By briefly describing the three stages of the social media analytics process, reference is made to some specific techniques and analytic methods used for data and information manipulation. In general, a variety techniques and methods for analysis and modeling, from different disciplines and fields, are used during the social media analytics process. According to Fan and Gordon (2014), the most used analytical methods and techniques for understanding, analyzing, and presenting large amounts of social media data are opinion mining or sentiment analysis, topic modeling, social network analysis, trend analysis, and visual analytics. These techniques can be used in the basic stages during the analysis process of data from different social media. For any method or technique is a characteristic that is primarily usable in a single stage, or some may be used in other stages. So, in the stage of understanding (Understand stage) can be used sentiment analysis and trend analysis. In the Understand stage can be used topic modeling and social network analysis. These two methods also can support the other two stages, stage Capture and Present stage. Visual analytics, however, can be used in the Understand and the Present stages.

The presented social media analytics process tries to cover the most of the activities/tools on social media, but it cannot cover all of them. Some tools have limitations in the information they can offer to their user or do not cover all the social media that are relevant for the user. Therefore, the scope of monitoring social media, or what will be analyzed and how it is determined according to every enterprise's business activities and needs, is crucial. The social media analytics compass is created (Figure 2) for the purpose of a more straightforward decision-making on what will be analyzed and how that.

As Figure 2 shows, the compass contains eight essential domains that should be analyzed on social media (Cleary, 2016):

- Audience profile.
- Audience size.
- Content analysis.
- Competitive benchmarking.
- Community responsiveness.
- Sentiment analysis.
- Traffic.
- Reach & engagement.

Audience profile and *audience size*, as suggested by their titles, apply to all interested parties of an organization with which it interacts through social media. Namely, every organization needs to continuously monitor the number of its followers/friends on social media and examine whether the tool that it

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 2. Social media analytics compass (Cleary, 2016)
Source: Cleary, 2016

uses for social media analysis can cover the magnitude of the audience. Besides, not only is it important to cover all the audience, but it is also important to analyze their characteristics-whether they are enterprises or private persons, what their domains of interest are, etc.

Reach & engagement is the domainof social media analysis in which an organization tries to find out how far its activity on socially media reaches. In this matter, the aim is to answer two questions: 1) How much of the organization's audience are social media reaching? 2) How much audience are social media engaging with the organization's content? Answers to these questions allow an organization to find out how many people are paying attention to its posts, if they are aware of the organization, and how many of them "work" with the posted content. Literature usually refers to a company audience as consisting of three groups (Cleary, 2016):

- **Lurkers:** Users who follow the activities of the company on social networks, but do not interact with the company or its contents. These users most often account for the largest share of an organization's audience.
- **Influencers:** The so-called social media leaders, more precisely users, that have access to a larger audience and on some way they could influence the audience.
- **Engagers:** Users that are more active in an organization's community; as such, the organization will start recognizing some of their names.

If *Reach &engagement* are very low, it should be examined if the organization audience group consists of right people and what kind of content the organization posts, or why the postedcontents do not cause a response in the audience.

The domain called *Traffic* is closely connected with *Reach & engagement*. Namely, every action on social media is aimed to produce an action in the audience, so it is necessary to monitor the traffic of their reactions.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Creating an account and posting content on a large number of social media is free of charge, but in the case of large and professional organizations, preparing content can be relatively expensive. A large organization with a good reputation cannot afford to post any sorts of content because it can significantly affect its image and interaction with stakeholders. Therefore, it is very important to conduct *content analysis*, too, bearing in mind that preparing content for posting is often quite expensive. The *content analysis* involves getting answers to questions like (Cleary, 2016):

- Are videos, pictures, or text updates working best?
- Does the organization have the right mix of content?
- Is the organization getting engagement on its questions?
- What modificationson the platforms request the organization to change (e.g., changes to profile images)?

Content analysis is related to s*entiment analysis* which is intended to determine what the organization's audience "thinks" about it. *Sentiment analysis* entails a very large dose of risk because the expressed opinions often do not reflect people's true opinions and are not entirely credible. Nevertheless, the analysis can help the organization to realize that there is a problem (e.g., it is unlikely that all activists in the audience have the same, whether positive or negative, reaction to some content).

