of on-demand based solutions also include a focus on core competencies, cost-effectiveness, flexibility in technology choices, and the lack of necessary IT application skills in many firms (Kern, Lacity, & Willcocks, 2002). As the range of demand-driven applications grows, it is important that business data and logics are properly integrated with other applications deployed by the SaaS subscriber (Sun, Zhang, Chen, Zhang, & Liang, 2007). According to market surveys on the integration requirement of SaaS customers, most companies expect that the SaaS solution can be integrated with their on-premises legacy applications or other SaaS solutions (Kern et al., 2002). Some SaaS solution vendors provide integration as part of their service offerings by maintaining an integration server with prebuilt connectors to on-premise applications (Hai & Sakoda, 2007). SaaS providers also maintain a set of standard Web service application programming interfaces (APIs) to enable data integration. There is also an emerging integration-on-demand market that facilitates integration service through menu-driven wizards and platforms for easily incorporating connectors as well as data cleansing and validation add-ons in an affordable and flexible pricing model (Hai & Sakoda, 2007).

The actual costs and benefits of a SaaS CRM deployment depend on several internal and external factors, including the unique needs of an organization, the required level of integration with on-premise applications as well as changes that may be required through future upgrades or extensions. Lashar (2009a) discusses the challenges, particularly for large organizations in deploying SaaS CRM and the tradeoffs these organizations should address in their strategy and planning. The major tradeoffs, according to Lashar (2009a), lie in idealism versus realism, adoption versus functionalism, and dynamism versus discipline. Thus, organizations should expect the challenges of transformation and change realistically. Second, large organizations should expect gaps in the functionality of SaaS CRM for business requirements where SaaS solutions are less mature. While these gaps can be closed in the long-term, understanding the depth and breadth of functionality in SaaS CRM applications is important to maintain the right balance between on-premise and on-demand applications in the implementation process. Third, large organizations should be wary of the speed and frequency of changes to their SaaS CRM applications after initial deployment. For large organizations, even small changes may result in unintended impacts, thus requiring a disciplined approach to avoid costly mistakes. Lashar (2009b) also emphasizes the challenges for large organizations in integrating their SaaS CRM platforms into the rest of the technology landscape. For large organizations, technical activities such as moving data from legacy applications and integrating the new software with existing applications may involve significant risks and costs due to limitations in the capabilities of native tools as well as limitations in the SaaS CRM data structures and maintenance. SaaS CRM platforms may also pose challenges for the IT staff in large organizations in operational support, which involves technical constraints in managing availability, controlling security, optimizing performance, and migrating configuration changes (Lashar, 2009b).

Traditionally, on-demand software applications were provided in several forms such as Application Service Providing (ASP) or Business Service Providing (BSP) (Benlian et al., 2009). Based on the key considerations discussed above, the early applications of ASPs were unable to offer greater economic benefits over locally installed applications and had limited ability for customization, data sharing and integration with other applications (Hai & Sakoda, 2007). However, SaaS is now becoming a popular model for CRM applications, particularly for small and medium size organizations which do not have the infrastructural requirements of social CRM. This increased demand has led to the proliferation of SaaS development platforms, third-party add-ons, social plug-ins, and integration tools. SaaS makes

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

it easier for many organizations to bundle the cost of the infrastructure, the right to use the software, and all hosting, maintenance and support services into a single monthly or per-use charging (Sun et al., 2007). Current SaaS solutions provide flexible software architecture and loosely coupled customizable and configurable modules which allow users to quickly meet their requirements without significant code changes (Hai & Sakoda, 2007).

Among the major CRM trends outlined by Forrester Research is that SaaS CRM solutions has become the default choice (Band, Hamerman, & Magarie, 2010). On-demand CRM solutions are relatively more affordable, particularly for small and medium size businesses with limited infrastructure and the resources needed to effectively run on-premise applications. Some of the key players of the on-demand CRM market (including social CRM applications) are *Salesforce.com, NetSuite*, and *RightNow Technologies* (SearchCRM.com). Targeting primarily small and medium businesses since its inception, Salesforce.com is the pioneer in the SaaS market that forced traditional CRM vendors to redefine their approach, including recent developments in social CRM applications. The company has been successful in establishing a sustainable business model and offering a pay-as-you-go CRM solution that includes sales force automation (SFA), marketing automation, and customer service and support automation. Salesforce.com provides an online application directory, AppExchange, and a Web-based programming tool for third party developers to facilitate integration of add-on services with other core on-demand CRM services. AppExchange's applications use the company's proprietary programming language, Apex, as their on-demand platform. Similarly, NetSuite's programming tool, SuiteFlex, enabled the company to offer customization capabilities to its customers while also allowing them to host new applications within the system (SearchCRM.Com).

While SaaS CRM may seem a natural fit to smaller businesses, larger organizations are also considering SaaS CRM as most traditional CRM vendors (e.g., Microsoft and Oracle) are now moving into the SaaS territory. For example, Microsoft's first multi-tenant version of CRM came in 2007, which allows users to benefit from economies of scale, with multiple customers running on the same instance of the CRM product. Later in the same year, Microsoft also announced pricing for on-demand Dynamics Live CRM, offering pricing in multiple tiers, the most expensive of which beats Salesforce.com's rate per user per month (SearchCRM.Com). Similarly, Oracle's on-demand CRM offers capabilities in sales, marketing, service, partner relationship management, call center, analytics, mobile, and integration (Oracle.com). These capabilities are available for a number of industries, including life sciences in medical as well as pharmaceutical, high technology, insurance, automotive, and wealth management (Oracle.com).

Forrester outlines five best practice strategies to succeed with CRM SaaS solutions based on an interview with early adopters of SaaS CRM, leading CRM SaaS vendors and professional services organizations (Band et al., 2008). These best practice strategies include: building a solid business case; negotiating a sound contract; using a proven implementation approach; establishing strong data security procedures; and creating robust governance and support structures (Band et al., 2008).

In building a solid business case, Forrester's study identified the importance of deeply understanding the total costs of SaaS CRM, and focusing on business models and economic drivers, differences in business benefits, flexibility, and risk. In the contractual agreement, the study identified the need for a formal service-level agreement (SLA) and that companies need to protect themselves from hidden cost drivers, unexpected service outages, declines in customer support, and obscure disaster recovery procedures. Concerning the implementation approach, the best practice includes defining business objectives; establishing a team (that involves an executive sponsor, a steering committee with a user group representative, a CRM SaaS solution administrator, and a CRM SaaS vendor developer or consultant);

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

defining a timeline that outlines major tasks, milestones, and accountabilities upfront; defining a scope and prioritizing initiatives; and configuring a SaaS CRM solution that meets the specific needs of the users. In the area of data security, the study also identified the need for data protection guarantees; compliance with industry standards; clearly defining roles and access rights for different users in an organization; and defining vendor data integration, conversion and exit blueprints. The final area of best practice identified in Forrester's study relates to the governance structure of the SaaS solution. Governance structure involves managing the SaaS solution; identifying the support resources and designating the support staff; establishing data backup procedures; and outlining upgrade schedules and procedures.

SOCIAL CRM VENDOR SOLUTIONS AND CAPABILITIES

Regardless of the delivery model, social CRM applications should leverage traditional CRM capabilities with the emerging social technologies to maximize engagement with customers and business partners. This increasing focus on customer engagement is one of the driving forces for the growth of the social CRM market. Recognizing this trend, not only the traditional CRM vendors, but also new entrants are striving to offer solutions that can help companies meet their customers' need in a transparent manner. This section summarizes how existing vendors are supporting social CRM applications and describe the features and functionalities provided by new solutions in the social CRM market based on industry reports.

According MarketsandMarkets (M&M), the social CRM market is expected to grow from $1.91 billion in 2013 to $9.08 billion in 2018, representing a compound annual growth rate of 36.5% from 2013 to 2018(MarketsandMarkets, 2013). Their study identifies *SAP, Oracle, Salesforce.com, Amdocs* and *IBM* as the major vendors in the social CRM market, and companies such as *Lithium* and *Jive Inc.* moving towards this market. Their assessment of the market also includes the areas of applications (i.e., marketing, sales, customer support and service, and others), deployment options (i.e., On-demand, On-premise, or hybrid), solutions (i.e., social monitoring, social mapping, social middleware, social management, and social measurement), users (SMEs or enterprises), and verticals (i.e., academic and government, automotive, transportation and logistics, Banking, Financial services and Insurance (BFSI), consumer goods and retail, energy, power and utilities, and healthcare).

An analysis of social CRM vendors is also provided in Gartner's Magic Quadrant report (Gartner, 2012). Gartner's Magic Quadrant for social CRM evaluates the market and ranks the leading social CRM vendors according to two major dimensions: *ability to execute* and *completeness of vision*. The evaluation categories under the ability to execute dimension include: product/service; overall viability in terms of business unit, financial, strategy, and organization; sales execution/pricing; market responsiveness and track record; marketing execution; and customer experience. The evaluation categories under the completeness of vision dimension include: market understanding; marketing strategy; sales strategy; offering (product) strategy; business model; vertical/industry strategy; innovation; and geographic strategy. Beginning with a large list of vendors that offer some elements of social CRM, Gartner short-listed few vendors by emphasizing on processes and how vendors meet minimum inclusion requirements. Vendor categories include social-media monitoring; peer-to-peer community; social campaigns; enterprise feedback management; and product reviews. Gartner noted that, in the last few years, there have been accelerated mergers and acquisitions in the market and this is expected to continue every year.

Gartner's four quadrants of the market based on its evaluation criteria are "Leaders", "Challengers", "Visionaries", and "Niche Players". Table 1 describes Gartner's characteristics of vendors that fall in

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

each quadrant. For example, vendors falling in the Leaders' quadrant have software that benefits both the company and the community. *Jive Software* and *Lithium* are the only vendors identified in this quadrant in 2010, but *Salesforce.com* has joined this quadrant in 2012. Visionaries demonstrate strong understanding of current and future market trends and directions. In the 2010 report, the vendors identified in this quadrant include *Mzinga, Salesforce.com, and KichApps*. In 2012, this quadrant includes *Attensity* and *Telligent*. Challengers have an established presence, credibility and viability, as well as strong products, market position, and resources to become leaders, but lack functional breadth, marketing strategy, or rate of innovation. Gartner did not identify vendors exemplifying these characteristics in its 2010 report. However, in its 2012 report, two vendors, *Bazzzrvoice* and *Oracle,* were identified. The Niche Players provide useful, focused technology, understand changing market dynamics and work toward evolving their product capabilities, but may have limited functions, product road maps, or an innovative growth strategy. The vast majority of vendors short-listed in Gartner's study are in this quadrant (See Table 1). However, this list has been substantially changed from the 2010 list. In 2010, the vendors include *RightNow; Demand Media; Vovici; Bazaarvoice; Nielsen BuzzMetrics; LiveWorld; Thompson Reuter-Hubbard One; Radian6; Oracle CRM On Demand; Globalpark; Leverage Software; InsideView; Visible Technologies;* and *Overtone.* In 2012, this list includes *Demand Media; QuestBack; Visible Technologies; Get Satisfaction; Kana; Artesian.*

Business-Software (www.business-software.com, 2010; 2012) also evaluated the CRM market in 2010 as well as 2012 and reported the top CRM vendors, categorized by functionality, delivery model, customer focus, and other criteria. Business-Software describes two basic Social CRM models: 1) the first model relates to the social media management capabilities offered by major CRM vendors in the form of modules that integrate with their existing CRM platforms, which can range from simple (just a Twitter integration) to complex (complete community management); 2) the second model is offered by social

Table 1. Gartner's magic quadrants and vendor characteristics (Gartner, 2012)

Challengers	**Leaders**
• Offer solutions that are poised to move into leadership, but have not yet done so. • Have strong products, as well as the market position and resources to become leaders, but may not have either the same functional breadth, marketing strategy, or rate of innovation as those in the visionaries quadrant. • Have an established presence, credibility and viability, and once their products become "good enough", they will likely cross-sell to their customer base to leapfrog others into the Leaders quadrant at some point in the future. **Vendors:** *Bazaarvoice; Oracle*	• Leaders' software must benefit both company and community: Leaders show benefits to enterprises by demonstrating ROI, by supporting KPIs, and leaders' software convinces users that they get something valuable by participating in a conversation or community. • Leaders' offerings demonstrate support for multiple CRM processes, not just one domain, and have substantial revenue coming specifically from their social CRM offerings. **Vendors:** *Salesforce.com, Jive, Lithium*
• Provide useful, focused technology, understand changing market dynamics and are working toward evolving their product capabilities. • Some can be held back by narrow functions, limited product road maps or by the lack of an innovative growth strategy • Many of the smaller vendors may enjoy success relative to their size, but need to grow and establish their positions before their competitive differentiation erodes in 2011. **Vendors:** *Demand Media; QuestBack; Visible Technologies; Get Satisfaction; Kana; Artesian*	• Demonstrate strong understanding of current and future market trends and directions. • Their products and product road map exhibit innovation especially in architecture and lightweight integration. • The Visionaries in this market have not exhibited the scope of delivery of the Challengers, but have demonstrated vision across a range of capabilities. **Vendors:** *Attensity; Telligent*
Niche Players	**Visionaries**

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

CRM vendors whose platforms focus almost exclusively on customer relationship management through social networks. These products focus on community engagement and online communication. Some of them are standalone platforms, but they can be integrative with major CRM platforms. Their 2010 top CRM vendors list includes *Microsoft Dynamics, Salesforce.com, NetSuite, SAP, Sage, eSalesTrack, Jive Software, Lithium, BatchBlue*, and *Helpstream*. The first 10 positions of their 2012 top 40 list include *Netsuite,SAP, Maximizer, Pivotal (CDC Software), Microsoft Dynamics, Salesforce.com, Sage, Adapt CRM, Amdocs,* and *MyBusiness CRM*. Vendors are also profiled in terms of business processes (suite, marketing, customer service, call center, sales force automation), deployment options (hosted/SaaS versus on-premise), and size of organizations (small, mid-size, enterprise). The vast majority of the top ranked vendors support the core functionalities in the marketing, customer service and sales force automation area. The top vendors in the category of hosted/SaaS model include *NetSuite, SAP, Microsoft Dynamics, Salesforce.com, Sage, MyBusiness CRM, Avidian Technologies, C2CRM, ClaritySoft, Tracker-RMS*, among others. The top vendors in the category of on-premise include *SAP, Maximizer, Pivotal (CDC Software), Microsoft Dynamics, Sage, Adapt CRM, Amdocs, Avidian Technologies, C2CRM, ClaritySoft, Consona,* among others. As the list shows, some vendors offer both the on-demand as well as on-premise deployment options. Most of the top-ranked vendors also support companies in all size categories.

Due to variations in design priorities and the market being served, the social CRM software modules and functionalities are not uniform across the vendors. Accordingly, several research and consultancy firms have attempted to evaluate the various offerings, features, and functionalities of vendors in order to guide clients on their choices. For example, Gartner's reports provide a comprehensive description of social CRM applications offered by vendors identified in its Magic Quadrant for Social CRM (Gartner, 2010; 2012). These applications typically have customer-centric functions to facilitate purchase decisions, customer support, and access to product and service information, as well as administrative tools for businesses to support different initiatives. Similarly, Business-Software (2010) describes the main components of a social CRM suite to include *Brand Monitoring* to track conversation regarding a brand or business which can take the form of sentiment tracking on third-party sites or internal contributions, or opinions expressed in customer service/support calls; *Social Media Platforms* to access and contribute to social media platforms such as Twitter and Facebook from within the Social CRM solution; *Community Support*: to create and manage customer communities from within the platform; and *Social CRM Analytics* to generate reports on popular content, search keywords, and navigation paths, sentiment and behavioral analysis, and monitor customer interactions within online communities.

Social CRM Challenges

In addition to the operational as well as strategic benefits of social CRM, organizations should be aware of the challenges and risks involved in a social CRM strategy. For example, in Avande's 2008 survey, fear and apathy toward social media were noted as key obstacles to using social media. The survey found that senior executives and IT staff tend to resist social media due to concerns over its impact on employee productivity. In addition, organizations may tend to resist social CRM adoption in order to avoid possible liability for privacy and security, intellectual property infringement or other social and legal risks. In this section, we review some of the critical challenges organizations may face in embracing social media in their CRM strategy.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Integration

The success of a CRM strategy depends on effective integration of front-office operations with back-office analytical efforts, among other things. The social CRM programs make this integration process even more demanding. The review of the vendors in the social CRM market indicates that vendors excel at different priority areas and offer different capabilities. A comprehensive social CRM program requires effective integration of solutions that may come from multiple vendors, but most organizations lack the IT resources to achieve this objective.

Training and Software Utilization

Organizations adopting the social CRM strategy need to match the hiring and training requirements with the pace of technological progress. With advances in new database and internet technologies and analytical techniques, organizations need to monitor the capabilities of the solutions they invest in and the utilization rates of the tools and functionalities by their employees. One of the key components in assessing the total cost of ownership with CRM or social CRM is training. In order to take full advantage of the capabilities, organizations should plan for regular training as part of their learning and growth objective in the social CRM strategy.

Data Security

Privacy and security are the foundation for effective customer engagement and part of the social CRM overall strategy. One of the major challenges of social CRM platforms is the security of personal profiles residing in vendor's data repositories as well as social networking sites such as Facebook and LinkedIn. The decentralized nature of social media data makes the issue of data security more serious in today's online environment. CRM solutions that rely on Web-based data repositories need to establish data security policies concerning the profiles of customers and business partners. Organizations that belong to industries such as financial services and healthcare are subject to extensive government and industry data security regulations that are challenging to address with SaaS solutions (Hai & Sakoda, 2007). Another operational issue that comes with data security is the service reliability. If SaaS solutions face frequent downtime, it can easily compromise the various advantages of on-demand applications. From the end-users perspectives, both data security and service reliability are critical requirements for an effective integration of social CRM applications.

Companies providing social CRM solution should do more than framing the terms of use that protect themselves from potential legal liabilities. Several issues have already been the subject of discussion concerning terms of use as well as user's rights on their data with popular social networks. Adding to these challenges are policies towards the use of customer data by third-party developers. Third-party developers play a major role in extending the value of SaaS services by providing add-on services or facilitating application integrations. However, in the absence well-defined policies on the use of core customer data by these developers, the privacy and security of customers can be easily compromised with serious legal consequences. Applications that are interwoven with third-party networks are directly or indirectly affected by these issues. Today's customers are not only more sensitive about their information, but also have more power to challenge businesses on their privacy and security policies.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Analytics and Privacy

Although the analytical capabilities of social CRM helps marketers to gain marketing intelligence, mining social data poses a threat to ethical issues concerning customer privacy and individuality. Social media prompts users to disseminate data about their personal profiles which can be easily discovered, mined and combined with other data for use in a completely different purpose. This capability also raises privacy concerns for customers because their information and actions can be easily analyzed and used for different purposes without their consent. CRM analytics can be used to discover a wealth of information on customer categories, profiles, and personal preferences. Beyond basic customer information, analytics can target a customer's specific events and actions on the social Web. This analytical capability, which is increasingly becoming better, makes customers' age-old concerns about the Internet and their privacy even more serious. In order to use this capability for productive business insights, organizations should give equal attention to the ethical issues concerning customer privacy and individuality.

Intellectual Property Rights

Social media has resulted in an explosive growth of user-generated content which presents significant legal challenges (George & Scerri, 2007). Social CRM strategies involve the use of Web-based data repositories that allow users to store and share various types of contents. Yet, several social media companies have already been the subject of copyright issues due to loose policies on user actions. The more difficult challenge is the variation of copyright laws from place to place, while many of the social media sites cross several cultures and operate in multiple nations and geographic regions. Yet, their approach has been predominantly reactive, rather than proactive in dealing with copyright infringements. The user-friendly nature and flexible content sharing capabilities of most social media applications put unwary employees at risk of disseminating proprietary contents or violating the terms of service of partner Web sites. Several Web-based applications and features are available free of charge in order to attract the user base and enhance future functionalities based on user feedback and usage. If users do not pay attention to their proprietary contents, they can be easily exposed to copyrights infringements.

Social Media Policy

Organizational policy governing the use of social CRM applications and tools should be an integral part of any social CRM strategy. Furthermore, organizations should monitor any government regulations (national or international) as well as industry regulations that provide guidance on social software applications, customer interactions, management of customer data and transactions in a SaaS delivery model. Many organizations today are active members of the social media environment, but policies governing their participation as well as their employees are not usually given the attention they deserve, particularly in customer-facing applications. Incidents happen on a routine basis mostly involving employees that are unaware of many legal and business issues surrounding social media technologies and their use in customer-facing activities. Thus, the decision to participate in social media, including the use of social software or application tools should consider a broad organizational policy framework that can help educate employees on their rights and limitations, as well as understand the approach or format they should follow in the day-to-day business use of social media technologies. As primary tools for engaging with customers and business partners, social CRM applications are more exposed to potential

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

legal risks. Employees may damage company image while genuinely trying to promote their organization if they are unaware of the information they can disclose or its accuracy. In the absence of established company policies, guidelines, and appropriate training, employees are more than likely to face such risks.

CONCLUDING REMARKS

This chapter reviewed the business and technology trends in social CRM and discussed several capabilities of social CRM applications for businesses in their sales, marketing and service activities. A review of the CRM market by analysts and research firms presented in this chapter also shows that the market will continue to grow in the next few years with the potential of more capable and integrated offerings from many vendors and Web-based platforms. The market has also shown several mergers and acquisitions as some vendors continue to maintain their market share by extending their capabilities through these strategies.

This chapter also discussed the additional challenges social CRM brings for organizations in the areas of implementation, application integration, data management, data security, and consumer privacy. In addition, while the business benefits and cost advantages of SaaS CRM solutions look attractive for organizations, industry experts advise organizations to conduct a comprehensive analysis of the deployment options and to follow a disciplined approach to the SaaS approach. To generate timely business actions using social CRM applications, organizations need enhanced business analytics and a holistic approach to the data that is coming from both structured and unstructured sources.

The various opportunities and challenges imply that social CRM requires a well-defined business strategy that helps organizations integrate the many touch points into their sales, marketing, and service processes and other internal systems. Industry experts also emphasize that organizations should not eliminate existing customer strategy, but redefine their overall CRM program to support new customer engagement and collaboration models (Greenberg, 2010; Wang & Owyang, 2010; Attensity and Chess Media Group, 2010). To derive real business values, this strategy should also incorporate change management, training, and appropriate measures based on business goals.

Finally, in addition to the internal challenges to adopting social CRM strategy, organizations should be wary of the related ethical and legal issues. As discussed, social CRM is directly and indirectly affected by the global issues surrounding social media technologies. Therefore, establishing proactive policies, training, and staying current with national and international regulations as well as industry requirements should be part of any social CRM initiative.

KEY TERMS AND DEFINITIONS

Analytics: Software-based algorithms and statistics used to derive meaning from data.

Brand Monitoring: A practice of listening to and/or measuring what customers say and write about a company or brand using social media tools.

CRM (Customer Relationship Management): A technology solution for managing customers and establishing long-term relationship for companies.

Legacy System: System, application, or technology that is obsolete, but continues to be used because it performs a needed function adequately.

Metrics: Detailed measures that are defined to feed KPIs in a measurement system.

Sentiment Analysis: Part of social media analytics that uses analytical or computational techniques to determine the attitude or judgment of a speaker or a writer with respect to some topic, organization, brand, or products.

Social Channel: A Web 2.0 enabled medium that allows users to communicate and amongst one another. I.e. Facebook, Google +.

Social CRM: A technology solution based on social media which includes social networks, blogs, forums, chats, audio and video sharing, etc.

Social CRM Analytics: Algorithms that support various types of social media data analysis to generate reports.

Software Suite: A collection of software modules with specific functionalities that are integrated with common interface to support different business processes/objectives.

Text Analytics: The use of advanced data mining techniques and algorithms to identify meaning from words and sentences. Natural language processing is a technique.

Use Case: A software engineering term used to describe system behavior from an actor's point of view or high-level functional description of requirements.

Chapter 72
Beyond Micro-Tasks: Research Opportunities in Observational Crowdsourcing

Roman Lukyanenko
University of Saskatchewan, Canada

Jeffrey Parsons
Memorial University of Newfoundland, Canada

ABSTRACT

The emergence of crowdsourcing as an important mode of information production has attracted increasing research attention. In this article, the authors review crowdsourcing research in the data management field. Most research in this domain can be termed tasked-based, focusing on micro-tasks that exploit scale and redundancy in crowds. The authors' review points to another important type of crowdsourcing – which they term observational – that can expand the scope of extant crowdsourcing data management research. Observational crowdsourcing consists of projects that harness human sensory ability to support long-term data acquisition. The authors consider the challenges in this domain, review approaches to data management for crowdsourcing, and suggest directions for future research that bridges the gaps between the two research streams.

INTRODUCTION

Recent years have seen a major shift in knowledge production via crowdsourcing, wherein increasingly work is being done by distributed members of the general public (the crowd), rather than employees or traditional subsidiaries. Crowdsourcing promises to dramatically expand organizational computing power and "sensor" networks, making it possible to engage ordinary people in large-scale data collection (Brabham, 2013; Doan, Ramakrishnan, & Halevy, 2011; Franklin, Kossmann, Kraska, Ramesh, & Xin, 2011; Garcia-Molina, Joglekar, Marcus, Parameswaran, & Verroios, 2016; Li, Wang, Zheng, & Franklin, 2016).

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Applications of crowdsourcing are rapidly expanding and power such diverse activities as corporate product development, marketing, public policy, scientific research, graphic design, software development, and writing and editing. Crowdsourcing is increasingly tasked with tackling difficult societal and technological challenges, such as climate change (Theobald et al., 2015), natural disasters (Brabham, 2013) and commonsense reasoning in artificial intelligence (Davis & Marcus, 2015).

Organizations integrate crowdsourcing into internal decision making and operations. Fortune 500 companies maintain digital platforms to monitor what potential customers are saying and understand customer reactions to products and services. They also use consumer feedback to design better products and monitor market changes (Abbasi, Chen, & Salem, 2008; Barwise & Meehan, 2010; Brynjolfsson & McAfee, 2014; Delort, Arunasalam, & Paris, 2011).

Crowdsourcing turns problem-solving capacity and data into commodities, making them available on-demand. For example, many municipalities in the United States now subscribe to CitySourced.com, which harnesses citizens' reports of crime, graffiti, potholes, broken street lights, and other civic issues, to better support infrastructure management. In a more general setting, Amazon's Mechanical Turk (mturk.com), CrowdFlower.com, and Clickworker.com maintain pools of "crowdworkers" that companies hire on-demand to perform small problem-solving tasks.

There is also a proliferation of platforms for automatically generating data collection forms that can be easily configured and rapidly launched on a large scale. Projects such as EpiCollect.net, SciStarter.com, or SmartCitizen.me make crowdsourcing possible for organizations and even individuals, requiring little technical expertise and infrastructure. Crowd-powered extensions of word processors, such as Soylent, enlist crowds for document writing and editing (Bernstein et al., 2015). In addition to becoming a mainstream commercial service, crowdsourcing has become a major resource for scientific research (Goodman & Paolacci, 2017).

Crowdsourcing presents several data management challenges. Unlike traditional data collection in organizations, in crowdsourcing there are typically weaker constraints on who can participate. This creates the challenge of managing data produced by often anonymous users with varying levels of domain expertise or motivation (Lukyanenko, Parsons, Wiersma, Sieber, & Maddah, 2016). Furthermore, in many projects participation is voluntary, making it difficult to engage users in eliciting information requirements (e.g., to guide database design) or in improving the quality of existing data (e.g., to clarify a particular data entry, or request additional information) (Chen, Xu, & Whinston, 2011). These challenges offer exciting opportunities for data management researchers to design innovative solutions.

In this paper, we survey current research on data management in crowdsourcing. We argue that two major, largely disconnected, streams of crowdsourcing research exist: (1) studies that investigate uses for crowds as links in a larger technological chain and tend to focus on small, granular and well-defined micro-tasks (task-based crowdsourcing); (2) studies that explore the potential of crowds as "sensors" in the environment that can be leveraged in organizational decision making and innovation (observational crowdsourcing). Until now, the data management community has studied primarily the first kind of crowdsourcing, resulting in a serious gap in resolving challenges associated with the latter type. With this in mind, we analyze the challenges and opportunities associated with observational crowdsourcing environments and suggest directions for future database research in this context.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

TYPES OF CROWDSOURCING

Driven by a combination of: (1) sustained interest from organizations in harnessing the knowledge of ordinary people; and (2) formidable research challenges, the data management community has increasingly adopted crowdsourcing as a serious research topic. The growth of crowdsourcing data management research is evidenced by the proliferation of panels, workshops, and special journal issues on this topic. Examples include: *VLDB* panels and workshops starting from 2007's "Web 2.0 and Databases"; *ACM SIGMOD 2009*'s panel "Crowd, Clouds, and Algorithms"; *ACM CIKM* "CrowdSense" 2012 and 2014 workshops; *ACM SIGKDD* workshops; *AAAI Conference on Human Computation & Crowdsourcing* (*HCOMP*) since 2009; and a growing number of journal articles.

The importance of research on crowdsourcing data management is underscored by its relevance to other major data management problems. Crowdsourcing is a key contributor to the growth of user-generated content and is commonly considered together with social media and social networking (Faraj, Jarvenpaa, & Majchrzak, 2011; Germonprez & Hovorka, 2013; Kane, Alavi, Labianca, & Borgatti, 2014; Levina & Arriaga, 2014; Zwass, 2010). As crowds, due to their scale, are capable of generating massive volumes of rich and heterogeneous data, crowdsourcing exemplifies the "big data" management challenge (Carlo Batini, Rula, Scannapieco, & Viscusi, 2015; Jagadish et al., 2014). As crowd data is often sparse, and of uncertain quality, crowdsourcing research is relevant to work on noSQL databases, integration of heterogeneous data sources, and data quality (Cattell, 2011; Kosmala, Wiggins, Swanson, & Simmons, 2016; Lukyanenko, Parsons, & Wiersma, 2014b). Finally, tapping into human problem-solving ability, crowdsourcing promises to complement technological shortcomings of machines (e.g., through human-powered query execution, sorts, joins, or inference-making) (Bernstein et al., 2015; Davis & Marcus, 2015; Franklin et al., 2011).

Despite such potential, the scope of data management research in crowdsourcing has been narrow. Based on current publications in information systems, computer science, and software engineering, we focus on two clearly identifiable streams of crowdsourcing research – the dominant (small) task-based crowdsourcing and the less common observational crowdsourcing – that, while related, are pursued largely independent of each other.

On one hand, there is growing body of work that aims to leverage crowds as links in a larger technological chain, in which people are seen primarily as problem-solvers in small, granular and well-defined tasks (Amsterdamer & Milo, 2015; Garcia-Molina et al., 2016; Kittur, Chi, & Suh, 2008; Li et al., 2016; Paolacci, Chandler, & Ipeirotis, 2010; Weld, 2015). In this context, Amsterdamer et al. (2015) liken crowds to "an external (and very slow, potentially unreliable) hard drive" that can be queried on demand for information. Since this work typically considers crowds as useful for performing small, independent, and well-defined tasks, we term this stream task-based crowdsourcing.

On the other hand, there is growing recognition of the potential of crowds to support organizational decision-making, operations and innovation through the ability to observe and report on their environment (Brabham, 2013; Brynjolfsson & McAfee, 2014). With an explicit organizational focus, this line of research aims to better understand the advantages and limitations of crowdsourcing as a unique form of organizational "sense-making" (Brabham, 2013; Brynjolfsson & McAfee, 2014). Researchers in this stream investigate a variety of issues, including motivation of crowds (Coleman, Georgiadou, & Labonte, 2009; Daugherty, Eastin, & Bright, 2008; Nov, Arazy, & Anderson, 2011; Prestopnik & Crowston, 2011), data quality in the crowds (Ogunseye, Parsons, & Lukyanenko, 2017; Parsons, Lukyanenko, & Wiersma, 2011; Sheng, Provost, & Ipeirotis, 2008; Sheppard, Wiggins, & Terveen, 2014; Wiggins,

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Newman, Stevenson, & Crowston, 2011), organization of crowds (Arazy, Nov, Patterson, & Yeo, 2011), design of crowdsourcing platforms (Lukyanenko, Parsons, & Wiersma, 2011; Prestopnik & Crowston, 2011; Wiggins et al., 2013), and utilization of crowd-produced resources in organizations (Majchrzak & More, 2011). We focus on those issues relevant to data management. As organizational data collection is typically a continuous, on-going process that involves observing or sensing the broader enviornment, we term this research stream *observational crowdsourcing*.

Note that other types of applications of crowdsourcing exist, including question-answering sites, contests, reviews, and fundraising (Brabham, 2013; Dissanayake, Zhang, & Gu, 2015; Doan et al., 2011; Leimeister, Huber, Bretschneider, & Krcmar, 2009). We limit our focus to the two streams of research that have explicit data management implications (but as databases underlie most crowdsourcing technologies, future research should consider other types of crowdsourcing as well).

TASK-BASED VS. OBSERVATIONAL CROWDSOURCING

In task-based crowdsourcing, crowds are data providers and problem solvers in a larger technological chain. Characteristic features of this type of crowdsourcing include:

1. Small, well-defined tasks;
2. Activities take place primarily online;
3. Crowdworkers are typically (but not always) paid.

Major examples of task-based crowdsourcing platforms include Amazon Mechanical Turk, CrowdFlower, and Microworkers. Using such platforms, designers can pose tasks to a crowd of workers for a small payment. Typical small ("micro") tasks include classifying items, providing missing values, sorting and filtering items, and comparing items; however, more complex tasks, such as answering open-ended questions, are possible (Amsterdamer et al., 2015; Amsterdamer & Milo, 2015; Kittur et al., 2008; Paolacci et al., 2010; Sorokin & Forsyth, 2008). These tasks can be sent to crowd database engines that combine traditional SQL statements with user-defined functions (Franklin et al., 2011; Park et al., 2013). Micro-task data management projects include CrowdDB (Franklin et al., 2011), sCOOP and Deco (Parameswaran, Park, Garcia-Molina, Polyzotis & Widom, 2012; Park et al., 2013), Qurk (Marcus, Wu, Karger, Madden, & Miller, 2011b) and CrowdFill (Park & Widom, 2014).

Task-based crowdsourcing also includes some citizen science projects such as GalaxyZoo, Snapshot Serengeti, and FoldIt (Cardamone et al., 2009; Clery, 2011; Simpson, Page, & De Roure, 2014). Unlike Amazon Mechanical Turk, these projects do not involve payment, but instead tap into the enthusiasm of participants to advance science. Typical tasks in these projects are small, well-defined, and carried out entirely online (e.g., classifying galaxies, identifying animals from digital photographs) (Garcia-Molina et al., 2016).

Commonly, micro-tasks are stripped of broader context and underlying objectives, and can be treated by workers as stand-alone autonomous problems (Brynjolfsson, Geva, & Reichman, 2016; Deng, Joshi, & Galliers, 2016). While special skills may be required to complete a task, broader understanding of the projects or sponsoring organizations is not expected. Each task accrues some cost – making it desirable

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

to "minimize the number of questions" (Parameswaran, Sarma, Garcia-Molina, Polyzotis, & Widom, 2011, p. 267) and trade off cost against other objectives, such as accuracy, completeness, timeliness (see, e.g., Amsterdamer & Milo, 2015). The questions posted to the crowd may have widely-accepted answers that deal with general knowledge (e.g., "What is the capital of country X?") or be more subjective and individual (e.g., "Is movie X a comedy?") (see (Amsterdamer & Milo, 2015)).

As task-based crowdsourcing seeks to gather evidence for well-defined problems or tasks, it conforms to deductive reasoning and the hypothetico-deductive method of inquiry (Evans, Newstead, & Byrne, 1993; Popper, 2002). Deductive reasoning relies on making general statements (i.e., philosophically, beginning with a premise) and finding specific instances of these general statements. The hypothetico-deductive method proceeds by formulating a hypothesis in a form that could be falsified by empirical evidence. As a result, many researchers suggest that crowdsourcing (being a typical data collection endevour that involves people) should be targeted and hypothesis-driven (Francis, Blancher, & Phoenix, 2009; Goodman & Paolacci, 2017; Nichols & Williams, 2006; Wiersma, 2005).

Task-based crowdsourcing naturally fits the prevailing conceptualization of knowledge inquiry and data collection. It also aligns with prevailing methods in science, where conclusions derived primarily from exploratory analysis are still met with skeptisism under the typical assumption that "[i]t is a capital mistake to look at the data before you have identified all the theories" (Leamer, 1990, p. 239). Deductive reasoning is further aligned with traditional data management technologies and approaches (e.g., relational databases, entity relationship diagrams) based on a *closed world* assumption (Reiter, 1987).

While task-based crowdsourcing remains an important area, data management knowledge can be expanded through deeper understanding of another major model of crowdsourcing, observational crowdsourcing, in which organizations harness human perceptual and information-gathering abilities to make sense of the environment in which they operate. Characteristic features of this type of crowdsourcing include:

1. Long-term, continuous data collection;
2. Ill-defined, open-ended tasks;
3. At least in part performed out in the world;
4. Mostly voluntary in nature.

Major examples of observational crowdsourcing include eBird.org, iSpotNature.org, CitySourced.com, and MedWatch (www.fda.gov/Safety/MedWatch). Applications of these projects span diverse topics such as community mapping, crisis management, civic engagement, corporate market surveillance, and online citizen science. These projects are typically created by organizations as standalone platforms to allow people to report on natural or social phenomena they experience in the course of daily life, as well as to interact with each other and the organizational sponsors.

To illustrate the breadth of observational crowdsourcing, consider one of its major manifestations, citizen science, in which organizations (e.g., academic institutions) create purpose-built, open participation, online platforms that allow non-experts to provide data, view data, and often interact with scientists (Gura, 2013; Levy & Germonprez, 2017; Show, 2015; Wiersma, 2010). For example, in 2002 Cornell University launched eBird (www.ebird.com) to collect bird sightings from amateur birdwatchers around the globe to generate data for their ornithology research program (Hochachka et al., 2012; Sullivan et

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

al., 2009).[1] Similar scientific projects include GalaxyZoo (galaxies), iSpotNature.org (global natural history with an historic UK focus), and many regional projects. To appreciate the pervasiveness of citizen science, consider that there are over a dozen large scale, global projects that focus on soils alone (e.g., OPAL Soil, The GLOBE, mySoil App, see (Rossiter, Liu, Carlisle, & Zhu, 2015)).

Much hope is vested in this kind of crowdsourcing, including assisting in tackling humanity's "evil quintet" – climate change, overexploitation, invasive species, land use change, and pollution (Theobald et al., 2015) – and unleashing unprecedented innovation and growth (Brynjolfsson & McAfee, 2014). In biology alone, it is estimated that more than two million people are engaged in major citizen science projects contributing up to $2.5 billion of in-kind value (Theobald et al., 2015). Citizen science promises to reduce research costs and has led to significant discoveries, such as Hanny's Voorwerp - a novel astronomical object named after a Dutch teacher Hanny van Arkel who discovered it on the GalaxyZoo project.

Indeed, citizen science was one of the first applications of crowdsourcing. Scientists have traditionally been accustomed to dealing with outside research participants, field settings, noisy data, and unreliable sources. Science has also been a major investor in resource-intensive and novel data collection infrastructure, and has embraced the promise of user-generated content and interactive web technologies since the late 1990s (Brossard, Lewenstein, & Bonney, 2005; Mims, 1999). Thus, the technological challenges (including those of data management) are relatively well established (Claire, Louise, & Mordechai, 2011; Wiggins et al., 2011).

Unlike highly focused, task-based crowdsourcing, which follows the hypothetico-deductive method of inquiry, observational crowdsourcing often relies on inductive reasoning. Philosophically, this makes (at least some) observational crowdsourcing data collection inductive in nature. Inductive reasoning involves hypothesis construction and making generalizations based on current empirical evidence, knowledge and understanding of phenomena. As a basis for systematic data collection, induction continues to be met with skepticism (Chalmers, 2013; Popper, 2002). Indeed, some observational crowdsourcing is targeted and hypothesis-based (Wiersma, 2010)

At the same time, working with diverse volunteers who are asked to experience a complex and unbounded real world opens an exciting opportunity to discover something new, find unanticipated uses of data, and deepen our understanding of the domain. Consequently, researchers increasingly suggest to approach this type of crowdsourcing in a hypothesis-free manner and explicitly seek to capture "unknown unknowns" (Lukyanenko, Parsons, & Wiersma, 2016; Wintle, Runge, & Bekessy, 2010). Among other things, this suggests embracing a more open view of domains. The reliance on targeted collection, however, limits the potential for knowledge discovery using crowds. Any predefined data collection inherently constrains the variety of data that can be collected in a study by fixing in advance the classes and attributes of interest and, consequently, determines both the classes and attributes to be excluded. While this results in highly consistent data, it limits creativity, discovery and innovation in crowds.

As many traditional data management approaches (e.g., based on a closed-world assumption) are more aligned with task-based crowdsourcing, we call on researchers to support observational crowdsourcing with innovative data management solutions.

The differences between typical task-based and observational projects are summarized in Table 1. Next, we discuss trends and opportunities in task-based crowdsourcing and then turn our attention to the observational crowdsourcing data management issues and challenges.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Table 1. Comparison between typical task-based and observational crowdsourcing

Characteristic	Observational	Task-based
Nature of data collection	Long-term, continuous	Short, standalone
Problem formulation	Often ill-defined, open-ended	Well-defined
Data collection setting	Out in the world	Online
Nature of participation	Voluntary	Paid, sometimes voluntary
Philosophical underpinning	Inductive reasoning	Deductive reasoning

TASK-BASED CROWDSOURCING RESEARCH: TRENDS AND FUTURE OPPORTUNITIES

The work on task-based crowdsourcing highlights a number of problems requiring future research. Recently, there have been several reviews examining current and future potential of task-based crowdsourcing (Amsterdamer & Milo, 2015; Garcia-Molina et al., 2016; Li et al., 2016). Here, we briefly summarize some research questions in this stream (done here for context-setting and comparison with observational crowdsourcing, the main focus of this paper).

Major task-based crowdsourcing challenges relate to cost-benefit management when selecting the number of crowdworkers, number of tasks per worker, and models for aggregating crowd-produced results (Franklin et al., 2011). A major open challenge in crowdsourcing is incentivization and motivation of crowd workers (e.g., (Sheng et al., 2008)). As discussed by Amsterdamer and Milo (2015), trade-offs are inevitable and an unresolved issue is which objective function is best for a given application. Since incentives frequently involve payment, a research challenge is determining when and how much payment is appropriate for a given scenario, and when more intrinsic motivators can be more effective (Dow, Kulkarni, Klemmer, & Hartmann, 2012).

Information quality is a major challenge in task-based crowdsourcing. While crowd workers typically get paid for their contributions, the payments are often small, and traditional organizational incentives (e.g., awards, recognition by peers and promotions) are lacking (Deng et al., 2016; Gray, Suri, Ali, & Kulkarni, 2016). A common approach when dealing with small tasks assigned to crowd workers is that, by exploiting redundancy in the crowds (i.e., asking multiple users the same question, see (Franklin et al., 2011; Park & Widom, 2014)), some mean tendency can be established. Redundancy is thus a major form of quality control (in addition to other strategies, such as qualifying crowdworkers based on a number of previously completed tasks, and post-hoc statistical analysis, see (Hochachka et al., 2012; Wiggins et al., 2011)).

Another issue is crowd selection, as expertise and motivation differs substantially within crowds (Arazy et al., 2011; Coleman et al., 2009; Ogunseye & Parsons, 2016). As much task-based crowdsourcing is focusing on major platforms, such as Amazon's Mechanical Turk, research has examined crowd selection mechanisms provided by these platforms (e.g., qualifying tests, available worker profile variables) (Ipeirotis, Provost, & Wang, 2010; Kittur et al., 2008; Paolacci et al., 2010). A major stream of research examines task-worker matching and making task recommendations given worker attributes (e.g., expertise, past task performance) and declared preferences (Ambati, Vogel, & Carbonell, 2011; Geiger & Schader,

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

2014; Mao, Yang, Wang, Jia, & Harman, 2015; Yuen, King, & Leung, 2011, 2012). A promising, but thus far ill-explored (Amsterdamer et al., 2015), technique is specifying crowd properties directly when formulating a query. For example, a CrowdSQL (Franklin et al., 2011) query may be in this form:

```
SELECT SpeciesName
FROM BiologyPhotos
WHERE conservationStatus ~= 'Invasive'
   AND crowdExpertise IN ('Biology',  'Ecology', 'Australia')
```

In this query, the results are effectively conditioned on the right mix of crowd workers. This, of course, presupposes there is a shared ontology of crowd properties and leads to challenges in interpreting the results in the context of crowd qualifications.

Bringing humans into the technological chain of query formulation, writing, and execution necessitates rethinking existing query optimization algorithms. Specifically, query optimization strategies for crowds need to confront significantly greater latency and provide redundancy to deal with the unreliability of individual crowd worker results. The key to addressing this issue may lie in parallel execution and innovative approaches to decomposing, merging, and aggregating results (Difallah, Catasta, Demartini, & Cudré-Mauroux, 2014; Kucherbaev, Daniel, Tranquillini, & Marchese, 2016; Tranquillini, Daniel, Kucherbaev, & Casati, 2015).

A broader problem is establishing which tasks are amenable to human-powered intervention, discovering and enlarging the boundaries on crowd potential. An open issue is that of scale and the ability of human-powered problem-solving to handle big data queries. As the issue of information quality looms large when dealing with variable and often limited domain expertise, it motivates a search for innovative solutions for conceptual and logical storage and corresponding interfaces for micro-tasks that makes it easier for crowdworkers to find tasks to which they are able to contribute (Park & Widom, 2014).

We expect that research on task-based crowdsourcing will continue to benefit from major advances in related fields. Indeed, many studies of small tasks lie at the intersection of cognitive psychology, human-computer interaction, artificial intelligence (AI), natural language processing (NLP), and computer vision. A growing area of research is hybrid intelligence, wherein crowdsourcing is augmented with AI (Bernstein et al., 2015; Davis & Marcus, 2015; Guo et al., 2015). For example, a growing application of hybrid intelligence is when initial work is done by AI and humans are asked to tackle tasks for which AI has low confidence (e.g., beta version of CrowdFlowerAI, see crowdflower.com). As AI is less expensive than human crowds, a key challenge is in expanding abilities of AI to support human tasks. This can be done by using AI for pre-processing information and prioritizing work to be done by humans, and by identifying those tasks that are particularly difficult for AI, but easier for humans (Davis & Marcus, 2015; Guo et al., 2015).

Finally, research is needed to expand this context beyond such popular and well-understood platforms as Amazon's Mechanical Turk, and investigate micro-task problems in small projects where there is less redundancy and less is known about potential contributors (as an example, consider small projects created using EpiCollect.com[2]). In such scenarios, the "cold start" problem (i.e., when task requesters or the platforms cannot draw inferences for users about which it has not yet gathered sufficient information) is a major challenge (Lika, Kolomvatsos, & Hadjiefthymiades, 2014; Schein, Popescul, Ungar, & Pen-

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

nock, 2002; Tejeda-Lorente, Bernabé-Moreno, Porcel, & Herrera-Viedma, 2017). Cold start potentially affects worker selection, providing appropriate interface designs, and selecting questions and conceptual structures matching potentially unknown characteristics of the crowd. These challenges motivate research examining potential solutions to this problem (Chen, Zhao, Wang, & Ng, 2016; Fan, Wei, Zhang, Yang, & Du, 2016; Safran & Che, 2017).

The challenges related to task-based crowdsourcing are summarized in Table 2, with sample solutions taken from research discussed above.

OBSERVATIONAL CROWDSOURCING: TRENDS AND OPPORTUNITIES

To understand data management challenges in observational crowdsourcing, consider the case of eBird. eBird contributors report birds they have seen in the wild. To generate consistent data, the collection is structured to make it amenable to search and retrieval by scientists. In particular, users are asked to select the biological species of the observed bird from a set of available options and indicate how many birds of the species were observed, as well as where and when the observation took place. Data are stored in a relational database.

Some decisions related to data management in a project such as eBird include: conceptual structures used to capture objects of interest to scientists; database schema used for storage; data collection interfaces; and, possibly, data visualization tools. Traditionally, users (in this case, amateur birders and scientists) would be involved in conceptual modeling and database design (for verification purposes) to ensure that the resulting structures reflect the views of all participants. The key issue is that, while scientists are a relatively homogenous and well understood stakeholder group, in a project such as eBird there are typically no constraints on who can participate. As a result, data contributors can be an extremely diverse, anonymous, and ill-understood user group. Therefore, it is unclear how to best structure data in such a project.

Table 2. Challenges and sample solutions in task-based crowdsourcing

Challenge	Sample solutions
Task and worker cost-benefit management	Formal models of optimality between number of tasks per worker and task cost, models of optimal number of workers
Data quality management	Employing task redundancy, data post-processing, traning, tutorials
Incentives and motivation	Paying crowd workers, modeling optimal payment schedules
Crowd selection	Using CrowdSQL to specify crowd attributes, qualifying tests, platform-provided filters
Innovative interface design	Allowing workers to select questions to answer (e.g., CrowdFill)
Task-worker matching	Automatic task recommendation agents
Crowd SQL query optimization	Optimizing worker response time by decomposing tasks
Crowd-database integration	Human-powered queries (e.g., CrowdSQL)
Establishing bounds of crowdsourcing	Hybrid intelligence solutions

Managing Key Objective Trade-Offs: Quality, Utility and Participation

The eBird project shows a key challenge of observational crowdsourcing: managing the key trade-offs between utility of the data, data quality and user participation. In addition, recognizing that people may observe something unusual or novel, projects often have another objective: fostering discoveries.

It is generally recognized that data quality is a major issue for these types of projects (Kosmala et al., 2016; Lewandowski & Specht, 2015; Lukyanenko et al., 2014b). At the same time, eBird would not survive if volunteers do not provide observations of birds – making efforts to increase participation of great importance (Diner, Nakayama, Nov, & Porfiri, 2017; Domroese & Johnson, 2017; Lee, Crowston, Østerlund, & Miller, 2017). Finally, the project is designed to deliver data for scientific research and thus, citizen science projects organize domains to maximize the scientific utility of the data (Burgess et al., 2017; Prestopnik & Crowston, 2012; Stevens et al., 2014).

The search for solutions to address these three issues often means emphasizing one over the other. Thus, most projects in biology require positive identification (i.e., classification) of genera or species, as this classification level is useful for scientific analysis (Elbroch et al., 2011; Lewandowski & Specht, 2015; Mayden, 2002). For example, eBird asks users to discriminate discriminate between Common, Caspian and Artic Tern. However, members of the general population targeted by crowdsourcing are not biology experts and may not be able to correctly identify at the species level (Gura, 2013; Lewandowski & Specht, 2015). Requiring contributors to classify at the species-genus level (or other levels of interest to science) may lead to guessing or project abandonment (Lukyanenko, Parsons, & Wiersma, 2014a; Lukyanenko et al., 2014b). One common solution to this challenge is traning data contributors, but this approach is limited given the often-anonymous Internet setting and uncommitted nature of online volunteers (Lewandowski & Specht, 2015). This is quite different from typical task-based crowdsourcing, where training may be required or crowd workers with desired characteristics can be specified as part of the task design.

Recently, researchers have been exploring advanced statistical techniques that can be used after data is captured to detect outliers or increase confidence in data provided by non-expert crowds (Bonney et al., 2014). Advanced computational techniques (e.g., live questions from an artificial agent) have also been used to support of volunteers during the data collection activity itself. For example, a promising direction is applying machine learning techniques that aim to classify an organism based on the photograph provided (e.g., eBird's MerlinApp). Yet, this is generally possible only with few target classes (which may not work in most general purpose projects[3]), and only when the photos are available and of sufficient resolution. In addition, such approaches do not recognize the value of capturing additional information about an observation. Thus, beyond classifying the focal object, projects are frequently interested in the context of observation and other notable objects. For example, a project may hope to collect in a structured form information such as "observed species *x* while on a tourist trip from *h* to *z*; *x* was preying on species *y*; species *y* appeared ill; one wing was broken and it seems to have been covered in oil; it was sunny and windy; species *x* and *y* were identified with the help of the tour guide *j*." As each such story would be different, this uniqueness makes observational crowdsourcing especially promising as a source of discoveries.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Data Sparsity and Data Intergration

From an organizational perspective, observational data production is continuous (consider eBird, which has been operating since 2002). At the same time, crowd members are free to drop in and out of projects sporadically, as organizations have little control over user participation (Rossiter et al., 2015; Wiersma, 2010). This results in a major challenge of integrating data across participants into a coherent domain view. Moreover, projects often involve observations of phenomena across a geographic area (e.g., UK in iSpot.org.uk, Australia in ala.org.au). This contrasts with the way much research has conceptualized crowdsourcing thus far, since, in task-based crowdsourcing, sparsity can be dealt with through task design. Indeed, the prevalence of redundancy as a common feature of task-based crowdsourcing creates an opposite challenge of data aggregation. Unlike micro-tasks that are necessarily focused, a major obstacle in observational data collection is integrating sparse and weakly-related data across time and space.

Large or Open Domain Boundaries

Traditional database development, as typically used in micro-task crowdsourcing, presupposes that domain boundaries are well-established. As organizations hope to better understand a complex and dynamic real-world environment through crowdsourcing, the scope of projects can be extensive and malleable. For example, iSpot.org.uk collected sightings of all-natural history in Great Britain. Similarly, GalaxyZoo images contain a variety of cosmic objects, some unknown to scientists themselves. A Canadian project, www.nlnature.com, interprets its interest in "local natural history" as including "any sighting of plants, animals, and other things (e.g., interesting rocks, landmarks)."[4] This means no single crowd member, developer or domain expert is likely to be an expert in the entire application domain.

Dealing with spatial, temporal, and attribute data scarcity is an important research direction. If an organization (e.g., a city) is looking to manage services based on a crowdsourcing data set (e.g., citysourced.com), it needs to "impute" gaps in coverage that necessarily arise when data is not collected systematically. The question arises whether it is possible to anticipate such gaps and proactively channel crowd effort in appropriate directions. Thus far, research has demonstrated the extent of this problem (Boakes et al., 2010; Lukyanenko et al., 2014b), but offered few solutions (none to our knowledge dealing with databases).

Need to Understand Data Creation Context

In many citizen science projects, it is critical to understand the context (i.e., relevant environmental factors) of data creation in order to better interpret the observations. In many projects, the phenomena about which users supply data may be available only to the original contributor (or a handful of people). For example, in projects that map biodiversity, the objects of interest (e.g., birds, animals) may be fleeting with a very short exposure time. In such cases, it is extremely difficult to exploit redundancy in the crowds (Franklin et al., 2011; Sheng et al., 2008), and the challenge is to get the most value out of a single data point. The anonymous nature of many projects further precludes seeking clarification or additional information unless such a query can be formulated before the contributor leaves the project.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

While the issue is relevant to many projects, few specialized solutions exist. For example, a recent study suggests that the common practice of relying on the same volunteers over time may result in crowds becoming "stale"; this manifests in volunteers providing fewer context-rich observations (Ogunseye et al., 2017). This may suggest that projects should continuously recruit new volunteers, as well as offer incentives for existing volunteers to provide context-rich data.

Difficulty in Collecting System Requirements

A major feature of observational crowdsourcing is the democratic nature of participation. Projects such as eBird allow anyone to register and post observations of birds. While these projects are developed primarily to serve the needs of organizations (with stable cohorts of subject matter experts, such as scientists or product engineers), the users or contributors (i.e., citizen scientists, product consumers) are ordinary people, often lacking subject matter expertise and possessing diverse domain views (Gura, 2013; Lewandowski & Specht, 2015; Sullivan et al., 2009). Whereas task-based crowdsourcing may constrain who gets to perform a task (e.g., by eliminating members with low reputation, requiring a certain skill, or pruning data post-hoc based on known user attributes), this is often impossible when participation is open and anonymous. In citizen science, for example, many projects require only minimal information from participants (e.g., to comply with anonymity requirements of research protocols (see, e.g., Lukyanenko et al., 2014a)). As a result, some requirements and domain knowledge may originate from domain experts within organizations, but data are often provided by anonymous and non-expert users. It is furthermore impossible to reach every potential user who may wish to contribute data. As modelers are unable to fully determine the domain expertise of crowd providers and reach every potential user, a major challenge is how to conduct requirements elicitation and analysis to design appropriate database schemas and user interfaces that are congruent with the views of all users.

The challenges of requirements elicitation loom larger in observational crowdsourcing than in task-based projects. Unlike the latter, observational crowdsourcing projects are often developed from scratch and require custom modeling, database design and user interfaces. They are also considerably larger in development scope, and thus more expensive to implement, than task-based projects where existing platforms provide complete environments for worker participation and even provide ready-made templates for common tasks. In contrast, observational projects have to create the entire user environment for each project (e.g., data collection forms, visualization of existing data points, user forums). Furthermore, as many tasks are quite inexpensive, task providers working with such environments as AMT may freely experiment with test configurations until the desired outcomes are reached. In contrast, for many observational projects, there is a considerable delay (sometimes measured in years) between the original inception of the idea and the analysis of the data provided by contributors and the realization that something should be adjusted or modified in the task protocols and project designs. Consequently, it is critical to ensure that analysts collect accurate and complete requirements to specify appropriate features of the projects.

Motivated by the challenges to requirements elicitation in UGC, researchers have been exploring such solutions as user surrogates (e.g., usability experts), attracting average or representative users, conducing elicitation via videoconferencing platforms, and conducting requirements based on stratified sampling of users from common groups (e.g., non-experts vs. experts) (Anand & Mobasher, 2005; Carroll, Hoffman, Han, & Rosson, 2015; Iivari & Iivari, 2011; Iivari, 2011; Le Dantec, Asad, Misra, & Watkins, 2015; Salgado & Galanakis, 2014). Despite these solutions, often a very small group of users (e.g., those most

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

accessible to the development team, such as scientists) are intensely involved (Bratteteig & Wagner, 2012, 2014). Requirements elicitation in UGC remains an open and exciting opportunity that researchers are continuously encouraged to pursue (Iivari, 2011; Kyng, 2010; Lukyanenko, Parsons, Wiersma, et al., 2016; Obendorf, Janneck, & Finck, 2009; Shapiro, 2010, 2010; Titlestad, Staring, & Braa, 2009).

Choice of Data Model

The choice of the data model affects the way information is collected and stored in crowdsourcing, including task difficulty and the quality of the resulting data. Thus, we specifically focus on the issue of data models in observational crowdsourcing.

Currently, there is no agreed-upon data model for observational crowdsourcing. Many major crowdsourcing projects, such as eBird, CitySourced, and EpiCollect, are based on traditional (e.g., relational) implementations, as there is no established solution specialized for observational crowdsourcing. Indeed, much work on micro-task based crowdsourcing extends the relational data model and SQL (Davidson, Khanna, Milo, & Roy, 2013; Franklin et al., 2011; Marcus, Wu, Karger, Madden, & Miller, 2011a). In contrast, some researchers argue the relational model has a negative impact on information quality and user participation and suggest that noSQL flexible data structures are more appropriate in this setting (Lukyanenko et al., 2014b).

In recent years, there has been growing interest in flexible data models. One approach is dynamic schema evolution or malleable schema (Dong & Halevy, 2005; Roussopoulos & Karagiannis, 2009). These approaches have been suggested for web-based systems and micro-task markets (Selke, Lofi, & Balke, 2012). As a variation, users may also be allowed to create their own schemas. The malleable schema approach, however, invites unresolved issues of cooperative schema evolution, concurrent access, and modification of schemas. It is also unclear if this approach is reliable for less knowledgeable or technology-averse users who may lack skills and motivation to create or alter models. Also, the sporadic nature of participation (anonymous or semi-anonymous in some projects) makes it difficult to assume quality of schemas (unlike in more predictable task-based crowdsourcing; see (Selke et al., 2012)).

One approach that has received research attention, including empirical evaluation, is the instance-based data model (Parsons & Wand, 2000) in crowdsourcing (Lukyanenko et al., 2017, 2014b). The model is based on the premise that instance and attribute are more fundamental modeling constructs than class. Although promising, unresolved issues with instance-based approaches include usability (i.e., developing appropriately flexible user interfaces) and assuring that data is useful for project sponsors. Given the demonstrable benefits of the instance-based model, an open question is whether other similar models, such as graph, key-value, or document-based, can also be leveraged (Cattell, 2011; Chang et al., 2008; DeCandia et al., 2007). Application of graph databases has been examined in task-based crowdsourcing (Parameswaran et al., 2011), but could be extended to observational crowdsourcing as well.

Both traditional and flexible approaches to modeling crowdsourced data embody the assumption that data schemas (rigid or flexible) are specified before data can be collected and stored. The case of citizen science above should motivate data management researchers to rethink this assumption.

One possible solution is storing user input in an unstructured form (e.g., as free-form text). However, without systematic data production in the direction required by project sponsors, the yield of useful information from free-form data collection is likely to be dismal. Furthermore, since a hallmark of crowdsourcing is massive datasets (even "big data") (Hochachka et al., 2012; Ipeirotis & Gabrilovich, 2014), to the extent possible data needs to be structured to allow for automatic querying and analysis. Currently many

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

projects (e.g., eBird, GalaxyZoo) employ a hybrid solution: there are few predefined fields (e.g., type of galaxy; bird species observed), while additional information can be entered in a comments field, via email or an accompanying discussion forum (if available). This raises the question of how to determine the best allocation of data between structured and unstructured forms, and, importantly, how to increase the structured component of the project. Some solutions include post-hoc application of data-intensive techniques (e.g., data mining) (Hochachka et al., 2012). An open question is whether innovative data modeling and artificial intelligence can be used to collect more structured data at the point of capture. Artificial intelligence, including hybrid intelligence, is a major trend in task-based crowdsourcing (see above), yet its applications to observational projects remains limited.

Advances in natural language processing open opportunities in data collection and processing. One impact on data management research is increased utility of unstructured data formats when data from crowds can be collected as text and then parsed using text mining or natural language processing (NLP) (e.g., Jha, Andreas, Thadani, Rosenthal, & McKeown, 2010). A promising area of research resulting from NLP is voice-based data collection in crowdsourcing (e.g., dictating observations into a smart phone that is able to parse this information and possibly ask follow-up questions in real time). These applications may be limited in task-based environments (where activities occur primarily online), but may be quite effective in observational projects that involve generating data while experiencing the world. In many natural settings (in the forest, on the road, on a boat), speaking into a system may be more convenient than typing. Presently, we are not aware of research that specifically investigates this solution, creating an opportunity for a potential breakthrough in observational crowdsourcing.

Summary

Unlike task-based crowdsourcing that places crowds in a well-controlled technological chain, observational crowdsourcing conceptualizes crowds as integral elements of the organizational information chain that links internal decision making with the messy external environment. Crowds are sources of data and insights on the broader context in which organizations operate, giving people a more active and open-ended role in the data gathering process, and in the project as a whole. In this setting, database researchers are confronted with the need to produce solutions that are both technologically sound and effective at unlocking the potential of people as sensors of their surroundings, while delivering data of high quality to be usable in scientific research. The challenges related to observational crowdsourcing are summarized in Table 3; the table also presents potential solutions taken from research discussed above.

OUTLOOK FOR THE FUTURE

Crowdsourcing provides an opportunity for researchers to develop applications that support knowledge acquisition from diverse and heterogeneous crowds. Drawn to its promise, crowdsourcing research is on the rise. This survey of the crowdsourcing landscape suggests there are two major, but disconnected, "islands" of crowdsourcing research: task-based and observational. Task-based crowdsourcing builds innovative technological chains by inserting human workers at various points of data processing. In contrast, observational crowdsourcing conceptualizes as volunteers and "intelligent sensors" of reality. While much scope for innovation remains in task-based crowdsourcing, research on data management for observational crowdsourcing is scarcer and the challenges formidable.

Table 3. Challenges and solutions in observational crowdsourcing

Challenge	Sample solutions
Data quality	Training of volunteers, post-processing of data
Participation and motivation (as it relates to data management)	Gamification of tasks, removing participation barriers by making data collection easy and intuitive
Organizational (scientific) utility of data	Restricting data input, using advanced computational techniques to structure and analyze data after it is collected
Fostering discoveries	Promoting discoveries through open and flexible interfaces, asking real-time follow-up questions using natural language capable artificial agents
Optimizing objective trade-offs (e.g., between quality and utility)	Using open and flexible data collection processes and data models
Data sparsity, data intergration	Statistical techniques for data integration
Large and open domain boundaries	Democratizing requirements elicitation, keeping project open to new classes of things
Need to understand data creation context	Avoid crowd staleness, encourage volunteers to provide diverse and context-rich data
Difficulty in collecting system requirements	Leverage usability experts, representative users, massive videoconferencing platforms
What data model to use?	Flexible in schema-less solutions, NLP

Our goal is to bring into focus the potential of observational crowdsourcing that we hope will catalyze database researchers to search for innovative solutions. While challenges in this domain are significant, we believe there are reasons to be optimistic. Many issues in observational crowdsourcing have been subjects of considerable research in the data management research community, including flexible schemas (Abiteboul, 1997; Angles & Gutierrez, 2008), data integration (Batini, Lenzerini, & Navathe, 1986; Zhao & Ram, 2007), schema evolution (Banerjee, Kim, Kim, & Korth, 1987; Liu, Chrysanthis, & Chang, 1994), data sparsity (Chang et al., 2008; Lehner, Albrecht, & Wedekind, 1998), conceptual modeling for dynamic and changing requirements (Chen, 2006; Liddle & Embley, 2007), data quality (Batini et al., 2015; Becker, 1998; Lee, Pipino, Strong, & Wang, 2004; Wang & Strong, 1996), and the rapidly expanding fields of AI, NLP, computer vision and hybrid intelligence (Bernstein et al., 2015; Davenport & Patil, 2012; Davis & Marcus, 2015; Nixon & Aguado, 2012). This and other relevant knowledge can be brought to bear on data management challenges in observational crowdsourcing.

The work in micro-task markets has already resulted in promising technologies that improve schema design, enhance query execution and optimization, and support innovative database and interface integration. Such innovative concepts as human-powered queries or joins have been proposed and implemented. Many of these solutions could be applied to power observational crowdsourcing as well. For example, the CrowdFill (Park & Widom, 2014) application introduces a novel data model for task-based crowdsourcing that gives workers considerable discretion in what to contribute. This data model could be leveraged in other kinds of crowdsourcing as well by giving volunteers flexibility in determining what kind of data they wish to contribute. Similarly, the concept of redundancy is central to many micro-tasks, with much ongoing research that examines efficient design of repeating tasks, organization of multiple labelers, detection of abnormalities, and models of optimality when other factors (e.g., cost) are considered (Franklin et al., 2011; Sheng et al., 2008). As many observational projects (e.g., eBird.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

org) actively employ statistical algorithms that seek to detect outliers and discover averages (Bonney et al., 2014; Hochachka et al., 2012), both streams of research stand to benefit from closer interaction.

There appears to be a significant opportunity for cross-pollination of findings and solutions between task-based and observational crowdsourcing. Both study very similar phenomena of large numbers of ordinary people contributing their abilities, talents and observational capacities to specific projects. This shared opportunity translates into a common challenge of creating an effective technological space that allows people of different views, motivations, and backgrounds to contribute successfully. Having this common challenge underscores the need for greater cooperation between the two islands of data management research in crowdsourcing.

The challenges posed by crowdsourcing (see Table 2 and Table 3) give rise to exciting research opportunities. The ongoing work on human-powered data management tasks has made significant strides, and many open questions remain. However, it is in another major type of crowdsourcing – one emphasizing human surveillance of the environment – that more wicked problems lurk. Unlike closed corporate environments which can be conceptually "frozen" to develop agreed-on conceptual and logical structures that represent domains, observational crowdsourcing is inherently dynamic and open. This translates into an opportunity for researchers to gain a deeper understanding of crowdsourcing and leverage this knowledge to potentially revolutionize data management theory and practice.

Chapter 73
Integrated and Transactional Platforms: Crowdsourcing and Crowdfunding Platforms

Sergey Yablonsky
St. Petersburg University, Russia

ABSTRACT

In recent years, crowdsourcing has increased in popularity as a method for gathering ideas for new innovations and providing solutions to existing problems. In this chapter, crowdsourcing intermediaries and business models are analyzed. How intermediaries' providers are managing interactions between different groups of platform actors (contributors) in order to receive new ideas, feedback, and solutions for improving consumers products and services is studied. Crowdfunding platforms are discussed based on crowdsourcing open innovation vision. Hence, research focuses on crowdfunding innovations for alternative financial services. The chapter aims to collect and analyze quality data regarding the current status and prospective evolution of crowdfunding. The study offers classification and examination of the current status of crowdfunding and proposes a definition of the crowdfunding multi-sided platform, develops research framework for crowdfunding platform comparison and business model analysis. The results of this chapter reveal benefits but also practical challenges to overcome before innovation crowdsourcing and crowdfunding intermediaries can be effectively utilized.

INTRODUCTION

The term "crowdsourcing" was introduced by Howe (2006) and defined as "the act of a company or institution taking a function once performed by employees and outsourcing it to an undefined (and generally large) network of people in the form of an open call. This can take the form of peer-production (when the job is performed collaboratively), but is also often undertaken by sole individuals. The crucial prerequisite is the use of the open call format and the large network of potential laborers."

Estellés-Arolas, E. and González-Ladrón-de-Guevara (2012) found more than 40 definitions of crowdsourcing in the extant literature. Based on those findings, they have created a comprehensive definition for crowdsourcing: "Crowdsourcing is a type of participative online activity in which an individual, an institution, a non-profit organization or company proposes to a group of individuals of varying knowledge, heterogeneity and number, via a flexible open call, the voluntary undertaking of a task. The undertaking of the task, of variable complexity and modularity, and in which the crowd should participate bringing their work, money, knowledge and/or experience, always entails mutual benefit. The user will receive the satisfaction of a given type of need, be it economic, social recognition, self- esteem or the development of individual skills, while the crowdsourcer will obtain and utilize to their advantage what the user has brought to the venture, whose form will depend on the type of activity undertaken."

Brabham (2008, 2013) defined "crowdsourcing" as an "online, distributed problem-solving and production model." Brabham defined the following 4 key ingredients of crowdsourcing:

1. An organization that has a task it needs to be performed,
2. A community (crowd) that is willing to perform the task voluntarily,
3. An online environment that allows the work to take place and the community to interact with the organization, and
4. Mutual benefit for the organization and the community.

What is more, crowdsourced labor is truly motivated to make a contribution only if they see their efforts make a real difference and the game is worth playing. That is why crowdsourcing is about networking and tapping the right crowd (Belleflamme et al., 2014).

Nakatsu, Grossman and Iacovou (2014) define crowdsourcing as a four-step process in which:

1. A requestor (either an individual or organization) identifies a specific task to be performed or problem to be solved;
2. The requestor broadcasts the task or problem online;
3. The crowd performs the task or solves the problem;
4. Depending on the nature of the task, the requestor either
    a. Sifts through the solutions and selects the best solution (selective crowdsourcing), or
    b. Aggregates/synthesizes the crowd's submissions in a meaningful way (integrative crowdsourcing)."

It is helpful to look at the levels of crowdsourcing classification (see Figure 1) to determine what is included in crowdsourcing approaches.

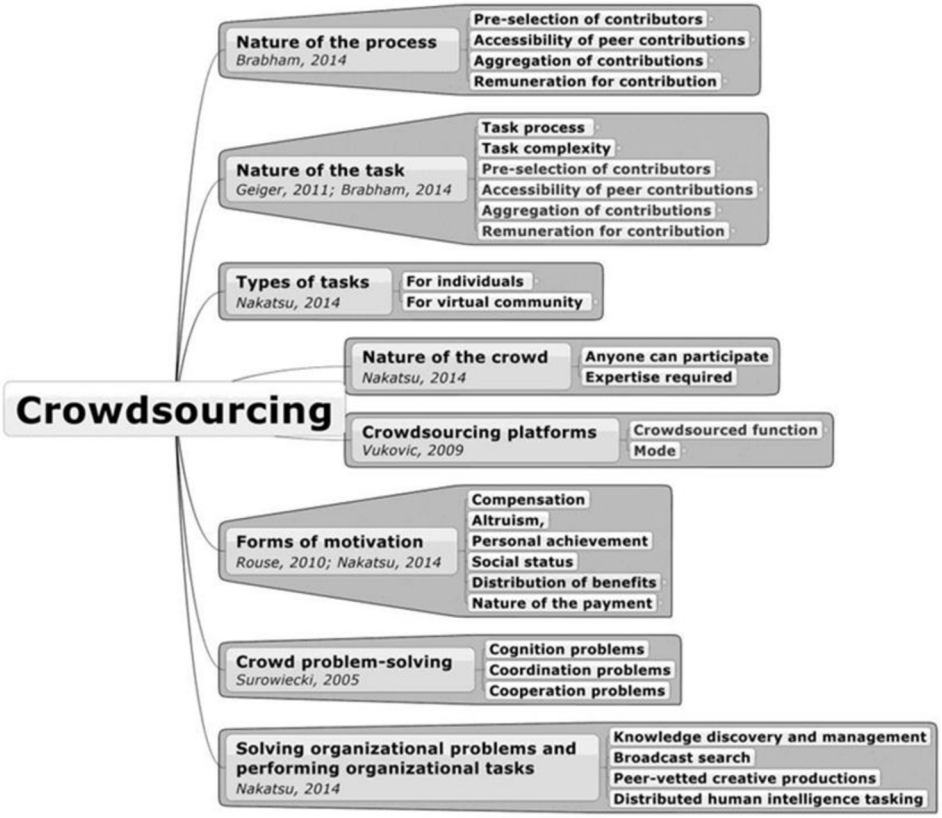
Crowdsourcing and Open Innovation

The open innovation concept was introduced by Chesbrough and Rosenbloom (2002), Chesbrough (2011). Marjanovic et al. (2012) and Wikhamn (2013) hold that crowdsourcing is an important type of open innovation.

While open innovation is a central idea in crowdsourcing, the two terms are not synonymous and should not be used interchangeably (Marjanovic et al., 2012). Open innovation focuses primarily on innovation processes, with many of these processes describing knowledge flows between firms (B2B

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 1. Classification of crowdsourcing approaches (2 levels)



transactions) rather than between firms and large crowds of anonymous individuals. As we have shown above, there are many other reasons why firms and individuals use crowdsourcing. So not all forms of open innovation are used for crowdsourcing (see Figure 2).

Crowdsourcing innovation is a multi-dimensional phenomenon that should be described from different perspectives – cultural, organizational and technological spheres – that have transformed significantly

Figure 2. Classification of open innovation approaches (2 levels)

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

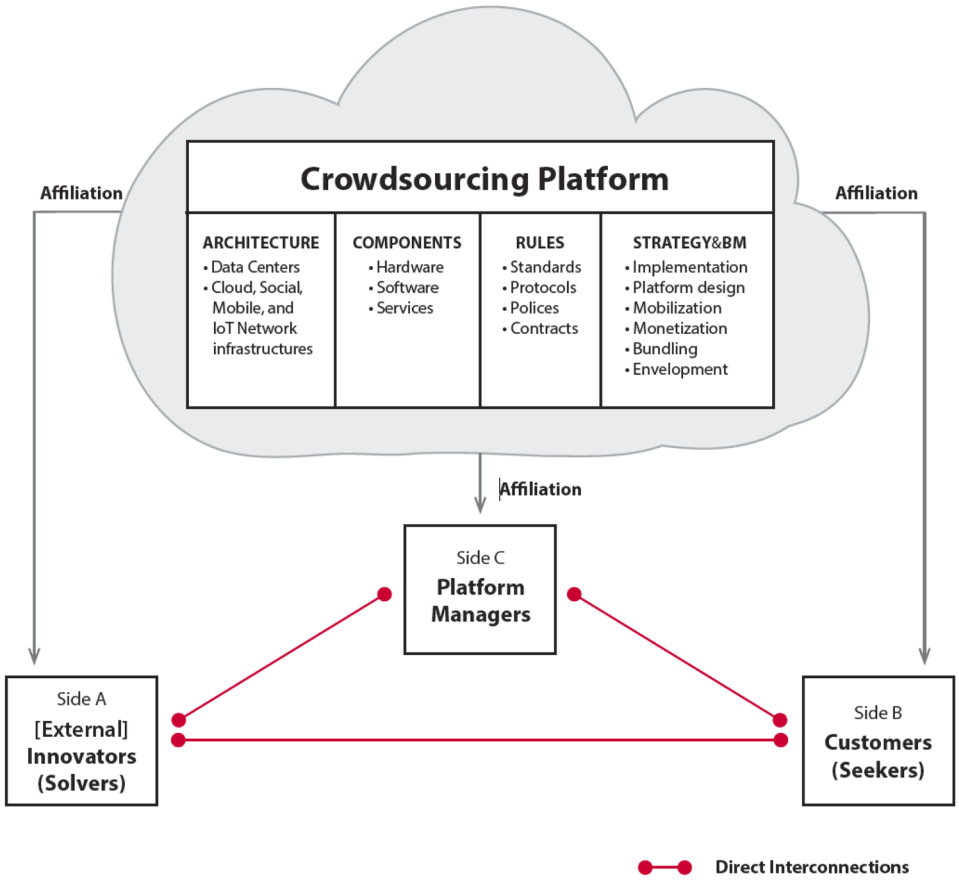
under the development of web technologies, web 2.0 in particular. A crowdsourcing process comprises a number of activities that involve resources within and beyond organizational boundaries, mostly human participants.

The characteristics of the activities and resources within this process depend on the specific purpose of a crowdsourcing effort. Research on crowdsourcing innovations comes from a variety of fields such as IT innovations, platform innovations, open innovations, social innovations, management, psychology and many other areas that have discovered crowdsourcing as a useful approach.

Crowdsourcing network users (seekers and solvers) access a common platform that facilitates their interactions. Platforms are usually a subset of components (hardware, software, services) and rules (technical standards, protocols for information exchange, policies and contracts that govern transactions) employed by users in most of their transactions. Crowdsourcing MSP business model always should be related with Crowdsourcing MSP strategy. All this forms main platform building blocks (Figure 3). Minimal number of crowdsourcing MSP sides is usually 3.

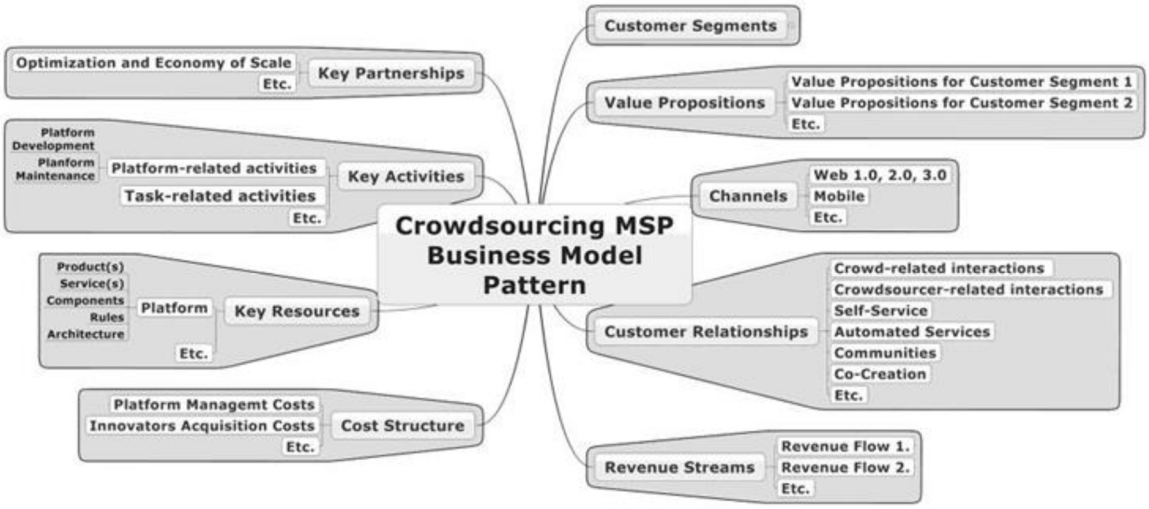
Therefore, crowdsourcing MSP BMP framework has a distinct structure of taxonomy and is shown on the Figure 4. Crowdsourcing MSP BMP creates Value by facilitating interactions between different

Figure 3. Three-sided crowdsourcing platform main building blocks



EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 4. Crowdsourcing MSP business model pattern



groups/sides of the platform. The crowdsourcing MSP BMP Value Proposition usually creates value in such main areas (Hagiu, 2006; Osterwalder & Pigneur, 2010; Evans, 2011):

- Mobilizing user groups (Customer Segments) and balancing interests;
- Matchmaking between Customer Segments;
- Reducing costs by channeling transaction through the platform;
- Strategic decisions in platform evolution, multi-homing costs, scaling and liquidity.

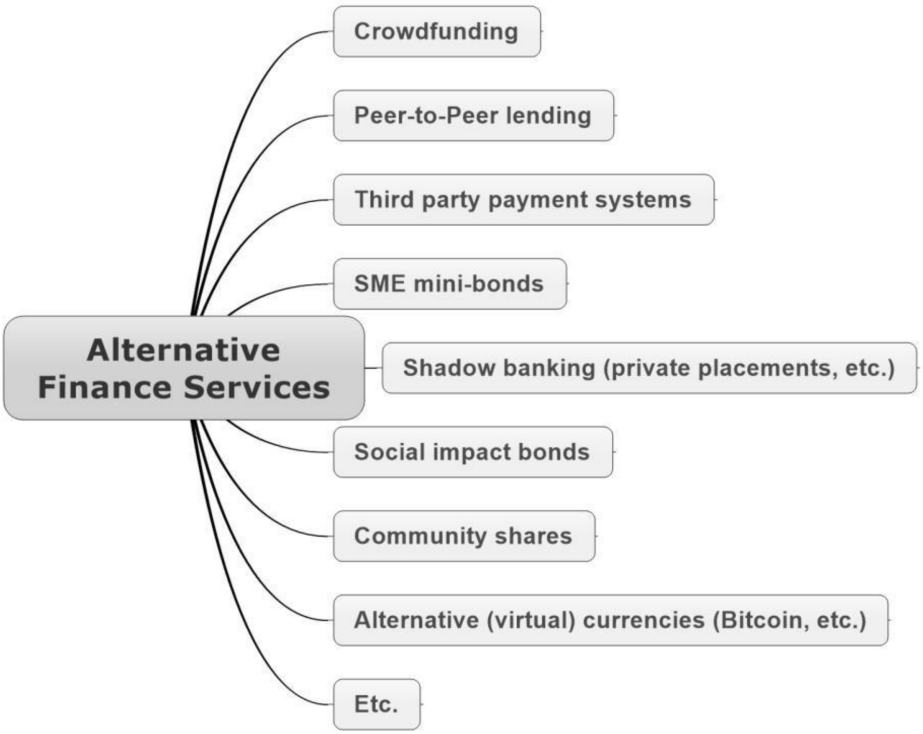
Crowdsourcing MSP BMP has several Platform Customer Segments, each of which has its own Value Proposition and associated Revenue Stream. Furthermore in some business models one Customer Segment cannot exist without another. Sometimes one or more Customer Segments may enjoy free offers or reduced prices subsidized by revenues from other Customer Segments. Choosing which segment to subsidize can be a crucial strategic pricing decision that determines the success of MSP BM. MSPs are of value to one group of customers only if the other groups of customers are also present.

Crowdfunding Platforms

Crowdfunding is considered as an option or a part of crowdsourcing. In the recent years new forms of alternative finance including crowdfunding are growing quickly. This growth is beginning to attract institutional investors and alternative finance is on the cusp of becoming mainstream (Wardrop et al., 2015). Alternative financial services (AFS) are financial services provided inside or outside traditional financial institutions (Nesta, 2014; Wardrop et al., 2015). As it is mentioned by Wardrop et al. (2015), this innovative, decentralized and potentially disruptive alternative finances are supplying credit to consumers, providing early stage investments to start-ups and growth capital to SMEs, stimulating regional economies and funding worthwhile causes (Figure 5). Crowdfunding is a latest AFS innovation that appears to have tapped a new funding channel for entrepreneurs and enterprises. In particular, crowd-

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 5. Alternative Finance Services (based on Wardrop et al., 2015)



funding is emerging as an alternative funding channel for any stage of enterprise growth and becomes a powerful tool to drive innovations and bring the social change.

Despite its increased importance, limited research has systematically examined why and how non-financial and financial institutions engage in crowdfunding and how crowdfunding impacts alternative financial innovations. This chapter aims to address this critical gap by focusing on the following questions:

- What are the elements, relationships, vocabulary, and semantics of crowdfunding innovations?
- How to develop the methodology, the classification and organization of domain concepts of the crowdfunding innovation ontology?
- What are the basic types and the main business models of crowdfunding intermediaries?

We propose the crowdfunding ontology/taxonomy, which is a conceptualization and formalization of the elements, relationships, vocabulary and semantics of crowdfunding innovations. Our research was motivated by the observation that various descriptions of crowdfunding innovation services implement the concept of a crowdfunding services on similar core concepts with distinct features. The scope is the Global economy and the emerging economy, namely Russia. The goal is to capture the common core of different approaches to facilitate research in crowdfunding. Thus we illustrate how the crowdfunding innovation ontology can be complemented by the real instances in the Global market and emerging market of Russia.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

As a result, the analysis methodology incorporates information from different but interrelated sources that form a representative sample of the domain:

- Reported and observed crowdfunding trends and e-finance activity. This study incorporates data from 2005 up to 2015 from the Internet (blogs, web conferences, etc.).
- Financial and non-financial organizations, finance/bank/crowdfunding cloud service providers, consulting companies, financial organizations and universities briefings, press releases, market and company reports, as well as other publicly available information.
- Research and text books in the field of crowdfunding, published from 2005 up to 2015.

A crowdfunding process comprises a number of activities that involve resources within and beyond organizational boundaries, mostly human participants and information technology (IT). The characteristics of the activities and resources within this process depend on the specific purpose of a crowdfunding effort. Research on crowdfunding innovations comes from a variety of fields such as IT innovations, platform innovations, open innovations, social innovations, management, psychology, and many other areas that have discovered crowdfunding as a useful approach. Accordingly, research questions mostly center on specific use cases and individual aspects of crowdfunding. This fragmentation of crowdfunding research and a general lack of foundational theory, however, make it difficult to provide organizations and entrepreneurs with well-founded guidance for the design of their crowdfunding initiatives (Haas, Blohm and Leimeister, 2014).

Schwienbacher and Larralde (2010) define crowdfunding as "an open call, essentially through the Internet, for the provision of financial resources either in form of donation or in exchange for some form of reward and/or voting rights in order to support initiatives for specific purposes." Mollick (2014) presents a definition in an entrepreneurial context: "Crowdfunding refers to the efforts by entrepreneurial individuals and groups – cultural, social and for profit – to fund their ventures by drawing on relatively small contributions from a relatively large number of individuals using the Internet, without standard financial intermediaries".

These definitions give the opportunity to associate to crowdfunding other financing modes like micro- finance and internet-based peer-to-peer lending and other cases.

Micro-finance concept means providing a limited financial support to low-income, unprivileged people that are non-secured from a usual banking point of view. The idea emerged recently and expanded rapidly around the world both online and offline. The best known platform for micro-financing abroad is Kiva, a non-profit organization that "provides safe, affordable access to capital to those in need and helps people create better lives for themselves and their families". Prosper is another well-known platform with similar purpose but whereas the former focuses the most on philanthropy the latter is more concentrated on transactional benefits and financial returns for both parties – "cutting out the middleman and connecting the people who need money with those who have it, borrowers get better rates and investors, better returns for their loans." While it is a wide-spread belief that micro-financing has a lot in common with crowdfunding, many authors refuse to accept this opinion – Caetano and Cardoso (2011) claims that "sites like Kiva and Prosper can be better placed within the finance sector than crowdfunding projects. That is because lenders charge interest rates."

Peer-to-peer lending relies on the same fundamentals as crowdfunding does but the applicability of these means of funds collection depends on the stage of business development. Peer-to-peer lending is a fast cash inflow to the business when no rewards need to be given away but the interest rate is paid on a

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

constant basis just like it would happen in a bank. So it reminds mostly micro-financing process and has little to do with traditional crowdfunding. Crowdfunding is considered as an option or a part of crowdsourcing. The term was introduced by Howe (2006) and defined as "the act of a company or institution taking a function once performed by employees and outsourcing it to an undefined (and generally large) network of people in the form of an open call. This can take the form of peer-production (when the job is performed collaboratively), but is also often undertaken by sole individuals. The crucial prerequisite is the use of the open call format and the large network of potential laborers." What is more, crowdsourced labor is truly motivated to make a contribution only if they see their efforts make a real difference and the game is worth playing. That is why crowdsourcing is about networking and tapping the right crowd, those being the points of parity with crowdfunding (Najah and Jarboui, 2015).

Crowdfunding Industry

Global Market

According to the statistical data for 2014, crowdfunding showed an excessive growth – crowdfunding platforms funded overall more than 2 million projects and collected more than $16,2 billion which makes a 162% of the figure for the same indicator in 2013 – $6,2 billion (Baeck, Collins and Zhang, 2014; Wardrop et al., 2015). Moreover, the crowdfunding industry is expected to double the results and reach $34,4 billion by the end of 2015. It may come as a surprise but the majority of funds – more than 53% – were collected on reward-free platforms that stand for only 30% of all crowdfunding platforms, while the most popular type – reward-based platforms – were less successful in raising funds despite of the fact they stand for 70% of all crowdfunding platforms. The total cumulative sum of investments in a reward-based crowdfunding rose by 549% annually, from $1,6 million in 2009. And it came as no surprise that the major part of investments is collected by Northern America ($837 million), which stands for more than a half of sum collected worldwide. North America has been the most rapidly growing region as well. By April 2014, there were 452 crowdfunding platforms worldwide, and the number was expected to grow by more than 600 by the end of 2015. Most of the platforms – 208 – are based in Northern America, 191 of which in USA. European region stands for 139 platforms, 44 of which are in Great Britain. Herewith, 95% of all funds attracted in Europe and 73% of all funds attracted in North America were assembled at the top five crowdfunding platforms. That happened mostly because of the size of the platforms, their reputation and expertise in audience knowledge, promotional activities and therefore – funds attraction.

The most well-known crowdfunding platforms are Kickstarter and its closest competitor Indiegogo. Other platforms have not reach yet such level of recognition and trust as those two.

Emerging Markets: Russia

Crowdfunding came to Russia in 2008 with a platform called Kroogi – it was launched by Miroslav Sabaev, who worked for a long time in American IT-companies and had an acquaintance with famous Russian musician Boris Grebenshikov. The idea of the project was the following: the musicians uploaded their musical works on the website and the fans were free to donate as much money as they wanted. Boris Grebenshikov was among the initiators of Kroogi campaign in Russia and uploaded a unique record from

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

his concert which was not available anywhere else. Ultimately, a lot of musicians took part in the campaign and managed to earn as much as they would have probably earned working with record companies.