When analyzing all the defined important domains, the organization should always pay attention to its competition. For this reason, the domain of analysis called *competitive benchmarking* is indispensable in obtaining a true picture of the activities and success on social media. Every organization should always and repeatedly compare itself with its competitors to find out what it can learn from the competition on its way to success, and to establish what makes competitors much better and how the organization can improve.

The last domain of measurement in the social media analytics process according to Cleary (2016) is *Community Responsiveness*. Namely, the organization has to be very responsible to its community to ensure that the audience, or the community in which the organization exists, interacts with the company. In this way, the entity shows an interest in the community, ensuring a greater interaction with it, and this eventually leads to better results of the social media analysis.

SELECTION OF SOCIAL MEDIA ANALYTICS TOOLS

Tools for social media analytics can be perceived in very varied ways; further, literature offers different classification tools used in the social media analytics process. Namely, it is possible to speak of groups of tools that combine a number of techniques and methods applicable to individual stages of the social media analytics process. Thus, Batrinca and Treleaven (2015) specify three groups of tools:

- **Tools for Accessing to Data on Social Media**: Data services and tools for text data sourcing and scraping from social networking media, wikis, RSS feeds, news, etc.
- **Tools for Cleaning and Storage of Data from Social Media:** text data cleaning and storing tools.
- **Tools for Text Analysis:** Separate tools or collection of transformation and analysis tools for the analysis of scraped and cleaned data from the social media. These are simple tools capable of

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

converting text data into other forms such as tables, charts, maps, more advanced analytics tools for social data analysis, connection identification, and network building.

Cleary (2016), however, identifies three types of tools:

- **Platform Analytics:** Free analytics tools offered by individual platforms (e.g. Facebook Insights or Twitter analytics).
- **Management Tool Analytics:** Analytics tools provided by social media management providers as part of their solution (for example, Agorapulse or SproutSocial).
- **Standalone Analytics:** Social media measurement tools that only provide functionality of social media analytics.

On the other hand, a large number of articles that can be found on the Web present, as social media analytics tools, a number of commercial and free applications that incorporate methods and techniques for all three stages of the social media analytics process. Different authors (Guido, 2016; Lee, 2014; Marvin & Behr 2016; Opitz, 2016), on their blogs or on specialized Websites, present tools, highlight their both strengths and weaknesses, and compare them against a number of technical and functional criteria, such as: company size, range of coverage referring to social networks, type of analysis that they support, frequency of alerts, CRM integration, support and training, real-time stream monitoring, geographic/language coverage, metrics and reporting, internal post and engagement metrics, free trial, integration with other applications, price, mobile apps, community analysis and demographics, and access to historical data.

Different recommendations for the selection of appropriate tools can be found by analyzing available texts (papers). This particularly applies to commercial tools, which are available in large numbers. In this regard, Ideya Ltd. made comparison of social media monitoring tools in November 2015 and found that at least 242 tools were available, as free, as payable (Chaffey, 2016).

However, in order to make the selection relatively easy, it is necessary to follow some guidance. One of the options is the social media analytics compass that was described in the previous section. This compass identifies what needs to be analyzed and measured and can be a reference for the selection of tools to conduct the analysis. Namely, knowing the importance of particular domains for its business, a company can pinpoint the appropriate tool for the analysis.

Also, as a good reference for the selection of social media platforms as well as social media analytics tools, the following criteria can be used (Tracx, 2015):

- An end-to-end integrated enterprise-wide platform that offers, at a minimum, the functionalities of listening, intelligence, advanced analytics, engagement, and monetization.
- Deep, data-driven, and actionable insights, and predictive and proactive guidance providing information for engagement and content strategies and strategic business decisions.
- Contextual insights (e.g., geo-spatial, behavioral, time of day), and how communities that discuss about brands are formed.
- Support for global brands, including multiple languages and a scalable architecture.
- Ability to interpret videos, images, and other non-text posts.
- Integration with other data sources and marketing platforms.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Undeniably, these criteria are quite general. Indeed, not only are they applicable for making decisions on tools for social media analysis, but they also allow to decide on the social media platform that the company will use for social media.

Once again, various lists of the best tools, sorted according to different criteria, are available on the Internet. However, more importantly, the basiccriterion that the company should follow is their business objective. Depending on this objective, key indicators will also be defined and used as a good filter for the selection of social media tools.