Another crowdfunding campaign that went aloud was RosPil activists oriented service organized by Alexey Navalny. Started in the middle of 2011, it gained huge popularity and quickly reached its target figures – 5 million rubles were collected within a month. That was some sort of signal for other political organizations – and if earlier activists were forced to fund their publishing and meetings by themselves, now this financial part could be shared with other sympathizers (Sokolov, 2015).

Yet politician projects are not able to attract as many investors from the crowd as projects devoted to charity, and the situation is quite clear – charity based on collective support existed long before the emergence of crowdfunding but the Internet just gave it a new wave, offering all the benefits of unlimited and boundless communication between parties of a campaign. In this connection, not only individuals and small non-profit organizations tend to apply to crowdfunding but also large holdings. Thus, in 2013 a federal TV Channel "One" launched a charity campaign for those people who were affected by the flood in the Far East of Russia and collected a significant amount of more than 700 million rubles.

Crowdfunding in Russia despite all those successful projects is still at the very beginning of its development. Experts estimate a total amount of Russian crowdfunding market to be worth $2 million, which is incomparably smaller than European and American ones, but predict a 10 times grow in the future, though. Currently, there are already 9 working crowdfunding platforms. Only two of the existing Russian platforms have succeded so far: the biggest one is Planeta.ru with more than 50 million rubles collected so far, while the smaller one is Boomstarter with 10 million rubles raised. Some of other existing platforms are S miru po nitke, Tugeza and Kroogi.

Boomstarter is a Russian analog of the extremely popular American crowdfunding giant Kickstarter. In fact, it is the closest copy of the latter in everything – name, interface and functional opportunities. It was founded in 2012 by Ruslan Tugushev and Evgeny Gavrilin. Boomstarter helps authors of creative, scientific and other projects to attract funds by asking investors from the crowd. As a dividend, Boomstarter takes a 5% commission of all money collected, while another 5% goes to electronic paying systems. When placing a project to the platform, the author maintains all the rights concerned with property law but at the same time all project data goes public and cannot be deleted or somehow changed after the project's fulfillment. Projects that can be funded using the platform are classified by 12 categories, such as: design, food, publishing, fashion, technology, choreography, photography, theater, music, video and games, the last 3 ones being the most popular. Projects with a strictly determined aim like music album recording, book publishing or making a masterpiece, bounded with time frames and prototypes are welcomed as well, while charity, grant funding, medical and agitation campaigns are not allowed. Start-ups do not belong to the project classification so they are forbidden as well. Boomstarter applies the following scheme of collecting money: there is a strict rule that in order to transfer all money collected to the crowdfunder, the project needs to attract the whole sum that was initially stated during a certain period of time that is also determined beforehand. If the project does not manage to attract that sum in time, the money goes back to the investors.

Planeta.ru is another popular crowdfunding platform launched in 2012. Its system of money collection differs considerably from that of Boomstarter – no time boundaries and funding limits. If a crowdfunder manages to attract at least half of the sum initially stated, he can then take the money and start the project realization. The time span of the funding process is flexible as well – it is enough to inform the investors about a possible time period and that is it. Max Lakmus, the founder of Planeta.ru, points out that the restrictions on amounts and time applied by Boomstarter, prevent crowdfunding campaigns

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

from successful fulfillment since the market for Russia is small and unstable so far. Besides, they do not reject charity projects and provide them with functional service without charging any commission. That advantageously distinguishes Planeta.ru from others and broadens its perspectives. By now Planeta.ru has 34 successfully completed and more than 45 on-going projects, it has helped to collect 9,5 million rubles and the number of registered users is dynamically approaching a 100 000 people border, more than 8 500 of whom have already participated in funding process.

Crowdfunding Regulations

Crowdfunding is developing rapidly around the world acting as an innovative mean of fundraising, but to facilitate effective transactions and ensure further growth it is important to establish a legislative base that would coordinate actions of all the parties of the process.

The history of crowdfunding legislative regulation in the US started on April 5, 2012, when the JOB Act was signed by the president Barak Obama. The Act implies a simplified system of investment collection for small-sized companies, so called start-ups without moving to IPO. The Act allows collecting up to $1 million with no more than 2 thousands investors as a maximum amount. In this case any restrictions concerned investors accreditations are removed. Each investor may participate in a crowdfunding campaign with a maximum amount of $10,000. Currently all crowdfunding platforms are available for accredited investors only.

It was stated, that during the thorough analysis of crowdfunding campaigns in the US, which reached a total of more than $250 million, no case of fraud was detected. Experts from Forbes believe that investments via crowdfunding platforms are more transparent and traceable in terms of accountability (Barnett, 2013).

The history of crowdfunding in Russia started in the second half of 2012 with the advent of such crowdfunding platforms as Boomstarter and Planeta.ru, which are currently developing very dynamically. And in spite of the fact that these projects were originally just copied from the American model, they have got their own characteristics, adapted to Russian realities. As a result, the explosive growth of interest to crowdfunding from domestic Internet users happened. Most Russian crowdfunding platform implement free-of-charge or conditionally repayable and conditionally return projects. In other words, there may be simple donations for a certain idea, or it may be a reward-based crowdfunding when investor gets either material or emotional value in return. From the point of view of Russian legislation such projects as crowdfunding fall under the regulation of art. 572 of the Civil Code and are seen as a donation contract. In this scheme, the investor, or more appropriately in this case – donor or giver, donates a certain amount of money to the recipient's property. The disadvantage of this structure is that it is actually excluded from legal entities by virtue of an outright ban on such transactions as well as the presence of additional constraints associated with the legislation to fight money laundering and maintain tax burden. One of the possible legal schemes that can be used to simplify the access of investors to start-ups, is available from July 1, 2014, after the entry into force of amendments to the Federal Law of 22.04.1996 N 39-FZ on the securities market concerning the legal status of the companies specialized on project financing. However, this form is only accessible for long-term (not less than 3 years) investment projects alongside with an issuance of bonds, which individuals can subsequently acquire.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

So to sum up, there are no strict norms prohibiting from raising funds via crowdfunding but at the same time there are no norm supporting a simplified schemes of investment via the Internet either. And due to the fact that the essence of crowdfunding platforms lies in the possibility of becoming an investor remotely, without leaving home, it is advisable to consider some ways of simplifying the existing rules on the limited liability company (LLC) establishment. To implement crowdfunding projects within the LLC scheme it is necessary to remove the existing restriction on the number of participants and to simplify the procedure of re-registration of new members as well as the procedure of making important decisions. Taking into account all mentioned obstacles the development of a full-fledged investment in terms of crowdfunding in Russia would probably require the preparation of a special law, similar to the one signed in 2012 in the United States.

We propose the following definition of the crowdfunding multi-sided platform (Yablonsky, 2016b):

Crowdfunding multi-sided platform (henceforth, CMSP) is an organization that creates value primarily by enabling direct interactions between two main (or more) distinct types of affiliated customers: Capital- seeking Agents and Capital-giving Agents.

All this forms main crowdfunding multisided platform building blocks (Figure 6).

The study of CMSPs is important because it is a large and constantly growing share of global economy, and CMSPs' firms face distinctive management challenges: familiar rules, such as value-based pricing, may fail and traditional barriers to entry may no longer hold. Due to the network effects, platform intermediaries often enjoy increasing returns to scale and their industries have room for only a few players (Eisenmann, Parker, Van Alstyne, 2006).

We propose crowdfunding ontology/taxonomy as a basic conceptual framework and knowledge management tool for analyzing and interpreting non-price instruments used by crowdfunding (Figure 7). General crowdfunding taxonomy suggests a framework for SMSP description and comparison.

We propose crowdfunding BMP (Figure 8). We set 7 main types of crowdfunding value propositions. The general crowdfunding business model sets the framework for thriving business model innovations that have been created and take into account the potential disruptive nature of crowdfunding. Going forward, more hybrid models will emerge. Some CMSP experiment with a combined model of loans and pre-sales. A percentage of the funding can be put into a loan (and will be repaid with interest) and the other part of the funding can be used to pre-finance the production of the product or service. Also there are benefits for the entrepreneur in hybrid models or in approaches to mix crowd-funding with other investment forms, for example, when crowdfunding is used to pre-sell a product, through which market validation and segmentation can be done to generate revenue and position the project for a follow-up or parallel investment from business angels. Crowdfunding is transformative in its total of business models, with the biggest potential lying in the combination of different approaches that will allow funding the whole life- cycle of a project, product, services or other business innovation.

In reality crowdfunding MSP use nuanced combinations of legal, technological, informational and other instruments (including price-setting) to implement desired outcomes (Boudreau and Hagiu, 2008).

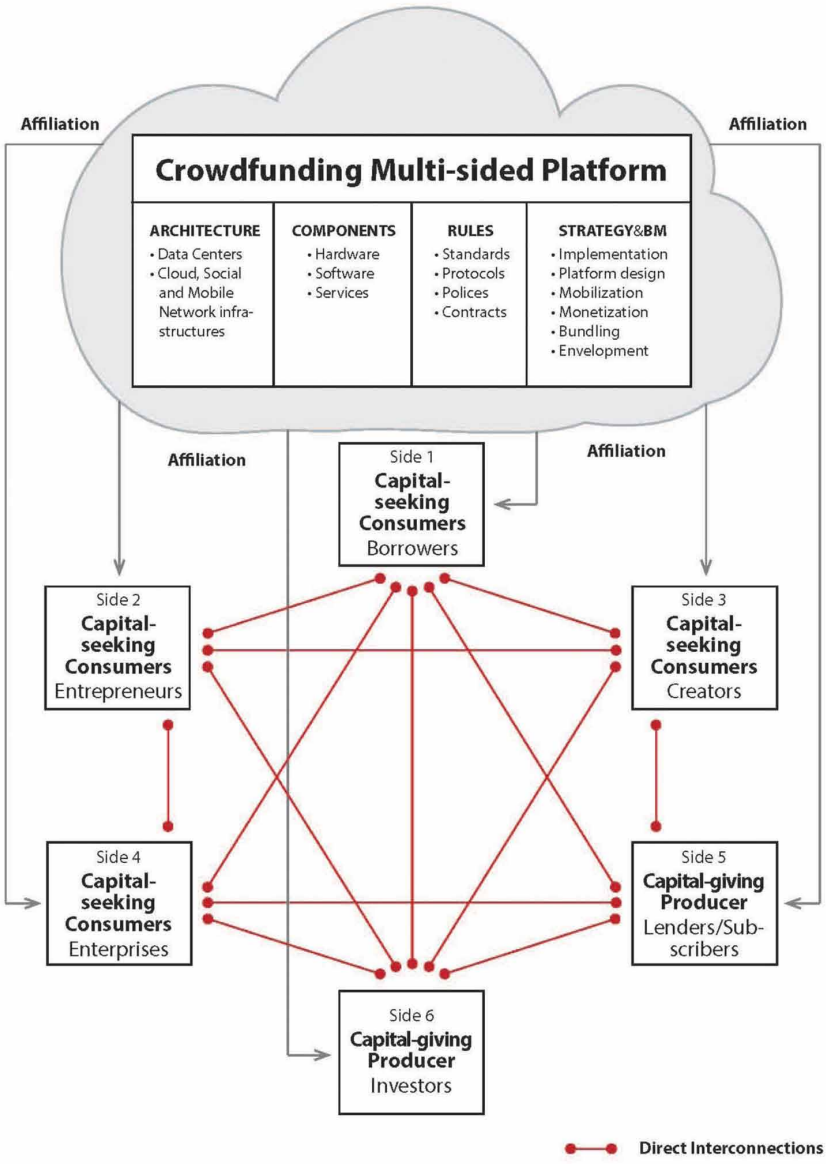
Figure 6. Crowdfunding multisided platform building blocks



CONCLUSION

Summarizing we can conclude the following:

- Having analyzed innovation crowdsourcing e-intermediaries we propose a layered taxonomy framework for approaching the crowdsourcing in a platform business models context. The framework is illustrated by the example of crowdfunding and consulting platforms.
- A clear and precise description and structuring of the information on innovation crowdsourcing platform business models are prerequisites for a common understanding of the innovation

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 7. Crowdfunding taxonomy

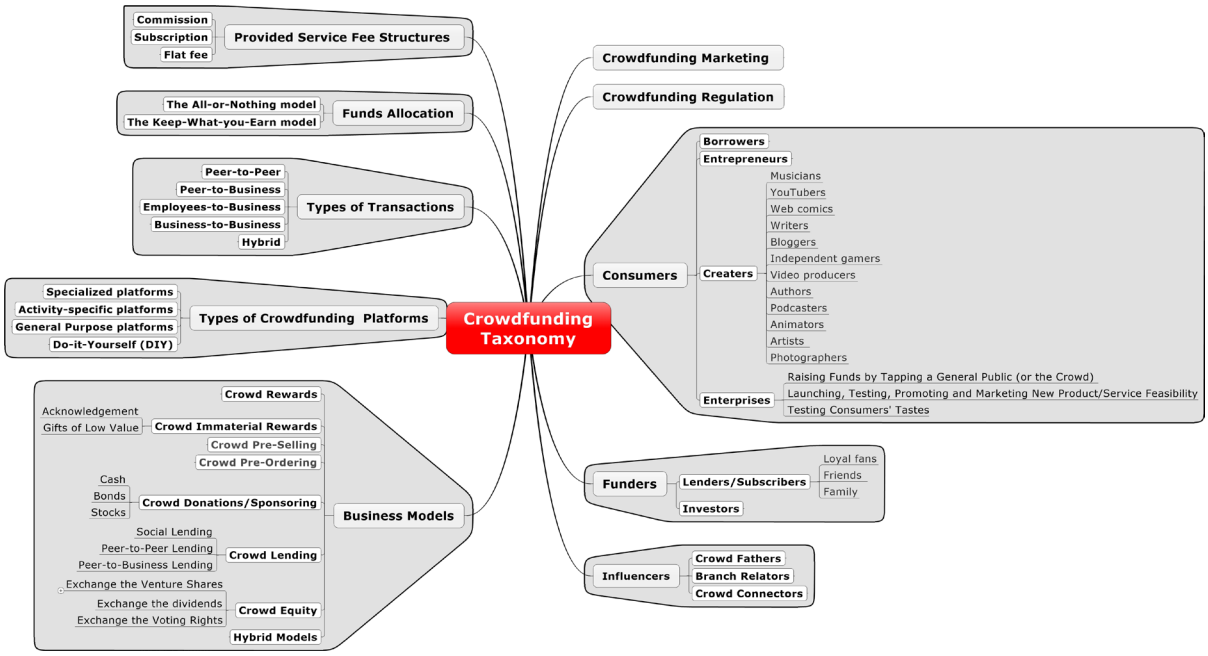


Figure 8. Crowdfunding BMP

crowdsourcing e-intermediaries. Following Osterwalder (2004) we provide an innovation crowdsourcing e-intermediaries business model pattern ontology, thT is a conceptualization and formalization of the elements, relationships, vocabulary and semantics of an e-intermediaries MSP (Yablonsky, 2016a). It is structured into several levels of decomposition with increasing depth and complexity. Ontologies, taxonomies and other types of controlled vocabularies are the preferred means to achieve such a common understanding by specifying the terms of the e-intermediary's domain, disambiguating them from each other, controlling synonyms and structuring the domain via term relationships.

- We propose a new definition of the innovation crowdsourcing multi-sided platform and the crowdfunding MSP.
- The research observes crowdfunding industry, including the global and the emerging markets (Russia), and proposes a definition of the crowdfunding multi-sided platform.
- The study offers a classification and examination of the current status of crowdfunding globally and in Russia.
- Crowdfunding is a term used to collectively describe many different delivery channels available to platform affiliated capital-seeking agents (investee) and capital-giving agents (investors) plus other members of crowdfunding ecosystem.
- The crowdfunding innovation taxonomy for global and Russian markets is deduced from the qualitative empirical research and offers a means to structure the understanding of the crowdfunding innovation services and main ecosystem actors, such as stakeholders, payment instruments, types, channels provided service fee structures, types of platforms, business models, agents, crowdfunding platforms, crowdfunding regulation, etc.
- Platform crowdfunding innovations prevail. Our research proposes a new definition of the crowdfunding multi-sided platform and develops a conceptual research framework for crowdfunding platform business models analysis, comparison and implementation.
- The general crowdfunding platform business model pattern sets the framework for thriving business model innovations that have been created and take into account the potential disruptive nature of crowdfunding. BMP contains 7 main types of crowdfunding value propositions.
- In the future more hybrid models will emerge. Some CMSP experiment with a combined model of loans and pre-sales. There are benefits for the entrepreneur in hybrid models or in approaches to mix crowd funding with other investment forms, for example where crowdfunding is used to pre-sell a product, through which market validation and segmentation can be done, to generate revenue and position the project for a follow-up or parallel investment from business angels.
- Platform crowdfunding is transformative in the total of its business models, with the biggest potential lying in the combination of different approaches that will allow funding the whole life cycle of a project, product, service or other business innovation.
- Crowdfunding platform is opposed by the prevalent information asymmetry between both parties. The investee holds all the information while the investor has only limited chances to verify the truth and relevance of the information given by the platform.
- The main limitations of crowdfunding innovations are related with the lack of a unified regulation between the US, Europe and the Emerging countries.
- *Practical implications.* The evaluation logic presents a tool that managers, company owners and investors can use to identify innovation crowdsourcing business models to interact with differ-

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

ent groups of contributors in order to receive new ideas, feedback and solutions, so that it can be later used to evaluate the effectiveness of innovation crowdsourcing platforms and in decision-making regarding the design of the value offering of platform's products and services. Since the framework has been specifically designed for evaluating the innovation crowdsourcing potential of platforms, it proves to be particularly convenient for analyzing different types of platforms. It can be used not only to evaluate the effectiveness of innovation crowdsourcing platforms, but also in decision-making concerning the design of a different value offering of innovation crowdsourcing multi-sided platform business models and products or services.

Chapter 74
Investigating Factors Influencing the Quality of Crowdsourced Work Under Different Incentives:
Some Empirical Results

Evangelos Mourelatos
University of Patras, Greece

Manolis Tzagarakis
University of Patras, Greece

ABSTRACT

Crowdsourcing is a new form of online labor, where the process of solving a problem is approached by soliciting contributions from a large group of people. In this paper, the authors attempt to investigate how different incentives affect the quality of work in such contexts, by completing the same task in three different environments: in a laboratory setting, on a social networking as well as on a crowdsourcing site. Analyzing the obtained results indicates that under different incentives, different factors contribute to the quality of work in crowdsourcing tasks. In general the research highlights that the identification of factors contributing positively to higher quality of work in crowdsourcing environments is a complex question, depending on the task at hand.

1. INTRODUCTION

The rise of the web and its big impact to people's daily routine has created suitable conditions for new economic processes to emerge. In this respect, crowdsourcing can be considered as a fast-growing activity which involves division of labor for tedious tasks. It can be used to successfully address a great variety of tasks that include funding, reviewing, idea hatching as well as a general search for answers and solu-

Copyright © 2019, IGI Global. Copying or distributing in print or electronic forms without written permission of IGI Global is prohibited.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

tions. In general, crowdsourcing is a process which obtains needed services, ideas, or content and looks for contributions from a large group of people, in the form of an online community, rather than from traditional employees and/or suppliers. The process of crowdsourcing is often used to subdivide tedious work by combining the efforts of numerous self-identified volunteers or part-time workers, where each contributor of their own initiative adds a small portion to the greater result (Howe 2006). Nowadays, it is often used for particular types of work such as translation services, microtasks, image tagging and transcription. (Estellés-Arolas et al. 2012).

Crowdsourcing has received in recent years the interest of researchers in various fields that aim to analyze, comprehend, assess and even improve this new form of labor and finally find strategies and frameworks in order to increase the quality of the work being done in high levels (Howe 2008). An overview of the general principles of crowdsourcing aimed towards achieving high quality of work is given by existing literature (Yuen et al. 2011).

Quality of work in crowdsourcing is the extent to which the provided outcome of the worker fulfills the requirements of the requester (Allahbakhsh et al. 2013: 76-81). In general, quality of work in such contexts is considered a subjective issue. That's why many researches try to propose various models and metrics to assess and ensure high the quality of work in such environments. With respect to the existing models, two approaches to achieving quality results can be identified: approaches based on the profile of individual workers and approaches focusing on the specification and design of the submitted task. Workers in crowdsourcing markets usually have different levels of expertise and experience and many times adjust their efforts according to incentives hence affecting the quality of the outcome. (Wang et al. 2013). On the other hand approaches focusing on task design (under which the requester describes the task that should be completed) consists of several components (task definition, user interface, granularity and compensation policy) which obviously affect the quality of the worker's result (Finnerty et al. 2013: 16-20).

In this paper we aim to address questions related to what factor affect the quality of work in crowdsourced tasks when these are performed under different incentives. The focus is in particular whether or not different incentives are associated with different factors influencing the quality of work (Chandler 2013:123-133). Towards this, we conducted experiments where the same crowdsourcing task has been submitted under three different incentive schemes and compare the quality of work received.

This paper is structured as follows. In the next section we describe the task workers had to complete and present the three environments where the task was submitted. Consequently, we present the methodology and show the results of the analysis. The paper concludes with a summary and an some future research directions.

2. RELATED WORK

The literature suggests that the level of the quality of workers' results closely relates to the incentives of the participants as well as depends on the environment where the experiments take place (Kaufmann et al., 2011:340). In existing literature, motivation in participating in crowdsourcing tasks can be divided in two categories: intrinsic and extrinsic (Thompson et al. 1999:25-37). Intrinsic motivation exists if an individual is activated because of his/her seeking for the fulfillment generated by the activity (e.g. acting just for fun). In the case of extrinsic motivation the activity is just an instrument for achieving a certain desired outcome (e.g. acting for money or to avoid sanctions). (Thompson et al. 1999) showed

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

that, in general, extrinsic motivation is generally stronger than intrinsic motivation concerning the use of Internet while (Brabham, 2008) showed that the possibility of earning money (extrinsic motivation) is the most dominant factor to participate in crowdsourcing platforms, followed by the generated fun (intrinsic motivation). On the other hand the research of (Kaufmann et al., 2011) showed that there are cases in crowdsourcing environments where many intrinsic factors seem to dominate the extrinsic ones. Finally (Rogstadius et al. 2011:321-328) presented a study in which the effect of extrinsic and intrinsic motivators on task performance was estimated. The study concluded that work accuracy can be improved significantly through intrinsic motivators, especially in cases where extrinsic motivation is low. In general, existing research point out the positive role that intrinsic and extrinsic motivation play in crowdsourced tasks. However, the question of how motivational aspects can be influenced or triggered by the design choices of the crowdsourcing requester i.e. how a task has to be designed so as to motivate only specific groups of workers, which can guarantee a desired level of quality of work, is not addressed.

3. MODELING FRAMEWORK

The goal of the research reported in this paper is to investigate the incentives that affect the quality of the results in crowdsourced tasks. Towards this, we have selected the form of the experiment to be related to the task of transcription. In particular, the experiment was designed to welcome answers from the participants for addressing the problem of Mondegreen (Wikipedia 2014). The term Mondegreens describes misperceptions as defined by "slips of the ear", denoting that an utterance is perceived differently to what has actually been said. In general, the analysis of these misperceptions permits a deeper insight into speech processing in the human brain (Meyer et al., 2011: 926-930). This phenomenon is very widespread in music, when a person mishears or misinterprets the lyrics of a song.

In particular, in the context of our research we tried to examine whether or not different incentives in crowdsourcing environments can affect the quality of results in transcription tasks. In addition, the research aims to identify factors that may increase or decrease the quality of crowdsourcing results in three different environments: i) in a controlled laboratory setting with university students, ii) on a popular social networking site (Facebook) and iii) on a crowdsourcing platform (microworkers.com) (Hossfeld et al. 2014: 541 –558). The experiment aims to investigate intrinsic as well as extrinsic motivations: while the experiment in the laboratory and on the microworkers.com environments are extrinsically motivated, the experiment on the social networking site Facebook is intrinsically motivated.

4. METHODOLOGY

In order to investigate better the factors that either raise or reduce the overall quality perception, we firstly outline the setup of the research (Brabham, 2008:75-90).

The first experiment was conducted in a controlled laboratory setting of 44 first year undergraduate students of the department of Economics at the University of Patras, which resulted in 44 distinct answers. At first, the students had to fill out a demographic survey which included also questions related to their personality. Subsequently, the students were allowed to listen to an unknown music sample having duration of 32 seconds. The music sample contained eight verses with a total of 42 English words. The students were asked to listen to the music sample as many times they wanted in a two hours period and

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

write down the words they think they heard and were asked to submit their answers. In order to motivate participation, students were told that the quality of their work would be taken into consideration –as a weighted factor- for their final grade.

The same experiment was conducted in two more environments: on the social networking site Facebook and on the crowdsourcing platform Microworkers (microworkers.com) in which the experiment was conducted under two different settings: one setup which solicited contributions from workers from all over the world called "international setting" and one setup with a hired group of workers in which workers from certain eastern world countries were deliberately excluded, called the "western world setting". Eastern countries that were omitted, included Bangladesh, Pakistan, India, China, Egypt etc. The detailed lists of the workers' countries in both versions of the experiment are available in the appendix of this paper.

In each environment, workers participated in the same task with different incentives. While for students the incentive was the grade they receive (extrinsic motivation), on the crowdsourcing platform the incentive had the form of a monetary reward (extrinsic motivation). Participants in the experiment on the social networking site Facebook had no tangible reward (intrinsic motivation).

5. DATA ANALYSIS

5.1 Demographics

A total of 44 students participated in the laboratory setting of the experiment with the gender distribution shown in Table 1.

All participants were of Greek origin covering the age group 18-19. Likewise all had the same education level (all students had currently finished the first year of their undergraduate studies) and employment status (full-time students). In addition, each participant answered questions related to family monthly income, internet use, English language qualifications and their first contact with social networks. Participants were also asked questions about their personality using a standardized personality test. The following tables (Tables 2-7) summarize the data collected from the participating students in the laboratory setting.

With respect to questions related to their personality, these were based on the big five personality test principles (Extraversion, Emotional Stability, Agreeableness, Conscientiousness and Openness to Experience) (Linden et al. 2010:315-327).

Concerning the experiment conducted on the social networking site Facebook the total number of the participants was also 44 with the gender and age distribution shown in Tables 8 and 9.

On Facebook, all participants were also of Greek origin and employment status (full-time work) but differed in their education level as shown in table 10.

Table 1. Gender distribution of the laboratory experiment

Regarding the experiment conducted on the crowdsourcing site microworkers.com we had some noteworthy differences in the gender, age and education level as shown in the following tables (Tables 11, 12 and 13).

The participants on the crowdsourcing site microworkers.com had to answer also a question about their education level. The following tables (Tables 14 and 15) show the received answers.

Table 11. Gender of the microworkers.com participants (International)

A first look at the retrieved data reveals that participants in the international setting on the crowdsourcing website had a lower educational level (75.51% have a bachelor level degree) than the western only participants on the same website (61.22%).

One last variable which was examined was the number of times participant listened to the song ("Number of repeats") before entering their final answer in each of the four experiments (Table 16).

This factor is important in order to estimate the efforts of the participants in providing the lyrics. As can be noticed, the mean number of the repeats in the laboratory setting is the highest (on average 16.5 repeats) in relation to the other experiments conducted on Facebook and in both settings on the microworkers.com platform (on average 7.59, 6.45 and 5.76 repeats respectively).

5.2 Experiment Results

5.2.1. Initial Results

In the laboratory setting of the experiment, 44 participants provided 44 answers for a music sample with duration of 32 seconds. In general, the quality of results was satisfactory ($\bar{x}$ near to 0.7). More detailed descriptive statistics are presented on the following table (see Table 17, Figure 1).

In addition we examined possible correlations between the observed variables. The first results showed that the quality of results in the laboratory setting is positively correlated with the students' demographic and educational levels. For example the correlation between the students' results and the

Table 16. "Number of repeats" variable in each experiment

Number of Repeats	Obs.	Mean	Std. Dev.	Min	Max
Laboratory	44	16.5	10.56	2	50
Facebook	44	7.59	4.43	2	20
Microworkers International	49	6.45	5.90	1	23
Microworkers Western	49	5.76	3.89	1	16

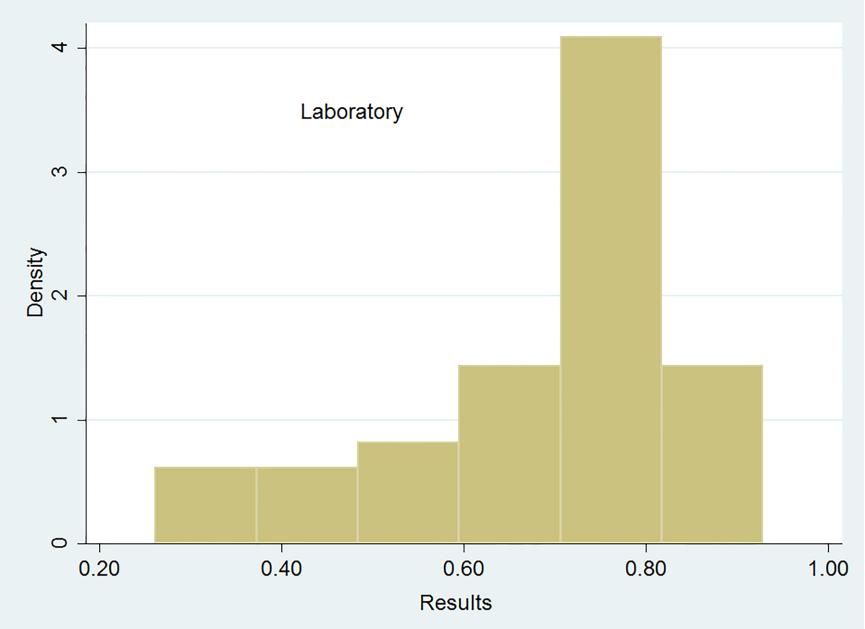
Table 17. Descriptive statistics of the provided answers. The minimum percent of lyrics correctly identified by the participants is 26% while the maximum is near to 93% on total of 44 observations

Variable	Obs	Mean	Std. Dev.	Min	Max
Results	44	0.69	0.16	0.26	0.93

Figure 1. Distribution of the success rate in the laboratory experiment



gender (male, female) was marginally statistically significant at the 5% level of significance (r= 0.095, p= .045). Moreover the correlation between the students' results and their qualifications in English (on the scale: No degree, competency in English, advanced competency in English, Proficiency in English) is very strong against the null hypothesis and the right hand variable is positively correlated to the left hand variable (r=0.033, p<.001).

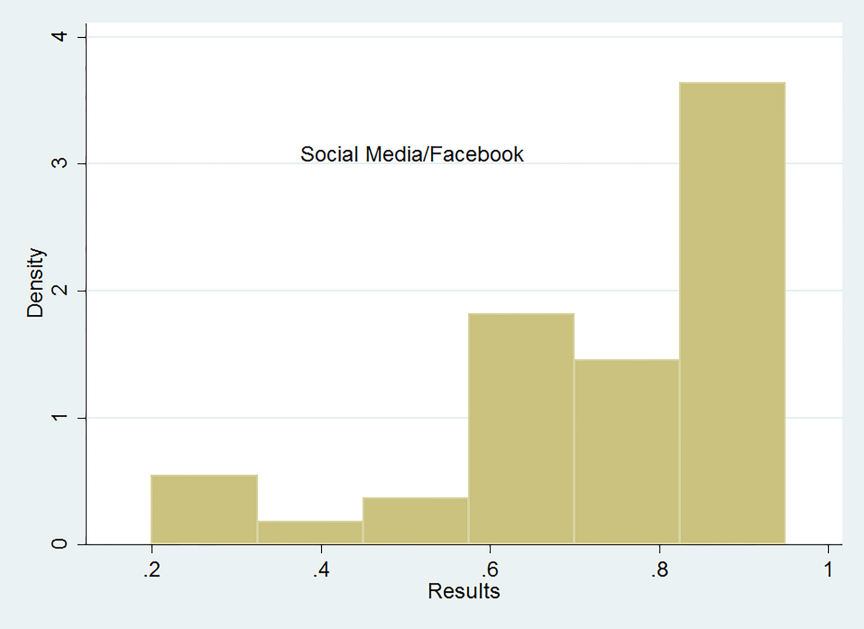
In the social networking setting (Facebook) of the experiment, 44 participants provided 44 answers for the same music sample with duration of 32 seconds. The quality of results received was ($\bar{x}$ near to 0.75) as well as their volunteering will to participate. More detailed results are presented on the following table (see Table 18, Figure 2).

Table 18. Descriptive statistics of answers in the Facebook experiment. The minimum percent of lyrics correctly identified by the participants is 20% while the maximum is near to 95% on total of 44 observations

Variable	Obs	Mean	Std. Dev.	Min	Max
Results	44	0.75	0.18	0.20	0.95

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 2. Distribution of the success rate on Facebook



The results showed that the answers provided by Facebook users had also a positive correlation with several variables. The correlation between the participants' results and the age variable (age<25) is marginally statistically significant at the 10% level of significance and the right hand variable is negatively related to the left hand variable (r= -0.106, p= .061). Moreover the correlation between participants' quality of results and their English qualifications (considering the levels competency and advanced competency in English) is strongly against null hypothesis differing in the sign of the coefficient (r= -0.128, p= .020 & r= 0.135, p<.001 respectively). Lastly but most importantly the data indicates that there is a statistical significance between the quality of results and the acquisition year of their English qualifications. More specifically in this context the results show that p<.090 (statistically significant at the 10% level of significance) and r= -0.156 indicating that the quality of results drop the longer participants are in possession of an English qualification degree.

The microworkers.com experiment was conducted under two different settings, based on the country of origin of participants.

In the first experiment setup, workers from all over the world were allowed to participate in the experiment. In this setting, a total of 49 participants (34 from eastern and 15 from western world countries) provided 49 answers for the same music sample with duration of 32 seconds. In general, the quality of results was not satisfactory ($\bar{x}$ near equal to 0.4). More detailed statistics are presented on the following table (see Table 19 and Figure 3).

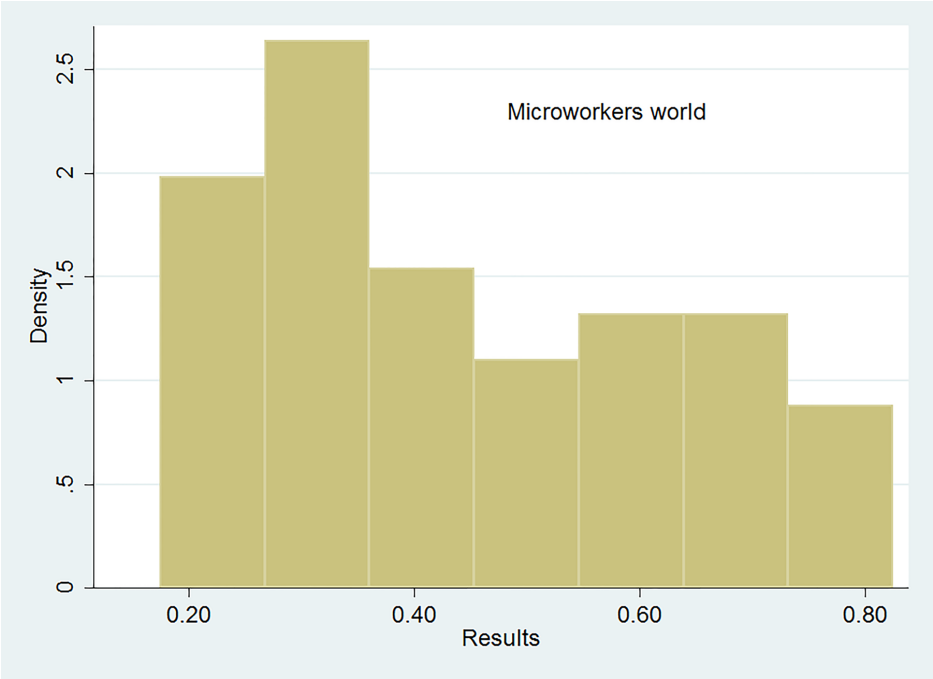
This analysis showed that the quality of results in this setting is positively correlated to several variables. We constructed a new variable which contained the highly educated workers i.e. workers who have graduated from a certificate program. The correlation between the quality of results and the worker's education level (Table 15) was marginally statistically significant at the 10% level of significance and the right hand variable is positively correlated to the left hand variable (r= 0.115, p= .071). The analysis

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Table 19 Descriptive statistics of the provided answers in the international setting of the experiment on microworkers.com. The minimum percentage of lyrics correctly identified by the participants is 18% while the maximum percentage was 83% in a total of 49 observations

Variable	Obs	Mean	Std. Dev.	Min	Max
Results	49	0.44	0.19	0.18	0.83

Figure 3. Distribution of the success rate microworkers.com (International)



also shows that with respect to advanced competencies or proficiency in English of participants, the quality of results is statistically strongly correlated at the 5% level of significance (r= 0.002, p= .034). Moreover a correlation at the 10% significance level was observed with the computer literacy levels of workers (r= 0.126, p= .067). Finally, it was the only experiment in which revealed a marginally statistically significant at the 10% significance level between the quality of results and a factor from the Big Five Personality test (r= 0.005, p= .098). In particular, a marginally statistical significance was observed with the factor "plasticity" which encompasses extraversion and openness to experience and refers to the extent to which a person actively searches for new and rewarding experience, as it is the case in the conducted experiment. (DeYoung et al. 2002: 1138-1151)

In the second setup, we excluded workers from certain countries from participating in our experiment based on research that indicated that workers from eastern world countries (specially countries from Asia) are low- trained to crowdsourcing and provide low quality of services (Khanna et al. 2010) due to several factors related to their way of life (Gupta et al. 2014: 1-11). A total of 49 participants from western world countries provided 49 answers for the same music sample. The quality of results was satisfactory and in general better in comparison to the results received from workers in the international

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

setting of the experiment ($\bar{x}$ near equal to 0.64). More detailed results are presented on the following table (Table 20, Figure 4).

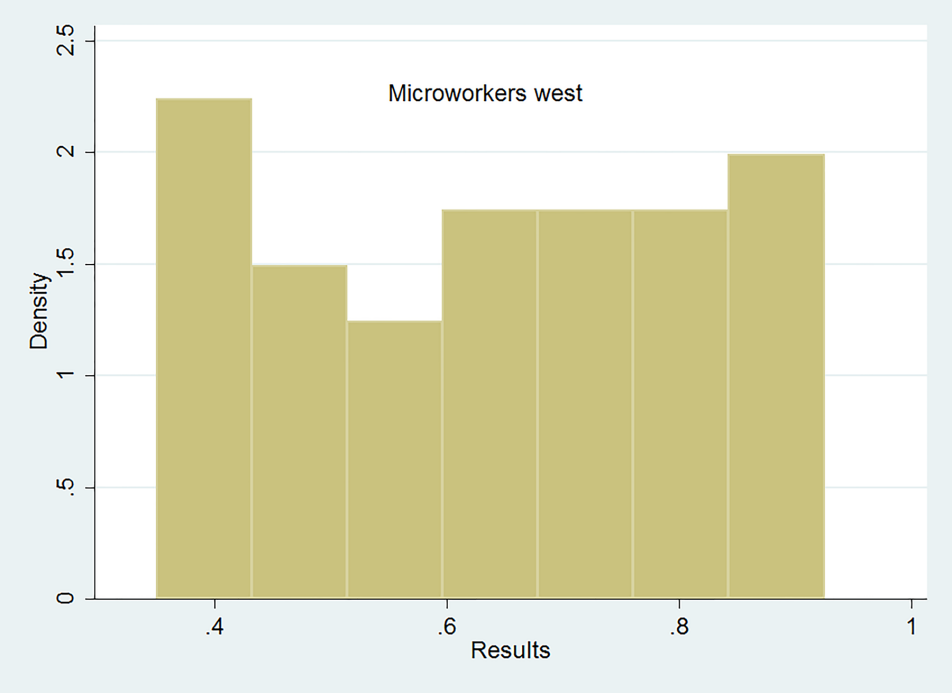
In this case of the experiment, we initially constructed additional variables in order to investigate correlations with combined effects. These variables included: "young participants", which are defined as participants less than 30 years of age, "young males" which captures males less than 30 years of age as well as a variable capturing participants with at least advanced competency level in English qualifications ("advanced competency in English"). The correlations observed between the quality of results and those constructed variables are shown below:

- With respect to the variable "young participants" (age<30), the quality of results was statistically significant at the 5% level of significance and the right hand variable was positively related to the left hand variable (r= 0.105, p= .037).

Table 20. Descriptive statistics of the provided answers in the western world setup of the microworkers.com experiment. The minimum percentage of lyrics correctly identified by the participants is 35% while the maximum percentage is 93%

Variable	Obs	Mean	Std. Dev.	Min	Max
Results	49	0.64	0.17	0.35	0.93

Figure 4. Distribution of the success rate on microworkers.com (Western world)



EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

- With respect to the variable "young male" (age<30 & male participants), the quality of results was statistically significant at the 5% level of significance and the right hand variable was positively related to the left hand variable (r= 0.116, p= .020).
- With respect to the variable "advanced competency in English", the quality of results was statistically strongly significant at the 5% level of significance and the right hand variable was positively related to the left hand variable (r= 0.159, p= .012).

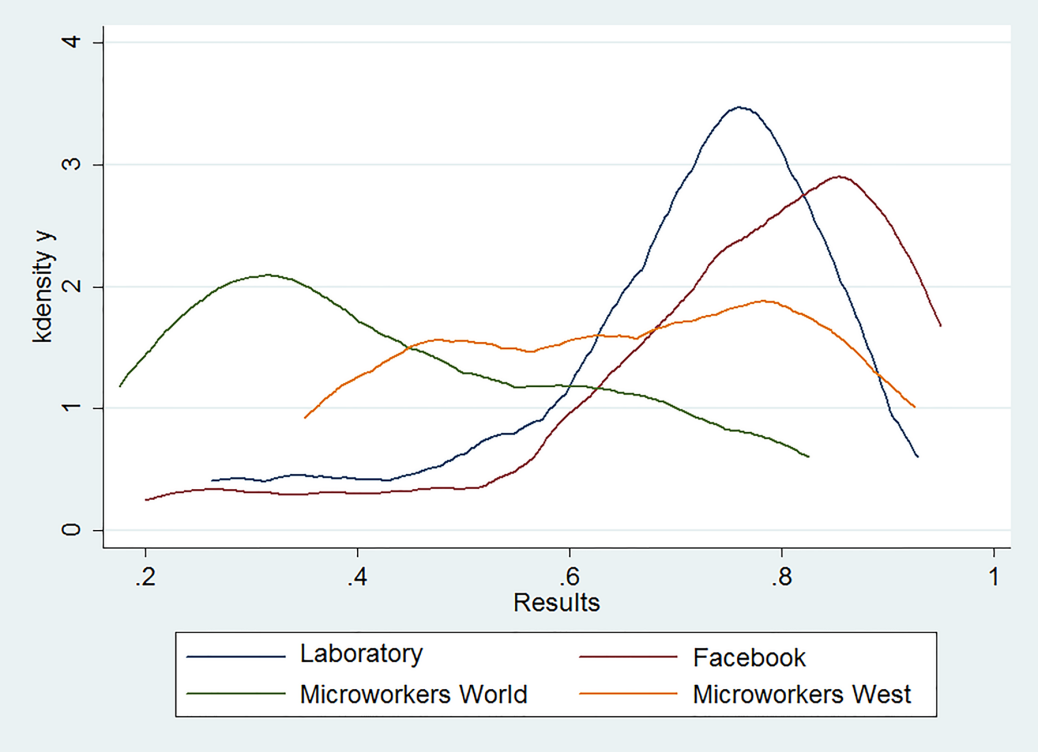
In this experiment the quality of results was not correlated with plasticity and the right hand variable was negatively related to the left hand variable (r= -001, p= .923).

5.2.2. Discussion

Figure 5 shows an overview of the quality of results obtained in each experiment presented previously.

As can be seen, the best results in terms of quality were achieved on Facebook (75% success rate on average) whose users are mainly motivated by volunteerism (Dolmaya 2011). In addition, the longest task completion time was also observed on Facebook (24 hours) as shown in Table 21. While this is an expected result, given the nature of the medium, it is noteworthy to point out that the task completion time on Facebook was comparable to the completion time on microworkers.com (22 hours), an environment dedicated to crowdsourcing tasks.

Figure 5. Overview of quality of results in all experiments



**For a more accurate representation see the electronic version.*

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Table 21. Overview data for each experiment

	Facebook	Laboratory	Microworkers (western world)	Microworkers (international)
Participants	Users	Students	Western world workers	International workers
Cost	None	None	41.06 $	41.06 $
Preparation time	Small	Considerable	Small	Small
Task completion time	24 hours	1 hour	10 hours	22 hours
Motivation	Fun, Contributing to research	Scaled-granting grade	Monetary reward	Monetary reward
Success rate	75%	69%	64%	44%

The study of motivation is primarily a behavioral science, the understanding of which depends on recognizing different motivational processes and how they operate (Reeve 2009). Reeve specifies four aspects through which human motivation is expressed (individual's behavior, engagement, physiology & self-report). In the context of our research, Facebook was studied on the basis of these aspects. However, the analysis of data did not reveal any correlation between the quality of results given by the participants and the big five personality test, a well-established tool for mapping the personality of the participants. In the conducted experiments, the quality of results was closely correlated with physiological aspects of participants -age and gender in particular - as well as their English language qualifications.

The experiment conducted in the controlled laboratory environment achieved 69% success rate on average with a maximum success rate of 93% which is the second best among the conducted experiments. When the participants came at the designated time, we first explained the tasks they needed to complete and were given one hour to accomplish the work. We answers received were highly correlated to gender and their English language qualifications. These outcomes show that besides extrinsic motives there are other factors at play that affect the quality result of a crowdsourced task. Hence, it is crucial to further investigate factors that influence the quality of results in crowdsourced tasks as proposed in (Shaw 2010).

The experiment conducted on the website microworkers.com exhibited a large deviation of results (success rate of 64% and 44% for western world and international participants respectively), which raised many questions with respect to the factors that affect the quality of results on such platforms. In the case of the experiment on microworkers.com in the international setting, the participation of workers from eastern countries such as India, Bangladesh, and Nepal etc. decreased the quality of the results by 20% compared with the experiment conducted with participants from the western world. It is already known that the purpose and motivation of workers in crowdsourcing websites differs, due to demographics and the conditions of living. (Ipeirotis 2010). The workers, which participate on crowdsourcing platforms, originating from western countries such as USA and Germany are mainly young and highly-educated females, with 40% earning more than $40,000 per year, while workers originating from countries such as India and Bangladesh are mostly middle-aged males with middle education level and an annual income less than $10,000 (Rose et al. 2010: 2863-2872). Such observations explain the different reasons these workers participate in crowdsourcing tasks: while the former participate on crowdsourcing platforms and respond to open calls for work in order to earn extra supplementary income, the latter workers participate to earn wages in order to make ends meet or even make a full-time living. (Gupta et al. 2014)

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Last but not least this deviation of successful results may be also explained by examining the English language qualifications. The nature of the posted crowdsourcing task is highly associated with a high competency in the English language. It is known that workers from western countries such as USA and European countries are in general competent in the English language (for some countries English is even the official language) while in the Eastern world the knowledge of the English language is rather limited (Gupta et al. 2014:1-11). This factor has consequences not only in carrying out certain requested tasks (such as transcription) but also in understanding the description of the submitted tasks. In general, western world workers have an advantage in understanding better the requirements and the work to be done compared to eastern workers, which may misunderstand or misinterpret the description of tasks.

6. CONCLUSION

Investigating the factors that contribute to the quality of results in crowdsourced work under different incentive schemes is today an important and still open issue. Towards addressing such questions, we conducted three experiments where the same task was submitted to three different environments featuring different incentives and assessed the quality of work received. The submitted task fell under the subject of Mondegreens.

The analysis of results revealed that some factors had great impact on the quality of results in all contexts, independently of incentives. This includes factors such as English language qualifications, where higher qualifications were associated with better quality of results. In general, formal foreign language certifications seem to be a good proxy for language knowledge indicating that they can be used as a mean to achieve good results in relevant tasks.

While such observation might sound rather straightforward and trivial some findings were rather unexpected. The obtained results indicate that under different incentives, different factors contribute to the quality of work in crowdsourcing tasks. In the laboratory setting of the experiment, gender seems to marginally correlate with the quality of results. On Facebook, high quality results were associated with young age (< 25), while in the international setting of the experiment on the microworkers.com website, high quality results were associated with higher level of education of participants and the plasticity factor of the Big Five personality test. Finally, in the western world setup of the microworkers.com experiment, correlations were observed with the age (<30) of participants.

The high quality results obtained on the social networking site Facebook, motives further questions related to how intrinsic motivations function and how these affect the quality of results. In addition, it raises questions related to whether or not social media sites in general can offer the appropriate context to conduct crowdsourcing tasks. While our results indicate that social media sites like Facebook can compete with -in terms of quality of work - or even outperform platforms offering crowdsourcing services, the question of their ability to cope with crowdsourcing sites and if so, under what circumstances, is still open.

Finally, the research presented highlights also the question why participants from certain countries achieve in general a low quality score, independently of the offered incentives. In particular, research should focus on how the conditions of work in these countries (in terms of culture, infrastructure, educations, cost of living, income etc.) affect the day-to-day engagement with crowdsourcing related tasks and how much impact such aspect have on the quality of the final work carried out.

Chapter 75
Critical Success Factors in Enterprise 2.0:
The Importance of Business Performance

Ana Silva
Porto Business School, Portugal

ABSTRACT

While evangelists and enthusiasts of Enterprise 2.0 praise the benefits of the use of social software in the workplace, the sceptics are not that convinced and some draw attention to the failures of the Knowledge Management concept and tools that were trendy some years ago. In parallel, board members and top management question the true business benefits of Enterprise 2.0 and demand proof of the potential business value prior to giving a green light to this type of investment. If it is true that some of the benefits of Enterprise 2.0 are intangible and therefore harder to measure, the impact on business performance should be observable and consequently measurable. This chapter reflects on the importance of addressing the topic of business performance when it comes to social software in the enterprise. It also discusses the importance of integrating social software into the flow of work in order to drive adoption and sustained use.

INTRODUCTION

The enterprise of the 21st century will be a connected entity: one that leverages internal and external networks of people and knowledge to gain competitive advantage and face the increasing challenges of a highly mutable external environment.

The profound economy crisis, coupled with a deep social unease, has set the scenario for the rethinking, on a global scale, of the future of public and private institutions, of society as a whole and of work. Individuals and groups' opinions and actions are all being shared and amplified via a new generation of media—social media—that has given voice at a large scale to previously anonymous people. As authors Hagel, Brown and Davison (2010) recently said in their recent book The Power of Pull "each of us,

individually and together, are now, for the first time in history, in a position to collaborate in a complete reimagination of our biggest private- and public-sector institutions that will eventually remake society as a whole" (p. 159).

Authors such as Don Tapscott and Gary Hamel have well described some of the key concepts that will influence the future of organizations and work: openness, connectedness, mass collaboration, agility, and transparency. And social tools are playing an important part in enabling this internal and external connectivity and collaboration in companies big and small. For both leaders and employees the construction of the new enterprise presents new opportunities, but also new challenges and new work concepts to grasp, creating a mixture of excitement and fear.

A key concept in the modernization and adaptation of the enterprise to the challenges it will increasingly face is that of Enterprise 2.0: the deployment of Web 2.0-style tools (social software) and practices with the purpose of fostering collaboration and collective intelligence inside organizations.

But while evangelists and overall enthusiasts of Enterprise 2.0 praise the benefits of the use of social software in the workplace, the sceptics are not that convinced and some draw attention to the failures of the Knowledge Management concept and tools so trendy some years ago. In parallel, board members and top management question the true business benefits of Enterprise 2.0 and demand proof of the potential business value prior to giving green light to this type of investment.

If it is true that some of the benefits of Enterprise 2.0 are intangible and therefore harder to measure, especially those related to employee satisfaction and engagement, the impact on business performance should be observable and consequently measurable, demonstrating to companies' executives the concrete value of Enterprise 2.0.

In this chapter, we look at the importance of tying Enterprise 2.0 projects to the topic of business performance, as a way of measuring value to the organization, and also the need for integrating social software in the flow of work, as a critical success factor when it comes to driving adoption.

ENTERPRISE 2.0: CURRENT CHALLENGES

Andrew McAfee (2009) wrote in his Enterprise 2.0 book about one of the big shifts witnessed from Web 1.0 to Web 2.0 which was "the realization that software could be social – that in addition to making individuals more productive and automating away their roles in a process, software could and should be used to let people find one another and form communities" (p. 139).

Several years before, in the spring of 2006, the same McAfee published in the MIT Sloan Management Review magazine an article entitled Enterprise 2.0: The Dawn of Emergent Collaboration. The article, taking on the example of the investment bank Dresdner Kleinwort Wasserstein (DrKW) to reflect on the use of Web 2.0 tools inside organizations, is generally viewed as the text that coined the Enterprise 2.0 expression. And it opened up with a question: "Do we finally have the right technologies for knowledge work?" (McAfee, 2006, p. 21). That article is said to be one of the first case studies that shows how the use of software—in the particular form of social software—could help an organization work and share knowledge in a more efficient and human way.

Several years have passed now but the concept, its frontiers, advantages and challenges are still being discussed and researched, as more and more companies use the so-called social tools internally and report their experience and results.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

And several years after that groundbreaking article the division persists: on one side the evangelists and overall enthusiasts of Enterprise 2.0 praise the benefits of the use of social software in the workplace, while on the other side the sceptics are less convinced and compare it to the promise, to many undelivered, of the Knowledge Management tools and practices some years ago.

Miller, Marks and DeCoulode (2011) from The Deloitte Center for the Edge state that Enterprise 2.0 is very different from traditional Knowledge Management methodologies and tools as the use of social software inside companies allows them to go one step further. With Enterprise 2.0 tools and methodologies, companies can actually create new knowledge whereas Knowledge Management was usually confined to the capture and sharing of existing knowledge.

But if it is true that Enterprise 2.0 draws on something that Knowledge Management seemed to miss – the importance of human-to-human interactions and conversations (thus the social component) in sharing tacit knowledge, the hardest form of knowledge to capture, and as well as in creating new knowledge – it is also true that some, if not most, of the social software experiences inside the enterprise are failing to deliver the expected adoption rates and return on investment (ROI).

Many Enterprise 2.0 projects are just pushed at executives, middle-managers and employees as Knowledge Management 2.0 projects or as a new way to communicate, with very little focus on performance improvement (Miller, Marks & DeCoulode, 2011).

In parallel, board members and top management usually question the true business benefits of Enterprise 2.0 and demand proof of the potential business value prior to supporting groundswell initiatives or to giving green light to investments in more customized and comprehensive (hence costly) platforms. As McKinsey stated in their late-2010 research on the use of social tools for business "management is trying to understand if they are a passing fad or an enduring trend that will underwrite a new era of better corporate performance" (Bughin & Chui, 2011, p. 2).

John Stepper, collaboration and social media evangelist at the Deutsch Bank, told the audience of the 2011 Enterprise 2.0 conference in Boston how his pitch for senior executives, asking for an investment sum for an enterprise platform and a small team, was received with the following reaction: "What problem are you trying to solve?" (Stepper, 2011, para. 11). This example helps to demonstrate the point of this chapter: the impact on business performance, including problem solving issues, should be considered from the outset when it comes to planning and implementing an Enterprise 2.0 project. And for that impact to be accomplished and noticeable, adoption of these social tools in the context of how work gets done is essential. For this matter, social software needs to be integrated into business processes and in the flow of work.

ENTERPRISE 2.0 AND BUSINESS PERFORMANCE

Current Challenges and Considerations in Enterprise 2.0 Implementation

As with any other concept or technology, implementation and adoption are two key issues when discussing Enterprise 2.0. The big questions of what (a single Enterprise 2.0 platform or several applications that can be integrated), how (bottom-up or top-down approach; led by managers or led by the IT department; starting with a small pilot project or going enterprise-wide) and when (advance now or wait until some applications and players mature) naturally emerge. But most importantly, organizations should start by defining why: what are the key goals of an Enterprise 2.0 project.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Before diving into the topic of the why, the key focus of this chapter, let us explore briefly the topic of the what—the technology side of the Enterprise 2.0 project—leaving aside the how and when, less relevant for this particular discussion.

Understanding the different capabilities that social software enables, and in turn the impact of each technological functionality in enabling those capabilities, is very important when it comes to defining the technology focus of an Enterprise 2.0 project. Different authors look at these capabilities and tools from different perspectives, thus generating distinct frameworks.

Cook (2008) classified the different functionalities according to four Cs—communication, cooperation, collaboration, and connection—placing them on a matrix formed by two axes: the level of interaction enabled by a certain technology and the level of formality required by each technology. According to Cook, connection and collaboration require more formality than communication and cooperation mainly because they rely on people doing things in a more structured way. And collaboration and cooperation require higher levels of interaction because they have a higher focus on group than on individuals.

The two axes of interaction and formality, and the resulting four quadrants, thus serve as a guide for companies to prioritize the introduction of different forms of Enterprise 2.0 software (deciding where to focus their time and effort) into their organizations. For that, consider that interaction refers to the relations between different groups inside a company, and that formality looks at the organizational structure of that company. So, a company with predominantly formal organizational structures and a culture of group interaction will benefit most from software that enables collaboration. Similarly, an organization with an informal structure and a culture that rewards individual effort may prefer to invest in tools for communication purposes.

The framework by Miller et al. (2011) from The Deloitte Center for the Edge outlines five main capabilities: identifying expertise, facilitating cross-boundary communication & conversation, preserving institutional memory, harnessing distributed knowledge and discovering emerging opportunities. Each capability can then be more or less enabled depending on the technology functionalities employed. For example, social networking functionalities are very relevant for identifying internal expertise but not so much for preserving institutional memory. Wikis, on the other hand, are particularly relevant when it comes to preserving institutional memory but less adequate for facilitating cross-boundary communication & conversation.

So Miller et al. (2011) have also put together a matrix that combines the five main capabilities with the different categories of social technology (wikis, blogs, etc.), with an indication, using a relevance scale that goes from not applicable to high, of the fit between a certain capability and a certain tool. When compared to the framework proposed by Cook (2008), this matrix seems grounded on concepts that are more concrete, and therefore easier for executives to understand and use.

Nonetheless, whatever framework a company uses as a guide, it should first think about the objectives that an Enterprise 2.0 project will help enable and only then return to the chosen framework in order to understand the pieces of technology (blogs, wikis, etc.) that need to be deployed.

Coming back to the topic of the why, usually the main driver of an Enterprise 2.0 project, common to the vast majority of companies, will be to harness their internal collective intelligence, preparing the company for the connectedness demanded by the challenging environment of the 21st century, and trying to derive an important competitive advantage. Nevertheless, and in order to achieve this key long-term goal, an Enterprise 2.0 project will need to serve some smaller and short to medium-term objectives that help prepare for the future accomplishment of the greater strategy. No organization transforms itself overnight into a 21st century connected entity. Enterprise 2.0 is a road, not a destination. So companies

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

usually set goals such as improving knowledge sharing and collaboration internally, breaking down departmental or geographical silos, and improving ideation and innovation processes. A new way of working, collaborating and sharing knowledge in the medium run is thus generally the overall aim.

But as Marks and Patel (2010) recently pointed out, using social software to help enable the values of transparency, openness, agility and collaboration, key factors of the future of work and businesses, whilst generating value to the business, together with managing the envisioned change in the way employees work and share knowledge, can be extremely challenging.

An Enterprise 2.0 project will have to solve specific business problems that are currently preventing an organization from reaping the benefits of their collective thinking: it will pave the road to guarantee a smooth ride. So companies should first start by identifying opportunities for improvement, or business problems that need to be addressed, and then evaluate how an Enterprise 2.0 project could help bridge the gaps. Only after defining the objectives can a company think about the how, what and when. But identifying the specific problems that these new social technologies will help solve, and defining the metrics and methods to measure the efficiency of these projects from a business perspective, are two key challenges often cited. So, where do companies start?

Current Research and the Importance of Business Performance

The topic of the use of social software inside companies and business performance has been address in one way or the other in recent research. At the beginning of 2011 Gartner's research of 200 successful social media implementations indicated that, when it came to the use of social tools inside organizations, "pursuing collective intelligence to achieve operational effectiveness is one of the most successful social media adoption trends" (Gartner, 2011, para. 6).

The consultancy company McKinsey has been doing some important, and pioneering, work in trying to sense and evaluate the impact of Web 2.0 in the enterprise, conducting an annual worldwide survey on the use of social tools for internal and external purposes (in this last case, connecting and collaborating with stakeholders such as customers or suppliers). In the 4th edition of their annual survey, McKinsey asked respondents to report measurable business benefits obtained from the use of these social tools for business. Amongst organizations using them for internal purposes, 40% reported a decrease in operational costs and 29% a reduced time to market for products and services (Bughin & Chui, 2010).

But why is it important to address the topic of business performance and operational efficiency when considering the use of social software inside the enterprise? Isn't business performance being accounted for by existing technologies? What could be the impact of these social tools in operational efficiency?

Marks and Patel (2010) pointed to something that helps frame the issue: when it comes to repeatable and clearly defined business processes, current technologies in place seem fairly capable of contributing to operational efficiency, aiding workers in their day-to-day tasks. But challenges arise when exceptions that disrupt the clearly defined processes emerge, calling for human intervention, brainstorming and collaboration, many times with the need to go beyond the boundaries of departments or business divisions to find the right solutions or internal expertise. This same view on the deficiencies of existing technologies to cope with the challenges of managing the 21st enterprise is shared in the research of Miller et al. (2011). And here is precisely where social software inside the enterprise can make a difference: it can help employees reach for valuable weak ties inside their organizations.

In the article "Managing the 21st Century Organization," Krebs (2007) demonstrated the value of using social network analysis inside companies to visualize the networked enterprise: the representation

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

of how individuals and teams inside organizations are really connected and how knowledge is shared. In a nutshell, visualizing how work really gets done when we look beyond the hierarchical representation of a company. As Krebs (2007) noted, "an organization's knowledge sharing and learning are often informal processes dependent upon social ties for transmission" (p. 3), adding an important reminder that "better connections are those that provide you access to nodes that you currently do not have access to." (p. 4).

The importance of these so called weak ties has been stressed in the work of Granovetter (1973) that in his paper The Strength of Weak Ties concluded that "weak ties... are here seen as indispensable to individuals' opportunities and to their integration into communities." (p. 1378). The concept of strong and weak ties resurfaced in the context of social tools inside companies in McAfee's 2009 book Enterprise 2.0. There McAfee (2009) explained that "the ability to form, maintain, and exploit weak ties and the ability to convert potential ties into actual ones (either strong or weak) are both hugely valuable assets, both to individuals and to enterprises in which they work." (p. 88).

Social software is an important enabler of network connections inside an organization, especially amongst those colleagues that do not already form part of the same working groups or departments and thus rarely have the chance to connect (the weaker ties), this being particularly true in, but not exclusive of, large and geographically dispersed organizations. Truth is that many times the answer to an employee's business problem or the piece of information that she is looking for is already inside the organization, if only she knew who to contact. Reaching to a network of ties inside the company is especially valuable because an employee can speedily and in an agile way tap into those ties to get the answer she was looking for. And chances are that the answer is probably in a weak tie.

It is also true that we generally prefer to find and connect to another person when looking for help in addressing a certain problem or searching for a certain solution, more than just searching for and retrieving a document. The recommendation, help or knowledge of another colleague adds an important layer of context to a static piece of information. Semple (2007) emphasized the importance of context when in an article he wrote "having context in the question, context in the answer and the collective memory of your corporate meatspace, empowered by the mighty hyper-link, in between is hard to beat" (para. 5).

Coming back to the note made by Marks and Patel (2010) regarding how employees are dealing with exceptional situations that occur ever more frequently, meaning that they need to reach out to other colleagues in an agile and speedy way, and taking into consideration the importance of looking at the enterprise as a networked entity that needs tools to stimulate and enable that connectedness, we can see the important role that social tools can play inside companies. And, as we begin to understand, this important role of providing the connectivity tissue of an organization, giving context to information and strengthening social ties, can (and should) have an impact on business performance.

In 2011 the research from The Deloitte Center for the Edge explored the link between social software and business performance with greater detail, and the result can be summed up to this: "social software has the potential to address operational "pain points" and significantly enhance business performance in the short-term and transform it in the long-term" (Miller et al., 2011, p. 4). The *father* of the Enterprise 2.0 concept, Andrew McAfee, praised such a research for being "the first long-term, before-and-after data on Enterprise 2.0 that I'm aware of, and I'm grateful for the team's work" (McAfee, 2011a, para. 13).

The reason for focusing such a research on business performance is that The Deloitte Center for the Edge believes that if social software implementation does not impact business performance then it will fail to deliver concrete value to the organization. And if value cannot be achieved and measured, then the concept of Enterprise 2.0 will fall short of its promise. In other words, implementation of social software in the enterprise needs to go beyond the focus of what could be seen as vague goals (such as

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

better collaboration and greater employee engagement), to more concrete objectives of improving business performance, especially in what concerns operational efficiency. And metrics need to go beyond adoption figures, like the number of users registered or the number of blog posts created, metrics that usually fail to capture frequency or sustained use, to metrics that show improved performance.

This is not to say that those adoption metrics, easier to track and share, are not valuable, nor that they should not be captured or shared. These adoption figures, together with small anecdotes derived from the first interaction of employees with the tools, form many times the first set of *success* stories told around the use of social software inside companies, acting as small *quick wins* to get other employees or departments to join the effort. They are many times the prime (and sometimes even the sole) material that internal evangelists can use to *spread the word*. But it should be noted that they shouldn't be the only set of metrics the company is tracking, or intends to track and measure, in order to understand the progress of the implementation of an Enterprise 2.0 project.

The focus on business performance is also important for another set of reasons. A research entitled Social Business Systems - success factors for Enterprise 2.0 applications, conducted in 2011 by the Association for Information and Image Management (AIIM), asked respondents what were the three biggest issues with Enterprise 2.0 applications in their respective organizations. Two of the three most cited issues were non-involvement of senior staff, referred by 36% of those surveyed, closely followed by too much social, not enough business, cited by almost 25% of respondents (AIIM, 2011). If senior staff fails to see the business value of these social tools in the enterprise, then they will surely not feel the appeal to participate. And they will also most certainly refrain from approving investments in this area, as the story shared by Stepper (2011) cited previously clearly showed.

But if the need to demonstrate business value is critical for getting the top management to approve investments in social tools, and also to guarantee their involvement and leadership by example when projects are implemented, employees too need to understand the value and impact that this new way of working will have in their daily work.

The top issue revealed from that same AIIM (2011) survey was the reluctance of staff to contribute. The reasoning here can be two-fold. First, the organization's culture—the beliefs, values, norms, and habits that embody the way things get done around here—may not be one that stimulates participation. Companies cannot expect to simply deploy the tools and have an army of employees eager to jump on board and share their knowledge (the build it and they will come belief has generally proven to be false).

Secondly, employees may not feel that contributing will help them in any way. In a time where they are expected to work under a more, better, faster motto, surrounded by an increasingly challenging competitive environment that demands them to be ever more agile and productive, the introduction of new tools that demand their attention, dedication and time without helping them improve their performance is doomed to fail. The new tools will become, sooner or later, just another component of an already complex landscape of enterprise applications, intranets and the like that seem to provide little real value when it comes to day-to-day tasks and problems. This topic will be addressed later in this chapter.

But if results from recent research point to the need of grounding Enterprise 2.0 projects to concrete business objectives, especially those related to business performance, how do companies determine exactly which objectives to tie in to the implementation of social tools? Again, the research of Miller et al. (2011) from The Deloitte Center for the Edge provides some important guidance. No one doubts that we currently face challenging times, with a fast pace of change that demands great adaptability and agility from organizations big or small. One of the consequences of this increasing pace of change, and the complexity it generates, is the growth in the number of exceptional situations that employees are

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

faced with: situations that escape predefined and clearly mapped business procedures. Think of occurrences like a customer with a particular problem or requirement, demanding (or at least expecting) a speedy feedback and resolution.

These exception handling situations are increasingly frequent. Hagel and Brown co-authored an article for the Harvard Business Review Blog Network where they stated that "in our informal surveys, we have found that as much as two-thirds of headcount time in major enterprise functions like marketing, manufacturing and supply chain management is spent on exception handling" (Hagel & Brown, 2010, para. 12).

As had already been hinted in this chapter, this is one of the areas where social software brings great potential value to businesses by improving the access to people, data and knowledge not easily accessible in the context of clearly defined business processes. And it is, thus, a first and important lead of the linkage between social technologies inside the enterprise and business performance: improving agility and swiftness in problem solving when exceptions occur. In other words, improving speed and agility of response and therefore operational performance.

Miller et al. (2011) summed the importance of looking at this topic when they referred that "while social software can be applied against a variety of business challenges to yield performance improvement, exception handling offers one of the best opportunities to prove the concept and overcome skepticism" (p. 7). It is to say that the disruption and unbalance caused by the increase in exceptional situations impacting operational activities of organizations, consuming time and energy from employees that struggle to find the right resource or piece of information to deal with those exceptions, combined with the capabilities of social tools in solving those problems, set a powerful starting point when it comes to defining the purpose and key initial focus of an Enterprise 2.0 project.

So how would a framework for developing an Enterprise 2.0 project in light of the business performance focus look like? Companies should start by recognizing a situation (pain point) that could be addressed by social tools in the enterprise, identify the associated operating metric (and preferably also the related financial metrics), reflect on which social software capabilities are critical to help deal with that pain point, and only then think about the technology side of the equation. This is what Miller et al. (2011) call a focused implementation: one that starts by looking at a particular problem or difficulty, one that impacts business performance, and only then starts developing the basis for the Enterprise 2.0 project. "Clarity about goals brings clarity about means", wrote McAfee (2009) in his book on Enterprise 2.0 (p. 142).

The research by Miller et al. (2011) cites the example of OSIsoft, a US company developing enterprise software to manage real-time data and events, which used social software to improve an operating metric—average time to issue resolution—affected by the increasing difficulties of the customer support team in quickly providing accurate answers to customer questions. The company followed a focused implementation: identifying the capabilities that needed to be leveraged—identifying expertise, improving cross-boundary communication and conversation, preserving institutional memory, and harnessing distributed knowledge—and the corresponding social tools functionalities. The result? A 22% improvement in average issue resolution time and, according to that same research, "reductions in average time to issue resolution translated to cost savings and increased productivity" (Miller et al., 2011, p. 10), which means that the impact on an operational metric also derived benefits at the financial level.

Another starting point may be to begin looking for initiatives already underway in the company that can be substantially leveraged by the use of social software. Many companies, especially in manufacturing sectors, may already have internal communities of practice that get together to share and discuss best

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

practices leading to overall operational improvements through cost savings or improved efficiency. These communities, especially in larger and geographically disperse organizations, can receive a significant boost in performance and agility with the use of social tools to facilitate contextual communication, discussion, and sharing. So an Enterprise 2.0 project should look internally for good examples of multi-disciplinary groups already working together towards performance improvement and collective problem solving and think: how can social software help gather momentum for these initiatives or make group discussions more nimble and rich?

Of course this approach needs to leave space for other important topics that are bound to be crucial in later stages of the project: scalability and emergence. There is the danger that an Enterprise 2.0 project that is too focused on the needs of certain areas of the company (in the case of a focused implementation as the one developed for OSIsoft those areas more closely related to customer service), will encounter difficulties when trying to scale to an enterprise-wide level.

Also, the 21st century enterprise, as an internal and externally connected entity, is one that evolves with the interaction of the different nodes and clusters in the network (Krebs, 2007). Think of life in perpetual beta but for organizations. This draws attention to the concept of emergence outlined by Hinchcliffe (2007) referring to a system that co-evolves with its users. In both cases the flexibility and adaptability of the chosen social tool is important and should also be considered from the outset of the project. Adapting a well-known mantra—start small, move fast, think big—we could think of Enterprise 2.0 as a start focused, move fast, think enterprise-wide project.

When it comes to measurement of results obtained, this is usually one of the most difficult items in many software projects, and an Enterprise 2.0 implementation, with the added complexity of being more than just a software project, is no exception. There is much discussion in the Enterprise 2.0 space around the topic of Return On Investment (ROI) and also around the lack of use cases that report more than just vague and cumulative adoption metrics such as the number of blog posts or entries to wikis. On this last issue some claim that if companies are deriving real competitive advantage from the internal use of social software then they may not be very open to publicly sharing their achievements, as author McAfee (2011a) emphasized.

Authors, such as Newman and Thomas (2009) sometimes distinguish between *soft* and *hard* benefits, the first set referring to metrics such as increased employees' productivity and satisfaction or better collaboration, usually captured via internal surveys or small anecdotes collected to help prove the validity and results obtained with the internal use of social tools. The second set usually includes benefits such as reduced email volume (communication moves from the inbox to the social tools), decrease in travel costs (as online collaboration improves) or increase in revenues from ideas generated using social software.

When it comes to measuring the impact on business performance, a focused implementation, starting with a clearly defined problem or pain point that has an associated operating indicator, gives a concrete indication on the key metric (or set of metrics) that should be tracked and evaluated. Of course one might question if concurring factors are easy to isolate. Was OSIsoft's performance improvement achieved only due to the use of social software? Could other factors be in fact contributing to this improvement? It is up to each company to try to isolate as much as possible the effects of the use of social tools from other also positive benefits.

A focused implementation seems to help address two key challenges discussed previously: the scepticism of executives regarding the benefits and impact of social software, and also the low level of participation by employees. As the research of Miller et al. (2011) indicated "showing how a social tool

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

can improve an operational metric can prompt managers to use social software and to encourage their employees to use it as well" (p. 9).

But is employee adoption something that you dictate by mandate? If it is true that employees are likely to be more motivated to use a tool that directly addresses a problem (pain point) that they face in a certain business process, is this sufficient to encourage them to use it? This brings us to the topic of employee adoption.

Road to Adoption: Integrating Social Software Into the Flow of Work

The nature of the Enterprise 2.0 concept has always been grounded on principles of openness, emergence, willingness to participate and voluntary action. Social tools in the enterprise are usually non-obligatory, following an opt-in concept that accommodates for both the voluntary nature of the concept (people participate because they want to connect with colleagues, share their knowledge and expertises, and participate in online internal communities) and also for legal questions regarding individual privacy, especially in the European Union (Frappaolo, 2010).

Previously in this chapter we have seen how an AIIM (2011) survey pointed to the reluctance of staff to contribute as a top issue in what concerns Enterprise 2.0 adoption. The question is that an Enterprise 2.0 project that fails to reach, inside the organization, the equivalent of the Internet concept of critical mass, will hardly produce the expected results because it will be lacking a base of committed users that give life to a networked and user-generated ecosystem.

This means that adoption clearly matters. If so, how to drive adoption of social software inside an organization? Opinions diverge but overall there's a consensus that the strategy to get employees on board may be very different from one organization to another and, therefore, that no unique solution exists. Some companies, striving to break down information silos, may try to enforce the use of social tools as a substitute for email communications in the management of projects, for example, while others may opt for strategies of raising awareness to the benefits of the social tools vis-à-vis existing ones, though not enforcing them onto their workforce. Some companies may also tie some of the employees' incentives and rewards to their collaborative effort, measured through their contributions to the wikis, comments, and so forth.

But an important aspect needs to be taken into account: the company's culture may be one that does not stimulate employees' participation and therefore just throwing some technology at the problem will certainly not solve it. Some companies, understanding this, seem prepared to embark into a change management journey to adapt to a new way of working.

But another reason may help explain why many companies deploying social software internally usually report difficulties in adoption: in the words of Buczek (2011), a practitioner in the area of Enterprise 2.0, "the big failure of social business is a lack of integration of social tools into the collaborative workflow" (para. 3). This empirical view from someone responsible for leading an internal social collaboration effort for a large global enterprise is corroborated by the results of some research and by the opinions of many thought leaders in the field of Enterprise 2.0, such as Dion Hinchcliffe, Andrew McAfee, Bertrand Duperrin or Emanuele Quintarelli.

The motive seems quite straightforward: if social tools are yet another addition to the already complex puzzle of technology that employees have at work, usually consisting of a variety of systems, intranets and extranets with little integration between them, they will ask themselves how the new tools will improve their productivity and help them do their job. If they cannot find real value in them, the initial enthusiasm

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

caused by the novelty of those social tools will quickly fade away as the normal rhythm of day-to-day tasks and challenges imposes itself. Sooner or later the project team of the Enterprise 2.0 project, in many cases stimulated by the initial uptake in the number of employees visiting or contributing to the internal digital social environment, will struggle to boost adoption rates or to maintain sustained rates of usage.

This argument was supported by the research done by the McKinsey Group in 2009 with their 3rd edition of the annual survey on the use of social tools for business. When reflecting on the results from that research, and on the conclusions they could draw on which were the key success factors for making social software work inside the enterprise, Chui, Miller, and Roberts (2009) clearly stated that "participatory technologies have the highest chance of success when incorporated into a user's daily workflow" (p. 4). In fact, 75% of respondents to McKinsey's survey that claimed to be observing measurable benefits from those technologies said that one of the most important practices for success of social tools for business was integrating the use of Web 2.0 into employees' day-to-day work activities (Bughin, Chui & Miller, 2009).

This conclusion was reinforced in the findings of the 4th edition of that same survey in 2010 when McKinsey's researchers, reflecting on the findings, suggested as a specific step: "integrate the use of Web 2.0 into employees' day-to-day work activities. This practice is the key success factor in all of our analyses, as well as other research we have done" (Bughin & Chui, 2011, p. 8).

The research from The Deloitte Center for the Edge, already cited in this chapter, studied social software adoption at Alcoa Fastening Systems, a global business unit of Alcoa that designs and manufactures fastening systems for the aerospace and industrial industries, and discovered that as employees realized that the use of the social tools helped them perform better at work, they integrated their use into the workflow (Miller et al., 2011). We shouldn't forget, however, that the project at Alcoa is an example of a focused implementation, with a clear emphasis on improving productivity and reducing exception handling, which could in fact favour employees' perception on the positive impact that the use of social tools could have in their daily work.

The research of AIIM (2011) pointed to the need of firmly embedding social tools in business processes and applications, as a means to guaranteeing adoption. Hinchcliffe (2011), reflecting on the integration and connection of social tools to the workflow, articulated that "the isolation of social business platforms from the key operational activities of the organization is increasingly understood as a root cause of slower adoption and lower relevance" (para. 4). These two authors take the concept of integration into the flow of work one step further, as embedding of social tools may imply the tight integration of a social dimension into existing processes and systems as Customer Relation Management (CRM), for example, giving rise to concepts such as social CRM that we will not explore in this chapter. This calls for a tighter connection between systems of records (tools such as Enterprise Resource Planning – ERP – or CRM where structured work gets done) and systems of engagement (social tools that strengthen ties and communication between employees).

McAfee (2011b) also explored the topic of the connection of what he called formal (structured and pre-defined) and informal (unstructured and emergent) work by claiming that "the digital environments that support the formal and informal work should also be very close to each other, either within the same application or across tightly integrated ones" (para. 5).

With more or less integration, it all boils down to demonstrating the value of social software in employees' productivity and problem-solving capabilities, and thus making sure that those social tools serve in fact as regular work tools. A focused implementation, with a key emphasis on improving busi-

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

ness performance and satisfying business needs as in the case of Alcoa Fastening Systems mentioned earlier, will certainly be conductive to workers realizing the benefits of social tools for their productivity.

Besides that, companies too often presume that their workforce will know how to use that technology in the context of work, when most of them are only used to resorting to similar tools in the social Web to connect with family and friends. This means that, besides resorting to focused implementations and integrating social software into the flow of work, companies also need to educate their employees on how those tools can help them improve their productivity. Leading by example is important and thus management sponsorship and role model behaviour are also important success factors to driving adoption in a business context.

FUTURE RESEARCH DIRECTIONS

Following some maturity of the Enterprise 2.0 concept and practices, especially in the United States, and the outcomes from the initiatives of the early adopting companies, there has been one main discussion topic generating much debate when it comes to the topic of social in a business context. Some call it Social Business, others focus on specific business processes and speak of Social CRM or others, thus with an implied concept of socializing the value chain. Carter (2011) reflects on the distinction between social media and Social Business as she states that the later "expands the usage and efficiencies beyond "media and marketing" to all of a company's processes, both internal... and external" (p. 5). Quintarelli (2011) focused on the topic of socializing the extended value chain, reflecting on the challenges that companies currently face, how different social technology vendors are approaching these challenges, and thinking about a four steps approach to that topic.

No matter how wide or narrow the focus is, truth is that these concepts are still in their infancy and therefore more research is needed to study the challenges and results of companies that *went social*, both internally and externally, and tightly integrated these two dimensions as one single social enterprise. Furthermore, greater consensus on the definitions and frontiers of each concept—Enterprise 2.0, Social Business, etc.—would be greatly valuable to advance the discussion beyond the basics or the buzzwords. The road to prepare businesses for the 21st century is still being paved.

CONCLUSION

Many Enterprise 2.0 implementations are failing to produce the expected results and adoption levels, and several executives are still sceptic about the benefits of social software for business. To this reality surely contributed an excessive emphasis on vaguer concepts such as better collaboration or an empowered workforce, and a lack of focus on business performance. The problem is that if projects cannot impact business processes and performance then they will hardly impact business value.

The concept of focused implementation helps address this issue, looking at operational problems (*pain points*) and applying social software capabilities to help solve them. The emphasis is thus on business needs and problem solving, striving for a concrete and measurable impact on business performance, especially at the operational level. This also helps address the always cumbersome task of tracking the right metrics when it comes to measuring Enterprise 2.0 success: by focusing on clearly identified business problems and needs at the operating level, the identification of the correct metrics is facilitated.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

But adoption also needs to be stimulated to make sure that a threshold level of participation is attained in order to guarantee that network effects are facilitated. Too often the initial enthusiasm with social tools at the office soon fades away as the regular workload gets in the way. To overcome this, and really derive benefits from Enterprise 2.0 projects, social tools need to be integrated into the flow of work. Employees need to understand the benefits of social software to improve their productivity and problem solving skills, and should also be educated on the use of social tools in a work context.

The discussion on the use of social software for business is now heading for the bigger picture of the Social Business concept: the enterprise as an entity that embeds social into business processes, touching beyond its own borders to connect with external stakeholders. Further discussion is needed to reach consensus on the concept and future research needs to concentrate on the benefits and challenges that fully networked (both internally and externally) businesses are encountering.

KEY TERMS AND DEFINITIONS

Adoption: Use of social software, whether by simply registering/creating an account (less participatory) or by actively participating through comment, discussing, etc.

Business Performance: Balance of the outcomes of a company in key areas, usually associated with business processes, against the goals initially defined.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Business Processes: Set of activities and tasks associated with the completion of a certain output, be it a project or a product.

Collective Intelligence: Shared knowledge jointly constructed by a group of people through their collaboration and interactions.

Enterprise 2.0: Deployment of Web 2.0-style tools and practices inside organizations with the purpose of fostering collaboration and collective intelligence (employee-oriented).

Knowledge Management: The concept of capturing, retaining, and managing organizational knowledge, either tacit or explicit, with the purpose of guaranteeing that it can be kept and reused.

Social Business: A company that embeds social tools and practices both internally (employee-oriented) and externally (oriented to other stakeholders such as customers or other business partners) with an integrated approach.

Social CRM: The embedding of social tools and practices into the process of Customer Relationship Management with the purpose of better serving and understanding the market.

Social Software: Software inspired by the functionalities of Web 2.0 tools such as blogs, wikis, microblogging, social networks, and others.

Chapter 76
Evaluating the Business Impacts of Social Media Use With System Dynamics and Agent-Based Modeling: A Literature Review

Olli Pirttilä
Granite Partners Ltd., Finland

Hannu Kärkkäinen
Tampere University of Technology, Finland

Jari Jussila
Tampere University of Technology, Finland

ABSTRACT

Social media has been widely adopted as a useful business tool, especially in the domain of business to consumer marketing. However, the deployment of social media tools to business processes is hindered by the lack of concrete indicators of the effects its use has on the business process. Computer based modeling has been widely used to simulate and predict business effects in other streams of study, but relatively little in the evaluation of social media impacts. This paper argues that System Dynamics and Agent-Based Modeling have been and should be utilized in measuring social media and its impacts in business context in general, as well as in the context of business ecosystems. The authors review the current state of the use of these simulation methods in the evaluation of social media business impacts by conducting a systematic literature review.

INTRODUCTION

There is a body of existing scientific research on the effects of social media use in a business setting. For example, in marketing literature the biggest obstacle in deploying social media to business processes is often viewed to be the difficulty to demonstrate its effects and return on investment. According to

DOI: 10.4018/978-1-5225-8182-6.ch076

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Fisher (2009) the lack of indicators of potential benefits and expected return on investment slows down or hinders the adoption of social media as a part of a company's marketing strategy. In addition, the ability to show measurable effects in other business functions would be beneficial. According to Jussila et al. (2014), the adoption of social media in business-to-business companies is restricted by the difficulty to show and assess the business benefits. They state that effective means and models to measure and demonstrate the benefits of social media use would be beneficial. Also Aral, Dellarocas, and Godes (2013) emphasize in their framework for the research of social media that the measuring of the effects of social media use on the individual level, platform level and company level is ranked as one of the major goals for new social media research.

This paper aims to answer how system dynamics and agent-based modeling has been used in the past to measure the effects of social media use and what possibilities could it offer for measuring social media and effects of its use in business ecosystems. Of the possible modeling methods, agent-based modeling (ABM) and system dynamics modeling (SDM) have been chosen for this review, because they are especially well suited for modeling complex social systems, and are quite well established methods for research in the scientific community. By carrying out a systematic literature review on the subject, we aim to give a comprehensive picture of the current state of modeling applications that provide various solutions to the challenges posed by the measuring and demonstrating the business effects of social media use by traditional methods.

The main research problem of this review is "Do agent-based and system dynamics modeling offer useful ways to measure social media and effects of its use in a business context?". This paper aims to resolve this problem by answering these research questions:

- **RQ1:** In which ways have ABM and SDM been used to measure the impacts of social media use?
- **RQ2:** Why have ABM and SDM been used and why should they be used in the evaluation of social media impacts?
- **RQ3:** Based on found applications, what are the direct or indirect business implications of using ABM or SDM in measuring the impacts of social media?

SOCIAL MEDIA AND ITS BUSINESS USE

In order to define social media accurately, one has to define the terms "web 2.0" and" User Generated Content". Web 2.0 is a term first introduced by Tim O'Reilly in 2004 that describes the new approach of users and developers in using www-technology (O'Reilly, 2009). In the new approach the content and applications of the World Wide Web are no longer made only by individual developers. Instead, the content is constantly generated and modified communally by both the developers and users. (Kaplan & Haenlein, 2010) The term "web 2.0" includes open, interactive and communal applications that support the aforementioned communal nature of the World Wide Web. Web 2.0 applications support the formation of informal user communities and create a frame that allows the sharing of ideas and information by enabling effective creation, modification, spreading and sharing of informal information (Constantinides & Fountain, 2008).

User Generated Content (UGC) is the wide variety of publicly accessible information that exists on web 2.0 applications, and is generated by the users of that application (Kaplan & Haenlein, 2010). By

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

combining the definitions of UGC and web 2.0, one can give a broader definition for the term "social media". Social Media is defined as internet-based applications that utilize web 2.0 technology and principles, and enable the creation and sharing of User Generated Content (Kaplan & Haenlein, 2010).

In spoken language the term social media is often affiliated only with social networking and micro blogging services, but in fact the term includes a broader set of application. Also, the terms "social media" and "web 2.0" are often used as synonyms, but in reality they mean different things. Social media is a very broad term that includes a wide variety of applications, in which the social interactions and user participation are key features.

Lietsala and Sirkkunen (2008) propose that social media should be used as an umbrella term, under which different practices and applications can be categorized. They state that established social media practices or application are, for example, blogging, social networking services and wikis. Kaplan and Haenlain (2010) similarly divide social media applications into six different categories according to the needed social presence and information richness. The categories are: blogs, social networking services, virtual social worlds and collaborative projects. These social media applications can be used to gain measurable business benefits, and develop social business ecosystems. For example, the social business ecosystem of a company can consist of open source communities, inter-organizational social networks, as well as customer and supplier communities. Using these aforementioned social media tools has been demonstrated to open new possibilities, because they enhance communication, interaction, learning and collaboration (Jussila, 2015). However, these novel tools and business ecosystems are often very abstract and complex social systems, and thus, their business effects and return on investment is hard to measure and demonstrate.

SYSTEM DYNAMICS AND AGENT-BASED MODELING

With agent-based modeling one can simulate social systems, which often are formed as a sum of complex social procedures and interactions (Bonabeau, 2002). On the other hand, system dynamics modeling offers a system level perspective on the behavior and forming of trends in the social system. Agent-based and system dynamics modeling also complement each other, because agent-based modeling offers a way to investigate individual actors in detail, whereas system dynamics offers a way to examine the system as a whole. (Wang & Moon, 2013)

Agent-Based Modeling

Agent based-modeling (ABM) is a modeling method that enables the simulation of complex systems that consists of autonomous agents that interact with each other. The interaction between agents is defined according to certain simple rules and procedures that are assigned to them. By simulating the individual actions of different agents one can model the complexity of a social system and the effect that the individual actions have on the system as a whole. (Macal & North, 2010; Janssen, 2005) At its simplest, an agent-based model consists of agents and relations between those agents. In more complex models one can include network and learning algorithms that more accurately describe the learning and unpredictable behavior of the agents. (Bonabeau, 2002)

System Dynamics Modeling

System dynamics modeling (SDM) is a computer based modeling method that is based on a system dynamics view. The goal is to understand complex, non-linear, problems with the help of systems thinking. System dynamics models are based on the causal nature of the problems and on the wholesome effect that different factors have on the system as a whole. Modeling can be done in a qualitative or quantitative level. On the qualitative level one examines, for example, effect-tables or causal loops. On the quantitative level one examines, among others, stock-flow tables. (IGI Global Dictionary, 2014; Sterman, 2002; System Dynamics Society, 2014) The goal of system dynamics models is to create a model that holds equations that describe the system, and then understand the dynamic behavior of the system by simulating the working system with the model (Forrester, 1994).

RESEARCH APPROACH

The research method of this paper is a systematic literature review. The research material has been gathered by conducting an article search from the following international journal databases: Elsevier Science Direct, Scopus, EBSCOhost (Academic Search Elite & Business Source Complete), ABI Inform (Business Suite) – ProQuest, ACM Digital Library, IEEE Xplore Digital Library, Emerald Insight. The search parameter is constructed in a way that the results consist of the intersection of the social media topic set and modeling topic set. The search parameters were searched from the title, abstract and keywords of the database articles. Each result contains at least one search keyword from the social media topic set and one from the modeling topic set. Social media topic set keywords were: *social media, web 2.0, enterprise 2.0, online community, online social network, virtual world, crowdsourcing, social platform, social office tool, blog, microblog, online collaboration.* Modeling topic set keywords were: *agent-based modelling, agent based modelling, agent-based simulation, agent based simulation, system dynamic, system dynamics, system dynamic modelling, system dynamics modelling, system dynamic simulation, hybrid model, hybrid simulation model.*

The scope of the search is confined to include scientific journals and conference papers. Including conference papers is justified, because the most high-quality and novel research about the modeling topic is often published especially on modeling and simulation conferences. Conference papers also offer quite novel information due to their relatively short review and publishing cycle. The search is also confined to papers published after the year 2000. This is due to the fact that social media related research is unlikely to be found before the year 2005, when social media and web 2.0 became established, and first well known social media applications became common (Lietsala & Sirkkunen, 2008).