Issues, Controversies, Problems

As organizations have used social media more, their expectations, especially related to the fulfillment of social media promises, have become higher. Namely, social media promised companies that they would have become customer-centric and met all of their customers' needs if entities had used social media communication channels. Also, high growth of different social media analytics tools created the illusion that organizations would have been able to measure everything (Samuel & Reid, 2014). Unfortunately, so far social media analytics has failed to fulfill some of its promises, especially those related to full customer-centricity.

The following list summarizes the main social media analytics pitfalls of which their users should be aware:

- **Analytics Tools Cannot Reflect What Happens in Social Media:** Some of the recent research literature (Samuel & Reid, 2014) shows that a majority of social media users are relatively quiet, i.e., 85% of what social media analytics tools "hear" comes from less than 30% of social media audience, while the others are quiet, meaning they just listen (Samuel & Reid, 2014). Since social media analytics tools work with data gathered from about 30% of social media users, it is obvious that they cannot tell organizations what they need to know about their customers.
- **Social Media Users do not Reflect Organizations' Customers:** Social media users are not a representative pattern of the customer base. For example, the estimation is that 80% of the USA population is now on Facebook, but only 25% is on Twitter (Samuel & Reid, 2014).
- **Age and Geographic Bias:** Social media data contain a recognized bias that can significantly influence the output of social media analytics. People of younger age and in certain geographic locations use social media more frequently. As a result, some providers of social media analytics reduce these biases by normalizing their data. Nevertheless, it is important for marketing professionals to make allowances for this bias when making decisions. Indeed, if products are intended for younger urban population, this bias is positive, but if they are designed for more general groups, social media data can be observed only in regard of data from other sources that are free of these biases. It is important to stress this with social media having become a standard part of standard commercial interactions, like websites, some of these biases are likely to dilute or dissolve (Petrocelli, 2013).
- **Amplification Issue:** Amplification, meaning content and message spreading by using social media network effects, makes the social media a desirable cost-effective marketing tool. However, amplification can bring serious drawbacks through message drift. Namely, people sometimes, instead of simply sharing a post and content, rephrase or shorten a message. In this way, they can

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

change the basic meaning, sometimes into entirely new messages. It is hard to keep control of this process without continuous attention (Petrocelli, 2013).

- **Non-Textual Information:** Social media analytics tools highly rely on text data, especially when sentiment analysis tools are in question. However, it is impossible for these tools to directly analyze increasingly large amount of image, video, and audio content. The result is that the growing body of content contained in video blogs, video sharing (YouTube), photo sharing (Instagram and Pinterest), or podcasts, as well as the most part of the content on Facebook, do not yet have a prominent position in social media analysis (Petrocelli, 2013).
- **Inconsistent Dataset:** Substantial differences exist between social media analytics tools regarding filtering capabilities and access to Facebook and Twitter data. Also, crawlers and spam filters can affect dataset results (Etlinger & Li, 2011).
- **Language Limitations:** Social media analytics tools have many problems to cope with particular industry terms (e.g., wine-tasting notes "barnyardy", "wood smoke"), slangs and abbreviations, irony and sarcasm, emoticons (e.g., ☺), and especially with support for all global languages (Etlinger & Li, 2011).
- **Different Analytical Approaches by Social Media Analytics Tools Vendors:** Differences in the ways of data collection can affect final results. An approach based on a keyword is the simplest and cheap, but it is not accurate, as opposed to more advanced, but more costly, natural language processing and algorithmic approaches (Etlinger & Li, 2011).
- **Privacy and Security:** There are no absolute guarantees that customer and business information will not be compromised by online sharing or attacked by computer hackers.
- **Measuring Success and Monetization:** Although industry observers have noted that the lack of convincing evidence of the financial benefit of a social media strategy is an impediment to substantial investment in this area (Divol,Edelman & Sarrazin, 2012), there is also an emerging literature that researches the relation between social media and overall firm value or performance (Hitt,Jin &Wu, 2015).
- **Complaints and Bad Reviews Management:** If organizations are not prepared for complaints and bad reviews, negative publicity can seriously damage their reputations because customers in social media have very powerful tools for fast spreading both positive and negative comments.
- **Time Commitment:** Using social media as communication channels with customers requires the continuous engagement of organizational resources (human, technological, and financial) and full commitment of the whole organization. A social media marketing process is very iterative in comparison with traditional marketing campaigns has the ability to change and adapt at a faster rate. This adaptability requires platforms that marketing professionals can use to design, launch, and manage social media marketing campaigns in a proper way and conduct the social media analytics that provides deep customer understanding and monitoring for the effectiveness of these campaigns (Petrocelli, 2013).