The backward and forward references of these articles were also examined with Scopus and Thomson Reuters Web of Science to find more relevant material on the subject. Based on this search, 2 additional articles were identified from backward references. The titles and abstracts of articles published after 2000 in the System Dynamics Review and Journal of Artificial Societies and Social Simulation were also examined. No additional material was found from these journals.

The identified material was narrowed down according to two exclusion/inclusion criteria:

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

- **C1:** The article has to discuss the agent-based or system dynamics modeling of utilization of social media or the effects of using social media in general or the modeling of a specific social media application in a business setting or a setting that is applicable to business also. Furthermore, we included only papers that present a model created by authors, not e.g. generic examples of modeling or reviews of others' models.
- **C2:** The article must be a scientifically peer-reviewed publication.

The database searches of this research were carried out systematically from multiple databases with broad, non-restricting search parameters. The results yielded 101 publications that were narrowed down to 20 according to the inclusion/exclusion criteria C1 and C2. The distribution of these publications with respect to journal or conference is given in Table 1.

6 publications from the found publications were published in a scientific journal and the rest were published in conference proceedings or books edited from conference papers. Most of the found scientific journal articles have been published in a journal with Thompson Reuters Journal Impact Factor. All studied conference papers were published in conference proceedings that are organized by Institute of Electrical and Electronics Engineers (IEEE) or some other well-known and respected publications organizations.

RESULTS

In the systematic literature review, of the overall 20 articles found in the literature review, 10 described direct business implications and 10 entailed indirect or potential business implications of using ABM and SDM.

Altogether 9 different types of applications of ABM and SDM were identified from the publications discovered in the systematic literature review. The found applications range from modeling individual user behavior to examining network formation. The found applications are:

1. Examining effective ways to encourage the use of social network services (articles 4, 6 & 11)
2. Examining online community networks and collaboration (article 1)
3. Modeling online network formation (articles 17, 18 & 19)
4. Modeling of online social network dynamics (articles 20)
5. Modeling the diffusion of information in social media (articles 15 & 16)
6. Modeling the effects of online word of mouth to consumer behavior (articles 2 & 3)
7. Modeling opinion formation of stakeholders in social media to understand & predict social behavior. (article 14)
8. Examining social media to support decision making in policy making (5, 7, 12 & 13 articles)
9. Modeling future trends in social media conversations (article 10)

From the above applications one could underline two broad themes. Applications 1-4 deal with understanding online networks and dynamics that lie within them by, for example, modeling the drivers that affect user behavior in the social media service or tool in question. The general goal of these applications was to understand the internal mechanisms of the social media services or tools, and to identify ways that could enhance the use of these tools. By understanding, firstly, how online networks were formed and which factors increase cohesion in the online network or community (applications 3 & 4), and secondly, how agents interacted within that network (applications 1 & 2), the studies created useful insight and measured the effectiveness of online social networking tools in business use. In addition to measuring the effects of the tool, one could also test different scenarios and methods that aimed to encourage the use of these tools and make it more effective.

Applications 5-9 on the other hand deal with understanding how social media affects various types of information flow- related phenomena by, for example, examining how information was diffused in social media, and how that affected opinion formation or consumer behavior. The goal of these applications, in general, was to simulate social media phenomena in order to develop useful insights on how the social media information flows affected real world indicators and impacted, for example, decision making. Applications 5 & 6 deal with the diffusion of information in social media and its impacts in a business context and other societal contexts. Applications 7 & 9 deals with understanding and predicting social behavior, by modeling how opinions emerged, diffused and gained momentum. Application 8 (with 4 different articles) models the formation of opinions and opinion groups in social media to better understand how policy makers' decisions impact different stakeholders.

By analyzing these applications, several direct implications for business that were described in the articles were discovered. Also indirect business implications were discovered that weren't described directly in the articles, but were implied or deductible from the articles. Ten of the articles found in the systematic literature review described ABM or SDM applications that presented direct business impli-

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

cations. The applications that had direct business implications and the different empirical data they rely on are presented in Table 2.

The underlying theme of all the direct business implications stated in table 2 was the examination and forecasting of human behavior in complex social and business ecosystems. Almost all of the described applications relied on empirical data and are implemented using ABM. The stated benefits of

Development and Evaluation of Multi-Agent Models Predicting Twitter Trends in Multiple Domains	ABM	Modeling future trends in Twitter conversations (number of tweets and its set of subtopics)	31 134 bankin tweets and 13 124 universities tweets	Organizations can extend their social media monitoring capabilities and thus become more pro-active and less reactive

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

using computer based simulation and modeling included the facilitated understanding and additional insight they brought to the comprehension of business ecosystems and the actions of their individual actors. By understanding and forecasting the inner systemic structure and operation of these ecosystems one could make more informed business decisions, as well as better understand and even forecast their short- and long-term impacts. Often the forecasts and analyses could also be made without having to extrapolate from actual history data. As seen in the found articles, the models could be calibrated with openly available empirical data, and this enabled to forecast ecosystem behavior without having to collect vast amounts of data first.

10 of the found articles had indirect or potential business implications that weren't addressed as such in the articles, but could be applied to modeling the complex systemic impacts of social media in a business context. The applications that had indirect or potential business implications are presented in table 3.

Most of the indirect or potential business implications stated in table 3 deal with the better understanding of complex social systems or business ecosystems. The recognized business implications included forecasting market reactions to public policy changes, understanding the mechanisms of information resonance in marketing strategy formation, as well as the understanding the information diffusion in social media communities for marketing purposes.

DISCUSSION AND CONCLUSION

The found applications give a good overall answer to the first research question (RQ1). The two major themes that are present in the found applications coincide well with the general qualities and benefits that are usually associated with ABM and SDM. Of the discovered articles, only 3 used SDM, all others utilized ABM. The fact that clear majority of the found applications utilizes ABM instead of SDM is not surprising if one considers that ABM is especially well suited to model complex social systems. The lack of SDM applications however is a noteworthy result, because it is the more established method of the two, and yet hasn't been utilized that much in social media research.

Regarding the differences of the modeling methods, Otto & Simon (2008) point out that system dynamics modeling can describe the properties of causal links and essential features of the whole system with a high level perspective. The difference between ABM and SDM is that SDM rarely includes modeling that takes into account the individual and random actions of every single agent in the system. Instead SDM explains the working of the network as a whole system. Most of the found ABM applications imply that the model gives a micro level perspective on the subject in addition to the macro level perspective that other more traditional empirical studies and models offer.

Regarding the second research question (RQ2), we were able to draw three major arguments why simulation approaches were used in studied articles and should be used in general.

First, the simulation approaches were found to take into account the dynamic nature of social interactions in the evaluation of social media impacts in various different ways that traditional approaches, such as survey-based statistical methods or case studies used in the impact evaluations do not enable. Traditional methods and related algorithms are not generally able to handle well the complex and sometimes chaotic behaviour that is derived from relatively simple interactions of individual agents (e.g. consumers). These interactions may lead to unexpected and often counter-intuitive impacts, realized over time, from e.g. social media marketing and word-of-mouth campaigns (e.g. Okada & Yamato 2011; Okada 2012),

which again, lead to consumer opinion formation about products and finally to purchasing decisions often in quite unexpected ways.

Second, traditional methods are considered ill-suited to capture changes over time and during measurement. For instance, with surveys the data is captured at fixed time intervals, often a single time interval, and they are unable to capture, for instance, how the purchasing behavior of agents (e.g. consumers) changes over time and is influenced by other agents (e.g. friends of the consumers). In comparison, in the analysed ABM simulation models, for example, new actors (agents) could be added during the simulation and the network and relationships linking the actors (individuals, organizations, etc.) could evolve over time, making use of different rules and patterns based on empirical data (e.g. Toriumi & Ishii 2010; Sobkowicz et al. 2012b) as well as theoretical models (e.g. Okada & Yamato 2011; Okada 2012).

Third, by making of use of the increased computational power of computers simulation models can be built and infused with empirical data collected from web and social media that make it fairly easy and cost effective to observe dynamic behavior, whereas with using traditional methods (e.g. surveys or interviews) the cost and difficulty of making large-scale observations of dynamic behavior would be enormous (Kaschesky et al. 2011).

The systematic literature review revealed both direct and indirect business implications of using ABM and SDM to model the use of social media. For answering the third research question (RQ3), these implications give a good overview of the business potential of the methods based on current literature.

On the basis of this study, it seems that the use of computer based modeling has significant potential in social media related business research and measuring the effects of social media use.

FUTURE RESEARCH AND LIMITATIONS

Further exploration and analyses of the discovered benefits of computer based modeling would be helpful in determining the best ways to utilize these novel methods and justify their use. As a result of this review, there are several issues that should be addressed in future research on the evaluation of social media impacts by simulation: overall, due to the provided benefits of ABM and SDM to better understanding of social media impacts, and the relatively small amount of existing found research, first, there is a clear need for more research on social media impacts in various business contexts using ABM or SDM. The possibilities of SDM use in this context are currently especially little researched and analysed. Second, in these studies, one should aim to create concrete measures and indicators for business impacts or benefits of social media use.

Considering the limitations of this study, we were not able to find, at the time of this review, yet, a very large number of applications of studied computer-based modeling approaches in the modeling of social media impacts for business. Thus, there might exist a broad variety of other application areas of modeling which have not been made use of. This issue should be revisited along with the increase of such research.

Chapter 77
Creating Social Value in Societies

Igbinakhase Idahosa
UKZN, Nigeria

ABSTRACT

This chapter critically examines social value creation in societies focusing on the "shared value" theory and stakeholders' "collective responsibility" hinged on social responsibility. The social value creation process is reviewed from the social entrepreneurship perspective considering the essential business/social inputs required to create social value for the business and the host society. The United Kingdom (UK) is used as a case study, depicting factors shaping the business environment. Other current meaningful developments, which include the Social Value Act 2012 that promotes social value creation in the country, are discussed. An analysis of the UK model of social value creation and why it will be difficult to implement in developing countries is also provided. Constraints such as poor infrastructure, corruption and other limiting factors are considered. Finally, social value creation is a sustainable process and every stakeholder benefits from its outcomes.

INTRODUCTION

Modern societies demand and expect high value from social entrepreneurial activities and business outcomes. Businesses exist because of societies and societal needs (Porter, Hills, Pfitzer, Patscheke, & Hawkins, 2012). In this regard, society dictates the business outcomes it values or to which it attaches significant importance (Porter & Kramer, 2006).

Creating social value is a dedicated conscious process incorporating all positive stakeholders commitment and decisions that create great and better societies (Auerswald, 2009; Porter & Kramer, 2011). Social value creation process contains both a tactical and a strategic operational focus, which confidently set in motion the development of desired societies from the present to the perceived future (Porter & Kramer, 2006). It is due to the decision to better societies and to improve business efficiencies that the need for partnership is advocated for in the social value creation process (Porter & Kramer, 2011).

The concept of ''shared value'' that benefits all stakeholders is a great decision to be included in the creation of social value in societies (Porter & Kramer, 2011). The shared value concept is one that ensures business survival and also benefits society (Porter & Kramer, 2011). The creation process should include stakeholders' functions from the social entrepreneur's business model, to government involvement via policies and regulatory frameworks (Kirlin, 1996) and societal expectation and appreciation (Porter & Kramer, 2011). It is important to state that every business or firm has the capacity to be socially responsible (Baron, 2005) based on social capital (Bowles & Gintis, 2002; Russo & Perrini, 2010) or individual and community influences (Rossi, 2001). The current chapter focuses on social entrepreneurship as a valuable and effective tool in creating social value in societies due to social enterprises' unique platform and business model to solve societal problems profitably (Peredo & Mclean, 2006).

The United Kingdom is a reference point in terms of location showing developments and efforts in the social value creation process worth emulating.

The following are the objectives of this chapter:

1. To provide a comprehensive definition of social values incorporating key stakeholders' perspectives.
2. To identify and explain the forms and nature of social values.
3. To identify and state the processes and procedures involved in creating social value in societies by considering the inputs of social entrepreneurs or social enterprises (business and social), government regulatory framework/policies, timing, defined mediums and platforms, society's expectations and expected or actual social value outputs and performance measuring models.
4. To critically analyse the evolution of social value creation from a theoretical perspective.
5. To critically identify and analyse stakeholders' involvement in social value creation.
6. To provide a theoretical framework for the concepts "collective responsibility" and "shared value" in social value creation.
7. To provide solutions and recommendations to issues associated with the subject while also identifying future research directions.

Background

Social value characterises value that appeals to the social nature of man and society with the intent to better and to improve man's social standing. The nature of this value allows its impacts to have both a general appeal (societal approval) and also a specific appeal (individual stakeholder approval) (Auerswald, 2009).

It can be stated that social value originated from an aspect of social value orientation (cooperative orientation) as it provides value for all after due consideration of the key stakeholders' needs and assigned benefits (Balliet, Parks & Joireman, 2009). Some influences can be traced to government policies and regulations guiding human and business conduct within a defined society (Kirlin, 1996).

Increasingly, social value has become a concrete and measurable term (Wood & Leighton, 2010) which cuts across economic, environmental and social outcomes amongst other human-related matters. Social value is a dynamic concept. It can change across borders and regions due to cultural influences and social value orientations (Balliet, Parks & Joireman, 2009).

The development of societies is based on conscious consensus efforts. Stakeholders need to envision the society of their dream and team up to actualise it. In modern societies, the significance of social value cannot be over emphasised. When social value as a tool for development is properly utilised, it can

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

be an integral part of communal and social culture where all communal and individual activities take place solely in the best interest of the society (Butler, 2014). The United Kingdom is a good example of a developed nation that still insists that social value has come to stay and will lead future developments (Butler, 2014).

The identified research gap indicated that little is known on how culture influences the creation of social value in different regions.

From the literature reviewed, the following sub-topics: case study background, the United Kingdom social value creation model, factors that can limit the replication of the UK model of social value creation in developing countries, understanding social value and its place in the society, the process of social value creation in today's dynamic societies, stakeholder functions and effects on social value creation, and social value creation and its impact on modern societies will lead the discussion for further insights.

Case Study Background: The United Kingdom (UK) Country Profile and External Business Environment Analysis (PESTEL)

The United Kingdom is a member of the European Union, and it is made up of England, Wales, Scotland and Northern Ireland (BBC, 2014). According to the BBC (2014), the United Kingdom is an English-speaking country and its main religion is Christianity. The United Kingdom occupies 242 514 km^2 (93 638 $miles^2$), an area with a population of about 63 million (BBC, 2014). It is among the first industrialised country in the world (BBC, 2014) and its main export includes manufactured goods, chemicals, foodstuffs among others (BBC, 2014). The United Kingdom's GNI (gross national income) per capita is US$38 370.00 (BBC, 2014). London is the capital of the United Kingdom (UK) and the UK can be described as a modern society.

The United Kingdom's business environment can be termed one of the most developed in the world due to its history of being the first industrialised country (BBC, 2014).It is important to state that certain factors contribute to the current state of the UK external business environment. These factors include political, economic, social, technological, environmental and legal factors (BBC News, 2014; Fisher & Phillips, 2013; Inman, 2014; United Kingdom Government, 2014; United States Department of State, 2013; Vaughan, 2013). These factors are prevalent and come into play as the businesses interact with its stakeholders and society.

Politically, the UK has one of the most stable political environments in the world (United States Department of State, 2013). According to the United Kingdom Government (2014), the Prime Minister leads the government and the cabinet and ministers perform their stated functions in support of the Prime Minister. The UK has a constitutional monarchy in place (The British Monarchy, 2014).

Factors such as taxation policy, trade regulations and government stability can influence the way businesses interact with the environment (Inman, 2014; UK Trade and Investment, 2012; Winnett, 2010). Government stability is experienced in the UK (Winnett, 2010). According to Winnett (2010), co-operation among politicians in the UK enables maintenance of stability in the business environment and the political space. The UK offers one of the most relaxed tax policies for businesses (Inman, 2014). According to Inman (2014), the UK is a corporate tax haven and this has made American firms to relocate some of their businesses to the UK.

Trade regulations have also affected the business environment positively (UK Trade and Investment, 2012). According to UK Trade and Investment (2012), the UK benefits from the World Trade Organization (WTO) as a major exporter of manufactured goods, chemicals, foodstuffs and other goods (BBC, 2014).

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

It also benefits from the European Union (EU) as the EU service directive has removed a high number of barriers to service-oriented businesses to benefit from the EU (UK Trade and Investment, 2012).

Economically, the UK is very sound (BBC News, 2014). Key determinants of the economy continue to maintain a positive outlook in the business environment (BBC News, 2014). A typical example is the inflation rate, which is currently 1.2%, and which has been the lowest rate for five years now (BBC News, 2014). Growth in consumer spending is also on the increase and this has further led to the growth of the economy (BBC News, 2013). The European Commission has also confirmed the growth of the UK economy as the country continually experiences a high rate of consumer spending (Ryan, 2014). The UK is currently out of recession and is experiencing economic recovery that will eventually lead to an economic boom (Graham, 2014).

Social factors are very active in the UK business environment. According to the BBC (2014), the UK's main religion is Christianity and the country has always promoted religious tolerance. In terms of education, the UK can boast world-class institutions where quality teaching and learning take place (Adams, 2014).

Technologically, Information Technology plays a strategic role in the UK (Burn-Callander, 2014). It is an environment where e-commerce functions and delivers the necessary value for the government and citizens (Burn-Callander, 2014). The UK has of excellent high-speed internet access (Curtis, 2014) and this makes internet access very easy within the environment. The UK is also a leader in Europe in terms of social networking (Office of National Statistics, 2013b).

Technologically, the UK has witnessed 170 years of industrial change (Office of National Statistics, 2013a). The UK business environment has evolved technologically having witnessed several developments in technology, like the steam locomotive (Office of National Statistics, 2013a). It is also important to state that social factors have contributed to the rate of change of technology (Office of National Statistics, 2013a). Manufacturing has been around the UK since 1841 (Wallop, 2009; Office of National Statistics, 2013a) and this has led to the excellent manufacturing competencies being displayed in the business environment.

Environmentally, doing business in the UK is a rewarding experience due to the competitive advantage the business environment provides to firms within its diverse business sectors. According to Wilson (2014), the UK continually exports quality physical products and services and this is an excellent reflection of the country's quality business environment. According to Berry (2012), competitive advantage involves doing things better than competitors, and this can be achieved through quality personnel and processes.As part of its quality processes, the UK is leading in the recycling rates compared to other countries in the EU(Vaughan, 2013). According to Vaughan (2013), the UK is capable of meeting the EU target of recycling 50% of waste by around 2017.

Energy consumption is an important factor in the UK's business environment as energy plays a vital role in the day-to-day running of businesses (Anderson, 2013). According to Anderson (2013), energy consumption in the UK is currently less than consumption in 1970. This is so despite an increase in the population (Anderson, 2013).Energy efficiency offers opportunities for economic growth and a clean green environment. According to Neslen (2014), energy cuts can increase UK's gross domestic product (GDP) and also create new jobs for citizens.Energy is important in large scale manufacturing(Anderson, 2013) and increased energy cuts through efficient means yearly can increase the UK's GDP by £62 billion and create additional 40,000 jobs(Neslen, 2014).

Prevailing legal factors provide the legal guidance for business conduct (Department for Business, Innovation and Skills, 2013; European Agency for Safety and Health at Work 2014; Fisher & Phillips,

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

2013). In the UK business environment, labour law plays a very pivotal role in determining the overall success of the economy in terms of regulating labour activities (Fisher & Phillips, 2013). The contents of the UK labour law includes employment contracts, minimum wages and hours of work, holiday entitlement, discrimination laws, maternity and paternity leave, terminations and redundancies (Fisher & Phillips, 2013). These contents adequately cater for the rights of potential employees and provide the necessary information for them to deliberate upon when accepting prospective offers (Fisher & Phillips, 2013). It also protects the rights of the hiring firm as it ensures that the firm has a legal document to enforce the expectations and rights of the business (Fisher & Phillips, 2013).

Health and safety laws are another important factor that ensures the overall safety of citizens (European Agency for Safety and Health at Work, 2014). According to the European Agency for Safety and Health at Work (2014), the UK has a long-standing record of health and safety since the 19th century. The Health and Safety at Work etc. Act 1974 is the guiding principle for health and safety activities in the UK (European Agency for Safety and Health at Work, 2014).

Product safety is a firm requirement in the UK (Department for Business, Innovation and Skills, 2012). As a member of the World Trade Organization (UK Trade and Investment, 2012) and the European Union, the UK has made it a point of duty to ensure continuously that products are manufactured to the highest standards (Department for Business, Innovation and Skills, 2012). According to the Department for Business, Innovation and Skills (2012), there is statutory guidance for manufacturers of products to ensure that products are continuously subjected to technical and legal requirements for safety, design, packaging and insurance. This is to ensure that products manufactured in the UK are not harmful and that they are fit for the purpose.

It is also necessary to add that the attractiveness of the business environment is made possible by government, businesses and residents overcoming everyday challenges experienced in the business environment.

The United Kingdom (UK) Social Value Creation Model

The UK model of social value creation hinges upon social responsibility. According to Rossi (2001), social responsibility allows individuals to carry out activities that are beneficial to society. It is also an obligatory and mandatory expectation of government, businesses and the citizens of a society that stakeholders should think of better and safer ways of contributing to the development of the environment, citizens/residents, businesses and society.

The business environment plays a key role in the social value creation process (Porter & Kramer, 2011). It is the origin, foundation and space where all interactions (business and social) occur (Porter & Kramer, 2011) and it is also the major recipient of the benefits and consequences that these interactions bring (Porter & Kramer 2011; Porter et al., 2012).

According to Worthington and Britton (2009), the business environment consists of both internal and external environments. The internal environment is limited to the organisation while the external environment refers to the host community or nation (Worthington & Britton, 2009). The external business environment is controlled by political, economic, social, technological, environmental and legal factors(BBC News, 2014;Fisher & Phillips, 2013;Inman, 2014;United Kingdom Government, 2014;United States Department of State, 2013;Vaughan, 2013). The UK business environment, which is well developed, has an effective regulatory framework, enforcement system, quality infrastructures, business support systems and political stability (BBC News, 2014; Fisher & Phillips, 2013; Inman, 2014; United

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Kingdom Government, 2014; United States Department of State, 2013; Vaughan, 2013). It is important to add that the business environment has been contributing immensely to the development of the country (BBC News, 2014; Inman, 2014; United Kingdom Government, 2014; United States Department of State, 2013; Vaughan, 2013).

The UK government has provided an enabling environment for social value creation using an organised regulatory framework (Smale, 2010). According to Smale (2010), the UK regulatory framework consists of policies that promote the encouragement and establishment of businesses.

This regulatory framework guides the conduct of government, businesses, citizens and society (Butler, 2014; Smale, 2010). According to Butler (2014), the UK government has mandated that social responsibility and accountability must be the watchword in business and in government interactions with society. It is important to state that in the social value creation model (see Figure 1 and Table 1), the UK government is saddled with the responsibility of creating a socially responsible society through its policies (Butler, 2014).

Social enterprises and other businesses also contribute positively to the social value creation model and processes (Frynas, 2007). According to Newell and Frynas (2007), policy and global decision-makers such as the World Bank and the United Nations recognise the contributions that businesses can make to society and the World Bank and the United Nations constantly ensure that an encouraging environment is provided to assist businesses. Social entrepreneurs and business owners play a key role by being socially responsible in their conduct and interactions with society (see Figure 1 and Table 1).

Social entrepreneurs are driven by their primary functions of transforming societies (Alvord, Brown, & Letts, 2004; Austin, Stevenson, & Wei-Skillern, 2006; Dacin, Dacin, & Matear, 2010) while other businesses contribute to the development of society through corporate social responsibility initiatives (Newell & Frynas, 2007). Social enterprises and other businesses are bounded by their own business forms, ethics and law to interact favourably with the host communities and to promote their development and sustainability (Butler, 2014).

Citizens and residents also play an important role in the UK social value creation model (see Figure 1 and Table 1). Citizens and residents are the driving force in a society as they occupy various positions of responsibilities within the government, businesses and other areas of occupation in the society. Citizens and residents must be law-abiding and do things in the interest and to the benefit of society (Rossi, 2001). It is the contributions of citizens and residents through their roles in government, businesses and other positions in society over the years that have greatly contributed to the overall development of the UK (Butler, 2014; Forestry Commission, 2014;The UK Legislation, 2012) and which have made its business environment very attractive for foreign direct investments (FDIs) (UK Trade and Investment, 2013).

Collective social responsibility refers to the combination of stakeholders' individual social responsibilities as mandated by law. This notion is based on the premise that the social entrepreneur plays a supportive role in the social value creation process and cannot undertake the sole responsibility of being the main stakeholder (Rohatynskyj, 2011). Austin et al. (2006) affirm that social value can be created by government, social entrepreneurs and businesses. It is a collaborative effort by all stakeholders to contribute effectively to the development of the environment, citizens and society(Austin et al., 2006). The co-operation between stakeholders (governments, social enterprises, other businesses and citizens) tends to create a pool of collective social responsibility with the expected social and shared value outcomes (see Figure 1 and Table 1).

The social value outcome can sometimes be measured and at other times be experienced in the form of improved services and a better standard of living (Auerswald, 2009; Wood & Leighton, 2010). Ac-

Figure 1. The United Kingdom social value creation model

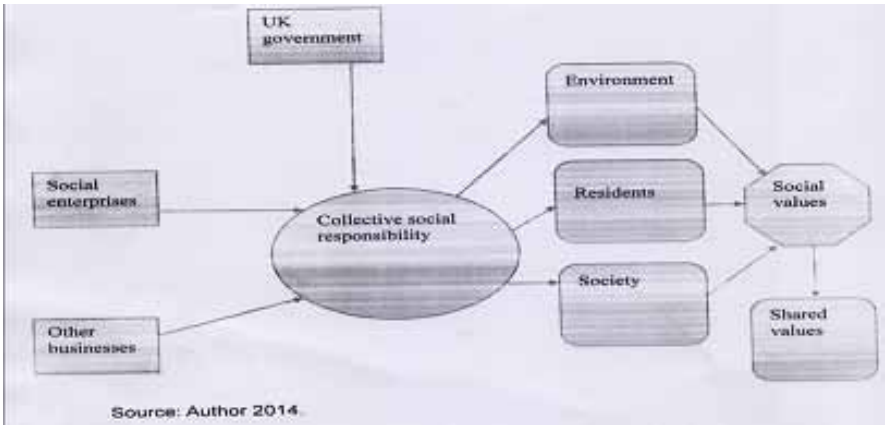

Table 1. Summary table of stakeholders' responsibility, collective social responsibilities and outcome

Item /Number	Stakeholders	Social responsibility	Collective social responsibility	Outcome
1	UK government	Provision of political stability, regulatory framework, quality infrastructures and conducive business environment	A highly responsive and responsible government	Shared value
2	Social entrepreneur	Sound business ethics, social innovations and social value	Law-abiding business	Shared value
3	Other business	Sound business ethics, quality products/services and corporate social responsibility	Law-abiding business	Shared value
4	Citizens /residents	Morally upright, law-abiding and very productive citizens/ residents	Patriotic and law-abiding citizens/ residents	Shared value

Source: Author 2014

cording to Auerswald (2009), social value can take the form of economic, environmental, social and technological gains. In more recent times, social value has become shared value (Porter & Kramer, 2011) and it enables the creator of value also to benefit from the value created.

Social value creation is actively promoted in the UK (Butler 2014; UK Civil Society, 2012). Below are some of the benefits (Butler, 2014; UK Civil Society, 2012; Porter & Kramer, 2011):

1. The UK model of social value creation is patriotic in nature.
2. It promotes individual and collective social responsibilities.
3. It allows for the preservation of society.
4. It assists in the development of stakeholders' competencies.
5. It promotes accountability.
6. It can easily be replicated.
7. It allows for proper planning for future generations.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

8. It promotes civil tolerance within society.
9. It reduces criminality in the society.
10. It creates economic prosperity.

Factors That Can Limit the Replication of the UK Model of Social Value Creation in Developing Countries

Social value creation in the UK can be viewed as a way of life due to historical and current quality regulatory frameworks that have been put in place to enforce it (Butler, 2014; Forest Commission, 2014; The UK Legislation, 2012). In the UK, the business environment is developed (BBC, 2014).

Business environments with political instability, poor infrastructure and a high degree of breakdown of law and order tend to hinder entrepreneurial activities and social value creation (Acs, Boardman, & McNeely, 2013; Baumol, 1990). Another factor that can hinder the replication of the UK model in developing countries is the inherent differences in public institutions, indigenous social and economic policies (Olson, 1996). Certain policies are indigenous in nature and are based on prevailing circumstances within the business environments (Olson, 1996).

A lack of basic infrastructure is a common feature in business environments of developing countries (Chowdhury, 2007). Chowdhury (2007) affirms that some developing countries have poor transportation facilities. Government will need to provide the necessary infrastructure to encourage smooth business activities that will encourage social value. The essence of social value creation is to ensure that citizens and society benefit from the everyday business and social interactions that occur within the business environment (Alvord, Brown & Letts 2014; Auerswald, 2009; Porter & Kramer, 2011). A lack of basic infrastructure can also hamper or disorganise the supply chain needed for the smooth creation and delivery of goods and services that will have positive effect on society (Dahan, Doh, Oetzel & Yaziyi, 2010). According to Dahan, Doh, Oetzel, and Yaziyi (2010), developing countries have issues with supply chains and access to local networks.

Inadequate regulatory framework is also a major issue in developing countries. According to Chowdhury (2007), developing countries experience poor government support and assistance in the regulation of the business environment to allow for meaningful development. Government plays a key role in providing an attractive and conducive business environment (Kirlin, 1996). A typical example of government support in the UK is the Social Value Act of 2012(Butler, 2014). This law enables citizens to be aware of the significance of social value in the society and encourages government, businesses and citizens to make it a priority when interacting in the society (The UK Legislation, 2012).

Limited knowledge of social value creation in developing countries is also a major factor that can affect the replication of the UK model of social value creation. According to Dahan, Doh, Oetzel & Yaziyi (2010), inadequate knowledge in essential and critical areas is a big issue in developing countries. Developing countries experience underdeveloped human capital (Dahan, Doh, Oetzel & Yaziyi, 2010). This may also have negative effect on the business environment as people play a key role in creating a competitive advantage in the business environment (Berry, 2012).

Corruption can be a major issue in developing countries. According to Chowdhury (2007), the lack of effective mechanisms to tackle corruption is a major problem in developing countries. This may also affect social value creation in developing countries.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Technologically, developing countries are behind compared to the developed economies. According to Chowdhury (2007), developing countries experience the presence of obsolete technology. This is sometimes due to a lack of sufficient investment in research and development activities (Chowdhury, 2007).

Some developing countries sometimes have unstable business environments that experience frequent tensions in the form of strikes, disorderliness and other forms of criminal tendencies (Chowdhury, 2007). These tensions tend to discouragee the right kind of entrepreneurial activities that promote social value creation in a society (Acs, Boardman, & McNeely, 2013).

Understanding Social Value and Its Place in the Society

The nature of social value guarantees that societies benefit from business outcomes and other related outcomes (Alvord, Brown & Letts, 2004). According to Auerswald (2009), social value is an outcome of the proper utilisation of good governance to produce positive effects and to address social challenges. It is a concept that describes specific forms of standard outcomes and the nature of these that society accepts as positive effects and relies upon to build a social belief system and social value orientation(Butler, 2014;Porter & Kramer, 2011).

There are set standards of value that drive the society belief system. The belief system can be moulded by state laws (Kirlin, 1996) and religious inclinations (Pavlovich & Corner, 2014). For this chapter, the focus is on the prevailing social laws in the form of regulatory frameworks and policies that affect and guide both business and individual conduct within a defined society. Government plays a key role in this instance, by creating public policies and other regulatory frameworks to guide citizens, businesses and society interactions in stipulated functions. One such policy is the Social Value Act 2012 in the UK. The UK Legislation (2012) (Social Value Act Chapter 3) dictates that the economic, social and environmental wellbeing of the citizens and society must be considered in the awarding of public services contract. According to Butler (2014), the Social Value Act in the UK has the capacity to transform financial management practices within public services. This Act was enacted in 2012 by the UK Government in the United Kingdom and is tagged "Pubic Services (Social Value Act, 2012)" (Butler, 2014). Butler (2014) further adds that the social value act mandates public authorities to consider social and environmental concerns in their choice of suppliers rather than considering only cost. It is important to add here that the main focus of the Social Value Act is on local government, Whitehall and the National Health Service (NHS) (Butler, 2014). The Social Value Act simply encourages businesses with a social focus to benefit from government patronage while delivering excellent social value (Butler, 2014).

The UK is a unique modern and developed society (BBC, 2014). It operates within a well-defined public policy that guarantees social value (Butler, 2014). It is a very good example of how to create social value in a society using well-meaning public policies (Butler, 2014).

Social value has a priority position in the society. Its place in society is undeniable. Modern societies rely on it to correct social anomalies and transform societies (Alvord, Brown & Letts, 2004).The social entrepreneur's mindset on social value is to address social challenges constantly to make society a better place for all (Auerswald, 2009).

The Process of Social Value Creation in Today's Dynamic Societies

The process of social value creation is a predetermined act based on a firm's social responsibility (Rossi, 2001), social value orientations (Murphy, Ackermann, & Handgraaf, 2011), social capital (Bowles &

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Gintis, 2002; Russo & Perrini, 2010) and a shared value ideology (Porter & Kramer, 2011). The process consists of a series of inputs from the social entrepreneur within a defined business model to achieve set organisational goals and targets. Auerswald (2009) affirms that private value and social value can be a business outcome as entrepreneurs engage with society and carry out their specific legal business functions. He further observes that a strategic business plan adopted by an enterprise could enable the enterprise to remain financially viable and create the necessary social influence.

The key components of the social value creation process are summarised below. These serve as general information as specifics will depend on the social entrepreneur, region, and social problem, among other specific considerations.

Summary of key components and stakeholders (social value creation process):

1. Social entrepreneur: provides initiative, business model (shared value and collective responsibility ideology), utilises local content (contractors and resources), socially responsible, social capital, takes risk, etc (Auerswald, 2009;Peredo & Mclean, 2006; Porter & Kramer 2011).
2. Government: provides enabling environment, socially responsible, provides regulatory framework and policies (e.g. Social Value Act 2012)(Butler, 2014;Kirlin, 1996).
3. Society: provides business patronage and are the main beneficiaries of the social value and social solution being created (Alvord, Brown & Letts, 2004).
4. Inputs: these may include a business model with a social focus. It also involves the role of the social entrepreneur as stated above (Peredo & Mclean, 2006; Porter & Kramer, 2011).
5. Timing: very important as proper utilization of transaction time allows the social entrepreneur to achieve more at a reduced cost (Porter & Kramer, 2011).
6. Mediums/Platforms: these will depend on the sector and the nature of the problem or issue to be addressed. It can be social, economic and environmental (Butler 2014; Forestry Commission, 2014).
7. Society's expectation/actual social value outputs (forms and nature): social value or social solution with profitability while addressing the social problems, e.g. economic outcomes (employment, etc.), environmental outcomes (avoiding the destruction of the ecosystem) and social outcomes (improved standard of living, social developments, etc.)(Porter & Kramer, 2011) .
8. Location: it varies and depends on the social entrepreneur, government and society. It can be in the local government area or at a national level (Butler, 2014). This is found in developing countries and also in the developed countries.
9. Social value measurement system: This should be based on stakeholder feedback in the form of social accounting (this is a system that generates data from stakeholders for the organisation) and social auditing (this is a system that confirms the data) which reflects in the reduction in magnitude of the social issue being solved ((Wood & Leighton, 2010).

Stakeholder Function and Effects on Social Value Creation

Stakeholders play a significant role in the social value creation process and they are the driving force behind business formations and business conduct (Donaldson & Preston, 1995). According to Donaldson and Preston (1995), stakeholders are the key parties who inform and affect key business decisions and business outcomes.

In this chapter, the focus is on the three major stakeholders in the social value creation process, namely the social entrepreneur, government and the society (citizens). The stakeholders have assigned

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

responsibilities and functions (Donaldson & Preston, 1995). It is important to note that they are socially responsible for the development and advancement of the society. According to Rossi (2001), social responsibility is an ethical theory and concept guiding individual or organisational conduct and activities. This is done in the interest and benefit of society (Rossi, 2001).

In order to discuss the stakeholders' functions and their influence on the social value creation in the society critically, each stakeholder role is analysed and discussed below:

1. **Social Entrepreneur:** This is the business head and initiator of a social value business model who has the responsibility to deliver profitable business outcomes while addressing social challenges in the business environment (Peredo & Mclean, 2006). Russo and Perrini (2010) observe that social capital plays a distinct role in small and medium enterprises (SMEs) while carrying out Corporate Social Responsibility (CSR) activities or creating social value. The social entrepreneur has a lot to do in the business environment in terms of creating value in society (Auerswald, 2009). The challenges in a defined society can include economic, environmental and social problems occurring at the same time. The social entrepreneur will need to see the opportunities in solving these societal challenges profitably and transforming the society (Auerswald, 2009; Alvord, Brown & Letts, 2004).
2. **Government:** Governments all over the world have a significant role to play as a major stakeholder in the business environment and the larger society. According to Kirlin (1996), government involvement can be felt strongly in their regulations in diverse sectors and policies dictating how business and society should relate. Their ability and capacity to provide policies and regulations in society make them very powerful in championing the social value policy in the society. The enactment of the Social Value Act 2012 in the UK is an example of government taking the initiative to drive the social value orientation for both businesses and the citizenry (Butler, 2014). Beyond the public policies and regulations, governments can also produce role models to mentor individuals and businesses to promote the social value policy (UK Civil Society, 2012). The appointment of Chris White who is a Member of Parliament (MP) by the UK government as its first social value ambassador is a sterling example (UK Civil Society, 2012), while strong targets in the reduction of carbon emissions by 2050 (Forestry Commission, 2014) is another good example of creating social value to protect the environment.
3. **Citizens (Society):** Society is another major stakeholder worthy of note (Porter & Kramer, 2011). Society includes the business environment, national environment and residents who play active roles in the social value creation process (Kirlin, 1996; Porter & Kramer, 2011). Citizens are also beneficiaries of the social value created in society through the shared value concept (Porter & Kramer, 2011). They are all expected to be socially responsible (Rossi, 2001) and develop significant social capital (Russo & Perrini, 2010) to advance social value creation in society. Collectively, the stakeholders can direct society and also create mutually beneficially outcomes. An opportunity for that is the utilisation of the shared value concept and the collective responsibility approach while being socially responsible in making society a better place (Rossi, 2001). According to Porter et al. (2012), the shared value concept promotes the creation of profitable business outcomes that produce concrete social benefits while Chant (2014) affirms that collective responsibility provides a structure in which every stakeholder in a group is held accountable to the fortunes of the group regardless of individual stakeholder roles.

Social Value Creation and Its Effect on Modern Societies

Social value creation is a good development that can accelerate the progress of a society. As a way of life, social value creation makes businesses, governments and citizens to be socially responsible (Rossi, 2001). The social value creation processes also helps stakeholders to cooperate and generate meaningful social capital that allows citizens and businesses to meet collective or individual goals (Bowles & Gintis, 2002; Russo & Perrini, 2010).

Environmentally, social value creation can help to protect the environment and promote sustainability of the earth's resources (Dresner, 2002; Kates, Parris & Leiserowitz, 2005) through government interventions such as in the case study where the UK government has set achievable targets for carbon emission reduction (Forestry Commission, 2014).

FUTURE RESEARCH DIRECTIONS

The concept of shared value creation is a welcome development (Porter & Kramer, 2011). Existing literature has moved towards providing a strategy for the adoption of a business model that benefits both the social entrepreneur and society (Porter &Kramer, 2011; Porter et al., 2012). The presence of social factors such as social responsibility (Rossi, 2001), social value orientations (Balliet et al., 2009) and social capital (Bowles & Gintis, 2002; Russo & Perrini, 2010) indicate that other social factors such as culture, education and political system could also play a major role in influencing social value creation. This is so because the society and environment normally influences the type of value to be created or the social problems to solve. Based on this logic, subsequent studies can consider how culture can shape social value creation. Other prospective research efforts may study the effect of social value decisions in certain regions to provide an impact analysis, while other studies could focus on how/why social entrepreneurs identify and select certain social challenges to solve.

CONCLUSION

The modern-day approach to social value creation in societies hinges on collective responsibility and shared value. Stakeholders in the social value creation process must be alive to their duties and social responsibilities to achieve the desired society and preserve future societies (Porter & Kramer, 2011). The social entrepreneur, government and society have been strategically identified as the main drivers of social value creation in their own right and must constantly improve upon their positions on shared value, collective responsibility; social value orientations, social capital and social responsibilities, and they should work closely together in meeting set business and social targets.

Finally, in creating social value, the shared value concept is a recommended guide and approach focusing on stakeholder participation and collective responsibility for societal good and progress (Porter & Kramer, 2011).

KEY TERMS AND DEFINITIONS

Collective Responsibility: This is an implied or written agreement by a group to accept success or failure as an outcome in an endeavour, regardless of individual contributions/performances.

Shared Value: This is a concept which allows society and business stakeholders to share in the business successes or in the value created by the business.

Social Capital: This is a unique resource developed via social affiliations to meet individual or team aspirations.

Social Enterprise: This is a business set up to solve societal challenges while carrying out its business functions.

Social Entrepreneurship: This is a business concept where a firm is set up to address society's problems using business processes.

Social Responsibility: This refers to the obligation an individual or firm has towards society. It is usually for the benefit of society.

Stakeholders: These are active participants bounded by common goals or who have certain rights and obligations in a collective project.

Chapter 78
Framing Sustainable Practices: Middle Managers and Social Intrapreneurial Championing

Jeffrey Gauthier
SUNY Plattsburgh, USA

Chris Meyer
Fordham University, USA

David Cohen
Skidmore College, USA

ABSTRACT

This paper develops and clarifies social intrapreneurship theory by examining the "how" of effective intrapreneurial championing. More specifically, the authors consider the following research question: How does the manner in which middle managers frame sustainable practices influence successful championing outcomes? The authors integrate the natural-resource-based view of the firm with research on middle management championing behaviors and issue-contingent models of ethical decision making to propose a model of sustainability championing for social intrapreneurs. To that end, propositions are developed concerning the relationship between the types of sustainable practice championed, how the argument for a given practice is framed, and successful championing outcomes. This paper contributes to a growing body of literature on social intrapreneurship, providing insight into how intrapreneurial championing can be more effective and building a foundation for future research.

INTRODUCTION

Increasingly, large businesses claim that they are committed to solving social and environmental concerns (Massetti et al., 2016). These claims have spawned a range of productive literature streams, including scholarship on the triple bottom line of sustainability, i.e., measuring social and environmental impacts, in addition to financial results, and how it can be implemented in firms. Despite this focus, it continues to be unclear whether this professed concern is a matter of marketing or mission, which has obvious

implications for corporate commitment to social and environmental sustainability (Massetti et al., 2016). In this paper, the authors suggest that to understand whether triple bottom line measures have become integral to the firm's strategy, we need to examine the firm's strategy process.

Strategy guides the firm's decisions about investing in internal resources to better fit its industry environment (Barney, 1991; Venkatraman, 1989). Strategy process is concerned with how these decisions are made (Floyd & Wooldridge, 2000). A firm that has decided that its strategic fit does not depend upon triple bottom line factors may hold only a limited commitment to social and environmental concerns, viewing sustainability more as marketing than strategy (Massetti et al., 2016). Before a business will commit to transfer sufficient resources to address triple bottom line concerns, top managers must believe that addressing those concerns will support the business's strategy moving forward. But how do top managers come to be convinced in the strategic importance of sustainability?

It is this process of "convincing" that is the focus of this paper. More specifically, the authors address the following research question: How does the manner in which middle managers frame sustainable practices influence successful championing outcomes? Championing constitutes a tool used by middle managers to affect change in their firm's strategy (Burgelman, 2016; Dutton & Ashford, 1993; Floyd & Wooldridge, 1992). Middle management championing is critical for successful strategic adaptation (Heyden et al., 2015; Rouleau, 2005, Wooldridge et al., 2008). For businesses to make substantive triple bottom line progress, middle managers must learn to champion triple bottom line improvements as a critical part of organizational strategy. In brief, for firms to commit to sustainability, middle manager "social intrapreneurs" (Mair & Marti, 2006) must use the levers and routines of the firm's strategy process, including framing, to champion improvement.

This paper makes two important contributions. First, the authors develop and clarify theory about social intrapreneurship by suggesting that middle management championing is critical for increasing resource allocation towards positive social and environmental change (Floyd & Wooldridge, 2000). Second, the paper adds nuance to our understanding of middle manager championing processes by utilizing triple bottom line measures as a context to break down the nature of and activities involved in championing. Strategy process in general, and championing in particular, is critical to understanding how firms come to commit resources to social and environmental considerations. Social intrapreneurs "persistently champion a vision of change" (SustainAbility, 2008, p. 5), and by combining elements from the sustainability and social intrapreneurship literature with the literature on championing, the authors add useful insight into how social intrapreneurship championing can be more effective.

In developing a conceptual model linking the type of sustainability initiative and championing mode to successful strategic change, the authors draw on Hart's natural-resource-based view of the firm (Hart, 1995; Hart & Dowell, 2011). This work identifies four categories of organizational actions that improve both the environmental and social dimensions of firms' triple bottom line: pollution prevention, product stewardship, clean technology, and base of the pyramid strategies. The natural-resource-based-view has yielded significant interest among scholars and practitioners (Hart & Dowell, 2011). While alternative categorizations of sustainable business strategies have been offered in subsequent years (e.g., Orsato, 2006), the natural-resource-based view has gained widespread credibility in scholarly research (e.g., Dowell & Muthulingam, 2017; Russo & Fouts, 1997; Sharma & Vredenburg, 1998), and offers a helpful means through which to explore the championing of triple bottom line improvement. Importantly, the framework's two dimensions – timeframe and internal vs. external focus – provide a useful foundation on which to explore championing behaviors.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Integrating the natural-resource-based view with issue-contingent models of ethical decision making (Jones, 1991), the authors propose a model of sustainability championing (Andersson & Bateman, 2000) as part of strategy processes. Theories of ethical decision making inform research on environmentally ethical behavior (Flannery & May, 2000), and are thus relevant to the paper's research question. Using these lenses, the paper develops propositions linking the type of sustainable practice championed, the manner of framing (Dutton & Ashford, 1993), and successful championing outcomes. By better understanding these relationships, the authors hope to provide insight into how social intrapreneurs influence more successful championing outcomes and advance social and environmental sustainability within their organizations.

THEORY AND PROPOSITIONS

The concept of social entrepreneurship refers to innovative activity that creates social value (Austin et al., 2006). The forging of new combinations of resources, central to Schumpeter's notion of entrepreneurship, is fundamental to the realization of this innovative activity (Rahdari et al., 2016; Swedberg, 2006). Applying Schumpeter's ideas to social entrepreneurship, Swedberg (2006) argues that significant resistance to social entrepreneurship can be expected. Indeed, to the degree that championing sustainability measures may threaten long-standing arrangements within an existing organization, resistance to social intrapreneurship – social entrepreneurship that occurs within established organizations (Mair & Marti, 2006) – may also be expected. It is perhaps not surprising, then, that the extent to which social intrapreneurs have successfully created social value, as measured by the triple bottom line, remains unclear. Firms may view their sustainability efforts as solely a public relations exercise, and research indicates that corporate actions to create social value have not significantly increased in recent years (Massetti et al., 2016). Firms that embed the creation of social value in their strategy process, however, can enable social intrapreneurship to realize its potential to address triple bottom line concerns by fostering strategic change.

Middle managers are critical to the implementation of strategic change (Burgelman, 2016), and thus potentially to the enhancement of the triple bottom line. Our understanding of how middle managers can act as social intrapreneurs to effectively champion the triple bottom line, however, is limited. To shed light on this topic, this paper draws on established theory on the natural-resource-based view of the firm (Hart, 1995) and issue-contingent models of ethical decision making (Jones, 1991).

The Natural-Resource-Based View

The natural-resource-based view of the firm identifies four types of sustainable business practices that differ across two dimensions: organizational focus (internal or external) and time horizon (current or future) (Hart & Dowell, 2011). Pollution prevention (current horizon) and clean technology (future horizon) involve an internal focus, while product stewardship (current) and base of the pyramid strategies (future) utilize an external focus. Pollution prevention and clean technology are considered to involve an internal focus because they can be advanced largely through internal capability development and internal operational improvements. Product stewardship and base of the pyramid strategies require engagement with external stakeholders and consideration of currently unmet needs, particularly in emerging econo-

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

mies. Further, clean technology and base of the pyramid strategies focus largely on the technologies and needs of the future, while pollution prevention and product stewardship emphasize current needs. Each of the four categories is further defined, below, and presented in Figure 1.

Pollution prevention seeks to reduce or end the generation of toxic waste as the byproduct of processes (Hart, 1997). Initial efforts at pollution prevention may reveal opportunities for emissions reduction with minimal investment, but continuing efforts may involve more substantive investment or process changes. As waste represents inefficiency, pollution prevention holds the potential to increase productivity. Operational costs and compliance costs, in addition to pollution itself, can thereby be reduced (Chen et al., 2016; Hart, 1997; Hart & Milstein, 2003).

Product stewardship involves a high degree of external engagement, necessitating collaboration with a range of stakeholders to build a comprehensive understanding of products' impact (Hart, 1997; Roscoe et al., 2016). The mitigation of negative environmental impacts at each stage of the product's life cycle often requires substantial design changes. By minimizing the use of raw materials in production, product stewardship, like pollution prevention, may benefit firms through cost reduction. Additional benefits that may accrue to firms pursuing product stewardship strategies include the enhanced legitimacy and reputation that arises from the integration of stakeholder concerns (Hart, 1997; Hart & Milstein, 2003).

Clean technology entails a longer-term focus than either pollution prevention or product stewardship (Hart, 1997). Given research and development requirements, the development of clean technologies may not provide the immediate financial benefits of other strategies. The creation of products powered by renewable sources of energy is illustrative of a clean technology strategy. The benefits of this strategy for the firm also include the development of organizational innovation capabilities (Hart, 1997; Hart & Milstein, 2003).

Finally, a firm embracing base of the pyramid strategies seeks to determine which needs among the world's very poor are not being addressed, and to develop solutions to address those needs (Hart & Dowell, 2011). Importantly, the base of the pyramid strategies require that sustainability's social dimension be addressed in concert with the environmental dimension, and improvement in the triple social dimension must not be garnered through deterioration of the environmental component (Duke, 2016; Meyer & Gauthier, 2013). The benefits to firms pursuing base of the pyramid strategies include the potential for increased revenue growth arising from customers at the base of the pyramid (Hart, 1997; Hart & Milstein, 2003).

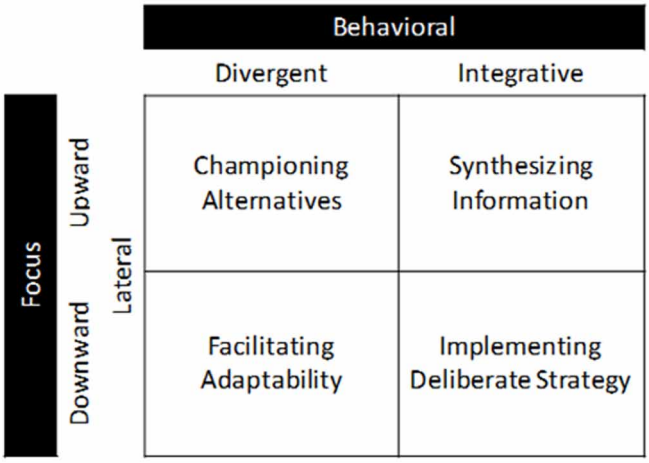
Thus, the natural-resource-based view presents a range of organizational actions that firms may implement to promote the environmental and social dimensions of sustainability. As shown, each category of actions is associated with a particular focus and time horizon, and each category carries different types of organizational benefits.

Such organizational actions will only be carried out because of the strategies, actions, and behaviors of the various individuals that constitute the organization. Examinations of such actions and behaviors have contributed greatly to our understanding of organizational effectiveness in social intrapreneurship (Cordano & Frieze, 2000; Egri & Herman, 2000; Inoue & Alfaro-Barrantes, 2015). Exploring this topic further, the following section links the natural-resource-based view with scholarship on middle management strategic processes, championing, and issue-contingent models of ethical decision making.

Middle Manager Strategic Processes

Floyd & Wooldridge (1992) identified four types of middle management strategic involvement, based upon whether the middle manager is working up or down the organizational hierarchy and whether he or she is working integratively with existing strategy or divergently. The Championing Alternatives mode involves managers working up the organizational hierarchy, seeking to enact divergent strategies (see Figure 2). It is this championing mode that is the focus of this paper.

Figure 2. A typology of middle management involvement in strategy (adapted from Floyd & Wooldridge, 1992)



EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Upward divergent strategic involvement is inherently problematic for middle managers. Championing threatens existing organizational strategy, and thus poses an inherent danger. Organizations perform better with a coherent strategy legitimized by top management, suitable for the organization's particular environment and carried out cohesively across functions (Floyd & Wooldridge, 1992). Championing can threaten this cohesiveness. Middle managers may lack a comprehensive understanding of strategy across the organization, with the risk that what they perceive as an opportunity for the organization, within their field of view, might pose a threat to the organization overall.

These risks are further complicated when the strategies being championed involve non-financial social objectives. Managing socially focused organizations across multiple dimensions poses considerable challenges for managers (Meyer & Gauthier, 2013), and managing across multiple dimensions in commercial organizations would be expected to present further challenges.

Championing has the potential, however, to pull organizational strategy towards better performance on important metrics. While middle managers might lack a coherent overview of overall strategy, they may have a better view than do top managers of important portions of the firm's internal resources and local environment, and thus can see incremental opportunities for improvement; this is one of the key benefits of a strategy process that includes divergent middle managers (Wooldridge et al., 2008). If their knowledge points to the need to change strategy, either to capitalize on an opportunity or to avoid a threat, the organization can ill afford to ignore that need. A well-run organization must allow for the possibility of middle-manager-led upward divergent strategic change.

Championing

Champions are "individuals who, through formal organizational roles and/or personal activism, attempt to introduce or create change in a product, process, or method within an organization" (Andersson & Bateman, 2000, p. 549). In the context of social intrapreneurship, champions may be considered to function as change agents, drawing on motivations associated with different types: experts, facilitators, catalysts, and activists (Visser, 2011). Champions, acting as change agents, can come from any part of the organization. However, for the sake of legitimacy and effectiveness, they typically arise from middle management, top management, or some other position of influence. Their effectiveness depends, at least in part, on their familiarity with and adherence to the norms of the organization, including the way in which strategic decisions are made (Blomfield et al., 2016).

Traditional, top-down conceptions of organizational management and strategy enactment would consider only executives, founders, etc., to be noteworthy champions. However, as scholars and practitioners recognize the value of more broadly enacted strategy (e.g., Burgelman, 1991), this has changed. In addition, contemporary organizational forms generally involve distributed autonomy and a devolving of power to lower levels of the organization (Meyer et al., 2017), increasing the relative power of middle managers.

Championing activities themselves can be sorted into three major categories: issue identification, issue packaging, and the issue selling process itself (Andersson & Bateman, 2000). The focus of this paper's model is issue framing, a part of issue packaging (Dutton & Ashford, 1993). Issue framing is an area with significant implications for the ability of firms to effectively and successfully carry out actions supportive of triple bottom line considerations (Andersson & Bateman, 2000).

Issue framing refers to choices in substance and attributes that champions may either emphasize or de-emphasize (Dutton & Ashford, 1993). Framing "becomes the lens through which people view and

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

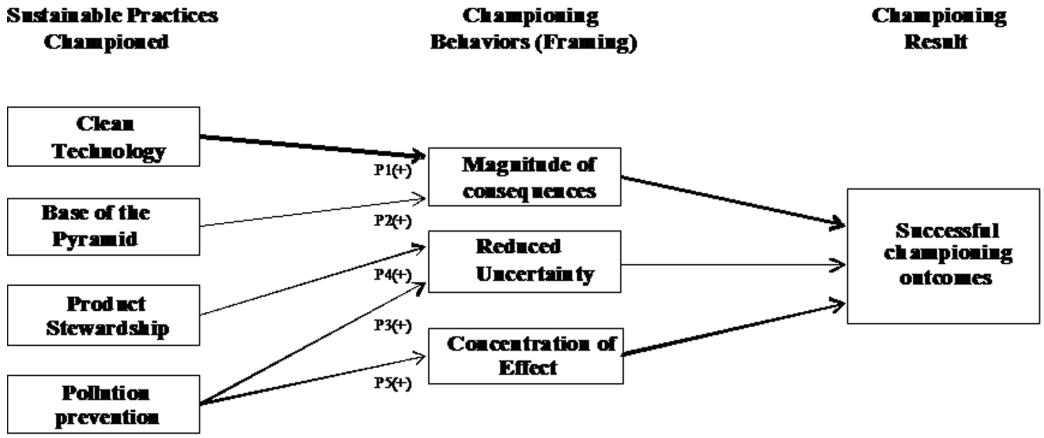
think about the issue" (Butterfield et al., 2000, p. 988). Framing is a particularly appropriate process for the upward, divergent segment of Floyd & Wooldridge's (1992) typology – middle managers are unable to force top managers to adopt a particular course of action. Framing a strategic change to upper management is a matter of presenting information and strategic ideas in a way that is both sufficiently respectful and politically expedient. 'Selling,' per se, is not necessarily appropriate. Framing – creating a new lens, as described by Butterfield and colleagues (2000) – aptly describes the process of putting forth information in a subtly persuasive manner. It is a critical process for middle managers to utilize when they wish to see top managers adopt a strategic change.

Framing is particularly relevant for championing triple bottom line issues because of the nature of the strategic change involved. Any sustainability initiative runs the risk of being seen as counter to the financial interests of the firm. Thus, by definition, an emphasis on environmental and social issues will require a change in thinking from a traditional commercially driven approach. Conceptual frames provide the foundations of individuals' perceptions (Goffman, 1974), and managers' persistent mindsets regarding the need to adhere to commercially driven approaches serve as barriers to consideration of triple bottom line issues. Triple bottom line objectives are fundamentally a different lens through which to view the firm's work, and new lenses require framing.

This importance has been echoed in scholarship. Researching environmental champions, Andersson and Bateman (2000) found, for example, that framing an issue as urgent and as having local impact increased the likelihood of successful championing outcomes. Champions should further recognize that the relationship between the category of sustainable practices championed and positive outcomes will be mediated by the framing employed by champions.

To complete the model, shown in Figure 3, the authors draw on issue-contingent models of ethical decision making (Jones, 1991). There are a range of lenses that have informed understanding of ethical decision making, such as social contracts (Donaldson & Dunfee, 1994) and social network analysis (Brass et al., 1998). This paper utilizes Jones's (1991) framework, as it suggests three categories of championing behaviors relevant to the framing of environmental sustainability issues. These categories are the magnitude of consequences, reduced uncertainty (influencing immediacy), and concentration of effect.

Figure 3. Conceptual model of sustainability championing



EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Magnitude of Consequences

Jones (1991) proposes that issues of higher moral intensity will be associated with ethical decision making and behavior. To the extent that responsible environmental and social practices represent ethical behaviors, the concept of moral intensity can be applied to questions of sustainability championing. Jones's underlying argument is that characteristics of issues themselves will affect individuals' ethical decision making.

Jones (1991) argues that magnitude of consequences – the amount of harm or benefit accruing to victims or beneficiaries of a decision – is an underlying component of moral intensity. When a manager is confronted with a decision whose consequences are severe rather than one whose consequences are less impactful, the manager is more likely to behave ethically in his or her decision (Fritzsche & Becker, 1983). Empirical research has validated the applicability of the magnitude of consequences concept to ethical behaviors in general (Singer & Singer, 1997; Weber, 1996; Marshall & Dewe, 1997; Morris & McDonald, 1995) and to environmentally ethical decision making in particular (Flannery & May, 2000). Champions hold a critical role in the ethical decision-making processes of the firm's decision makers, given their ability to frame issues in manners that underscore the magnitude of the issues' consequences.

Of the four categories of sustainable business practices outlined in the natural-resource-based view, clean technology and base of the pyramid strategies are likely to be perceived as having the greatest magnitude of consequences. While pollution prevention and product stewardship are restricted to the pollution emitted and products currently produced by the individual firm, clean technology and base of the pyramid strategies are much broader in scope. The development of clean technologies holds the potential to drastically reduce greenhouse gas emissions and mitigate climate change; as such, the magnitude of consequences is dramatic. Similarly, a base of the pyramid strategy that seeks to meet the unmet needs of the world's poorest citizens in an environmentally responsible manner is particularly consequential.

Taken together, these arguments suggest a mediated relationship between the championing of clean technology and base of the pyramid strategies and positive outcomes. Championing behaviors that emphasize magnitude of consequences would be expected to be most successful in the pursuit of clean technology and base of the pyramid strategies. Each of these categories of sustainable practices can be expected to resonate with organizational decision makers as especially consequential, suggesting the following:

Proposition 1: High-magnitude consequence framing will mediate the relationship between clean technology championing and successful championing outcomes.

Proposition 2: High-magnitude consequence framing will mediate the relationship between base of the pyramid championing and successful championing outcomes.

Reduced Uncertainty

Additional components of moral intensity include social consensus, probability of effect, temporal immediacy, and proximity (Jones, 1991). Reduced uncertainty links each of these components, serving to heighten moral intensity for decision makers.

Social consensus's power derives from reducing uncertainty. Significant consensus exerts influence on decision makers, clarifying the propriety or impropriety of potential decisions. The link between

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

consensus and immediacy rests in legitimacy; to the extent that a particular course of action is broadly seen as legitimate, a greater sense of urgency to follow this course of action arises.

Given the strength of organizational desires for legitimacy (Suchman, 1995), we can expect that an organization's decision makers will act in concert with societal expectations in decisions of high social consensus; such consensus constitutes a significant factor in determining moral judgment (Morris & McDonald, 1995). In addition, instrumental stakeholder theory (Jones, 1995) argues that financial value can accrue to following socially beneficial policies wherein there is broad social consensus.

Among the four categories of sustainable business practices, those with the highest degree of social consensus are pollution prevention and product stewardship. While clean technology and base of the pyramid strategies are also desirable, intuitively, we would expect consensus to be relatively stronger that companies should reduce pollution emissions and integrate stakeholder concerns into existing production. This reasoning is consistent with the stakeholder salience framework (Mitchell et al., 1997), which suggests that the perceived legitimacy of stakeholder groups, defined in part as the extent to which there is social consensus regarding their concerns, influences organizational responsiveness to stakeholder issues.

In summary, sustainability championing behaviors stressing social consensus can be expected to result in the most positive outcomes for pollution prevention and product stewardship. This success would be expected to result from perceptions of high consensus in these areas.

Probability of Effect

Moral intensity is also affected by probability of effect – the likelihood that an act will cause a corresponding benefit or harm (Jones, 1991). Decision makers will feel greater pressure to adopt decisions that maximize benefit or minimize harm when confronted with a high probability of effect.

Within the natural-resource-based view, probability of effect corresponds roughly to time horizon. The two categories associated with current time horizons, pollution prevention and product stewardship, would be expected to have a higher probability of effect. If an organization decides to continue pollution at current levels, the negative impacts of that decision can be measured with a fair degree of certainty. In fact, the U.S. Environmental Protection Agency requires industrial facilities to measure and report their releases of toxic chemicals (Heller, 1997; Karp & Gaulding, 1995). Similarly, the negative environmental ramifications connected to a product's life cycle can also be assessed with a degree of certainty. This certainty or likelihood is reduced, however, as organizations consider more future-oriented actions such as clean technology and base of the pyramid strategies. As such, decision makers will likely conclude that significant changes in pollution prevention and product stewardship will be likely to have a positive environmental impact.

Framing issues as having a high probability of effect would, therefore, be expected to result in the most positive outcomes in the areas of pollution prevention and product stewardship.

Temporal Immediacy

The duration between a decision and the ramifications of that decision constitute temporal immediacy (Jones, 1991). The tendency of individuals to discount future events suggests that decision makers will be more sensitive to more immediate issues.

Temporal immediacy's implications for the natural-resource-based view are best considered through the dimension of time horizon and, commensurately, with reduced uncertainty. By Hart's definition,

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

pollution prevention and product stewardship are associated with a current time horizon and, therefore, higher immediacy. An additional component of the stakeholder salience framework, urgency (Mitchell et al., 1997), offers support for the importance of immediacy. Organizations have been found to be more responsive to urgent environmental issues, defined in part through their time-sensitive nature (Eesley & Lenox, 2006).

The implications of these arguments are that sustainability champions framing issues as temporally immediate will meet with the highest levels of success in pollution prevention and product stewardship.

Proximity

An issue is seen as proximate if the decision makers feel a sense of nearness with those affected by a corresponding decision (Jones, 1991). Individuals care more about people who are close than those who are distant. A sense of geographic proximity informs the circumstances in which decision makers are more likely to adopt sustainable business practices.

Pollution prevention and product stewardship are particularly relevant for proximity. The potential impacts of clean technology and base of the pyramid strategies are more widely dispersed than the impacts of pollution prevention and product stewardship. Although all pollution has global ramifications, the effects of pollution are most acute for local populations suffering degraded water supplies and air quality. By similar logic, adverse product life cycle consequences – including the need for communities to dispose of the toxic wastes products may yield – accrue to local communities that purchase the products. And emphasis on local impact in framing has been found to be positively associated with successful environmental championing (Andersson & Bateman, 2000).

Ultimately, we would expect that champions who accentuate proximity will have the highest probability of successful outcomes when championing pollution prevention and product stewardship practices.

Social consensus, probability of effect, temporal immediacy, and proximity have each been suggested to influence ethical decision making (Jones, 1991). Given that these four components are linked by a sense of lower uncertainty and, along with it, urgency, and given the arguments presented in this section, we would anticipate that championing behaviors that emphasize lower uncertainty would mediate the relationship between pollution prevention and successful results, and between product stewardship and successful results. These arguments suggest the following propositions:

Proposition 3: Low uncertainty framing will mediate the relationship between pollution prevention championing and successful championing outcomes.

Proposition 4: Low uncertainty framing will mediate the relationship between product stewardship championing and successful championing outcomes.

Concentration of Effect

Individuals tend to consider actions to be immoral when they result in highly concentrated negative effects (Jones, 1991). Ethical decision makers will seek to avoid decisions whose adverse impacts are seen as highly concentrated. Further, from a purely functionalist viewpoint, a concentrated effect is less likely to go unnoticed; concentrated negative social or environmental effects are more likely to yield negative publicity and other tangible, negative outcomes for firms. Consequently, a concentrated effect commands attention.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

The effects of emitting continued pollution levels can be highly concentrated. Among chemical firms, for example, the worst effects typically accrue to communities within a close radius of facilities generating toxic emissions, even for airborne toxins. This concentrated negative effect is more pronounced in pollution prevention than in other areas of triple bottom line considerations.

Conversely, base of the pyramid issues are typically widely dispersed across large populations, or in populations with less access to media and other tools that can create attention and a sense of urgency. Base of the pyramid issues, additionally, are often longstanding and less dynamic than many pollution related issues, which are manifest as changes from extant environmental and health conditions.

Green technologies and product stewardship generally lack effects that are readily identifiable with regard to certain groups, also leading to less concentrated effects. Proper framing needs to be conducted to counteract the appeal of short-term financial benefits from avoiding pollution prevention investments. And to the degree that a decision maker understands that his or her failure to adopt pollution prevention strategies may serve to maintain an undesirable level of concentrated negative effects, the probability of pollution prevention adoption increases. Thus, the authors suggest the following mediated relationship:

Proposition 5: Concentrated effect framing will mediate the relationship between pollution prevention championing and successful championing outcomes.

CONCLUSION

Unless and until triple bottom line considerations become central to organizational strategy, commitment to sustainability will be seen by top managers as secondary to financial performance. Middle management change agents who wish to champion upwardly directed, divergent sustainability initiatives can effectively use the firm's strategy process to do so through appropriate framing. By so doing, middle managers can serve an important role in championing the triple bottom line of sustainability within their organizations. In this paper, the authors examined this role by addressing the following research question: How does the manner in which middle managers frame sustainable practices influence successful championing outcomes? The authors' model proposes that the relationship between the types of sustainable practices championed and successful outcomes would be mediated by the manner in which champions frame the issues connected to those practices, adding granularity and nuance to our understanding of middle manager championing in social intrapreneurship.

In examining how middle managers can use the levers of strategy process to affect strategic change in their organizations, this paper contributes to a growing literature on the "how" of social intrapreneurship arising from a number of theoretical lenses. Blomfield, Troth and Jordan (2016) theorized that change agents attempting to further a sustainability initiative must match their apparent emotion to the level acceptable within their organization. Alt and Craig (2016) discuss how social intrapreneurs use the meaning systems of their organizations and targets. The present research adopts a different perspective that underscores strategy process, drawing on the natural-resource-based view and issue-contingent models of ethical decision making to develop a model of sustainability championing. Future research affords the opportunity to integrate these different perspectives to enable a more comprehensive understanding of social intrapreneurship processes.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

It is worth noting that the articles discussed above, as well as this paper, are conceptual rather than empirical. Social intrapreneurship theory is arguably in its infancy, in need of further development and strong connections to our existing theories of the firm. Scholars interested in how and why agents of change can successfully urge new sustainability initiatives must work inductively to integrate current theory (Salomone, 1993). The range of theories brought to bear on social intrapreneurship (entrepreneurship theory, theories of emotion in the workplace, sensemaking, issue selling, etc.), suggests that social intrapreneurship may not yet be ready for the "compartmentalizing and operationalization required for empirical work" (Meyer et al., 2017, p. 536).

For practitioners, this research suggests optimal framings that social intrapreneurs may employ to maximize the likelihood of successful outcomes. Pollution prevention actions have the widest range of potential framings: the model suggests that emphasizing low uncertainty and concentrated effects should be useful. For product stewardship, framing as lower uncertainty should be productive. With respect to clean technology and base of the pyramid strategies, an emphasis on high-magnitude consequences would be expected to improve the probability of successful championing results.

The challenge of championing clean technology and base of the pyramid strategies is heightened by an ambiguous link to competitive advantage. While prior research on environmental sustainability suggests that firms may realize cost benefits through pollution prevention (Hart & Ahuja, 1996; King & Lenox, 2002) and may adopt actions consistent with product stewardship in the hopes of securing legitimacy (Bansal & Roth, 2000), there is no such evidence for the relatively future-oriented dimensions of the natural-resource-based view.

For scholars, the application of framing under the guidelines of Jones's (1991) ethical decision making to Hart's (1995) natural-resource-based view suggests avenues for additional research into framing by middle managers in general. Other issues outside of the social and environmental arenas may involve, for example, issues with varying magnitudes of consequences, varying proximity, etc., where this paper can inform how middle managers can increase the effectiveness of their strategic advocacy to top management.

Future research might also examine how additional variables might, in concert with framing, influence the probability of successful championing outcomes. Drawing on prior research on change agents (Visser, 2011), for example, scholars might seek to better understand how specific framing choices enhance or diminish the likelihood of successful outcomes among different types of agents: experts, facilitators, catalysts, and activists. Additionally, scholars might examine how varying aspects of the firm's competitive environment, including the pace of technological change in the industry, might impact the success of different framing strategies. These areas merit exploration in future research.

Advancement of the triple bottom line is accomplished through the behaviors of individuals within organizations. Middle managers, acting as social intrapreneurs, can advance the process of triple bottom line improvement through careful consideration of the championing behaviors most likely to resonate with the organization's decision makers. The authors hope that this paper offers insights for both scholars and practitioners seeking to aid the effectiveness of these efforts.

Chapter 79
Animal Spirits or Engaging Spirits?
The Importance of the Not-for-Profit Economy – Coopetitiveness and Grant-Making Foundations

Angela Besana
IULM, Italy

ABSTRACT

After having discussed the contemporary importance of the not-for-profit and social economy, the chapter builds on a cluster analysis of performances and roles of grant-making foundations, who are the essential node of the cooperation and coopetitiveness, today. This chapter aims to present worldwide grant-making foundations for their performances and profiling according to the latest accounting data and mission reports, which collect results of their projects according to the classification of pure grant-making, networking, leadership, partnership and pooling. With this in mind, the chapter adopts a typical approach of cluster analysis of industrial organization. The cluster analysis emphasizes the profiling of the sample and it allows to separate groups with significant features. The main focus remains on the issues of the finance of the social economy, when the Public Welfare State is too much indebted. Complementary and substitute roles of the Private Welfare State can emerge for the support the not-for-profit economy.

INTRODUCTION

Not-for-profit organizations are significant players of the economy today (Caroli, 2015; Bode 2006, Dart 2004, Weisbord 1998) and they are confronted with very similar challenges to for-profit organizations as concerns resource allocation, entrepreneurship, social accountability, sustainability and cooperation (Daub, Scherrer and Verkuil 2014; Grassi, 2012; Bacq and Janssen, 2011; Zahra, Rawhouser, Bhawe, Neubaum and Shulman, 2009; Martin and Osberg, 2007). These are only some examples of contemporary issues in the so-called not-for-profit or social economy.

Social economy and the not-for-profit, they are not only a theoretical revolution in economics and industrial organization, but they are also evidence of dramatic and challenging times, when the market, the hierarchy and the for-profit are discussed and traditional theories are not more useful to understand and foresee.

With the crisis as a significant contingency, the entrepreneur cannot more behave according to animal spirits. Very scarce resources, collapsing markets, the growth of intangible (and online) transactions and '0' marginal costs (Rifkin, 2014), growing inclinations for altruism, voluntarism and cooperation, they are only some evidence of what is revolutionizing economies. Standards and traditional approaches cannot more be useful to understand what is going on in the *real economy*.

Traditional macroeconomic and microeconomic models have shown their multiple weaknesses for decades and the latest crisis has emphasized these weaknesses (Stiglitz, 2011). There is a growing overlap between the stylized phenomena addressed by traditional economic theories and the emerging relevance of beliefs, the importance of institutions (like not-for-profits) governing behaviors (Coricelli and Dosi, 1998). Behavioral economics has been a theoretical revolution that has obliged economists to investigate implications of motivations, beliefs, aptitudes, irrationality, altruism, regret and the individual dimension not simply isolated but also in relation with communities, society and, above all, with needs of the society (Bleichrodt and Wakker 2015, Kahneman and Krueger, 2006; Kahneman and Tversky, 1979).

According to behavioral economics, implications of individual aptitudes, actions, and behaviors cannot more be neglected and the own ambition and goals, they are not as relevant as other people's goal. *Animal spirits* are vanishing in front of the common and social good, *engaging spirits* are involved in.

Altruism and cooperation, they both become focus of the today' economy. Resource allocation and sustainability, they now derive of coopetition and coopetitiveness.

This revolution has obliged to consider that, next to resources like nature, capital and human capital, the social capital of human relations is essential to growth, welfare and happiness (Santos, 2012; Di Tella and MacCulloch, 2006; Routledge and Von Amsberg, 2003; Easterlin 1995 and 2001). The social capital has emerged as the appraisal of connections, networks, relations and, above all, altruism. The social capital is growing in a society where markets and the willingness-to-pay, they are not the exclusive way of transactions (Ahn and Ostrom, 2009; Manski, 2000; Della Giusta, 1999; Coleman, 1998; Knack and Keefer, 1997).

Coopetition is the cooperation for resource allocation in the for-profit economy, *coopetitiveness* is here meant as the inclination, intensity and framework of the not-for-profit economy, where the empathy and social goals are leading every organization to support the creation and growth of social capital. Organizations of the not-for-profit economy are, first of all, not-for-profit organizations. Nevertheless, it is not excluded that the not-for-profit and the for-profit cooperate for the growth of social capital. This is coopetitiveness, too.

This chapter aims to present the framework of coopetitiveness in the not-for-profit economy. The not-for-profit economy is the Private Welfare State of several grant-makers who are subsidiary to and complementary with the Public Welfare State. Among these grant-makers, worldwide grant-making foundations will be here deeply investigated for their performances and profiling according to the latest available accounting data and mission reports. The aim is the classification of pure grant-making, networking, leadership, partnership and pooling roles of these foundations who *coopete* with other stakeholders for the social capital. Today, they coopete more than in the past. In the past, they simply supplied money for merit causes.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

According to the rich database and multiple rankings of the Foundation Center and Guidestar, a sample will be investigated for financial performances and strategies. The latest and comparable accounting refers to 990 Forms ending 31st December 2013.

With this in mind, the chapter adopts a typical approach of ranking and classification of industrial organization and applied economics, in order to investigate economic performances of the sample and in order to focus on the philanthropy thanks to networks and partnerships these foundations enable.

The cluster analysis (hierarchical and then, k-means) emphasizes the profiling of the sample and it allows separate groups with significant features.

The main focus remains on issues of the social economy, when the Public Welfare State is too much indebted and not-for-profit organizations are competing for resources of the Private Welfare State. Complementary and substitute roles can emerge.

As a consequence, the chapter focuses on the most important Private Welfare State affecting the growth and evolution with and within local, regional and national economies thanks to coopetitiveness.

SOCIAL AND NOT-FOR-PROFIT ENTREPRENEUR, COOPETITION, AND COOPETITIVENESS

Social capital is not only the evidence of a new resource. It is also a drastic change in the vision and strategy. Animal spirits are not more leading. Spirits are led by cooperation, instead. Who is playing coopetitiveness, who is combining competition with cooperation according opportunity costs, this is a new actor. This is the evolution from animal to *engaging and cooperating spirits*. These spirits are, first of all, in the not-for-profit and social entrepreneur

Who is the not-for-profit and social entrepreneur or stakeholder whose main aim is not profit but the not-for-profit share of common goods?

Dees (1998) focused on the not-for-profit as an "innovative activity with a social purpose in either the private or nonprofit sector, or across both." In his opinion, boundaries between the market and the community were vanishing: individual goals had to be confronted with superior goals of communities and the society.

Others have offered conceptual upgrading of this definition for the integration of business into social aims, for the ability of networking with other stakeholders, local and national communities, for innovative and disruptive strategies like crowd-funding, for ethics, for values more than brands (…). In these refinements, for-profits can still prevail, but they have to consider the importance and key-goals of social needs and relations (Caroli, 2015; Birchall 2013; Grassi, 2012; Bacq and Janssen, 2011; Borzaga et al. 2011, Borzaga 2010).

The not-for-profit or social entrepreneur has usually been meant as an alternative to the for-profit. For-profits were in the origin led by their animal spirits. Next to the urgent need of anybody supplying public goods, the inefficiency of for-profits, of their spirits and their market failures gave support to an alternative provision of private and public goods, the not-for-profit economy (Weerawardena, McDonald, Mort, 2010; McDonald, 2007; Powell, 1987).

Coopetitiveness is the key frame of relationships between not-for-profit organizations in the not-for-profit economy. It can also be meant as collaboration between the for-profit and the not-for-profit when they share the goal of the growth of the social capital.

Coopetition is the most common 'label of cooperation' in manufacturing and for-profit economies.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Firms need to cooperate with each other in order to create value, even if they operate in competitive landscapes with competing goals (Dyer, Singh and Kale, 2008).

Coopetition encompasses several complex phenomena. According to the approach of game theory, coopetition reduces costs thanks to information sharing, so that knowledge development can be attained (Hong and Snell, 2015; Brandenburger and Nalebuff, 2011; Okura, 2007). Thanks to coopetition firms are able to achieve superior performances than through collaboration or competition alone (Lado, Boyd, Hanlon, 1997). Complementarity and synergy of resources they are drivers of coopetition according to resource-based view of firms (Brakman and Dean, 2014; Robert, Marques, Le Roy, 2009; Bonel, Pellizzari, Rocco, 2008). With the meaning of cooperation, coopetition has been investigated in industrial organization, management and marketing of small and medium sized firms, service and other industries for more than two decades. The focus has been both on advantages and disadvantages, added values, internationalization, globalization of cooperation and poles between the desire to combine and co-create and the emergence of opportunism and unfair appropriation of benefits, innovative frameworks and approaches (Beamish, Lupton, 2016; Bouncken, Gast, Kraus, Bogers, 2015; Ritala, Tidstroem, 2014; Bouncken and Kreis, 2013).

For the interdependence of services and destination managers, coopetition has been recently investigated in the tourism industry, too (Czernek, Czakon, 2016; Wang, 2008).

If competitiveness is the intensity of competition and coopetition refers to cooperation in the for-profit economy, coopetitiveness is here meant as empathy, altruism and intensity of coopetition in the not-for-profit economy.

Coopetitiveness is cooperation between the not-for-profit for the growth of human relations, social capital and welfare.

Coopetitiveness can refer to not-for-profit and for-profit cooperation, too. Not-for-profits can be next to for-profits for objectives of the social economy. They can work in parallel and they can be complementary. For example, the for-profit hospital and the not-for-profit one, they both supply the same core business though strategies and performances can be differently meant and some literature is focused on differences and phenomena separation (Grassi, 2012; Bacq and Janssen, 2011). Social economies confront both enterprises and organizations with comparable challenges, although their precise forms may, in some cases, differ significantly: associations, cooperatives, companies, trusts, NGOs (Non Governmental Organizations), public administrations and foundations. Pronounced similarities can be evident in the employment market, in which both focus intensively on the recruitment of specialists (financial analyst and fundraiser) and in which they frequently compete.

The main difference and the key-feature is nonprofit or not-for-profit where 'not-for' is much more significant than 'non'. Profit is not neglected. Nevertheless, profit must be reinvested 'for' the merit cause, for the common good and for the social capital. Social capital and social economy are meant for the collective benefit.

Competition and aptitude for cooperation, they have always been present in the not-for-profit economy. The competition among not-for-profit firms, the for-profit and the government has always been tempered by intrasectoral cooperation (Steinberg, 1993 and 1987).

In this environment the for-profit organization is not excluded, if the entrepreneur has social goals next to profit-maximization. Entering the market for services and merit goods previously supplied only by for-profits, not-for-profits must demonstrate to achieve multiple goals, provided they exploit the potential for success according not exclusively to financial performances and with the burden of common and social challenges. Literature on these two poles, their separation and their neighborhood is fragmented,

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

because research is conducted under a multitude of similar, yet distinct, concepts (e.g., commercialization, professionalization, mixture and symbiosis, cooperation and hybridization). On one hand, management and organization approaches play a decisive role for the adoption of business-like approaches. On the other hand, researchers criticize paradigm shifts and loss of idealism (Maier, Meyer and Steinbereithner 2014, Kreutzer and Jaeger 2011, Hwang and Powell 2009). According to goals, processes and practices, the not-for-profit look at for-profit benchmarks. Nevertheless, for-profits *use the same mirror* when they have to compete and *coopete* in the same arena. Double benchmarks are frequent: the not-for-profit look at the not-for-profit and the for-profit of the same industry. The for-profits they do the same. Hybrids can arise in order to rationalize the best of both. Social entrepreneurship means hybrids, too (Battilana and Lee, 2014; Grassi, 2012; Halme, Lindeman and Linna, 2012).

The literature soon recognized that not-for-profits and for-profits are not more thinking of themselves as poles.

Coopetitiveness is the latest strategic trend between not-for-profit organizations and between the not-for-profit and the for-profit. With ongoing scarcity of resources, coopetitiveness is the target for both the not-for-profit and the for-profits. Thanks to coopetition, the for-profit maximize profits in manufacturing industry and the service industry like tourism. Thanks to coopetitiveness, the not-for-profit and the for-profit together, they maximize the social capital and the welfare with resources and contributions, they collected from different stakeholders.

Coopetitiveness is, first of all, the response to a volatile and unstable market. With this meaning, coopetition is naturally emerging at crisis times, when the structural, strategic and performance uncertainty obliges to abandon animal spirits. Individual resources are of strategic importance, when are valuable, rare and difficult to imitate and efficiently organized. Individual resources become more valuable, when they are matched with others' as it is in the not-for-profit market, in order to adapt to unstable and changing environments.

Coopetitiveness does not exclude competition. The instability and volatility, they both oblige entrepreneurs to the competition versus coo-petition choice. In order to avoid conflict, the not-for-profit and the for-profit will concentrate on increase of resources base, tools for setting primary objectives, from spot to stable agreements and the interdependence coordination. Clear goals and standards of coordination become salient. In case of long-term or renewable relations, the exchange of acquired resources enables to reduce the conflict, and sometimes leads to the synergy effect, where the use of the knowledge of one party and other resources of the second party is beneficial for all participants of the relation and furthermore it may contribute to increase of the Pareto-superior character of intrasectoral and intersectoral coopetitiveness.

With attention to the not-for-profit and when splitting the universe into operating and grant-making, the coo-petition is assured by both the operating not-for-profit and the grant-making one.

Foundations result as the copious grant-maker and the main node of networks and partnerships in the not-for-profit and social economy worldwide. Thanks to coopetitiveness, the not-for-profit and the for-profit together, they maximize the social capital and the welfare thanks to contributions collected by foundations and networks, foundations are leading. Foundations are the main link in the generous society, where coopetitiveness is intense.

Foundations are no the exclusive providers of resources to the social economy. The Public Welfare State plays a key-role, too. The following paragraph concerns the triad of the not-for-profit, the for-profit and the State.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Third Wheel or Parallel Engine? Public and Private Welfare States

The main background of the not-for-profit literature regards the issue that the for-profit are not enough for the welfare and social economy (Steinberg, 1993; Ben-Ner and Van Hoomissen, 1991; Powell, 1987). As developed in the previous paragraph, for-profit and not-for-profit organizations simultaneously display competitive and collaborative behaviors.

The State is another player of the cooperative game, if we recall that most often public services do not have a market. They are not sold but rather provided either for free or at heavily subsidized fares (Patrizii, Resce, 2015). Benefits to the community are made by cooperation among administrations, the not-for-profit and the for-profit. Public administrations solve for market failures in collaboration with the not-for- and the for-profit.

The social economy is, as a consequence, the intersection of not-for-profit organizations, public administrations, for-profit corporations, when they are mixing and balancing their operating and grant-making roles for the benefit of the whole society (Eggers and Macmillan, 2013; Hansmann 2013, Defourny and Nyssens, 2010; Mair and Marti, 2006; Austin, 2006).

Coopetition is, first of all, a strategy for firms (the for-profit) who innovate and it is well studied in industrial organization and management literature. Coopetitiveness is the ultimate trend of the not-for-profit, public administrations and the for-profit who collaborate in order to enhance the general welfare.

Coopetitiveness is not only 'sense and sensibility' of collaboration between the not-for-profit and the for-profit, but also inside of the not-for-profit and social economy, when not-for-profit organizations specialize with the separation of operating and grant-making roles and they collaborate.

Operating and grant-making are not always poles. The operating role cannot survive without the grant-making role and both roles can be found in the same organization. This organization supplies grants to social causes and at the same time, the organization leads social projects. Some of not-for-profit organizations specialize in the grant-making role, especially, foundations (corporate, community and independent). Different types of the not-for-profit, as a consequence, develop complementary roles next to and with the support of public administrations for common goals and projects, especially at the regional level (Birch and Whittam, 2008).

Public administrations are, therefore, present in this arena.

Public administrations are the core of the so-called Public Welfare State who is originally conceptualized in order to solve for market failures.

The Public Welfare State was meant to grant public goods, solutions to market failures, externalities, imperfect and asymmetric information (Barr 1993). Public goods refer to goods and merit causes, which the for-profit firm does not provide, as they are very costly and, at the same time, indivisible and not excludable. Negative externalities refer to damages (pollution, for example) nobody is paying for. Imperfect and asymmetric information refers to frauds, unbalance between supply and demand, when consumers and suppliers do not have the same quality and quantity of information for effective and efficient transactions.

Parallel to the Public Welfare State, the not-for-profit organization can emerge with same goals.

In some industries the triad of the State, the not-for-profit and the profit organizations can match their resources and businesses. This is the case of the health industry with public, for-profit and not-for-profit

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

hospitals. This is also the case of creative industries where theatre, movie and other entertainment can be public and private organizations, profit and not-for-profit entrepreneurs.

The Public Welfare State can be a solution till crisis times. When the real and financial crisis negatively affects public administrations, the Public Welfare State decides to reduce public expenditures. *Deleveraging* and spending review are still ongoing.

At crisis times the triad and coopetitiveness of the not-for-profit, public administrations and the for-profit can either collapse or get stronger for the best resource allocation. Complementary roles can become subsidiary roles, especially for private grant-makers and sponsors who replace the State and public administrations. The balance of roles and powers can move from the Public Welfare State to intermediate and hybrid organizations, whose strategies are a *bricolage* and hybrids of grant-making, leadership, partnership, networking and pooling of resources (Caroli, 2015; Battilana and Lee, 2014; Grassi, 2012; Halme, Lindeman and Linna, 2012; Kickul, Griffiths and Gundry, 2010).

At hard times with collapsing resources, the operating non-profit and social economy relies, as a consequence, on the philanthropy of the Welfare State of private grant-makers, as the Public Welfare State is affected by high debts and, as a consequence, concentrated on deleveraging and spending review. The Private Welfare State can be the grant-making foundation whose role is not concentrated only on grant-making, today more than in the past.

Grant-making foundations have been important partners of the social economy for more than two decades and their philanthropic role has gained a very significant importance since the latest crisis. In the above-mentioned triad, they are changing their roles from pure grant-makers into leaders, partners, networkers and collectors of pools of resources.

At crisis times, they are developing some brico-roles that innovate the traditional grant-making profile. These brico-roles are summing up profiles like the project manager, the project leader, the network leader, the fundraiser and also the collector of multiple resources, from money to in-kind. As they have important knowledge and forecasting visions of economies, including focus on critical problems, on priorities both surface-level and more deep-rooted, on the various organizations that can match their resources to address those problems, and on the underlying political and inter-organizational dynamics and contingencies, they can be project leaders.

The ability and strategy of foundations to connect to small and large communities, for their grant-making role and also for their partnering with different stakeholders, it could not be affordable if resources were not enough and connected with financial markets. Strong of their financial performances, the creation of networks, partnerships, pooling of resources and leaderships has become their best practices next to or with the Public Welfare State of central, regional and local administrations.

If the ability of the Public Welfare State has reduced, not-for-profit organizations disproportionately deliver essential services that typically fall to governments, while contemporary crisis times show some structural and strategic weaknesses. Foundations are important partners o these operating not-for-profit organizations.

The following cluster analysis will profile a sample of grant-making foundations according to their performances and it will show some main roles as for welfare issues with and next to (*bricolage* of roles) other Welfare States.