Regardless of the open issues related to social media and social media analytics tools, the number of social media users has constantly grown, as the market for social media analytics tools has enlarged. The potential value of social media data analysis draws both research-oriented and practice-oriented professionals to invest more and more time, money, and effort to resolving the above mentioned pitfalls.

SOLUTIONS AND RECOMMENDATIONS

A Framework for the Adoption of Social Media Analytics in Finance

As the financial sector is one of the most regulated areas, financial institutions should take a disciplined approach to the adoption and implementation of social media analytics. Also, financial entities should aim at a multidisciplinary approach, with specialists in compliance, technology, information security, law, human resources, and marketing included in the process of reviewing and implementing social media analytics (Hansche & Chen, 2014). In order to achieve adequate coordination and integration of these different specialists, financial institutions need a defined framework for the adoption of social media analytics. The existence of this framework can ensure that a financial institution meets its goals for social media engagement, minimizes risk, and ensures compliance with existing and new laws and guidance that apply to its social media activities (Hansche & Chen, 2014).

Different sources (Abughosh, 2016; Deloitte, 2013; Gilfoil, Aukers & Jobs, 2015; Hansche & Chen, 2014) were consulted during the development of a framework for the adoption of social media analytics in finance. The proposed framework is based on the following layers (Figure 3):

- Strategic context.
- Legal and compliance context.
- Social media platform context.
- Integration of social media into a business model.
- Content distribution and users' engagement.
- Data collection context.
- Evaluation, risk, and control context.

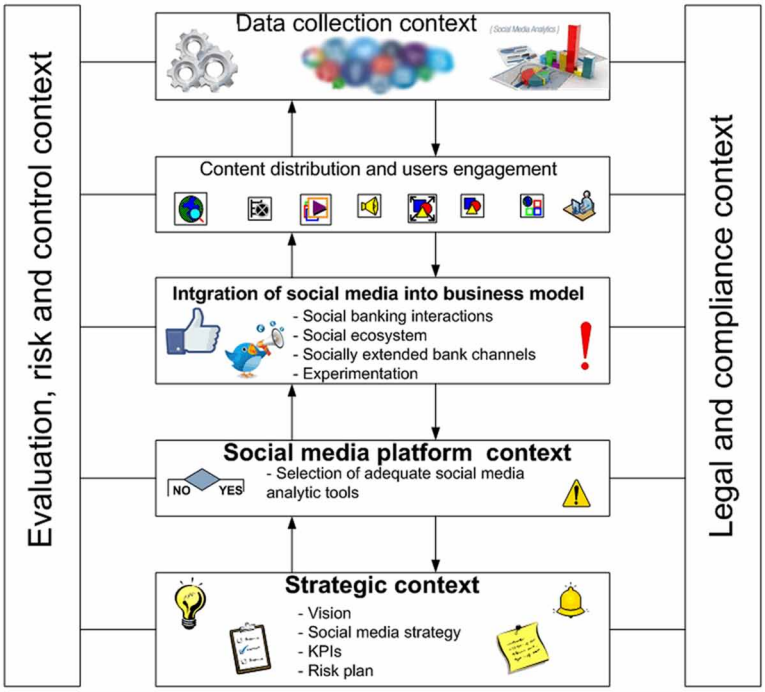
The strategic context layer stresses that financial institutions need a social media strategy and vision that is harmonized with institutional strategy and defined business goals. The social media strategy should define:

- A social vision tailored to support the financial institution's business drivers, brand image, and corporate strategy (Deloitte, 2013).
- The scope and objectives of the social media strategy.
- The measurement of the effectiveness of the strategy through KPIs (Key Performance Indicators), such as total reach, volume by social media channels, positive, negative and neutral mentions, average response time, unique visitors, frequency of interactions, frequency of followers, frequency of active followers, number of frequency of leads, frequency of issues logged and issues resolved (Cognizant, 2014).
- Develop a strong plan for reducing risks before engaging in social platforms (Abughosh, 2016).

The legal and compliance context layer is closely relatedto all the other layers of the framework (Figure 3). As the FFIEC Guidance points out, even financial institutions not actively participating in social media will be at risk that must be evaluated, monitored, and dealt with in their social media policies (Federal Financial Institutions Examination Council, 2013). The adoption and implementation of a

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 3. Framework for the adoption of social media analytics in finance
Source: Authors'own figure



social media policy for employees are one of the possible ways for a financial institution to reduce some business and legal risks of using social media use.