PROFILING OF GRANT-MAKING BIGGEST FOUNDATIONS: A CLUSTER ANALYSIS

Several empirical reports are available for the USA not-for-profit economy. Approximately 1.44 million nonprofits were registered with the Internal Revenue Service (IRS) in 2012, an increase of 8.6 percent from 2002 (McKeever and Pettijohn, 2014). The not-for-profit or social sector contributed an estimated $887.3 billion to the US economy in 2012, composing 5.4 percent of the country's gross domestic product. In 2013, total private giving from individuals, foundations, and businesses totalled $335.17 billion, an increase of just over 4 percent from 2012 after adjusting for inflation. According to Giving USA, total charitable giving rose for the fourth consecutive year in 2013 (Giving USA Foundation 2014). However, after adjusting for inflation, giving is still lower than at its pre-recession peak in 2007 ($348.03 billion in 2013 dollars). With more than 3 trillion of assets, in 2013, USA public charities reported over $1.74 trillion in total revenues and $1.63 trillion in total expenses. Of the revenue: 21% came from contributions, gifts and government grants, 72% came from program service revenues, which include government fees and contracts, 7% came from 'other' sources including dues, rental income, special event income, and gains or losses from goods sold.

In 2014 USA giving topped $358.38 billion, more than total giving before the Great Recession. Foundations represented 15% of contributions the USA social (not-for-profit) economy was able to collect. Thanks to this philanthropy this economy is going to reach more than 7% of the country's domestic product (Gross Domestic Product, GDP). While the private social spending amounts to almost 11% of USA GDP, it is on average 2.6% across OECD. If the public social spending is 20% in USA, the average public social expenditure is 23% in OECD. USA is top ranked for the private spending in comparison with other OECD countries, with the leading roles of individuals and foundations as grant-makers. Private and public spending summed together, USA total social spending is the second highest in the world (OECD, 2014).

Eurostat regularly supplies data on the EU not-for-profit economy when the household consumption is disaggregated in significant components.

The largest component, household final consumption, represented 56.5% of GDP in 2011. When adding final consumption of non-profit institutions serving households or (1.5% of GDP) and 'individual' government expenditure such as public education and public healthcare (13.6% of GDP), the result is households' actual individual consumption (71.4% of GDP). After adding 'collective' government consumption (8.2% of GDP), covering items as administration, justice, defence or the police, the result is total final consumption expenditure, which accounted for 79.7% of EU-27 GDP in 2011. (Gerstberger and Yaneva, 2013).

In 2014 the public social expenditure is 22% of the EU GDP and the total final consumption expenditure of the not-for-profit economy was more than 80 percent (OECD, 2014)

The here investigated sample includes 100 biggest foundations, most of them USA and with reference to worldwide rankings like www.foundationcenter.org. According to their reports at own websites and 990 Forms available at www.guidestar.org, main performances of this sample are calculated for year 2013. This is the latest year, reports are available with the same and comparable accounting standard, the 990 Form.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Guidestar collects IRS (Internal Revenue Service) 990 Forms of the USA not-for-profit economy. The 990 Form includes the Statement of Revenues ad Expenses and the Financial Statement. Accounting data are recorded according to IRS standards. Total Revenues are the Income: money that the organization has received from contributions, grants, the performance of services, etc. Guidestar takes this figure from line 12 (Total revenue) of IRS Form 990.

The latest available 990 Forms and Reports of this sample are investigated for the following accounting lines for fiscal year 2013: investments, total assets, net assets, contributions, financial revenue or investment income, total revenues, grants paid, total expenses, gain or loss. Seven ratios are then calculated: investment/total assets, as signal of the composition of their assets; net assets/total assets, as signal of solvency; contributions/total revenues; as signal of their fundraising in the community and relations with their stakeholders; investment income/total revenues, as signal of profitability of their investment strategy and relations with financial investors; net gain or loss/total revenues, as signal of their profitability; grants paid/total expenses as signal of their today's fundgiving; grants paid/total revenues as signal of the sustainability of their tomorrow's fundgiving and the weight of residual administrative costs.

Hierarchical clustering is applied to seven ratios.

Hierarchical clustering is a process that classifies items of the same sample for similar features. It starts with each point in its own cluster. At each step, the two clusters that are closest together are combined into a single cluster. This process continues until there is only one cluster containing all the points. The plot of dendrogram shows the aggregation of clusters.

A hierarchical clustering with the average method shows two main clusters (Figure 1) whose performances can be read in the Table 1.

The ■ cluster includes 30 foundations and the × cluster is the most crowded one with 50 foundations.

Both clusters show a very high solvency and most of their assets are investments, though the × cluster shows a higher percentage for 94.19 percent, investments.

The main difference refers, first of all, to contributions. They are 69.57 percent for the ■ cluster and only 1.61 percent for the × cluster. The range of stakeholders is, as a consequence, very different: for the ■ cluster, fundraising is a leading strategy, especially, within the territory, community and not only financial markets. USA community foundations are here included and it is the mission of community foundations to collect and connect within communities. Coopetitiveness is here mostly developed both with the other not-for-profit and with the for-profit. Deep in the society, these foundations look for resources, networks and partners in order to maximize the growth of social capital in several projects. They sometimes lead initiatives; they sometimes pool resources for programs that are launched by local

Table 1. Average performances of ■ cluster and × cluster (percentages, 2013)

	Investments/ Total Assets	Net Assets/ Total Assets	Contributions/Total Revenues	Investment Income/Total Revenues	Net gain or Loss/Total Revenues	Grants Paid/Total Expenses	Grants Paid/Total Revenues
■ Cluster	88.60	94.97	69.57	27.41	39.17	85.60	51.90
× Cluster	94.19	96.30	1.61	79.52	4.35	78.77	77.30

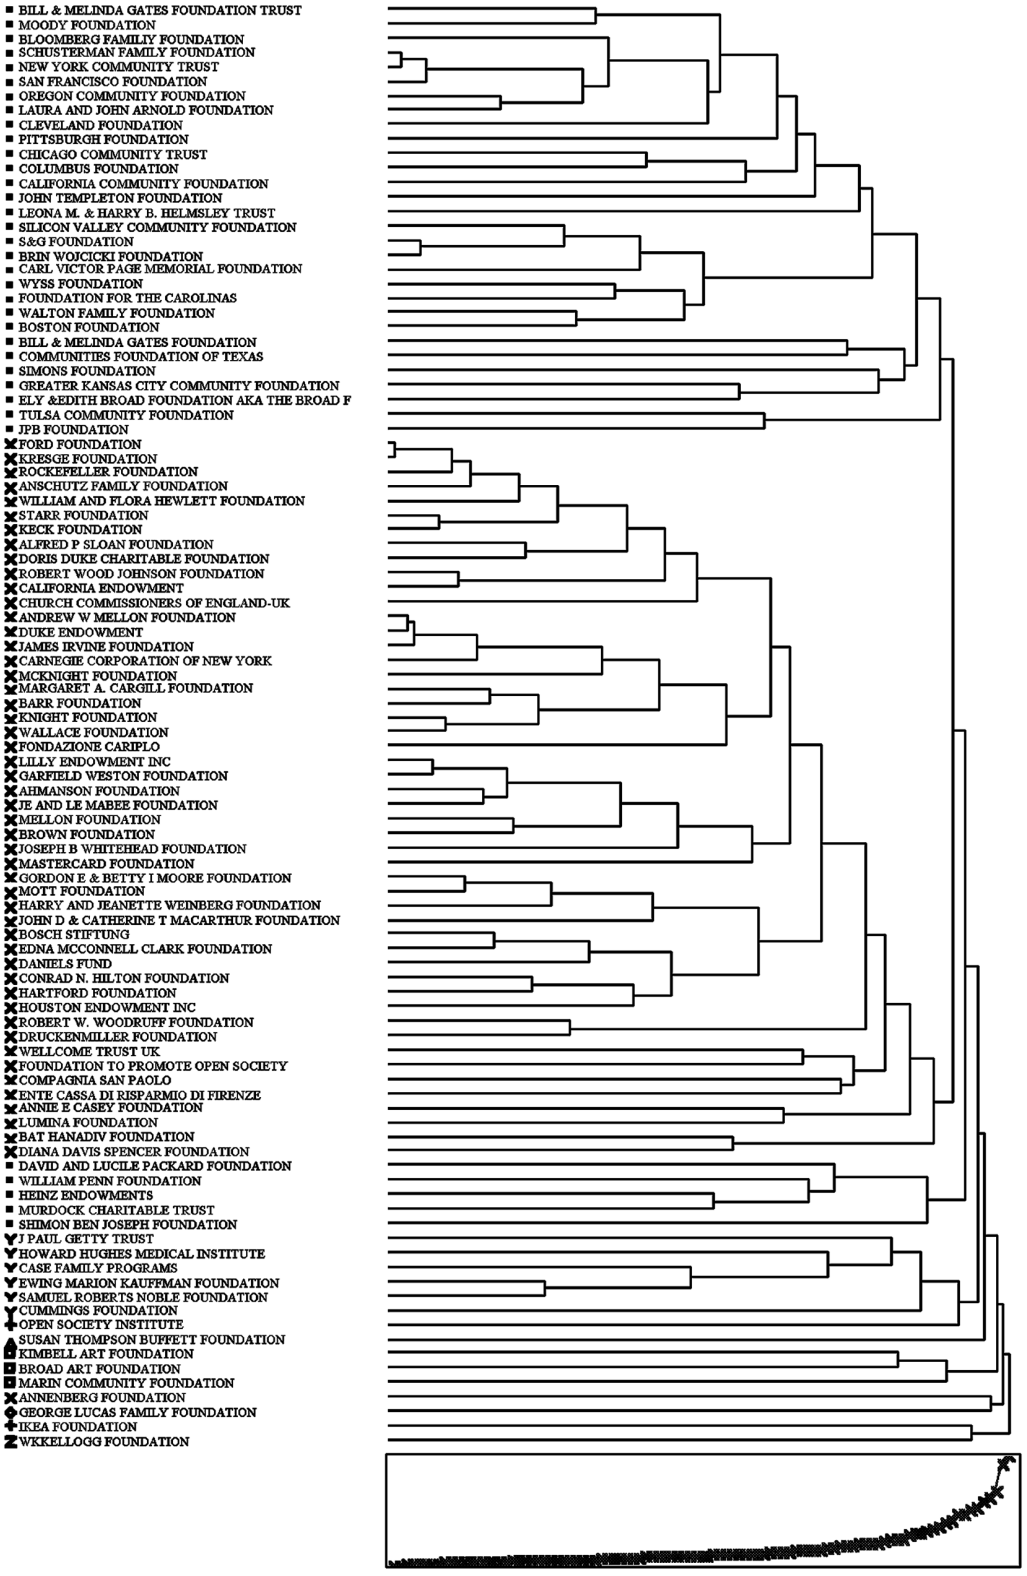
Figure 1. The dendrogram of 100 biggest foundations according to their average performances (2013)



EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

authorities (schooling programs, social housing, employment, etc.), which are clustering with associations, other foundations, philanthropists and any other leader of the not-for-profit and the for-profit economy. Foundations also invest in initiatives through the vehicles of intermediaries and anchor institutions such as trusts, funds, universities and hospitals they target copious grants to. They can develop new solutions (venture capital, crowdfunding, etc.) together with other stakeholders like the for-profit hospital or education provider, they innovate program models, they create ad hoc organizations in order to cope with urgent priorities (for climatic disasters, too), they advocate for changes in public policies, norms and philanthropic standards. Their philanthropy is motivated to catalyze public- and private-sector investment. To sum up, a hybrid role that is subsidiary of decreasing efforts and resources of traditional administrations, not-for-profit and for-profit economy.

The × cluster is an investor profile, instead. With 94.19 percent of investments and 79.52 percent of investment income, financial relations are leading their financing. Investments are here the priority in order to pool and maximize resources. Investments can refer to ancillary start-ups, trusts and funds they commit to in order to increase budgets and sustainability of projects. Permanent charitable funds, trusts and partner foundations are helpful intermediaries, in order to enable donors to maximize their charitable giving and support the work of dozens of local organizations. Partner foundations have a volunteer advisory board comprising local leaders, from the not-for-profit local leader to the for-profit corporation that is leading the national, regional or local economy. Through their association with the Greater Foundation, partner foundations are able to focus their efforts on local and small projects, while the Foundation provides administrative support and investment expertise both at local and regional (or national) level.

Ancillary start-ups can also correspond to for-profit firms, who generate program service revenues, which are modest and anyway, performance of their revenue diversification. This is the kind of coopetitiveness with the for-profit. This is for this cluster as for the ■ cluster.

Profitability is higher in the ■ cluster than in the × cluster. Above all, the grants paid ratio is higher for the ■ cluster (85.60 percent) and the sustainability of fund-giving is higher in the × cluster (77.30 percent), instead.

The grants paid ratio is significant as concerns the range of costs of these foundations, too. If most of costs refer to grants, residual expenses are administrative ones. For this sample, only one fifth of resources refer to administration.

At crisis times, the commitment to financial markets can compromise the profitability of the × cluster (4.35 percent). Anyway, the willingness-to-donate of × cluster is higher than in the ■ cluster.

These profiles are main poles of a philanthropy either who is integrated in the community (■ cluster) or who relies on investments (× cluster). These poles can also be aimed at the maintenance of the *impartial role*, without implications either with financial markets or the community philanthropy.

In conclusion, coopetitiveness is the leading strategy of the ■ cluster. This cluster is pooling resources thanks to networks within society and with multiple stakeholders. Profitability is higher in this cluster than in × cluster and connections with a wider range of community and local stakeholders can be significant for this performance. Nevertheless, the sustainability of future philanthropy is granted by investments (94.97 percent), too.

This analysis gives evidence to two poles of the same universe with different strategies, the same goal and solid performances for both.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

THE ISSUE OF SEPARATING AND MIXING PROFILES: SOLUTIONS, RECOMMENDATIONS, DIRECTIONS

The previous analysis gave evidence of two poles. Nevertheless, connections with multiple stakeholders, the priority of social capital and the growth of collaboration, networks and partnerships, they can profile these foundations further for more than two groups.

Profiles can be different and much more interesting for gain and grant ratios than significant clusters of the previous analysis. This is, if the clustering method is meant to separate and focus on differences. K-means clustering was, secondly, applied in order to focus on differences and the following empirical investigation results as a refinement of the previous one.

The *k*-means approach to clustering performs an iterative alternating fitting process to form the number of specified clusters. The *k*-means method first selects a set *n* points called *cluster seeds* as a first guess of the means of the clusters. Each observation is assigned to the nearest seed to form a set of temporary clusters. The seeds are then replaced by the cluster means, the points are reassigned, and the process continues until no further changes occur in the clusters. When the clustering process is finished, tables show average performances of separated clusters.

In Tables 2, 3 and 4 average performances of 8 clusters are shown. The most crowded four clusters will be here investigated in details.

Table 2. Final cluster centers: average performances of 8 clusters (ratios, 2013)

	1	2	3	4	5	6	7	8
Investments/total assets	.44	.85	.84	.86	1.00	.80	.95	.91

Source: Own elaboration with SPSS Software.

The most significant clusters are 3, 4, 6 and 8. Investment ratio and Net Assets one, they are not significant according to ANOVA Analysis, as this sample is solvent and focused on investments without separating features. Profiles are different for the revenue diversification: financial revenues are much more significant for two profiles (clusters 4 and 8) than for other two (clusters 3 and 6), whose contribution ratio is never less than 61 percent.

Two profiles with prevailing financial revenues are less profitable than profiles with prevailing contributions.

Clusters 4 and 8 are particularly connected with financial stakeholders and these connections generate financial revenues for 80 percent (cluster 4) and 92 percent (cluster 8). The exposure to financial markets is, nevertheless, not profitable for cluster 8 whose gain ratio is negative. It must be considered that cluster 8 shows the highest today' philanthropy ratio (83 percent of grants paid/total expenses) and tomorrow's (potential) philanthropy ratio (1.03 for grants paid/total revenues). Though affected by a loss, this is the most proactive in philanthropy.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Clusters 3 and 6 show connections with communities more than with financial investors and contribution ratios are prevailing. Both of them are profitable and the today's philanthropy ratio is the second highest for cluster 3 in comparison with the whole sample.

If the membership of clusters can be appreciated in Table 4, the most crowded cluster (cluster 4) collects international giants, inclusive of Italian ones (Fondazione Cariplo, Ente Cassa di Risparmio di Firenze, Compagnia San Paolo). Cluster 8, which is the second most crowded, includes USA foundations whose range of missions, projects and visions is not only American, in any case.

Considering both clustering methods and applications, philanthropy is maximized when contributions are maximized.

This solution means that coopetiveness with several stakeholders is leading to better performances. Raising of contributions, networking, pooling of resources and partnerships with the other not-for-profit and with the for-profit, they are all providing philanthropy and sustainability of projects, today and tomorrow.

Taking into consideration these solutions, recommendations about profiling of the universe and the here mentioned-sample should be recalled.

First of all, the crisis is exogenously impacting on performances, above all, foundations that are mostly connected with financial markets. Though performances can be affected by trends of financial markets, philanthropy is a priority for this sample with the support of their multiple stakeholders today and tomorrow. In fact, communities, donors, philanthropists, sponsors and any other grant-maker have experienced mature commitments with these foundations and their projects for the growth of the social capital since the beginning of the crisis.

For grant ratios of these foundations, policies should further stimulate their role of Private Welfare State at different latitudes, mixing their roles with public administrations for an efficient *bricolage*. Among these policies, rules against free-riding should be enacted so that resources are targeted to the best projects and frauds are limited.

Operating not-for-profits, who want to impact the social capital, cannot be myopic in front of this Welfare State and managerial implications should imply the optimization of networking, matching grants, pooling of resources and leadership.

The strategy to be recommended can include an extended initiative in which foundations take a lead or supportive role. On one side, they work to simplify the charitable giving of their donors. For example, a donor-advised fund for simple execution and documentation of tax-deductible gifts; competitive reinvestment of accumulated funds; and simple and prompt handling of grant recommendations. On the other side, foundations provide philanthropic benchmarks. Having important knowledge of economies, they connect to various organizations that are in a position to face problems, and the underlying political and inter-organizational dynamics in order to improve the social capital. These factors enable the not-for-profit economy to 'enlarge' their mission, visions, stakeholders and networks.

New directions can be shown in the trend of philanthropy, from pure grant-making to coopetitiveness in Figure 2. The trend develops from pure grant-makers to coopetitors, who provide grants to the not-for-profit economy, pool resources from different stakeholders, build a network and lead in order to maximize performances of philanthropy.

At the beginning foundations were only grant-makers. They were alone in their grant-making. They were considered as provider of money, with ancillary and external roles in projects they financed. Today they support coopetitiveness with the not-for-profit and the for-profit: they create networks with other stakeholders, they pool resources from money to in-kind and they can create partnerships with distribu-

tion of roles and, above all, leading roles. Roles can range from grant-making to operating in different supply chains, from the education industry to the health industry, from research to social housing, from environmentalism to unemployment compensations, etc. Roles benefit human relations, the welfare mix with definition of public priorities together with administrations and the social capital. In this cooperative game *engaging spirits* attract each other thanks to coopetitivenes in order to enhance performances of all of them. In the following paragraph the next evolution of their project management will be discussed, with focus on the role of policies.

CONCLUSION

When the Public Welfare State is too much indebted and not-for-profit organizations are competing for resources of the Private Welfare State, complementary and substitute roles can emerge.

The social capital of human relations, welfare and merit goals can be accrued by coopetitiveness. Foundations are playing the main role.

Taking into consideration the growth of social capital, coopetitiveness is the priority in a civil society where not-for-profit goals are not more negligible. Collaboration is a must for not-for-profits, for-profits and the State, between and among them.

Ward and K-means Clustering gave evidence to two and four clusters, their performances and their merit roles, for a sample of the biggest foundations all over the world. If efficiency in the not-for-profit does not firstly concern gains, performances confirmed high net assets and high philanthropy ratios, both today and tomorrow. The profiling emphasized coopetitiveness as concerns grant-making, networking, partnerships, leaderships and the importance of pooling resources around common goals. Online reports of these foundations gave information about social benefits generated by foundations. Strong of deep relations within societies and communities they work in, these foundations connect stakeholders with social aims in not-for-profit industries like education, human services, health, environment, arts, culture and humanities.

Some implications for their management, for policies and benchmarking at different latitudes should be considered. These implications are useful for project managers who work in the not-for-profit economy, if they look for strategic benchmarks.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Project management of foundations is now evolving into a mature *planned giving*. Planned giving refers to the philanthropy when grants are supplied with monitoring of intermediate results, so that the social aim is targeted with cautious attention to interim and final results. These steps include:

1. Community empowerment, which implies focus on problems and ranking of them.
2. After having selected priorities and merit-causes, stimulation of matching grants of other stakeholders, from the for-profit to the State.
3. Selection of financing methods and instruments so that multiple resources are pooled thanks to networks and partnerships with the intermediate calculus of economic and social impacts.
4. Monitoring of intermediate results, also thanks to story-telling of social media, and editing of intermediate reports, whose performances are communicated to all stakeholders in order to verify the growing impact on the *social capital*.
5. Post-selection, with focus on excellent projects, whose best practices and performances should be considered as a benchmark for their future grant-making.

The observation of these best practices can benefit small and big not-for-profit organizations, whose project managers look for inclusion of stakeholders, money and in-kind.

Next to the optimization of project management, foundations constantly take a judicious and visionary discernment of their goals and what they try to achieve. Scarcity of visions is a limitation for all stakeholders. With this in mind, collaboration is continually growing and boundaries of targets are bigger and bigger.

Not-for-profit project managers should, in this case, look for this *visioning approach*, too, so that they do not overestimate or underestimate their major and minor goals.

Exogenous conditions matter and from standards to regulatory frameworks, from ratings (or rankings) to policies, a lot of work can be done in order to optimize strategies, performances and impacts. Politicians and public administrations should pay attention to frameworks and they should affect them by enacting laws.

In a better regulatory and international framework, with a robust charitable registration process, 'charities rankings' should be further implemented both offline and online, in order to signal who is the best grant-maker and the best benchmark for all other philanthropists. These foundations as well as the other not-for-profit organizations, they can further grow if laws and competition change, thanks to rules against frauds and misuse of resources, too.

Next to this, industry analysis in order to evaluate competition, microeconomic and macroeconomic trends of rapidly changing economies and in order to asses how to impact social issues, they should be further implemented in order signal and reward the Best Private Welfare State, with fiscal incentives and *social reputation*, too.

The fundraising arena is turbulent, unstable and in need for funds for multiple and several good-causes. Long-term sustainability implies planning, project management, economic and social accountability according to common managerial standards. Associations, consortia and representative of not-for-profit organizations should lobby for screening schemes of the best projects, so that free-riding is prevented.

At the different latitude of USA and not-USA, the ongoing debate refers to similar issues with emphasis on the priority of rankings and fiscal stimulation. Diversity of clusters can be further stressed, while upgrading with other clustering and analysis. Nevertheless, the comparative research with larger

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

samples, longer time-series and the consideration of different labels like independent, corporate, family and community foundations, they all should be further implemented in order to focus on suggestions for managerial implications and policies. Animal spirits are today vanishing out of the competitive scenario and *engaging spirits* are not playing ancillary roles.

KEY TERMS AND DEFINITIONS

Coopetitiveness: Intensity of coopetition in the not-for-profit economy, between not-for-profit organizations. Between the not-for-profit, public administrations and the for-profit, too.

Foundation: This is an organization with assets to social goals. Their role classification is into operating and grant-making. Mixing roles is possible (*bricolage*).

Leadership: Who is governing and playing the main managing role in a project.

Network: Relationship with multiple stakeholders.

Not-for-Profit: This organization supplies goods and services without the commitment to profit maximization.

Partnership: Relationship with multiple stakeholders with distribution of roles: from grant-making to operating.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Pool of Resources: Aggregation of different resources, from money to in-kind for the comprehensive financing of a project.

Social Capital: The cluster of human relations that enable welfare, happiness and growth.

Welfare State: Who is providing resources for welfare. Private Welfare State includes foundations and other not-for-profits. Public Welfare State includes the State and public administrations.

Chapter 80
Sustainability and Competitive Advantage:
A Case of Patagonia's Sustainability-Driven Innovation and Shared Value

Francesco Rattalino
ESCP Europe, Italy

ABSTRACT

Sustainability and Corporate Social Responsibility have been perceived for many years by companies only as an annoyance, involving regulations and extra cost. The recent economic downturn and increasing stakeholder pressure have forced businesses to embrace the complexity and interdependencies between shareholder value and sustainable value. Sustainability-driven innovation is the key to overcoming the old conflict between economic and social objectives and, as in the case of Patagonia Inc., is paying off for a growing number of companies as it generates a sustainable competitive advantage. This chapter explores ways in which corporations can pursue economic, social, and environmental objectives simultaneously while creating shared values. It also looks into the very complex issue of measuring both the business and social impacts of shared-value strategies.

INTRODUCTION

The recent economic downturn, coupled with two of the worst ever environmental disasters and some highly questionable corporate practices, revived the long-standing debate about the role of business in society and is raising important questions about the ways in which businesses can pursue their objectives (being profitable), whilst generating positive value not only for themselves but also for the stakeholders involved in their activities – their investors, their employees, their suppliers, the communities where they operate and the natural environment (Kanter, 2011).

Modern communications systems, such as social networks – Facebook and Twitter – and on-line media offer people the opportunity to have access to more information faster than they did in the past.

Companies, therefore, cannot hide their activities anymore and, for this reason, over the last 15 years an incredible number of disasters and unauthorized activities have come to public light, mostly caused by the unethical behavior of business organizations. Here are some dramatic examples:

- Top managers of Bear Stearns and Lehman Brothers earned a shocking $1.4 billion and $1 billion in emoluments and bonuses respectively in the eight years preceding the bankruptcy of their companies (Bebchuk, Cohen, & Spamann, 2009). Were they maximizing value for their shareholders or for their own personal interests?
- In China 14 workers making Apple products committed suicide. As a consequence, instead of increasing the quality of working conditions, Cupertino's company obliged their subcontractors to make their employees sign a pledge to not commit suicide (Chamberlain, 2011).
- According to a survey conducted by Trucost on behalf of the United Nations, in 2008 the world's biggest companies polluted or caused damage to the environment amounting to $2.2 trillion (Young, 2010).
- On April 20, 2010, an explosion destroyed the Deepwater Horizon causing the death of eleven workers and the release of 4,9 millions of barrels of oil into the Gulf of Mexico. The well was eventually capped on July 15. The total damages to BP, the environment and the U.S. Gulf Coast economy are estimated to be $36.9 billion (Smith et al., 2011).
- On March 2011 a huge earthquake and tsunami struck the Fukushima Daiichi nuclear power station. The nuclear bars in the reactors' cores overheated causing the explosion in the reactors. "Radioactive material released into the atmosphere produced extremely high radiation dose rates near the plant and left large areas of land uninhabitable, especially to the northwest of the plant. Contaminated water from the plant was discharged into the sea, creating international controversy" (Holt, Campbell & Nikitin, 2012).

All of this has been creating a growing mood of protest among ordinary citizens. Many non-governmental organizations (NGO) are actively lobbying governments to increase the level of environmental accountability for business organizations and national and local governments are also trying to carry out a difficult mediation between business organizations and communities. The promoters of these protest movements, among them the famous "We are the 99%", maintain that the world of business and finance are only interested in short-term profits, while completely neglecting problems regarding the environment and sustainability.

The moral case for social responsibility boils down to a simple concept: It's the right thing to do. Until recently, business organizations have been asked to change their economic policies by leveraging themes such as "responsibility", "ethics" and "environment". Needless to say, these requests have mostly been ignored, as shown in the previous examples. Companies often only partially recognized the benefits that these changes could bring with them. However, a business case for social responsibility is slowly but steadily taking shape showing that it is more and more in the enlightened self-interest of companies to be good citizens and devote some of their energies and resources to the betterment of such stakeholders as employees, the communities in which they operate, and society in general (Kakabadse, Rozuel, & Lee-Davies, 2005). Public pressure has also dramatically increased, leading companies to start integrating sustainability into their way of doing business.

In 2010 United Nations Global Compact and Accenture carried out an important study on sustainability during which more than 750 CEOs and about 200 entrepreneurs, company directors and political

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

leaders were interviewed (Lacy et al., 2010). This opinion poll was very useful for understanding what managers think about sustainability today. Firstly and most importantly, more than 93% of the 750 CEOs surveyed believed that "sustainability issues will be critical to the success of their business" and 95% believed that in the future sustainability will be "fully integrated into the strategy and operations of a company" (three years before it was 72%). Secondly, when asked how long it will take, 10% of those CEOs forecast that it will take within 5 years to fully implement sustainability, 54% within 10 years, 80% within 15 years. Only 3% of them believe that it will never be reached (Lacy et al., 2010).

It is interesting to see how, counter-intuitively, CEOs believe that the economic crisis has not slowed progress towards sustainability but, on the contrary, 80% of them believe that it "has raised the importance of sustainability as an issue for top management". As a consequence 91% of them stated that their companies "will employ new technologies to address sustainability issues over the next five years". Over and above this, 72% of the interviewees feel that brand, trust and reputation are the most influential factors in taking action on issues regarding sustainability, which is a sign in itself of the changing times.

To fully understand the scope of this change, it must be remembered that William Ruckelshaus, the first Administrator of the US Environmental Protection Agency, declared that "Sustainability is as foreign a concept to managers in capitalist societies as profits are to managers in the former Soviet Union" (Hart & Milstein, 2003). Things are finally changing and western companies have come to understand that to perpetuate last century's economic success they must re-invent themselves by embracing a new paradigm that adds the sustainability of their strategic choices to the profit equation, at the risk of declining in favor of emerging economies.

Since 2008-2009 leading multinational firms have been experimenting with their business models in order to move from a philanthropic vision of sustainability, where economic objectives are separated from social and environmental ones, to more integrated strategies (Pies, Beckmann, & Hielscher, 2010; Ciravegna, 2012). The lack of links between the business model and strategy of a firm and its sustainability initiatives entails the latter risk becoming little more than marketing exercises aimed at improving corporate image, which raises a doubt with regards to the utility of having self-standing "Corporate Social Responsibility" (CSR) divisions and managers (Rattalino, 2014). If true impact on stakeholders is limited, CSR activities risk further alienating the stakeholders that firms intends to benefit, which are likely, in the medium and long term, to realize the gap between declared objectives and outcomes. In contrast to this, firms that do integrate their sustainability activities in their business model and core strategy formulation can truly have an impact, thereby ensuring that their investments are not pure philanthropy or marketing, but part of a new way of doing business, whereby cooperation and synergies lead to superior value creation (Porter and Kramer, 2011).

Nowadays sustainable strategies and business ethic are becoming pivotal in determining the success or failure of an organization (Jamali, 2008). They affect a company's reputation and help to define a business model that will thrive even in adversity (Amit & Zott, 2012). Many leading companies realize that an innovative sustainability strategy, aligned with goals and resources, delivers a competitive edge (Berns, Townend, Khayat, Balagopal, Reeves, Hopkins, & Kruschwitz, 2009). This competitive edge allows these companies to increase their profits and take advantage of opportunities in new markets (Khavul & Bruton, 2010).

Corporate managers are concluding that sustainability initiatives help cut costs and save money, particularly in environmental programs; drive innovation of new products and business models; and help to future-proof overall corporate strategy (Barton and Wiseman, 2014). Sustainability demands a broad view of issues and impacts, as well as a working understanding of what the company does and

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

how (Nidumolu, Prahalad, & Rangaswami, 2009). However, not considering the most advanced companies, a great portion of business organizations seem not to have the experience and expertise required to quickly and effectively develop frameworks to overcome the conflicts that naturally emerge among economic, social and environmental objectives - the so-called triple bottom line (Elkington, 1994). As a confirmation, the difficulty of implementation is mentioned by 49% of CEOs from United Nation's survey stating "complexity of implementation across functions as the most significant barrier to implementing an integrated companywide approach to sustainability" (Lacy et al., 2010).

Together with the difficulty of implementation, comes the need to overcome the old way of assessing corporate performance (profit as the only credo) and to find a new framework that can allow managers to clearly measure corporate performance along all the three relevant dimensions of sustainability. "CEOs believe that the new era of sustainability will bring with it a new way of assessing corporate performance. This will be characterized by a shift away from focusing solely on financial profit and loss to a broader, long term understanding of value creation that acknowledges every business action has an impact on society and the environment" (Lacy et al., 2010). The CEO of Alcatel-Lucent said that "We need more from business than just profit", while another CEO said that "A truly socially responsible company will not only have to serve shareholder and analysts but all stakeholders and society more widely" (Lacy et al., 2010).

SUSTAINABILITY THROUGHOUT HISTORY

The topic of exploitation of the environment by humans isn't new, it can be said that it is as old as the world itself, but only during the first industrial revolution did it reach paroxystic levels. In 1792 William Blake wrote "London", in which he described a society vituperated by social problems such as pollution, child labor, and abuse of women. Over 200 years later, child labor has not been eradicated, pollution has increased exponentially and women haven't achieved de facto equality with men, at least in the business world.

For a long time sustainability was not a major concern and only came back in vogue in 1972 when Meadows et al. published the book "*The Limits to Growth*", a research commissioned by the Club of Rome to the Massachusetts Institute of Technology (MIT) based on a system dynamics computer model to simulate the interactions of five global economic subsystems such as population, food production, industrial production, pollution and consumption of non-renewable natural resources. Essentially, the message that came across from The Limits to Growth modeling was that continued growth in the global economy would certainly lead to the exceeding of planetary limits at some point in the 21st century, resulting in the collapse of the population and economic system. However, according to the Club of Rome, that collapse could be avoided with a combination of early changes in behavior, policy and technology. The results of this study have been supported by the following researches based on data covering the period between 1970 and 2000 (Turner, 2008).

Today any attempt to define sustainability must start from the one given in the report compiled by the Brundtland Commission in 1987, which stated: "Sustainable development is development that meets the needs of the present without compromising the ability of future generations to meet their own needs". It contains within it two key concepts (Turner, 2008):

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

- The concept of 'needs', in particular the essential needs of the world's poor, the so-called base of the pyramid;
- The limits imposed by technology and social organization on the environment's ability to meet present and future needs.

Besides the above definition, sustainability in business terms is very often referred to as the "triple bottom line", a definition first coined in 1994 by John Elkington. His argument was that companies should be preparing three different and separate accounts, thus bottom lines. The first is the traditional measure of corporate profit - the "bottom line" of the profit and loss account. The second is the bottom line of a company's "people account" - a measure of how socially responsible an organization has been in its operations. The third is the bottom line of the company's "planet" account - a measure of how environmentally responsible it has been. It can be said the triple bottom line (TBL) consists of three Ps: Profit, People and Planet. It aims to measure the financial, social and environmental performance of the corporation over a period of time, in order to take into account the full cost involved in doing business.

Although it may be true that there is a general consensus regarding the topic of sustainability, this is not the case when it comes to understanding how to pursue it (and measure it). In fact, since the definition of sustainable development was first posed there has been an ongoing debate about the right way to realize the claim for "inter- and intra-generational fairness" (Brundtland, 1987). There have been many attempts to operationalize this rather elusive goal, but without doubt the preservation of the ecological system played, and still plays, a major role (Daly, 1996).

Politicians tried all kinds of environmental policy instruments, ranging from regulations and international agreements over taxes or transferable permits to subsidies that might help guide the economy to a more sustainable path. However, many of the actual attempts, like the European CO_2 trading scheme, did not achieve the predicted and desired results. One obvious reason may be a flawed implementation of the environmental policy, but not all shortfalls can be explained thereby. A far neglected issue may be the reliance on theoretical predictions of the instrument´s effects which are just not correct. This inadequacy of prediction results primarily from the underestimated complexity of the ecological and the economic system as well as the connection between the two.

Pursuing sustainability means facing the great challenge of transforming the systemic problems that afflict capitalism into real opportunities, and thus guaranteeing a sustainable growth to humankind. Business organizations should have taken this paradigm shift upon themselves, but apart from a few isolated cases, the declarations of intent were not followed up by concrete action. That is why almost all governments in the world (with various levels of enthusiasm and energy) have tried to address the problem and set rules to make businesses more sustainable. Up to now these ventures have not encountered much success, particularly because they are often perceived by the companies as outside interference, aimed more at undermining their global competitiveness than strengthening their competitive advantage. But in recent years consumer concerns and employee interests have changed drastically, forcing companies to put sustainability on the top of their list of priorities: "business leaders face a choice: they can reform the system, or watch as the government exerts control" (Barton, 2011).

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

SUSTAINABILITY AS A BUSINESS OPPORTUNITY

Until recently the concept of sustainability has been aimed at meeting citizens' needs rather than those of the business world. In particular, sustainability is seen as the right to live in a clean world and the duty to preserve it for future generations. But that is not how business organizations should look at the problem: "managers can no longer afford to ignore sustainability as a central factor in their companies' long term competitiveness" (Lubin & Esty, 2010). Companies that fail to acknowledge this will end up losing both competitiveness and market position. There are two main reasons for this: firstly, the forthcoming depletion of natural resources is a fact, therefore finding different supplies for business means beating competition in the race to grab those scarce and expensive resources; secondly, sustainability simply means extending a strategy's time horizon, and anticipating competitors through continuous innovation that, by definition, must represent a benefit.

A study by Goldman Sachs in 2007 clearly shows that 72% of companies committed to overcoming environmental, social and governance issues outperformed their peers over the same period (Ling et al., 2007). A similar study carried out by MIT Sloan Management Review and The Boston consulting Group five years later clearly confirm that sustainability is paying off for a growing number of companies and generates sustainable competitive advantage firmly rooted on innovation (Kiron, D. et al, 2013). It is not a coincidence, in fact, that there are many success stories of companies that benefitted from the implementation of policies for sustainability.

In 2012 3M, for example, declared that its program for the reduction of pollution helped the company to save about 1.4 billion dollars in 35 years, as well as avoiding the emission of 1.5 million tons of gas, mostly generated by solvents and paper waste (3M, 2012). It would have been interesting to know what their competitors thought at the time they implemented the program in 1975, and what they think of these figures today. Another example comes from Singapore. Although it had obtained its independence from Malaysia, Singapore had not solved one of its biggest problems: its totally unsustainable need to get water piped from Malaysia. Hyflux had developed water treatment programs and after having helped Singapore to sort out its water scarcity problem, went public and became a big international company (Grayson et al., 2008).

The growing concerns regarding sustainability are influencing workers in their choice of employers, who now take into serious consideration the reputation of the company when seeking employment. The importance of human capital in today's economy accentuates this trend and obliges companies to implement necessary changes so as to avoid losing the best resources on the market (Grayson et al., 2008).

Given that sustainability is a central factor for the success of businesses, which elements have hindered its spread? There are two main reasons for which CEOs have had a hard time putting this issue at the center of their strategies:

- **Market Impatience:** All too often the attention of managers is on areas of business that directly concern stock value, especially in the short and medium term. Although focusing solely on the shareholder value is a very important aspect, today it isn't enough anymore, as it overlooks a series of problems and opportunities (Grayson et al., 2008). Unfortunately though stock analysts do not rate positively companies that do not optimize their immediate profits, and for this reason the attention of top managers is strongly focused on short-term profits. Consequently attempts at innovation in the long term are simply put aside because they do not help generate short term profits (Di Giuli & Kostovetsky, 2014).

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

- **Difficulty of Implementation:** Businesses can reap the benefit of sustainability only with real innovation in management practices, business models and market infrastructure. As Dana Bena, PepsiCo's senior director of sustainable development, says: "These are clearly within the bull's-eye of sustainable development (Kiron, D. et al., 2013). Of course real innovation is difficult to achieve and implement and the complexity is also increased by the fact that "sustainability will touch every function, every business line and every employee" (Lubin & Esty, 2010).

Short-term focus and difficulty of implementation are the main obstacles to the implementation of sustainability. However some frameworks and practices can be used to translate sustainability into economic terms so that companies and stock analysts can better understand the strategic components of sustainability and overcome the obstacles mentioned.

A FRAMEWORK FOR INTERPRETING THE VALUE OF SUSTAINABILITY

In 2003 Hart and Milstein developed a model for the analysis of value creation for shareholders that put together two important factors that define sustainability:

1. **Time:** The vertical axis captures the need to achieve short term results while working on the generation of future results. It can be seen as an attempt to overcome short-termism, although the short term is still taken into account.
2. **Focus:** The horizontal axis captures the need to protect internal capabilities while infusing the firm with new perspectives and knowledge from the outside.

These two dimensions create a matrix of four quadrants: cost and risk reduction in the internal and short-term perspective; reputation and legitimacy in the external and short-term perspective, innovation and repositioning in the external and long-term perspective, and finally growth path and trajectory in the external and long-term perspective (Figure 1).

Cost and Risk Reduction

The objective of cost reduction can be summarized with: "more output with less input". This could be done through the reengineering of processes in order to eliminate waste, especially in terms of both material and energy consumption. Today there are already valid techniques that can be used, such as the adoption of standards such as ISO 14000 and other environmental management systems that guide companies in this process review.

Ideally these management skills should be developed internally: waste reduction is not a one-off project, but rather a continuous process of improvement that evolves while technology and waste management knowledge evolve.

No waste means less input, which means cost reduction and therefore higher profits: this is something that increases shareholder value immediately. Pressed by public opinion, governments have raised the bar regarding the environment. Companies that do not quickly adapt to the new standards run the risk of being penalized in the near future. Furthermore, the elimination of energy waste means reducing the

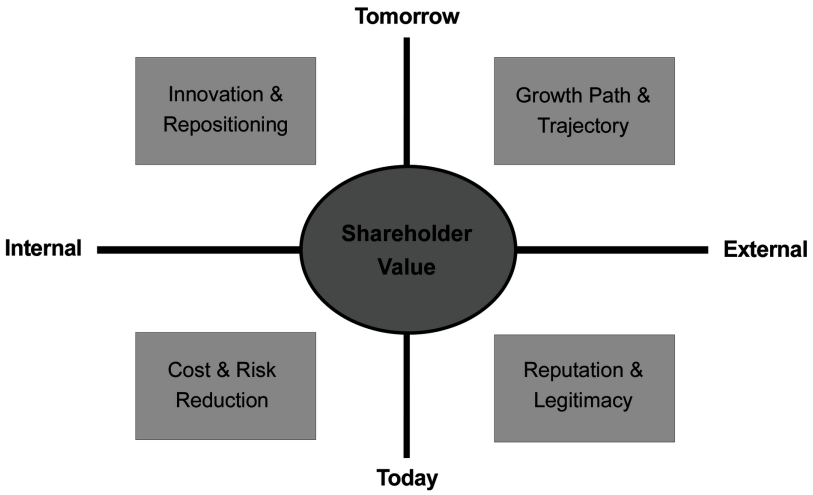
Figure 1. Key dimensions of shareholder value
Source: Hart & Milstein, 2003.



impact of an increase in the price of energy, if not eliminating it completely if new energy sources are renewable and therefore not scarce.

Reputation and Legitimacy

Direct stakeholders (such as consumers, employees, regulators and shareholders) are not the only ones who companies have responsibilities toward; in fact informal stakeholders (communities, citizens, non-profit organizations, etc.) cannot be ignored. In general it is not enough for companies to respect their contractual obligations, but they must also take into serious consideration other implicit responsibilities that arise from customer expectations, working standards, and so on. These informal obligations have practically become more stringent than formal ones, because ignoring them could seriously damage the company's reputation and consequently its activity. At the end of the 1990s Nike faced a serious negative impact on its business because of the scandal regarding the exploitation of child labor by subcontractors in Cambodia and Pakistan (Klein, 1999). Furthermore, these implicit responsibilities are more difficult to define because they tend to evolve over time. For instance, until a few years ago it would have been difficult to imagine tobacco companies being held responsible for the health of smokers, but today they are widely being accused of aggressively commercializing products that create a dependency. (Bonini et al., 2006).

In this context the protection and strengthening of the company's reputation has become an important issue. This can be done by extensively engaging all stakeholders, both formal and informal, and increasing their awareness of the company's intentions and activities in order for business organizations to increase confidence in what they are doing and will do, and resolving potential conflicts with stakeholders from the very beginning. This process is called "product stewardship" (responsible product management).

By becoming more "social" and "green", companies can even appeal to a larger number of potential customers who are sensitive to those issues or at least avoid the risk of losing some of them. In fact, consumers who are sensitive to the sustainability of products and services they buy represent a consid-

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

erable slice of the market today (more than 30% in four of the world's ten biggest economies) and are likely to increase in number in the future (Grayson et al., 2008).

It's vital therefore to concentrate on the stewardship of existing products and services, thereby generating a positive impact both on their current value and on potential benefits for future company performance.

Innovation and Repositioning

Sustainability is a megatrend, just like Information Technology (IT) in the 1980s. At that time many firms did not realize the importance and the revolutionary change that IT was bringing into industry and were swept aside as a result. If today sustainability is still just an option, tomorrow it will certainly be an essential factor in leading and competing in business (Lubin & Esty, 2010). For this reason business organizations should reposition their strategy on the axis of sustainability and heavily invest in overcoming the core technology of their own businesses, even if this can totally disrupt the technology upon which their own businesses are currently based. One can consider, for example, how hybrid traction technology will change the car industry. Breaking the technological paradigm of an entire industry today will mean becoming the leaders of that industry tomorrow. The drawback of this repositioning is that big investments can take many years to pay dividends. Companies must understand that not investing in that sector could really mean risking their businesses when their competitors prove to have made progress in that direction.

Growth Path and Trajectory

As every entrepreneur knows, a market characterized by very little competition is preferable to one where competition is fierce. However, most companies insist on the same target customers: basically the one seventh of the world's population that lives in rich countries. To embrace a more inclusive model of capitalism that can finally satisfy the needs of the so-called "base of the pyramid" is the challenge that companies must face when they think of their own future growth. Companies that will find a way to unlock the potential of the less exploited markets will surely be able to capitalize on them.

Some surveys have shown that the reason most companies are not interested in these markets is because they often have an outdated or incorrect view of them. However, companies that invest the necessary time in studying the potential of these markets manage to create successful new products or services. Let's consider the cases of Grameen Bank or Hindustan Unilever in which banking services in the first case and personal hygiene products in the second were strongly innovated to satisfy the needs of the rural populations of Bangladesh and India.

The main hurdle here is to find the time to study these markets and take into account that some experiments can lead to failure. However, even if a small fraction of the number of experiments attempted report success, the investment will have been worthwhile.

Companies should also explore what small local firms and NGOs are promoting, because sometimes they have valuable business ideas but do not possess the necessary expertise and financial power to develop those ideas in full.

The challenge of sustainability is complex, multidimensional and of increasing relevance, but the model presented shows that it is possible to pursue economic, social and environmental objectives simultaneously. This can happen in the short term through waste reduction that also produces economic savings and therefore an increase in marginal profits and more care for the environment.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

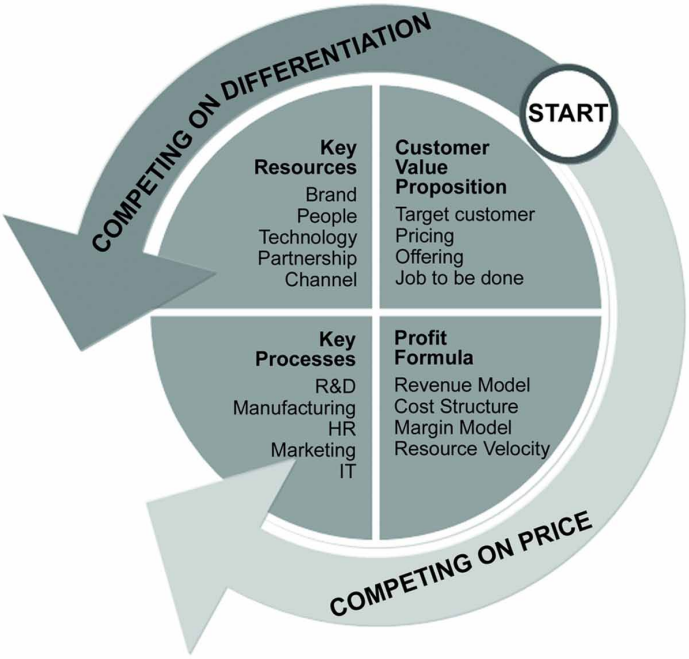
In the longer term the situation can be more complicated but is certainly achievable through innovation and repositioning, which means rethinking the business and technology upon which that business is based. Sustainability is a potential competitive advantage for the company, which, through the identification of an alternative path, can reach important strategic objectives.

SUSTAINABILITY-DRIVEN INNOVATION

The real business world provides many examples of business organizations (3M, Nike, SAP, UPS, PepsiCo, Mondelez International, and Patagonia just to mention a few) that reached important results thanks to policies of sustainability that they had launched years before (Kiron, D. et al., 2013). The idea therefore that economic objectives and sustainability must be in conflict with one another is proven wrong by the facts. Those companies found in sustainability-driven innovation the key to translate sustainability into economic terms and overcame the above mentioned obstacles. In order to really implement sustainability-driven innovation companies must follow the following five practices:

1. **Change Business Model:** Business model innovation is key to success because it addresses customer value proposition (CVP), profit formula, key processes and key resources. Changes to the current way of doing business must translate into a new business model; only in this way can the sustainability-driven innovation be disruptive (Johnson, Christensen & Kagermann, 2008). As shown in Figure 2, in developing a new business model, organizations must always start devising a new CVP. Then, when designing business models made to compete on differentiation, they must look first at the resources and processes needed to deliver the CVP, whose costs determine the

Figure 2. Key elements of a successful business model
Source: Eyring, Johnson & Nair, 2011.



EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

price required in the profit formula. On the contrary, when designing business models made to compete on price, organizations must proceed in the opposite way, establishing first the offering's price, then the cost structure and finally the resource required (Eyring, Johnson & Nair, 2011). According to Kiron, D. et al. (2013), companies that pursue sustainability-driven innovation across their business models by changing some key elements of their business model are the ones that report profit directly linked from their sustainability efforts (up to 59% of the companies inquired by MIT SMR and BCG). As such, being prepared to change the business model is the first key step toward sustainability.

2. **Secure Top Management Sponsorship:** Sustainability should never be a standalone effort as it gets its highest traction only if it is on the agenda of the top management. Executives must make sustainability a common and shared effort by setting goals that are tied to strategy. If this is done, the odds that sustainability translates into added profit goes from 38% to 61% (Kiron, D. et al., 2013).
3. **Measure and Track Sustainability Performance:** Translating sustainable into strategic goals and securing top management sponsorship is not enough if no measurement systems are put in place (Porter et al. 2012). Sustainability does not need just a new attitude and a shift in culture, but also a strategic approach based on real data in order to control results and modify their course if necessary. Even if it's difficult to put into practice, an integrated monitoring system is necessary as it makes use of all the advantages of a sustainable strategy. Companies that commit to create a clear business case for sustainability are almost 200% more likely to profit form it (Kiron, D. et al., 2013).
4. **Understand Customers' Willingness to Pay for Sustainable Products or Services:** According to several field studies, socially responsible products command an average premium of 17.3% to 60% when potential customers are interviewed as to what premium they are willing to pay (Tully & Winer, 2013). Although very encouraging, these statistical figures can be misleading and do not apply in the same way in different industries. For this reason it is important to always create a business case for sustainability projects or sustainable products, to make sure that the right target and customer needs are addressed. By doing this most companies learn that if the targeting is done properly, they can even broaden their range of market and customer needs.
5. **Effectively Collaborate With Stakeholders:** Natural resources provide enormous value to both business and society. However, much of that value is being destroyed through the suboptimal ways in which companies and other stakeholders use these complex and fragile systems. Governments, political organizations and above all NGOs can effectively cooperate with businesses helping them to frame their sustainability agenda. This is a good opportunity to get closer to customers and co-create with them new sustainable products or services and gain a unique competitive advantage (Gouillart, 2014).

THE PATAGONIA CASE[1]

The Company

In the mid-50s, Yvon Chouinard, a climbing fan from Burbank, California, installed a second-hand carbon fuelled forge in his parents' garage, and started producing pitons in ultra-resistant steel, thereby

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

creating a product that was decidedly superior to any in commerce at that time. Since he did not have a proper shop, he started to sell his products to enthusiasts from the boot of his car. The success of these pitons brought about the founding in 1957 of Chouinard Equipment for Alpinists Inc., which in a very short time became an icon in the field. Over time Chouinard Equipment continued to bring out innovative products, such as climbing irons and picks, and the book "Climbing Ice" consecrated this modern climbing discipline.

In 1970, Chouinard understood that although the pitons were extremely useful to the aficionados of this sport, they also damaged Yosemite's rock walls. Therefore, although this product represented 70 percent of his company's profits, Chouinard decided to develop an innovative product that could substitute for the traditional climbing pitons. Within two years, the company had developed new equipment that left no marks on the rock, and that embodied the "*clean climbing*" style that was spreading in those years.

At the end of the 80s, Chouinard Equipment for Alpinists Inc. became the object of many lawsuits, not because its climbing equipment was faulty, but because of the improper use of climbing ropes in rope-pulling competitions. Requests for compensation were so high that the company was obliged to declare bankruptcy. Yvon Chouinard therefore decided to dedicate all his energies to another of his business activities: Patagonia.

Patagonia, From 1972

In 1972, during the boom of the outdoors industry, Yvon Chouinard and his wife Malinda decided to start another company that produced resistant technical garments: they would call it Patagonia.

Yvon chose this name because of its simplicity of pronunciation in many languages and because it brought to mind "romantic visions of glaciers tumbling into fjords, jagged windswept peaks, gauchos and condors". True to the previous experience, Patagonia would produce practical and highly resistant nature-friendly materials.

In the Seventies, most mountain wear was made by layering wool and cotton fabric that could absorb humidity. Patagonia started to make use of a synthetic fiber like fleece, an isolating fabric, and polypropylene, which weighed very little and did not absorb water. Thanks to numerous experiments, Patagonia became a pioneer in the concept of layering: its catalogues explained how wearing various types of garments in a specific order would guarantee both excellent insulation and moisture discharge.

Patagonia continued to innovate and took a huge risk when, in 1985, it decided to replace fleece and polypropylene, which represented once again seventy per cent of the company's income, with "Synchilla" fleece and "Capilene" polyester. These highly technical products beat the competition and became a blockbuster making Patagonia a household name throughout the United States and not merely a niche company.

The company did not stop at this success, but continued to amaze the market with a nonconformist move. The competition manufactured outdoor products in classical colors such as brown, forest green and rust, so Patagonia decided to use bright colors for its products. This was a move that would floor the competition.

Things seemed to go well. At the end of the 1980s, the company boasted a growth trend of between 30 and 40 percent year on year. Convinced that they would carry on having so much success, the company hired eight product managers, about a hundred employees, and created a very ambitious development plan.

Then one year the growth in sales was "only" 20 percent. This brought distributors to believe that Patagonia had lost some of its customer appeal and, afraid of ending up with a lot of unsold stock, they

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

cancelled all their orders. At the same time the company's main investor was obliged to reduce credit lines for economic reasons and all of this in turn obliged Chouinard to reconsider his plans. In July 1991, the company fired twenty percent of its workers. Patagonia was a victim of its own success.

Two years later, in 1993, the company brought out *ecofriendly* Synchilla jackets that were made using recycled plastic bottles. It was once again an immediate success.

In 1994 the founder Yvon Chouinard commissioned an independent study to research the environmental impact of Patagonia's products. The study surprisingly revealed that the cotton used by the company was responsible for heavy pollution, as it required the use of big doses of insecticides and pesticides. So Chouinard decided to replace traditional cotton with a new type of *organic* cotton that, during the growing, harvesting and transformation stages, did not require the use of synthetic chemical products, but only natural products.

Although the new type of cotton cost 50% more than the traditional kind, the founder of Patagonia accepted the challenge and proposed a new standard of reference. After a few years, many other companies would convert to organic cotton, thereby setting off a price reduction. Once more, Chouinard had been right.

Patagonia Today

Today the company sells a wide range of products for men and women, from jackets to jumpers, t-shirts, trousers, footwear and many other technical products for all kinds of "silent human-powered sports done in nature" such as skiing, hang-gliding, surfing, climbing and fishing. The company has a host of athletes representing its products for all of these sports. In 2012, Patagonia owned about 23 companies in the United States, 15 in Europe and Japan and boasted a turnover of about 500 million dollars, almost the double of the turnover recorded five years before. In 2013, after the "buy less" campaign (see below) the company sales grew to 575 million dollars.

Corporate Social Responsibility

Patagonia, in addition to being known for its innovative nature and its commercial success, is famous for being one of the most socially responsible companies in the United States and is also among Fortune's "*100 Best Companies to Work for*". What's their secret? It's simple. Patagonia truly believes in Corporate Social Responsibility and uses it as a compass to guide it in defining its strategy, to the point that its mission statement is: "Build the best product, cause no unnecessary harm, use business to inspire and implement solutions to the environmental crisis".

Here is an incomplete list of the policies of sustainability adopted by the company:

- **Product Design and Quality:** Patagonia's mission, "Build the best product", clearly expresses the company philosophy. This product culture was already present in Chouinard's first company, Equipment Inc., and was further developed in Patagonia. In contrast to the fashion world, where design takes place starting from the fabric, in Patagonia the function of a product defines its design and fabric, that's why it's called industrial design (Esposito, 2009).

The characteristic that allowed the company to reach these levels of *social responsibility* is the care taken in its choice of materials: plastic, bamboo, organic cotton permitted an improvement in the qual-

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

ity of the product, the respect of the highest standards in environmental policy and has had enormous success among the public. The product's durability, for example, has improved customer satisfaction, because the equipment can be used for a lot longer, thereby reducing waste. The more versatile the product, the fewer the customers who will look for other clothes for different purposes, so the simplicity of design adopted by Patagonia allows for an item of clothing that can be worn in a variety of situations. The company's designers believe that the consumer is all too often induced to choose among a variety of products and that a multipurpose product can reduce the stress of having to choose. Furthermore, differentiating products bears directly on production costs as additional costs for energy, design, stock, catalogues etc. would be necessary.

Apple too has chosen this strategy; it makes only two series of laptops, divided into two categories and only one line of smartphones.

Furthermore Patagonia offers a complete guarantee on its products that can be repaired, through the "ironclad" initiative, at reasonable prices with an obvious benefit to both customers and the environment.

- **Recycled Products:** In 1993, Patagonia was the first company to market clothing made by recycling plastic bottles. Ten years later, the company went even further, providing incentives to its clients to return old "Capilene" clothes to shops. One of Patagonia's Japanese partner companies developed a process that was able to recycle polyester an infinite number of times, with an energy savings of about 75%. The company has always limited its use of paper, by substituting paper catalogues with electronic ones, and where impossible to do so, by using only recycled paper.
- **Non-Conventional Answers:** In 1994 Patagonia, following an independent study on the environmental impact of its products, discovered that the cotton being used was responsible for significant damage to the environment because of the use of pesticides, insecticides and defoliants. One need only consider that 10 percent of chemical products for agriculture is used for the cultivation of cotton. Chouinard was not discouraged by the fact that organic cotton cost 50 percent more and was produced in limited quantities. For him it was simply unacceptable to continue to produce in the traditional way and put aside his beliefs. He therefore decided that all the production of cotton garments would be 100% organic or he would stop production. This was a very risky move for him to make, as organic cotton was more expensive, was more difficult to find, and because traditional cotton products guaranteed Patagonia 20 percent of its turnover. Furthermore, in the beginning cotton suppliers were not enthusiastic about the change and tried to prevent it.

To compensate the increase in cost of the raw material, strategies for the rationalization of product lines and prices were adopted: profit margins were lowered and the final sales price was increased, leaving the distributor's margin basically unaltered.

The most incredible aspect of this story is that such a simple albeit risky decision had enormous impact on the company. Patagonia registered a 25 percent increase in sales thanks to this differentiation and contributed to the success of the entire organic cotton industry in California. In fact, today, other companies are also turning to organic cotton producers. In 2006 Wal-Mart, for example, was the biggest buyer in the world. The increase in demand for this type of raw material caused a reduction in prices, confirming once more the wisdom of Chouinard's choice (Esposito, 2009).

- **Unconventional Marketing:** In 2011 Patagonia launched the "Buy less" campaign, in order to lower the environmental strain from ever-growing consumption levels (Stevenson, 2012). To put

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

this idea into action, they partnered with eBay to enable consumers to resell their used Patagonia apparel via the Common Threads Initiative within eBay. Consumers will also be able to resell their used Patagonia apparel on a new Used Clothing & Gear section on Patagonia's website. With this initiative the company wants to influence consumer buying behavior as part of its corporate mission. It also makes consumers super loyal to its brand though as illustrated by the fact that despite the "buy less" campaign sales went up thanks to three tactics (Lowitt, 2011, October 3):

- **Increase Prices:** Behind the Patagonia's message is that consumers should buy high-quality apparel that will last a very long time. It makes sense that such apparel would command a premium price relative to lower quality substitutes.
- **Sell More New Apparel:** This campaign increased sales volume from two types of customers: the one who make decisions based on sustainability considerations and the one who can now sell their used Patagonia apparel for cash to buy new apparel. Indeed, John Donahue, the CEO of Patagonia's new business partner, eBay, suggested this might be possible: "Patagonia is extending its customer base and increasing it. People who are selling it are likely to turn around, take the money they got, and buy the new Patagonia products."
- **Expand into New Categories:** Finally Patagonia is expanding its customers looking "upstream" (i.e., suppliers) by recycle clothing that has been too worn to be resold and then sells the used materials back to its upstream suppliers at a lower price than comparable virgin materials.

This unconventional marketing approach it is only likely to work among companies with a long-term orientation (Patagonia is privately held), a long-standing commitment to sustainability, and high-quality products.

- **Green Building:** Patagonia created offices and production centers in its own image. Recycled materials were used for their construction with elements such as plastic for the bathroom fittings and polyester for the floors. The use of sensors for energy saving and other innovative solutions doubtlessly increased building costs, but they also helped improve the image of the company and energy savings. In 1998, Patagonia was the first big company in California to obtain all its energy from renewable sources.
- **Care for Its Employees:** Yvon Chouinard believes that "work has to be fun". At company headquarters employees are organized in a very horizontal structure. Working conditions are excellent and employees are strongly motivated. That's why Patagonia was rewarded for being one of the best employers by Fortune magazine. Chouinard allows employees to have flexible working hours.

One example is the "Let my people go surfing" policy that allows employees to do their favorite sports like skiing or surfing, and then have a shower and go back to work. This flexibility has noticeably improved the quality of the work and has strengthened the relationship with management (Esposito, 2009).

- **Benefits for Employees:** Over and above the flexible hours, Patagonia offers its employees health insurance and other interesting benefits. The opportunity to eat a meal or have a coffee at the company's café encourages the development of personal relationships that improve teamwork. A nursery school for new mothers, the defense of motherhood and the opportunity to have personal

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

time off are all benefits included in company policy and strengthen that sense of belonging to Patagonia that can be found in very few other companies.

- **Environmental Internships Program:** Since 1993, Patagonia has encouraged employees to leave their jobs for a couple of months to work in an environmental association of their choice. During this period they are paid by the company and they work for the association for free. The employees who have had the opportunity to live this experience strengthen company culture with their positive input, share their ideas with their colleagues and motivate the whole structure.
- **One Percent for the Planet Alliance:** Patagonia and its founder are well aware that acting alone does not produce significant change in the world. This is why they have created this alliance along with the owner of Blue Ribbon Flies. Their mission is to create a healthier world, by giving at least 1% of its profits to environmentalist organizations all over the world.

The members of the organization give their contribution directly to the organization of their choice, thereby reducing bureaucracy and encouraging transparency and a direct relationship between donor and beneficiary. Today the alliance includes about 700 companies from various industries.

- **The Footprint Chronicles:** Launched at the end of 2007, this online feature reveals how the manufacturing and delivery of Patagonia's products affect the environment. A visitor to the site can click on any product and track its environmental and social impact along its path to the store. Although the Footprint Chronicles have demonstrated that some Patagonia products have negative environmental impacts that are nearly impossible to upend, the company's presentation of fact rather than message has helped establish it as an honest, trustworthy company.
- **The Founder:** Yvon Chouinard is the promoter of the change that has molded the company from the beginning. The founder is a staunch environmentalist, he has established mutual respect between himself and his employees and he makes use of modern management techniques. When he decided to abandon the use of traditional cotton and changed to the use of organic, he took an enormous risk, but this man never hesitated to take responsibility for his choice and take the leap, which turned out to be a successful move (Esposito, 2009).

What really makes the difference are Chouinard's ideals. He pursues objectives he believes to be right and is prepared to take personal risks. To produce colorful jackets may seem trivial, but it was a risky choice at that time, when the most daring color was rust.

TOWARDS A NEW CAPITALIST MODEL

Throughout its history, Patagonia reached extraordinary goals both in economic and in social terms. In the early 1950s Yvon Chouinard started to make his first products in his parents' small garage. The first sales counter was his car which was more than just a symbol of America at that time. A sharp sense of business and a sincere concern for the environment led him to keep on innovating and create new products. Most companies limit themselves to adapting to changes in the macroeconomic framework and nothing more. They change company practices, behavior policies and business models simply to make room for changes imposed on them from the outside. Instead Chouinard revolutionized his field without even knowing it. He was the first to produce climbing equipment that protected the natural and

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

artistic heritage of his beloved mountains. This permitted him to differentiate from the competition and become a product leader in that market. Was it just good luck? Maybe. Is he just an entrepreneur with a lot of business savvy? No. In fact, the feature that allowed the creator of Patagonia to achieve all of this was the ability to believe in his ideals and take a personal risk to put them into practice. When he learned about the collateral damage caused by traditional cotton farming he could not let it go. He just had to do something, so he called all of his cotton suppliers and other stakeholders of the cotton supply chain, and explained his problem. It would have been interesting to see their faces. A Californian visionary with a penchant for technical equipment was telling them, cotton farmers for generations, that they were wrong. The cotton farmed using their methods was responsible for 10 percent of all chemical products used in the food farming industry. It's easy to imagine the answers they gave him. Chouinard, however, did not lose faith and accepted tougher economic conditions, for the sake of doing what he believed in: he would only buy organic cotton.

A few decades later and we know find corporate giants like Wal-Mart are buying organic cotton. The whole Californian cotton industry has completely modified its *modus operandi*. Patagonia accepted a 50 percent price increase to have the new type of cotton and bring its project to life, it rationalized production, accepted a reduction in profit margins and increased sales prices to the end customer. How many companies would have been able to do the same? Very few. Actually, in the last few years the capitalist system has been held responsible for the main causes of social, environmental and economic problems. The economic crisis that started in 2008 has contributed to the idea that multinational companies are thriving at the expense of the community.

The appearance on the scene of social responsibility policies has not promoted the long-awaited change. On the contrary, the more companies have started taking responsibility for social issues, the more they have been accused of lacking it by society. This lack of faith in companies has induced governments to adopt policies that jeopardize competition and suffocate growth.

Companies find themselves victims of a concept of value creation inspired by the illuminist economic model, in which an "invisible hand" regulates rational and opportunistic relationships between so-called "homines economici". (Un)fortunately economic transactions are never purely rational, but rather also emotional and based on information asymmetry. The "invisible hand" that regulates the market cannot manage such a complex and interconnected system such as the global economy. By continuing to see "value" from a limited perspective and by optimizing short-term financial performance it is easy to forget customers' essential needs and ignore factors of a wider scope that determine their success in the long term (Porter & Kramer, 2011).

Some choices, that find their logic in the short term, may turn out to be very bad investments for a company. Is the decision to move production to countries where salaries are lower a good one? Will not paying debts to suppliers and leaving them in dire economic straits, really improve company performance in the long term? Does exposing unwitting clients to enormous financial risk really help create value?

In the Anglo-Saxon world the creation of value for the shareholder has always been the axis around which the whole decision process of the company revolves. The problem arises when company policy is unable to protect even the shareholders. Should the short term performance of a share satisfy the value investors, the pension funds or the traders?

These are times of low economic growth, high unemployment and low tolerance for corporate greed. People no longer accept the traditional view that business' sole purpose is to make money. The time is due for a new capitalist model to emerge in which companies make an effort to reconcile economic success and social progress. For many decades leading companies and intellectual leaders have been

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

discussing what model to adopt to prevent opportunistic behaviors and give western industry back its edge. Although some progress has been made most companies remain tied to a "social responsibility" mentality in which social problems are not the center of strategic decisions but rather an afterthought. Rosabeth Moss Kanter (2011) suggests that by employing institutional logic – the idea that companies are more than just money-generating machines and hold the power to contribute to the greater good of society – companies can thrive despite today's changes and challenges. There are six ways in which great companies get ahead by using institutional logic:

- **A Common Purpose:** Holding purpose and values at the core of an organization's identity.
- **A Long-Term Focus:** A willingness to make short-term financial sacrifices for the sake of long-term perspective.
- **Emotional Engagement:** Influencing positive emotions to stimulate motivation.
- **Partnering with the Public:** Crossing borders for both new business opportunities and to address public concerns.
- **Innovation:** Committing to community projects without seeking immediate returns.
- **Self-Organization:** Trusting employees to make their own choices.

Dependent upon each other, the above principles work together in building institutions that, according to Kanter, "can restore confidence in business and will change the world in which we live."

Yvon Chouinard adopted, consciously or unconsciously, all the above principles, and made Patagonia a successful company. Was he alone? Fortunately not: Mahindra Group, PepsiCo, Banco Real (Brazil), Novartis, IBM, Shinhan Bank (South Korea), P&G and Cemex are some of the other companies that successfully employed an institutional logic.

The institutional view of the firm is fascinating and somehow revolutionary, since it seems to be able to reconcile the tradeoff between maximizing profits, saving the planet and doing good for society. However it is only when a company systematically creates economic value in ways that allow the creation of value for society too, by catering to its needs and solving its problems, that it can be sure that the institutional logic becomes the new capitalist model, which is grounded on the so called "shared value" (Porter & Kramer, 2011).

SHARED VALUE

For too long, companies and society have been seen as two opposing forces. Hosts of economists, on the other hand, have legitimized and spread the idea that to supply benefits to society, companies would have to limit their economic success. Up to now the growth trend of advanced economies has permitted the business and financial world to take the social context in which they operate for granted. It passively accepted the costs and viewed the standards and the program of corporate social responsibility as against its interests.

Social responsibility programs, generated as a reaction to the pressure of public opinion, were generally aimed at improving the companies' reputations and are still considered to be little more than a necessary expense. Any further effort is considered by many to be an irresponsible use of financial means at shareholders' disposal.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

The concept of shared value recognizes that it's the needs of society, and not only conventional economic needs that should define the market. It recognizes that environmental damages or social problems often create internal costs for companies, such as waste of energy or raw materials, costly accidents, and the need to re-train employees who are not adequately trained at university. To meet these needs does not necessarily mean to raise costs for firms, as technological evolution, new methods of operation and managerial approaches can improve the company's productivity.

Shared value has nothing to do with personal value or the sharing of value that has already been created by the companies. Rather it means expanding the overall economic endowment of social and economic value. A company's competitiveness and the well-being of the communities surrounding it are closely linked. The company needs a healthy community, not just to create a demand for its products, but also to benefit from assets which are less tangible, but critical for the success of the company (Porter & Kramer, 2011). As for the community, it must favor the development of competitive companies to create jobs and opportunities for the creation of wealth in its territory.

Governments and non-governmental organizations do not always completely understand this interdependence, and quite often they get into harsh conflicts with the business world. Policies aimed at limiting their ability to compete risk being damaging, especially in the current globalized economy, where production facilities, and therefore work, are easily transferable.

Economists like Milton Friedman maintained that business contributes to society by making a profit that generates occupation, salaries, spending, investments and taxes. To do business according to this concept of capitalism meant a sufficient social benefit. The company constituted an independent element, separate from the rest of society and its problems, to the point that if a CEO was pursuing social responsibility he was literally viewed as not acting in the interest of his employers (Friedman, 1970). This perspective, that has permeated economic thought for the last few decades, has induced companies to aim for short term benefits. They concentrated on the attempt of convincing consumers to increase the frequency with which they bought their products. The increase in number of competitors and the pressure from shareholders induced managers to restructure their businesses by reducing personnel and outsourcing production to countries with low labor costs. All of this got the companies into debt, encouraged product standardization, price cutting and a low rate of innovation, which drastically slowed the growth rate.

The communities and territories in which companies that adopt these strategies exist feel that they do not benefit from the companies' profits, but are only exposed to the negative aspects of company risks. This feeling has become stronger in this period of economic recession. The increase in profits has not compensated the high unemployment rate and other problems of the community. On the contrary, on one hand a fierce policy of delocalization and outsourcing has reduced the level of employment in advanced economies, and on the other policies for the offshoring of company profits, has reduced the taxable income, thus the contribution to the public good by the companies.

All of this has distanced the community from the company, especially if the company is multinational, in which it's hard to identify a head-office. This strategy has produced significant improvements in short-term economic indexes, but probably risks jeopardising other important ones and in turn, long-term success.

Strategic theory states that, to be successful, a company must create a specific proposition of value that is able to satisfy the needs of a certain group of customers. The company gains a competitive advantage from the way in which the value chain is set up, that is, the set of activities involved in the creation, production, sales, delivery and technical support of its products or services. Companies so far

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

have neglected the opportunities that can present themselves when satisfying the needs of those who are at the "base of the pyramid" and have often misinterpreted the indirect impact of underestimating the damage provoked by their value chains that are so unheeding of sustainability. It is important not to concentrate too deeply on the specific business of the company, but rather widen our scope, and take the economic environment that surrounds the main activities of the company into serious consideration.

How Is Shared Value Created?

According to Porter and Kramer (2011), the paradigm of shared value begins with the experiences made in the field of sustainability by individual companies who extend them systematically. Through the creation of both social and economic value, companies can achieve the goal of shared value. To this end, companies can pursue shared value opportunities on three levels that support each other:

- Reconceiving products and markets;
- Redefining productivity in the value chain;
- Enabling the development of local clusters.

The shared value opportunities at each level will differ by industry, company, and geography, depending on how a company's particular business and strategy intersect with social issues.

Reconceiving Products and Markets

The main needs of the global economy have remained unsatisfied, and companies have wasted the last few decades asking themselves the wrong questions. The attempt to solve social problems can improve company productivity in various ways. To protect the health of employees, with health insurance policies, and with suitable working hours and workplaces, produces benefits for the whole community. Workers and their families enjoy better health and the company minimizes absenteeism and loss of productivity.

Creating shared value from reconceiving products and markets focuses on revenue growth, market share, and profitability that arise from the environmental, social, or economic development benefits delivered by a company's products and services (Porter & Kramer, 2011).

Community needs aren't unchanging, they continually evolve. The company's task is to explore social needs and put itself in a condition to discover new opportunities for differentiation and repositioning in traditional markets, as well as identify the potential of neglected markets.

Redefining Productivity in the Value Chain

A company's value chain has an influence on many social problems, like safety, working conditions or the exploitation of natural resources such as water. Opportunities for the creation of shared value arise when these social problems can determine economic costs in the company's value chain (Porter & Kramer, 2011). Often big environmental performance improvements can be achieved by using more effective technologies with a minor incremental cost and can generate net cost savings from the very start.

Creating shared value from redefining productivity in the value chain focuses on improvements in internal operations that improve cost, input access, quality, and productivity achieved through environmental improvements, better resource utilization, investment in employees, supplier capability, and other areas.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Porter and Kramer (2011) have identified the main trends towards shared value is transforming the value chain:

- **Use of Energy and Logistics:** The increase in the price of energy has triggered a process of redesigning of logistic processes with the aim of reducing gas emissions, energy and transport costs.
- **Use of Resources:** By using water and other resources for production more efficiently it will be possible to improve economic performance of the company as well as improve environmental and social aspects.
- **Procurement:** Businesses have concentrated for too long on cost reduction, delocalizing most of their production to countries with lower labor costs. Now they have realized that they have neglected quality and innovation. By extending access to production factors, sharing technologies and supplying appropriate financial support, companies can improve their productivity and that of their suppliers.
- **Distribution:** As described before, multinational companies are rethinking their distribution models to take advantage of interesting opportunities for cost containment. In non-traditional markets there are also interesting possibilities for the development of completely new services.
- **Employee Productivity:** Containment of salary levels, reduction of benefits and offshoring, may not be the best instrument for improving employees' productivity. Many companies realize that a decent salary, well-being, training and health insurance have a positive effect on productivity.
- **Location:** Globalization has allowed companies to delocalize their production plants, to places where the cost of labor is lower, leading to the creation of factories that are highly specialized in the production of a specific component. However, the increase in the cost of energy, and therefore of transport, has highlighted the lower efficiency of highly fragmented production systems and the hidden costs of long-distance purchases.

Enabling the Development of Local *Clusters*

The third approach to the creation of shared value is based on the premise that the success of every company is influenced by the companies that support its business and the surrounding infrastructure. Productivity and innovation are influenced by *clusters*, which are those geographical concentrations of linked companies, suppliers and the logistic infrastructure of a certain industry (Porter & Kramer, 2011). Silicon Valley and Italian industrial districts are a classic example.

Creating shared value from enabling local cluster development derives from improving the external environment for the company through community investments and strengthening local suppliers, local institutions, and local infrastructure in ways that also enhance business productivity.

MEASURING SHARED VALUE

Although shared value is spreading among companies at a very impressive rate, the tools to put this concept into practice are still in their infancy. In particular, a new framework for measurement that focuses on the interaction between business and social results is among the most important tools to drive shared value in practice.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Even the companies that are most advanced in pursuing shared value today lack the data they need to optimize its results. Companies cannot know the extent to which they are creating shared value if they do not measure their progress on social objectives and, importantly, the degree to which social performance improves economic value for the business. When companies do not understand or rigorously track the interdependency between social and business results, they miss important opportunities for innovation, growth, and social impact at scale (Porter et al., 2012).

Measuring shared value aims to track the progress and results of tailored shared value strategies. For each shared value opportunity, companies identify and track simultaneously both social and business results; their parallel goals are to address a social problem and improve business performance (see Table 1).

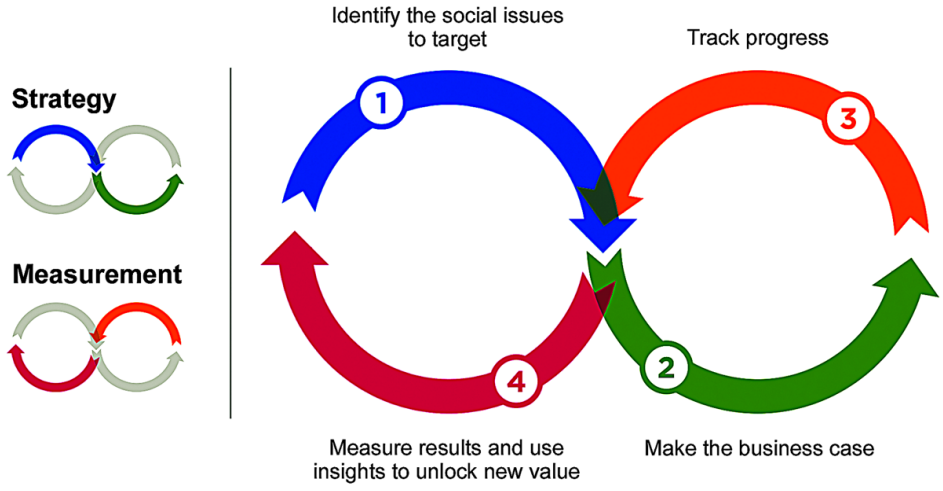
The process of creating shared value and measuring its impact is definitely iterative and totally integrated with business strategy and performance management of the company (Figure 3). To pursue successful shared value strategies, managers will need to reconsider traditional business disciplines –

Table 1. Illustrative business and social results by level of shared value

Levels of Shared Value	Business Results	Social Results
Reconceiving product and markets: How targeting unmet needs drives incremental revenue and profits	Increased revenue Increased market share Increased market growth Improved profitability	Improved patient care Reduced carbon footprint Improved nutrition Improved education
Redefining productivity in the value chain: How better management of internal operations increases productivity and reduces risks	Improved productivity Reduced logistical and operating costs Secured supply Improved quality Improved profitability	Reduced energy use Reduced water use Reduced raw materials Improved job skills Improved employee incomes
Enabling cluster development: How changing societal conditions outside the company unleashes new growth and productivity gains	Reduced costs Secured supply Improved distribution infrastructure Improved workforce access Improved profitability	Improved education Increased job creation Improved health Improved incomes

Source: Porter et al., 2012.

Figure 3. Integrating shared value strategy and measurement
Source: Porter et al., 2012.



EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

strategy, marketing, financial analysis, operations, etc. – and apply them in new ways. By reconceiving social problems as business opportunities, and applying rigorous execution and measurement, they can ensure an enduring creation of business and social value moving forward. There are tremendous opportunities for companies to further embed shared value measurement practices into their existing business processes. Only then will companies know if they are maximizing their shared value investments, not only to benefit their long-term competitiveness, but also to address critical social problems around the world.

The creation of shared value implies obeying the law and respecting ethical standards, as well as a reduction of the environmental impact caused by companies. This approach represents a new way of relating to customers, productivity and all of those external factors that influence a company's success. Companies need to start considering respect for the environment a successful competitive factor and not a cost that cannot be avoided.

In conclusion, in the new world of "shared value" it won't be the companies who solve the problems of the global economy, but they will give back to business more drive and a renewed dignity (Porter & Kramer, 2011). It's an extended view in which the economic element does not diminish the social, but rather makes use of the social as creative tension aimed at researching new opportunities for really sustainable development.

KEY TERMS AND DEFINITIONS

Competitive Advantage: An advantage that a firm has over its competitors, allowing it to generate greater-than-expected value from the resources it employs. Thus, competitive advantage means having low costs, differentiation advantage, or a successful focus strategy.

Corporate Social Responsibility: A company's sense of responsibility towards the community and environment (both ecological and social) in which it operates.

Creating Shared Value: Set of policies and operating practices that enhance the competitiveness of a company while simultaneously advancing the economic and social conditions in the communities in which it operates. Shared value creation focuses on identifying and expanding the connections between societal and economic progress.

Shareholder Value: The value delivered to shareholders because of management's ability to grow earnings, dividends and share price. In other words, shareholder value is the sum of all strategic decisions that affect the firm's ability to efficiently increase the amount of free cash flow over time.

Stakeholder: A party that has an interest in an enterprise or project. The primary stakeholders in a corporation are its customers, suppliers, employees and shareholders. Modern theory goes beyond this conventional notion to embrace additional stakeholders such as the community, government and trade associations.

Stakeholder Value: The value delivered to all the company's stakeholders (customers, suppliers, employees, shareholders, and the community). It is central to the Stakeholder Value Perspective in which the social responsibility is an organizational matter and, as a matter of fact, society is best served by organizations pursuing joint interests and economic symbiosis.

Sustainability: Continued development or growth that meets the needs of the present without compromising the ability of future generations to meet their own needs.

Sustainability-Driven Innovation: The creation of new market space, products and services or processes driven by social, environmental or sustainability issues.

Chapter 81
Social Business:
A Way to Promote Organizational Transformation

Maria João Ferreira

Isabel Seruca
Universidade Portucalense, Portugal & Universidade do Minho, Portugal

ABSTRACT

Information systems and technologies (IST) are the essence of up-to date organizations, and changes in this field are occurring at an uncontrollable pace, interrupting traditional business models and forcing organisations to implement new models of business. Social media represent a subset of these technologies which contribute to organizational transformation. However, by itself, the adoption of social media does not imply such a transformation; changes in the organization's culture and behaviour are also needed. The use of IST in an appropriate and integrated way with the organization's processes will depend on an individual and collective effort. For organizations to take advantages of these technologies within the context of Social Business, a comprehension exercise is required in how to demonstrate their usefulness. To this end, this paper will provide a comprehensive view of a new context of labour faced by traditional organizations i.e. social business supported by mobile IST – mobile_Create, Share, Document and Training (m_CSDT) – in order to improve the well-being of these organizations through the collective intelligence and agility dimensions.

INTRODUCTION

It is widely acknowledged that organizations have suffered a large evolution at the social, economic and technological levels, with particular predominance in the last 10 years, where the traditional barriers of transferring information and knowledge have been progressively eliminated. This evolution allowed the elimination of silos, the breaking down of hierarchies, the connection of internal and external stakehold-

ers and the empowering of employees (Berkman, 2014). According to Bear (2015), Social Business has contributed to this end, and has proved its value across nearly every business function, from marketing and commerce, to product development and human resources, to internal collaboration and intelligence.

Social Business (Yunus, 2007; IBM, 2013; Bear, 2015) can be defined as the ability of an organization to share information, produce knowledge collaboratively, manage knowledge, eliminate communication and sharing barriers, accelerate business processes, approaching the business partners, namely suppliers and customers, and create innovative products, services and business models. It is thus essential that such products, services and models are created and properly documented, managed and shared.

Information systems and technologies (IST) are the essence of up-to date organizations, and changes in this field are occurring at an uncontrollable pace, interrupting traditional business models and forcing organizations to implement new models of business. These changes need to be accompanied by new modeling methods that, for instance, drive the evolutionary changes of requirements, as argued by Gustas and Gustiene (2012). A change of paradigm in what comes to the use of IST in the day-to-day life of every citizen, by itself, does not sustain such a transformation; it is also necessary a change of culture and behavior. On the one hand, the use of IST in an appropriate and integrated way with the organization's processes will depend on an individual and collective effort, which may be called "collective leadership" (Friedrich et al., 2009; Paunova, 2015). On the other hand, the younger generation, accustomed to sharing, often through mobile devices, personal information on Facebook, Twitter, among others, enters the job market looking for similar tools. These new "social tools" allow the production, sharing and management of information and knowledge within the organization between peers and other stakeholders, allowing the barriers elimination of the communication and sharing.

Therefore, we may infer that Social Business is much more than just collaboration and sharing, since the IST that are currently available allow the organizations' processes to be more dynamic, more "social".

Following these developments, and according to the European Commission report "*A Roadmap for Advanced Cloud Technologies H2020 under*", the environment of IST (market research, industry, education, training, etc.) is undergoing constant changes. These changes originate, typically from the conflict between the technical restrictions and the "new" needs experienced by users. Thus, it is necessary to identify the major changes that can be expected in the next years and can, or will, affect the environment of IST. It is expected, for example, storage for all and the internet of and for things (World Economic Forum, 2015).

The growth of social media is already happening at a tremendous rhythm (Schultz, et al., 2015). The arrival and development of mobile internet applications has set to double the intensity of social media use (Gulbahar, and Yildirim, 2015).

The arrival of mobile internet has fully democratized the World Wide Web. Yesterday's non-internet users now only need a smartphone and a location with free *wifi* access to go online. In the past, it was needed a workplace, a computer and an internet subscription, which was too expensive for many people. This barrier has now, however, disappeared. As discussed in Van Belleghem (2012), the situation in the United States proves this beyond doubt. The highest smartphone penetration levels are to be found in the poorer Hispanic and Asiatic sections of the community. In 2011, the research company Nielsen found that in the traditionally more affluent white community only 27% had a smartphone. These figures are the reverse of what would be rationally expected, and they mean that all target groups in all social classes will soon be approachable on a large scale via social media.

The combination of internal and external conversations is well suited to take advantage of the changes ushered by mobile internet. If the company staff makes great use of online media, they will be ready

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

and waiting to pick up customer feedback, so that they can avoid or solve possible problems and fully take advantage of conversation potential. If the company's culture and service are good, this will result in positive conversations. Consumers who are looking for online information while they are out shopping will find these conversations in their search results and will be influenced by them. The fact that the internet has been democratized means that organizations have no other option: they must integrate the use of social media into their activities, if they wish to survive. Social media therefore connects the organization, its staff and its customers to each other.

The impact of these developments on the demand has been immense. In the United States, 27% of smartphone users use their phone while they are out of shopping, to find out more about the products they are thinking of buying. They also compare prices and look for promotion offers in other stores. From now on, it is clear that people always have the internet with them, wherever they go and whatever they do. This means they have instant access to all the information in the world. The impact for, namely, the retail industry is, therefore, phenomenal.

Taking advantage of these technologies for organizations within the context of Social Business, in particular nomadic workers, requires a comprehension exercise in how to demonstrate its usefulness with regard to the creation, sharing and documentation of information and knowledge in and out of an organization, the education and training of organizational workers and ad-hoc discussion, in a safe way. In this paper, we further develop the m_CSDT approach early described in (Ferreira, Moreira and Seruca, 2014a). The Case Study approach will be used as the research method (Yin, 2009).

We argue that Social Business, supported by different ISTs including mobile devices that comply with the m_CSDT approach will contribute in a particular way for the organizational well-being (Dodge et al. 2012) raising indicators of the collective intelligence (Schoder, et al., 2014) and agility (Singh, 2013) dimensions.

The intelligence dimension, on its different indicators is achieved through "collective leadership", since it is more efficient than hierarchic management, for certain types of tasks, allowing the internal relations of cooperation to increase and improving the flow of knowledge. Broad participation is usually more effective and leads to more information that can be processed and used in decision-making.

The agility dimension is achieved, through collaborative work, supported mainly by nomadic workers, allowing a systemic perception, especially taking advantage of the interconnections between the organization's capabilities and market opportunities.

As a result, the paper will provide a comprehensive view of the prevalent issues of a new dimension of labour for traditional organizations i.e. social business supported by mobile IST – m_CSDT – in order to improve the well-being of these organizations through the collective intelligence and agility dimensions.

THE NEW DIMENSION OF LABOUR FOR ORGANISATIONS: SOCIAL BUSINESS

The Social Business Concept

The concept of social business was firstly associated with Yunus´ work (Yunus, 2007). According to Yunus, the concept involved both economic and social perspectives: social business is supposed to solve a social problem and to achieve financial sustainability rather than to generate profits.

A new perspective was introduced by Kim (2012) in a blog post where the concept was applied to evolutionary marketing and technology strategies. Social Business, also called Social Enterprise and

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Enterprise 2.0 (Berkman, 2015), is a recent but popular trend that is revolutionizing organizational work and generating value for all of its elements, i.e. employees, customers, partners and suppliers. It means that all departments in an organization integrate their social capabilities into traditional business processes (Dorn et al., 2007) to change the way of working in order to create value. A Social Business organization uses social software technology to communicate with its rich ecosystem of customers, business partners and employees.

A Business is created and managed by people. The individual or group who is taking decisions will determine either the success or failure of an organization, i.e. if it will survive or will eventually die in market (Hiriyappa, 2008). In order to achieve that success long term goals are needed to be set, i.e. profitability, productivity, competitive position, employee's development, employee relationships, public responsibility, and technological leadership (Hiriyappa, 2008) that are converted into internal efforts and organizational transformations. However, those organizations often fail due to internal (Kotter, 1995) and external forces (Zakić et al., 2008).

An organization in the 21st century, known as Enterprise 2.0 (McAfee, 2006; McAfee, 2009), to achieve success, must be a connected entity that supports internal and external networks of people and knowledge in order to obtain competitive advantage and to face the constant and mutable external environmental forces. The potential of social business allows this challenge. Hagel et al. (2010) claim that "*each of us, individually and together, are now, for the first time in history, in a position to collaborate in a complete reimagination of our biggest private and public-sector institutions that will eventually remake society as a whole*". Following this imperative, organizations must be open to be supported by social business, which constitutes a shift in how people work, moving from hierarchies to networks. Nowadays, complex work is the most valuable, as well as the type of work that cannot be automated or outsourced. It is work that requires creativity and passion. Doing complex work in networks means that information, knowledge and power no longer flow up and down. They flow in all directions. Brown (2012) claims that to understand complex systems it is necessary to submerge in them. This requires social learning. Complex work is not linear. Social business is giving up centralized control and harnessing the power of networks.

Organizations must be able to share knowledge quicker than before. This requires a shift towards something like a starfish framework that not only allows for independent action but also distributes knowledge through all parts. Social learning is about how organizational knowledge gets distributed.

The work of social business can only be achieved through social learning; Jarche (2011) synthesized this idea into ten statements:

- The increasing complexity of work is a result of global interconnectedness.
- Today, simple work is being automated (e.g. bank tellers).
- Complicated work (e.g. accounting) is getting outsourced.
- Complex and creative work is what gives organizations unique business advantages.
- Complex and creative work is difficult to replicate, is constantly changing and requires greater tacit knowledge.
- Tacit knowledge is best developed through conversations and social relationships.
- Training courses are artefacts of a time when information was scarce and connections were few; that time has passed.
- Social learning networks enable better and faster knowledge feedback loops.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

- Hierarchies constrain social interactions so traditional management models must change.
- Learning amongst us is the real work in social businesses and management's role is to support social learning.

Undertaking social business is not the same of an organization that just uses a Facebook page or/and a Twitter account. Social business means that all departments of an organization, from human resources to marketing, to product development, to customer service, to sales, use social media in the same way they use any other tool and channel to do their job. It is an organization that uses social networking tools often to communicate inside and outside the organization. It is a strategic approach to shaping a business culture, highly dependent upon executive leadership and corporate strategy, including business process design, risk management, leadership development, financial controls and use of business analytics. According to Abbott (2015), for organizations, the use of mobile devices conjugated with social business allow the following benefits: market and sales are more effective; teamwork and collaboration are empowered; crowd-sourcing is facilitated, ideas and creativity are more easily spread; trends can be sooner spotted; meaningful interactions may be elevated, loyalty and trust can be enforced; performance can be optimized; stronger teams may be built and maintained; personalize motivation, and best of all … organizations can grow better, faster, bigger, stronger, happier – for less time, hassles and costs.

Integrating Social Business Into an Organization

Besides the well-known potential for organizations in the use of social media, most organizations show a paradoxical behavior in the way they perform business and in the way they manage their institutional social media. This paradoxical behavior results most often in the underuse of conversation potential. These issues are discussed in Van Belleghem (2012) and may be summarized as follows:

- Almost every organization thinks that word-of-mouth advertising is important, but they make little or no effort to manage it. There is a (mistaken) perception that organizations can do little to influence consumer conversations.
- Organizations communicate impersonally, while their customers are demanding a more human approach. The customer wants just one thing: to be treated in a manner that makes him happy. Organizations seem more concerned with processes, structures and budgets.
- One of the global trends in the business world is a growing requirement for good service. Many organizations see customer service as a budget item where savings can and should be done.
- Consumers now have relatively sophisticated technology at their disposal. Many organizations are still working with outdated technology.
- Customers often want to help organizations, to be their friends. On the other hand, organizations often do not think that just a few hundred fans are worth investing in.
- Organizations spend a small fortune on advertising in which they essentially make promises. The modern consumer wants proof, not promises; wants action, not just communication.
- Consumers talk to each other, and often have interesting and relevant things to say. Organizations make little effort to track down these comments and even less effort to take account of them.
- Staff is often proud of their organizations and would like to talk about them, but sometimes is forbidden to do so by their employers.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Perhaps the two last issues in the list provided constitute the biggest paradoxes of all the mentioned issues. Organizations keep referring that satisfied customers and satisfied staff are important, but very often their actions do little or nothing to reflect these words. These are the fundamental causes of unused conversation potential. This problem is exemplified in a further section with the discussion of real cases study.

The future of organizational work is social, collaborative and mobile (Streitz, 2003). The introduction of social business into an organization requires important changes in the way its collaborators work in all the organization structure (Cortada et al., 2012). According to Cortada et al. (2012), in order to integrate social business in the core of an organization three key issues must be addressed:

1. Organizations need to consider how to incorporate social metrics in themselves and in their processes;
2. Organizations need to understand and manage the risks associated with the integration of social business; and
3. Organizations need to manage change, which is a fundamental requirement to undertake with success social business practices.

Moreover, in SideraWorks (2013) seven dimensions are proposed that must be questioned and defined: (1) vision and goals; (2) cultural readiness; (3) organizational structure; (4) social strategy; (5) communication; (6) social technologies; and (7) training and education.

In this context, the two last dimensions (social technologies and training and education) should allow knowledge to flow in the organization. The primary function of social technologies and training and educating professionals in the networked organization is to connect and communicate based on three core processes:

1. Facilitating collaborative work and learning amongst workers, especially as peers;
2. Sensing patterns and helping to develop emergent work and learning practices; and
3. Working with management to fund and develop appropriate tools and processes for workers.

According to Zhao & Kemp (2012) employees tend to use blogs, wikis and social bookmarks to search and retrieve information about the organization, to connect with coworkers or to build relationships. Another survey, according to these authors, shows that the main goal of using social media tools, such as Facebook in the workplace is to maintain and develop connections with friends not work-related. The adoption of such tools in the workplace has therefore raised several issues and challenges for organizations. One of the most important issues is the virtual disappearance for employees of boundaries between the personal and professional life, as well as personal and professional connections.

Social Business Contributes for a More Competitive Organization

In a few short years, social technologies have given social interactions the speed and scale of the Internet. Whether discussing consumer products or organizing political movements, people around the world constantly use social media tools to seek and share information. And, in this context, business is changing their behavior and social media becomes an important business tool (McKinsey& Company, 2012).

The value of organizations that use social media tools is determined by how they are harnessed to create value for the organization (Majchrzack, Cherbakov & Ives, 2009). Martin & van Bavel, presents

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

a set of a number of potential benefits, i.e., tangible and intangible gains, when the organizations use social media tools, which they classified in terms of a) employ uses of the technologies, b) customer engagement activities, and c) external partner activities (Martin & van Bavel, 2013).

For employees the benefits are: (i) Fast access to organizational knowledge; (ii) Fast access to internal expertise; (iii) Greater collaboration opportunities; (iv) Reduced internal communication costs; (v) Improved training processes and (vi) Improved recruitment of new employees. For customer engagement: (i) More effective branding (Barwise & Meehan, 2010), stronger brand loyalty (Syncapse, 2013), and improved marketing, including stronger customer dialog (Gallaugher & Ransbotham, 2010); (ii) Ability to mine and analyze customer data more effectively; (iii) Ability to personalize marketing activities based on customer interests; (iv) Improved customer service and support; (v) Better product development; (v) Increased customer satisfaction, and (vi) Reduced marketing costs. For external partners the benefits are: (i) Fast access to external knowledge and improved information sharing; (ii) Reduced external communication costs; (iii) Improved collaboration and innovation opportunities, and (iv) Exploiting new marketing opportunities.

Those potential benefits are quantified in some studies, namely McKinsey & Company (2012), and PulsePoint Group and The Economist Intelligence Unit (2012). Gaál et al. (2015) present a study that analyses internal knowledge sharing technologies and practices in organizations (see Table 1).

Table 1. Existence and usage of internal knowledge sharing technologies/practices [From: Gaál et al., 2015]

Tool	Meaning	Existence %	Usage* %
Internal training	A method of preparing an employee to perform a task	*89*	*94*
Document management system and knowledge repository	Providing a comprehensive solution for managing capture, index, storage, retrieve of any information	*76*	*89*
Participation in the life of a communities of practices	Groups of people who are formed to share and create skills, knowledge, and expertise among employees	*70*	*79*
Internal instant messaging service	Facilitating near real-time text based communication between two or more participants	*56*	*83*
Presentation sharing	Offering the ability to publish any kind of organizational presentations to a specific audience or the entire world	*46*	*80*
Groupware	Enabling group collaboration over a network, providing flexible communication structures	*44*	*59*
Internal social networking services	Providing the network's members access to information and knowledge	*35*	*78*
Internal blogs	Offering individuals/groups to capture and publish information about specific topics	*33*	*63*
Knowledge map	Presenting what knowledge resides where (people) and for demonstrating the patterns of knowledge flow (distribution)	*31*	*68*
Competence center/ center of Excellence	Consultants with specific areas of knowledge and experience	*30*	*68*
Internal video sharing	Offering the ability to publish video content to a specific audience or the entire world	*19*	*71*

*In this issue, those organizations constituted the population where these technologies exist, therefore the usage is possible.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

The study driven by McKinsey & Company (2015) highlights that the organizations that interact with business stakeholders through social technologies have significant benefits and that they are growing (see Figure 1).

These studies show the importance of social business to organizations, not only inside the organization itself, but also in its relations with the outside, i.e., with the organizational ecosystem.

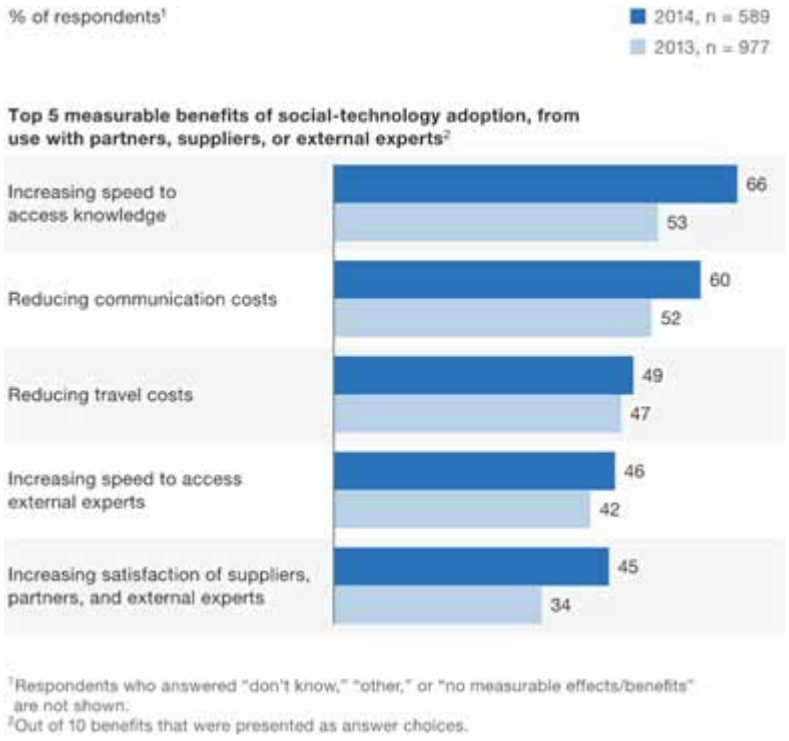
The Contribution of Social Business to the Organizational Well-Being

As referred in previously social business is the creation of an organization that is using social technology to benefit its entire ecosystem by embedding several aspects including collaboration. In this way the core of social business and the activities that it supports will have an impact in the organization through six dimensions (SideraWorks, 2013), which are presented in Figure 2: adaptability, empowerment, agility, connection, openness and collective intelligence (Malone, et al., 2009). We highlight two of these – the agility and collective intelligence dimensions.

Organizational agility is defined, in the Business dictionary, as the capability of an organization to rapidly change or adapt in response to changes in the market. A high degree of organizational agility can help an organization to react successfully to the emergence of new competitors, the development of new industry-changing technologies or sudden shifts in overall market conditions.

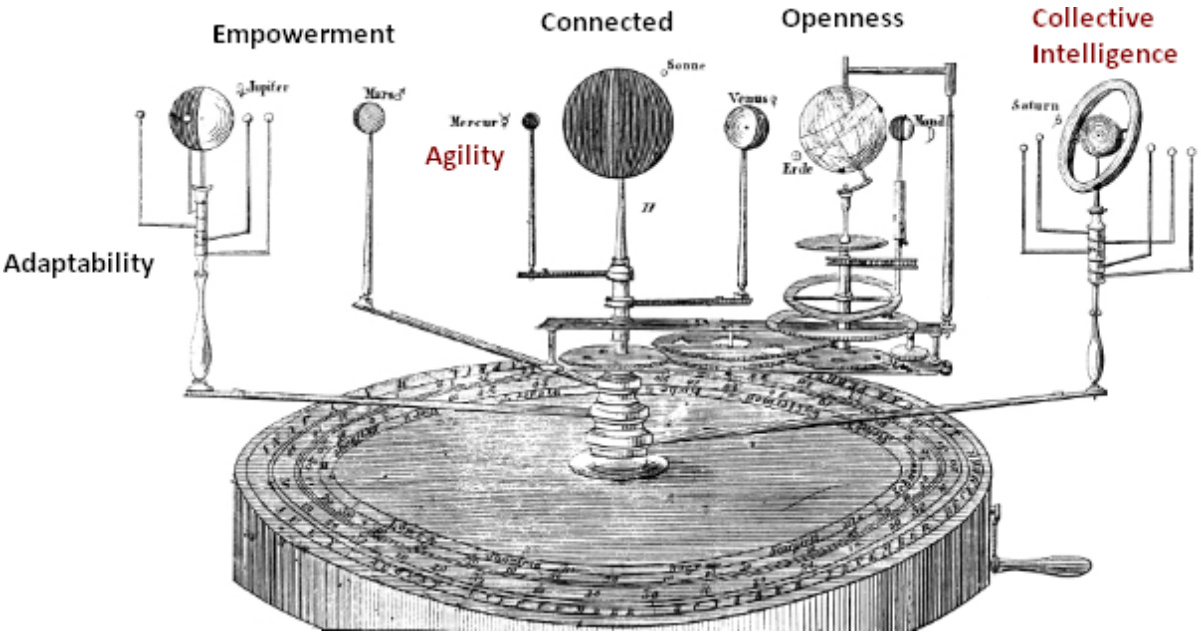
Organizational agility helps balancing speed of response, communication and information sharing with thoughtful coordination and long-term scalability. In this context, according to Charbonnier-Voirin

Figure 1. Benefits of adopting social business by the organizations (From: McKinsey & Company, 2015)



EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 2. Social business and its six features (adapted from SideraWorks, 2013).



(2011), organizational agility is the organization capacity to incorporate new elements such as innovations or improvements in order to enhance its performance.

Levy (1999) argues that collective intelligence is the "*capacity of human communities to co-operate intellectually in creation innovation and invention*". Levy also adds that collective intelligence is a "*fully distributed intelligence that is continuously enhanced and synergized in real time*" which results in effective mobilization of skills with social business. And in this context, collective intelligence leverages the capacity to listen and use established information as well as new sources of information. Evaluating and analyzing data is not just to track activity, but to actively support business decisions in order to improve products, services, and processes of an organization (SideraWorks, 2013).

Organizational well-being is the process of creating well-being across an organization (Dodge et al. 2012). Therefore if agility and collective intelligence are incremented in an organization, well-being will also be incremented.

The Support of Social Media Tools in Social Business Context

Social media can be defined "*a group of Internet based applications that build on the ideological and technological foundations of Web 2.0, and that allow the creation and exchange of user generated content*" (Kaplan and Haenlein, 2010). Social media tools are supposed to inflict a sharp transformation in the employees' private and professional lives. Through careful observation of the use of such tools it is widely acknowledged that they are vital in the process of communication in society today (Talug, 2012).

Organizations worldwide are adopting social media tools in many critical applications to create, share and documenting. Some industry executives from advertising and marketing consider their use crucial. Despite its growing ubiquity, social media tools are still not well understood from a strategic

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

business perspective, and also regarding its use in education and training in the workplace (Barczk & Duncan, 2012).

Studies on the organizational impacts of the use of social media tools to date have been mentioned only speculatively (Vannoy & Palvia 2010). According to (Boyd 2008; Lampe, Ellison & Steinfield 2006) a possible explanation for this is the growing use of social media tools outside the organization or explicitly social contexts, which are used mostly by youth and students.

According to Jarrahi & Sawyer (2013) the increase in the number and variety of information and communication technologies in the workplace, as well as the practices of knowledge sharing which are becoming increasingly digital allow traditional organizations to benefit from the wide variety of social technologies. The social media tools constitute the subset of social technologies that have allowed new possibilities for sharing organizational knowledge. The use of social media tools offer opportunities for collaboration and social exchange, and are well positioned to increase and prolong the interpersonal social connections (Skeels & Grudin 2009).

Jarrahi & Sawyer (2013) mention that what is known so far on the use of social media tools at work is based on studies focused on the use of a social media technology by itself. These studies provide useful information about some organizational implications of its use, but do not consider how technologies can be used together. However, it is easy to acknowledge that the vast majority of organizations have employees interacting with several technologies.

For a successful organization to have social business, social media must be understood as a means, not an end. Social media is the ideal partner for such an organization. The advantages are obvious: speed, a wide potential reach, a human method of communicating, no hierarchy, full transparency, creation of communities, etc. It is the only channel where feedback from the outside world is transparent and direct. Social media force organizations to be more honest, quicker and clearer in their communication. This trend has allowed organizations to develop in the direction of genuine customer-orientation.

Despite these advantages, the checklist mentality which some organizations use when dealing with social media is not the right way to maximize the company conversation potential. Regarding Facebook pages and Twitter accounts as some kind of magic trick is not the good way of achieving success and will only lead to disappointment. The reality is that, with a few exceptions, any company is likely to have a million fans on the first day. For the vast majority of organizations, it takes time and effort to build up a community of fans and followers. Besides, wide reach on social media is only one of the important criteria. Building up a strong relationship with the customer is just as important. The role of company employees in helping to make the company's culture tangible is another relevant issue to consider. Social media are then the ideal way to spread the company's culture and stories on a wide scale.

Social media tools refer to social networks (Facebook, Google+, LinkedIn, Twitter), in addition to sharing videos platforms (YouTube), blogging platforms, platforms of communication (Skype, etc.) and visual media (Instagram, Pinterest, Tumbir and Snapchat) (Drell and Davis 2014).

Social media tools provide their users a profile, a list of friends, a chat room and the ability to send public or private messages, create events, comment, get feedback, etc. From a general perspective we can say that they have in common the ease of use, and free use, for good or for evil, representing the day-to-day lives of young people, mostly.

Some studies about social networks show that about a third of employees from different organizations use Facebook (Skeels & Grudin, 2009). Thus, this social media tool can be used to create a large community of employees, both new and old, ensuring that within this community, new employees will

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

have the opportunity to interact with more experienced employees, with the objective of exchanging organization's information.

Twitter is a social media tool similar to Facebook. Both sites are considered social networking sites where people can communicate with each other, keep in touch and share information, although Twitter limits the amount of information that you can share at any time within a single tweet (Tagtmeier, 2010).

According to Nielsen (2010), Youtube is mainly used by adults aged from 18 to 34 years. In addition, it is also designed for mobile devices, because during a month 25% of the time viewing of YouTube videos was through mobile devices, representing over one billion views a day and is available in hundreds of millions of devices.

THE USE OF CONVERSATION POTENTIAL

Social media can enable and significantly increase the collaboration and learning from customers in various ways, for instance by novel social ways of providing and receiving feedback of a brand, an organization's products or services and practices. Today's consumers want an organization that is open and receptive to their opinions, an organization that puts the customer first, in a central position.

Thanks to social media, organizations can get their information out to the public faster than ever. However, social media can spread bad information about a business just as fast as it can spread good information, due to its powerful amplifying effect. Social media builds brand awareness in ways that no other form of media can and reaches customers who would be otherwise unreachable. The conversation potential and the reach provided by the use of social media can lay the foundations for an organization's future growth or damage of reputation or brand image.

Designing a social strategy for the organization and learning from the interaction with customers so as to re-design strategy or improve organization procedures and practices should allow the right balance for an organization to ensure success in engaging with social media. The two case studies provided in this section describe real stories of how organizations can use the conversation potential enabled by social media and the consequent impact on the businesses' brand image in both cases.

The 'KLM' Case

This case describes a complete change in how KLM (Ketting, 2012; Korzeniowski, 2015; Haar, 2015; Koetsier, 2015; Mcculloch, 2015) found novel ways to leverage social interactions with customers and improve business processes.

Background

KLM Royal Dutch Airlines has operated, for more than 90 years, flights throughout the world. With more than 32,000 employees serving more than 133 international destinations, KLM is one of the largest international airline companies. Moreover, KLM is dedicated to providing more than a reliable and cost efficient mean of transportation. The company has also taken the initiative for Corporate Social Responsibility involving customers, employees and society.

Since 2009, KLM had only just started exploring this new world with a Facebook page, a Twitter account and, like most companies taking their first steps in social media. At that time, KLM started its

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

contribution to social platforms by posting some pictures of planes and launching a campaign Indeed, the airline company found novel ways to leverage social interactions and improve business processes.

Problem

Few people had ever heard of the so called "Eyjafjallajökull" volcano until 14 April 2010. That was the day this Icelandic volcano erupted, causing most airline traffic to grind to a halt and creating a huge ash cloud above Europe, making plane travel impossible for about five days.

Around 10 million travelers were affected, forcing KLM to seek new ways of communicating with its passengers, and at that moment the company was starting using social media tools.. KLM has become a leader in using social media progressively. Ironically, the genesis of its work was more happenstance than a grandiose plan, as already referred.. This phenomena overwhelmed KLM's phone lines, email, and ticket counters. At the time, the company was using social media on a small scale, dabbling with Twitter and Facebook. Willing to get in touch with the airline, thousands of customers were desperately waiting for a response. Within an hour, KLM had created a social media room where company volunteers (about 100 employees used social media) took turns answering questions. Some would arrive at 4am wearing their business suits, so that they could do their shift and head straight through to an 8am meeting. Managers became service agents and some of them experienced direct customer contact for the very first time.

Solution

Because KLM customers used Facebook and Twitter to keep their friends and family updated on their lives, KLM had to be there as well. Hence, the KLM social customer service was born. This service has 150 people dedicated to serving clients via social. And each of them represents almost $170,000 in annual revenue.

Recognizing the potential power of social media, KLM committed to the new communication channel and expanded its efforts. Currently, the airline handles about 75,000 queries a week, 24/7, across a variety of social platforms including Facebook, Twitter, and LinkedIn. The company communicates in 14 languages and recently began tinkering with country-specific social tools, like Sina Weibo, Tencent Weibo, WeChat, and Renren in China and VKontakte in Russia. No automated answers, but a personal reply from one of the KLM service agents. The KLM social media policy is based on the one-stop-shop principle. If someone approaches the company on Twitter, they give them a tailored reply, not just a link to other channels.

KLM answers more questions than any other company on Facebook. There is no other brand that has higher social care demand on Facebook than KLM. Based on the analysis of their Socially Devoted Q4 data, KLM receives 40% of all queries addressed to Dutch companies, and nearly 30% of all queries in the airlines industry globally.

However, it was necessary to 'put the pieces together' in order to use social media to help customers book flights and to address the payment phase of the process. The problem arose as the airline could not easily and safely transmit credit card details through social platforms. Acknowledging the fledgling

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

nature of these tools, the company searched for a payment solution to fix the problem, but could not find one.Thus., the airline had to work with one of its payment service providers and build the platform itself.

The KLM booking system, which costed €3,500 to develop, allowed its social media representatives to offer a quick payment link and stay with the customer from booking to ticket issue. The social media booking application is generating more than €100,000 each business day and the number has been rising every week. In 2014, the system contributed €25 million to the company's year-end revenue.

Customers will get desired flight details, timing, and information on pricing, and, if the transaction proceeds, there is a direct link to a payment page. As soon as the customer credit card is processed, KLM agents are notified and inform the customer that his ticket is booked.

KLM has also put satisfaction measurements in place for its social contact center. The agent enters the measurements at the start and end of each contact center conversation, so as to monitor how customer sentiment changed during the interaction.

The data collected by KLM feeds into its social CRM efforts via Salesforce, where it ties Twitter handles or other social media data to customer records. Customer service agents can see the contextualized data in real time, and air crews can see these in mid-flight. All these data is increasingly being used by KLM's marketing in order to personalize communications and offers.

The 'Become the Doritos Guru' Case

This case describes a complete change in how the Canadian based chips brand Doritos (Paul, 2009; StuzoGroup, 2013) got through to its teen audience, and the success the organization had with a totally re-imagined, user-generated campaign based on the use of social media. The campaign was based on the proposition: "name the new Doritos flavor, create a 30-second commercial for it and in return we will pay the winner, who will be declared "The Doritos Guru", $25,000 cash and 1% of the flavor's Canadian net sales, forever". Although the effort was centered on the mystery flavor, the impact lifted overall Doritos sales. The case also showed excellent results for brand health and engagement through the use of social media.

Background

In early 2009 Doritos released a new chip flavor and wanted to use this as an opportunity to drive brand awareness and engagement through an innovative promotion that leveraged social media. Working with multiple partners, Doritos decided to pursue a cross-platform promotion focused on a viral video.

The campaign, called "Become the Doritos Guru", was a video upload contest wherein users were tasked to create a catchy TV spot and name for the new chip flavor. Doritos was prepared to offer a prize of $25,000 and 1% of future consumer sales to the winning commercial and name for the new flavor. At the outset of the campaign, Doritos identified the ideal business outcomes for the promotion:

- Reach consumers across multiple social channels to create high brand awareness and engagement;
- Launch brand presence on Facebook and build out a Facebook fan base and Social CRM;
- Drive sales of the brand and the new flavor.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

The Solution

The social promotion experts at Stuzo Group (StuzoGroup, 2013) conceived and developed the interactive components of the program. A first of its kind, the Stuzo Group proposed a solution which would launch an interconnected promotion on Facebook, YouTube, and a standalone website using Facebook Connect.

Consumers were able to engage with the promotion in the environment of their choice. Facebook and the Doritos Guru microsite served as the interfaces for video uploads and related promotion interactions, while a branded YouTube Channel was used to host the videos and provide additional exposure. Data such as number of votes, comments, and video views was transferred seamlessly between the three sites. The platform's administrative controls allowed Doritos to screen and approve video submissions before publishing them simultaneously to all three channels. Using the many tactical component features of the platform, users could vote, comment and share submissions, greatly encouraging viral spread. The winning video was based on votes from other users, showing the power of social media.

Campaign Results

This innovative promotion crushed all expectations set by Doritos and its agency partners. The campaign' participants took the opportunity to name the new flavor and to momentarily embody the Doritos brand. Furthermore, massive consumer engagement was achieved. Viewers came out in full force to express their opinions driving an enormous amount of traffic to all three channels. Overall, 75,000 people participated. 4,000 clever and well-produced ads were submitted, 570% more than the original goal. The Doritos YouTube channel became the #1 Subscribed Channel with 2.1 million video views. Viewers spent an average of 6 minutes on the sites, 2 minutes over the original goal. Viewer participation was exceptional with 560,000 votes and 188,000 comments. In one week after its official launch, Doritos' Facebook page gained 31,000 fans. Throughout the campaign, over 900,000 consumers visited the page. As a result of the integrated marketing program, Doritos sales increased dramatically in just two months. In particular, Doritos sales including the new flavor increased by an unprecedented 23% during the campaign period.

SOCIAL BUSINESS SUPPORTED BY MOBILE IST

Social business in organizations is a reality that needs to be improved and systematized. To address this issue, the m_CSDT approach was proposed (Ferreira, Moreira and Seruca, 2014a), which provides a way to introduce and/or systematize social business in organizations. The following subsections provide a summary of the approach highlighting its three layer framework structure and further elaborate on the description and conceptualization of its first and second layers.

Mobile_Create, Share, Document and Training (m_CSDT)

The relevance of conducting social business supported by social media tools is widely acknowledged and recognized by the scientific community and organizations, as discussed throughout the previous sections.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

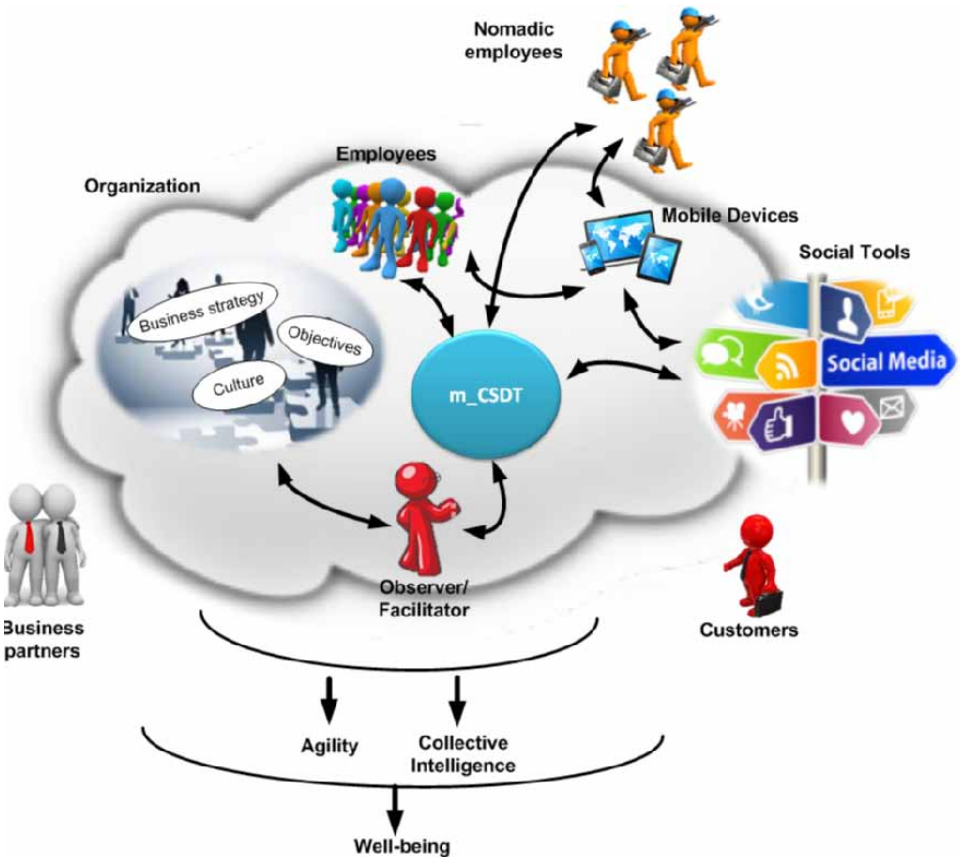
However, there is a lack of approaches that allow the systematization and that guide its implementation within an organization. The m_CSDT approach was envisaged to address this end and consists in a three-layer framework which covers the:

1. Creation, sharing and the documentation of information and knowledge in and out of an organization,
2. Education and training of organizational workers, and
3. Promotion of ad-hoc discussion.

As shown in Figure 3, it is possible to consider a generic approach for implementing a social business through the use of social media tools, in order to achieve the well-being of an organization, considering the agility and collective intelligence dimensions. In this approach, emphasis is given to the production of value for the organizational ecosystem.

Creating value often occurs in different social contexts. This approach considers the individual and organizational contextual factors. It identifies the crucial role that an organization plays in promoting a culture of lifelong learning, collaboration and innovation in order to achieve the organization's strategic objectives. The model identifies and presents the relationships and interaction between employees, the social media tools, the business strategy and the organization.

Figure 3. The m_CSDT approach



EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

The approach focuses on the collaboration issue and its relation with the accomplishment of the organizational goals. The employees are at the center of the collaboration and are mostly members of social networks. The approach considers the nature of collaboration in the workplace, with mobile devices, where social business is largely organized and conducted by the organization, and is based on the social context. It may be briefly described as the collaboration in the workplace based in social media tools. This means that the organization learns through the participation and involvement of its employees through a network, connecting, interacting and collaborating to obtain or share information and / or knowledge through social media tools.

We propose that the collaboration in the workplace is achieved through the integration of suitable social media tools to the needs of organizational development and learning. Therefore, we suggest a mixed form of peer tutoring with an instructor who acts as observer / facilitator. To realize the potential benefits of collaboration in the workplace based on social media tools, we recommend that organizations support rather than restrict the adequate use of social media tools in the workplace. Thus, organizations have to define the best long-term strategies and implement action plans to take advantage of collaboration based on social media tools.

m_CSDT 1st Layer: Monitoring the Use of Social Media

The effective and full use of social media by organizations, as advocated by the first layer of the m_CSDT approach, require that these organizations are able to monitor and analyze the high volumes of heterogeneous data that are produced by the use of social media, so as to obtain relevant information and valuable insights for decision making and for conducting their business. This task should be accomplished through the use of social media monitoring tools.

Social Media Monitoring Tools

Janssen (2014) defined social media monitoring as "a process of using social media channels to track, gather and mine the information and data of certain individuals or groups, usually companies or organizations, to assess their reputation and discern how they are perceived online". He also adds that "Social media monitoring is also known as social media listening and social media measurement". Rouse (2013) puts forward the following definition of the concept: "Social media listening, also known as social media monitoring, is the process of identifying and assessing what is being said about a company, individual, product or brand".

Social media monitoring tools are useful in the discovery of what is happening in online environments, in which the organization operates. Furthermore, these tools can also be used to measure the usefulness of the efforts made on interaction with customers and potential customers. Indeed, it can be quite difficult to fully understand the effectiveness of these efforts, only by analyzing subscriptions of customers and answers.

Today's organizations tend to use modern strategic marketing plans to promote their products and services by using social media tools. Hence, organizations can measure customer responses or potential customers' attraction regarding their interactions with social tools. This evaluation can only be carried out efficiently, if it is performed through the use of monitoring tools of the target social media. The results obtained can be used in defining new marketing strategies, address issues and problems identified by customers, etc.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Thus, by using social media monitoring tools, organizations can make better informed decisions about where improvements can be made, spot opportunities and strengthen any weaknesses that they may have in their social media output.

There are a large number of social media monitoring tools. Hence, depending on the goal to be achieved, the right tool may be a series of free Google Alerts or an expensive software suite, including ad hoc analysis and full integration with legacy customer relationship management applications. These tools transfer the desired words and phrases from unstructured to structured database data, for analysis with traditional data mining techniques.

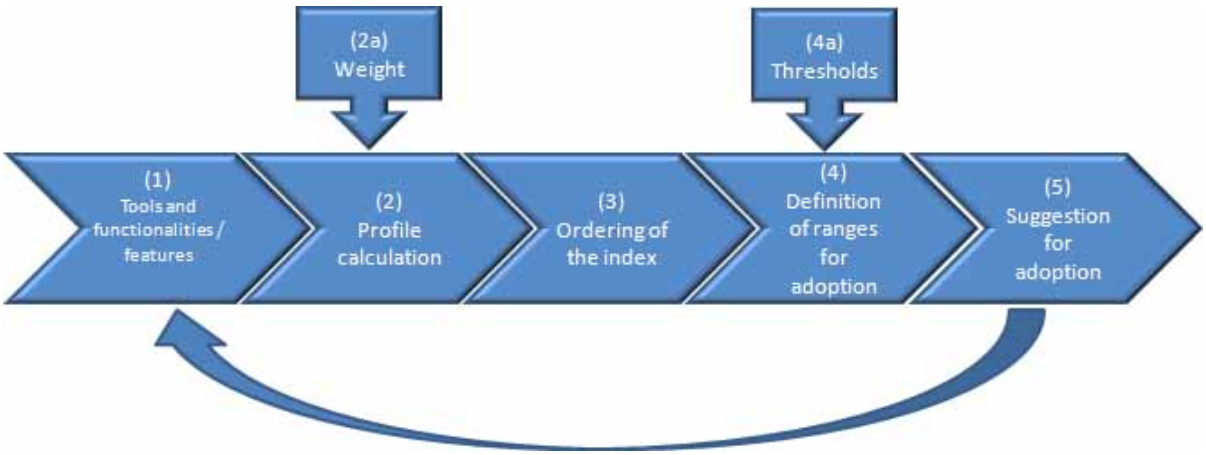
In the private and/or public sector, social media monitoring tools can mine text for specific keywords on social networking websites, blogs, discussion forums and other social media. For example, in the private sector, these tools are useful as companies aim to hear and analyze the complaints about their own products or services, or those of competitors, to help to attract customers; in the public sector, "observing" online conversations may be a way of collecting opinions from people who may not want to fill in a formal survey form.

Classification and Adoption of Social Media Monitoring Tools

Due to the diversity of social media monitoring tools available and wide range of features offered, we envisaged a framework to classify and guide the process of adoption of such a tool (or set of tools) by an organization. The framework called FCASM^{2}T (Framework for classification and adoption of social media monitoring tools) is described in (Moreira, Seruca and Ferreira, 2015) and is composed of five phases as illustrated in Figure 4: (1) Tools and functionalities/features; (2) Profile calculation; (3) Ordering of the index; (4) Definition of ranges of adoption and (5) Suggestion for adoption.

In the first stage (1) tools are collected from the repository of available tools, and their functionalities and features are identified. After building the matrix (tools – functionalities/features), in step (2), weights (2a) are assigned to each of the functionalities, according to the degree of importance that the feature is perceived to have. Subsequently, the profile of each tool is calculated. In step (3) the ordering of the sorting index is performed. This ordering is made based on the profiles calculated for each tool

Figure 4. The FCASM^{2}T framework



EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

in step (2). In step (4) thresholds are set (4a) so that intervals of choice may be defined. By using step (5) and based on the defined thresholds, it is possible to have as an outcome the suggested tool or tools most suitable for an adoption. At this stage, the following three types of adoption are allowed: (i) full adoption; (ii) conditional adoption, and (iii) should not to be adopted.

The process is iterative, as new tools and functionalities may be considered, and need to be evaluated in the process.

m_CSDT 2nd Layer: The Education and Training of Organizational Workers (EToW) Model

The education and training of organizational workers as advocated by the 2nd layer of the m_CSDT approach may be addressed by a model, the EToW model, which is fully described in (Ferreira, Moreira and Seruca, 2014b) and which is summarized in this section.

The Rationale for the Model Proposal

The Education and Training of organizational Workers (EToW) model is illustrated in Figure 5, and aims to use social tools to define educational and training strategies for the organization. It enables the conduction of training in the organization aligned with the organizational strategy, allowing training requested by the employees themselves or as a proposal made by the organization (of mandatory or optional attendance).

According to Figure 5, the EToW model of the m_CSDT approach aims the education and training of employees supported by social tools (4) (see section 3 from Ferreira, Moreira & Seruca (2014b)). Training strategies and training in the organization (2) are aligned with the organizational strategy (1). In order to allow a more flexible scheme of education and training, the model also allows the training proposed by the employees of the organization. Attending the training will be mandatory or optional, according to the strategy defined for training (3). The definition / adjustment of the training strategy (2) must be periodical so that it fits to the evolution / needs of the organization.

The model identifies and presents the relationships and interactions between the organizational strategy, the training needs of the employees, social tools, training strategies and their implications for practice and training in the workplace.

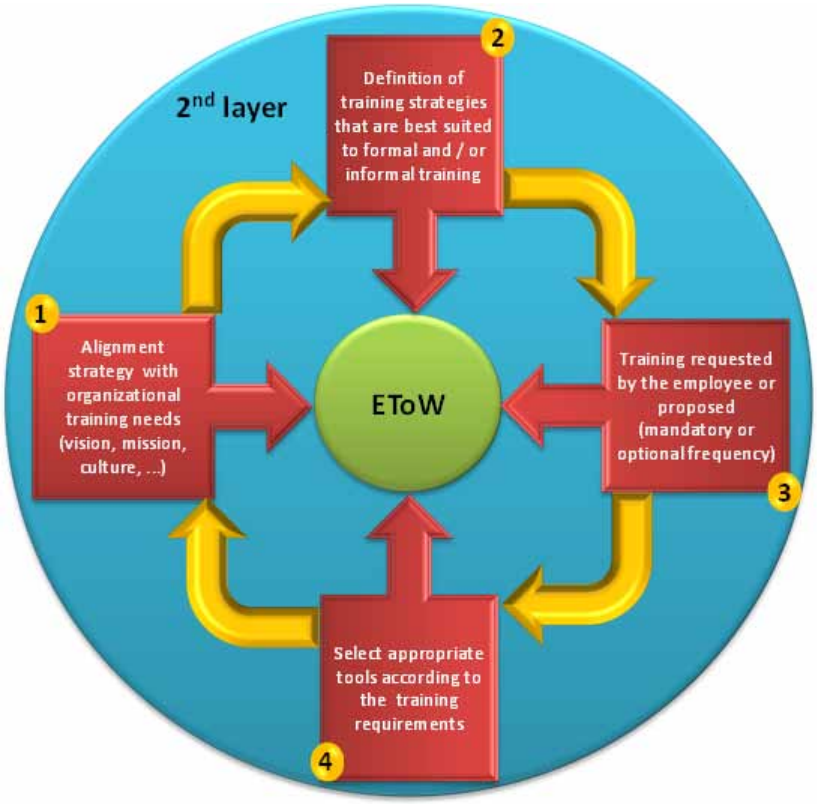
Regarding the use of Social Media tools, the model foresees a rather complete set of tools to be used within the training activities, which can be organized inside and outside the organization, i.e., in different learning contexts. We may assert that the model supports a learning classroom / distance, on the type of peer-to-peer mentoring or formal learning. In the learning type mentoring peer-to-peer, the instructor acts as an observer / facilitator. whilest in the formal learning type, the instructor acts as an educator.

The use of social tools in learning is described in EToW as collaborative learning. That means that employees learn through participation and involvement with the (internal and external) social tools, connecting, interacting and collaborating to obtain or share information and / or knowledge through this kind of tools.

The use of social tools leads to the existence of sharing (implicit or explicit) of information on personal and professional networks. Thus, in order to overcome this potential problem (public exposure of information and knowledge owned by the organization), the creation of private groups is proposed, with restricted access to employees. Any violation of the established rules will be subject to sanctions.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 5. EToW model



The proposed model intends to promote the development of a culture of training and learning that supports lifelong training, adding value to the organizational development, as well as being central to achieve the objectives set in aligning organizational strategy with organizational training needs. Without a culture of learning incorporated into the ecosystem of the organization, it is unlikely that any training strategy in the organization may be successful.

CONCLUSION AND FURTHER WORK

This paper aimed to give an overview of the state-of-the art of the issues underlying the undertaking by organizations of social business supported by social media tools. Then it further developed the m_CSDT approach, consisting in a three-layer framework that covers (1) the systematization of the creation, sharing and documentation of information and knowledge in and out of an organization, (2) the education and training of organizational workers and (3) ad-hoc discussion.

Even though the m_CSDT approach seems to be a valuable contribution to offer a new context to the traditional way of performing business - the social business context, in order to achieve organizational well-being in the agility and collective intelligence dimensions, the approach needs a greater degree of formalization.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

The main difference between a traditional organization with and without social business is the involvement of the customers, business partners and employees in the life of an organization. Both visions present benefits and drawbacks. In particular, it is envisaged that the m_CSDT approach will allow the implementation of social business in an organization. The approach is focused on the production of value for the customer, reducing whatever does not add value from his point of view as well as to the organization itself. Therefore, the involvement of the organization ecosystem is of paramount importance to achieve this goal. On the contrary, traditional approaches allow the conduction of business within an organization in a closed way.

Despite the successes and progress made to date, many important topics remain open for investigation with respect to providing appropriate approaches to undertake social business in organizations supported by the use of social media tools.

Many of the results achieved so far in social business supported by social media tools have come from joint work between researchers and organizations. Awareness, education and systematization remain three of the biggest issues to develop for those working in social business.

Researchers need to have practical experience as well as a sound theoretical foundation. Practitioners need to be equipped with a variety of approaches to use where appropriate depending on what is best suited to a given situation. Customers need to understand the importance of the process, believe in it, and support the efforts involved in doing it right. That was the context for the proposal of the m_CSDT approach.

Even though we have progressed in the conceptualization of the m_CSDT approach, it needs to be conceptualized to a full extent, as well as implemented and validated in an organizational context.

Finally, the third layer will not be the object of study in this conceptualization, because as it can be concluded from the name itself, it is intended that *the promotion of ad- hoc discussion* is unrestricted and not planned. However the analysis of the results will be held through the in indicators set for the first layer.

Chapter 82
The Entrepreneur and Its Vision of Economic Development: Changes in the Corporate Tissue – Case Study Haiti

Angelica María Jimenez Coronado
Universidad del Norte, Colombia & Universidad del Atlántico, Colombia

Carmen Esther Marquez Ariza
International Caritas ONG, Colombia

ABSTRACT

The main objective of this study, developed in the capital of Haiti, is to determine the effect of the business fabric to strengthen the social, economic, political and environmental structure of some variables of economic performance pertinent to the lack of alternatives and the need to meet basic daily needs and to identify innovation factors in different sectors to boost the economy in Haiti, according to the Global Entrepreneurship Monitor study (GEM, 2016). The methodology is based on qualitative descriptive study developed from 17 in-depth interviews to determine the economic strategies of sustainability from the informality in young people and women with a greater perspective of innovation and challenge in spite of the environmental catastrophes that have not allowed the continuous growth of the Business economy. The results suggest some basic elements to build integral and dynamic strategy that seeks to attack the structural aspects and the manifestations to create impacts in the enterprise achieving sustainable and sustainable companies that can achieve changes with capacity for innovation.

INTRODUCTION

Haiti is the poorest country in the Western Hemisphere and is among the poorest countries in the world, living more than 80% of its population below the absolute poverty level. The economy depends to a large extent on donations and donations received abroad and political stability, which is achieved with the collaboration of the government and its just and honest government to fight corruption.

On January 12, 2010, a devastating earthquake measuring 7.0 hit Haiti and left more than 200,000 dead, 1.5 million refugees and more than 300,000 buildings destroyed. Since then, Haiti has successfully passed the humanitarian recovery stage and achieved significant socio-economic progress. The country has a consistently high net enrollment rate in primary education and has achieved equal access for children.

However, as Haiti moves towards long-term sustainable development, the country continues to face significant challenges. The political system remains fragile, sustainable jobs are scarce and the environment has the same degree of vulnerability as in the past.

The latest World Bank (WB) report argues: "disappointing economic growth" Haiti over the last four decades and called for the creation of a social contract between the state and citizens to help the poorest.

According to the World Bank, Haiti has the advantages of its proximity to the US market and has a predominantly young population. But endemic poverty, weak fiscal revenues, and strong private sector concentration are obstacles that slow the development of the country.

PNUD launched the Laboratory for Innovation and Economic Development (IDE) Project in late 2014 to train young entrepreneurs with innovative projects supported by professional programs. Training is needed to find strategies to co-finance and launch Their own ventures.

In Haiti, nothing seems to be planned and long-term thinking is probably the reason why entrepreneurship is not playing a major role in economic development (Financial Times, 2015). This short term is the majority of the population. However, it is not an absolute truth because the largely minority population group, the wealthy or the economic elite, entrepreneurs responsible for the effects of rich countries, that is, people with a long-term business vision with Perspective of company growth and personal enrichment. Sometimes 'peppered' here and there with a social touch, compared to the increasing phenomenon of Corporate Social Responsibility (CSR).

This chapter of the book is based on entrepreneurship that points to the Haitian context, where the business focus attaches importance to the lack of alternatives and the need to meet basic daily needs and identify factors of innovation in different sectors to promote the Economy in Haiti.

Certainly there are debates, where the academics have highlighted several dimensions relevant to evidence studies on social entrepreneurship, with implications for the definition of social entrepreneurship, and this is a case without exception; Self-perception as a social enterprise is commonly used in empirical studies to identify social entrepreneurs or social entrepreneurs (Lyon, Teasdale & Baldock, 2010; Mair, Battilana and Cardenas, 2012), Meyskens, Robb-Post, Stamp, Carsrud and Reynolds Suggesting that the fact that individuals consider their company to be a social enterprise is key to understanding their mission and activities. Similarly, some authors have analyzed the choice of activities as well as patterns of profit distribution as a way of assessing the coexistence of social and profitability objectives and thus determining the social entrepreneurial nature of a company (Doherty et al., 2014; Santos, 2012; Zahra et al., 2009). Other research highlights the diversity that exists between social enterprises, leading to the development of typologies based on a variety of dimensions (e.g. Mair et al., 2012; Zahra et al., 2009)

Most definitions of social entrepreneurship are practical (Mair & Martí, 2006; Santos, 2012). For example, Mort, Weerawardena and Carnegie (2002) wrote that social entrepreneurship is multidimensional and covers entrepreneurial activities (entrepreneurship) in achieving social mission. Its emphasis is on the achievement of a social mission, which is accompanied by a balance between goals and immoral actions. Social entrepreneurship is described as the action of individuals for change using principles and business models to meet social needs, to address social problems and to maintain social values. This can be done by using innovation to create products, services and new economic markets (Dees & Anderson, 2006; Dees, 1998). Despite the fact that political and economic conditions are not well strengthened in

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Haiti, it creates a framework for understanding empirical studies and the literature indicates that social entrepreneurship offers economic opportunities, even for the poor. Schumpeter, cited in Santos (2012), understood social entrepreneurship as entrepreneurs in general with respect to the production of new goods, the discovery of new production methods and new markets, as well as the creation of new organizations. Entrepreneurs, including social entrepreneurs, act as agents of significant changes in the economy and thus become agents of economic growth and job creation and wealth that can improve the well-being of the community (Wiklund, Davidsson, Audretsch and Karlsson, 2011).

CURRENT SITUATION OF THE ENTREPRENEUR IN HAITI

Haiti was a country born of a slave revolution, the spirit of slavery remains a systematic looting of public funds by officials who have kept people in poverty (Thomson, 2004). Haiti was once the richest French colony. It was even called the "Pearl of the West Indies", but today it is one of the poorest countries in the world. Life expectancy (62 years), infant mortality (80%), maternal mortality (523 per 100,000 live births) and adult illiteracy (50%), unemployment among the active population is very high, with 65% Of the population living below the poverty line (Roc, 2008). Between 1800 and 2009, the services sector went from less than 5% to 60% of Haiti's GDP. The transition from the primary sector as the main sector of the country's economy to the services sector is mainly due to the change in activity of a large part of the population (Benedique et al, 2010).

Tourism is often described as one of the largest industries in the world (Cooper and Hall, 2008: 252). When it comes to the Caribbean most people think of the sunny islands of white beach paradise, colorful cocktails and lively music. Because the region is very diverse, not all islands are "dedicated to the brand and commercialization of paradise" (Sheller, 2004, p. 23). For example, Haiti and the Dominican Republic have two different images. On the one hand, we have one of the most visited islands in the Caribbean (Dominican Republic), on the other hand, Haiti, classified as an insecure destination (Higate and Henry, 2009), is perceived as a place where the worst is always likely to occur Bonnet, 2010). Haiti used to be the most popular tourist destination in the Caribbean between 1940e - 1960e (Séraphin, 2010) and as such attracted an international jet set. Mick Jagger, Charles Addams, Jackie Kennedy, etc. They were among those who popularized Haiti (Thomson, 2004). In fact, in 1951, the island received 10,788 visitors and in 1956, 67,700 tourists visited the island. The number of tourists has multiplied by 6 in 5 years (Jules and Laplanche, 2006).

In 1957, the dictatorship and the atmosphere of terror organized by François Duvalier and his Tontons Macoutes, paralyzed the country's tourist industry. When Jean Claude Duvalier became president in 1972, the island's situation improved slightly. In the late 1970s and 1980s, things changed drastically for Haiti. During this decade fate went through a serious economic crisis that became a socio-political crisis. Between 1987 and 2004, the number of tourists increased from 239,200 in 1987 to 108,868 in 2004, representing a decrease of more than 54% in the number of visitors in 17 years. Today, Haiti is one of the least visited islands for three main reasons: Political instability; The climate of insecurity and, finally, the lack of facilities for tourists (Séraphin, 2011).

Haiti is currently a very vulnerable context, as the continent's poorest country due to two major catastrophes: 1. Earthquake occurred in 2010 2. Hurricane Matthew in 2016. For this reason, Haiti remains vulnerable to natural disasters, for Therefore, the priority objective is to foster resilience. In addition, PNUD supports the country's Civil Protection Directorate to better prepare for emergencies, implement

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

a national disaster risk management system, improve risk management and develop long-term projects that promote recovery and sustainable development.

Haiti ranks last in the PNUD Human Development list in the Americas. Its economy is ruined, infrastructures are non-existent and unemployment has become a chronic problem. It is necessary to train young people, women, entrepreneurs and the whole population to strengthen entrepreneurship.

ENTREPRENEURSHIP: AN ANALYSIS OF IDENTIFICATION OF THE PROFILES OF THE EMPLOYEES OF THE INFORMAL ECONOMY

Entrepreneurship contributes phenomenally to the welfare and wealth of society. Some consequences and constructive energies generated by the entrepreneurial movement are: competition, variety, selection, cooperation, transformation, evolution, imitation, innovation, scientific and knowledge advancement, among others. For Schumpeter (1934), the entrepreneur is the founder of a new company, an innovator that breaks with the traditional way of doing things, with established routines. Must be a person with leadership skills, and a special talent to identify the best way to act. The entrepreneur has the "ability to see things as no one sees them, entrepreneurs are not managers (like Marshall) or investors, they are a special type of people" (pp. 77-78).

The entrepreneurial spirit is characterized by the transformation of innovation, knowledge, opportunities or ideas for the creation of new companies in order to obtain benefits and stimulate social and economic changes. According to the literature, for these changes to occur, it is necessary to have high levels of regional business activity. The economic enterprise seeks to know the elements that stimulate business activity as an impact of economic growth for the new institutional economy.

In the Haitian context, the formulation of projects to contribute to the development of the Haitian private sector through the promotion of micro-enterprises is analyzed. The specific objective is to develop a micro-franchise system, managed by women to create sustainable microenterprises with social responsibility. For this reason, entrepreneurship in the Dominican Republic is a reality, proof of the many initiatives that several sectors are making to support the creativity and talent of our population. In this order, the Ministry of Industry and Commerce (MIC); And the NGO Cives Mundi launched the initiative "El Hueco Caribe: Promoting Social Entrepreneurship in the Dominican Republic and in Haiti" with the support of ERASMUS + from the European Commission.

Economic regions have a number of unique resources to stimulate activities that lead to sustained economic development. There are regions more conducive to entrepreneurship than others (Mueller, 2004). In addition, there are regions with similar business characteristics and different development rates (Acs & Armington, 2003). Consequently, Ignacio Méndez, current deputy minister of Promotion of SMEs for SMEs, said that this initiative is part of the first program to promote social and rural entrepreneurship in the nation. The initiative aims to increase the capacities of vulnerable youth, their organizations, universities and NGOs, to develop social enterprises in the country and the neighboring nation of Haiti.

Mendez says that this program will impact at least 6,000 people; 1,200 families and will promote the birth of 120 social enterprises.

The deputy minister announced a call to social entrepreneurs from all over the country to present their business ideas in a contest where they can access seed capital of up to RD $ 150,000.

Business activity is a key element for economic development. Business activity can be identified in societies, regions or organizations that identify business opportunities to generate wealth (George and

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Zahra, 2002). These environments are characterized by accepting controversial situations as normal, the ability to depersonalize politics, a long-term emphasis on education in schools, openness to pay taxes to maintain public infrastructure and flexibility and diversity of community leaders (MacKenzie, 1992). The lack of a business environment can be felt regionally in a shortage in the creation of systems of innovation. The research has found evidence of this indicating that culture is determinant in the production of entrepreneurs (Amit et al., 1993). It has been shown that business activity varies according to the combination of resources, factors or elements that exist in the regions.

There is a gap between public policies and strategies implemented to foster entrepreneurship in the regions. Lundstrom and Stevenson (2002) stated that the policies that foster entrepreneurship have no theoretical basis.

ESTIMATION OF THE INFORMAL ECONOMY: YOUNG PEOPLE AND WOMEN

It is necessary to know the formal and informal economy to know the regional competitive strategies with the possible benefits of the programs that the State takes advantage of.

Formal sector: includes all employees working in establishments of 5 or more workers, as well as self-employed and employers belonging to professional groups: professionals and intellectuals, administrators and administrators, professionals and technicians, regardless of the size of the company. jobs.

Informal sector: includes all employees working in establishments with less than five employees, as well as self-employed workers and employers belonging to the following professional groups: farmers and livestock farmers, operators, drivers, artisans and operators, traders and unskilled workers . In addition, domestic and unpaid workers are included. “

CHARACTERIZATION OF BUSINESS STRATEGIES FOR SUSTAINABILITY IN HAITI

In order to develop the characterizations of this research it is tried to extend considerably the concept of social entrepreneurship with a perspective of economic development, where it involves making radical decisions for the sustainability strategy, the surveys were carried out starting from the informality of the sale of The products and was characterized in the first instance to ask ourselves To what extent does the knowledge of minority entrepreneurship apply to the successful creation of new ventures? There is a relevance of the entrepreneurship and the processes involved in the exploitation of innovative opportunities (Hindle, 2010; Welter, 2011). Studies have indicated that start-ups are highly dependent on the constraints on which entrepreneurs live and work (Schoon & Romanelli, 2001). These advances in entrepreneurial research have opened up new areas of research to explore the socio-spatial dimensions of entrepreneurship (Katz & Steyaert, 2004). This has also emphasized that not all ventures are created within “Westernized” contexts that are often assumed in traditional research. Some studies have attempted to introduce contemporary ontological perspectives (Foley, 2008, 2010; Pascal & Stewart, 2008), but most have focused on anthropological research. In particular, there are very few studies focusing on the emerging sub-field of entrepreneurship. It is argued that there may be very good convergence between SME entrepreneurship and minority entrepreneurship, which may lead to a better understanding of certain phenomena (Rigby, Mueller and Baker, 2011, Tapsell and Woods, 2010).

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Therefore, we have presented the Business Performance Model as a general framework of success to offer more plausible explanations of the entrepreneurial process in the economic sector.

METHODOLOGY

This research is approached from a qualitative and descriptive methodological approach, whose objective is to recognize rather than explain, the characteristics present in the entrepreneurs who managed to create their own business from a source of financing by the state of HAITI. For this, the methodological strategy proposed by Quivy and Campenhoudt was used in the social science research manual, based on three fundamental components: rupture, structuring, and verification. Other authors within the context studied create a model of Social Entrepreneurship based on their expertise.

In the first stage, the city is selected to explore the enterprises in all their social context, in addition, the exploratory readings are carried out, and it is determined that the problem to be investigated is the entrepreneur. The second phase begins with the theoretical structuring, and the postulates of the GEM were chosen to validate the information. In the last component, the fieldwork was carried out, the collection instrument was elaborated and applied, the information collected was analyzed, the results obtained are compared with the expected results; And finally come to the conclusions.

The instruments used for data collection were the following:

- **Secondary Sources, Electronic Databases Were Consulted:** Books, articles of great impact in indexed journals. Printed books, web page information, and conference proceedings were also used.
- **The Methodological Tool Used:** In-depth semistructured interviews.
- Information from primary sources, obtained directly from the Chamber of Commerce and Industry of Northern Haiti.

Method: The fieldwork begins with the information obtained directly from the Chamber of Commerce and Industry of Northern Haiti, which was validated with the information by calls of the website and updating of the databases of the entity. Once all the entrepreneurs have been identified, a random sample of 22 SMEs[1] is taken. These entrepreneurs were contacted by e-mail, calls to landlines and mobiles, as well as visits to the place of their residence or office. This allowed to confirm the participation in the investigation of 17 people, as well as the impossibility of the remaining 5 because of difficulties in the location. This situation determined that the study was carried out with 17 entrepreneurs.

The semi-structured interview in depth is elaborated simultaneously to the selection of the subjects' subject of the present study. The instrument was designed with questions such as age, gender, academic background, income level, among other aspects that were framed in the characterization revealed by the GEM (2016) to apply them in the city of Puerto Principe. The structure of the survey allowed a prompt response on the part of the entrepreneurs, who acceded without any inconvenience. Once the information is compiled, the data analysis is performed, which allowed to graph this information for each of the situations encountered. In the end, the results of the survey were compared with each of the dimensions proposed by the GEM (2016) for the City of Puerto Principe in Haiti.

Once analyzed the situation of these 22 entrepreneurs was found: 5 retired from their activity and 17 found that they are active and participated in the survey. The instrument used is based on the characterization proposed by GEM 2016 for the city of Puerto Principe. The results of the survey are analyzed against similar studies, which are revealed in the following Figures:

Most are in the stage of new companies or baby business, with duration between 3 and 42 months of operation according to the GEM (2016). There is an increase in the life cycle of companies during the first year of life, where the highest mortality rate occurs.

These entrepreneurs are mostly in the process of seeking resources for the consolidation and establishment of the company (Castro et al., 2015). Therefore, they do not have a dedicated dedication to the company constituted, but obtain additional income from the exercise of their profession.

It is relevant to know within the process of creation of the enterprise on gender trends, and it is evident more non-recurrent that men influence this initiative very much although the female gender tend to be the same. Although they are almost equal, the participation of women is lower than that of men (GEM, 2016).

In terms of age, according to Figure 5 shows that the greatest number of entrepreneurs oscillate between 25 and 29 years of age. It is emphasized that the younger the age, the less fear of failure and the older the decision to fail is more fearful. (GEM, 2017)

The academic formation of these entrepreneurs, is in accordance with the context of economic development, because there is a margin of error with a tendency not to formalize their entrepreneurship

by not assuming very relevant tax rates where their business profits diminish. It is evident for this case study, is found most entrepreneurs belong to a group of university professionals without specialization

In Haiti for 2016 the state increased 25% by Presidential decree, in order to respond to a strong daily degradation of the lives of wage earners in the face of strong inflation. As of May 1, the remuneration of the eight-hour working day in the industrial sector goes from 240 gourdes ($ 3.87) to 300 gourdes ($ 4.84). Most entrepreneurs earn less than 3 minimum wages. This explains why the rate of performance and informality where many entrepreneurs of Survival are born. (GEM, 2016).

At this point only 8 entrepreneurs claimed to have met someone before creating their company. It is noteworthy that due to the acquired training of entrepreneurship in their academic stage plus their own entrepreneurial initiative, they embarked on the path of creating their own business.

It is important as the family, people with business experience, the company where he worked, the spouse, among others; Were determining factors that influence in creating its own company. (GEM, 2016).

As a result, new enterprises contribute to economic development, they build a source of employment. Therefore, it is very important to motivate the entrepreneurs to take the ability to play a fundamental part in the quest to find not only them but other people to provide a better quality of life.

The response of the entrepreneurs once again demonstrates their ability to change to achieve a better present and to obtain a prosperous future, in addition, they are considered a contribution mainly to their

- It is considered in its maximum expression the creation of company, as a radical change in their lives and their professional projection.
- It recognizes the lack of motivation of the state to support and strengthen the media for new entrepreneurs, there are not many entrepreneurship programs.

PERSPECTIVE OF ENTREPRENEURSHIP OF INNOVATION AND THE IMPACT OF PUBLIC POLICIES

The social factors integrated in this model are education and culture (Acs & Armington, 2003, Acs et al., 2006, Armington & Acs, 2002, Kostova, 1997). Education is analyzed through the number of people formed with the intention of creating a company (Beugelsdijk & Noorderhaven, 2004). Culture is analyzed through innovative capacity and the promotion of entrepreneurship in a region.

Business activity will be defined, according to Bosma and Harding (2006), as the number of people who are in the process of starting a business or who are already new owners of a company. The entrepreneurial elements identified are the markets for goods and services, opportunities, the business environment and innovation.

That is why it is necessary for people to commit themselves to reach their maximum potential to achieve the objectives of creating and sustaining a business unit through specialized services through financing strategies, from an acceleration where they think and act to overcome obstacles And grow.

Entrepreneurship in Haiti is a challenge and in particular women entrepreneurship is essential to a nation's economy in economic development and poverty reduction. In addition, entrepreneurship in the Dominican Republic is a reality, in order to support the creativity and talent of our population. In this order, the Ministry of Industry and Commerce (MIC); And the NGO Cives Mundi launched the initiative "El Hueco Caribe: Promoting Social Entrepreneurship in the Dominican Republic and in Haiti" with the support of ERASMUS + from the European Commission.

A context with dynamic capacities is needed to create sustainable and sustainable enterprises capable of absorbing components that leverage changes with capacity for innovation. For Schumpeter (in Teece et al., 1997 and Wang and Ahmed, 2007), the capacity for innovation is characterized by the development of new products and services, the development of new production methods, the identification of new markets, the discovery of New sources of supply and the development of new forms of organization. Wang and Ahmed (2007) define it as the ability of the company to develop new products and / or markets, aligning an innovative strategic orientation with new behaviors and processes. Therefore, innovation capacity explains the links between the company's resources and capabilities with its portfolio of products and markets when the company operates in fast-changing environments.

CONCLUSION

Haiti presents an economic, social and environmental situation that has repercussions on the projects of companies that want to be called to obtain a dynamic economic development in the Country. Political actors have major challenges and strengthen them in their environmental and economic structure, creating new public policies that deliver the support of the international community and their own efforts to achieve the livelihood struggle and that of their family.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

In order to improve the economic role of young people and women through the formal involvement of the company, through training in business management. Although they are present in large numbers in the informal economy, which are not taken into account in economic development indicators, they are under-represented in the formal business council.

Young people and women have recently gained a better place in public administration, they remain active in services with little or no budget. Microfinance institutions that finance their small economic activities are not really able to help them out of poverty or economically empower them.

However, by the time we were completing this research, a natural catastrophe occurred with Hurricane Matthew causing devastating damage with a large increase in casualties due to the humanitarian crisis. It can be said that the economy has been lost with statistics of 150 per cent according to some calculations. The basic infrastructure has collapsed. In other words, the standard of living of Haitians has gone from a state of construction to the 2010 earthquake, to be a place lagging behind desolation and poverty. The important thing is for the world to take a look at Haiti because everything has to be done and we must look for opportunities to create and promote companies with great social value. Ensure that the international community offers projects that give hope to build a dignified life for the Haitian people.

The objective of this research was to contribute to the debate on social entrepreneurship emphasizing the importance of incorporating contextual influences, thus responding to the demands of a better understanding of the relationship between social enterprises and their environments (Mair et al., 2012) and With the help of the Global Entrepreneurship Monitor - GEM, to observe the role of entrepreneurship from a team of experts to measure business activities according to the abilities of individuals, their activities and aspirations can clarify doubts, exploring the influence of the contextual dimensions that Are particularly prominent in Haiti, thus underscoring the ideas that can be derived from the use of Haitian data to inform broader academic discussions. We develop predictions about the impact of poverty, informality, the history of colonization and ethnic identity on the self-perception of the company as a social enterprise and in its options of activities that reflect its social mission.

A new debate on the role of social entrepreneurship in the creation of economic opportunities for the poor is proposed for the new research. A review of the role of social entrepreneurship in literature and society shows that social entrepreneurship has expanded access to financial sources, promoted the use of social innovations to reduce social problems, empowered people and social inclusion And job creator. The first three factors generate income for the poor, allowing economic opportunities, while the latter eliminates the deprivation of capabilities that enable the poor to get involved and engage in economic activities. All these factors allow economic opportunities for the poor. The links between social entrepreneurship and economic opportunities in this research occur in the current context.

Trying to answer these questions in the Haitian context is a challenge for poverty and the phenomenon of social entrepreneurship that must be faced: *¿How to transform the dreams of entrepreneurs into successful businesses that can grow, generate quality employment and export? What are the innovative ideas that Haitians could develop to transform the country's economy?*

Chapter 83
Created Shared Value and Sustainable, Inclusive Development of Developing Countries

James Odia
University of Benin, Nigeria

ABSTRACT

The created shared value represents a paradigm shift in business corporate social responsibility (CSR) and sustainability strategy. Apart from addressing the limitations inherent in the traditional CSR which is mainly philanthropic, short-lived and separated from the core business strategy and activities, it enhances the company's competitiveness while simultaneously advancing the economic and social conditions in the community of operation. Companies can create shared values through re-conceiving products and markets, redefining productivity in the value chain and building supportive industry clusters at the company's locations and solving society problems. Despite the criticisms and challenges of the shared value concept, there are convincing evidences that the created shared value is a veritable instrument for addressing the bottom of the pyramid resulting in inclusive, sustainable development of developing countries and it has the potentials to unleash the next wave of global economic growth, prosperity and sustainable development when governments, companies and non-government organizations in developing countries demonstrate commitment to their roles in shared value creation and companies start to think and take long-term views of social investments and economic prosperity, and look at corporate decisions and opportunities through the lens of shared value by incorporating social and societal values into their economic agenda.

INTRODUCTION

The concept of Created Shared Value (CSV) has been pioneered by Professor Michael Porter and Mark Kramer of the Harvard University since 2011. Although the idea of shared value was first expressed in their publication in the Harvard Business Review on "Strategy and society: The link between competitive advantage and corporate social responsibility" in 2006 where they advocated a mutual dependence

between corporations and society or a win-win business-society relationship. There would be a symbiotic relationship and reciprocity between business and society as firms redefine and readjust their concept of value in a broader, more "shared" perspective (Davenport, 2011). It is business paving ground for its own success by curing the defects of a dysfunctional society through provision of infrastructure (such as roads, water supplies, schools) required for its production and produce shared value for the whole area (Kleemann & Krieger-Boden, 2011).

The CSV is a new revolutionary way of business thinking in the business-society relationship, which integrates social goals within business practice without distracting a firm from its primary purpose of achieving profit (Porter & Kramer, 2011; Rocchi & Fererro, 2014). This could trigger once again the greatest economic wealth, growth and innovation for humanity and business (Porter & Kramer, 2011). According to Porter and Kramer (2011), shared value can be defined as policies and operating practices that enhance the competitiveness of a company while simultaneously advancing the economic and social conditions in the community in which it operates and companies can create shared values through re-conceiving products and markets, redefining productivity in the value chain and building supportive industry clusters at the company's locations.

Porter and Kramer's propositions for the CSV have been laudable and applauded by many supporters (Bockstette & Stamp, 2011; Hills, Russell, Borgonovi, Doty, & Lyer, 2012; Pfitzer, Bockstette & Stamp, 2013; Visser, 2013) in re-connecting the disconnected corporations' successes to society's development, particularly in the advancement of social causes to strategic level, specifying the roles of government in enhancing shared value and introducing a broader conception of capitalism- the "caring or conscious capitalism". Without doubts, the world has experienced unparalleled prosperity following the industrial revolution and the free-market economy. Nevertheless Ringmar (2005) argued that although capitalism has produced comparable levels of economic prosperity, it has brought to human beings and societies the consequences of income inequality, erosion of non-market values, commodification and alienation of people and hence it should be controlled.

The arguments on CSR have revolved around the CSR continuum of Professor Friedman's neo-classical economic theory and Professor Freeman's stakeholder theory. Although Porter and Kramer (2011) argued that CSV is not social responsibility, philanthropy or even sustainability, it does appear that CSV is beyond CSR of business! In fact, In every country, particularly the developing ones, CSR has become inescapable priority for businesses (Porter & Kramer, 2006; Jean & Yazdanifard, 2015) and they are being blamed for every society's failures (Porter & Kramer, 2011), as corporate prosperity at the expense of the society's deep poverty and problems. Moreover, most of companies' efforts have not pay off greatly in their productivity due to the disconnect from or the ditch against society and the failure to link CSR to their strategy (Porter & Kramer, 2006). Porter and Kramer (2011) argued that there is a growing perception of companies' successes at the expense of society's social, environmental and economic problems. The companies' CSR have not been strategic to be a source of business opportunity, innovation, revenue growth, competitive advantage and benefits to society (Moore, 2014).

The CSV represents a win-win situation where an organization creates value for the society by tackling its needs and challenges in a way, which also creates economic value to them. Epstein (2012) remarks that CSV will grow future markets as well as strengthen economies and communities The CSV challenges the academic literature on corporate social responsibility as well as business practice in the few years of its existence. No wonder, CSV has been studied from different point of views, contexts such as industrial sectors and multinationals, social entrepreneurship (Pirson, 2012) and countries e.g. Brazil (Spitzek & Chapman, 2012), India (Vaidyanathan & Scott, 2012), and Australia (Leth & Hems,

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

2014). Some have tried to reconstruct/redesign or extend the original CSV framework by Porter and Kramer (Michelini & Fiorentino, 2012; Moon, Pare, Yim & Park, 2011) and/or widely applied the CSV to regional development, poverty reduction and to other disciplines like finance and banking (Bockstette, Pfitzer, Smith, Bhavaraju, Priestley & Bhatt 2014), education (Kramer &Tallant, 2014), global health (Peterson, Rehrig, Stamp & Kim, 2012), oil, gas and mining companies (Hidalgo, Peterson, Sith & Foley, 2014), agriculture, business corporate strategy, low-income markets and emerging markets (Hills, Russell, Borgonovi, Doty & Iyer, 2012).

A global assessment of CSV projects by Kreckova (2015) shows that CSV by regions is very uneven with South America, Central America and Caribbean region (22%), Africa (18%), North America (14%) and Asia (14%). The top social incidents are health and nutrition projects (21%), education, including workforce development (19%), financial inclusion, human rights and poverty with 9% each. Again AT Kearney (2015) study of over 200 social impact initiatives of United Nations Global Compact led companies reveals that 40% was shared value, 35% fall into philanthropy and 25% in community investments. This study was different from 2011 study where 75% of corporate social investment was philanthropy. The reason for the shift was attributed to the increased focus on minimizing environmental impacts and expanding employment and educational opportunities.

There are lots of literature and empirical evidences that the CSR approach in the developing countries of Africa including Nigeria has been mainly philanthropic and normative CSR (Visser, 2006, 2008; Visser, Matten, Pohl & Tolhurst, 2007; Amaeshi, Adi, Ogbechie & Amao, 2006; Odia, 2016). There are also increasing expectations by various stakeholders that corporate organizations, especially the multinational companies (MNCs) and transnational companies (TNCs) should go beyond profit maximization and regulatory compliance to take up responsibilities that make significant impact on society by helping to remedy the social problems including the ones caused by them (Odia, 2016). Some of the multinational oil companies in Nigeria like Shell Petroleum and Chevron have tried to move towards value sharing in their social responsiveness to oil producing communities in the Niger Delta region through partnership and social investments in host communities. Chevron's Partnership Initiatives in the Niger Delta (PIND) through the collaborative venture with the United States Agency for International Development (USAID), the Department for International Development (DFID), and others was aimed at enabling economic growth in the nine (9) oil-producing States of the Niger Delta area of Nigeria through investment of over $100 million in five years to create opportunities in other areas other than its value chain.

The CSV may just be the desired solution that the stakeholders have been waiting for to make corporations break away from the restricted CSR involvement to embrace the broader view of "caring, conscious capitalism" and respond to social issues and problems (Visser, 2013; Kreckova, 2015). While there are social and economic benefits, and prospects associated with CSV to the society and businesses at least from evidences of companies that have keyed into the CSV, a research gap exists on how CVS is linked to the sustainable, inclusive development of developing countries. There are also numerous limitations and criticisms regarding CSV such as: measurement issues, changing corporate mindsets to view environmental and social problems not as constraints but as business opportunities, gaining support of top management of MNCs, TNCs and other companies to key in and their voluntary CSV compliance and getting support of governments and agencies at the local, national and international levels to encourage more businesses to adopt shared value strategies.

Therefore, based on the review of extant literature and case studies on CSV, the objective of the chapter is to examine the relationship between CVS and sustainable, inclusive development from the perspective of developing countries like Nigeria. The rest of the chapter is divided into four sections:

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

The immediate section clarifies the concept of CSV and differentiates it from CSR. Section three considers the issues, controversies and problems relating to CSV such as the problems with the presents CSR, the creation of shared value, shared valued opportunities in the extractive industries including the roles of government, extractive industries and civil society in creating in-country shared value, CSV opportunities and benefits in developing countries, criticisms and limitations of CSV measurement and the inclusive, sustainable development through CSV. Section four proffers solutions and recommendations to the constraints of the effective implementation of CSV in developing countries. Section five is the conclusion and suggestions for further study.

BACKGROUND

The Concept of Created Share Value

According to Porter and Kramer (2011), shared value can be defined as policies and operating practices that enhance the competitiveness of a company while simultaneously advancing the economic and social conditions in the community in which it operates. Shared value was born due to the need to address societal needs, mostly in the bottom-of-the-pyramid segments of the customers (Kreckova, 2015). Shared value creation focuses on identifying and expanding the connections between societal and economic progress. It describes how firms can incorporate CSR activities to their overall business strategy so that they not solely represent a cost but also create value for the firm in terms of a unique market position. Creating shared value implies ethical standards and complying with the law, and it also considers any mitigation after harms that may affect results of business practices. Shared value involves creating economic value in a way that also creates value for society by addressing its needs and challenges. It aligns CSR activities with core business activities to generate business returns and thereby create a business case for sustained commitment and investment (Porter & Kramer 2011). Shared value positions social engagement as a "long-term investment that is intrinsic to business success." (Bockstette & Stamp 2011, p. 21). A shared value perspective recognizes the interdependency between business and society. It is creating economic value in a way that also creates value for society by addressing its needs and challenges. The idea is combining "traditional objectives with additional benefits for society" (Altman & Berman, 2011).

Again shared value is being referred to as a new way to address the underlying root causes of community concerns and unlock economic opportunities for companies in the extractives sector which have made little progress using current approaches (philanthropy, reputation building, local content requirements), with rising disputes, unending conflicts, violence and militancy like in the Niger Delta Region of Nigeria. CSV is a differentiation strategy (Spitzeck & Chapman 2012) that creates business value by tackling social issues or converting social issues into tangible business opportunities based on three pillars of (i) re-conceiving products and markets, (ii) re-defining productivity in the value chain and (iii) enabling local clusters development (Porter & Kramer, 2011; Porter, Hills, Pfitzer, Patscheke & Hawkins, 2012).

Although there are numerous social issues as generic, value chain social impacts and social dimensions of competitive context impacts, the CSV concept focuses particularly on those issues within the business context that have significant impact on firm competitiveness. The CSV is about creating social and business values simultaneously. The social values refer to positive improvements in the social issues targeted by the firm, and social outcomes or social changes that are needed to be achieved. The business

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

values are the actual economic benefits to the firms (Porter et al., 2012). According to Porter and Kramer (2011), the most pressing social issues that could be targeted by shared value strategy include supplier access and viability, employee skills, worker safety, employee health, water use, energy use, and environmental impact. It is argued that businesses acting as businesses, not as charitable, philanthropic givers, are arguably the most powerful force to address pressing society's issues. It is believed that businesses' quest to create economic value while simultaneously creating shared value for society will give rise to far broader opportunities for strategy and profitability that would drive the next wave of innovation, productivity and economic growth while also motivating and attracting consumers, business partners, employees, shareholders, and the public to them (Porter, 2014). This is because only the companies who address social issues strategically and understand the interdependence between business and society (Porter & Kramer, 2006, 2011) would be able to compete in this new world (Bockstette, 2011; Porter & Kramer, 2011). It must be emphasized that solving social problems requires innovation (Pfitzer et al., 2013), collective impact (Kania & Kramer, 2011) and changes to the traditional CSR mindset.

While many researchers have presented corporate responsibility with regard to social and environmental problems as an ethical duty (Donaldson & Dunfee, 1999), a political responsibility (Scherer & Palazzo, 2007, 2011; Whelan, 2012; Néron, 2013; Whelan, 2013; Scherer, Palazzo & Matten, 2014) or a response to business risks (Fombrun, Gardberg & Barnett, 2000), the CSV makes corporations to see social and environmental problems not as disconnected and externally imposed but as real opportunities and serious strategic targets for genuine business decisions. According to Brown and Knudsen (2013), the shared value replaces and expands the notion of CSR, which as a practice has too often become affiliated with misguided initiatives, costly sideshows and shallow public relation activities.

Camilleri (2012) has argued that there seems to be Adam Smith's "invisible hand" in force with regard to the CSV conceptualization since businesses contribute to society's value creation when they pursue their own interests. Thus the CSV argument tends to support Adam Smith's (1776) remark that it is not from the benevolence of the butcher, the brewer or the baker, that we can expect our dinner, but from their regard to their own interest. Again, Moczadlo (2015) argues that taking into account the examples cited by Porter and Kramer in their 2011 article, their understanding of CSV seems to correspond in some respects with strategic CSR. Strategic CSR can be located between strict compliance of given rules and regulations and good corporate citizenship (Windsor, 2013). Nonetheless, CSV is going beyond the pure business case approach of CSR because it requires integrating shared value into the core business and the long-term strategic alignment of companies. Porter and Kramer (2011) posit that strategic CSR, value co-creation, social innovation and inclusive business model follow the principle of the CSV. Young (2012) argues that CSV represents one particular model for implementing strategic CSR in larger organizations. Like CSV, strategic CSR reframes sustainability and social benefits as a driver of business innovation, value creation and competitive advantage.

The Differences Between CSR and CSV

CSV goes beyond CSR because shared value creates long-term potential for a company's profitability and competitive position in the market, while corporate social responsibility is a short-term remedy that is hard to justify in the long run. While CSR is based on being responsible, philanthropy and doing good for society, its impacts are too reactionary and cursory to make a significant impact in improving either society or the company's earnings potential. On the other hand, CSV is a readjustment of the company's overall operations in order to create new value. Again, whereas CSR is a short-term solution,

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

CSV is a long-term realignment of the company‘s entire budget, market position and overall mission. CSV is distinct from CSR where companies are challenged to sponsor the (costly) production of social goods, or like social businesses and social entrepreneurs that refrain from profit maximization in favour of a social goal and accept forgoing a higher income. Nevertheless, compliance with laws and ethical standards and reducing harm from corporate activities are assumed in both CSR and CSV (see Table 1).

The European Commission changed the definition of CSR in 2011 to include CSV as a core element for companies with their owners and shareholders respectively, as well as for other stakeholders and the society. Moreover, the Commission sees strategic CSR as an important tool for the competitiveness of companies and a measure for business to contribute to inclusive growth, employment and well-being of the society. Therefore, companies should take into account economic, social and environmental targets including ethical human rights and consumer concerns when developing their long-term business strategy. Maczaldo (2015) differentiates between the CSV of the European Commission and Porter and Kramer (see Table 2). First, the CSV of Porter and Kramer goes beyond the pure business case of CSR because CSV is a long-term measure integrated systematically into the strategic core business of companies. The Commission sees the shareholders as just one common group of a company’s stakeholders and gives no preference to them. For Porter and Kramer the simultaneous creation of profit and societal value are decisive. While the European Commission sees CSR as a driving concept, Porter and Kramer differenti-

Table 1. Differences between CSR and CSV

	Bases	CSR	CSV
1	**Motivation/focus**	Corporate reputation	Competitive advantage
2	**Main driver**	External stakeholders	Corporate strategy
3	**Approach**	Reactive and defensive	Proactive
4	**Measurement**	Spending, standard ESG metrics	Social and economics values
5	**Management**	CSR/ public affairs	Across the firm
6	**Business Benefits**	Risk reduction and goodwill	New business opportunities
7	**Social benefits**	Successful projects	Large scale, sustainable chain
8	**Value**	Doing good	Economic and societal benefits relative to cost
9	**Type**	Citizenship, philanthropy, sustainability	Joint company and community value creation
10	**Profit definition**	Separate from profit maximization	Integral to profit maximization
11	**Motives**	Discretionary in response to external pressures	Integral to competing strategy
12	**Budget**	Impact limited by company’s footprint and CSR budget	Realign the entire company’s budget.
13	**Agenda**	Defined by external reporting and personal preference	Company’s specific and internally guidelines
14	**Person(s) in charge**	Typically led by CSR, marketing, corporate communications, external/public/government affairs, community relations, sustainability and foundation departments	Typically led by CEO, senior executive team and individual champions across the company in close collaboration with corporate affairs and sustainability departments
15	**Example**	Fair trade purchasing	Transforming procurement to increase quality and yield

Table 2. Distinction between European Commission (2011) CSR and Porter and Kramer (2011) CSV

Category	European Commission (2011)	Porter and Kramer CSV
Role of business in society	CSR as core element for legitimation of business	
Pre requisite	Companies fulfill their legal obligations; collective between social partners	Companies fulfill their legal obligations
Aims	Contribution to inclusive growth and well-being of the society; triple-bottom	To reach simultaneously economic and social progress through value creation quantified by the relation of benefits to costs
Stakeholder	Shareholders, other stakeholders, the whole society	Varied with the concrete projects
Strategic orientation	CSR/CSV is a long-term strategy and included in the core activities of business	
Role of government	No strict regulation but flexible for businesses; Government procurement directives can be used to enhance CSR	Government should set clear and measurable social goals; public authorities should support business rather than over-regulate them

Source: Maczaldo (2015)

ate CSV from CSR-development of a new strategic business concept which can simultaneously create economic and societal value as well as increase the competitiveness of companies.

ISSUES, CONTROVERSIES, AND PROBLEMS

What Is Wrong With the Present (Traditional) CSR?

Basically, traditional CSR activities in most developing countries of Africa encompass employment benefits, community development and philanthropy which is not linked to the core business strategy. Porter and Kramer (2006) argued that the prevailing approach of CSR is so fragmented and so disconnected from business and its strategy that many of the greatest opportunities of companies to benefit society are obscure and lost. Again all four schools of CSR (moral obligation, license to operate sustainability, reputation) focus on the tensions between society and business rather than the interdependence; and they are not sufficient enough to enable a company to identify, prioritize and address social issues it can make the biggest impact.

According to Browne and Nuttall (2013), this CSR has failed to fulfill its core purpose in building stronger relationships with the external world because of the following. First, the head-office initiatives rarely gain the full support of the business and tend to break down in discussions over who pays and who gets the credit. Second, centralized CSR teams can easily lose touch with reality- they tend to take too narrow view of the relevant external stakeholders. Firms' investments in CSR are moderate and minimum because they consider such investments as a cost or expense factor only which takes its share of the firm's profit (Christmann & Taylor, 2006). Corporate social responsibility is considered as a means to an end, and the bare-minimum mentality de-motivates companies from further pursuing any other sort of contributory value to society (Davenport, 2011). Third, CSR focuses too closely on limiting the downside. Companies often see it only as an exercise in protecting or enhancing their reputations- to get away with irresponsible behavior elsewhere. Fourth, CSR programs tend to be short-lived and because they are separated from the company's commercial activity, they survive on the whims and caprices of

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

senior executives rather than the value they deliver. Therefore the programs are vulnerable when there are changes in management or costs are cut. Besides, they fail to see the future business opportunities and competitive advantages that may accrue to them over their competitors in the longer term. Fifth, there is wrong perception of CSR and lack of top management support. Also, it is hard to determine the social impact and business benefits of CSR.

Many MNCs do only what they must in order to please stakeholders and obtain legitimacy, seeking to keep their actions to a minimum (Chen & Bouvain, 2009; Christmann & Taylor, 2006). According to Salzmann (2004), firms are only interested in making profits while supporting employment, investments, purchases, wages and taxes without any consideration of the welfare of the community around them. The responsible actions were due to external pressure and reputation enhancing, public relation and gaining a positive score on CSR scorecards which ultimately failed to connect CSR activities to their core business strategy; and not the desire to do good (Aspelund, Fjell & Rødland, 2015; Milliman, Ferguson & Sylvester, 2008). Porter and Kramer (2006) summed up the traditional CSR as a hodgepodge of uncoordinated CSR and philanthropic activities disconnected from the company's strategy that neither make any meaningful social impact nor strengthen the firm's long-term competitiveness.

Furthermore, scholars have argued that CSR has not proved itself in businesses of the current century because it lacks criteria of differentiation for businesses to follow this theory (Szmigin & Rutherford, 2013). The benefits of traditional CSR are often nebulous, difficult to define and measure, externally influenced, and only indirectly connected to the action being taken (Bockstette & Stamp, 2011). The traditional CSR is differentiated in motivation, implementation, and impact from strategic CSR (Werner, 2009). The CSR is carried as a reactionary and reputation-enhancing agenda with no clear strategic framework link to core business. Hence the result has suboptimal economic or social impacts on stakeholders and society. The present CSR does not fully comply with the society needs; CSR means a reduction of profits for the sake of an environmental or social environmental end (Bosch-Badia, Montllor-Serrats & Tarrazon, 2013), and stakeholders' interests are being ignored (Székely & Knirch, 2005). Although CSR has some potentials to deal with environmental issues such as carbon emission, pollution, waste disposal and oil spills (Frynas, 2009), and also emphasizes various activities including corporate governance, sustainability, stakeholders management, relationship with employees, unions, suppliers and community representatives, commitment to transparent reporting and harm reduction (Petrovic-Lazarevic, 2008), it is reactive, defensive, lack active strategic choices within companies, and fail to deal with key challenges in the business-society relationships (Frynas, 2009). Jonikas (2013) contends that CSR can often create use-value for stakeholders and society but little value for companies in terms of profit increases. He suggests that CSR should become more oriented towards CSV to help companies gain sustainable competitive advantage and make significant social impact on society.

Salzmann (2005) argues that corporations currently used both social benefits theory and practice to fulfill the requirements of environmental and social issues by rising up, at the same time, the financial aspects of the firms themselves. There has been a shift from philanthropic or ancillary CSR to a more strategic perspective because the current models of CSR have been largely ineffective at addressing society's pressing and urgent challenges (Visser, 2010; McWilliams & Siegel, 2011; Young, 2012). This requires that firms should move away from the emphasis on image to emphasis on substance; from fragmented, defensive CSR posture to an integrated, affirmative approach; go beyond good corporate citizenship, philanthropy and pre-occupation with measuring shareholders' satisfaction to creating shared value by becoming more selective in mounting initiatives whose social and business benefits are larger and distinctive (Porter & Kramer, 2006). Strategic CSR helps firms to build trust and reputation,

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Table 3. Philanthropic and created shared value approach

Philanthropic Approach	Areas of Investments	CSV Approach	Business Benefit	Social Benefit
Drinking water/wells for local communities	Infrastructure e.g. water	Develop sustainable water utility leveraging business process	Reduce water treatment costs by charging commercial water rates	Provide water to communities that lack access to it
Provide broad- based skills training with no link to employment opportunities	Training	Create training program based on business and supplier needs and link it to jobs	Reduce employee costs by reducing on expatriate employees	Improve employability and wage-earning capabilities of local workforce
Invest in Environmental restoration unrelated to the business	Environment	Restore degraded coastlines or wetlands to reduce risk of a natural disaster to the business	Protect assets (e.g. pipelines) near coastlines from disasters	Improve the resilience of host communities to natural disasters
Funds construction of local clinic	Health Care	Develop program to reduce disease burden among population living in mine catchment area	Improve employee productivity and reduce company's health care costs	Reduce the disease burden in local communities
Provide scholarship for local students	Education	Catalyze coalition to improve secondary school educational outcomes in host community	Improve the quality of the future talent pool in host communities	Improve educational achievement and job prospects for students

Source: Hidalgo et al. (2014)

increase financial performance, minimize risk, gain competitive advantage, enhance strategic positioning and synergistic value creation (Porter & Kramer, 2006; Juscius & Jonikas, 2013; Fleming & Jones, 2013). Strategic CSR unlocks shared value by investing in social impacts that strengthen company's competitiveness. The CSV theory recognizes the social needs rather than focusing only on the economic needs to define markets. It also goes beyond the strategy theory by motivating companies to look at opportunities that strive to satisfy fundamental social needs of the community (Porter & Kramer, 2011).