The FFIEC Guidance recommends a financial institutions to adopt such a policy for their employees' social media use that is related to work, specifying what activities are prohibited, as well as a policy for employees' use that is unrelated to work, within the financial institution's social media governance policies and procedures (Federal Financial Institutions Examination Council, 2013).

The objectives of the policy should cover mitigating the risks of defamation and brand damage and of exposure of confidential customer and financial institution information.

The following issues should be addressed in a policy for the employees authorized by the financial institution to engage in social media activities on its behalf: establishing of adequate governance structure for posts approval; education of employees; tracking the use of personal and business electronic devices; protection of internal and external business information; derogatory comments about co-workers, bosses and/or clients, transparency - identifying oneself as an employee when posting about the financial institution (Hansche & Chen, 2014).

Also, the financial institution should develope general policies covering social media use by employees who do not participate in social media activities on behalf of the financial institution.

The social media platform context layer is related to the selection of adequate social media analytics tools (Figure 3). This process has been detailed in the previous section.

The integration of social media into a business model is the critical context in the proposed framework (Figure 3). Namely, the main reasons why financial institutions, or other organizations, decide to use social media are to ensure transparency and almost instant two-way interaction with their customers,

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

to better respond to customers' requests, and to offer new services by channels their customers already used for other private or business activities. Nonetheless, if financial institutions want to be successful in using social media, they should integrate the use of social media into their overall business model and exploit these means to meet the goals defined in their business strategy.

In order to effectively integrate social media into their business model, financial institutions have to consider and define the following (Deloitte, 2013):

- **Social Banking Interactions:** Financial institutions have to discover how customers want to interact with them and how to engage customersin creating shared social value.
- **Social Ecosystem:** Each financial institution has to find and build the right mix of social channels to support their business goals.
- **Socially Extended Bank Channels:** Traditional financial channels should be transformed and expanded with social media channels enabling real two-way dialogue.
- **Experimentation:** Financial institutions first have to pilot their social concepts to refine understanding of customer's expectations and develop their internal capabilities.

The integration of social media into a business model is a very complex process. It means building the cross-functional capabilities needed to process insights from social channels, engage with customers, respond to their requests, and recognize and act on social opportunities (Deloitte, 2013). Obviously, this process of integration can affect an entire financial institution, asking for adoption of many changes in the institutional organization and behavior. A successful adoption of changesasks that financial institutions have answers to the following questions (Deloitte, 2013):

- Which groups will need to respond to customer service requests and inquiries?
- What types of requests and interactions will be received and supported?
- Which groups might be able to use the social insights being harvested?
- Where are the new connections between the functional areas needed to deliver on institutional vision?

The use of social media data should not be limited only to employees who work directly with the technology, but it should be used by the workers from different divisions of financial institutions. The reason for this lies in the fact that social media can provide signals about every part of the institutions' operation, so it is important to incorporate the signals learned from social media into the overall corporate business process. As users can directly interact with new financial institutions' product or service offerings through comments and reviews, financial institutions that can effectively manage these data is in a better position to predict future demands and improve their existing product or service lines. Signals learned from social media sentiment could feed directly into the product design, which, in turn, affects operations, marketing, and sales. Thus, tightly integrating social media data into financial institutions' operation and marketing efforts is critical (Ghose, Ipeirotis & Li, 2012). Especially when employees from various divisions of the financial institution can make sense of the social media data and effectively incorporate them into the institution's strategies, social media could have a much more profound effect on the financial institution than simply the marketing department. Using signals learned from social media can help guide the financial institution to flexibly adjust to changes in the business environment (Hitt, Jin & Wu, 2015).

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Through the content distribution and users' engagement context (Figure 3), the financial institution should demonstrate that it can create or forward information that meets its target customers' needs, wants, or desires. Content can be defined as any information related to the particular financial institution, its products, and its service. The formats of content can be different: photos, video, display ads, blogs, tweets, emails, pop-up ads, white papers, and similar. In its social media strategy, a financial institution should define time schedules (daily, weekly, or monthly) and activities (e.g., content creation, content sharing, responding to comments and inquiries, spam deletion, enable effective tracking, review daily/weekly/monthly activities) related to content distribution and users' engagement.