Creation of Shared Value

Bockstette and Stamp (2011) identify ten common building blocks to create shared value to include: articulate a vision, prioritize key issues, set specific ambitious goals, deploy a wide range of assets to address the issue, manage efforts holistically across the organization, collaborate with partners, measure progress on key indicators, learn from measurement to improve efforts, address issues at scale, and communicate progress to internal and external audiences. Pfitzer et al. (2013) provide a five-step framework in the development of shared value strategy as (a) embedding a social purpose; (b) rigorously defining the social need;(c) measuring the social and business value; (d) creating the optimal innovation structure; and (e) co-creating with external stakeholders like government, universities, NGOs, and other companies. There are usually many values created but Jonikas (2013) argues that only shared value creation through CSR seems to be sustainable.

According to Porter and Kramer (2011), companies can create shared values in three levels as: re-conceiving products and markets, redefining productivity in the value chain and building supportive industry clusters at the company's locations. In order to re-conceive products and markets, companies should re-evaluate the relationships they have with their consumers, and then incorporate shared value into the process of goods exchange. They can use strong advertisement, rebrand their mission to be more

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

socially conscious and address many unmet needs in order to attract consumers to their company and products/services. This level focuses on revenue growth, market share and profitability that arise from the environmental, social, or economic development benefits delivered by a company's products and services (Porter et al, 2012). For example, Shell has established a sustainable utility company on Bonny Island, Nigeria, that serves and supply energy to over 93,000 customers (Hidalgo et al 2014).

Redefining productivity can be done in the value chain through: (a) energy use and logistics, (b) resource use, (c) procurement, (d) distribution, (e) employee productivity, and (f) location. It could also be by sub-contracting. The level focuses on improvements in internal operations that improve cost, input access, quality and productivity achieved through environmental improvements, better resource utilization, investment in employees, supplier capability and other areas. For instance, Intercontinental Hotels Group (IHG), the largest hotel company in the world, launched its Green Engage programmes in 2009 with the objective of testing dozens of options for reducing energy use, water consumption, and waste disposal in pilot hotels, and providing a detailed ranking of all possible shared value opportunities in terms of returns to IHG through substantial reductions in hotel operating costs, including energy savings of up to 25%.

Clusters include not only businesses, institutions such as academic programmes, associations and standards organizations but also broader public assets in the surrounding community such as schools and universities, clean water, fair-competition laws, quality standards and market transparency. Creating shared value from enabling local cluster development derives from improving the external environment for the company through community investments and strengthening local suppliers, local institutions, and local infrastructure in ways that also enhance business productivity. As the world's largest food and beverage company, Nestlé created clusters by implementing a rural development strategy that trains, assists and supports small diary Indian farmers with better technology in order to increase the productivity of their cattle thereby ensuring the reliable supply of high quality raw materials. In fact without a supporting cluster, productivity suffers. According to Porter and Kramer (2011), a focus on clusters and location has been all but absent in management thinking. Cluster thinking has also been missing in many economic development initiatives which have failed because they involved isolated interventions and overlooked critical complementary investments. While a key aspect of cluster building in developing and developed countries alike is the formation of open and transparent markets, companies can support cluster development in the communities in which they operate by identifying gaps and deficiencies in areas such as logistics, suppliers, distribution channels, training, market organization and educational institutions. Delgado, Porter and Stern (2010) argue that clusters help to reduce the costs and risks associated with new venture formation, and they can also increase the likelihood of survival during early years of a business' development.

They drive local competition by not only increasing operational effectiveness and strategic positioning (Porter, 2000) but also resulting in more resilient competitive advantage.

Porter and Kramer (2006) argued that firms can create shared value by using CSR strategically to achieve a competitive advantage. Companies can create and sustain a competitive advantage by cooperating with other companies in a supply chain by nurturing and building competencies through collaborative partnerships. In fact, the success of every company is affected by the supporting companies and infrastructure around it. Gradl and Jenkins (2011) noted that inclusive business model acts as a catalyst for the CSV concept. Bisgaard (2009) consideres cross-sector partnership, collaboration and alliances with non-governmental organizations (NGOs), governmental bodies and other business companies, co-

Table 4. Social and business benefits associated with the levels of shared value

Levels of Shared Value	Business Results	Social Results
Re-conceiving products and markets: How targeting unmet needs drives incremental revenue and profits	-Increased revenue - Increased market share - Increased market growth - Improved profitability	- Improved patient care - Reduced carbon footprint - Improved nutrition - Improved education
Redefining productivity in the value chain: How better management of internal operations increases productivity and reduces risks	-Improved productivity -Reduced logistical and operating costs -Secured supply -Improved quality -Improved profitability	- Reduced energy use - Reduced water use - Reduced raw materials - Improved job skills - Improved employee incomes
Enabling cluster development: How changing societal conditions outside the company unleashes new growth and productivity gains	-Reduced costs - Secured supply - Improved distribution infrastructure - Improved workforce access - Improved profitability	-Improved education - Increased job creation - Improved health - Improved incomes

Source: Porter et al (2012)

creation with stakeholders and development of new business models as the strategic dimensions to create shared value. Saul (2011) focuses on social innovation to enhance shared value creation.

Fjell and Rødland (2015) found that MNCs can create shared value by pursuing the two different methods of responsible differentiations to obtain competitive advantage over competitors, and by sustainable value innovation to have a blue ocean based on responsible actions (green planet strategy). Also a company can instigate shared value by solving problems through the products and services it creates, addressing problems through company operations, including better use of natural resources and a business investing outside its operations in order to solve problems connected with company growth and productivity, such as improving growing techniques. According to Porter and Kramer (2011), to create social value companies must invest in areas that address social and environmental objective; to create share value they must invest in long-term business competitiveness that simultaneously address social and environmental objectives and to create business value, they should invest in long-term competitiveness. Effective internal communication of CSR implementation is one essential ingredient to embed value creation in a company. Companies with economies of scale can also use pricing to create shared value (Bertini & Gourville, 2012).

Shared Value Creation and Appropriation

There is distinction between value creation and value appropriation; organizations that create new value may lose except they share this value with other stakeholders such as employees, competitors or society (Nohria & Ghoshal, 1994; Makadok & Coff, 2002; Chatain & Zemsky, 2011; Porter & Kramer, 2011). According to Di Gregorio (2013), value appropriation is a two-step process through which a firm first competes against other firms to create and protect appropriation streams (inter-organizational value appropriation), and then managers, employees, shareholders and other stakeholders compete to capture the value that has been retained within the firm (intra-organizational value appropriation). Companies will not only benefit by creating and capturing value, but also by sharing or appropriating it. Both value creation and value appropriation capabilities are required for achieving sustainable competitive advantage and superior financial performance (Ghemawat, 1991; Mizik & Jacobson, 2003). But a firm must strive

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

for balance (March, 1991; Mizik & Jacobson, 2003) or integrate the two (Di Gregorio, 2013) depending on its choice. It is argued that value appropriation is the more relevant process since it only impacts firm profitability (Barney, 2001); it is also of more immediate concern to managers and researchers than value creation (Di Gregorio, 2013).

Basically, societal value created is captured by the innovating firms, consumers, communities and other firms-competitors and non-competitors (Mansfield et al., 1977). Value creation often entails the development of strategic resources while value appropriation entails the extraction of value that is embedded in resources. Whereas value creation influences the potential magnitude of the advantage, value appropriation influences the amount of the advantage the firm is able to capture and the length of time the advantage persists. Nevertheless there is a trade-offs in the strategic emphasis by firms between developing customer-value creation and value appropriation capabilities. Various organizational resources and capabilities such as technological (R&D), financial, physical, legal, human, organizational, informational, and relational capabilities influence value creation and value appropriation (Mizik et al., 2003). Di Gregorio (2013) argued that value is not created by resources, but by the actions of individuals and organizations in factor markets, internalized transactions, and product markets (dynamic capabilities). However, resources plays key role because they are the result of value creation processes and they are exploited in value appropriation processes. Di Gregorio (2013) identifies four elements of value appropriation that apply to both inter- and intra-organizational contexts to include: market-based bargaining power, relation-based power, isolating mechanisms, and opportunity-based action.

CREATED SHARED VALUE IN THE EXTRACTIVE INDUSTRIES: FROM LOCAL CONTENT TO CREATED SHARED VALUE

According to Porter (2014), the extractives sector represents a significant opportunity for impact on society given its unique characteristics which include: $3.5 trillion in annual revenues (about 5% of global GDP as at 2012); long time horizon for operations; multiple points of interaction with local communities; and often located in remote areas with major societal needs and poor infrastructure, generate employment, revenues for the government and with significant impact on procurement and the gross domestic product (GDP). The economic value created by extractive companies can transform the lives of millions living in resource-rich, cash-poor countries. The extractives sectors are a critical source for economic and social development in many of these countries. But most developing countries have failed to fully capitalize on the societal opportunities created by oil and gas or mining companies. Instead there are increasing conflicts, agitations and militancy in this sector and countries like the Niger Delta region of Nigeria and the platinum mines in South Africa. Consequently, 23 out of the 25 nations that depend most heavily on minerals and fuels are poor with low Human Development Index (HDI) and GDP.

The local content, "non-technical" risk management and current CSR approach used by the extractive industries have largely limited the actualization of this objective. Therefore, shared value is advocated as a new way to address the underlying root causes of community concerns and unlock economic opportunities for companies in the extractive sector including the oil and gas industry (Hidalgo, Peterson, Sith & Foley, 2014; Organization for Economic Co-operation and Development-OECD, 2016; Swartout, 2016). The concept of shared value is becoming a linchpin of the modern mining and extractive sectors (Crosbey et al., 2016). Given advances and changes in technology, it is predicted that the mining of the future will involve decreased local equipment-related procurement resulting in drop in benefits derived

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

from local procurement and employment. The consequence is of critical concerns to firms, host communities and countries like Nigeria which depend and earn a greater part of their revenues from the sector. Therefore, firms and countries are expected to focus on other ways in which mining can contribute to the host economy and communities. Table 5 indicates the shared valued opportunities in the extractive industries.

Outside the realms of procurement and employment, there are four other avenues through which shared value can be created (Cosbey et al., 2016). These include:

- **Downstream (Forward) Linkages:** Relate to the beneficiation of extracted commodities through refining, smelting and further downstream processing of the commodity before reaching the final consumer(s).
- **Horizontal (Lateral) Linkages:** Relate to the development of new non-mining-related industries adapting the capabilities developed to serve the mining-related value chain.
- **Knowledge (Technological) Linkages:** Relate to the transfer of knowledge and technological know- how to state-owned companies, the employees of the mine and to the labour force involved in the mine's value chain.
- **Spatial (Infrastructure) Linkages:** Relate to the benefits associated with the infrastructure developed for an extractive-industry project (such as railways) profiting other actors in the economy.

There might be revision to the fiscal element of shared value, adoption of more progressive fiscal regimes, changes to the fundamental relationship between investor and host governments and evolution of a more collaboration and commitment to defined roles for government, extractive industries and civil societies. National or host governments can help companies create shared value by creating enabling policies and regulations as well as show collaboration by acting as knowledge broker, serving as convener of interested stakeholders, acting as operating partner for shared value strategies and incentivizing shared value investments. On the other hand companies can take a long-term view toward solving societal issues to benefit the business; they should invest in improving business unit operations' knowledge of societal issues and vice-versa, measure societal outcomes and their impact on the business, and work with other multinational companies in the extractive sectors, NGOs, and governments. The five actionable steps specified in the OECD (2016) framework on collaborative strategies for in-country shared value creation of extractive projects and the roles of government, extractive industries and civil societies are shown in Table 6.

Table 5. Shared values opportunities in extractives and mining industries

Re-Conceiving Products and Market	Re-Defining Productivity in the Value Chains	Creating Enabling Local Environment
Build local markets for intermediate products created by extractive activity (e.g., water, electricity, transport, housing)	Improve local workforce capabilities Develop local suppliers Improve the health of employees Improve utilization of water, energy and other resources in operations Increase local emergency response capabilities	Develop the local cluster supporting the extractives sector Invest in shared local infrastructure and logistics networks Partner with other local clusters and government in building community infrastructure Play an active role in broad-based regional economic and community development

Table 6. Actionable steps and roles of government, extractive industries and civil societies for in-country shared value creation

Actionable Steps	Roles of Government, Extractive Industries and Civil Societies			
	Government	**Extractive Industries**	**Government & Extractive Industries**	**Government, Extractive Industries & Civil Societies**
1.Adopt a comprehensive long-term vision and implementation strategy to build competitive and diversified economies and create in-country shared value out of resources	Articulate vision, coordination; limit rent seeking opportunities; enhance economic competiveness; transparent reporting; counter macro-economic policies	Take long-term approach, engage with relevant stakeholders; understand local dynamics and power structures in resource-bearing communities; share best practices developed		Build inclusive fora for continuous dialogue; forecast the necessary infrastructure and capacity to achieve extractive stage; identify opportunities to which business activities can make a significant positive contribution
2.Build an empirical basis to inform decision making through an inclusive participatory process	Serve as conveners and identify the stakeholders; Identify trade-offs and associated costs/benefits; create the conditions for proactive interventions and reduce conflicts recognize areas of value creation	Provide information on an individual basis (to avoid any anti-competitive issues) to governments on future demand		Assess the extractives sector's collective current and future needs; map out potential economic opportunities and potential negative impacts and constraints of project; Identify barriers to entry for production of goods/
3.Unlock opportunities for in-country shared value creation: local workforce and supplier development; shared infrastructure (power, water and transport)				
3A. Shared Power	Take a long-term perspective of potential synergies, affordability and willingness to pay design appropriate power pricing mechanisms consider other partners in development of power generation capacity; engage in regional and sub-regional policy co-ordination for infrastructure development and power sharing	Provide forecasts regarding anticipated demand for power and sourcing of power; implement energy efficient operations; develop electricity self-supply plans that align with government's plans	Undertake early discussions regarding power infrastructure needs, synergies, efficiencies and other opportunities for shared value creation with respect to power generation and distribution; articulate government and company responsibilities and liabilities for any project undertaken; consider power usage and distribution	
3B.Shared value for water	Adopt an integrated approach to water resource management; have a well-designed, adjustable and transparent plans for allocating water resources among competing uses; ensure policy coherence and adequate institutional framework for used water	Engage with local communities and water users to understand water-related issues and risks and offer solution; collaborate with other extractives; collaborate with other extractives companies for water management and allocation	Devise mutually beneficial arrangements; share knowledge, information and expertise	
3C.Shared use for transport infrastructure	Provide a clear and effective regulatory framework for multi-purpose and multi-user infrastructure; avoid exclusive access or monopoly pricing; effective coordination and policy encouraging investment in transport infrastructure	Collaborate with other extractive companies from the same basin to determine the potential for shared value by developing shared transport infrastructure	Devise mutually beneficial arrangements concerning transport infrastructure	
4.Support and contribute to innovation leading to new products and services	Identify changing trends in global consumption and production patterns; consider trade-offs associated with technological innovation; support R&D efforts to identify, adapt, and transfer technology	Invest in specialized technologies that reduce environmental impact; increase use of renewable energy; Contribute to improving the innovative capacity of subsidiaries and subcontractors and finding solutions to challenges shared by extractive industries	Engage in co-operation based on project life cycle analysis, covering the entire value chain and offering the opportunity to build on best practices of several sectors	
5.Establish effective and transparent monitoring and evaluation systems and regularly review the collaborative strategy		Integrate the standardized methodology and reporting procedures into internal local monitoring and evaluation system; Provide detailed reporting to better measure and manage company activities		Build on existing structures e.g. EITI, MSG develop governance mechanisms to ensure effective and transparent monitoring and evaluation; evaluate impact, local industry participation, efficient use of limited resources and creation of value for all stakeholders; re-evaluate measurements from time-to-time communicate results to stakeholders

CSV Opportunities and Benefits in Developing Countries

Despite the criticisms, CSV has been applauded for the strengths in appealing to practitioners and scholars, elevating social goals to a strategic level, defining a role for government in responsible behaviour and propagating the idea of "conscious and caring capitalism" (Crane, Palazzo, Spence & Matten, 2014). Moreover, there is growing consensus that through CSV firms can better respond to the societal, environmental and market needs, support business activities, and develop innovative capacity. Moczadlo (2015) argued that Porter and Kramer's CSV bring the business world closer to society's issues as it focuses on unmet needs and under-served markets or Blue Ocean Strategy (Kim &Mauborgne, 2005) and the business model innovation which is a key factor in competitiveness (Scott-Kemmis, 2012). In fact, the shared value has already made some companies like WEG Corporation in Brazil and HP to be industry leaders, improved companies' value chains as well as strengthened local economies in companies such as Intel, Nestle, Unilever and Nepresso, and led to long-term company's profitability, competitive advantage and sustainability like the case of Coca Cola Company.

There are numerous examples of multinational organizations that are either already implementing and investing in CSV or making efforts to implement CSV as part of their business strategies such as: Coca-Cola, Nestlé, Nepresso, Unilever, Intel, Nutreco, McDonald's, IBM, Cisco, Dow, Intel, Becton Dickinson (BD), Novartis, Wal-Mart, Inter-American Development bank, General Motor (GM), General Electric (GE), Google, Johnson and Johnson, InterContinental Hotels Group (IHG) and social entrepreneurs like Gramen Bank in Bangladesh among others (Porter & Kramer, 2011; Porter et al. 2012; World Bank, 2013).

A typical example of CSV is the corporate Water Stewardship Programme particularly the Replenish Africa Initiative (RAIN) water for schools created by Coca-Cola Company in 2009 but presently in 37 African countries. The programme has the intention to provide sustainable and safe water access to 6 million people across Africa by the end of 2020.Similarly, the WASH programme, particularly the RAIN Water for Schools, not only creates social value and but also indirectly promotes business value and contributes to virtuous cycles of creating value for local communities (Mitler, Rostorfer & Ledbetter, 2015). The Coca Cola Company also launched a two-month Coletivo Retail training programme for Brazilian low-income (including youth and students) in 2009 to enable retailers gain hands-on experience, placement and enhance their performance. By 2015, about 25,000 youths have graduated with over 10% of Coletivo graduates setting up their own retail stores with micro-credit support as well as the Coletivo Retail community sales growing on an annual average of 9.5% (Coca-Cola Supports, 2015). Moreover, the Coca Cola Company's 5by20 Initiatives aim to improve the economic empowerment of five million women entrepreneurs within the company's global value chain by 2020 through a combination of core business operations, cross-sector partnership and strategic social investment mostly in developing countries. The Coca-Cola Company began working toward its 5by20 commitment in Brazil, India, the Philippines, and South Africa in 2010. Over, 300,000 women have participated in 5by20 initiatives in 12 countries (Brazil, China, Costa Rica, Egypt, Haiti, India, Kenya, Mexico, Nigeria, Philippines, South Africa, and Thailand) as at 2013. The company expects 5by20 initiatives to reach 1.5 million women in 20 to 30 countries by 2015 and 5 million women in 100 countries by 2020. The Coca Cola's 5by 20 initiatives include: Coletivo Recycling and Artesians in Brazil, Project Nurture in Kenya and Uganda, the STAR Programme in the Philippines, and Kwanza's Micro Distribution Center Model in Tanzania (Jenkins, Valikai & Baptista, 2013).

The CSV of Nestle for joint value optimization with society encompasses three areas of water, rural development and nutrition. Nestlé aligned corporate vision with a social purpose and set enterprise-wide shared value goals to guide business planning. For instance, Nestlé trains and assists smallholder farmers to foster rural development while ensuring a reliable supply of high quality raw materials. Nepresso's collaboration focuses on three commitments: Coffee, Capsules and Carbon Footprint as well as creating shared value for society. The areas where value was created and shared in McDonald were: employee welfare, waste, climate/energy, animal welfare, water, raw materials and community impact. Unilever's poverty eradication, women empowerment, education of rural dwellers and hand-washing campaigns have recorded a huge success in bringing profitable micro-enterprise opportunities for rural women, reducing diseases and saving many lives of children in Asia and Africa (Kreckova, 2015). Intel tied a portion of incentive compensation to performance on social and environmental priorities.

BHP Billiton invested $50M in northern Chile to create a cluster of world-class mining suppliers. BHP created the "World Class Supplier Program" in Chile which engaged local suppliers to develop innovative solutions to manage various areas of BHP Billiton's operations such as water, energy, human capital, maintenance, air quality, acid mist control, and leaching. The goal of the initiative was for Chile to have at least 250 world-class suppliers that can export their services to mining projects around the world by 2020.The 36 suppliers involved employ 5,000 people, and BHP Billiton has achieved $121m in net present value of cost savings as at 2012 (Porter, 2014) and generated combined sales of $400 million. The social and economic benefits for BHP Billiton include: creation of world-class suppliers for the mining sector and high-quality employment, and reduced cost of inputs, goods, and services. Rio Tinto's Diavik Diamond Mine in Northern Canada worked with communities, contractors, local governments and education institutions to develop a local workforce and supplier base which enables it to hire 62% of its employees, and sources 71% of goods and services locally, saving transportation costs (Porter, 2014). For SNC-Lavalin with interest in mining and metallurgy, oil and gas, infrastructure and environment and power, the Local Resource Development Initiative ™ (LRDI) helps to maximize local benefits and create shared value with communities as the LRDI aligns project objectives with community objectives whenever possible, promotes sustainability opportunities, reduces project costs and generates values for farmers, communities and operating company in many countries of Africa, Latin America and Asia.

Criticisms of Porter and Kramer's CSV

Despite the many benefits and opportunities acclaim to CSV, there are also many critics of Porter and Kramer's CSV (such as Crane, Palazzo, Spence & Matten, 2014; Mohammed, 2013; Denning, 2011 & 2012; Hartman & Werhane, 2013; Wilburn & Wilburn, 2014; Rocchi & Fererro, 2014; Escudero, 2013 and others) who argued that CSV is not new or original; CSV ignores the tensions inherent to responsible business activity, naïve about business compliance and it is based on a shallow conception of the corporation's role in society (Crane et al., 2014). CSV is "undercooked", ignores tensions and differences between societal and economic goals, lacks specific framework upon which shared value creation can be measured (Crane et al., 2014; Mohammed, 2013), can't fix capitalism (Denning, 2011, 2012), incomplete mental model (Hartman & Werhane, 2013), misunderstood concept (Wilburn & Wilburn, 2014), incomplete and process-orientation ignoring the people in the work process (Rocchi & Fererro, 2014), akin to strategic CSR and not a new approach (Escudero, 2013). It has also been argued that the CSV is not different from Elkington's (1998) that focused on the triple-bottom line of economic, environmental and social goals. Again, the main idea is not so different from strategic CSR concept

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Table 7. Examples of created shared value social and economic benefits in developing countries

S/no	Company/ Organization	Country	Initiatives	Social Benefits	Economic/Business Benefits
1	Coca Cola	37African countries including South Africa	Corporate water stewardship and Replenish Africa Initiative (RAIN) water for schools	-Improvements across a wide range of capabilities, both directly and indirectly -Increase in the value of natural capital	Every US$1 invested would yield at least US$2 in benefits, and in some locations it could be over US$11 in benefits for every US$1 invested
		Brazil	A two-month Coletivo Retail training programme for Brazilian low-income (including youth and students employment) in 2009	- 30% of the young people trained immediately land their first job with Coca-Cola or one of its partners - 10% set up their own business with micro-credit support from the company	- Increased sales of Coca-Cola products - Higher penetration of consumers among the emerging lower middle class segment - Better retailer performance and a stronger Coca-Cola brand connection
2	Chevron	Nigeria	Niger Delta Partnership Initiative (NDPI) and Partnership Initiative in the Niger Delta in 9 oil producing in the Niger Delta region and creation of addition value chains	Development of economic opportunities outside of Chevron's direct oil and gas supply chains	Reduction in business disruptions due to greater economic opportunities outside of oil and gas; potential reductions in supply chain costs
			Chevron's General Memorandum of Understanding (GMOU) approach in the Niger Delta for building local governance and decision-making capabilities through delivering value for the business via reduced risk and a stronger operating environment	- Community-led disruptions to Chevron operations dropped from 81 in 1998 to 11 in 2011 to zero in 2012 - Create a platform for communities to debate, discuss, and agree on their priorities	- Create enabling environment for the company to do its business -Significant cost saving in company's operations - Saving of tens of millions of dollars in lost revenues in vandalism and theft
3	BHP Billiton	Chile	Creation of at least 250 world-class suppliers that can export their services to mining projects around the world by 2020	Creation of world-class suppliers for the mining sector and high-quality employment	Reduced cost of inputs, goods, and services
4	AngloGold Ashanti	Ghana	Addresses health problems (endemic malaria) by implementing an integrated control programme involving multiple community-level interventions	Decrease in disease incidence by over 72% in the first two years of the programme	Improved employee productivity, lowered treatment costs, with the number of person-shifts lost per month falling from 7,500 to around 90 in 2012 and declining treatment costs resulting in cost savings to the company of around $600,000 per year by 2013
5	Anglo American	South Africa	Water Reclamation Plant for treatment of water for drinking and irrigation water by the local municipality in the Malahleni and Mpumalanga provinces	Access to potable water in local community, generating 25-30 million liters per day or 12% of the water requirement	Over 60% offset of treatment costs from revenues in water sold to BHP Billiton and local community, reduction in the cost of responsible environmental management and compliance with regulation
6	Banka BioLoo	India	Bio-toilet system to dispose human waste in eco-friendly manner	Improved hygienic sanitation, treated, recycle human wastes and bio-toilet for millions of people	Increased employment opportunity, growing revenues in multi-fields
7	Capital Diamond Star Group with Action Aid	Myanmar	Provide farmers with necessary training, technical and financial skills for optimal productivity, quality livelihood and increased bottom line.	Improved livelihoods through empowerment of farmers, sustainable agriculture and better access to finance and to markets for rural communities	More productive, better quality and more reliable supplier base; stronger, more loyal and better educated customer base

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

earlier defined by Porter and Kramer in 2006 (Neves, 2013). Nevertheless, Drucker (1984) has argued that the proper "social responsibility" of business is to tame the dragon, that is, to turn a social problem into economic opportunity and economic benefit". Wheeler, Colbert & Freeman2003 (2003) have also defended that "in certain circumstances the creation of communities and social networks or value-based networks is a pre-requisite to economic pay-off'. The idea that businesses should address new markets based on social issues, being profitable had been presented by Prahalad and Hart (2002) arguing that "low-income markets present a prodigious opportunity for the world`s wealthiest companies to seek their fortunes and bring prosperity to the aspiring poor".

Hartman and Werbane (2013) see Porter and Kramer's CSV as an incomplete mental model with imprecise conception of "profit," overemphasis on the novelty of their theory, and broadly negative description of prior attempts to achieve social progress through private enterprise. They argue that there was no explanation on the calibration of shared value from profits. Besides, some have argued that Porter and Kramer were not the first and novel to propose alternative to the single-minded pursuits of shareholders' gain, and that "shared value" is just one of the many viable means to reconstruct a corporate worldview to tackle new-world social, environmental and economic problems. Moreover, many profitable companies have been successful in addressing social problems through profitable business ventures without the need of the shared value approach. Again, the CSV omits the revision of companies' core mission to reflect the pursuit, not of "profit per se," but "profits involving social purpose". Beschorner (2013) argued that Porter and Kramer's CSV is "neither so radical nor such a departure from standard management thinking" and their ultimate reliance on economic arguments is too normatively thin to reconnect businesses with society. He suggested that prospects for a genuine reinvention of capitalism lie elsewhere. There is also criticism that ethics and integrity is left out of the CSV as well as its measurement. Companies that are most advanced in pursuing shared value lack the data they need to optimize its results. Besides, some of the companies that claim to implement CSV are not doing the right thing (Brown & Knudsen, 2013).

Challenges and Limitations of CSV

Cane et al. (2014) concluded that the short comings of CVS take us further from the solution to a challenge that we are already struggling to address. Although shared value has gained momentum, it is still largely experimental and short-term. Only a few companies particularly multinational companies like Coca-Cola, Novo Nordisk, Nestlé, Intel, and InterContinental Hotels Group among others have enshrined the shared value into their corporate objective and core business strategy due to CSR fatigue. Most companies around the world remain unaware of shared value improvement opportunities and are ill-prepared to capitalize on them when they materialize thereby limiting the company's bottom line and short- changing society of the much needed innovation to solve social problems (Porter et al., 2012). Brown and Knudsen (2013) have argued that failure to appropriately manage shared value could result in wasted resources, unsustainable projects, and in the worst cases, marred corporate reputations thereby resulting in negative social and environmental consequences. This could be as a result of companies' failure to (1) carry through responsible practice in its implementation, (2) change their overall business model to address a social or environmental problem, and (3) discuss how they should manage the complexities and trade-offs required to address social issues.

Again, studies from various sectors (food, beverages, agriculture, pharmaceutical, health care, financial services, extractives, and natural resources) advocated that firms can enhance their competitiveness by embracing the CSV concept in their business strategy (Hills et al., 2012). However, the results are

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

mainly based on successful individual cases from large Multinational corporations and the nature of the relationships between CSV and firm competitiveness in those studies is still unclear and has not been verified empirically. Also, examples and number of local listed companies as well as small and medium scale enterprises embedding CSV in their core business or moving beyond traditional CSR to the shared value in their CSR are limited. Haxby, Compela and Weperen (2014) argued that CSV can be complicated because of the diverse interests of each stakeholder and attempts to optimize value for one stakeholder can have a negative effect for others.

It is not easy to measure social activities and their impacts on a company and the economy. There are also several problems in finding reasonable and significant key performance indicators (KPIs) or metrics to measure shared value of the social and business outputs, outcomes and impacts (Giddens, 2011). In fact, the lack of understanding of the interdependency between social and business results by companies limit the opportunities for innovation, growth and social impact (Porter et al., 2012). Despite lot of suggested frameworks and approaches to measure shared value including employee engagement, stakeholder feedback, scalability, growth opportunities, risk mitigation, public policy impact, and brand and reputation impact, there is no holistic framework or universal tool on how to measure value created through CSR. Besides decision making on CSR implementation still remains subjective and one-sided in most cases (Jonikas, 2014). Again, Porter et al. (2012) argued that the framework to link social progress directly to business success and vice versa is still missing Moreover, the relationship between social welfare and company profitability is complex (Lin et al., 2009). The analysis of sustainability results is complicated "due to the wide range of reporting practices for environmental, social and corporate governance risks/opportunities and also due to the difficulty of verifying the accuracy of the information provided by companies" (Székely & Knirsch, 2005). Hidalgo et al. (2014) summarized four interrelated and entrenched challenges that inhibit creation of shared value to include: inadequate organizational structure and behavior or culture, incomplete measurement costs and benefits, low motivation for collaboration and lack of alignment with government.

CSV AND SUSTAINABLE, INCLUSIVE DEVELOPMENT OF DEVELOPING COUNTRIES

The Brundtland Report of the World Commission for Environment and Development (1987) defines sustainable development as development that meets the needs of the present generation without compromising the ability of the future generations to meet their needs. In 2015, the world leaders agreed that the realization of the sustainable development goals (SDGs) by 2030 needs governments' partnership with businesses and other stakeholders. A recent survey by Fleishman Hillard and the U.S. Chamber of Commerce Foundation in May, 2015 identified top 5 SDGs as important to business in the post 2015 to include: build resilient infrastructure (67%), sustain economic growth (65%), achieve gender equality (60%), ensure quality education (52%) and strengthen global partnership (44%). The 'My world 2015' survey by the United Nations put the three top concerns the world over to include: good education, better health care and better job opportunities. The CSV tends to be moving corporations towards the direction of achieving these goals through shared value approach which is premised on the simultaneous realization of economic, social and societal progress. Through the inclusive business strategy, the CSV helps to integrate poor and low income communities into the leading companies' value chains in order to create

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

new opportunities for poor people at the bottom of the pyramid, increase their incomes, improve the living standards and create a competitive value chain and long term economic value for the companies.

At its heart, the notion of shared value pertains to the sustainable development of the host community and countries. For instance, the OECD (2016) framework for collaborative Strategies for in-country shared value creation in the extractive sector is a tool for forging a public-private alliance which can be used to advance the sustainable development agenda of 2030 adopted by the United Nations in 2015. Specifically, the OECD framework supports the achievement of SDGs 8 (promote inclusive and sustainable economic growth, employment and decent work for all), 9 (build resilient infrastructure, promote sustainable industrialization and foster innovation), 6 (ensure access to water and sanitation for all) and 7 (ensure access to affordable, reliable, sustainable and modern energy for all). According to Cosbey et al. (2016), the shared-value paradigm, by promising to deliver benefits to host communities, regions and countries, has become increasingly critical for mining companies in securing their social license to operate. The delicate balance inherent in the shared-value paradigm is especially relevant for developing countries and other states (most of which are resource-driven countries) where poverty eradication, social development and environmental protection are urgent development challenges.

Due to the expectations that the application of the shared-value paradigm in the mining and extractive sector would bring substantial developmental benefits to large populations and the link to sustainable development, it has been endorsed to become the mainstay of most major mining policy frameworks such as: the Africa Mining Vision (African Union, 2009), the Mining Policy Framework (Intergovernmental Forum (IGF) on Mining, Minerals, Metals and Sustainable Development (2012), and the OECD Framework on Public-Private Collaboration for in-Country Shared Value Creation from Extractive Projects (OECD, 2016).The International Council for Mining and Metals (ICMM) also reference the shared-value concept in their good practice guidance (ICMM, 2015).Leading civil society organizations working in the area of mining and sustainable development like Columbia Center on Sustainable Investment (CCSI), 2015; International Institute for Environment and Development (IIED); International Institute for Sustainable Development (IISD), 2014; and Natural Resource Governance Institute (NRGI), 2015 have fully subscribed to shared value. Both the developed and developing countries are benefiting and enjoying from the shared value concept as more and more corporations are keying into the social change. While the focus in developed markets is less on poverty but more on education, income inequalities, health and wellness, environment and sustainability, the CSV focus by corporations in developing markets is building capacity and financing, empowerment and entrepreneurship, expansion of the value chain and raising the standard of living in the communities of operations.

Shared value approach has the potentials to foster sustainable development of developing countries as CSV concept is embraced and promoted not only by the few multinationals but all companies. For instance, the activities of Novartis to provide the locals in remote villages with health services and train some of them to be health educators in India, Vietnam, Kenya and Indonesia resulted in over 10 million receiving health education and 750,000 direct health services. The '+' projects by Phillips a multi-sector partnership with governments, NGOs and consumers in Southeast Asia reached over 50 million people in Indonesia, Thailand and Singapore, generating 28,000 social media conversations. The goal was to increase Philips' bottom line and simultaneously have positive social impact. Phillips sourced ideas from local consumers to provide insights that enabled the company to accelerate innovation and ultimately improve the health and well-being of consumers. Vodafone partnered with a Kenyan telecoms firm, Safaricom and created a new market by launching M-Pesa in Kenya in 2007.Vodafone's goal was to support financial inclusion in Kenya through a money transfer solution with a simple key message, "Send Money

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Home", which enabled customers to send money directly between each other using mobile technology. By 2015, M-Pesa is now available in many countries including India, Egypt, Tanzania, South Africa, Democratic Republic of Congo, Lesotho, Mozambique, Romania and Albania with over 19.9 million active customers who used M-Pesa with over 3.4 billion transactions processed yearly.

Following the challenges of a quadruple burden of disease, an undersupply of doctors and an egalitarian healthcare system presented a significant challenge to the healthcare industry in South Africa, Discovery Insurance Company developed Vitality, a behaviour based wellness solution that incentivized healthier behavior by giving customers access to wellness partners such as gyms, empowering them with healthcare knowledge and tools, and offering financial incentives that increased as members engaged with the Vitality programme. The increased health and fitness levels, lowered the frequency and cost of hospitalization and reduced the disease burden of customers improve the financial incentives and rewards that by 2015, the company currently serves over 5.1 million clients across South Africa, the United Kingdom, the United States, China, Singapore, Australia and Hong Kong. Discovery is globally acknowledged as the pioneer of shared value insurance. The shared value presents an open window of opportunities and benefits not only for economic prosperity of business but also the sustainable development of developing economies. Therefore a high level corporate commitment to the shared value concept, and ingenuity of the private sector and business leaders in forming alliances would lead to the actualization of the United Nation's sustainable development goals (UN SDGs) by eradicating poverty in all its forms by 2030.

SOLUTIONS AND RECOMMENDATIONS

In an era of increasingly stakeholders' knowledgeable demands and expectations amidst the increasing global challenges, integrating economic and social goals will demonstrate corporation's real concerns and ability to achieve the "win-wins" of the shared value model, long-term sustainability, competitive advantage and economic prosperity. In order to give concrete meaning to the concept of CSV in developing economies, the companies must change the philanthropic way that CSR is presently conceptualized and organized because of its limitations in helping them to achieve competitive advantages and adequately address societal problems. Based on the shared value approach, companies in developing countries should restructure and prioritize CSR to be part of their organizational culture, value and core business strategy that emphasizes sustainability by redefining corporate leadership and integrating economic and social goals in their business pursuits in addressing societal problems. The integration makes CSR a core element of strategy, structure and process, eliminates distinct CSR functions in the organization and makes CSR a mutual responsibility across the firm - from top down and thereby increasing its credibility and implementation.

However, achieving shared value will require a radical and collective rethinking of management practice by all parties. There must be strong commitment at the executive, top management level and employees; Leading managers of global players as well as of small and medium companies in developing countries must discuss and take CSR very seriously by going beyond "green washing" or "window dressing". They must begin to embrace and transmit the CSV vision and ideology among all employees of their organizations through re-conceiving new products and services in new markets, improving productivity and developing clusters. Therefore, companies would need to incorporate shared value thinking into the operations of employees at all levels of their businesses to really transform capitalism and bring about

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

inclusive and sustainable development. The realization of the SDGs in 2030 requires that companies in developing countries have a major mindset change towards the adoption of the CSV agenda. This will involve the companies working inside out and embracing top down leadership, commitment and strategy as well as a bottom up overhauling of the operating models to reflect total commitment; CSV takes time, energy, tenacity and patience to embed and thus the process requires change managers and skilled leaders rather than programme managers (Bockstette & Stamp, 2011; AT Kearney, 2015). In fact, achieving a successful, sustainable and scalable shared value requires significant changes in the way that corporations do business. Therefore, businesses in developing countries must change their business models and current CSR philosophy to include shared value creation and business value sustainability.

Government and regulators in developing countries should recognize their roles in helping businesses to create shared value by focusing on measuring environmental performance and introducing standards, phase-in periods and support for technology that would promote innovation, improve the environment and increase competitiveness of business simultaneously. They would need to limit the pursuit of exploitative, unfair or deceptive practices in which companies benefit at the expense of society. Governments can help companies create shared value by: creating enabling policies and regulations, showing collaboration by acting as knowledge broker, serving as convener of interested stakeholders, acting as operating partner for shared value strategies and incentivizing shared value investments. Regulatory authorities like the National Hydrocarbon Agency (NHA) in Columbia must promote shared value creation through its regulatory framework. Although local content presents one of the clearest opportunities to create shared value, governments in developing countries particularly those with rich minerals and extractive industries must collaborate with companies to access opportunities to deliver real value for business and society across different areas of investments based on shared value approach.

On the other hand, companies must take a long-term view toward solving societal issues that would benefit the business by investing in improved business unit operations' knowledge of societal issues. They should measure societal outcomes and their impact on the business, and work with other multinational companies, NGOs and governments to create shared value. They must also take concrete actions to shift the current dynamic relationships between the corporations and government from one that views for instance extractive companies as contractors who pay for the privilege of carrying out extraction to one that sees these companies as development partners who could help solve societal issues of concern to government and create shared values through direct engagement with various levels of governments and communities, capacity building and indirect support for independent, third-party efforts. Faculties and business schools would also need to broaden their curricula and teaching to include: efficient use and stewardship of all forms of resources, human and societal needs and how to serve non-traditional customer groups; because these would define the next-generation thinking on value chains.

CONCLUSION

The chapter examines CSV and the inclusive, sustainable development of developing countries The CSV is a (r)evolutionary strategic management thinking meant to enhance the companies' competitiveness while simultaneously advancing their economic and social conditions in the society they operate. It challenges the constrained corporate mindset of lip-service philanthropic CSR activities of business over half a century to making it a major solver of society's problems in a much beneficial and profitable ways through creation of shared values. Created shared value tasks companies in developing countries

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

to go beyond CSR to addressing social and society's issues in addition to their pursuit of profits by incorporating social and societal values into their economic agenda. The shared values created by these companies in developing countries would give rise to long-term corporate profitability, competitiveness and sustainable development of host communities and countries. Interestingly, evidence abound of companies at least of global multinational and transnational companies in developed and developing countries, which have already keyed into the CSV enjoying immense profits, sales growth and sustainable competitive advantages through integration of social and economic goal while also addressing societal needs. Therefore, companies including extractive and mining industries in developing countries must begin to take a long-term approach to social investments and prosperity of company, host communities or countries by embracing the pillars of shared value of re-conceiving new products and services, identifying new market opportunities and enabling clusters development. It has been demonstrated that the created shared value has the potentials to foster unparalleled economic growth, prosperity and sustainable development in countries when companies start to think a new and look at decisions and opportunities through the lens of shared value.

Although, the created shared value approach is being embraced and applied by most global multinational corporations, there is no known study in Nigeria. Therefore a study of the current CSR practices is recommended on whether the shared value concept is already being practiced by indigenous companies in Nigeria, the influencing factors and challenges of creating shared value in turbulent environments.

KEY TERMS AND DEFINITIONS

Corporate Social Responsibility: This refers to the continuing commitment by business to contribute to economic development while improving the quality of life of the workforce and their families as well as of the community and society at large.

Created Share Value: This is a paradigm shift in corporate social responsibility and sustainability strategy where business create economic values and values for societies through the simultaneous pursuit of economic, social and societal goals. Companies can create shared values through re-conceiving products and markets, redefining productivity in the value chain and building supportive industry clusters at the company's locations.

Shared Value: This can be defined as policies and operating practices that enhance the competitiveness of a company while simultaneously advancing the economic and social conditions in the community in which it operates.

Sustainable Development: This refers to development that meets the needs of the present generation without compromising the ability of the future generations to meet their needs.

This research was previously published in Value Sharing for Sustainable and Inclusive Development edited by Mario Risso and Silvia Testarmata, pages 122-153, copyright year 2018 by Business Science Reference (an imprint of IGI Global).

Chapter 84
New Perspectives: Not-for-Profit Organizations in the Advent of the 4th Industrial Revolution

Albena Antonova
Sofia University, Bulgaria

ABSTRACT

As social and environmental struggles intensify, the raising economic and social role of not for profits will continue to expand globally. Not for profit organizations have the potential to mobilize digitally-enabled communities and to work on various global challenges, overcoming the limitations of governmental institutions, local and short-term perspectives of public administration and private interests of business organizations. The present research aims to reassess the business models and value creation behind NFP operational models, their role for social innovation, the impact of the new technologies and the characteristics of the emerging digital communities. Further, there will be discussed the new perspectives for NFP development as innovative instruments, protecting social interests between government and private organizations, and contributing to solve increasing social problems.

INTRODUCTION

Not for profit – NFP or referred as well as non-government organizations expand globally and have become an important source of economic activity. While NFP organizations have long traditions both in developed and developing countries a recent economic phenomenon is their rising importance as providers of public goods and services (Aldashev, Jaimovich & Verdier, 2016). In the Organization of Economic Co-operation and Development (OECD) countries NFP have become the main public goods and services providers especially in sectors such as healthcare, media, education, arts and poverty relief (Bilodeau & Steinberg, 2006). Quite remarkably, NFPs employ about 7.5 percent of economically active population in OECD countries and even in Belgium, Netherlands, Canada, U.K., USA and Ireland their share exceeds 10 percent (Salamon, 2010). The NFPs sector contributes for 5.3 percent of the USA GDP, employing about 10.1 percent of the USA workforce (Salamon, Sokolowsky & Geller, 2012).

At a time when public debt is rising and government funding for social services is decreasing globally the activity of NFP organizations and social entrepreneurship is assumed as an instrument to complement governments' financing of social welfare (Dey, Schneider & Maier, 2016). Thus, even in countries where welfare services are mainly delivered by the public sector, the initially auxiliary or complimentary role of private NFP organizations and social entrepreneurship augment. This trend comes along with the increasing attacks against the public sector and the rhetoric that public services in a whole are inefficient, costly and ultimately useless (Archibugi & Filippetti, 2016). Social entrepreneurship emerges as a promise to both generate commercial income and to solve social problems while becoming financially self-sufficient (Dey et al, 2016).

Social entrepreneurship nurtures further public expectation toward NFP's role, promoting social entrepreneurship as more efficient solution for social services procurement and wealth distribution. NFPs are therefore popularized as alternative providers of welfare services, managing deepening social and environmental problems. Moreover, the research in the field of NFPs is largely dominated by enthusiasts who restraint to make critique, over-emphasizing the political arguments and potentials or failing to analyze NFPs efficiency and impact (Chell, Spence, Perrini & Harris, 2016; Dey et al, 2016). Different reports highlight the real controversies and problems with NFP mode of operation, accountability and efficiency, both on local and on international level. For example, in the paper Small is Beautiful (Aldashev, Jaimovich and Verdier, 2016) discussed different problems that NFP organizations experience in the areas as resource allocation and efficiency when coping with environmental disasters.

Aldashev, Jaimovich and Verdier (2016) summarized findings of the humanitarian campaigns evaluations after the tsunami disaster in 2004 in Indonesia and Sri Lanka, comparing them with NFPs campaigns after the earthquake in Haiti in 2010. They concluded that even sufficiently financed humanitarian campaigns manifested numerous problems in relief activities, leading to inefficiencies in the distribution of funds, unsatisfactory plans, cost escalations and many coordination failures, leading to even more weak and inefficient national institutions and devastated local social systems. Several reasons for these fails were outlined, of which one is the rush of too many NGOs to carry out short-term but highly visible (for the donors) activities in disaster-prone areas. Aldashev et al. (2016) derived at a model proving that rent-seeking and ego-utility seeking motives can attract selfish individuals and organizations in the NFP sector, which in turn may end up crowding out and displacing intrinsically motivated agents. Furthermore, selfish motives and motivational crowding out can become increasingly severe as economies get richer and give more generously to the non-profit sector, as in the case of disaster attacks and many international donors. The findings indicate that as NFPs play an increasing role for state-aid allocation of funding, the efficiency and long-term effects on the operations of NFPs could benefit from further exploration.

Not for profit organizations, whatever their scope of operation is, have the responsibility and the commitment to justify their efficiency and capacity to implement development projects. Moreover, new technologies and Internet, social media and virtual communities, NFPs could further transform their financial and operational models for the benefit of all – donors, beneficiaries, public and private entities. Thus the increasing role of internet technologies and platform-oriented business models can additionally help to attain better social effect. Therefore operation of non-for-profit internet organizations and foundations like World Wide Web Foundation, Open-Source software movement, Wikimedia and others can serve as role-models proposing sustainable models for global collaboration and cooperation in a non-profit manner beneficial for all. Internet-based NFPss are global actors, work in international environment and promote global cooperation and services, improving access to knowledge, international cooperation, providing meaningful services to all. As NFPs business models can be successfully applied

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

in Internet and IT sector, these technology innovations can enable further scenarios for activating users, developers, customers and partners to solve local, national and international problems.

The present chapter aims to analyze the nature of the NFP organizations and to discuss some of the operational models used by the sector. More specifically how NFP can adopt technology-enabled and networked business models, involving and better collaborating with different stakeholders and communities to provide better value on local, national and global level drive this discussion. The analysis of the platform business models will serve as a matrix for problem solving and value creation from NFP perspective. Providing insights into some of the issues of NFP organizations, are two main problems:

- How new technologies can enhance development of new business models and mode of operations for Non-profit organizations.
- How open business models of Internet-based organizations can be exploited in NFPs perspective.

While private organizations gain more instruments and resources to cope with the new coming economic revolution and to adapt to organizational change, many NFPs and public organizations often work under increasing financial and social pressure. This is due both on the raising expectations from the public and donors, and demand for better Return-on-Investments schemes. But moreover, as developed in Sedlarski (2013), public organizations and NFP work in more rigid institutional framework, slowly adapting to the environment due to many institutional settings (such as lock-in costs, path-dependencies, special-interest-groups pressure and lobbying). Thus providing theoretical research on NFPs business models innovations and analyzing in more details the value-formation mechanisms can help to better conceptualize NFP value-providing network and to reassess their strategies for development. Holistic thinking and a new approach to evaluate the instruments, policies and models could help to manage and to survive the coming challenges.

The chapter first provide a theoretical overview of the main definitions and terms, mode of financing and mode of control specific to not for profit organizations and then discusses business models concepts, value creation and key considerations for service-dominant logic, service provision and welfare services. Key business model characteristics and components which explain the main considerations that have to be taken into account for the NFP business model implementation. An overview of Internet business models used in some NFP organizations and the problems associated with such models will be outlined with a focus on value creation and mechanisms for value formation for NFPs organizations to conclude with emerging and innovative models of NFP financing. This chapter contributes to the understanding that NFPs as institutions, protecting interests of the social community and finally how adoption of emerging technologies can further empower NFPs and increase its perspectives.

BACKGROUND

Defining Not for Profit Organisations

Nongovernmental organizations (NGO) were established in 1945 as a legal form by United Nations (UN). They are any type of organization from non-profit sector that is actively engaged in international cooperation (Willetts, 2009). More specifically, NGOs were designated as group of players who are active in the efforts of international development and increasing the welfare of poor people in poor countries.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

NGOs work both independently and alongside bilateral aid agencies from developed countries, private-sector infrastructure operators, self-help associations, and local governments (Werker & Ahmed, 2008). However, today term NGO become interchangeable with NFP.

According to the UN, any kind of private organization that is independent from government control can be called NGO, provided that it is not-for-profit, non-prevention, and not simply an opposition political party. Not for profit organizations can be largely defined as any form of organization that is banned from distributing net earnings or profits to individuals who exercise control over it, such as members, officers, directors or trustees (Hansmann, 1980). The net earnings should be retained and devoted in their entirety to finance further production of the services that the organization was formed to provide. This basic characteristic of the NFPs is called nondistribution constraint and it is the main factor for differentiation from any other type of business or social organization (Hansmann, 1980). While most of the nonprofits are incorporated and act upon specific legislation framework, not for profit organizations, under the NGO umbrella term, include various forms of cooperatives, spin-offs, private or public organizations that acts under the clause of non-distribution constrain".

Policy-oriented UN defined the term non-profit institution (NPIs) to designate organizations that can be legal or social entities, related for the purpose of producing goods and services whose status does not permit them to be a source of income, profit or other financial gain for the units that establish, control or finance them (UN, 2003). Further non-governmental organizations (NGOs) are defined as private organizations characterized primarily by humanitarian or cooperative, rather than commercial, objectives. Under this definition, NFP pursue activities to relieve suffering, promote the interests of the poor, protect the environment, provide basic social services, or undertake community development (Werker & Ahmed, 2008).

Social enterprise (SE) and social entrepreneurship have emerged recently as alternative organizations in nonprofit sector (Nicholls, 2006). The global popularity of 'social entrepreneurship' is directly connected to 2006 Nobel Prize winner Muhammad Yunus and Garmeen Bank (Dey et al., 2016). As defined by (Dey et al., 2016), social enterprises are businesses with primarily social objectives whose surpluses are principally reinvested for that purpose in the business or community, rather than being driven by the need to maximize profit for shareholders and owners.

The main difference between social enterprises and other NFPs/NGOs is that SE addresses social or environmental problems by employing business strategies and innovative approaches, looking for innovative opportunities to raise funds. SEs are open for innovation and appropriate risk taking (Granados, Hlupic, Coakes & Mohamed, 2011). This means that the ultimate aim of the social entrepreneur is to reinvest revenues into their mission and in the same time to reduce their dependence on external sources of funding and becoming self-sustaining (Kerlin, 2013). The potential of social entrepreneurship become an increasing topic of research and consideration (Aziz & El Ebrashi, 2016).

Mode of Financing and Mode of Operation

As the mission of NFPs/NGOs is by definition to do good things (Werker & Ahmed, 2008), it could be hard to identify hidden inefficiencies or incongruities in the NFP official statements and charters. However, the models of financing and control behind NFPs largely determine their operation. Financing schemes predefine the models of interaction, the models of dependencies and the models of governance behind NFPs. Finally, the models of financing affects the mix of products and services, their quality and

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

the efficiency of the invested resources (return on investment) transferred to social impact and social transformation (Aziz & El Ebrashi, 2016). Analyzing the basic models of financing for NFPs/NGOs Hansmann (1980) identify three basic forms:

1. Donative or grant-depending NFPs, receiving most of their incomes as grants or donations, mostly by individuals, other organizations or state. NFPs act as intermediaries who distribute products and services to beneficiaries, in behalf of donors. This is the main model of operation and sustenance for many international foundations and institutions, like Salvation Army, Red Cross, CARE and other working to provide relief of the needy
2. Commercial NFPs receive the bulk of their incomes from prices and fees, charged for specific services. Here NFP organizations are self-sustaining and support their activities by the incomes that they collect from members or customers, who pay a tax for the obtained services, like nursing homes, hospitals, member clubs and others. The main difference in this case is that the donors are in fact the main beneficiaries or end-users
3. Mixed type NFPs, or a combination of funding from donations and commercial services. Here the income comes both from donations and from paid services and fees. Usually this is the type of financing behind universities' NFPs, where part of the funding is paid by donations and alumni support programs, and another part is paid by the fees of the actual students.

To further discuss these approaches, the agency theory is explored. Both commercial and mixed models of NFPs can be highly competitive, outperforming successfully in many cases for-profit companies. However, the mode of financing and control largely depends from the main NFPs sources of income (or the big donors) whose will shall predefine and shape the NFPs policy and agenda. Hansmann (1980) determined that in specific cases people could have intrinsic reasons to prefer different social services (as education, healthcare, social support and others) to be provided by NFPs or public organizations. This can be explained by the contract failure theory of Hansmann (1980) that views NFP organizations as a response to agency problems between consumers and for-profit firms.

Contract failure arises when consumers face an informational disadvantage and are unable to evaluate accurately the quantity or quality of certain goods and services. In such circumstances, for-profit organizations have both the incentive and opportunity to take advantage of consumers by exerting less effort, producing lower quality, or delivering less than the promised quantity (Hansmann, 1980). However, it's not clear if NFPs can overcome these problems, as they are in fact "private" agents, but acting "outside" the main market forces. For example, according to data of US National Center of Educational Statistics available on (http://nces.ed.gov/fastfacts/display.asp?id=76) for the 2013–14 academic year, annual current dollar prices for undergraduate tuition, fees, room, and board were estimated to be $US15, 640 at public institutions, $US40, 614 at private nonprofit institutions, and $US23, 135 at private for-profit institutions. Thus taxes for universities and colleges in USA show how NFPs can act opportunistically.

Furthermore, grant-based NFPs meet other types of problems coming mainly from the intermediary character of the NFPs' activities and the indirect relationship between the donors and beneficiaries. The logistics of transferring donor's payment to final goods and services on behalf of beneficiaries can be very complex, involving various international organizations, environmental conditions, institutional pre-conditions and public authorities' approval. Usually these NFPs have to overcome various dependences and limitations, transferring money and support to the needy (Aldashev, Jaimovich, & Verdier,

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

2016). To enhance the understanding of the complex issues, some of the main problems in financing structure and support and agency theory, public funding and government grants, support organizations are further discussed.

Agency Theory Funding and Operations

The agency relationship is defined as one, in which one person (the principal) engage another person (the agent) to perform some service on his behalf which involves delegating some decision-making authority to the agent (Hill & Jones, 1992). From methodological point of view, the principal-agent relation is closely related to risk sharing, hidden efforts, monitoring, hidden characteristics, screening, and self-selection (Spremann, 1987). The agency theory is well studied in the for-profit companies and private relationships (as problems between shareholder-manager, employer-employee and investor-investee). Further there are well investigated interrelationships due to hierarchy and information asymmetry (Spremann, 1987). The main assumption of the Agency theory is that the interests of the principal and the agent diverge. Thus the agent will try to maximize its utility function on the expense of the principal. This can lead not only to direct loss for the principal, but as well to not-realized potential gain. Thus the agency problem become a corner-stone for organizations and the agency cost occurring in these relationships is identified such as: residual loss, monitoring expenditures and agent bonding expenditures; Moreover it's worth to mention that agency theory asserts that natural selection processes favor governance structures that economize on agency costs (Hill & Jones, 1992).

Recent research on agency theory reflects the operation of NFPs/NGOs (Van Puyvelde, Caers, Du Bois & Jegers, 2012). While there can be classified six categories of principal-agent relationships in NFPs (Van Puyvelde et al., 2012), the most important issue remain the relationship between the donors and the NFPs principal activities. As authors further summarize some of the main problems for the nonprofit organizations include the lack of shareholders who are legally entitled to financially control their agents (in this case all the decision-making is in the hands of the NFPs/NGOs executives), the nature of the work projects that can be hard to control as they are complex, hard-to-define by objective functions; the difficulty to measure accurately the NFPs output and investments in operations, the lack of financial measurement of the managerial performance and the lack of effective control mechanisms. All issues can lead to significant agency problems.

Even if Steinberg (2010) concludes that the presence of multiple principals with different objectives hinders the potential of agency theory to resolve questions of nonprofit accountability, in many cases due to the Agency costs, donors can pre-define NFPs services and products provisions. Mainly by donating to a nonprofit organization, private and corporate donors become principals who delegate decision-making authority to the organization and thus can further effectuate control partly or fully on its activities. Therefore the agency costs will apply mainly to donor-NFPs management relationships. Thus agency costs, such as monitoring costs, bonding costs, and residual loss will increase the transaction costs, but in the same time these additional fees will predefine the donor's interests to support the NFPs/NGOs activity. Especially in the case of public/government funding, organizational funding or substantial private funding, donors will require specific clauses and contractual relationships that can control NFPs/NGOs activities. Some of the main agency costs for NFPs/NGOs are (Van Puyvelde et al., 2012):

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

1. First, to improve the access of information, the principal may require additional efforts from the agent on providing evidences - information, monitoring and reporting, increasing paperwork and reducing capacity of the NFPs to perform its main work.
2. Second, there could be identified different ways to replace the compensation schemes from effort-based pay (for example – per hour) to outcome-based pay (paying for final product or outcome, as in many service or project-based contracts). But this can be difficult in the nonprofit context due to the problems of accurately measuring the performance and difficulty to define the final outcomes.
3. Another approach is by improving accounting and financial information from NPFs financial reports. Thus nonprofit financial reports can be divided into four categories: (a) efficiency variables that represent the degree to which the organization allocates resources to its mission, (b) financial stability variables that refer to the ability of the organization to continue operations if faced with a decrease in resources, (c) fundraising variables that serve as proxies for the amount of information available to donors, and (d) variables that represent the reputation of the nonprofit organization, such as the size or age of the organization.
4. Finally, from a signaling perspective, donors are willing to finance nonprofit organizations audited by a high-quality auditor, which further increase NFPs/NGOs transaction costs.

The findings suggest that in the case of NFPs agency costs can represent substantial transaction costs and can provide further problems for organizing the activity. Looking for overcoming this problem (for example, by orienting to one or two main donors) can be a question of long-term survival. This fact can further explain why NFPs are much more reluctant to provide short-term evidences and information reports to their donors, than to work for effective and long-term solutions for their beneficiaries (Aldashev, Jaimovich & Verdier, 2016). The nature of the relationships between NFPs/NGOs and their donors can further determine some additional and substantial limitations and obstacles for finding the best possible solutions for the needy.

In addition to agency theory Van Puyvelde et al. (2012) conceptualize the stewardship-based approach that stipulates that nonprofit organizations are motivated to act in the interests of their donors. Kelly (2001) proposed four stewardship strategies that nonprofit organizations can use to develop a favorable fundraising relationship with their donors: reciprocity, responsibility, reporting, and relationship nurturing.

1. Reciprocity requires that NFPs demonstrate gratitude toward their donors, like thank cards, note of appreciation or offering them a tax-deductible receipt.
2. Responsibility means that nonprofit organizations act in a socially responsible manner to their donors, for example, by considering them when deciding how to use their donations or by telling them which project their donations will fund so that they feel confident that their donations will be used wisely.
3. Reporting means that nonprofit organizations should inform donors about how they have used their donations by providing them with accurate financial information.
4. Relationship nurturing refers to continued relationship building with donors outside the fundraising context, for example, by inviting them to special events.

To mitigate the risk, NFP need adopt different tools, such as monitoring mechanisms, trust-building relationships, reputation, open-doors incentives, and sanctions in contract relationships to achieve goal alignment between the parties to the contract and reassess the Agency costs. Further, as Werker and

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Ahmed (2008) comment, the increasing professionalization of NFPs and the increasing management competences and abilities of the NFPs management boards allow them to develop their own professionalized class, better negotiating contracts and terms and conditions with the donor organizations.

However, the question from the Agency theory is about the relationships between donors and the efficiency of their operations and the quality of the goods and services provided to final beneficiaries. In this sense, it is worth highlighting the findings of Werker & Ahmed (2008). Werker and Ahmed (2008) argues that the strengths of the NGO model produces corresponding weaknesses in agenda-setting, decision-making, and resource allocation, further leading to the debate whether NFPs provide the best alternative for resource allocation and problem-solving.

State Aid, State Financing, and Public Funding

Global numbers show that public financing for both grant-based and commercial NFPs is increasing, and thus various NFPs can be subsidized through different public schemes. However, the policy efforts for *small governm*ent, public service outsourcing and government aids can have further implications both for NFPs, for beneficiaries and for the efficiency of the services, financed by public sources. On one hand redistribution of public funds and outsourcing of public activities through different competitive systems for state procurements make it possible for more NGOs to find competitive and more stable sources of income. On the other hand, the reduction in communication and transaction costs and better access to information has made it easier and cheaper for social entrepreneurs and NFPs to organize and to compete for public financing and procurement contracts on a global scale (Aldashev, Jaimovich, & Verdier, 2016). This combination has provided the fodder and catalyst for many NGOs to take off with a momentum of their own.

However, as discussed above, due to Agency-based theory, government funding can directly affect the work of the NFPs/NGOs in different ways as for example through undermining the independence of nonprofits (and their course of action) or pushing them to change their approach to client service or staffing. Moreover, as summarized by Marwell & Calabrese (2015) government funding creates inefficiencies and increases transaction costs for nonprofits and this can push away the private donors. Obtaining subsidies or state contracts can result in less fundraising efforts and costs, and thus many NFPs/NGOs prefer to work with public funds. However, as different authors outline, subsidizing authority can impose increasing requirements for monitoring and paper work and explicit restrictions on other fundraising expenses and thus can make NFP/NGO increasingly dependable, leading even to hidden subsidizing for public services, as proved further in the work of (Marwell & Calabrese, 2015).

State funding to NFPs can have some important political and social characteristics. As Salamon (1997) underline, in case of public/state funding, it's very important to make the difference between charity and provision of social rights. Thus, when nonprofits use government funds to assist individuals, nonprofits are not providing "charity" services but rather then they are securing specific "rights of citizenship". Therefore social rights, as distinguished from both civil rights and political rights are affirmative government guarantees of conditions of well-being for their citizens.

Marwell and Calabrese (2015) further open the debate about how government's provision of social rights for citizens can be secured by private non-profit organizations using public funds and whereas the state can properly be considered as a guarantor of social rights when nonprofit organizations have to fit this bill. Therefore, in their research they illustrate that poor mechanisms of state/public funding of NFP/NGOs further undermine their capacity to provide quality services and to guarantee the social rights to

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

citizens. Moreover, government funding generates significant transaction costs for nonprofits in terms of additional personnel, required to manage the contracts and additional financial costs, caused by the delays in contract payments, requiring additional funding (obtained by private loans, bank financing, donors' funds and others).

Another problem comes from the fact that more government services are allocating state funding and policy provision to NFPs/NGOs organizations. Thus different public services tend to outsource aid delivery to NGOs, following the concept amongst all organizations to outsource their non-core functions (Werker & Ahmed, 2008). This initiative comes as well from the effects of devolution and privatization on government service provision. In part this is driven by market and political ideologies that have their roots in perceptions about greater efficiencies and innovations arising from the private sector and broader support for smaller government (Van Puyvelde et al., 2012). All these initiatives for further "outsourcing" public services, paid with tax funding, can both generate inefficiencies due to agency costs, and moreover, can artificially drive to "competition" among social/subsidized service providers, who will additionally compromise the interests of the final beneficiaries, especially in areas of complex services provision, where the quality and the amount of work is hard to be proven.

International Financing and State Aid Distribution

When discussing state financing, it becomes especially important to mention the rising role of the NFPs in international support, grants schemes and aid distribution. This is explained by the fact that state aid and international organizations support is increasingly provided through the form of NFPs project-based funding. Thus many international NFPs structures are extensively financed by state funds, replacing or substituting other forms of state aid. As explained by Aldashev et al. (2016), international NFPs started to act as large state aid intermediaries, becoming part of international public relations and intergovernment policy.

This trend is to a large extent the result of the growing disillusionment in government-to-government project aid, often considered to be politicized and easily corruptible (Alesina & Dollar, 2000; Kuziemko & Werker, 2006). Therefore, the rise of the NGOs intermediation in international aid provision and support has meant an increasing emphasis of project ownership, decentralization, and participatory development. Thus, the largest single financial contributor to non-governmental organizations is often contribution from national government (Werker & Ahmed, 2008). This can generate additional agency costs, as NFPs/NGOs have to increasingly conform not only to the best practices of delivering services to beneficiaries, overcoming day-to-day struggles in international environment, but should further respond on other policy implications both in donor countries, in government policy and abroad.

Raising Role of NFPs Support Ecosystem and Intermediary Organizations

In many cases, NFPs are financed and supported through more complex structured networks of intermediary organizations that can lead to substantial effect on their operations (Dey et al., 2016). More specifically, NFPs intermediary organizations provide not only funding, but different forms of support and environment, that can further stimulate social innovations, social entrepreneurship and forms of profit/not-profit/public and pro-bono cooperation. Especially in recent years, there are promoted different public-funded schemes that not only facilitate the access to resources, but allow more organizations and professionals to enter to NFPs and to develop social innovations projects.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Intermediaries and NFPs support organizations can be further identified as organizations whose main purposes are to provide various forms of services and environmental support for NFPs and social innovations. Some of the activities can be structured as: raising awareness, organizing social innovation competitions and public events, distributing awards and promoting best practices, providing trainings, distributing various forms of loans and debt financing, establishing and lending subsidized workspaces, providing incubation services or networking and business services, designated for social entrepreneurship and NFPs. Intermediary organizations can provide as well more traditional forms of services and support, such as legal help, business planning, money or legitimacy promotion agencies, incubators or field building actors– as pre-eminent actors in defining the meaning of SE (Dey et al., 2016). This ecosystem shift toward more "social innovations" and social entrepreneurship leads to the consequence for the rising number of social entrepreneurships funding, and in a whole as raising the role of SE as suppliers of social initiatives.

However, many of these support initiatives and intermediaries programs are transferred from the vibrant technology innovation start-up ecosystem, successfully fueled by business angels, venture capital funds, private investors, university programs, science conferences and research initiatives, government support schemes and others. As current literature further insist, some of the critiques of social entrepreneurship is that "social change" is not specified whether it should be incremental (i.e., addressing market failures through innovative products and services), institutional (readjusting existing market structures) or disruptive activity (aiming at systems change, (Nicholls & Murdock, 2012) quoted in (Dey et al., 2016). Thus when discussing the raising role of social innovations intermediaries, more specific attention should be paid on their ways of directions for promoting specific social innovations and NFP activities.

Another aspect of the agency theory and the raising role of the NFPs can be further derived by the special forms of governance, control and public treatment of the NFPs. As defined in Hansmann (1980) the crucial factor of the NFPs/NGOs governance is the patron, or the person who constitutes the ultimate source of a non-profit income. While in the most cases the patrons for small NFPs are many donors (for donative NFPs) or customers (for commercial NFPs), the largest foundations and charity organizations depend more substantially from single-source private donors. In the previous paragraphs we discussed how government and public funding can increase the agency costs of the NFPs/NGOs and this can lead to further diminishing the quality of the services provided to the beneficiaries.

In the case of private-owned NFPs governed by wealthy individuals or patrons, it is evident that NFPs activities and programs for beneficiaries cannot hurt the interests of the patrons. The emerging agency problems in this situation come from the fact that sometimes the interests of the beneficiaries (and the society as a whole) and the private interests of the wealthy individuals (NFPs/ patrons) can differ substantially. Thus in many areas, where NFPs gain increasing impact as for example in the field of breakthrough research, new technologies and health care, education and others, private interests can be divergent from the public ones. Moreover, the increasing role of the NFPs both on national and international scene can further extend and reshape political and economic processes, hindering the role of the state to assure the democratic rights and promoting private-dominating practices.

As the legal form of NFP brings many in-kind, financial and social benefits to donors and patrons, they can be successfully used as tax haven for personal fortunes or as instruments for hidden political and economic dominance. As NFPs are subject of special legal and tax treatment upon specific conditions as for example favorable corporate income taxation, better rules for social security, unemployment insurance, minimum wage, securities regulation, bankruptcy, antitrust, unfair competition, copyright, postal

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

rates and others (Hansmann, 1980). All this can further attract "selfish" individuals and profit-seeking agents that can try to exploit NFPs/ for private interests. More specifically different examples suggest that NFPs can accumulate and distribute significant amount of funds that can be further employed for economic and politic pressure on international and local actors and economic processes. For example, one recent investigation in press (Rossell, 2015) show up how two large foundations invested more than 196 Millions USD to "push Internet regulations". Moreover, the NFPs sources of political and economic influence can be invisible through different forms of networking support and hidden subventions that can be hardly followed.

BUSINESS MODELS, SERVICE PROVISION, AND VALUE CREATION

Business model describe the internal logic and the processes of organizing an activity for delivering value for end-user. The business model is the conceptual model of business functions, structure and systems that constitutes company´s operational and physical form (Osterwalder, Pigneur & Tucci, 2005). The business model is centered on the value provided to the customer and how it is produced and financed. The research on business models expands recently, both for profit companies and for non-profit organizations (Wirtz, Pistoia, Ullrich, & Göttel, 2016). The increasing interest to business models is due to ICT and Internet technologies that are considered as main source of differentiation (Ostenwalder et al. 2005). Thus both for profit and not-for-profit organizations can improve and enhance further the way they conceive business with adopting innovative and technology-based approach for connecting with clients, suppliers and value-defining network.

Lindgardt, Reeves, Stalk and Deimler (2009) states that business models consist of two main elements: value proposition and operating model. The value proposition stands for what is offered to whom, and it covers three main dimensions – target segment, product/service offering and revenue model (financial model). Therefore, the model of value proposition for NFPs/NGOs should strongly correspond to the interests of the beneficiaries. More specifically, as Aziz and El Ebrashi (2016) suggest, the main mission and value proposition for social enterprises (and for all NFPs as well) is to create "transformational impact", and their success should be measured by the magnitude of the provided social impact. Thus "value proposition" in the context of NFPs/NGOs should be understood as general transformation of the context, leading to meaningful, long-term impact and improvement of the situation.

On the other hand the operating model describes how to efficiently deliver the offering and include business choices of value chain, cost model and organization of value-delivering network. Thus the operating model of NFPs should discuss more specifically how to optimize the efficiency of the offering and how to extend services, involving communities and potential networks of interested suppliers.

While the research literature in the field of business models for social entrepreneurship is recently exploding (Wirtz, Pistoia, Ullrich, & Göttel (2016), we will further concentrate more specifically on new technologies and Internet and how they can extended business models of the NFPs/NGOs in order to optimize their value proposition (for beneficiaries) and their value offering (or efficiency of service provision). Therefore, more attention will be put on two main approaches – pipeline view of the business models (connected with traditional organizations) and the emerging platform view of the business, becoming popular recently after UBER (Van Alstyne, Parker, Choudary, 2016). NFPs offer value for customers and beneficiaries and the specific characteristics of value requires further discussion.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Traditional Model

Historically, non-profits and particularly commercial non-profits emerged mainly as providers of services. Some of the reasons include the limitation to raise capital (due to non-distribution constraint) and the limitations to secure additional debt, in order to set more capital-intensive organizations (as for example manufacturing or industry organizations). NFP organizations operate primarily directly in the field of service provision (as in the case of education, healthcare, social care…) or in resource allocation (charity distribution), providing additional services for collecting goods (money, food, clothes and other) and distributing them to the needy.

As Van Slyke (2007) maintains, NFPs are usually specialized in social services that can be characterized as complex services, requiring substantial expertise and capacity to provide. He underlines a number of challenges for providing social services (Van Slyke, 2007). First, social services are more complex to evaluate than the industrial goods and their quality and efficiency may vary by both external and internal factors. Furthermore, it's more difficult to mitigate the risk in the service sector (especially in social services) and to measure directly or to evaluate indirectly the quality of the obtained services, as services are personal and labor-intensive and their reach cannot be assured. The main issue is that neither the efforts nor the quality of the service provider can guarantee the successful outcomes of the service systems and its final results (as for example – a scientific breakthrough in university research, or successful healing of every disease). Thus within the service-system focus should be put on improving the processes of service delivery and not the attainment of final assessments or results.

Service-Dominant Logic and Value Creation

Recently, many scholars contributed to the evolution of service science, clarifying some of the basic concepts behind the fast-developing service sector (Vargo & Lusch, 2004, 2016). In general, services can be defined as intangible, non-material transactional configurations that cannot result in ownership (Beltagui, Riedel & Pawar, 2008). While traditional definitions of services describe them as "activities, deeds and performance", the evolving understanding of services is the application of competences (skills and knowledge) for the benefit of another party. The benefit provided through service is value, that is, an increase in the viability of the system (individual, family, firm, customer) under consideration, which arises as actors in an exchange integrate their varied resources (Barrett, Davidson, Prabhu & Vargo, 2015).

The competencies to provide a service can be manifested in a complex combination of goods, money, activities and institutions within a complex and social service system (Ng & Maull, 2009, Vargo & Lusch 2004). The key characteristic that differentiates a service system model from the traditional economic transaction model is the interaction with the customers as active participants in the service process (Fitzsimmons & Fitzsimmons, 2006). It is important to note that the most important feature of the service system structure consists of institutions and institutional arrangements (Vargo & Lusch, 2016). Furthermore, based on the evolved S-D model, Vargo and Lusch (2016) defined 11 Foundation Premises (FP) that constitute the basic foundations of the service science. Three general perceptions of services which are:

1. Value is co-created by multiple actors, always including the beneficiary (FP6)
2. Actors cannot deliver value but can participate in the creation and offering of value propositions (FP7)

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

3. Value co-creation is coordinated through actor-generated institutions and institutional arrangements (FP11).

Value System Model

Value is generally considered to describe either the importance of something or its worth (Yusof, 2010). In traditional literature, leaded by Good-dominant (G-D) logic, value is understood as intrinsic or exchange-based. The intrinsic value is constant and do not depends on circumstances or time, while the exchange value reflects the price variations at the time of the exchange (Yusof, 2010). Thus the intrinsic value is usually attributed to the product's costs and alternatives, while the exchange value reflects the market dynamics (Supply-Demand processes) and the prices of the competitive/complimentary goods and goods elasticity.

Goods Dominator

While within Goods-dominant (G-D) logic the producer is conceptualized as creator of value and the customer is a final user or destroyer of value, in Service-dominant (S-D) logic, the both parties are resource integrators (FP 9), actors in an "A2A" (actor-to-actor) relationship, who jointly co-create value (FP 6). However, resources are valuable only within particular social context and the respective social system. Moreover, as (Edvardsson, Tronvoll & Gruber, 2011) highlight service provision can lead to power and information asymmetries, including such phenomena as opportunism, deception, persuasion and seduction. Additional research have to focus on how power relationships influence service exchange and value co-creation, and how various actors perceive the value being created in the service exchange.

Service Dominator

Thus within the service-dominant logic the value is no longer characterized as value-in-exchange, even neither as value-in-use (Ng & Maull, 2009), but more specifically as "value-in-social-context" (Edvardsson et al., 2011). This means that an individual's value perceptions are, at least in part, dependent on the relative positions of the individual within the wider social context, depending on much larger extend to its social environment and its social role. Moreover as Vargo & Lusch (2016) underline, the most important features of the social structure consists of institutions "rules, norms, meanings, symbols, practices, and similar aides to collaboration" and, more generally, institutional arrangements and interdependent assemblages of institutions. Therefore the concept of value-in-social-context (Edvardsson et al., 2011) can extend our understanding about service-provision, as the value is due not only on the possession/exchange/use – but more specifically on the social context, defined largely by institutional premises;

Focusing more specifically on customer value, in traditional for-profit firm, it can be simply defined as what customers get (benefits, quality, worth, utility) versus what it costs him (price, costs, sacrifices) (Yusof, 2010). More specifically, to identify the term "customer value" Zeithaml (1988) explored the concepts of perceived price, perceived quality and perceived value and found out that customers thought of value in four ways: "value is low price; value is whatever I want in a product; value is the quality I get for the price I pay; value is what I get for what I give. Extending these findings to the case of NFPs/ there can be made the following observations. The NFP customer -the final beneficiary is not expected

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

to contribute substantially to the costs (as they do not have to pay the (full) price, or their costs are substantially lower than in the market situations). However, from theoretical point of view, there should be a balance between what the beneficiary gets: "quality, worth, utility, benefits, anything that I get and what they give. As literature suggest, this equality will generally depend from more complex social and institutional context.

Institution Dominator

Thus, in the case of NFPs beneficiaries, the price of getting products and services could be much more socially-determined and linked to social elements and human standing in the social structure. Therefore becoming "beneficiary" of the NFPs services can have a specific social price as it can designate a person in a weak social status (illness, aging, poverty, need to be supported, addiction, social exclusion, ignorance, family problems, loneliness, lack of support etc.). This means that the status of beneficiary" of the NFPs can hurt person's social standing and social position, including his/her dignity, self-confidence and self-respect, social networks and motivation for improvement and change. Therefore, when considering beneficiaries and actual receivers of NFPs/ products and services qualified as charity, we have to admit the social and emotional price that they have to pay. That is largely influenced by social context and institutions (rules, norms, social practices and others). Thus the perception of value-in-social-context should lead to better understanding of the real social costs and social values associated with the work of NFP organizations.

Many NFPs provide public services that cannot be attributed to specific target users or where the impact could be evaluated only as long-term and for the benefit to all. Based on the taxonomy proposed by Simmons (1998) the not for profit activities can range in the fields such as: advocacy; information gathering and analysis; information dissemination; generation of ideas and recommendations; monitoring and watchdog role; service delivery; meditation/facilitation. There, the final impact of activities cannot be measured with terms such as value-in-context, as the results from activities as research, raising awareness, improving the social rights and environmental protection can lead to more general institutional change that can make a better life for all. Good examples of organizations that strive for institutional change can be Amnesty International, The World Conservation Union, Reporters without Borders and others.

Simmons (1998) maintained that in the early 1800s, the British and Foreign Anti-Slavery Society were the driving forces behind government action on the slave trade, and Anglo-Oriental Society for the Suppression of the Opium Trade were leading influential antidrug movement, that culminated in the 1912 Hague Opium Convention. Therefore, the work of the not for profit organizations should be defined as crucial for the institutional paradigm shift, in the way that NFPs organizations can actually change the institutional settings, overcoming the institutional dependencies and provoking new legislation frameworks, better understanding of social and environmental problems, breaking cultural norms and leading to more substantial transformational changes.

Operational Model of Business

To evaluate the operating models and how not for profit organizations mobilize resources to provide value for the beneficiaries and the society, the concept of Hansmann (1980), is discussed. Hansmann (1980) explored 5 specific situations, where NFPs can play specific role to:

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

1. Act as intermediary organization, collecting and distributing goods and services from donors and delivering them to different recipients and end-use
2. Work for the procurement of "public goods" that would be difficult to be enjoyed by a single person, but can contribute for everybody (for example environmental protection, social rights, health research and others)
3. Finance NFPs working in the narrow fields of expertise or interest and operating in terms of price discrimination. In this case, it is observed the problem of subsidies (donations) and collected ticket prices for specific art events, museums and performances, where the final price is distributed on several groups of persons
4. Work in situations of implicit financing (as alternative for loans/debt financing), where the alumni donations actually represent additional payments to the reduced costs of the received services – as in the case of university education
5. Coordinate complex services that require better coordination of various contributing organizations and fields of expertise.

As many scholars have shown (Dey et al., 2016, Chell et al., 2016, Aldashev et al., 2016 to name a few) it is very difficult to set specific standards for measuring and determining the social value or the mechanisms by which NFPs operate for accomplishing their mission. Thus, the final goal is that invested money and efforts by NFPs organizations lead to more substantial transformational change and long-term impact for the beneficiaries and for the future development. One of the main problems, as recognized by Simmons (1998) is that NGOs become source of pressure and influence since they get increasingly financed by national governments, organizations and private interests. Thus NGOs, governments and multilateral institutions need to ensure public participation that draw on expertise and resources of NGOs, innovation, sense of purpose, commitment and freedom from bureaucratic constraints (Simmons, 1998).

Controversies With Business Models

There is abundant economic literature that discuss the controversies of NFPs organizations, their benefits and limitations. For example, one of the widely-discussed controversies comes from the fact that NFPs work largely with voluntary work, with non-competitive HR policies and staff incentives. Different studies pointed out that NFPs could use other forms of compensation of their staff as reduced labor service, non-material stimulus and others (Marwell & Calabrese, 2015, Aldashev et al., 2016). Moreover, as there lacks profit or financial results that can motivate the management body, different researchers pointed out that it would be difficult to attract competent experts in the field. However, empirical data prove that NFPs attract many professional employees and provide competitive salaries that are close to the public sector, but less than the private companies. Further, instead of working less, some in-house inspections of time schedules show that even the permanent staff of NFPs works voluntary and provide more services. Even the research of (Marwell & Calabrese, 2015) demonstrated how private NFPs subsidized in fact public funded services as social care. As Aldashev, Jaimovich, & Verdier (2016) state, NFPs work have to be primary intrinsic motivated, leaded by internal and altruistic intentions and mission-driven. Furthermore, in specific cases, the market dynamics and the easy access to (public) funding can attract some profit-oriented organizations and rent-looking entrepreneurs;

A major controversy is that non-governmental organizations, especially working as distributors of charities delivers goods and services to a population that provides little feedback on the range or qual-

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

ity of the delivered products. This comes primary by the consequence that NFPs are more interested to guarantee donor satisfaction than beneficiary welfare. For instance, if donors expect that charity products or services should be with inferior quality than market-traded products/services, then NFPs should provide evidences about the wisely use of the donations. Indeed, donations are the only "market force" in the non-government sector industry, where donors can be viewed as desiring to improve the quantity and quality of the product of the NGO without having their donation expropriated. In this instance, the donor and funding base of NGOs will reveal the primary set of interests that a NGO is forced to manage (Figure 1).

Some other problems of NFPs operations come with the fact that it is in neither the interests of the NGOs nor the official donor agency, complicit as a funder, to publicize less-than-stellar results (Riddell & Robinson, 1995). In addition, public opinion of non-government organizations is is generally high in rich countries and poor countries alike, so the demand for rigorous and critique evaluation is correspondingly low (Barr & Fafchamps, 2006). Too many actors, lack of coordination to achieve efficient result, too many stakeholders separating fund-raising to actual work by subcontracting it to local NFPs where there can arise some agency problems and too many missions without clear understanding of NFPs efficiency impede improved operations of NFPs. Furthermore, fund and resource allocation and how these pass through multiple channels, from the taxpayer (public funding) to a bilateral aid agency, to an intergovernmental organization, to an international and finally to a local organizations before being finally spent on goods or services is increasingly a problem. Additionally, whether NFPs collectively are better at development than public or private-sector institutions is increasingly questioned. Moreover, as evaluations that allow for causal inference are rarer, substantiating the quality and effectiveness in NFP organizations, although increasing, remains a challenge.

BUSINESS MODELS

Successful business models have in common that they are designed in a way to reduce the upfront investments, to accelerate the revenue/receivables and cash inflow and to obtain reliable customer feedback often and earlier. Chen (2009) pointed out that business model in the twenty-first century has to combine the capabilities of Web 2.0 as collective intelligence, network effects, user generated content, and the possibility of self-improving systems. He emphasized that Business Model 2.0 should include not just technology but also the networking and open business effect. Thus in coherence with Web 2.0 movement it is identified Open Business models. For the NFPs/NGOs, open business model mean business models that do not restrict the results of the innovation to the rest of humanity, open business models cannot be based on restrictive forms of intellectual property.

Open Business Model

Open business is in general the concept of doing business in a transparent way by intimately integrating an ecosystem of stake holders and abiding by a model of transparency. Often, small minorities harness the business benefits away at the cost of other stakeholders and the market. Open Business structures seek to rectify this. They activate personal productivity like no other organization can by simply redirecting the returns to those that produced them, and by their nature, the individuals themselves play a central role.

A more strict definition is inspired by free software movement, open standards, open source and open content, which implies that an open business, is a business whose business model is run on open standards, "free software" and "open source" software and open content principles, and focuses on creating `open´ products and services. This approach would guarantee that the business is run for the benefit of all, and not just for one group or stakeholders, whether shareholders, personnel, government etc. Also the strict application of open principles will guarantee that bankruptcy of a specific open business will not result in the loss of the fruits of its knowledge. Some of the basic characteristics of an Open Business Model are:

1. Transparent business exchanges and production of products or services, with transparent processes.
2. Majority-oriented as a commitment for the majority of involved people:
    a. Sustainable by caring for a sustainable local and global system.
    b. Wellbeing-oriented, giving the health and wellbeing of people the highest preference.
    c. Flexible, opening up space for people to grow, communicate, build trust and relationship.
    d. Flat, taking measures to devolve power over decision making in different ways.
3. Wealth-sharing, offering shared revenue.
4. Location-independent, encouraging distributive production.

Furthermore, it is important to state that open business models generated the momentum and paved the way to the emergence of more complex platform business models. As stated in (Van Alstyne, Parker & Choudary, 2016) the platforms businesses have existed for years, like malls that link consumers and merchants. However, the difference emerged with the ICT and the reduced needs to possess physical infrastructure and assets, as IT makes building and scaling up platforms vastly simpler and cheaper. This allows nearly frictionless participation that strengthens network effects, enhances the ability to capture,

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

analyze, and exchange huge amounts of data that increase the platform's value to all. This can further explained the examples of platform businesses, from Apple iPhone, to Uber, whose spectacular growth abruptly upended their industries.

As Van Alstyne, Parker & Choudary (2016) further reveals, platforms have an ecosystem with the same basic structure, comprising main four types of players. *The owners of* the platforms control their intellectual property and governance, setting the main rules and interaction models. Providers serve as the platforms interface with users. Producers create their offerings, and consumers use those offerings. Thus the platform value-adding is based on the evolving networks interactions, where creating fruitful ecosystem become crucial factor for success. Main characteristics of platform organizations are listed below (Van Alstyne, Parker & Choudary, 2016):

1. Resource orchestration, instead of resource control.
2. External interaction, instead of internal optimization.
3. Ecosystem value, instead of customer value.

The main asset for the platform organizations is the community and the resources its members own and contribute, be they rooms or cars or ideas and information (as in the case of AIRBNB, Uber or Wikipedia).The main efforts for the platform organizations are to create value by facilitating interactions between external producers and consumers. Because of this external orientation they have to organize and master good ecosystem governance or setting appropriate rules and mechanisms for interaction inside the ecosystem. Finally, the platforms seek to maximize the total value of an expanding ecosystem in a circular, iterative, feedback-driven process. Sometimes that requires subsidizing one type of consumer in order to attract another type. Although researchers have attempted to reveal how external factors and institutions influence and have a leading impact on the performance of the NFPs (Aziz & Ebrashi, 2016; Muñoz & Kibler, 2015), it is crucial to highlight the opposite process – or what is the capacity of the NFPs to transform the environment, including existing social systems and institutions.

Institutions shape the social realm as they pre-define the social framework or complex set of rules, norms, meanings, symbols, practices, and similar aides to collaboration. Therefore, institutions form socially-determined understandings of what is good and what is bad, what is right and what is wrong and what is acceptable and unacceptable. Thus institutional transformation and social development is a difficult and complex process, involving substantial efforts and reassessment of evident" and well-proved traditional understandings. However governance of the ecosystem as a complex social mechanism. To this end, ecosystem governance, institutional change and platform model of operation require further vision development.

Social Entrepreneurship Model

It is anticipated that the role of not for profit organizations in the sphere of social entrepreneurship will continue to increase as not for profit organizations continue to adapt the operation of social systems and institutions. As the main mission for not for profit organizations and social enterprises are to create transformational impact on social or environmental ecosystems (Werker & Ahmed, 2008), its further success will largely depend on their mode of operation. Therefore, better understanding of the transformational impact that not for profit organizations have on social systems and institutional transformation is important. Successful business models for non-for-profit organizations need to orchestrate elements:

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

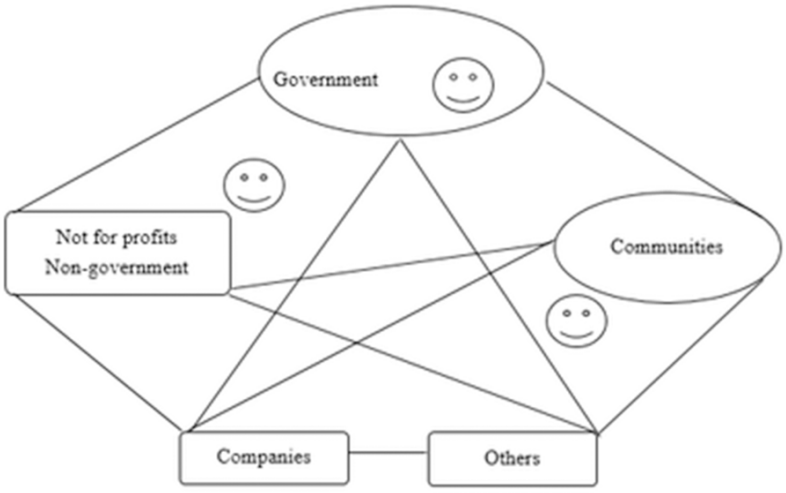
1. Good ecosystem governance.
2. Proper technology mastering.
3. Appropriate financing mechanisms.
4. Outperforming the agency problems.

Historically, NFPs played substantial role for institutional and social transformation. As described in Simmons (1998), different social movements and forms of social associations played substantial role for the abolishment of slavery, for drug control, for rising human rights, for introducing environmental protection and many others. If working for the interests of their beneficiaries and for their causes, NFPs can lead to large institutional changes, playing substantial role for shaping better "rules of the game". Thus in the advent of major economic transformations such as the 4th industrial revolution, where many new social issues will further emerge, NFPs can provide many incentives, knowledge and perspectives for shaping better rules in society. That is why there should be investigated more specifically the mechanisms by which NGOs/NFPs can assist the social transformation, successfully overcoming some of the rising problems such as agency dependency and private/narrow shaped interests of specific groups of donors, national/institutional funders, private interests and other funders and donors.

Platform Model

Analyzing the platform models for organizing NFPs activities provides a more successful way to mobilize resources, to deliver better value-in-social-context, and to set more transparent rules of interaction and governance. Communities, end-users, companies and for-profit organizations, public organizations and institutions can work together for delivering better services and better social perspectives for all. This comes to show that we need to change our thinking for NGOs/NFPs from pipeline (Figure 1) to platform-oriented (Figure 2) organizational models. As reveal (Van Alstyne, Parker, Choudary, 2016), discussing the uberization effect on the economy, when a platform enters a pipeline organization's market, the platform almost always wins.

Figure 2. Platform oriented model of operation multiple interactions between various partners
Source 2 Antonova (2016)



EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

As George & Reeds (2016) emphasize NFPs should try to build strong social networks and connections with partners, communities and stakeholders with broader power and decision-making abilities. It is important to highlight that ecosystem design and involvement of different stakeholders, as for example state and public institutions and civil society communities will largely differ from state to state, as historically the social institutions emerged differently and thus there are not available "one-fit-all" solution (Aziz & Ebrashi, 2016). Furthermore, defining the social design of a platform-based organizational model consists of making appropriate rules and architecture.

An *open architecture* allows players to access platform resources and to create new sources of value for them. *Open governance* allows players other than the owner to shape the rules of trade and reward sharing on the platform. Regardless of who sets the rules, a fair and transparent reward/motivation system is a key. If platform have an open architecture but do not share the some valuable compensation or rewards, potential platform participants will have the ability to engage but no incentives. On opposite, if rules are open but the architecture (the way of interaction is relatively closed), potential participants could have incentives to engage but not the ability (Van Alstyne, Parker, Choudary, 2016).

The critical strategic aim of the platform organization is the strong up-front design of the processes that will attract the desired participants, enable the right interactions (so-called core interactions), and encourage ever-more-powerful network effects. To that end, platform must define the access (whom to let onto the platform) and governance (or "control"—what consumers, producers, providers, and even competitors are allowed to do), fostering further interactions and the associated network effects as the ultimate source of competitive advantage.

Technology Factors and Internet Models

In order to design better organizational models for NFPs it is important to outline the important features of the Internet technologies that can further contribute for better communication, networking and communities' collaboration for the non-for-profit. As Rheingold (1993) states one of the surprising properties of the computing is that it is a social activity.

The driving force behind the rising internet economy is the demand-side economies of scale or the network effect (Van Alstyne, Parker, Choudary, 2016). These are enhanced by technologies that create efficiencies in social networking, demand aggregation and other phenomena that help social networks to expand. In the internet economy, platforms that achieve higher "volume" than competitors (or that attract more participants) offer a higher average value (value-in-social-context) per transaction. That's because the larger the network, the better the matches between supply and demand and the richer the data that can be used to find matches. Greater scale generates more value, which attracts more participants, which creates more value, and thus forming another virtuous feedback loop that produces monopolies (Van Alstyne, Parker, Choudary, 2016).

Furthermore, the wider application of ICT technologies and Internet contributed to the decrease of the transaction costs (Masanell & Ricart, 2007). Thus, Internet improved largely the information asymmetries and made the information accessible globally, decreasing communication costs, along with remote business operations, and transforming tremendously the global NGOs/NFPs realms. But more importantly Internet brought enormous leverage to ordinary citizens at relatively little cost, including intellectual leverage, social leverage, commercial leverage, and most important, political leverage (Rheingold, 1993). As the public sphere depends on free communication and discussion of ideas, the Internet can enhance NGOs/NFPs efforts for leading to institutional transformation by bringing open access,

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

voluntary participation, generation of public opinion through assemblies of citizens who engage in rational argument, freedom to express opinions, and freedom to discuss matters of the state and criticize the way state power is organized.

Alternative Internet-Based Funding Models

One of the crucial factors for NFPs modes of operations are the ways for NFPs financing. As discussed above, the main transaction costs that occur in NFPs are purely related to agency costs – or the costs of getting funding, including communication and negotiation between the donors and the management of the NFPs. This is explained by the fact that many non-for profits invest considerable resources to collect donations, to develop fundraising programs or to apply for specific grant programs.

Some of the alternatives to reduce the agency costs and fundraising efforts for some NFPs can be to stick on some public financing programs (specializing in specific areas) or to attract investments and funding from wealthy individuals, but both of these models can lead to governance and management problems, hindering the ultimate goal – helping the end-users and leading social transformations. Thus we will discuss another funding alternative or crowdfunding that emerged largely as platform activity. Some popular web-platforms for crowdfunding are Kickstarter.com and Indiegogo.com, presenting many financing opportunities both for investors and for (social) entrepreneurs.

More specifically, crowd-funding is a peculiar form of funding with customers (or final users) acting as direct investors (Belleflame, Lambert & Schwienbacher, 2010). The data reveals that a large share of crowdfunding initiatives are based on passive investments, or investments with a promise of compensation but no direct involvement in the decision-making process, or provision of time or expertise for the initiative. But more importantly, crowdfunding is for sharing information and finding partnership, communities and networking. Furthermore, it is important to note that non-profit organizations tend to be more successful in finding and attracting crowd-funding financing (Belleflame, Lambert & Schwienbacher, 2010). Further, Wojciechowski (2009) discusses that donations via crowdfunding platforms increase and that social networks can become a worthwhile model for money collection for many charity organizations and NGOs.

Thus, using crowdfunding can improve not only fundraising for NFPs, but it can help to improve visibility and participation opportunities, including better options for transparency, evidences, credibility; inserting ratings and others, and leading to better organization and operation. All this will further decrease the agency and transaction costs for NFPs operations, providing better opportunities for organizations to increase their activities and to lead to substantial ecosystem transformations.

CONCLUSION

Recently the interest and funding for not for profit organizations largely increased in a global perspective and further augmented their possibility to exercise power both on political and economic processes. Thus, as not for profit organizations continue to become active players for social transformation and their share of social services providers raised not only on regional, but as well on national and international context. However, a small critical literature exists questioning whether NFPs are effective in improving lives or providing goods and services for their beneficiaries. Moreover, there is a lack of evidences and proper understanding of service providers and alternative public organizations or for-profit private organiza-

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

tions which has resulted in a number of controversies about governance and management capacity of not for profit organizations. Some of the issues, reported by different researchers state that nobody has the interest to measure and report negative outcomes of the not for profit activities and it is very difficult to identify quantified approach and measures to assess the quality of the work of non-profits in large.

Even if social organizations can play increasing role for the institutional transformation and social development, this model of development of not for profit is not without challenges. Many researches prove that decentralized and multi-layered decision-making can lead to inefficiencies and furthermore – can create additional burden for public and social services funding. Thus, new technologies and emerging business models for not for profit operations can help the organizations to improve coordination, to reduce transaction costs and to increase visibility of services, increasing the focus on beneficiaries and end-users. Therefore not for profits must be considered as service integrators or platforms, connecting different actors, communities and stakeholders.

Further research is needed to identify how not for profit organizations interact with public organizations and how they actually influence political and institutional decisions. More specifically, it's important to investigate how not for profit organizations are financed by public funds or large private donors can undermine the social development, supporting status-quo or just defending the interests of the donors and not of the beneficiaries. Adopting more flexible, open and platform-based business model can enhance not for profit main goal, the potentials for social and institutional transformation.

KEY TERMS AND DEFINITIONS

Institutional Transformation: New technologies and new business models for not for profit operations can help the organizations to improve coordination, to reduce transaction costs and to increase visibility of services, increasing the focus on beneficiaries and end-users. Thus institutional transformation should put not-for-profits as service integrators or platforms, connecting different actors, communities and stakeholders.

NFP Impact: Historically, NFPs played substantial role for institutional and social transformation, as for example - forms of social associations played substantial role for the abolishment of slavery, for drug control, for rising human rights, for introducing environmental protection and many others. If working for the interests of their beneficiaries and for their causes, NFPs can lead to large institutional changes, playing substantial role for shaping better "rules of the game".

Platform Model: It is enhanced by technologies that create efficiencies in social networking and demand aggregation that help social networks to expand. Platforms offer a higher average value when attracting more participants. The larger the network, greater scale generates more value, which attracts more participants, which creates more value, and thus forming another virtuous feedback loop that produces monopolies.

Chapter 85
Socioeconomics of Solidarity: A Multilateral Perspective from the European Union

José Manuel Saiz-Alvarez
Tecnológico de Monterrey, Mexico

ABSTRACT

This work deals with the Socioeconomics of Solidarity analyzed from a double public and private perspectives. The chapter begins with the guiding principles of this emerging economic thought based on the principle of subsidiarity, the search for the Common Good, and the necessary solidarity based on justice. After having grounded these principles, the author develops different solidarity-based public policies, mainly focused on the European Union, by including principles, objectives and stages of the European Official Development Aid, the European Development Fund, and the Common Framework for Joint Multiannual Programming and Efficiency. This analysis is complemented with the ideas rooted on the Socioeconomics of Solidarity that is analyzed following a private perspective, arguing that it is necessary to re-launch these School of Thought based on solidarity and justice to search for an economic world characterized by social welfare and economic wealth.

INTRODUCTION

Today, the business world is characterized by a strong "glocalization" (think globally, act locally), with a business policy development based on outsourcing. This business strategy is complemented with the launching of public Official Development Assistance (hereinafter, ODA), close with economic policy prescriptions, to achieve higher levels of economic and social welfare.

In this process, the Information and Communication Technologies (hereinafter, ICTs) have a key role to play, which have transformed the world as a global village (McLuhan, 1964). Following Rifkin (2011), we are now facing the Third Industrial Revolution, also called the Revolution of Intelligence or Knowledge Economy[1] (Marginean, 2009), which is defined by the transmission of real-time information through Internet over the world. Faced with the undeniable benefits associated with Internet, most notably:

1. Real-time communication independently of the type of transmission used;
2. Higher levels of productivity;
3. More efficient academic work;
4. Networks rooted on personal and professional contacts;
5. Less operating and supply costs;
6. Further expansion of clients by opening new markets, and
7. The possibility of collaborative consumption, leading to a global social re-humanization.

As the world is immersed into a global village, economic crises have a deeper impact, as has happened in the First Global Crisis, beginning on 15 September 2008 after the Lehman Brothers'[2] bankruptcy. Given the negative effects arisen from this crisis, a reintroduction of values and guiding principles defining subsidiarity, solidarity and the common good, as well as a strengthening of ODA mechanisms, is necessary.

The Socioeconomics of Solidarity has recently emerged in Latin America and Spain as a complementary School of Thought to diminish the strong economic imbalances in terms of unfair income and welfare distribution existing in these countries. Fostering social entrepreneurship and welfare generates positive externalities (Leadbeater, 1997; Dees, 2001; Drayton, 2002), Braunerhjelm & Stuart, 2012), to combat poverty by implementing business strategies to maximize profit, such as applying Corporate Social Responsibility and the Triple Bottom Line. In fact, any initiative based on economic issues has a social impact (Certo & Miller, 2008; Mair & Schoen, 2007), whose intensity varies according to business and social characteristics in the country, being particularly important in the case of social entrepreneurship.

In this sense, and after having analyzed the entrepreneurial activity in 49 countries, Lepoutre et al (2011) show that countries with high levels of entrepreneurship, most of them are social enterprises focused on creating economic welfare with social value, while stimulating social changes by offering goods and services to meet consumer needs. All of this leads us to conclude that entrepreneurs create value to stakeholders. After having studied the Ashoka's 'hybrid value chain', and the 'holistic approach to development' conceived by Bangladesh Rural Advancement Committee (BRAC), Kim (2014) propose a global social entrepreneurship model both to fight poverty, and to highlight how entrepreneurial efforts can create opportunities for launching ventures to satisfy social needs, while balancing economic and social imperatives on a global scale.

Social entrepreneurship can be improved through solidarity focused on social needs. Good business practices are characterized by the implementation of policies based on social entrepreneurship seeking to "catalyze social change and social needs" (Mair & Marti, 2006: 37) and "social value through the implementation of new business opportunities" (Weerawardena & Mort, 2006: 25). This social value is translated into a higher quality of life for society, as well as a growing sense of self-worth and self-assessment individual sentiments.

This sense of self-assessment is enhanced by the desire of a continuous improvement in the pursuit of excellence through cooperation and self-competition. Actually, this fact is a constant pursuit of happiness for entrepreneurs and their immediate environment, leading to a constant search for quality and needs' satisfaction, not only for their customers and suppliers, but also for their own happiness.

Given these premises, social entrepreneurship can be fostered through solidarity addressing a variety of social needs. Generated from entrepreneurship, well-done jobs are a mixture of motivation, courage, determination, ethics, continuous learning, intelligence, passion, and entrepreneurship seeking the welfare

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

of others to create a better society. Public-private initiatives are necessary to achieve this social objective. Achieving higher levels of entrepreneurship is one of the ways to accomplish this goal. The combination of a good capacity for innovation, strong working skills, and ability to develop new business ideas, guarantees socioeconomic development by creating opportunity and social successful entrepreneurs. As a result, it is essential for entrepreneurs to be associated with values, prosperity and happiness gained in the market, by developing successfully-oriented short and medium term business policies born from quality management strategies, and best practices based on efficient management principles resulting into increased turnover, profits, productivity and customer satisfaction. Also, business excellence identifies improvement opportunities, and areas of strength.

Social entrepreneurship is directly affected by entrepreneurial spirit, culture, and business policies carried out by strategic business plans for decreasing differences in terms of GDP per capita (*Beta convergence*) (Dolado et al, 1994), through opportunity entrepreneurship (Block & Wagner, 2010), that is directly influenced by education. As demonstrated by Kets de Vries (1985), cited in Hisrich et al (2007), and in Páez and García (2011), emotional and behavioral family conditions in childhood and adolescence influence entrepreneurial behavior, as entrepreneurship can be taught and learned (Kuratko, 2003).

The aim of this chapter is to analyze the Socioeconomics of Solidarity's guiding principles, and how solidarity impulses economic growth and wealth. To do this, and mainly focused on the private sector, we will begin analyzing how the guiding principles can optimize the efficient use of resources to achieving fair and caring societies. Then we will study public solidarity from a European perspective. Finally, the Socioeconomics of Solidarity will be analyzed, as a complementary driving source of solidarity from private and community initiatives. The chapter will be finalized with some conclusions.

BACKGROUND

First Guiding Principle: The Importance of Subsidiarity

From a sociological point of view, the term "Subsidiarity" (from Latin, *subsidiarius*) can be defined as "trend favorable to the subsidiary State involved in supporting private or community activities." Born in the EU law, the principle of Subsidiarity limits EU actions to only those cases in which the States alone are not effective for achieving an objective. Therefore, Subsidiarity creates and guarantees the space for personal responsibility and personal initiative, especially at the level of good governance (Horga, 2010). This level of responsibility is collective, because it is performed at a multilevel scale, so the implementation of the economic policy is made in any of the four existing Governmental levels (European, national, regional and local). As a result, the principle of Subsidiarity optimizes the efficient use of resources due to coordinated processes (Guerin, 2002). Therefore, subsidiarity increases welfare and wealth (Chowdhury & Garonna, 2007).

Along with these advantages, the Subsidiarity principle is connected with a social economy

… characterized by people focused on consuming and on producing goods or services, equipped with management autonomy and democratic organization (internal management and participatory decision-making power). This strategy gives services to the community, respects the environment, and favors labor in the distribution of surplus (García et al, 2006, p. 217).

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

The aim of both the principle of Subsidiarity and the social economy is to maximize welfare through an efficient allocation of resources, taking into account a topic ignored by modern competitive economy: the perpetuation of values, whether person-centered (humanistic values), spirituality (religious values) or both. The absence of these values dehumanizes people. Hence is valid the sentence written by the Roman playwright, Plautus Titus Maccius (254-184 BC) who, in his *Asinaria*, established that: *Lupus est homo homini, non homo, quom qualis sit non novit*[3] to describe a reality of his time which continues even today. Sentence popularized by the English philosopher Thomas Hobbes of Malmesmury[4] (1588-1679) in his *Leviathan*, written in 1651[5], in which the author includes his *Theory of social contract*, where agreements are reached between the Government and the ruled. Social contracts continue today, implicitly, in modern democracies for seeking social harmony and the common good. When corruption, this social contract is violated, causing social unrest and, in extreme cases, anarchy.

The State must be guided by social justice, freedom and equality (Gallegos, 2008; Olives, 2011). Social interest is internationally-conceived, thanks to the implementation of ODA policies intended to benefit the poorest, and

… to ensure that values, such as solidarity, transparency and brotherly love, remain within the social conscience to fight against corruption through consensus and dialogue, and never under coercion and violence (Saiz-Alvarez, 2013a, p. 75).

As the behavior of economic agents is guided by merit and well-used values, they have a positive-negative polarity, unlike things that can only be positive. As a result, values can be classified as:

1. *Useful and pleasant-based values*, formed by convenience, comfort, pleasure and wealth;
2. *Vital values*, comprising health, fitness and longevity;
3. *Spiritual values*, subdivided in aesthetic (beauty), legal (justice), and intellectual (truth and goodness), and
4. *Religious values* expressed by holiness.

Therefore, every human action is based on values. But recently, a strong dehumanization process has fragmented and severely beaten today's societies. To avoid this loss of values, it is necessary to harmonize «all forces directed towards the common good, driven in a genuine respect for the supreme values of the spirit» (John Paul II, 1982, p. 3). This will make greater values-based countries to benefit citizens as a whole.

In implementing these objectives, education are of fundamental importance, both in the family and in the elementary school as first educational nucleus, and in upper levels, once the student has matured to internalize the use of values, and the deep thinking of axiology as a science. Now is the time to do it, before the flame of hope will be extinguished.

Second Guiding Principle: The Search for the Common Good

As a complementary way to Subsidiarity, searching for the common good is a guide to channel economic activities towards solidarity and mutual aid. This explains why the Social Doctrine of the Catholic Church defines the common good as "the sum of social conditions which allow people, either individually or col-

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

lectively, to easily reach its full objective" (Pontifical Council for Justice and Peace, 2004). Therefore, the common good is what founds and legitimizes social communities and, by extension, economic policies.

To be fully comprehensive and effective in exploring common goods, a double spiritual (Christ-centered) and human (anthropocentric) vision must be performed, both based on the integral concept of the person as a whole. As a result, a comprehensive development of individuals and families, respecting their fundamental rights and dignity, will be achieved. A Christ centric vision gives meaning to life and sanctifies human actions and decisions in daily life. Without Christ, human life is impoverished of content, even reaching a spiritual void.

Values-based societies must be rooted on people guiding others always looking their well-being, which contradicts the traditionally idea advocated by Neoliberalism, where individuals are selfish, as they seek their own good, and only the "invisible hand" generate welfare through a self-regulating market process in which the anarchic behavior of private economic agents (producers and consumers), guided by their own selfishness, maximize their highest level of satisfaction or utility, and by extension, it leads to social welfare maximization.

Faced with this social vision, the Aristotelian-Thomistic tradition on the notion of the common good concerns about the good of people (Argandoña, 2011) and, by extension, of society, because the common good is formed by "the integration of civic awareness, political virtues, the sense of right and freedom, and any activity, material prosperity and wealth of the spirit, active unconsciously inherited wisdom, moral righteousness, justice, friendship, happiness, virtue and heroism in every individual are living on the community" (Maritain, 1951, p. 45). As a result, once the common good is achieved, both collective welfare and social justice are maximized. Without social justice, peace and social stability are threatened. A social peace needed to achieve stable levels of economic growth, and to increase the degree of happiness for the society as a whole.

For this reason, and only when justice and solidarity are pursued, economic management is not immune "to the fundamental principles of the Social Doctrine of the Catholic Church, which are: the centrality of the human person, solidarity, subsidiarity, and the common good" (Bertone, 2009, p. 1). Moreover, "in the era of globalization, economic activity cannot be done without gratuitousness, which fosters and disseminates solidarity and responsibility for justice and the common good among different economic players" (Benedict XVI, *Caritas in Veritate*, 38).

This economic democracy can be strengthened when companies strive for desiring common goods following a spirit of solidarity full of social justice and Christian charity. Working for the common good is dealing with love. When nations (*gentium*), cities (*polis*), institutions, and organizations are structured following a multiple juridical, social, political, and economical perspective, while fighting for social welfare and collective wealth, societies (*societas*) will be guided by empathy and mutual respect. When the source of love is Christ as a guide towards the common good, higher values are accomplished. So, "every Christian is called to practice this charity, according to their vocation and their abilities to influence the *polis*. […] The commitment for the common good, when it is animated by charity, has a higher value than a merely secular and political promise" (Benedict XVI, *Caritas in Veritate*, 7)

Today's society, part of which is characterized by its social dismemberment and its strong social irresponsibility towards future generations, must be based on the respect for the human dignity supported on justice, temperance, and culture. Therefore, styles and models of life must substantially change to preserve and to improve the social and political environment for future generations.

Although the last search is the common good, social wealth and economic profit are generated while working to achieve it. But when only profit is pursued, social wealth is destroyed, and poverty is created.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

This socioeconomic reality characterizes much of the current economic world defined by their high levels of job insecurity, by the existence of strong social inequalities, and by the unfair and unsupportive distribution of goods produced and/or marketed in global markets.

It is necessary to build a new economic world in which people, and not material goods, have a central position. No holistic development and universal common good can be reached, unless the support of spirituality and moral welfare. *Anima et corpus* acting together, according to the principles of subsidiarity and solidarity, and are directly focused on the common good and, by extension, on their personal sanctification.

Searching the common good and social peace must constitute a priority in economic policy, with the social inclusion of the poor, and the need for a social dialogue as a contribution to peace. The inclusion of subjects related to morality and ethics in Social Sciences and Law is a necessary step to re-humanize both economics and law. As an example of this dehumanization, among many other cases, is the so-called "zero-hour contracts" in the United Kingdom, based on the flexibility in the labor market where workers without contract (hence the name) can be called at any time of any day of the week to cover peak-hours.

Without going to this extreme, in other countries labor flexibility is widely used what dehumanizes people, especially if they belong to low educational backgrounds, have family responsibilities, and dispose of insufficient work experience. As a result, labor rights are depleted, and the provision of decent work is not guaranteed (Ferrajoli, 2013), a situation that does not change, despite the poor results obtained with this labor strategy, in terms of creating low degrees of wealth and welfare, reducing consumption level, and the impossibility of creating savings and investment (Gallino, 2014).

This globalization of indifference must be avoided by introducing labor-based strategies for achieving inclusive economies, where disadvantaged people are not left out (*cfr*. Pope Francesco, *Evangelii Gaudium*, 54), and economic development is rooted on peace, solidarity, and the common good (*cfr*. St. John Paul II, *Sollicitudo Rei Socialis*, 10).

Third Guiding Principle: A Necessary Solidarity Based on Justice

Along with the implementation of the principle of subsidiarity, a third guiding principle in the economy is given by solidarity with the goal of seeking market economies focused on the common good to achieve higher levels of economic welfare. In fact, "solidarity-based markets set the condition that family production units organized in community groups turn into federated social enterprises" (González et al, 2003, p. 32)

This process of economic development based on solidarity has been largely possible thanks to the building process of a united Europe, as we know it today, led by the launch of the Social Market Economy (in German, *Soziale Marktwirtschaft*) based on economic policy's recipes designed between the Market Economy and the Planned Economy. Alfred Müller-Armack (1901-1978), in his *Soziale Marktwirtschaft: Alternative Politische und Wirtschaftliche Ein Projekt* [Social Market Economy: an Alternative Economic and Political Project], affirms the Social Market Economy aims to maximize both social prosperity and economic welfare, to reach Pareto optimal situations for achieving values, such as economic freedom, individual initiative, and solidarity, always thinking on the common good and social justice to favor the weakest and most vulnerable, teaching them to act successfully in adverse situations. Moreover, and since the early seminal works of this Economic School of Thought born at the University of Freiburg (Germany), the Social Market Economy has been founded on four general principles, and three operational principles. As general principles can be cited:

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

1. The promotion of private initiatives and responsibility to achieve economic and social skills;
2. The protection of private property, and the support of both legal security, free competition and economic freedom, with the establishment of control and supervision mechanisms to eliminate, or at least to reduce corruption practices and tax fraud;
3. The definition of the principle of solidarity and joint action for the common good; and
4. The creation of the principle of subsidiarity, as a tool to achieve social justice by achieving equity, equality and justice in the distribution of scarce resources.

Among the operational principles, should be noted (Olives, 2011):

1. The protection of consumers and/or producers by assuring clear information for proper and effective decision-making processes;
2. The implementation of the principle of individual responsibility to ensure free competition and regulated market prices; and
3. The design of an adequate and consensual labor policy agreed among governments, business organizations, and trade unions to achieve fair and decent wages.

These good economic and corporate earnings are even higher in cooperatives regardless of their economic productivity, commercial sectors they operate, and investment companies they socially interact and impact (Giovanelli, 2014). Thus, the mere utilitarianism is exceeded, which is gained in spiritual and moral values (Morelos, 2004). Throughout this process, the State has a major supervisory role, so that "their actions are geared towards promoting efficient competition without breaking, oversee undisturbed, without obstructing monitor and intervene without destroying. That is, intervention should be proportional and gradual in the exercise of the legal powers of control and monitoring legally granted" (Olives, 2011, p. 2).

The combination of good practices carried out by companies and the government paths the way to implement the so-called Socioeconomics of Solidarity, whose main driver is born from combining private and social initiatives. Conceived as a way of helping others in a worldwide scale, the EU's ODA is a must to foster richness and health in Third World countries, as seen in the next section.

SOLIDARITY FROM PUBLIC INSTITUTIONS: ODA AND THE EUROPEAN DEVELOPMENT FUND

More than half the money spent in the world to help the Third and Fourth Worlds comes from the EU, whose legal basis in terms of development cooperation are synthesized in [1] the Title III of the Maastricht Treaty, signed on February 7, 1992, with entry into force on November 1, 1993; [2] the general mandate and guiding principles referred in Article 21, paragraph 1 of the Treaty, and [3] the Article 4, paragraph 4 and Articles 208 to 211 of the Treaty on the Functioning of the EU or the Treaty of Lisbon, signed on December 13, 2007 and entered into force on December 1, 2009 after a lengthy process of ratification by the EU parliaments. In addition to ODA inserted into the Maastricht and Lisbon Treaties, aid assistance is supplemented by

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

1. *Specific cooperation agreements*, like the Cotonou Agreement concerning the African, Caribbean and Pacific (ACP countries);
2. *Bilateral association agreements* referred to in Article 217 of the Treaty of Lisbon, and
3. Some *budgetary additional aspects* synthesized in Articles 312 to 316 of the Treaty of Lisbon.

This EU's ODA policy complements the provisions donated by the United Nations through the promotion and strengthening of a collective global partnership for development reaffirmed in

1. The "Millennium Declaration" (Resolution 55/2 the United Nations General Assembly, on September 13, 2000);
2. The "Monterrey Consensus" issued by the International Conference on Financing for Development held in Monterrey (Mexico), 18 to March 22, 2002;
3. The World Summit Implementation Plan on Sustainable Development within the Report of the World Summit on Sustainable Development held in Johannesburg (South Africa), from August 26 to September 4, 2002;
4. The 2005 World Summit Final Document, and
5. The Doha Declaration on Financing for Development, as the final document issued from the International Conference on Financing for Development to Review the Implementation of the Monterrey Consensus (resolution 63/239, annex).

All this regulatory complexity aims to reduce poverty in the world. In fact, the main objective of the European ODA is to gradually reduce, and to ideally eradicate, poverty in the long term. Poverty reduction achieved after having applied a general framework of development characterized by following a purely economic endowments of aid and cooperation capped by four groups of beneficiary countries: the ACP countries (Africa, Caribbean, Pacific), South Africa, Overseas Countries and Territories (hereinafter, OCTs), and the Least Developed Countries. Such sectorial development policies promote both the protection of human rights and migration control, as an incentive, through the implementation of sustainable development policies for environmental protection and rural development, thus ensuring food security, and the right management of natural resources.

This ODA had a strong revival in the EU after the signing on December 20, 2005, by the Presidents of the Commission, Parliament and Council, of the so-called 'European Council' by which, for the first time, was defined the framework of common principles on which the EU will implement complementary development policies. With this Consensus, the EU undertook to increase budgets for ODA to 0.7% of GDP by 2015, with an intermediate target of 0.56% in 2010, half of this increase is intended for Africa's development.

Since the enactment of the Communication from the Commission to the Council and the European Parliament of June 21, 2007 (COM (2007) 349 final, not published in the Official Journal), there have been important changes regarding EU management policies development, by adopting strategies for stronger control, both on the methodology to be followed in evaluating results, and on the simplification of instruments for external assistance with the creation of the Financing Instrument for Cooperation Development (Regulation (EC) 1905/2006 of the European Parliament and Council of December 19, Official Journal L 378 of December 27, 2006, as subsequently amended by Regulation (EC) 960/2009 of 18 October, Journal Official L 270 of October 15, 2009) and the Instrument for the Promotion of

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Democracy and Human Rights (Regulation (EC) 1889/2006 of the European Parliament and the Council of December 20, 2006).

The ODA Principles

The European ODA launch has a double economic and political aspect based on the "principle of aid effectiveness" based on the integration of the European ODA into the Millennium Development Goals (hereinafter, MDGs) of the United Nations beneficiary States. This double involvement of European ODA is more than a mere "European Consensus on Development" (Official Journal C 46 of February 24, 2006), as the EU is really interested in accelerating the compliance of the MDGs following a spirit of complementarily, under the so-called "European Consensus," signed on December 20, 2005, to make the EU to remain the greater solidarity region in the world, by representing more than 55 percent of world's ODA.

The general framework of the European ODA is given from the joint declaration entitled "The European Consensus on Development" signed between the Council and the representatives of the Governments of the Member States meeting within the Council, the European Parliament and the Commission on the European ODA, with the aim of achieving the MDGs promulgated by the United Nations (Bourgignon et al, 2008), so that by 2015 the goal is:

1. To eradicate extreme poverty, and hunger in the world;
2. To contribute to good governance and respect for human rights throughout the world;
3. To encourage the creation of a global partnership for development;
4. To ensure environmental sustainability with the implementation of clean development policies and the fight against environmental dumping;
5. To achieve universal primary education in the Third and Fourth World;
6. To fight Acquired Immune Deficiency Syndrome (AIDS), malaria, malaria and yellow fever, among other endemic diseases;
7. To improve maternal health with decreased mortality rate of women during childbirth;
8. To promote gender equality and empower women; and
9. To reduce infant mortality.

The European ODA is founded on the principles of concentration, ownership and alignment. According to "the concentration principle," based on a limited number of priority areas for action to achieve best results, efforts have been centralized to increase quality. Thus, when a greater national ownership of the partner country is achieved, coordination and harmonization between donors and aid improvement in the recipient country systems and guidance based on the results are aligned. And all of this, in coordination and complementarily among donors, to implement a mechanism for joint multiannual programming.

Complementary to this principle, *the ownership principle* unites EU partners to exercise effective leadership over their development policies and strategies, while coordinating development actions, and *the principle of alienation* where EU donor countries base their overall support on strategies, institutions and procedures for EU partner countries' development. These principles were established in the Paris Declaration on the Effectiveness of Development Aid, signed on March 2, 2005.

An important solidarity-based aspect of the European ODA is mainly focused on Africa, having a multiple target:

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

1. To have a sustainable economic development throughout the continent, especially in sub-Saharan Africa;
2. To undertake governance reforms that are necessary to launch and fuel sustainable development processes (Paris Declaration, point 20);
3. To work together for EU donor countries to establish mutually agreed frameworks for providing reliable assessments based on performance, transparency and accountability of the national systems of African countries (Paris Declaration, paragraph 19), and
4. To achieve the MDGs in Africa by 2015 (Communication from the Commission to the European Parliament, the Council, the Economic Committee and Social and the Committee of the Regions, COM (2010) 159 final, April 21, 2010, not published in the Official Journal) most notably, the commitment to increase spending on ODA to 0.7% of Gross National Income by 2015, aiming to allocate at least half of this additional funding for Africa.

Objectives and Stages in ODA: Towards a Greater Efficiency?

The implementation of these principles has resulted in the launch of three objectives through which the European ODA is channeled. These objectives are given by

1. Contributing to economic and social development of developing countries;
2. Improving neighborly relations with Northern Africa, Eastern Europe, and the Middle East; and
3. Reaching financial and trading agreements focused on trade cooperation, poverty reduction, respect for democracy and human rights, good governance, environmental protection, social services, and education and health development.

Initially, the European ODA was not part of any of the three founding treaties of the EU. Therefore, their incorporation into the European policy has been gradual over time, always seeking greater impacts derived from aid, as well as an increased presence of the EU in the world, as discussed below.

First Stage: Helping OCTs

European ODA began in the French colonies of Africa in the late 1950s seeking to encourage its development. Such assistance was channeled through donations, mainly carried out by the European Investment Bank, as well as the growing development of non-governmental organizations (NGOs) as part of the Third Sector. Being considered as donations, the EU action does not create foreign debt problems to avoid financial suffocation in much of the Third World. This sensibility contrasts to what is happening in other regions of the world financed by other means of support, mainly born in non-EU countries.

Second Stage: Food Aid and Generalized System of Preferences

Financed from the EU budget, food aid began in 1968 as a result of the obligations acquired by the European countries after having acceded to the International Grains Agreement signed in 1967. Food Aid that was definitively established in 1996 with the dual strategy formed by the combination of delivery of EU agricultural surpluses close with technical assistance for the production of local crops in the Third World. This food aid was complemented by reducing barriers to entry of manufactured goods from the

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Third World (mainly tariffs and quotas on imports), creating the Generalized System of Preferences. System established for all developing countries after the 1972 Paris Summit.

Third Stage: Development Third European Non-Governmental Development Organizations and Lomé Conventions

It began in 1976 when European NGOs could be able to get EU funding. Until then, only NGOs in the Catholic and in some Protestant branches had a strong development, so the involvement of the European ODA through civil society was a turnabout in policy, because it was channeled through political channels.

The signature of the first Lomé Convention between the EU and 46 African, Caribbean and Pacific (ACP) countries changed this situation, as it was based on three pillars:

1. Elimination of entry barriers (tariffs, and technical and legal barriers) for products exported to Europe by the ACP countries;
2. Economic and technical cooperation, and
3. The establishment of STABEX (compensatory mechanism for avoiding loss of export earnings in ACP countries, as a result of changes in international prices, according to arts. 186-212 of IV Lomé Convention), and SYSMIN (helping system to keep mines engaged in export, according to arts. 214-219 of the Lomé IV Convention).

Fourth Stage: Decentralized Cooperation

Decentralized cooperation involves the ODA democratization by various economic and social actors (universities, associations, NGOs, foundations, unions, business organizations, municipalities, and autonomous regions, among others) with the aim of getting aid to the Third and Fourth Worlds more efficiently. Since the entry into force of the Treaty of Maastricht on November 1, 1993, the European ODA has been centered into pushing democracy and human rights, as an objective of the European Common Foreign and Security Policy (CFSP).

THE EUROPEAN DEVELOPMENT FUND: A PAN-EUROPEAN INSTRUMENT BASED ON SOLIDARITY

One of the main European ODA instruments includes the European Development Fund (hereinafter, EDF) whose importance, chronology, composition and effects will be discussed below.

Importance of the EDF

Born in 1993, the EDF is one of the largest and oldest instruments of European ODA directed to ACP countries and OCTs. The EDF is not included in the budget of the EU, because its inclusion would add administrative arrangements for the disbursement of funds phases, which would threaten the ACP-EU long-term co-management arrangements by reducing allocations given by EU Member States to the EDF. Therefore, the EDF has its own financial rules, and a specific committee, and presents a definite timeline over time (see Table 1).

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Table 1. EDF chronology

Period	Convention
EDF I (1959-1964)	---
EDF II (1965-1970)	Yaoundé I Convention
EDF III (1971-1975)	Yaoundé II Convention
EDF IV (1976-1980)	Lomé I Convention
EDF V (1981-1985)	Lomé II Convention
EDF VI (1986-1990)	Lomé III Convention
EDF VII (1991-1995)	Lomé IV Convention
EDF VIII (1996-2000)	Lome IV bis Convention
EDF IX (2001-2007)	Cotonou Agreement
EDF X (2008-2013)	Revised Cotonou Agreement
EDF XI (2014-2020)	---

Source: Adapted from Eurostat.

The EDF is made up of grants, risk capital and loans given to the private sector. During the duration of the Lomé Conventions (II to VII FED) highlighted two programs: STABEX (from French, *Système de Stabilisation des Recettes d'Exportation*) consisting of a system of agricultural support, and the SYSMIN instrument (from French, *Système de Stabilisation Minière*) which dealt with aids to the mining sector. In short, the EDF covers cooperation with ACP countries and OCTs, and its main areas are economic development, social and human development, and regional cooperation and integration.

Today, and alongside the EDF, the Development Cooperation Instrument is a major source of funding through thematic instruments (investment in human capital, non-State actors and local authorities, environment, food safety and cooperation with third countries, migration and asylum) aimed to support States, NGOs and civil society groups for development. For the 2014-2020 period, the so-called "differentiation" will apply, which means that Middle-income countries, representing more than 1 percent of global GDP, will be graduated, that is, will be ceased to be eligible for funding EU bilateral grant-based aid. As a result, direct aid from the Development Cooperation Instrument has been replaced in 19 developing countries by differentiated development partnerships based on specific needs.

Finally, the EDF provides additional financing, called Incentive Amounts, to developing countries with histories of improved governance following a co-decision process, which is defined by including the approval of the European Parliament to enhance the democratic control of EU aid. In addition, and to ensure transparency in the granting of EU aid, the EDF is allocated according to a rotating schedule in which partner countries participate in setting priorities and cooperation projects.

The Common Framework for Joint Multiannual Programming and Efficiency

After the reform of the procedure for granting aid by the European Commission in 2000, the EU adopted a new framework for programming national and regional strategies in all developing countries benefiting from EDF, including TACIS and CARDS programs. The TACIS program, in operation from 1991 to 2006, mainly benefited the Slavic countries of the former Soviet Union (Russia, Ukraine and Belarus), and was replaced in 2007 by the European Neighborhood and Partnership for seeking a greater impact

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

on the area[6]. These programs include the implementation of multiannual indicative programs defined by [1] relations between donors and partner countries; [2] measurable objectives to be achieved through the implementation of support mechanisms, and [3] the implementation of scheduled program executions.

Respecting the CARDS program, established by Regulation (EC) 2666/2000 (Official Journal L 306, of 7 December)[7], whose objective was the Assistance for Reconstruction, Development and Stabilization of the Southeastern European countries (Albania and the former Yugoslavia countries) was replaced in 2007 by the Pre-Accession Instrument. Before the CARDS program, can be included the PHARE program, created by Regulation (EC) 3906/89, and the OBNOVA program, established by Regulation (EC) 1628/96. These EU aid programs show a constant concern towards the Western Balkans since the breakup of the former Yugoslavia on May 4, 1980, and its continuous acceleration during the Balkan Wars, as follows: [1] The Ten-Day War or the Slovenian Liberation War (1991); [2] The Croatian War of Independence (1991-1995); [3] The Croatian-Bosnian War (1992-1994); [4] The Bosnian War (1992-1995); [5] The Kosovo War (1998-1999), and [6] Conflict in Southern Serbia (2001) and Macedonia (2001).

This EU strategic vision to economically and politically develop its Eastern and Southeastern European neighbors, is complemented by a threefold strategy:

1. The approval of an strategic document entitled "The EU Agenda for Change," signed in May 2012, which aims to increase the impact of the Official Aid in countries most in need;
2. The concession of financial aid following the "principle of differentiation" to take into account not only the economic results of the aid granted, but also the governmental performance done by each recipient country; and
3. The promotion of human rights, democracy, rule of law and good governance and achieving inclusive and sustainable growth, as the basic pillars of a sustainable development policy (Table 2).

Having analyzed the complexity of the European ODA, such financial aid should have a greater economic and social impact in order to achieve a Socioeconomics of Solidarity, at least in countries receiving EU aid.

Table 2. Overview of the EU instruments for development policy

Program	EUR Million
Development Cooperation Instrument Latin America, East Asia and Central, South Africa	19,700
European Neighborhood and Partnership European Neighborhood and Russia (since 2014, European Neighborhood)	15,400
IPA Balkans and Turkey	11,700
Cooperation with Industrialized Countries Industrialized countries (from 2014, Partnership Instrument)	955
European Instrument for Democracy and Human Rights Promotion of Democracy and Human Rights in the World	1,300
Instrument for Stability and Peace Achieving and Maintaining Peace	2,300
Instrument for nuclear safety since 2014, Cooperation Instrument for Nuclear Safety	225
Instrument for Greenland	184
ACP Countries and territories EDF	29,100
Total	**80,864**

SOCIOECONOMICS OF SOLIDARITY: A SOLUTION FROM PRIVATE AND SOCIAL INITIATIVES

Also called "Solidarity Economy," "Humanoeconomía"·(Loebl, 1978), "Popular Economy," "Economy Emancipated Work," "Solidarity Socioeconomics" (Arruda, 2005), "Social Economy," "Popular Solidarity Economy," "Social and Solidarity Economy," and "Economy of Reciprocity" (Carranza, 2013), the Socioeconomics of Solidarity can be defined as the kind of economy "complementary to the Green Economy" (Rosas-Baños, 2012, p. 91), mainly based on humanistic Christian-based (charity and fraternal love) and human-based (solidarity, not fraudulent or corrupt behavior, cooperation and mutual assistance) values, focused on producing sustainable goods and services benefitting people, and not only shareholders, and thus achieving fairer, more equitable, and more inclusive social groups (Saiz-Alvarez, 2013a).

Rooted on the sixteenth century's School of Salamanca[8], ethics and morality play a key role in the Socioeconomics of Solidarity, where "the value of a good depends on three factors: objective utility (*virtuositas*), scarcity (*raritas*) and consumer appeal (*complacibilitas*), i.e., the subjective utility" (Partridge, 2004, pp. 23-24). Within the rich set of theologians[9] who belonged to this Spanish School, mainly Jesuits and Dominicans, highlights the Dominican Francisco de Vitoria (1483-1546) who, more than two centuries before Adam Smith (1723-1790), founder of the Classical School in response to the so-called "the Paradox of Mandeville"[10], wrote in 1535 that:

Whoever does something good, or for the benefit of a particular, he/she also makes it for the common and public interest, but if he/she hurts a person, he/she harms the common good. Therefore, who favors an individual, the entire society must deserve praise and rewards him/her, although this person only thinks on his/her own profit (De Vitoria, 1535, pp. 1344-1345).

In fact, the same idea was written by Adam Smith in 1776 with other words:

When the [economic activity] is managed by maximizing products with the highest possible value, entrepreneurs just thinks on their own gain; but in this, as in many other cases, these individuals are led by an invisible hand[11] that guide them towards a goal which are no part of their intentions (Smith, 1958[1776], p. 402).

This social benefit is determined by solidarity, as the *homo economicus* is characterized for being social (*zoon politikon*, from Greek ζῷον πολιτικόν). In fact, the fifth Principle (*De Indis recenter Inventis, prior relectio*), enunciated by Francisco de Vitoria, affirms that: "It is good and lawful for man to have private property, but no one owns exclusively, as they should sometimes share things [...] and with extreme need, all things are common." This principle can be applicable today in the Socioeconomics of Solidarity.

The main difference between the Spanish theorists and the Classical economists is the ethical and moral behavior shown by the Spanish theorists (Santos del Cerro, 1998). As a result, Economics might be rooted on moral philosophy, a fact forgotten by the Classical School, as their authors condemned the ideas born in the School of Salamanca two centuries before, as the School of Salamanca condemned from a double moral and ethical perspective the use of interest rates on the exchange and, when interest rates are too high, usury-based economic transactions are created. Therefore, the Socioeconomics of

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Solidarity's precepts of moral philosophy are closely related with the Spanish School of Salamanca. As a result, the Socioeconomics of Solidarity goes well beyond the economic principles established in traditional and well-established Schools of Economic Thought, such as Neoliberalism, Social Market Economy, and Keynesianism in their different variants, which theoretically aims to reduce inequalities in income distribution by maximizing economic wealth of individuals seeking social justice, without taking into consideration any further moral issue (Table 3).

An example of solidarity-based socioeconomic development is rooted on communal lands (*Tupambaé*), community work (*Minga*) and the practical application of the Principle of reciprocity made with the Jesuit Missions (1609-1629) in the Guaraní region of Guayrá, now situated in Paraguay (Ossanna, 2008). Solidarity-based practices that preceded in more than three centuries the Rochdale Society of Equitable Pioneers created in 1844, as the first successful cooperative retail store made by working class members (Guerra, 2006).

These humanistic and axiological values inserted into the Socioeconomics of Solidarity leads to individuals come together with Christian values, as shown:

1. In the Encyclical Letter *Rerum Novarum*, written by Pope Leo XIII (1878-1903), in which the relations between capital and labor are studied;
2. The Encyclical Letter *Quadragesimo Anno*, written by Pope Pius XI (1922-1939), on the restoration of both economic and social order illuminated by Christian charity;
3. The Encyclical Letter *Mater et Magistra*, written by St. John XXIII (1958-1963), dealing with social issues;
4. The Encyclical Letter *Populorum Progressio,* written by Pope Paul VI (1963-1978), with the need for greater social progress through economic growth, and
5. The Encyclical Letter *Centesimus Annus*, written by St. John Paul II in 1991, to commemorate the centenary of *Rerum Novarum* and to build a Socioeconomics of Solidarity in his speech to the Economic Commission for Latin America and the Caribbean.

Introducing Christian values in economic thinking leads to the creation of a new economy based on solidarity and responsibility, leading to fair trade, ethical finance, responsible procurement, eco-villages, and networks based on Alternative and Solidarity Economy (REAS) (Roman & Loebl, 1979). Thus, love, empathy, and desire to help others lead to the birth of a Socioeconomics of Solidarity characterized by "another way of production, close with the basic principles based on collective property, capital and the right for achieving individual freedom. The application of these principles unites production in a class of workers who are equal capital owners in each cooperative or economic society. The natural result "is the combination of both solidarity and equality" (Singer, 2002, p. 10).

The term "solidarity" appears recurrently in the Socioeconomics of Solidarity with different meanings. In this sense, Razeto (1993) and Max-Neef (1997) with their "barefoot economy" and "human scale development," respectively, say that solidarity, love, mutual aid, brotherhood, family care, and neighborhood ties are ways to achieving higher levels of social justice, especially for small and popular solidarity firms, many of them informal ("the invisible world"), which creates a socioeconomic development based on a human scale for everyone, as "human needs, self-reliance and organic joints are the fundamental pillars of Human Scale Development" (Max-Neef, 1994, p. 30). A supportive behavior affected by the so-called "factor C" (companionship, community, cooperation, collaboration, communion, and coordination) (Razeto, 1998) determined by the letter "c" as the capital letter of Christ. When the factor C is fully developed, economic and business growth lead to a collective improvement.

FUTURE RESEARCH DIRECTIONS

The Socioeconomics of Solidarity is, in the background, a kind of internal democracy based on solidarity and the sharing of goods and services generated by individuals, in which there is "a collective identity aimed at a common goal" (Defourny, Favreau & Laville, 1998, p. 31). In fact, it is a kind of "economy at the service of the people" (Garcia, Vialop & Xirinachs, 2006: p. 167-178) where cooperative movements and solidarity-based firms are characterized by "in varying proportions, collective arrangements in the possession of the means of production, in the process of work and enterprise management, minimizing the presence of salaried relations, occurring mainly in the economies of the popular sectors" (Gaiger, 2004, p. 231).

The insertion of values in the Socioeconomics of Solidarity will move economics from *homo economicus* to *homo reciprocans* (Gintis, 2000) defined by companies headed by solidarity, mutual cooperation, and reciprocal trade. This process of exchange "structure social relations, links, and obligations within the movement of material, symbolic, and knowledge-based goods, through the triple obligation of giving, receiving, and returning, which describes other economic relations, which does not necessarily correspond to supply and demand, economic profit, balance, or market" (Carranza, 2013, p. 15).

Finally, the Socioeconomics of Solidarity is a complement to capitalism, so they can enrich countries. Economic systems work by both building horizontal and vertical production networks, as well as through exchange and consumption of goods guided by the principles of compensation and solidarity. Given these characteristics, it is expected that future researchers will suggest future research opportunities within the domain of this topic.

CONCLUSION

The EU is facing a challenge both in terms of ODA in the search for new models of development based on solidarity. While in the Central and Eastern European Countries, the EU's ODA have had their effect, Africa's extreme poverty continues to have entrenched in the economic and social fabric of the continent, so it can be a fertile ground for introducing community practices based on Socioeconomics of Solidarity that generate economic growth and social welfare. Aware of this fact, through the European External

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Action Service[12] inserted into the MFF 2007-2013, the EU simplified and rationalized its development portfolio by replacing the 30 programs and 90 budget lines in the previous frame for eight instruments development. Thus, the Directorate General for Development and Cooperation-EuropeAid (DG DEVCO-EuropeAid) of the Commission, created in January 2011 is, at present, the only body responsible for the programming and implementation of most of the instruments development of the EU, and its objectives: [1] the eradication of poverty and hunger; [2] the promotion of sustainable development; and [3] the support of democracy, peace and security.

The DG DEVCO-EuropeAid has adapted the European development policy to the current needs in the recent proposal "A dignified life for all by 2030," currently under review by the Council and Parliament. The Directorate General for Humanitarian Aid and Civil Protection (DG ECHO) is responsible for providing humanitarian aid, civil protection and crisis management tasks that formally constitute a separate ODA portfolio. Other organs of the Commission to help coordinate development instruments of the EU are: the Directorate General for Regional Policy, the Directorate General for Economic and Financial Affairs, and the Service for Foreign Policy Instruments.

European development policy promotes the harmonization of policies and better inclusion of the countries in the financial allocation process and scheduling through a "Code of Conduct on the division of labor in development policy" in 2007, and "Operational Framework on aid effectiveness" in 2011. In 2005, the EU also adopted the program "Policy coherence for development" to be applied into twelve different policy areas, including trade, migration, and transport. All this makes a re-launch of the European ODA, once community partners have improved their economic fundamentals, especially in terms of higher employment rates, and lower inflation needed.

In short, although the triple-C (combination of economic crisis, financial crisis, and crisis of credibility on economic policy) (Saiz-Alvarez, 2013b) has hampered the MDGs achievement by 2015, the Socioeconomics of Solidarity can help to recover the lost path. Therefore, and in conjunction with the private and community initiatives, efforts made on the European side to re-launch ODA are always welcome to reduce poverty gaps, and to accelerate the formation of united economic blocks. Moreover, increasing social, demographic and economic problems derived from higher poverty rates will cause greater and negative imbalances. And in this sense, the world's most developed countries have a moral obligation to avoid it.

KEY TERMS AND DEFINITIONS

ACP Countries: They are made up of African, Caribbean and Pacific countries receiving Official Development Aid from the European Union.

Common Good: A natural law that leads to the creation of a common wealth that must be shared in order to achieve happiness and, in the case of believers, their holiness.

Millennium Development Goals (MDGs): Formed by eight goals for 2015, it is a global strategy driven by the United Nations to eradicate extreme poverty and hunger, achieve universal primary education, promote gender equality and empower women, reduce child mortality, improve maternal health, combat HIV/AIDS, malaria and other diseases, ensure environmental sustainability, and develop a global partnership for development.

Official Development Aid (ODA): The total amount of economic aid donated by the European Union to the economically weakest countries in the world.

Principle of Subsidiarity: Defined in Article 5 of the Treaty on the European Union, it ensures efficiency and effectiveness in decision taking as decisions are taken as closely to citizens.

Social Market Economy: A form of market capitalism by combining social policy and coordinated market economy. This type of capitalism was used in Germany after World War II, and it was responsible of the Austrian and German economic miracles.

Socioeconomics of Solidarity: A kind of economy based on Christian-based (charity and fraternal love) and human-based (solidarity, not fraudulent or corrupt behavior, cooperation and mutual assistance) values, focused on producing sustainable goods and services benefitting people.

Chapter 86
Social Responsibility, Shared Value, and Business Modelling: An Integrated Approach

Alessandro Giosi
Lumsa University, Italy

Eleonora Zaccaro

Silvia Testarmata
Niccolò Cusano University, Italy

ABSTRACT

While more and more businesses incorporate sustainability in their core business strategy, there has recently been a shift from corporate social responsibility (CSR) to the notion of creating shared value (CSV). This thesis investigates the emergence of new hybrid enterprises and innovative business models. Starting from a literature review about CSR and its evolution into the "Big Idea" proposed by Porter and Kramer, the chapter will analyse the link between business and society, especially in the developing countries where this link is stronger. The main aim is to identify the most effective business models that enhance the competitiveness of a company, while simultaneously advancing the economic and social conditions in the communities in which it operates. The general idea is that enterprises should have longer-term perspective on how they operate in relation to the external society and environment, addressing societal needs and challenges through the business itself, within a business model.

INTRODUCTION

Businesses' responsibility in terms of economic, social and environmental impact has always been a very thorny subjected in the business community's debate, evidencing alignments and conflicts between external and internal stakeholders (Sheehy, 2015).

Nevertheless, the recent global agreement on the importance of the role of business in society for the international development, economic growth and poverty reduction (Nwagbara & Kamara, 2015) has reached the audience and the attention of academics and industry experts.

Despite in recent years business has been increasingly viewed as one of the major cause of society's problems, the big idea claimed by Porter and Kramer (2011) presents a new business perspective that aims to reconnect company success to with social progress.

Adopting the concept of creating shared value is a journey companies need to embark on to overcome the "blindness" that made them ignore all the big opportunities that rise once this fundamental link is restored.

The solution lies in the shift from Corporate Social Responsibility, a concept still powerful but not efficient in the contemporary competitive environment, to a new paradigm of business focused on Shared Value principle that enhance company's competitiveness while simultaneously creates value for society. In any different conceptual framework the problem still remain how to help companies to response to stakeholder expectations through their management systems and value chain linkages (Visser & Kymal, 2015). This means, in the lens of Italian doctrine of Economia Aziendale, re-discover the company systemic relationships.

The logic of shared value becomes more influential when companies decide to operate into developing countries (Cavaco & Crifo, 2014) where the interconnection between business and society is definitely stronger, since these countries offer great opportunities to develop new business but they are also characterized by deep social disadvantages (Michelini & Fiorentino, 2011).

Thus, businesses' response to low-income markets problems has contributed to blur the lines between for profit and not for profit organizations and the rise of hybrid enterprises is one of the strong signs of this transformation (Beugré, 2017).

According to this new perspective, this research intends to identify the business models that allow companies to invest in new markets (mature or developing countries) adopting a shared value approach based on addressing social needs by creating economic value.

This study is exploratory in nature, since it aims to provide both theoretical and empirical backgrounds analysing the transformation process from Corporate Social Responsibility to Creating Shared Value and highlighting the distinctive features and the level of criticality of both the managerial approaches to sustainability.

Finally, not all societal problems can be solved through shared value solutions. However, shared value offers corporations the opportunity to utilize their skills, resources, and management capabilities to lead social progress in ways that provide economic and societal benefit both for businesses and the communities in which they operate.

BACKGROUND

From Corporate Social Responsibility to Creating Shared Value

Corporate social responsibility thinking has evolved over the past few decades from a traditional positioning, mainly focused on philanthropic initiatives, to a more strategic approach that incorporates social issues into businesses core strategies to benefit both society and their own long-term competitiveness

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

(Blodgett, Hoitash, & Markelevich, 2014). Although corporations without good performance of CSR can make profits occasionally in a short term game, they have greater difficulty winning in a repeated game. The reason is that any stakeholders are not willing to deal with corporations that lack of CSR (Wang, 2014).

In addition, the expansion of corporate responsibility in the social environment is increasingly connected to the development strategies of the company, which to successfully pursue its business purpose, cannot ignore the characteristics of the context in which it operates.

In 2006 Porter evaluating the CSR theory, traditionally driven by reputational reasons (Plewa, Conduit, Quester, & Johnson, 2015), has pointed up the importance of going beyond the "doing good, being good avoiding risks" attitude, embracing a new management thinking that reinforces corporate engagement in society.

For this reason, the transformation process from CSR to CSV is necessary to reshape the capitalistic system (now under siege) and find new links that are profitable for both the company and the society (Kramer, 2011).

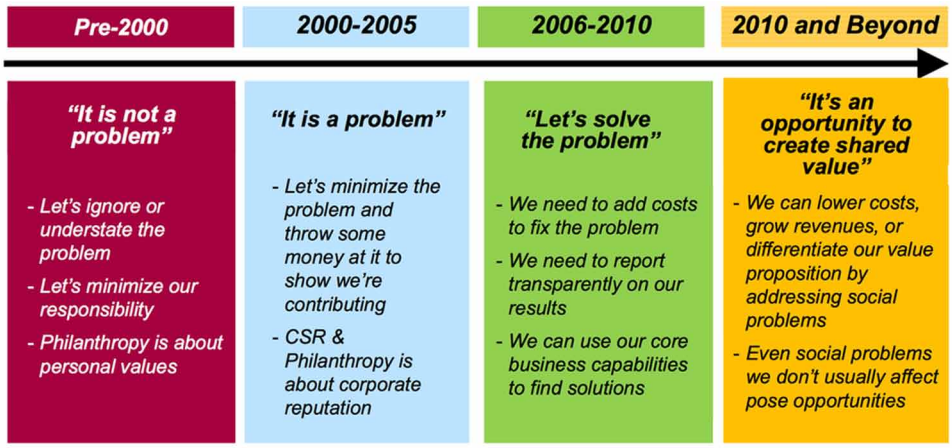
Figure 1, introduced by Porter at the Annual Summit for Shared Value Leadership, shows that not many years ago businesses were mainly focused on philanthropic activities, like donations to worthy social causes or volunteering. Philanthropy is about personal value or corporate reputation and usually understates the problems.

Progressively, businesses become more aware of societal issues and start to use their core resources and capabilities to find solutions.

At the very basic level, businesses are getting more sensible engaging in "good activities" that show off how they spend money for projects of corporate social responsibility. However, this approach presents some limits on the implementation of these perspectives inside and outside the organizations. This is the fundamental reason why recently companies have lost their legitimacy and have been widely perceived to be prospering at the expense of the broader community.

Hence, Porter's idea of a socially integrated company refers to the policies and practices that enhance competitiveness while advancing economic and social conditions.

Figure 1. Corporate Thinking Has Evolved Over the Past Decade
Source: FSG, 2011.



EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

In 2010 the transformation process seemed to be definitive: businesses began to embrace the shared value concept, meant as an opportunity to abandon the short term perspective and supersede the CSR logic by generating benefits for both companies and society. However, moving a corporation toward a shared value approach require a major mindset change that will differ for each company, depending on its goals, context and culture.

The concept of shared value can be defined as policies and operating practices that enhance the competitiveness of a company while simultaneously advancing the economic and social conditions in the communities in which it operates. Thus, CSV focuses on identifying the connection between societal and economic progress that should always be addressed using value principles. Value is defined as benefits relative to costs, not just benefits alone (Porter & Kramer, 2011).

Although a growing number of companies have integrated the shared value concept into their business strategies, until now societal issues have been rarely approached from a value perspective but have been treated as peripheral matters. In accordance to Porter and Kramer point of view, CSV should supersede CSR in guiding the investments of the companies in the society and as a consequence assimilating economic and social objectives together in order to look at shared value through entirely different lenses.

In the past, all the corporate social responsibility programs have emerged as an attempt of the firm to improve their own reputation and their role of corporate citizenship, thus they have been seen as "necessary" costs. Basically, CSR initiatives are short term oriented and have a limited link to the business or sometimes a non-existing one. Shared value perspective, instead, is functional to the profitability and the competitive advantage of the company since profit maximization and investments in social issues are not separated (Kramer, 2011). Sure the boundaries, the overlapping or the contrasts between CSR and CSV is still discussed in the literature, in particular the CSV is questioned from scholars advocates for a strategic CSR, defining CSR in a different way of a corporate image management (Jean & Yazdanifard, 2015). Moreover, Dembek, Singh and Bhakoo (2015), after a greater literature review concludes that share value has spread into the language of multiple disciplines, but that its current conceptualization is vague, and it presents important discrepancies in the way it is defined and operationalized from scholars. The authors recommended for defining and measuring the concept even through case studies. Despite these critics and following the latter suggestion carry out by the authors about case studies, we are still moving in the context of the Porter's framework.

According to Porter and Kramer, one of the strengths of the shared value approach is its connection with the long-term business strategy of the company and for this reason Porter's idea could be defined as a real business model. In order to adopt a shared value approach a change of business strategy is needed: corporate engagement in society will lead to the next major transformation of business thinking.

The Three Level of Shared Value: How It Is Created

In general, companies can create shared value in three basic ways: reconceiving products and markets, redefining productivity in the value chains and enabling local clusters development.

For what concern the first level of creating shared value, it refers to the huge numbers of unmet social needs. For a company, the starting point for creating this kind of shared value is to identify all the societal needs, benefits, and harms that could be embodied in companies' products. Thus, meeting needs in underserved markets is a great opportunity for businesses to redesign their products or to enter in new markets that could offer strategy differentiation and company repositioning. In addition, the societal needs in developing countries or disadvantaged communities are even more pressing and the attention

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

of big leading companies, focused on the needs of emerging markets, offers the possibility to access billions of new customers at the so called Bottom of the Pyramid (Panapanaa, Bruce, Virkki-Hatakka, & Linnanen, 2016; Ansari, Muni, & Gregg, 2012).

Every company had a well-developed value chain, made of primary activities like sourcing and procurement, inbound logistic, operation assembly and sales and customer services, and support activities, like research and development, human resources management and marketing and advertisement activities. In this case, opportunities to create shared value arise because societal problems can create economic costs in the firm's value chain. This leads consequently to a redefinition of the productivity of the value chain, definitely more effective, in order to avoid externalities or societal costs generated by companies that could compromise the health of the overall society.

Finally, the third way of creating shared value is linked to the external environment with which companies dialogue. Indeed, companies do not operate in isolation from their surrounding but their success is defined by the context in which they operate. To support clusters development, companies need to identify gaps and deficiencies in different areas, like logistics, suppliers, distribution channels, etc.. Focusing on these weaknesses that constrain company's productivity and growth will be the greatest opportunity to create shared value.

Hence, shared value creation is strictly related to the relationship between companies and local clusters that could improve businesses performances in terms of productivity, innovation and competitiveness, simultaneously generating benefits for the communities.

This three methods for creating shared value are mutually reinforcing, as they create a *virtuous circle* in which businesses tend to incorporate social issues into their core business strategies to gain social benefits and a long-term competitive advantage.

To sum up, the shared value concept arise new social needs to meet, new products to offer, new ways to refine the value chain, allowing companies to leverage their expertise and competences to drive economic and social development.

Shared Value Concept Into the Strategic Planning Process

A growing numbers of companies are adopting this new pragmatic approach and increasingly recognize that their contributions can be more effective if they align them with core competencies.

General Electric, IBM, Unilver and obviously Nestlè are pioneers in this corporate (re)evolution since they have already started to contribute to social problems redefying their own strategies and business models in order to create a connection between social and business performances.

Such companies seek to create "shared value" incorporating social issues into their core business strategies to benefit both society and their own long-term competitiveness as shown in Figure 2.

Shared value framework defines a new role for business in society that goes beyond the traditional CSR perspective, usually seen as a response to external stimulus, to government regulation or pending regulation. Shared value reconnects company success with social progress and could also drive the next wave of innovation and productivity growth in the global economy as it opens managers' eyes to immense human needs that must be met, large new markets to be served, and the internal costs of social deficits as well as the competitive advantages available from addressing them (Porter & Kramer, 2011).

Thus, Porter's concept is not just to redistributing value previously created through philanthropic or CSR activities, but consist mainly in having a robust strategy to solve social issues and make profit.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 2. Shared Value
Source: Bockstette & Stamp, 2011.

According to Porter and Kramer (2011), the logic of creating shared value could be defined as a re-shaped capitalism that, connecting companies' success with societal improvement, inevitably opens up new ways addressing societal needs while simultaneously create economic value in a long-term perspective.

Building Blocks

Creating shared value can be broken out into ten key building blocks that help any kind of businesses or organizations to build a strong and effective strategy (Bockstette & Stamp, 2011). Basically we can compare these building blocks to a sort of blueprint that translate the shared value idea into concrete actions (see Figure 3).

The shared value approach is unique for every single company and its strictly linked to the company strategy, context and competitive advantage. Nevertheless, FSG a non-profit consulting firm for leaders in search of large-scale, lasting social change, working with different leading corporations, has identified some common points to generate shared value.

Creating shared value starts with an explicit strategic decision by top management that need to delineate company's vision and ensure that all the business areas are actively engagement.

Vision is fundamental to the strategic long-term direction of the company; indeed the second step focuses on the strategy.

In order to create shared value, the vision needs to be translated into a robust strategy that identifies a clear focus and articulates ambitious goals. A good strategy should be tailored to reflect a company's unique positioning, capabilities, and competitive environment and should also identify social challenges that represent cost-reduction or growth opportunities.

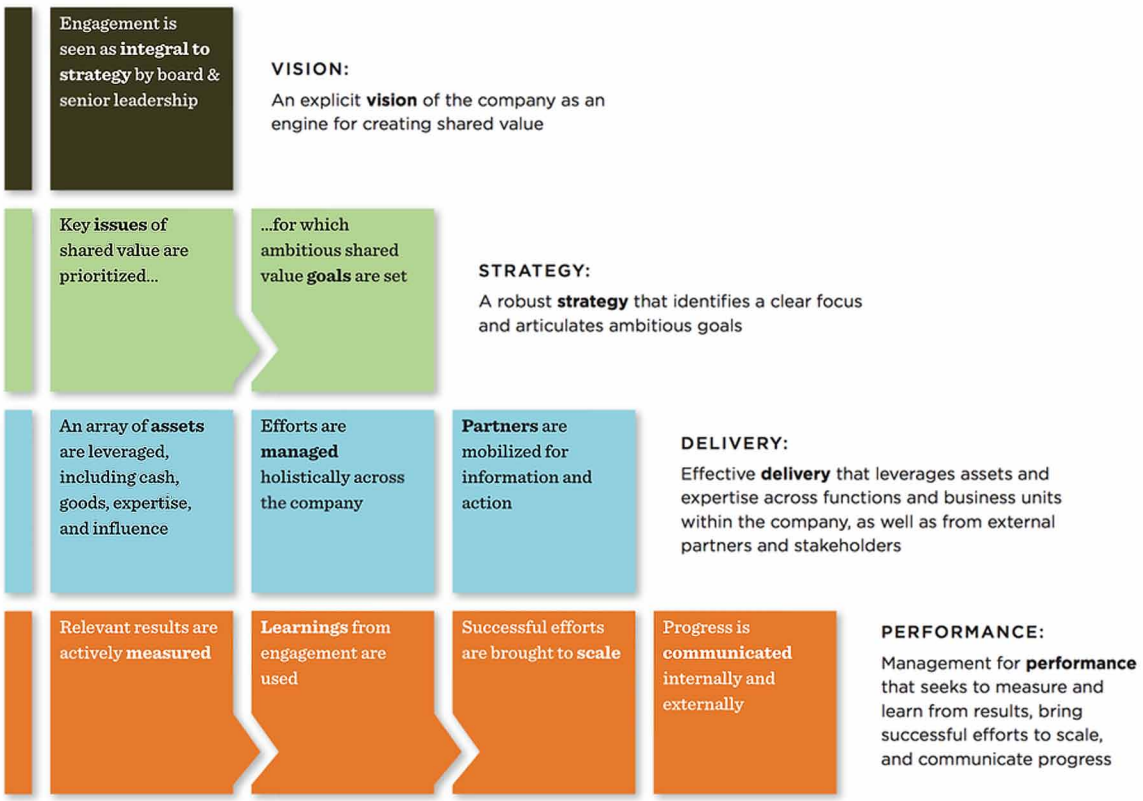
The third block refers to the management of the delivery process that leverage and add value to the internal and external assets of the company.

Once ambitious goal are set, companies need to regroup all the business units and mobilize a wide range of internal and external resources. This process could be broken down into three essential practices.

- **Deploy a Range of Assets to Address the Issue:** These assets can include goods and services, skills, political influences, etc.. The most effective companies are the ones able to combine in a strategic way the different assets in the areas where they have an edge over other actors.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 3. The Building Blocks of Creating Shared Value
Source: Bockstette & Stamp, 2011.



- **Manage Efforts Holistically Across the Organization:** In many companies' social engagement is not confined to an isolated silo, but instead is integrated into a wide variety of roles and functions, and often overseen at the board level.
- **Collaborate With Partners:** Creating shared value requires new and strong forms of collaborations. Indeed, most companies consult with stakeholders and work with NGOs to embrace competences and resources useful to the company's success.

Finally, the last building block of shared value is linked to the company's modus operandi that, if well manage, could deliver high performance.

Usually companies measure their progress and learn lessons from their activities, structured for continuous improvement.

New Business Models for Creating Shared Value

One central goal for companies nowadays is to create shared valued, for this reason new type of innovative business model are arising and represent a hybrid managerial choices between profit and non-profit oriented models. As suggested by Porter during an interview for the Western State Colorado University

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

(Driver, 2012), new hybrid enterprises are rapidly appearing due to the blurring of the boundary between successful for-profit and non-profit organizations.

Hybrid enterprises are those enterprises straddling the boundary between the for- profit business world and the social mission-driven public and not for profit organizations (Daw, 2013; Wilson & Post, 2013). Thus, they belong to the Social Entrepreneurship category that could be defined as an important transitional vehicle toward the creation of shared value and a capitalist system in which meeting social needs is not just a peripheral activity but a core aspect of every business (Driver, 2012).

In other words, Social Entrepreneurship is a step of the creating shared value process through which a social oriented company gain the right competences in order to incorporate social issues into their core business strategies. Social Entrepreneurship may be defined along a continuum from the creation of positive social change to earned income in the pursuit of social change (Driver, 2012).

Despite Social Entrepreneurship concept is relatively new and still need to be properly defined it could open up new ways of doing business and bring a whole new sensibility and a whole new set of tools and attitudes to addressing social issues.

As previously mentioned, hybrid organizations strive to combine their own economic benefits to the societal benefits of the developing countries through managerial strategies and models, based on social entrepreneurship and shared value concepts. Indeed, social entrepreneurship includes the use of market principles and economic value to meet social needs of the underserved communities that should be considered not just as "exploratory territories" but as real markets with specific needs to address through ad hoc business models.

At this point in the study it is useful to underline the connections between hybrid enterprises and the rise of innovative business model, based on social innovation whose main aim is to improve community well-being while simultaneously guarantee economic and financial sustainability. Based on companies' decision to expand their businesses into low-income markets, Michelini and Fiorentino (2011) identified two innovative business models (social and inclusive business models) that generate shared value.

Social Business Model

Social Business Model represents a new way for the companies to address unmet social needs through combining business know-how with the desire to improve quality of life of the developing countries.

The Nobel Prize Muhammad Yunus introduce this new dimension for capitalism: a business model that does not strive to maximize profits but rather to serve humanity's most pressing needs (Yunus, 2010). Nevertheless, many authors agree that meeting societal needs is a governments' responsibility since they should represent all the society interests. Instead, the right kind of government regulation can encourage companies to pursue shared value investing in the economic and social development of the society.

Contrary to the traditional business models, in the Social Business Model there are no losses nor dividends for shareholders and the company is led exclusively by predetermined social objectives. Obviously there is still profit though it is only used to keep the company alive and further develop it. Investors should not focus only on profit from their own activities; they should also be incentivised by the success that could be obtained if their social needs were fulfilled.

The European Commission uses the term "social business" to cover

…businesses providing social services and/or goods and services to vulnerable persons (access to housing, health care, assistance for elderly or disabled persons, inclusion of vulnerable groups, child care,

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

access to employment and training, dependency management, etc.); and/or businesses with a method of production of goods or services with a social objective (social and professional integration via access to employment for people disadvantaged in particular by insufficient qualifications or social or professional problems leading to exclusion and marginalization) but whose activity may be outside the realm of the provision of social goods or services. (European Commission, 2011, p. 3)

Social Business Model is characterized by two mains typologies: social business that includes all the companies that do not distribute dividends and social business adopted by all the companies whose mission is social oriented independently from the financial management (Clark & Brennan, 2012).

According to Yunus's idea, type one focuses on businesses dealing with social objectives only, as has just been mentioned. Type two, instead, can take up any profitable business so long as the poor and the disadvantaged, who can gain through receiving direct dividends or by some indirect benefits, own it.

The key element of the first type of Social Business Model is to not allow any dividends (share of profits) for shareholders due to the fact that profit seeking companies with a strong CSR commitment try to make their pursuit of profit consistent with social considerations (Yunus, 2007). Hence, even if this model could generate profits shareholders would not benefit of any dividend because all the revenues will guarantee company sustainability. Any surplus coming from company's activities will be return to the investor or reinvested into the company itself.

A concrete example of this type of social business model could be a limited company (Ltd) resulted from a strategic alliance between profit organization and no profit local organization. Sharing their know-how, both organizations realize together a sort of new activity, linked to the traditional business of the company while simultaneously creating social value in the community in which it operates. Indeed, social benefits derives from the company's goods and services (Kroeger & Weber, 2015).

Although the second type of Social Business Model is more profit oriented, its social purpose consists on making underserved communities autonomous in order to improve their economic and social condition through dividends and profit generated by the company.

In general, companies that adopt a Social Business Model are tied to the creation of a joint venture with local non-profit organizations: sharing resources and competences both companies and organizations create shared value.

Inclusive Business Model

As previously said, in attempting to apply the principle of creating shared value many companies have started to implement alternative models of governance and management, which can be referred to the social entrepreneurship concept. One of these models is the Inclusive Business Model that aims to build bridges between businesses and the disadvantaged communities for mutual benefit: making profit and improving social conditions of local population. Thus, the term "inclusive" refers to active engagement of low-income sector into the core business of the company and vice versa (Halme, Linderman, & Lima, 2012).

Inclusive Business Model has its roots into the Bottom of Pyramid Theory proposed by Prahalad, which is based on the concept of "serving the poor profitability" (Prahalad, 2004).

According to this socio-economic concept, that refers to more than 4 billion people all over the world living with less than 1 dollar per day, developing countries should no longer be considered as a territory

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

to exploit but a market composed of producers and consumers with specific need, which could be met through innovative business models.

The main pillar on which the Inclusive Business Model is founded is the strategic relationship between a local dimension (the low income communities) and a global dimension (companies) that offers new opportunities to conduct business responsibly creating – at the same time – economic and social value (Hann, 2012).

According to the World Business Council for Sustainable Development definition, the Inclusive Business Model is:

one which seeks to contribute toward the alleviation of poverty by including lower-income communities within its value chain while not losing sight of the ultimate goal of business, which is to generate profits. (WBCSD-SNV, 2010, p. 2)

The integration of low- income communities into company's value chain could be represented by two broad categories (WBCSD-SNV, 2010, p. 3):

- **Low Income People as Consumers:** Companies male available quality goods and services which underserved populations need and want at prices they can afford;
- **Low Income People as Suppliers or Distributors:** Low income populations are business partners, suppliers and/or distributors. By including small local entrepreneurs in their value chain, companies create jobs and speed up the transfer of skills.

For this reason, the inclusive business model could be seen also as a co-working model, where goods and services come from the merger between the bottom and the top of the pyramid.

Inclusive and Social Business Models

Based on the definitions of these two models, it is necessary to outline the main characteristics of both Inclusive and Social Business Models highlighting common points and differences (Speiss-Knafl, Mast, & Janse, 2015).

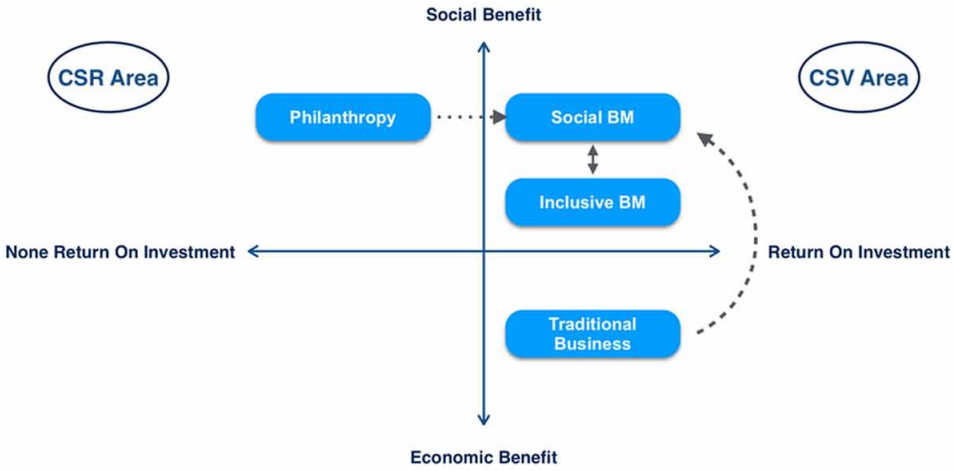
Despite both models can create shared value their strategies and governance systems are completely aligned.

First of all, the main objective of the two models are different: Inclusive Business Model aims to economic and societal benefits; while Social Business Model focuses principally on societal benefit without excluding the economic ones. As outlined by Michelini and Fiorentino (2011), Inclusive Business Model could represent an evolution of the traditional business to a model based on a mutual co-dependence between the company and its social environment. Social Business Model, instead, can be considered as an advanced philanthropic approach that improves social conditions of the underserved communities while simultaneously pursuing companies' economic sustainability.

In accordance to the framework proposed by Michelini and Fiorentino (2011), it is possible to categorize these two models by using two variables: economic return on investments and social/economic benefits (see Figure 4). In the quadrant at the top left section of the matrix below are located philanthropic initiatives that do not represent a conventional form of business model since they aim to generate social benefit, without providing any economic returns for the company. Inclusive and Social Business Models

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 4. Social and Inclusive Business Models
Source: Adapted from Michelini & Fiorentino, 2011.



are positioned into the second quadrant at the top right of the matrix. Both models, indeed, are focused on addressing social needs generating positive effects for the communities and for the companies in terms of social and economic value. Finally, the traditional business model is located in the bottom right quadrant of the matrix and is solely profit- oriented without consideration of any social effects

Hence, due to the limits of the traditional business to embrace type of hybrid enterprises, where the social dimension is crucial, it is necessary to explore and consider alternative business models definitely more appropriate to the transformation outlined.

CASE STUDY ANALYSIS

Despite the growing importance of the issues previously analysed, the concrete examples of new forms of business models aimed at creating shared value is still limited. For this reason, this study intends to provide an analytical and exhaustive representation of the shared value concept and its role into the economic and social environment. Therefore, the aim of this study is to identify the key elements of OneSight's business model in order to define a new paradigm of business, focused on expanding the connection between economic and societal progress.

To accomplish this goal, a case study of a not for profit organization was conducted based on a qualitative analysis. This approach consists of two consecutive phases. The first phase aims to collect and explore different documents coming from internal and external sources. In the second phase, semi-structured interviews were conducted to a remarkable number of employees belonging to different business areas in order to have an homogenous and holistic point of view of the case study. Specifically the people involved in the interview were:

- **Lukas Ruecker:** *President Lux Vision Care EyeMed*
- **Paul Case:** *OneSight Sr Manager Clinics Operations Shared Services*
- **Emily Ryan:** *OneSight Sr. Manager Communications*

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

- **Mony Iyer:** *OneSight Sr Director Strategy Shared Services*
- **Gloria Bondi:** *OneSight Fundraising Manager*
- **Mustapha Njie:** *OneSight Project Manager Gambia*

The method used is exploratory and is also characterized by a strong focus on resultus measurement, meant as fundamental tool of this research. Most interviews were conducted in English, face to face, some by telephone due to the inability of some employees to be physically present during the conversations.

The purpose of these interviews was to gain richer and deeper information about Onesight and its business model, for this reason questions were asked following a specific funnel: starting from the generic information about the overall organization to the most accurate ones. In each interview some open-ended questions were asked, so respondents were encouraged to speak freely, creating a dynamic relationship (Qu & Dumay, 2011).

In the following pages we meticulously explain the insights and outcomes linked to the adoption of the shared value approach by OneSight.

OneSight Profile

OneSight is an independent non-profit organization providing access to quality vision care and glasses in underserved communities worldwide, mobilizing eye care professionals, industry experts, volunteers and partners. The real strength of the company lies in its partnerships with global organizations, businesses and mainly with Luxottica, funding partner and global sponsor.

Luxottica's commitment to OneSight consists on funding administrative costs and providing annual operating support, glasses and engagement of its employees. Every year more than a thousand of Luxottica employees travel the globe to be part of OneSight programs, using their skills and expertise in day-to-day activities.

Since 1988, year of foundation, OneSight programs had impacted more than 9 millions lives across 41 countries. Thanks to partnerships with local health organizations, 8 sustainable vision centres, that provide permanent vision care access to two million people around the globe, have been opened.

Unfortunately, the number of people that require access to eye treatment continues to grow, for this reason OneSight is highly committed to pursuing its mission: eradicating the global vision care crisis and building permanent solutions to help the world see better.

Indeed, since every community is different, OneSight develops customized solutions to meet the local needs at best: patients can count on comprehensive eye exams and top high quality glasses coming from the OneSight's collection made by Luxottica. (OneSight, 2016).

Global Need for Glasses

Together with Deloitte (2015), OneSight conducted an extensive study to determine the number of people in the world who need glasses but are living without access to vision care. The study defined visual impairment in relation to a child's ability to perform well in school and an adult's ability to be productive at work; access is determined by the availability of glasses at an affordable price.

About 1.1 billion people around the globe need glasses but lack access; specifically the crisis is most acute in Sub-Saharan Africa and Southeast Asia. In addition, the research has outlined that 1 in 7 people

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

across the globe can't get eye exams and thus do not have access to glasses due to the economic and social condition in which they live.

This situation brings necessarily not just physical consequences – an eye exam and a pair of glasses could definitely improve people's sight – but mainly psychological and social consequences since these problems are not linked only to a single person but in general address the whole community. For this reason, vision care is not just a healthcare issue; it is also an education and an economic development issue: 80% of learning is visual and in wider terms studies show that people are 35% more productive at work when they can see clearly.

In order to establish exactly the problems of each single country in which OneSight operates, Deloitte has suggested to refine the "vision-crisis sizing approach" to enhance and improve in a more strategic way OneSight's sustainable business model.

By employing a strategy of both immediate and long-term solutions, OneSight provides on-going, top quality vision care to adults and children throughout temporary and permanent initiatives, sponsored by capable local partners to serve each community's distinct needs.

In general, lack of access can mean not living near an eye doctor or not being able to afford an eye exam and a pair of glasses. As previously discussed, those who lack access are hindered by poor eyesight in school, in jobs and in relationships. Thus, to avoid all these problems OneSight offers two different solutions: charitable solutions (or the so-called Vision Care Clinics) and Sustainable Vision Centers.

At OneSight Vision Care Clinics, adults and children receive comprehensive eye exams and free eyeglasses over the period of a few days or weeks. Through more than 50 Vision Care Clinics each year, OneSight brings the right tools and expertise to both remote villages and bustling cities–wherever the need takes them. Naturally, in order to make these charitable solutions efficient - as Paul Case (OneSight Sr. manger Clinics Operation) said - it is necessary to partner with local governments, health departments and volunteers that actively contribute to the temporary equipment of the clinics and to the distribution of the glasses coming from the special collection made by Luxottica.

Because OneSight mission is to eradicate the global vision care crisis around the globe, short-term clinics are just one piece of the solution; indeed, OneSight has developed a new long term approach by building permanent clinics. The Sustainable solution brings together public sector, private industry leaders and no-profit partners to create a new optical micro-economy in underserved communities. In other words, by empowering and training local communities OneSight creates permanent and affordable Vision Centers that are independently run by local teams through existing hospitals and healthcare systems. Within this sustainable model permanent vision care access is guaranteed.

Despite OneSight's different initiatives could be included in the large category of not for profit organizations, it is possible to put into practice all the theoretical principles outlined before and try to define what is the most efficient business model for OneSight, always keeping in mind the "social nature" of the organization in a shared value point of view.

The Gambia Project

As previously stated, the main focus of this study is to analyse the strategical transformation process of OneSight from traditional and charitable solution to the new sustainable model.

Launched in 2013, Sustainable Vision Centers are revolutionising the way OneSight is operating in the underserved countries, creating permanent and autonomous system for local communities. During the interview, Paul Case outilined how in order to accomplish its mission and meet the objectives,

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

OneSight strategy was transformed in a long-term plan, which basically consists in building permanent infrastructures with support from governments and local partners within their own healthcare system.

Through the Vision Care Clinics, OneSight makes a purely philanthropic investment whereas thanks to the adoption of a new sustainable business model, that is the Sustainable Vision Centers, it is clear that the organization is changing its mind-set into a shared value approach (Porter & Kramer, 2011). The idea at the behind these projects is to build specialized infrastructures that help communities to develop an economic independence and to acquire the right expertise.

To sum up, OneSight establishes sustainable clinics staffed by local, capable partners to serve each community's distinct needs and patients pay an affordable price defined by the local market. Central manufacturing and supply chains are centralized and support local demand for clinic supplies and glasses.

OneSight's first global sustainable project was developed in Gambia: the smallest country in Africa with 1.9 million inhabitants with 1/3 of the population living under the international poverty line of $1.25/ day. The situation is so critical that Gambia is ranked 151 of 160 on the "Human Development Index" (Deloitte, 2015).

Although the small dimensions, the need of eye exams and glasses is impressive: as stated by Mustapha Nije, OneSight Project Manager in Gambia, almost one in three Gambians need refraction error corrections (especially cataract and trachoma) but only half of them are aware they have a problem or do not have sufficient resources to afford an eye exam.

Unfortunately, people have to travel for kilometres just to have access to refractive correction services. On top of this fact one has to consider that the cost of a pair of glasses is prohibitive: before OneSight's project a pair of glasses where worth almost an entire month's pay. After OneSight's arrival, the situation has definitely improved and from 2013 up to now the project is continuously growing.

In total OneSight opened 6 vision Centers in all the strategic locations of the country (administrative regions) and one in-country optical manufacturing lab in Kanifing, providing access to all the Gambians. Also, OneSight volunteers cooperated to make this shift in execution feasible and thanks to all their support about 236 Gambians were trained, with the positive results of 186 new jobs created.

All these Vision Centers are equipped with the most modern and advanced equipment, in order to allow local doctors and optometrists to practice all the knowledge and skills acquired during the training period.

Throughout local marketing strategies, the level of awareness about how a pair of glasses can correct refractive errors and change someone's life, has generated an increase of sales (about 6 thousand pair of glasses were sold by OneSight) with also an increase of revenues re-invested in OneSight's activities.

The success of a sustainable project like the one carried out by OneSight in Gambia is not measured only by the number of people who receive access to vision care with an immediate effect, but also considering the long-term impact that such project could have on an entire country.

The case study of Gambia is explicative of the fundamental shift in execution from philanthropic initiatives, like the charitable solutions developed in the traditional clinics, to the most advanced permanent centers based on a model strategically sustainable with long-term objectives (Porter & Kramer, 2011).

Hence, this new type of business model is completely different form the previous one and as Mustapha Njie said, what OneSight is doing in Gambia has a deep significance: OneSight not only helps people to see better but also allows local underserved communities to gain new skills, develop their economic and makes each single country a better place to live in.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

OneSight Sustainable Model

OneSight business model is based on three important pillars: Access, Awareness, Affordability (OneSight, 2016).

The terms Access refers to the spaces provided by the government, hospital and existing health care systems managed independently by local teams (Optical Lead). Basically, once trained local teams introduce the new Vision Center into their own community and serve neighbours together.

In many communities, vision care is a foreign concept. People are unaware that vision care exists, that their poor eyesight can be corrected, or that there is significant value in investing in a pair of eyeglasses. For this reason, one of the main objectives of this project is to increase awareness on the Vision Centers and drive traffic to them across localized marketing strategies.

Finally, once the clinics are built in permanent and well-equipped infrastructures it is necessary to make them visible to the population with appropriate marketing and communication campaigns aimed at launch the activities. In general, patients pay an affordable price defined by local market. Indeed, despite the economic condition of the countries in which OneSight operates are extremely poor, all the services offered (eye exam, glasses etc..) are not free but have a "convenient" and value for money price for the target.

Therefore, if the eye exam and the glasses were free, patients and local doctors will depend on OneSight's philanthropic donations and in this case the model will not be sustainable anymore. At this point of our study we can confirm that a sustainable solution like the one promoted by OneSight requires a steady economic situation and a change of mindset of all the stakeholder involved, definitely more oriented to a social dimension of the problem and willing to build long-lasting relationship with local partners (Porter & Kramer, 2011).

In the analysis of the business case has been widely utilized the research developed by Deloitte to examine the first implementation of the sustainable model in Gambia (Deloitte, 2015)

Specifically, the aim of the study was to analyse Gambian current state operations to understand the viability and sustainability of the OneSight model and its applicability to other contexts, in order to learn from operations and inform future expansion.

The Deloitte team conducted over 128 customer interviews/focus groups and 28 employee interviews in Farafenni, Basse, and Kanifing as part of the in-country data collection process.

Results can be summarized in three different categories:

- **Sustainability of the Program:** The steady state model in the Gambia is sustainable since the revenues coming from Vision Care Centers are able to cover operating costs and the cost of goods sold with profits. Also, some profits are allocated for building a fund to cover long-term equipment maintenance to ensure program longevity.
- **Increased Impact:** When profits comfortably cover operating costs with a surplus, funds are freed for strategic investments to advance OneSight's mission (e.g., free glasses for extreme poor or children) Surplus funds also become available to support outreach and education or program expansions.
- **Replicable Model:** The business model is efficient and sustainable so should be replicable in other markets.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

In order to better evaluate the sustainability of the model in terms of market potential and cost structure, Deloitte has developed in detail what was the relationship between the need for eye care in Gambia (market penetration) and the ability of the National Health Program to cover costs through the revenue generated from the sale of glasses or from the services offered. Only through the correlation of these two indicators it can be assessed how the model adopted is efficient and effective.

In brief, we can affirm that OneSight can definitely provide access to vision care and top quality eyewear through the new sustainable approach based on strategic partnerships and the development of local clusters.

Should OneSight Adopt CSV Approach?

According to the theoretical background previously outlined, it is now necessary to delineate a business model framework to understand the interactions between OneSight sustainable model and Porter and Kramer's shared value approach.

Shared value creation focuses on identifying the connections between societal and economic progress and should be applied by all type of organizations across the well-known three operating methods. Hence, a new and stronger linkage between business and society is needed to create economic value in a way that also creates value for society by addressing its needs and challenges.

Moreover, this win-win relationship becomes more relevant when companies decide to expand their businesses into developing countries or low-income markets, that are characterized by deep social disadvantages but could also offer great opportunity in terms of developing innovative business model, like social and inclusive business model.

OneSight's sustainable model lies exactly between this two new business models and cover all the three ways identified by Porter and Kramer to create shared value (Porter & Kramer, 2011). Throughout the Sustainable Vision Centers Gambian population could benefit (at the very beginning of the project) of the access to the health care system and therefore of an improvement of economic and social conditions of the local communities: reinforcing local economies, re-launching productivity and also creating new jobs.