The data collection context (Figure 3) should describe how a financial institution captures data from customers who responded in some way to the distributed content. Data should be generated by different social media channels (e.g., Facebook, Tweeter, blogs). Selected social media analytics tools are used for processing these data with the main goal of finding valuable information that the financial institution can use in its business.

The evaluation, risk, and control context stresses that a financial organization should continuously evaluate the activities described in the previous contexts and apply consistent controls across channels and departments engaged with or leveraging social media (Gilfoil, Aukers & Jobs, 2015). Continuous evaluations also means that the financial institution needs to make adjustments (e.g., replace platform, adopt new social media platform) on-the-fly, based on the analysis of social media metrics, such as number of members registered in the institution's social platform, number of interactions (user comments), number of times when institution social presence or post is visited, and similar elements. This context is closely related to all the other layers of the framework (Figure 3).

FUTURE RESEARCH DIRECTIONS

Social media analytics is still developing the field with many opportunities for further research exploration. Future research directions are divided into two categories:

- General social media analytics.
- Specific social media analytics for the financial sector.

Some of the main future research directions for general social media analytics can be summarized as follows:

- Achieving the full real real-time engagement, e.g. faster response times through improvements in social listening and automation software. Namely, as indicated by Search Engine Watch, 70% of Twitter users anticipate a brand to respond to their tweets, and 53% expect it to do so within an hour, but this percentage is as high as 72% when a complaint is involved (Beese, 2016).
- Live streaming video, thanks to applications like Snapchat, Periscope, Facebook Live and similar, can enable social engagement with customers in an entirely new way.
- Mobile friendly – the majority of users of social media use them primarily over screens of smart mobile devices. In 2015, desktop traffic was surpassed by mobile traffic in 10 countries, including U.S. and Japan (Beese, 2016), so organizations' the primary interest is to ensure that their social media platform is at least mobile-friendly.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

- Data-driven decisions. In the course of time, an increasingly important competitive edge will be in the ability of capturing, interpreting, and acting on signals from social media in the context of general enterprise data (Etlinger & Li, 2011). In the very near future, the ability to "speak data" will be a decisive skill for all those who work within the socially adaptive business. Namely, although machines will perform most of the processing-intensive analysis, the data interpretation ability will be fundamental to ensuring organizational agility.

The overall implications of data-driven business will prove to be disruptive to an even higher extent than the data itself. The businesses that can learn from disruption and use it to develop stronger and more reciprocal relationships with their customers will be successful in the age of data (Etlinger & Li, 2011).

- Dark social measurement - With 84% of what is globally shared in social media being dark to social media analytics (private sharing with close friends and family via peer-to-peer channels), there is a challenge to measure its efficiency in ways that sync with other social media measurement. The more concrete direction on this and collaboration between applications, networks, and platforms is necessary to make it meaningful (Odden, 2016).
- The content-based analysis should be more focused on including information on content that can provide important insights about the underlying social network. For example, the content at a given node may yield valuable clues on the expertise and interests of the corresponding party (Aggarwal, 2011).
- Social Chat Bots are recently offered by Facebook as a new kind of engagement. Since customers expect engagement in real time, it may be possible to satisfy basic customer service and information needs of brands by using bots. The result is that brands will need to invest in more interactive social experiences for their community (Odden, 2016).
- Social media automation features will grow to help brands with prospecting delivering content to the right customers at the right time and engagement–all integrated with a marketing dashboard for an end-to-end reporting of the impact social media has across the customer journey. However, similar to CRM, this is not a "plug and play" solution because organizations will need human expertise and a strategy to make the most out of their automation software investment (Odden, 2016).
- Temporal analysis, that is the inclusion of time-related development into network analysis, can significantly improve the quality of the results. Nonetheless, a significant amount of work has yet to be done on dynamic analysis of social networks which evolve rapidly in time (Aggarwal, 2011).
- Social media mining-the process of representing, analyzing, and extracting actionable patterns from social media data (Zafarani, Abbasi & Liu, 2014) - is becoming a more propulsive research field. It discusses and integrates theories and methodologies from different fields, such as computer science, data mining, machine learning, social network analysis, network science, sociology, ethnography, statistics, optimization, and mathematics. It covers the tools for formal representation, measuring, modeling, and mining of meaningful patterns from large-scale social media data (Zafarani, Abbasi & Liu, 2014). Also, social media mining is cultivating a new type of data scientist who is proficient in social and computational theories, specialized for analysis of recalcitrant social media data, and skilled to help bridge the gap between what is known (social and computational theories) and what organizations want to know about the vast social media world using computational tools (Zafarani, Abbasi & Liu, 2014).