In order to evaluate the possible alternatives for a company to create shared value, this study postulates a new framework, based on the one already defined by Michelini and Fiorentino (2011), to graphically highlight the evolution of the shared value approach.

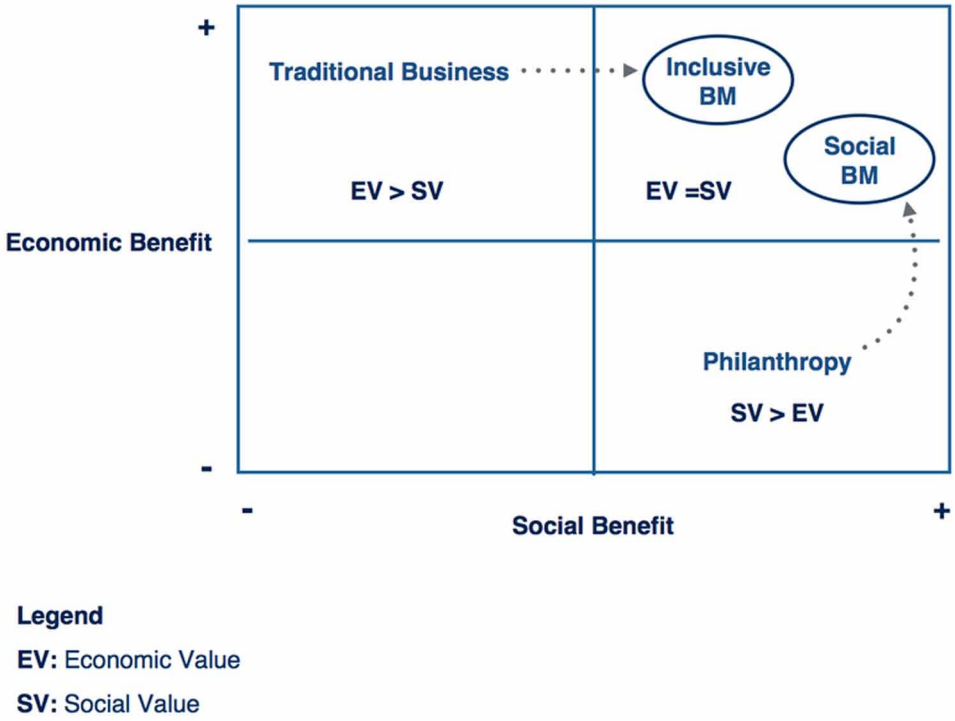
Figure 5 shows how the traditional business is definitely more oriented to create economic value than social value, focusing on maximizing profit per se and generating – as a consequence – "negative externalities".

Externalities arise when firms create social costs that they do not have to bear, such as pollution. Thus, society must impose taxes, regulations, and penalties so that firms "internalize" these externalities and influence many government decisions (Porter & Kramer, 2011). Meanwhile, philanthropic initiatives – by their nature – are mainly focused on societal needs not just conventional economic needs. The transition between these two distinct but correlated businesses, inevitably leads to the creation of shared value where the economic value accurately approximates the social value and vice versa.

Despite these models could be used by the same type of hybrid enterprises, they have different roots: Social Business Model, addressing predominantly social benefits, could be considered as a progressive philanthropic approach; while Inclusive Business Model has its roots in the traditional business given the emphasis on both social and economic benefits (Michelini & Fiorentino, 2011).

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 5. The evolution of social and Inclusive Business Models
Source: Our elaboration.



In addition to this theoretical framework, it could be useful to adopt the "building blocks method" to OneSight in order to clearly define which is the most efficient and effective strategy that the organization should pursue (Bockstette & Stamp, 2011).

Based on the blueprint developed by FSG, we can identify how the managerial approach of OneSight is intrinsically linked to the creation of shared value, although the not for profit disposition could lead to a philanthropic or CSR approach.

Figure 6 shows the steps of the creating shared value process, based on OneSight's sustainable model.

Each single block includes Onesight information on vision, strategy, delivery and performance so it is easy to extrapolate the business strategy developed in order to meet the goals and realize OneSight's mission.

Specifically, OneSight strategy aims to guarantee vision care access across the globe through sustainable solutions with support from industry experts, volunteer and partners.

Therefore, all the donations and support coming from partners and mainly form Luxottica, OneSight is able to manage in an holistic and cross-functional way the overall organization and the delivery of the planned initiatives.

To evaluate the sustainability of the business model, it needs to be constantly monitored highlighting its strengths and weakness. OneSight has a true P&L that brings together all the main KPI's to measure the results and the effectiveness of the plan.

Hence, the building blocks translate the shared value idea into concrete actions tailored to the context, the strategy and the measurement process.

Figure 6. The Building Blocks of Creating Shared Value in OneSight
Source: Our elaboration.

CONCLUSION

First of all, despite the corporate social responsibility is still fundamental for the business management, the principle of shared value is becoming a growing trend into the contemporary economic environment.

According to the evolution postulated in this study, shared value holds the key to unlocking the next wave of business innovation and growth. It will also reconnect company success and community success in ways that have been lost in an age of narrow management approaches, short-term thinking, and deepening divides among society's institutions.

Due to its versatile nature, the concept of shared value blurs the line between for-profit and not for profit organizations and new kinds of hybrid enterprises are rapidly appearing into the broad category of Social Entrepreneurship.

Hence, this study contributes on identifying a theoretical framework useful to analyse the rise of new business models for creating shared value: OneSight's sustainable model belongs to this new category and is a prime example of Social Entrepreneurship.

In a high level interpretation of the case study, it is also possible to analyse how OneSight's sustainable model and Luxottica business model could be integrated. Indeed, thanks to OneSight's initiatives Luxottica realize its CSR approach primarily through creating and strengthening local cluster in underserved communities.

The finding of the research outlines some open points especially regarding the concrete implementation of these business model. For this reason, further research should strive to extend the analysis of the relationship between hybrid enterprises and society to deep dive the development of shared value approach to definitely more "challenging" areas.

KEY TERMS AND DEFINITIONS

Building Blocks: A blueprint developed by FSG that help companies to translate the shared value idea into concrete actions tailored to the context, the strategy and the measurement process.

CSV: The concept of shared value can be defined as policies and operating practices that enhance the competitiveness of a company while simultaneously advancing the economic and social conditions in the communities in which it operates.

Hybrid Enterprises: Hybrid enterprises are those enterprises straddling the boundary between the for- profit business world and the social mission-driven public and not for profit organizations. Hybrid Enterprises belong to the broad category of Social Enterprises.

Inclusive Business Model: Inclusive business models are commercially viable and replicable business models that include low-income customers, retailers, suppliers, or distributors in core operations, recognizing the untapped opportunities this market segment represents. Companies with an inclusive business model are directly contributing to reducing poverty and promoting shared prosperity through better income opportunities and access to goods and services for 4.5 billion individuals who are often called the "Base of the Pyramid".

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Social Business Model: Social business is a new category of business. Specifically is a cause drive business model. In a social business, the investors/owners can gradually recoup the money invested, but cannot take any dividend beyond that point. Purpose of the investment is purely to achieve one or more social objectives through the operation of the company.

Social Entrepreneurship: Social Entrepreneurship is a step of the creating shared value process through which a social oriented company gain the right competences in order to incorporate social issues into their core business strategies. Social Entrepreneurship may be defined along a continuum from the creation of positive social change to earned income in the pursuit of social change.

Sustainable Model: OneSight's sustainable model results from the transformation process from traditional and charitable solution to the new permanent vision care clinics. OneSight business model is based on three important pillars (Access, Awareness, Affordability) and it was developed for the first time in Gambia.

This research was previously published in Value Sharing for Sustainable and Inclusive Development edited by Mario Risso and Silvia Testarmata, pages 100-121, copyright year 2018 by Business Science Reference (an imprint of IGI Global).

Chapter 87
Understanding Social Business and Wellbeing at the BoP:
The Inspiring Case of Algramo

Mahmoud Khalik
University of St. Andrews, UK

Sara Lopez-Gomez
Universidad del Norte, Colombia

ABSTRACT

The interest in poverty reduction has received scholarly attention from various academics studying developmental economics, the informal economy and the base of the pyramid (BoP). This chapter intends to engage with the BoP topic by reviewing research areas that are intertwined: the informal economy, the BoP and perhaps most importantly social business and wellbeing. The chapter introduces Algramo, a BoP venture from Chile that aims to reduce food poverty in Latin America. The focus of this chapter is on Algramo's activities in Colombia as a single case study to better understand the impact of three wellbeing aspects on the stakeholders involved. Although Algramo, a work in progress, is primarily focused on food poverty reduction; this chapter reveals that there are potentially much wider implications that are consistent with BoP literature. Wellbeing is important and merits further study when investigating BoP ventures. The chapter concludes with future research directions for BoP scholars and for those who are interested in the wider impacts of engaging with the BoP segment.

INTRODUCTION

Emerging markets have become an important context in the global economy over the last two decades. Management research has addressed emerging markets predominantly in two ways: 1) understanding the internationalisation of firms that originate from these markets and 2) how to alleviate or reduce poverty by serving poorer segments in these markets. The second topic, which is the focus of this chapter is known as the Base of the Pyramid (BoP). The BoP concept has attracted scholars' attention in the last decade. The topic was first introduced in 2002 by Prahalad and Hart in strategy+business, and initially

labelled as the 'bottom of the Pyramid'. The BoP concept attracted a number of Multinational enterprises (MNEs), such as Cemex in Mexico and Hindustan Lever Ltd (a subsidiary of Unilever) in India to venture into this market segment.

BoP research only garnered attention in 2005 when Prahalad (2005) further developed the idea in his infamous book 'the Fortune at the Bottom of the Pyramid'. Current BoP research is influenced mainly by the work of Ted London who the authors regard as the most encouraging and insightful scholar at present, especially with the William Davidson Institute. Since the inception of the BoP concept, there has been a growing interest with respect to business models and understanding BoP as consumers. Scholars have studied companies that have attempted to design new and innovative business models that target the BoP. Much has been learnt and this is well pointed out by Simanis (2012). The shift from making 'a fortune at the bottom of the pyramid' as initially proposed by Prahalad (2005) to 'co-creation with the BoP' by London and Hart (2011), emphasises a change in our understanding of BoP ventures. This means that there should be a greater understanding of the impact and wellbeing of people at the BoP (London, 2016).

It can be argued that scholars have mainly concentrated on the theoretical understanding of business models for the BoP segment. The informal economy literature focuses on this company-centric perspective and this is not without merit. However, it is equally imperative to measure or at least form some kind of understanding with respect to the impact on consumers' livelihoods, and there are traces and hints of this view from the work of Prahalad (2010). This means that a consumer-centric approach becomes more important to understand the BoP more holistically, and to further enhance our knowledge with respect to the impact on BoP consumers' wellbeing, which can be divided into different types (explained later in this chapter). It is important to understand the wellbeing of people at the BoP as this can provide more certainty that the design of new business models is not only economically viable and profitable, but can provide a positive impact on the lives of those served. Only when we have a deeper understanding in a holistic manner are we then in a better position to more confidently argue for social business models, which is at the heart and ethos of BoP research.

This chapter will discuss important aspects related to the informal economy, BoP research, social business models and wellbeing, before delving into a promising case of a Chilean firm already operating in Colombia in the early stages with the aim of reducing food poverty. The chapter will conclude with future directions and conclusions. The authors begin with information on the informal economy.

BACKGROUND

The Informal Economy

The purpose of this section is to provide some important aspects of the informal economy, where the majority of poor people reside. The research and literature on the informal economy provides a backdrop for BoP research. The more that is known and understood about the informal economy, the more one can better understand and justify the need for BoP enterprises and for further research on this topic. The use of the term 'informal' when describing an economy is heavily used by the Peruvian economist Hernando De Soto. De Soto views the economic activities that occur in the informal economy as those that take place outside of formal institutional boundaries, but remain within informal institutional boundaries for large segments of society (De Soto, 1989).

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

There is a plethora of definitions for the informal economy, and arguing for one over the other is fruitless. Webb, Tihanyi, Ireland and Sirmon (2009) explain that the informal economy as illegal yet legitimate activities through which actors recognize and exploit opportunities (Portes, Castells & Benton, 1989; Feige, 1990). A very large amount of activity takes place in the informal economy, and these activities can account for up to 10–20% of gross domestic product (GDP) in mature economies and between 40-60% in emerging economies (Schneider & Enste, 2002). This is similar to the estimates put forward by The International Labour Organization (ILO, 2002; Webb et al., 2009).

One of the most intriguing issues is that the informal economy is largely under researched in management research (Bruton, Ireland & Ketchen, 2012; Webb et al., 2009; Godfrey, 2011). There are two dominant schools of thought when viewing the informal economy: the dualist and structuralist (Chen, 2012). The dualist approach views the informal economy as separate, distinct and not related to the formal economy; while the structuralist approach views the formal and informal economy as intertwined (Chen, 2012). It appears to be logical that informal and formal firms are connected together in an exchange system (De Castro, 2014). There is debate as to whether the informal economy should be formalized and how this should unfold. While the World Bank is in favor of formalizing the informal sector, Professor Susanna Khavul (2016) a leading scholar on the informal economy, argues that moving the informal to formal is only a small part of the story and that there is no quick fix for this (AOM conference, 2016). If one looks more closely at literature in the entrepreneurship field and perspective, the literature is heavily focused on the study of small firms in the formal sector. There is a need for these journals to encourage scholars to study micro/small enterprises operating in the informal sector.

The growth and importance of research on the informal economy (e.g. Webb et al., 2009; Webb, Ireland and Ketchen, 2014; Bruton et al., 2012; Godfrey, 2011) clearly identifies the challenges we face with poverty and provides a backdrop for investigating the Base of the Pyramid. Most of those who live at the BoP are excluded from the formal sector, and the objective of BoP research is to eradicate or alleviate poverty through new innovative solutions. Microfinance is a clear example that offers finance to those who cannot obtain credit or loans from conventional banks, a pioneering example of this is Grameen Bank from Bangladesh. The chapter now turns to the BoP literature.

The Base of the Pyramid

It is important to recognize that it is unproductive to argue whether capitalism reduces or creates poverty. The authors acknowledge that there is promising research on sustainable economic models, reinventing capitalism, and reality checks of our current economic model which is advocated nicely by economist Tim Jackson. However, the current reality is that poverty exists and the current aim of BoP authors is not to challenge existing economic systems, but rather to find innovative solutions within the existing system we find ourselves in. At the heart of BoP research is poverty reduction or alleviation through financially profitable activity (Kolk, Rivera-Santos & Rufin, 2013; Prahalad & Hammond, 2002). There is no unified BoP definition, and it has been pointed out that studies adopt different values and figures which makes the comparison between studies difficult and this leads to inconsistencies (London & Hart, 2011). Kolk et al. (2013) confirm that the term 'the poor' is often used and so the BoP definition is unclear. This makes comparisons between studies difficult as there is no consensus on what constitutes 'the poor'. For example, in Colombia there are people with different incomes that live in different strata divisions. There are six divisions with one being the lowest (very poor) and six being the highest (rich).

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

We cannot just blindly assume that the main problems and issues with people at strata 1 to be exactly the same as those in strata 2.

The authors agree with London and Hart (2011) that trying to define a strict definition for the BoP, especially based only on 'income' is unproductive and unlikely to reach consensus as 'income' is an imperfect indicator which is used for convenience. A wider view of the BoP is needed and based on characteristics (London & Hart, 2011). This means that the BoP is the world's population that is excluded from the global capitalism system, and therefore refers to the 'low-income socio-economic segment that is not well-integrated into the formal economy' (p. 8). London and Hart (2011) argue that the BoP population are those with the least amount of income and living primarily in the informal economy and can be considered as vulnerable communities. This population lack access to basic goods, services, and opportunities to generate an income (Hammond, Kramer, Katz, Tran & Walker, 2007). The authors believe this to be the most sensible approach when defining the BoP (Sánchez-Barrios, Giraldo, Khalik & Manjarres, 2015).

Sheth (2011) states that this century will be focused on marketing to emerging markets, in the same way that the last century was dominated by marketing to the rich. Despite BoP research being an intriguing proposition, scholars are still learning about how MNEs or SMEs can serve this segment in an appropriate way. Prahalad (2005) emphasizes that firms can attain profits by serving BoP segments, and by doing so companies can alleviate poverty. Paviera and Khalik (2015) point out that the industry type will have different impacts on the poor. Healthcare and education should not be classified as similar to consumer retail in terms of impact. The aforementioned authors referred to this as 'sectorial paths and the base of the pyramid'. Different outcomes are a result of the type of service offered by a BoP venture. The venture may contribute to poverty alleviation or consumer satisfaction; the latter is more focused on enhancing the experience of the poor when making purchases. However, all types of business are important, but some are more pertinent than others.

Karnani in a series of publications criticizes the BoP concept (Karnani, 2007a, 2007b, 2008, 2009a, 2009b). Karnani (2009a) makes some notable points, such as buying from the poor would be more rewarding instead of selling to them and treating people at the BoP as consumers. He stresses the importance of job creation through employment. Furthermore, Garrette and Karnani (2010) argue that BoP consumers are price sensitive. This is based on the view that BoP consumers spending most of their insufficient income on food, clothing and fuel, which are basic needs. This would leave people at the BoP with insufficient funds to spend on extras, which non-BoP segments would regard as luxuries. This advocates the lower quality and lower cost sold in high volumes as an approach. However, what is clear from what we have learnt is that firms cannot sell lower quality products at low prices in large volumes as this is not a long term sustainable view. Prahalad (2010) argues that BoP consumers are becoming more sophisticated and supports the view that companies offering low-cost products will fail to develop profitable businesses. Poor people do not want cheap products, but risk free solutions. Therefore, companies need creativity and courage, not generosity (Kayser & Budinich, 2015).

It is clear that here we can start to identify a change in our understanding of the BoP concept since its inception. Initially, the BoP concept explained that there are untapped opportunities for firms to serve and we have learnt that this is not so straight forward. Prahalad (2005) brought the topic of poverty alleviation to the attention of management scholars. The concept has changed from merely viewing people at the BoP as consumers to engaging with them through 'co-creation' as pointed out by London and Hart (2004). The next section highlights two vital and integral features learnt from BoP research: Mindset and Networks.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

The Importance of Mindset and Networks for BoP Success

With respect to mindset, it is clear that different approaches are needed and vital for firms to serve the BoP successfully. Prahalad (2010) stresses reinventing marketing strategies. Scholars exploring BoP markets have established guidelines for firms targeting people at the BoP (Simanis, Hart & Duke, 2008; London & Hart, 2011; Prahalad, 2005, 2010; Sheth, 2011). This is very logical and a step in the right direction as BoP consumers are different due to high illiteracy, limited income, and live in areas with poor infrastructure. This means that a differentiated approach to this segment is needed.

From marketing research, most scholars and practitioners are aware of the infamous 4Ps (product, price, place and promotion) by McCarthy (1960). However, the 4As framework (availability, affordability, acceptability and awareness) was introduced by Anderson and Billou (2007). The 4As framework is not merely a reshaping of the initial 4Ps, but necessary when dealing with BoP markets and echoes the view that managers must change their mindset when addressing BoP markets (Prahalad, 2010). For example, Godrej's Chotukool refrigerator which is portable and catered for BoP customers in the Indian rural market. The success is due to 'co-creation' and goes beyond carrying out traditional market research. The company immersed itself in the community and even the women from the community were involved in the development of the product, selling and servicing (for more information see Whitney, 2011). The company did not provide a cheaper product, at a lower cost sold in high volumes and treating people at the BoP as consumers. The company spent time and effort technically inventing an 'acceptable' product tailored to people at the BoP as they were involved in the design. The product was 'affordable' and rather than using conventional promotional and distribution channels, "awareness' and 'availability' were raised through the involvement of the community. This is a completely different model and mindset from serving the Top of the Pyramid (ToP).

Networks or partnerships are pertinent for success when serving the BoP (London & Hart, 2004; London, 2016). A number of authors argue for a more inclusive approach with other partners and the need for rigorous governance (London & Hart, 2004; Kayser & Budinich, 2015). People at the BoP should not be viewed as consumers, but need to be included especially in the form of 'co-creation' if BoP initiatives are to succeed (Simanis & Hart, 2009; Hart & London, 2005). This idea of co-creating or co-building with poor people is a shift in our understanding with respect to the BoP concept. People at the BoP should be viewed as co-producers, and this can lead to employment and income. Rangan Chu and Petkoski (2011) explain that with training, people at the BoP can take part in different activities along the value chain, such as transportation, retailing and distribution. The aforementioned authors cite the examples of Nestlé and Mars working with farmers.

An interesting study by Ghauri, Tasavori and Zaefrian (2014) even explore developing a network of relationships with non-governmental organizations (NGOs) which can not only support, but contribute towards the internationalization of firms targeting the BoP in emerging markets. The findings reveal that MNEs through network of relationships have focused on the neglected needs of people at the BoP and delivered sustainable solutions. The focus of the MNEs began with social value creation (related to mindset) and delayed value capturing. It is argued that while MNEs possess the technical knowledge and financial resources; collaboration with NGOs have enabled MNEs to gain valuable insights in to the BOP's specific needs due to NGOs' knowledge and good relationships in this market. Partnerships, collaboration and networks appear vital for success and this is stressed as the way forward for firms targeting the BoP (London & Hart, 2011; London, 2016).

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Many studies that focus on the BoP view the poor as consumers. There is less understanding of the poor as being able to generate an income, or involving people at the BoP along the value chain, such as distributors or suppliers (Kolk et al., 2013; Paviera & Khalik, 2015). Having established the evolution of the BoP concept from selling lower quality products at cheaper prices in high volumes to the BoP and regarding this target market as consumers; the approach has changed to one that emphasizes different mindsets, involvement, and networks. However, what also needs to be discussed is the impact on the wellbeing of the BoP population. The chapter now turns to social business and wellbeing.

Social Business and Wellbeing

Taking into account the ethos of serving the BoP, particularly the reformed view: a fortune with the BoP, rather than a fortune at the bottom of the Pyramid reinforces the idea of impact and wellbeing. It is important to scale BoP ventures and understand how it can affect wellbeing (London, 2016). The key point authors need to bear in mind is 'co-creation' or at least the involvement of BoP consumers. The BoP concept offers companies the opportunity to rethink their strategies and operate differently to the way they have done so in the past. In our current capitalist system that focuses on growth, two types of organizations with contrasting goals can be identified. One that focuses on profit-maximization and the other on creating shareholder value (Yunus, Moingeon & Lehmann-Ortega, 2010). BoP ventures is the bridge between these two extremes, the new organizational form operates in the same way as a profit maximizing business (not a charity), but the goal is not only to be focused on profit, but social objectives. Social businesses need to recover their full costs in order to be self-sustainable (Yunus et al., 2010). Ghauri et al. (2014) refer to this as corporate social entrepreneurship.

The impact of BoP initiatives is important (London, 2009; London, 2016). Kolk et al. (2013) show the lack of understanding in the literature with respect to the economic impact on the firm. The social impact of BoP ventures is still in its infancy and mostly been measured in terms of the impact on the local populations (Kolk et al., 2013). The literature shows that different assessment criteria has been used from education, to healthcare, access to water and sanitation, to employment and income generation, and empowerment. This is a pressing issue given that one of the fundamental points of BoP research is to reduce poverty. Systematic and objective assessments of BoP ventures are needed and more empirical evidence of the economic, social, and environmental impact of BoP ventures is essential. (Kolk et al., 2013).

One way to start addressing this is to look at wellbeing. This is a complex term that is not properly defined even beyond management research. Wellbeing is a perplexing concept and this is highlighted in a recent publication titled 'The challenge of defining wellbeing' in the journal of wellbeing by Dodge, Daly, Huyton and Sanders (2012). If we look at businesses from a marketing perspective, it is clear that advertising and selling can be viewed at times misleading. It can be seen even at times as damaging or disregarding consumers' wellbeing, even simply by neglecting groups of people in need (Fisk, 2009). However, it can be viewed that when a business interacts with a consumer during a value-creation process, then there is strong potential for wellbeing outcomes to occur for both: company and consumer. This includes aspects such as access, health, life satisfaction, power, respect, and happiness (Anderson, Ostrom, Corus, Fisk, Gallan, Giraldo & Shirahada, 2013). Sánchez-Barrios et al. (2015) studied informal lending to people at the BoP and the impact on their wellbeing from the aspects of access, convenience, financial literacy and social communities. The findings show that informal service offerings result in unintentional positive effects on wellbeing at the individual, collective, and relational levels.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Aiming to establish one definition for wellbeing is as pointless as trying to define the BoP in a strict manner. The authors view that the most sensible approach is to look at wellbeing from the BoP literature (context of study). London (2016) explains that it is important to understand BoP ventures and their effects on the the BoP population, and introduces three aspects of wellbeing. London (2009, 2016) introduced the BoP Impact Assessment Framework (see figure 1) with the William Davidson Institute, and this is a useful tool that provides a more holistic view of value created by BoP ventures. It allows firms to continually improve their business model, and therefore meet the needs of those they serve in a more suitable manner. The framework, known as the BoP IAF introduces three broad aspects of wellbeing: economic, capability and relationship for three local BoP stakeholders: sellers (producer or distributor), buyers (consumers or agents) and communities. In addition to this, one can assess the wellbeing impact on each stakeholder in terms of magnitude (high/low), Likelihood (high/low) and attributes (positive/negative). Therefore, the framework encourages a more comprehensive approach than the earlier work undertaken on the BoP.

Figure 1. BoP impact assessment framework
Source: (London, 2016).

The following section of this chapter introduces the case or Algramo, a BoP venture that aims to alleviate food poverty sustainably. Algramo is in the early stages of operating in Colombia and is still learning about the market. In order to better understand the organisation's goals, objectives and experiences in the market; interviews were undertaken, documents reviewed, and observations by visiting a number of stores selling Algramo's products in Barranquilla, Colombia. The information is then related back to some of the wellbeing aspects introduced by Ted London. We begin by introducing Algramo.

THE CASE OF ALGRAMO

A clear and evident problem when discussing the topic of poverty is food. For the BoP population, food that is affordable is hard to come by. Algramo, which translates to 'by the gram' in Spanish is a BoP venture that began in the outskirts of Santiago, Chile. Algramo's philosophy is to deliver sustainable high quality food to impoverished Chilean and Colombian communities. The entrepreneur behind Algramo is Jose Manuel Moller, who is also an economist by background. The idea of Algramo first came to light in 2011 when Jose, along with some friends moved to the outskirts of Santiago and witnessed firsthand how poor communities live. A shocking observation is the cost of food at stores in rural areas. Obviously, there are a limited number of supermarkets and food obtained from small, local stores and kiosks can be up to 40% more expensive, and this was nicely labelled by an interviewee as a 'poverty tax'.

To start up the venture, Algramo obtained funding buy winning an entrepreneurial competition (run by Chivas Regal) and Algramo also used 'Indiegogo', a crowdfunding website as pointed out by one of the interviewees. Algramo has been successful, not only due to the energy and entrepreneurial flair of owner Jose Manuel Moller, but due to the mindset of the company from the get go. There are three impact objectives: 1) Economic: improving margins by offering high quality essential products at fair prices to BoP consumers, 2) Social: families will be able to pay at least half of what they used to pay for food products, 3) Sustainable: the neighborhood contributes to a reduction in carbon footprint with 100 percent returnable containers (Algramo website). It is clear that this has wellbeing implications that are discussed later on in the chapter.

Algramo buys essential products such as rice, lentils, sugar, chickpeas and beans in large quantities from suppliers and distributes the products to local grocery stores in the form of vending machines. The machines were tweaked, this can be referred to as incremental innovation, by Jose's business partner Salvador Achondo who is an industrial designer with a degree in innovation. The machines dispense essential food products into sustainable plastic containers. This makes essential products available to the poor in a more affordable manner in the areas where the BoP population live. People at the BoP can buy the quantities they need according to their income at a given time, and this is different to the single unit approach, which is more expensive over time.

One way the products are much cheaper is by Algramo cutting out expensive marketing, packaging often associated with supermarkets, and layers of distributors. Algramo has streamlined the traditional supply chain to buying from food products form the source and delivering them directly to the stores, which poor people can access directly. The company further cuts costs by providing only essential food products that poor consumers need. The products selected by Algramo are non-perishable which reduces risks with the inventory (e.g. fluctuations in demand). Algramo is truly innovative as they plan to further improve the machines and offer other products to BoP consumers, such as cooking oil and detergents. The reason for using machines is that it is more hygienic, practical, and avoids shopkeepers from cheating,

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

for example, the rice grain quality might not be controlled. Algramo agrees the price with the owners, and therefore Algramo delivers a consistent quality. Algramo installs the machines, refills them, and shares the margins with shopkeepers.

Algramo does aim one day to perfect the model through learning and perfecting the concept so that it can be available in other continents such as Africa. So far, Algramo has been so successful that their products are sold in over 400 stores in Chile according to one interviewee. The plan is to further expand and test the model in other Latin American countries, such as Colombia, Mexico, Peru, and Paraguay. Algramo has already internationalized to the city of Barranquilla in Colombia in 2015 and the firm is meeting its targets. One difference in Colombia is that currently the machines are not available in shops, but rather biodegradable containers that can be reused. The machines will be installed in the foreseeable future according to one interviewee.

Colombia was chosen due to the networks available to support the company, which is a factor in firm internationalization literature. Jose has attended many conferences, established relationships with different foundations, engaged in public relations, universities, and even utilized AIESEC; an organization that aims to activate the leadership of potential young people. From the interviews undertaken, observations and documents it is clear that Algramo view themselves as more than a simple organization that reduces food poverty. Algramo believes in building networks and long lasting partnerships to create a better ecosystem for all involved. This appears to be the key to success, impact and sustainability, and it echoes qualities of a recent economic view known as the collaborative or shared economy (see Botsman & Rogers, 2010) for more details. Having introduced Algramo as a promising BoP venture; the authors turn to understanding the experiences, insights and impact on wellbeing, with a focus on the activities in Barranquilla, Colombia. Wellbeing will be considered from the perspective put forward by London (2009,2016). It is important to note that when speaking to a representative at Algramo, no real way of measuring the impact of their venture at this stage is in place. However, this is something they are currently working on.

BEYOND FOOD POVERTY REDUCTION

This section of the paper looks at the three aspects of wellbeing in the relation to the stakeholders (see Figure 1), by assessing the case of Algramo. The authors begin by looking at the economic wellbeing for sellers.

Economic Wellbeing for Sellers (Producers and Distributors)

In Algramo's case we can consider the company in Colombia as a distributor of essential, and affordable non-perishable food products to those in need. From the company's perspective, it is clear that Algramo is starting to contribute to their own wellbeing by exceeding targets in rural areas in Barranquilla. It appears that there is income stability as was achieved in Chile, and this is evident by Algramo purchasing products at a price they require for their venture to work. In terms of the wholesalers, Algramo are buying the products in bulk at a fair price from the same producers to achieve consistent quality, and therefore increasing the income and stability of the producers. It is not clear if there is a positive or negative impact on economic wellbeing with respect to credit for Algramo or the producers at this stage. The following quote highlight these points:

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

We buy in bulk and so we guarantee big purchases from those that supply us. This is good for them. What I mean is that they are assured of big purchases from us and this is good as they can sell more. Remember we see our organisation as building relationships as that is at the heart of our company. If we work well with others, then we both do well and so things will run more smoothly.

At first we sometimes work with a few producers until we find the right ones. The right ones are those that we can trust and build a relationship with. Our producers or wholesalers that understand what we are doing can see the benefits for them. We are including everyone in our value chain as a team.

Here it appears that the magnitude, likelihood for both stakeholders involved: producers and Algramo are high and there are positive attributes at this stage with the potential for improvement as Algramo grows. This could lead to more income for Algramo to develop and innovate aspects of their model. For the producers, they can earn more income stability and selling products at a fair price.

Economic Wellbeing for Buyers (Consumers and Agents)

In the case of Algramo there are two important buyers. The shopkeepers (agents) that stack up the food products and the actual customers that are the end users of the product. An observation both authors identified at the stores visited with an Algramo representative was the simple signs outside the stores that have the Algramo logo (meaning that the products are sold there). The impact on wellbeing for the shopkeepers is illustrated by the following quotes:

We are adding products to the shopkeepers' portfolio based on needs and so when we choose oil for cooking we find out about the size and how much they need, for example one litre or more or less. This is not yet based on survey results, but from talking with the community shopkeeper about product development. I see this as a way of the shopkeeper attracting customers to the store and so more traffic. By coming to the store, customers can purchase other products also so he can earn more money.

The shopkeepers theoretically should earn more. The idea is that with us they purchase the product at a lower price and sell it at a lower price that is still less than competitors, even if he raises the price slightly, they should be able to bring in more customers, and by selling essential products at a cheaper price, the shopkeeper will gain more money and more customers and so more income without having to put his hand in his own pocket.

Bearing in mind that Algramo has only been in Barranquilla for a short time, it is evident that the shopkeepers' magnitude and likelihood for economic wellbeing is at a medium level with potential to increase. There are positive attributes at this stage with a real potential for this to increase. The shopkeepers have potential to earn more money, not only by attracting more customers to the store, but by customers visiting on a more regular basis. The shopkeepers are buying essential products at a lower price and can earn more money so they could potentially save. Shopkeepers could further promote the availability of Algramo products, and they provide more choice for customers. There is a high potential for more economic activity with little investment required. There is further evidence that measurements through surveys are needed as advocated by the BoP IAF framework. For consumers, who are the end users of Algramo products, there are opportunities for them to access essential food products at affordable prices.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

The products are easy to access in a convenient way as they are available in their own neighborhoods. It could be argued that as Algramo offers more than one product item, consumers have a wider choice. The following quotes illustrate the economic wellbeing for the end users who consume the products:

The idea is for people to save money, they are on a very low income so every penny is vital and substantial for them. If they have extra money, because our prices are lower than they can spend that money on other basic needs they will have. Remember that our products come to them, where they live.

The supermarkets are not in sight and so they do not have to travel to buy products that they need. They save as well by buying our products which are what they need at lower prices.

It is evident that there is economic wellbeing for consumers. There are more products available to them and we can see evidence of the 4As by Anderson and Billiou (2007). Consumers are aware of acceptable products that are affordable and available to them in their own neighbourhoods. It could be argued that the economic benefits in terms of magnitude and likelihood are high. There are positive attributes that can increase dramatically when Algramo grows. The BoP population can escape the so called 'poverty tax' and use their income for other purposes, while saving money on transportation.

Economic Wellbeing for the Community

Community as a stakeholder is interesting and here the community can be defined as small neighbourhoods in Barranquilla. Algramo divides areas up in the city into smaller neighbourhoods to serve. The greatest contribution Algramo can make here is job creation and there are opportunities for this. As Algramo has only been operating in Colombia since 2015, it is hard to assess the full benefits. However, while visiting two stores in Barranquilla, the authors witnessed a number of local people approaching the Algramo representative and talking to him. The following quotes indicate small impacts made and the vision for the future:

We have in Algramo Colombia admin staff who are mainly young people with work experience and who have graduated from college, but we work with the relatives of shopkeepers and others from low-income neighbourhoods where Algramo sells. A foundation in Colombia that works with low-income people make recommendations to us.

We have thought about developing some micro-franchising model with people from the communities we work with. For example, if we serve a neighbourhood called La Paz, then we hire someone from there and he will do the distribution to all the stores that work with us. The person will do the distribution through his house so the distance he has to cover is much shorter than what we have to do. We give them a tuk tuk through the united nations development programme and other things like baskets to transfer the items, including a helmet and uniform. We send the products to their houses and we pay them for each unit of our products sold. If you want to earn 2 million pesos (US$672) then you have to sell a certain amount and so on. The main idea is to work with people from the same community, so the security is higher and it is cheaper. This way we have more impact on the communities. One person per 10 neighbourhoods, there have been 4 people working on this model since June. We are testing this model in Colombia, and then we might do that in Chile also.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

It is evident that the impact of economic wellbeing is still in the early stages. However, it appears that as Algramo grows and further immerses itself in the community economic benefits will occur, and this is particularly true in terms of jobs. There could be potential for existing businesses to emerge in the form of micro-franchising. Currently the magnitude is low, but with the likelihood to be high with positive attributes for the community.

Capability Wellbeing for the Seller (Producer and Distributor)

Capability wellbeing is not as evident from the available data, but with potential more for Algramo than the producers. The producers could gain some skills and knowledge from working with Algramo. On the other hand, Algramo would still be at the stage of managing uncertainty and risk as they are the first of their kind in the market. The following quotes illustrate this:

Like I said before everyone is part of the team. All of them are involved with what we are trying to achieve. I think producers can learn some skills from us, but in the latter stages where maybe we work with some of them on new products that the poor will need.

Algramo has risks, there is no model to copy and we deal with uncertainty all the time. Talking to shopkeepers, consumers and working out ways to improve distribution always happens. We are happy with what we have achieved and we are learning new things all the time and working out solutions. For example, we are thinking in using bags as well as reusable containers to sell our products at the grocery stores. Two weeks ago, we met with a plastic provider and recently, he bought an amount of something called "Green plastic" which is a plastic made from sugar cane. The material is not biodegradable, but has a positive carbon footprint. The use of that plastic allows us to get the certification called "I'm green", which means that at least 51% of the material used in the production of it is green plastic. Having the certification and having more than 50% of the product made with green plastic is good, but we want more than that. We want 100% green plastic (despite their cost), because it is the right way to do the things.

It is clear that for the producers that provide the essential food products, the capability wellbeing in terms of magnitude and likelihood are low, while the attributes are neither positive nor negative unless 'co-creation' takes place. However, one could argue that by selling more to Algramo, producers can grow, diversify, and even invest in new technologies. However, there is no clear evidence of this. For Algramo, the magnitude and likelihood are very high and the attributes are positive as they are an innovative company with no existing model to replicate.

Capability Wellbeing for the Buyer (Consumers and Agents)

Capability wellbeing for the shopkeepers and consumers are similar here. Both sets of stakeholders can gain confidence, pride and dignity in what they sell while relieving stress. They can both save more money that can be put toward healthcare and education of their children, while being able to spend more time with their families. However, shopkeepers can learn new skills, such as marketing and sales by working with Algramo. The following quotes illustrate some of these points.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Shopkeepers can improve the store layout and learn from us and with us. They can learn how to promote their products and sell to their customers. This is not just for our products, but for all the products they sell in their stores. Since our products cost less, over time they should have less stress we hope.

Many of them (shopkeepers) develop more awareness about their own role as a shopkeeper. They become more aware of the importance of selling products, and some financial skills by working with us.

Shopkeepers and customers should feel happier and live with more dignity. With the money saved there should be extra funds to put toward their families' healthcare or children' education and for entertainment purposes. Shopkeepers have money assured and if they know they will have money by the end of the month they are better. Both can sleep better, they don't have to take on many jobs and have more certainty about their financial situation, so it can help their personal and family relationship.

The magnitude and likelihood for both sets of buyers are high and the attributes are very positive for both. The case of Algramo shows that capability wellbeing is an important aspect when studying wellbeing. Algramo can improve capability wellbeing of shopkeepers and end users that goes beyond food poverty reduction.

Capability Wellbeing for the Community

There is no strong evidence that capability wellbeing for the community occurs just yet. Although it can be argued that as economic wellbeing for the community enhances, there can be a stronger impact on capability wellbeing for the community. There is no strong evidence to support better infrastructure on a notable scale and aspirations for the future are hard at this stage to evaluate. One could argue that as Algramo grows, there might be stronger evidence of this. Shopkeepers may be able to have aspirations about growing their stores. With the money saved by end users, these consumers may be able to think about other productive ways to spend their money. In time, Algramo may be able to diversity and offer training courses to shopkeepers on how to keep track of their stock and train consumers about how to spend their finances more wisely with money saved. However, from our research this aspect appears to be in the infant stage.

Relationship Wellbeing for the Seller (Producer and Distributor)

This is an important wellbeing aspect for Algramo, who see themselves as a networking organisation. Algramo aims to build long lasting relationships with all those involved. It is clear that they have built a good reputation, are well respected and are trustworthy as they are transparent. Algramo buys products from producers that they trust and can work with long term which shows qualities of relationship wellbeing. The following quotes illustrate this:

We are doing good for those around us, business is growing and customers are happy. Many of them are excited about the machines we will install. We are selling something that is already known in a new way. Many see it working and they get excited about participating. This is why we have around 170

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

shopkeepers in 20 neighborhoods. This would not be the case if the shopkeepers and customers did not trust us. They see what we are doing and we are always talking to them to build a strong relationship, which gives us more information for us to improve…

We explain to the shopkeepers and talk to customers about what it is that we do. It is important to explain and show them everything. They can see the results and there is a trust. They know what Algramo stands for and so we have a good reputation and I would say that through trust we have earned their respect. No one else is doing what we do and it is benefiting them.

Algramo has worked hard to become an insider, build relationships, earn the trust of shopkeepers and end users. They have built a solid reputation and they are transparent about what they do. As Algramo grows, the organisation will develop more relationships with more partners and this should be fairly easy due to their very good reputation. The magnitude and Likelihood are very high with very positive attributes.

Relationship Wellbeing for the Buyer (Consumers and Agents)

Relationship wellbeing for the buyers is related and connected to the relationship of the sellers, in this case Algramo itself. Algramo's business model allows shopkeepers to depend on them and gain access to essential products at lower prices. Algramo delivers the products directly to the shopkeepers. The end user relies and is dependent on these stores to access essential food products more conveniently. Algramo obtains information from shopkeeper about end users and Algramo talks to end users directly. The following quotes illustrate some of these points:

Since we have the reputation we have, the shopkeepers and end users rely on us and we cannot let them down. As I said before, we are always looking for feedback, so we talk all the time to shopkeepers and customers.

Algramo is where the customers need us to be. The relationship with the shopkeeper is critical as they are between us and the customer. They learn the most about the customer, so the more we talk with them and make them feel part of the company, the more they will share with us.

The authors would argue that the magnitude and likelihood for relationship wellbeing with is at a high level with positive attributes. However, from the buyers' perspective (shopkeepers and end users) a negative attribute might be that the buyers can become too dependent on Algramo. There are no other companies offering something similar, so if anything happens to Algramo then the buyers may suffer from being too dependent on this relationship.

Relationship Wellbeing for the Community

In terms of relationship wellbeing for the community, the authors find no evidence of this so far as Algramo is still in the early stages, and the benefits found in one neighbourhood community have not spilt over to another or connected them yet. However, as Algramo aims to be a social responsible enterprise

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

by reducing their carbon footprint, the company is taking care of the environment in the neighbourhoods they serve and maybe in the long term can educate the poor about impacts on the environment. However, one thing that is evident through relationship building is the aim to bring a better understanding of each stakeholder to the other. This last point is illustrated by the following quotes:

Algramo is a good idea, but is our people who are the real rock stars. When I say 'Our people' I'm talking about our employees, our shopkeepers, our customers. I think Algramo is not for everyone, it requires something more than being able to buy food product. It requires sharing a philosophy. Maybe it is not for everyone, but I do feel that we are changing little by little how people think and act and more people will come together and be more involved.

Stronger relationships between us and shopkeepers, and shopkeepers with consumers are happening, but it is still in the early stages. Algramo interconnects all of these important players together, and provides a better understanding of each ones needs and this should benefit the community as a whole.

The authors believe that the magnitude for relationship wellbeing at the community level is low at this stage. However, the likelihood for this to happen is very high and with positive attributes that go well beyond offering essential food products at affordable prices.

Algramo Findings and the BoP Literature

Having assessed Algramo according to the three aspects of wellbeing and in relation to the three stakeholders, it is clear that the framework by London (2009; 2016) is very relevant for understanding BoP ventures. However, one needs to study Algramo as the company progresses over time to see if there are stronger impacts for the wellbeing of the community.

It is clear that Algramo does confirm findings in the BoP literature, particularly the importance of mindset and networks. Algramo does not follow traditional models, and instead caters for the specific needs of the BoP population. This is in line with Prahalad (2010), who argues for reinventing marketing strategies when addressing the BoP. The findings in this study also confirm the 4As by Anderson and Billou (2007).

Finally, in terms of networks, Algramo views all stakeholders as part of a team and has established networks, relationships and partnerships. This is essential for BoP ventures to succeed and advocated by a number of scholars (London & Hart, 2004; Kayser & Budinich, 2015). The authors now turn to future research directions.

FUTURE RESEARCH DIRECTIONS

BoP research was introduced in 2002 by Prahalad and Hart (2002) and more extensive research only began after 2005. The BoP field is still young and requires much more work to move the agenda forward. We recommend more in depth case studies: either single or multiple, along with more survey research. The authors advocate that future case studies or even surveys need to be conducted from each stakeholder's perspective. This will allow academics and practitioners to understand the impact of BoP

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

ventures more holistically. Although this chapter covered Algramo's activities in Barranquilla, Colombia to date, tracking Algramo over time is needed to assess progress and barriers. The authors would have liked to conduct more research on Algramo and study their activities to date in Chile, but resources and time were key constraints.

As BoP research, has moved away from viewing the BoP population as merely consumers, the authors advocate that wellbeing becomes an important topic to consider. The authors recommend more studies delve into understanding the wellbeing of sellers, buyers, and the community as advocated by Ted London and the William Davidson Institute. BoP ventures tackling similar issues will need to be compared so that scholars and practitioners can learn more about effective and innovative business models that work. Successful business models that have a track record need to be replicated in other contexts to eradicate the struggles faced by the BoP population on a larger scale.

It is important to research entrepreneurial and innovative ventures as this will provide further insights for the entrepreneurship field. There is a need to focus on researching formal entrepreneurial ventures that are interacting and serving the BoP population in the informal economy, such as Algramo. In addition to this, scholars should study informal entrepreneurial ventures and how they operate in the informal economy to learn more about how these ventures operate in unique settings.

Finally, there are opportunities to study the internationalisation of BoP ventures. The intersection of two fields related to the context of emerging markets: internationalisation and BoP research. This was advocated by Paviera and Khalik (2015), and the authors have only identified one study that has addressed this (see Ghauri et al., 2014).

CONCLUSION

This chapter reviewed literature related to the informal economy and the BoP, before highlighting the importance of social business and wellbeing. The chapter focused on the company Algramo in Colombia as a case study of a BoP venture that aims to alleviate food poverty. It is clear from the research undertaken that Algramo does more than simply offer low cost products in large quantities to the BoP population. Algramo builds networks, relationships and forms partnerships. It is clear that positive wellbeing unfolds for the different stakeholders involved, although this is hard to assess quantitatively and from the perspectives of each stakeholder involved.

More research is needed on Algramo as they further expand in Colombia, and especially if they internationalise further to other markets, such as Mexico and Peru. The chapter does support most of Ted London's perspective on wellbeing. It further supports the latest BoP view of co-creation and partnerships. BoP research is about 'a fortune with the BoP'. The authors hope that this chapter will encourage other scholars to engage with BoP research and carry out further case studies or even survey research, especially by investigating the impact of wellbeing on all stakeholders. Contributions are most likely to come entrepreneurship and BoP scholars that focus on wellbeing. Innovative and entrepreneurial companies like Algramo deserve attention as they are tackling neglected issues and problems in our world. The authors would like to end this chapter with a touching quote by one of Algramo's representatives:

We do what we do because it is the right way to do things. You could say that we prefer the harder right than the easier wrong, and that is what makes us who we are.

Chapter 88
Translation Learning Environments for the Future: Online Collaborative Practices

Maria del Mar Sanchez Ramos
University of Alcala, Spain

ABSTRACT

This chapter describes how recent years have seen a growing interest in so-called collaborative translation. This is the subject of an open debate in translation studies, where matters such as translator training in social translation or the motivation of volunteer translators are all widely discussed. This chapter recounts a teaching experience performed at a key stage of a localization course. It describes the social constructivist methodology used and the findings obtained from a qualitative analysis to bring collaborative translation into the classroom and to introduce students into new translation models and practices.

INTRODUCTION

In 1996, Dr Minako O'Hagan published her book *The Coming Industry of Teletranslation*. Under this suggestive title, she painted a new horizon of communication for translators and language service providers, underpinned by new telecommunications systems. Changes in society and the arrival of new technologies were bringing in a new panorama for the world of translation. The coming of the Internet and the subsequent appearance of social networks represented a new starting point, not only in communications between clients and providers of translation services, but also in exchanges of information *per se*. In the words of Perrino (2009):

Teletranslation will exploit the global networking capabilities of telecommunications technology to bring language service providers (using both human and computer resources) and their customers together. In doing so, it will help overcome many otherwise insolvable language problems. (pp. 61-62)

Almost a decade later, O'Hagan (2013) delved into the role even newer technologies play in translation studies. This author (2013, p. 27) refers to a "technological turn" at the heart of translation studies (Cronin, 2013; Fernández Costales, 2012), where technology as part of the world of work has led to undeniable changes in translators' daily lives and, therefore, likewise in the teaching of translation (Bowker, 2015). These changes, which have affected both the means of communication and the translation process, have led to new translation models and practices (Jiménez Crespo, 2015, p. 33).

The Internet has made it possible for the number of texts being translated to expand into new realms. Due to this undeniable expansion, new translation scenarios come into play, for example collaborative translation or website localization. As highlighted by Fernández Costales (2012), crowdsourcing and online collaborative translation are important features in the current translation landscape. The same author is also quite categorical when he states that these new practices are in no way passing trends, asserting that "we have to consider the possibility that community translation is here to stay" (p. 22). This new technological panorama gives rise not only to new translation tools, new text genres and new translation models, but also to a change in the actual players involved in the translation process. With the evolution from Web 1.0 to Web 2.0 – the latter term coined by O'Reilly (2005) – the user, previously passive, became an active user capable of controlling and sharing information with other users in a way that would have been unimaginable not so many years before (Cronin, 2010). In the same vein, these users work voluntarily most of the time without pay and for nonprofit organizations.

The growing influence of technology has also led to changes in the way we access information. Translation has made us a multilingual society where almost everything can be translated, not least digital products in all shapes and forms: software, websites, video games and so forth. The origins of the localization industry – an activity defined by Schäler as "the linguistic and cultural adaptation of digital content to the requirements and locale of a foreign market, and the provision of services and technologies for the management of multilingualism across the digital global information flow" (Schäler, 2011, p. 157) – trace back to the United States in the 1980s. Due to the wide success of their products in said country, companies like Oracle and Microsoft set their sights on foreign markets such as Japan, France, Italy, Germany and Spain. And the localization industry is now unquestionably one of the most promising fields for translation graduates. Academic institutions are aware of the localization demand the industry market is shaping. As a result, many institutions offer learning programs focusing on the processes, tools and development of strategies involved in localization (Folaron, 2006). Nevertheless, full support to include localization into the translation curriculum is an extremely challenging task due to the specific constraints it poses, such as the heterogeneous profile of students or the specialization that trainers should have.

Collaborative translation and crowdsourcing, other activities emerging on the scene even more recently, are playing an increasingly important role in the world of translation and in the localization industry. Translators from around the globe are gathered into communities who – for a variety of motives – help to generate multilingual content, which ranges from literature to software. This form of voluntary translation is particularly important for humanitarian work and emergency situations, with thousands of users enabling certain people, for example indigenous communities, to access vital information[1]. For organizations such as Permondo (Spain), The Rosetta Foundation (Ireland) and Kiva and the Mozilla Foundation (USA), granting volunteers a key role in their translation and localization processes is an established objective. These are examples of institutions working to "relieve poverty, support healthcare, develop education and promote justice through access to information and knowledge across the languages of the world" (The Rosetta Foundation). Collaborative translation and crowdsourcing are therefore areas that

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

demand further exploration; in terms of localization, these collaborative practices require knowledge of the collaborative work platforms (e.g. Launchpad), online translation management systems (Pootle, POEditor) and specific formats (e.g. po – portable object) used for working on open-source software localization processes and projects.

This chapter seeks to describe a study carried out in the translation classroom aimed at contributing to the debate on the existing relationship between translation and technology and providing a teaching framework to accommodate new emerging models in translation such as collaborative translation. It is divided in four parts. Following on from the introduction, the second part looks at the general panorama for translation resulting from new technologies and the arrival of the Internet. Under this section, localization is examined as a core activity in our field and the current era, one that has brought about important changes in our conceptions of translation processes and products. Collaborative practices in translation are also described, together with their main implications for the translation environment. The third part examines how collaborative practices in translation provide a learning environment to implement a social constructivist approach in translator training. In light of the benefits collaborative practices in translation can bring to translation students' development and the undeniable presence they have as a 21st century translation practice, this section gives a detailed description of the study carried out, which applied a social constructivist teaching methodology to a group of students enrolled in the 4th year optional Localization course as part of the Bachelor's Degree in Modern Languages and Translation Studies (University of Alcalá, Spain) during the 2015/2016 academic year. This section ends with the main results from the experience, including the perceptions of students and the course instructor. This is aimed chiefly at providing the field of translation studies with insights to fuel the existing debate on new realities in professional translation. The last section highlights the importance of adapting collaborative translation projects as part of translator training.

DIGITAL TRANSLATION PRACTICES: BEGINNING, PROGRESS AND FUTURE

The Internet has gained an inexorable presence in the current day and age. Its influence extends deep into most professional sectors and it is an indispensable aspect of everyday operations. The field of translation is no different, and the digital revolution has brought new challenges and possibilities. In 1980, when Tim Berners-Lee created a small piece of software called 'ENQUIRE', few could have imagined it would be the seed for something as great as the World Wide Web (Ryan, 2010, p. 105). Not only this, the architect of the Internet also created Hypertext Markup Language (HTML), based on Standard Generalized Markup Language (SGML), and began the development of the software for a browser and an editor. And this – while abridging the story to the extreme – was how the Internet came into being, a net that catches us on a daily basis and lets people explore beyond all imagined limits. The Internet has become the greatest ever repository of information, exceptional for its speed and accessibility, facilitating the tasks of communication, documentation and production. It removes physical boundaries and makes information accessible from almost any location.

According to O'Hagan (2013), the Internet and other new technologies have impacted on the entire translation ecosystem: they affect both the micro environment (i.e. the translation tools and platforms) and the macro environment of translation processes, with an expansion of text genres and translation practices:

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Technologies have significantly affected both the translators' microcosm, shaping their immediate local work environment, and also their macrocosm of global operating contexts in which new technologies are creating new content or products which require translation, as well as affording new ways of doing translation as illustrated by the current trend of crowdsourcing. (Howe 2006, 2008) (O'Hagan, 2013, p. 503)

Regarding the micro environment, the main impact from technology is seen in the development of new tools and documentary resources for translators. In addition to computer-assisted translation (CAT) tools – the subject of many descriptions elsewhere – translators have at their disposal a great array of computerized applications to aid their work, such as term bases, glossaries (monolingual, bilingual or multilingual), shared translation memories, various types of corpora (monolingual, parallel, comparable, etc.), electronic dictionaries, machine translation (MT) tools, and the list goes on. As regards the macro environment, and as a consequence of globalization, technology has enabled information to be accessed in a wider range of formats. Translation has moved on from concentrating on linguistic mediation to become a multimodal discipline (Fernández Costales, 2012) – an assertion that appears well-founded. Translation has widened its scope, focusing not only on the relationships between languages, but also on the adaptation of non-textual, semiotic and cultural elements. This is an idea close to that mentioned by O'Hagan (2013, p. 506) in reference to the impact of technology on the translator's macro environment and the development of new translation models and processes. A good example can be seen in localization, an activity examined more closely in the pages that follow. Conceived as the linguistic and cultural adaptation of a digital product to the demands of a certain market or 'locale' (Schäler, 2011), it is a discipline that clearly exemplifies the multimodal characteristic Fernández Costales (2012) attributes to translation. The term localization comes from the industry, and some debate has arisen regarding its relation to translation and, more specifically, regarding its inclusion within translation studies (Jiménez Crespo, 2013). Leaving such arguments to one side, what remains clear is that localization has opened the door to new kinds of formats (software, websites, video games or mobile apps), requiring specific tools rather than a mere text processor or CAT tool.

Although translation activities are technology-oriented nowadays, it can be stated that technology has been underrepresented within theories of translation (Munday, 2009; Williams, 2013). Scholars have tried to introduce the topic (Alonso & Calvo, 2015; Cronin, 2003; O'Hagan, 2013; Quah, 2006), concluding that technology plays an indispensable role in translation today and that it is much more than a supporting tool for translation practice. The most recent attempt is exemplified by O'Hagan (2016), who draws on the framework developed by critical theory of technology (CTT) to uncover the relationship between technology and translation. After reviewing CTT's theoretical foundations, whose roots can be found in the critical social theory of the Frankfurt School, O'Hagan considers that CTT provides "an analytical framework to understanding technology by combining philosophical (substantive) and sociological (constructivist) viewpoints" (2016, p. 934). In this sense, technology is a key factor transforming social and professional practices.

The next section introduces localization and collaborative practices in translation as new forms of the relationship between translation and technology.

Translating in the Digital Era

The growth of the World Wide Web together with societal, political and economic changes have significantly increased the need for localized content (Bowker, 2015). The emergence of localization – an

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

industry-oriented discipline – dates to the late 1970s, when leading US computer companies started producing for foreign markets. By the 1980s the localization industry had reached a stage of strong growth and wider recognition.

Closely related to the term 'locale', which represents a specific combination of language, region and character encoding (Esselink, 2000), localization is a core concept in our globalized era. A locale defines "all regional standards supported by a software product, such as date/time formats, sorting standards, currencies, and character sets" (Somers, 2003, p. 67). In order to distinguish locales, we name them by language-country pairs such as French-Canada, French-France, etc. (Cadieux & Esselink, 2004). Spanish and English language locales will be distinguished in a similar fashion (e.g. Spanish-Mexico, English-United States, English-Australia). The more locales there are in a given language, the more potential for the localization industry in that language.

Localization is closely related to GILT, an acronym which stands for Globalization, Internationalization, Localization and Translation. Since the rise of the Information Technology (IT) industry in the 1980s, the term GILT has been increasingly recurrent. Becerril (2013) mentions that professionals usually describe GILT as a series of industry processes that are interdependent and must function as a whole to create efficiencies. In the context of the marketing of digital products, none of the processes and strategies should be understood separately, and a variety of factors (linguistic, extralinguistic, cultural and technical) should be taken into account.

Within the localization context, translation can be defined as "the process of converting written or displayed text or spoken words to another language" (Esselink 2000, p. 4). More aspects need to be added to this definition, as translation processes are complex and involve various specific skills. A translator is an individual who has mastered linguistic, extralinguistic and cultural aspects of a given domain; translators do not merely engage in a "word-for-word 'global replacement' process", to use the same author's expression (Esselink, 2000). When it comes to conveying ideas and their meanings in localization, translation truly "requires that the full meaning of the source material be accurately rendered into the target language, with special attention paid to cultural nuance and style" (Esselink, 2000, p. 4). Translation in localization acquires certain additional characteristics, as it is typical for localization projects to involve numerous file formats. Technical knowledge is needed to deal with such formats and specialized software. Furthermore, the objectives of translation projects and localization projects can vary. Tasks that translation projects entail – besides that of transferring content from one language to another – can include proofreading, page layout, editing, and terminology searches. In localization projects, however, there are more activities that come into play: multilingual project management, conversion of translated documents to other formats, engineering and testing of software and online help, or multilingual product support (Somers, 2003). Localization projects typically contain a large number of items, such as software, sample files, online help, online and printed documentation, collateral materials such as product boxes and disk labels, and multimedia demos. In most cases, translation starts before the source material is final, so in localization projects the source files are updated several times during the translation. (Somers, 2003). Another difference between translation projects and localization projects is the level of adaptation. In this regard, the basic premise is that all local characteristics of the target market need to be implemented in the final product. In addition to language and culture, it is necessary to implement every type of regional standard possible, for example date/time formats, address formats, default page sizes, custom calendars, currencies, character sets, etc. (Somers, 2003). Regarding the translation environment, translators normally use CAT tools in their translation projects. The localization industry

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

additionally implements tools for the extraction and management of terminology, and MT systems and software localization tools for user interface translations.

Localization

Many scholars and institutions have offered definitions for the term localization. The Localization Industry Standards Association (LISA), which was by far the most recognized and cited organization in this area, gave the following definition:

Localization involves taking a product and making it linguistically and culturally appropriate to the target locale (country/region and language) where it will be used and sold. (LISA, 2003, p.13)

The definition made by Esselink in 2000 was in some senses narrower: "Generally speaking, localization is the translation and adaptation of a software or web product, which includes the software application itself and all related product documentation" (Esselink 2000, p.1).

Four years later, in 2004, Anthony Pym wrote his book *The Moving Text: Localization, translation and distribution*, in which he does not talk about products, but "texts". In his theory "text" is the key concept; "translation" is not consigned to being just one step in the localization process, but instead occupies a more influential role. Pym (2004, p. 1) defines localization as follows: "Localization is the adaptation and translation of a text (like a software program) to suit a particular reception situation". Dunne (2006, p. 115) describes localization as "[t]he processes by which digital content and products developed in one locale (defined in terms of geographical area, language and culture) are adapted for sale and use in another locale". Unlike the first edition (published in 1998) of the *Routledge Encyclopedia of Translation Studies*, the second edition by Mona Baker and Gabriela Saldanha in 2011 did include an entry for "localization". It was written by Reinhard Schäler, main researcher at the Localisation Research Centre at the University of Limerick, who defines localization as "the linguistic and cultural adaptation of digital content to the requirements and locale of a foreign market, and the provision of services and technologies for the management of multilingualism across the digital global information flow" (Schäler, 2011, p. 157). Dunne's "digital content" is also present in this definition. Indeed, in the same entry Schäler (2011, p. 157) goes on to explain that:

What makes localization, as we refer to it today, different from previous, similar activities, [is] namely that it deals with digital material. To be adapted or localized, digital material requires tools and technologies, skills, processes and standards that are different from those required for the adaptation of traditional material such as paper-based print or celluloid…

In other words, the emphasis is on the medium in which a text is conveyed.

From a practical perspective, localization projects involve tasks such as translation of software, translation and desktop publishing (DTP) of help and documentation, and linguistic and functional testing of software and help. In other words, the localization industry deals with very specific tasks, which ideally should be carried out by trained professionals. To sum up, the main purpose of localization is to make the final software product appear natural in a specific locale. Localization is linked to translation, but it goes further, since it also considers the technical aspects of the target locale. It is outside our scope of research to provide a detailed description of the different types of localization. However, it should

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

be highlighted that the ever-widening range of digital products such as software and video games have expanded the localization market significantly. What is worth noting here is the new challenges the different types of localization (web localization, software localization, or video game localization) entail in terms of processes, tools and translator training (Folaron, 2006).

Internationalization

Internationalization is essential for the creation of functional products such as web sites or computer games. Esselink (2000) defines the process as a way in which the software is designed during its development. Such design must "allow for translation into other languages without the need for re-design or re-compilation" (p. 1). As part of this process, the text and the source code are separated, to prevent translators from making inadvertent changes to the program's code.

Corte (2002) explains that internationalization consists of the identification of all local information included on the website (or product). Such information depends very much on the language and the culture of the country in which the product is originally designed. Elements such as dates, numbers, currencies, etc. should be saved separately to allow for their adaptation to other languages and locales.

Becerril (2013) lists some of the benefits of internationalization, such as reduced time and costs, presentation of a single source code for all applications, simpler maintenance, improved quality and code architecture, and simultaneous launch (sim-ship) of the product in a number of countries. In light of this, the importance of internationalization, otherwise known as enablement or localization-enablement, is clear.

Globalization

In the GILT industry, the term globalization is used to integrate localization and internationalization as one process, as illustrated in the diagram shown in Figure 1, showing the interrelation and interdependence of the two processes within the GILT industry.

The term globalization is used in many domains. Within the localization industry context, globalization refers to "the business issues associated with taking a product global. In the globalization of high-tech products this involves integrating localization throughout a company, after proper internationalization and product design, as well as marketing, sales, and support in the world markets" (Esselink, 2000, p. 4).

Significantly, globalization is never "all-encompassing", that is to say, it is impossible to target all countries or all languages. Typical globalization projects seldom target more than six languages at a time out of around 6,000 languages used in the world today (Cadieux & Esselink, 2004).

Regarding the globalization of websites which have already been designed in a way that allows them to be used in different countries without the need for major changes, only minimal alterations are required. As such, the task of globalization is more related to sales and marketing areas than it is to the technical area.

Collaborative Practices in Translation: Translation Crowdsourcing and Online Collaborative Translation

Due in great part to the multicultural and multilingual society we live in, the translation industry continues to grow. The rapidly increasing use of MT and collaborative translation environments are proof of the current demand for translations; project management platforms that incorporate collaborative translation

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 1. Globalization chart (LISA, 2011)

environments (Wordbee, POEditor, SDL Cloud Translation Solutions) are good examples of this (Drugan, 2013, p. 101). Recent explosions of technologies have facilitated not only access to information, but also voluntary collaborations on a variety of tasks. One need not look far to see that voluntary collaboration in the world of professional translation has always existed in one form or another (O'Brien, 2011), in translator associations, mailing lists, email exchanges, forums, and so forth. As noted by Gaspari (2015), "Usenet-based newsgroups were early online communities organized in hierarchical categories around topics of interests to their members, and designed to share textual messages via the nascent Internet infrastructure" (p. 579). The evolution towards collaborative forms of work represents a role reversal in translation's social processes. As pointed out by Cronin (2010), "the consumer becomes an active producer or prosumer[2]. It is no longer a question of the translator, for example, projecting a target-oriented model of translation on to an audience but the audience producing their own self-representation as a target audience" (p. 4).

The phenomenon of voluntary collaborative practices in translation – without entering yet into discussions regarding the terminology – is a direct result of technological, social and cultural changes. The Web 2.0 scenario provides a considerable number of opportunities for Internet users to take part in different online activities, contributing to the idea of translation democratization and shaping technology (O' Hagan, 2016, p. 934). Consequently, this participatory landscape has also opened new directions in translation. We live in a connected world in a constant technological progress and, as mentioned above, this has had its effects on the fields of translation and localization. As indicated by Tawileeh (2010), collaborative translation is "an innovative approach that responds to the rapidly changing trends in content production and dissemination by transforming the translation process to become more open,

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

inclusive and collaborative." (p. 2), and companies such as Twitter, Facebook, Google and TED Open Translation Project make use of volunteer translators from all over the world (McDonough Dolmaya 2012; Ray and Kelly, 2011).

The origins of these voluntary collaborative practices can be found in the activity known as 'crowdsourcing', whose beginning can be traced back to the business market. The neologism 'crowdsourcing' is attributed to Jeff Howe, who introduced it in a magazine called *The Wired* in June 2006. The author defines the term as the activity performed by a company or institution which outsources a task to an undefined and large network of people in the form of an open call. Since Howe (2006), other authors have focused their research on crowdsourcing. The 'undefined and large network of people' is referred to as 'collective intelligence' by Brabham (2013, p. xix). This author defines crowdsourcing as "an online, distributed problem-solving and production model that leverages the collective intelligence of online communities to serve specific organizational goals". Crowdsourcing represents a practice firmly grounded in the participatory nature of the Web 2.0, and it has been used by business, organizations, institutions, or collectives to harness the intelligence of the crowd, being it a large group of amateurs, experts, volunteers, professional, fans, or citizens, to accomplish a given task for free (Jiménez-Crespo, 2017). This is a practice that tends to be used by a variety of companies and institutions trying to find ways to lower costs. Its legal and ethical principles are not yet clearly defined though. Estellés Arolas and González Ladrón de Guevara (2012), after reviewing different approaches and definitions on crowdsourcing, provide the following definition, which includes the three key concepts of online activity, voluntary participation, benefits for the initiator and the participants:

A type of participative online activity in which an individual, an institution, a non-profit organization, or company proposes to a group of individuals of varying knowledge, heterogeneity, and number, via a flexible open call, the voluntary undertaking of a task. The undertaking of the task, of variable complexity and modularity, and in which the crowd should participate bringing their work, money, knowledge, and/or experience, always entails mutual benefit. The user will receive the satisfaction of a given type of need, be it economic, social recognition, self-esteem, or the development of individual skills, while the crowdsourcer will obtain and utilize to their advantage what the user has brought to the venture, whose form will depend on the type of activity undertaken. (Estellés Arolas and González Ladrón de Guevara, 2012, p. 197)

Estellés Arolas et al. (2015) gather the main achievements of the use of 'collective intelligence' and confirm the consolidation of a new area of research focused on studies analyzing the applications of crowdsourcing[3].

When looking at collaborative practices in translation, one must inevitably also discuss their terminology. Providing a clear definition for crowdsourcing is a task made harder and more uncertain by its relative newness and the fact that it is constantly evolving (Jiménez Crespo, 2017). O'Hagan (2011), meanwhile, asserts that doubts regarding the concept arise from its changeable terminology. 'Social translation', (Tawileeh, 2010, p. 2), 'wiki translation' (Cronin, 2013), 'volunteer translation' or 'amateur translation' (Pym, 2011; O'Brien & Schäler, 2010), and 'CT3' (community, crowdsourced and collaborative translation) (DePalma & Kelly, 2008) are some of the terms used to refer to various forms of this activity.

In terms of definitions, García refines Howe's (2006) original definition, describing the concept as "[r]oughly meaning the delegation to (unpaid) volunteers of tasks previously reserved for profession-

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

als" (García 2010, p. 1). However, other definitions add more characteristics to the concept. O'Hagan (2011) defines crowdsourcing as the result of volunteer translators coming together in some form of collaboration as a group of Internet users or an online community. Declerq meanwhile, refers to this new activity as "the outsourcing of a task (or several tasks at the same time) to an undefined, generally large, group of people or community, mutually connected through an e-medium" (2014, p. 46). In all these definitions, terms such as collaboration, Internet and community are used to narrow and delimit the scope of this new translation model. The definition provided by Jiménez Crespo (2017) appears as a good solution to the problem of identifying the crowdsourcing concept: "Collaborative translation processes performed through dedicated web platforms that are initiated by companies or organizations and in which participants collaborate with motivations other than those strictly monetary." In contrast, the term 'online collaborative translation' is defined by the same author as "collaborative translation processes in the web initiated by self-organized online communities in which participants collaborate with motivations other than monetary" (Jiménez Crespo, 2017, p 76), with activities such as subtitling, open source localization or fansubbing.

Taking into consideration the definitions given in the various works mentioned above, the fundamental differences between translation crowdsourcing and online collaborative translation can be seen as rooted in their starting points. In the case of crowdsourcing, it is a company or institution that initiates the translation process, with the objective of reducing production costs (e.g. Facebook, Twitter, and LinkedIn). In contrast, the starting point for online collaborative translations is the volunteers who, motivated by a range of factors, unite towards a primary objective of enabling other communities of users to access content in their own language. In the words of Fernández Costales (2012), "users are interacting or collaborating in order to disseminate a message into other cultures" (p. 8). In this regard, the relationship established in crowdsourcing is of a vertical and hierarchical nature, whereas the norm for collaborative translations is a horizontal relationship, with processes established between equal peers. Online collaborative translation is similar in many ways to activities such as 'fansubbing' (Díaz-Cintas & Muñoz Sánchez, 2006; O'Hagan & Mangiron, 2013), its equivalent for comics, 'scanlations' (Ferrer Simó, 2005), and the collaborative work performed on certain websites such as Wikipedia (McDonough Dolmaya, 2012).

TEACHING METHODOLOGY

This section is focused on social constructivism as the teaching methodology used in the study and the description of the teaching experience carried out. This ties in closely with calls for greater attention to discussions over teaching that focuses on the inclusion of new translation models (Fernández Costales, 2012) and the use of technology (Rico, 2017) in translation classrooms.

As in institutions, organizations and online communities, the popularity of translation as a social activity has also grown within the discipline of translation studies, and various research efforts have been made (Cronin, 2010; Desjardins, 2011; Fernández Costales, 2012; Jiménez Crespo, 2015, 2017; O'Hagan, 2011; Perrino, 2009) to give more visibility to social practices in translation. They reflect the progress made in our field by, for instance, focusing attention on the description of the implications of social translation within different translator training programmes (Desjardins, 2011; McDonough Dolmaya, 2012; Sánchez Ramos, 2015). Other works, such as those by Baker (2009) and Morado Vázquez et al. (2011), debate the wider role of volunteers in translation; and others focus on more specific matters, such

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

as the factors that motivate a group of volunteers to get involved in this type of translation (Fernández Costales, 2013; O'Brien & Schäler, 2010). Désilets (2007) focuses on the figure of the translator and the main challenges presented by online collaborative translation. Desjardins (2011) offers a descriptive work about a teaching strategy used in a range of courses and advocates the integration of social media – specifically Facebook – as part of translator training. She concludes that the inclusion of this kind of technology encourages teamwork and collaboration among students, as well as the creation of a "community" within the learning environment. A study by Gough (2011) looks at the attitudes of translation professionals towards the new collaborative environments. And focusing on translator training and social media, Olvera Lobo and Gutiérrez Artacho's (2014) article explores the use of the 'Ning' platform to create a customized social network for the teaching of legal, economic and commercial translation (English into Spanish). Several authors have also approached the issues of ethics and quality. Drugan (2011), for instance, explores the context of the professional and non-professional code of ethics. McDonough Dolmaya can also be taken as an example. Her article entitled 'The ethics of crowdsourcing' tries to answer questions such "how participants are remunerated, how the perception of translation is affected, and how minority languages are impacted" (2011, p. 97).

Collaborative translation is an innovative activity that has arisen in response to new trends and needs in the production and dissemination of information, making the translation process one that is more open and cooperative. The introduction of these new models into translation classrooms seems closely aligned with guidelines from the European Higher Education Area (EHEA), where the objectives include the achieving of competences, these being understood as sets of skills, knowledge and attitudes, all of which are very much oriented towards students' learning processes. When it comes to university translation studies, one of the primary objectives is to prepare graduates to enter the professional market, where they are to perform their work effectively and with an optimal level of quality. Professional translation – being a cognitive, social and communicative process – requires the development of a range of skills and knowledge if one is to pursue the occupation with any success (Schäffner, 2000). This set of skills, generally known within translation studies as 'translation competence', has been the object of various studies and has been given a range of different definitions. However, there is some consensus on the definition of this competence as a macro-competence, encompassing many more competences and sub-competences (Kelly, 2002).

In terms of training, the social constructivist theories ushered in by Kiraly (2000, 2016) argue in favor of project-based real translation work, such as tasks performed under situational approaches. Kiraly's (2000) approach represents one of the most influential theories in translation teaching. His social constructivist theory promotes "teaching methods that foster responsibility, independence, and the ability to see alternatives" (Kiraly 2000, p. 33). Translation teaching reaches its most dynamic pitch under this theory, aiming towards the construction of knowledge, a shift from knowledge transfer to knowledge construction, from teacher-oriented approaches to methodologies focused on the learner. Social constructivism attaches much importance to collaborative work, active learning, and authentic tasks and projects. A clear element of so-called situational learning (Vienne, 1994) can be seen in Kiraly's work (2000). The learning environments endorsed by social constructivist theories consist of collaborative contexts in which students can work on situations that resemble the professional reality. This fosters interaction with technologies and fulfillment of the roles involved in professional translation, such as project managers, terminologists, reviewers, etc. It seems logical to reason that the social constructivist approach is tightly connected to the philosophy of the digital and Web 2.0 era, in which users do not merely upload content and share information online, but they also interact and work together (Desjardins, 2011, p. 179).

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

If we transfer the social constructivist approach to the translation classroom, there are certain aspects that must be taken into account (Kiraly, 2000). Orchestrating a social constructivist classroom involves different factors. An appropriate physical environment will be necessary, together with an interaction framework for students who – in their role as translators – will be able to work and interact with other participants and employ technological and language resources. The right environment will facilitate the construction of learning based on interaction and responsibility shared between team members (Robinson, López Rodríguez, & Tercedor Sánchez, 2008, p. 100). Activities designed under this approach may be project-based or task-based. However, project-based learning (Thomas, Mergendoller and Michaelson, 1999; Moursund, 1999) appears to offer a suitable opportunity to create a scenario that resembles a professional work setting – in the case of this chapter, that of collaborative work.

CASE STUDY: PROCEDURE AND PARTICIPANTS

The study described here took place in the first half of 2015 and was conducted on the 4th year optional Localization course of the Bachelor's Degree in Modern Languages and Translation Studies at the University of Alcalá (Spain). The class was divided into different groups in order to collect qualitative data to examine the attitude of students towards different collaborative practices. The main objective was twofold: firstly, to offer a teaching framework that would accommodate new models such as collaborative translation, and secondly, to promote critical attitudes, encouraging students to reflect on the diverse range of aspects related to collaborative translation and initiate a debate on new translation models and their implications for the professional market. The course was worth 8 ECTS credits, requiring 25 hours' work per credit per student. A total of 20 students were enrolled on the course, who were organized in teams of five students each.

The students enrolled on this course had already completed courses such as translation and technology involving the use of CAT tools, MT or corpus management software, and other courses focusing on specialized translation (scientific and technical translation or legal and business translation) and project management. All of the participants worked from English or French into Spanish. The activity in question was carried out towards the end of the course, so the students had already developed a fair understanding of localization and some applicable technical knowledge. For example, they had worked on the localization of websites, software and video games, as well as social translation and open source software (introduction to the gettex system and file types .pot, .po and .mo).

The data were collected through two different processes in which the activity was carried out: a) two sessions of two hours each, where the four groups worked on their different collaborative translation projects; b) a one-hour debate session, where the different groups discussed the activities and any implications for the world of professional translation. Before the activity, students attended a theoretical lecture where they were introduced to the main concepts related to crowdsourcing (definitions, typology, organizations, actors involved, etc.) and collaborative practices in translation. In both data collection processes, the course instructor was what Massey & Brändli (2016, p.184) called "a minimally invasive facilitator", answering questions and clarifying doubts during the two sessions. Assuming this role, and using note-taking as the main instrument for gathering data, the teacher was the main data collector, as solving problems and answering queries revealed students' attitude to teamwork and to the activity. After the two sessions focused on the activity, the debate session was devoted to discussing and reflecting upon

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

the activity performance and the topic of collaborative practices in translation. The main idea underlying this type of data collection instrument was to set the classroom as a discussion and debate-focused learning environment. Both the group work and the final debate were especially useful for discussing the controversial issue of collaborative practices in translation and the role the translator plays. In terms of data collection, the main instruments were the different notes taken by the facilitator (teacher) during the three sessions and the concluding debate.

Before performing the activity, the students received instructions on how to use the collaborative platforms and on the translation tasks they were to perform. Following Jiménez-Crespo's classifications (2017), it was decided to provide two different environments of collaborative translation: crowdsourcing translation and online collaborative translation. The activity proposed for the course consisted of getting involved in a community of translators and participating in one of its projects, thereby finding out about the workflows and processes of two online collaborative platforms (Trommons[4] and Pootle[5]). The former is an example of a collaborative platform developed by The Rosetta Foundation (De Wille, 2014), while the latter is an open source platform mainly used to translate open source software. In this sense, collaborative tasks using Trommons are an example of crowdsourcing translation as there is a massive open call initiated by a non-profit organization, and the collaborative task using Pootle is an example of online collaborative translation as the massive call is triggered by a community of volunteers.

Due to the teamwork structure of the activity, students were able to explore the different platforms in groups and to interact among each other. Group 1 and Group 2 would work with a crowdsourcing platform, and Group 3 and Group 4 would do the same by using a collaborative platform. Each group was encouraged to divide tasks, with one of the members being responsible for organizing, planning and assigning the tasks. It was up to them to exchange information or discuss problems with the group accomplishing the same task, that is, the one using the same platform.

Groups and tasks were distributed as shown in Table 1.

Groups 1 and 2 worked using the collaborative platform created by The Rosetta Foundation[6] (Figure 2).

Group 1 was given the task of participating in a translation project from French into Spanish, the description for which was shown in the interface. To start with, the students were given the word count (approximately 2,000 words), the deadline, the NGO it came from and a preview of the text (Figure 3). Before they began translating, the platform asked them to commit to providing the translation.

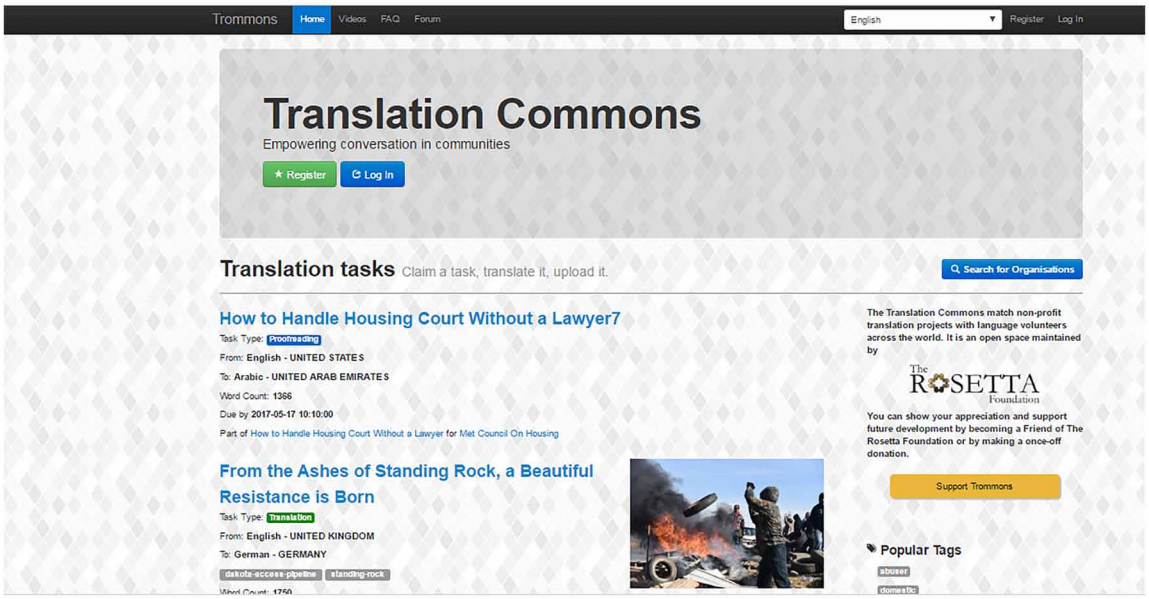
Group 2 was given the task of revising a translation from French into Spanish from a different project (around 2,000 words), and followed the same steps as Group 1. The students further decided to divide

Table 1. Tasks and groups' distribution

Activity on Collaborative Practices in Translation	Type of Platform Used	Duration	Task
Group 1 (Crowdsourcing translation)	Trommons	Two sessions (two hours each)	Translation from French into Spanish (around 2,000 words)
Group 2 (Crowdsourcing translation)	Trommons	Two sessions (two hours each)	Revising a translation from French into Spanish (around 2,000 words)
Group 3 (Collaborative translation)	Pootle	Two sessions (two hours each)	Translation from English into Spanish (around 2,000 words)
Group 4 (Collaborative translation)	Pootle	Two sessions (two hours each)	Revising a translation from French into Spanish (around 1,500 words)

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 2. Translation Trommons'



themselves to share the different tasks involved: translation, looking for parallel texts, looking for terminology, editing, proofreading, etc.

Group 3 was asked to work on a translation from English into Spanish as part of a larger project. Students had to create an account and look for the translation project assigned. They organized all the tasks they had to carry out. In this sense, one of the students worked as a project manager and distributed the different tasks. Once they were logged in, they had to work on the TuxPaint project, the translation of a bitmap graphics editor for young children. Students were encouraged to visit the webpage provided by the developer and use the editor before translating. Spanish is a very popular language in Pootle and almost all projects were nearly completed. Tuxpaint had a total of 16,157 words, and only half of the project needed to be translated. Students were asked to translate 2,000 words. Although the platform incorporates an interface very similar to a CAT tool (Figure 4), users can also work offline and download the files in .po or .xliff format to work on them using a suitable program and then upload their output. An example of the source code (.po file) is:

Group 4 was asked to revise a translation for the same project provided by users (around 1,500 words). Students worked online with the platform, which also provided some lexicographical information such as Wikipedia to help with the revision.

As it has been stated at the beginning of this section, one of the objectives specified when designing this activity was to spark a debate on collaborative practices in translation. In order to facilitate the organization of the activity and the final debate, some guidelines for the performance of the activity were given. For instance, when carrying out the activity during the two sessions (two hours each), students were encouraged to pay attention to the number of projects and languages on each platform, the platform's interface, the original file format and how easy it was to work with the platform. Once they had finished the activity, a one-hour session was devoted to group presentations followed by a debate to reflect on the different issues related to collaborative translation and the specificities of each platform. Each group had between 10-15 minutes to present the process and the product of the translation, the main advantages and disadvantages of the platform they had used, and any other comment they considered relevant.

The teacher took notes of all the comments and doubts students had during the activity (two sessions of two hours each), and the presentation and final debate of the one-hour session. The teacher, assuming the role of facilitator, intervened in the debate only to bring the discussion back to some specific points (e.g., in terms of file formats, which platform do you consider provide the most appropriate format to work with?) or to link comments between the participants.

CASE STUDY: FINDINGS

Our study was designed with two main objectives in mind, taking into account the new trends in translation technology: a) to offer a teaching framework that would accommodate new models such as collaborative practices in translation; b) to encourage students to reflect upon the wide range of issues related to collaborative translation and initiate a debate on new translation models and their implications for the professional market.

A descriptive analysis was carried out on the data collected: (a) notes and observation taken by the facilitator during the two-hour sessions and (b) notes and observation taken by the facilitator during the one-hour debate session. The general picture that emerged from the data analysis suggests that students were aware of the different advantages and disadvantages of collaborative practice in translation as well as some of the topics that arose in relation to it, such as ethics and quality of translation. Advantages highlighted by the students included the opportunity to access information in languages other than the typical target languages the market seeks to translate and localize. This social contribution made by collaborative translation was one of the issues the students highlighted most, in close connection with tasks relating to commitment and social responsibility within the community. Some of the students' comments made during the debate session can be taken as examples:

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Student 1: I think that previous knowledge of translation technology is essential if we want to work with Pootle. If I hadn't known what .po or .xliff were, I would have said 'no' to work on this collaborative project. I would have taken me time no know these files and the tools I need to work with them.
Student 2: What about those minority languages? I think collaborative translation is a kind of humanitarian activity. We need to know more about it.
Student 3: I really learnt with this activity a new way of helping people. I didn't know there were so many localization projects available to be translated into so many different languages.

Among the disadvantages, the debate confirmed aspects noted by other authors (Drugan, 2011; McDonough Dolmaya, 2011) in relation to ethical issues and the questionable quality of the translations. Some of the students' comments were:

Student 4: And what about translating for free? I believe it shouldn't be like that.
Student 5: Are the translations being reviewed by professionals? There is no information about that.

The final debate activity resulted in an extensive discussion that was a clear demonstration of why collaborative translation is such a hot topic. The students expounded a variety of points of view on the different platforms used in collaborative translation, ethics and social translation, or social translation and minority languages, and expressed wide-ranging opinions, with their development of critical thinking and reflections on new translation models evidently enhanced.

It was clear that carrying out this activity reflected positively on the teaching of the course, the methodology used and the fulfilment of objectives. From our own experience, the new translation models highlighted by authors such as Jiménez Crespo (2015), Gaspari (2015), Declerq (2014) and O'Hagan (2013) need to be included in translator training, although many aspects need to be considered beforehand. To start with, a significant problem that frequently appears is the position of the new translation models within the translation syllabus. The wide range of factors to consider includes students' preexisting technological knowledge, the time available, and indeed the experience of the teaching staff themselves (Bowker, 2015). Overall, in light of the outcomes explained in this section, such as the awareness that students developed towards the collaborative practices in translation, the teaching framework—the group work and the final debate—was suitable due to the fact that the students had previously acquired the required technological background (i.e. the students had already completed compulsory courses on translation and technology and were in the final year of the degree program). In the second place, the teaching methodology used, rooted in social constructivist principles, certainly allowed students to further develop skills related to teamwork, and to interactions between team members and the course instructor. The sessions in which the activity was performed put into practice knowledge gained in other sessions (i.e. management of different file formats such as .po). Lastly, the debate session allowed for a pooling of thoughts about the work done using the Trommons platform and the Pootle platform. It also saw the tabling of various matters, most notably the advantages, disadvantages and consequences of collaborative translation for the world of professional translation.

As other studies have highlighted (Gough, 2011), a certain degree of awareness is growing among translation students in our study for the new tools and processes in the translation technology era, such as online collaborative translation. However, a real engagement into the process is still in its infant stage. From the perspective of the course instructor, a considerable number of improvements were identified, both in the development of the activity over the sessions and in the final debate. For instance, although

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

students had passed subjects on translation technology, this activity and the discussion and debate session consolidated their technical knowledge about open tools and files. In the same line as the study carried out by Desjardins (2011), students shared a feeling of enjoyment and motivation while performing the activity. It was very positive for them to share their problems with the rest of the students and discuss their main points of view regarding collaborative translation. The activity was also an example of how social translation can be used as a training tool within the translation classroom to explore real voluntary translation contexts (Jiménez Crespo, 2017) through a social constructivist approach. There was undoubtedly an improvement in the interactions between students and the course instructor, increased motivation in teamwork tasks, and a positive attitude towards the group work activity.

CONCLUSION

Having started this chapter with the words of Ryan (2010), it is worth re-emphasizing that collaboration and connection are essentially inherent to the human condition, and translation is no exception. As an information exchange process, the act of translating is itself an example of linguistic collaboration. The aim of this study has been to call attention to the impact which new translation models are creating in the professional translation world, and to do so the focus has centered on crowdsourcing and collaborative localization and translation tasks. Framing teaching within a social constructivist approach, the chapter has sought to supplement existing works on translator training and collaborative translation. The study also cast some light on collaborative translation as a learning environment. and confirmed that the teaching method turned the classroom into an open space for collaborative work among participants, and made it possible to generate an exceptional learning atmosphere for exchanges of opinion and the development of a critical spirit towards new translation models.

From the standpoint of translation studies scholars who are in favor of integrating translation and technology in students' learning programs, it is essential not only to expose students to the latest advances in the professional translation world but also to work towards creating a syllabus that reflects these advances. Although issues such as translation quality in these new models or the fact that they often involve unpaid work may result in them being eschewed, it is undeniable that these are activities that have broken new ground and are in no way a passing trend. This work, while by no means conclusive, offers a starting point for future teaching research and a contribution to the existing debate on crowdsourcing and collaborative translation.

ENDNOTES

1. A clear recent example of this is the 'Mozilla Nativo' project (http://mozillanativo.org/). This is an initiative by which the Mozilla Foundation supports the translation of various resources (apps for iOS and Android, and instructions for its Firefox browser) into a number of indigenous Latin American languages. The aim is to support the universal human right to access information and knowledge in one's own native language.
2. This new term is described in detail by Cronin (2010). Rooted in a consumer-model of translation, crowdsourcing I a clear example of how the user of consumer becomes the producer (prosumer) as it is the audience the one that produces "their own self-representation as a target audience" (Cronin, 2010, p. 4).
3. Estellés Arolas, E., & González Ladrón de Guevara (2012) and Brabham (2013) offer a detailed classification of different instances of crowdsourcing.