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Some of the main future research directions for specific social media analytics for the financial sector can be summarized as follows (Greenfield, 2014):

- It is necessary to develop standards for international growth and methods optimized for mining non–Cashtag data.
- The increased amount of financial content has opened up possibilities for even more types of monitoring and analytics.
- With the advent of new data and tools for monitoring what is globally discussed and thought, it is on financial professionals to examine which ones of them would be best suited for their investment theses. Benefits will be drawn and information and profits made by those who prove capable of implementing them successfully.

CONCLUSION

The phrase *many-to-many* can be used to describe the situation related to social media. Many participants create an enormous quantity of content, making the *jungle of information* in which it is sometimes hard to find a right way without a good compass. Although social media analytics tools are pretending to be that compass, the huge number of different tools can additionally contribute to confusion and even make the whole situation more complex.

This chapter focused on social media analytics tools and the criteria for their selection. The chapter discusses main open issues and controversies, and finally proposes a general framework for the adoption of social media analytics as a possible solution for better coping with the complexity related to social media. The proposed framework is maybe general, but it recognizes necessary contexts and relations between them, and can be used as a compass for a better integration of social media into business processes.

Although social media analytics tools are necessary to ease organizations to cope with ever growing data from social media, it is important to stress that just tools (i.e., technology) are not enough. If social media analytics tools are not strategically aligned with existing business goals, if there is not a well-defined and aligned social media strategy, or, simply, if there is not an adequate framework for the adoption of social media analytics tools, organizations, including financial institutions, will continue to struggle to get their desired results.

Also, the proposed framework points out that the use of social media should not be limited just to employees who work directly with technology, but it should be spread to different departments in organizations because social media can provide signals about almost every part of organizations' operations. Namely, just knowing data about customers is not enough, without adequate business action, this knowledge has no sense. Social media analytics tools can assist users in exploiting customer information, but they cannot replace human creativity in building along-lasting relationship.

KEY TERMS AND DEFINITIONS

Amplification: The use of social media for spreading digital content and messages.

Cashtag: The special ($) tag associated to discussions about stock market (today financial issues generally) that enables easier tracking of that type of discussions on social media.

Community Responsiveness: The capability of an organization that readily reacts to suggestions, influences, appeals, or efforts of its customers and community.

Dark Social: The social sharing of content that can be measured by Web analytics programs (private sharing).

Sentiment Analysis: The computer identification, analysis, and categorization of opinions expressed in social media (usually in a piece of text) in order to determine whether the writer's attitude towards a particular topic or product is positive, negative, or neutral.

Social Chat Bots: The integration of artificial intelligence software (a chatbot) into social media (Facebook) to allow very sophisticated automated response (instead of real-life representative) to user queries.

Social Media: A collection of digital communication channels (e.g., blogs, forums, social networks) that enables interaction, collaboration, and sharing of content.

Social Media Analytics: The practice of gathering data from social media in order to analyze them and make business decisions.

Social Media Mining: The process of representing, analyzing, and extracting actionable patterns from social media data.

Chapter 32
Social Media as Persuasive Technology for Business in Malaysia

Shahizan Hassan
Universiti Utara Malaysia, Malaysia

Norshuhada Shiratuddin
Universiti Utara Malaysia, Malaysia

Sobihatun Nur Ab Salam
Universiti Utara Malaysia, Malaysia

ABSTRACT

The use of social media for business purposes has been growing exponentially due to its great potential as an effective marketing tool. Nonetheless, studies which assess how effective social media can be as a persuasive technology are limited, especially in the context of developing countries. Therefore, this study attempts to evaluate the perceived impact of social media as a persuasive technology for businesses in Malaysia. To accomplish this, a questionnaire survey was conducted with 1,196 social media users. Geographical clustering sampling was used, together with simple random sampling to select participants for the survey, which was based in five regions in Malaysia. The outcome of the survey shows that social media can have a significant impact on business and that the majority of social media users perceive that social media content can indeed persuade people to purchase products or services offered. Furthermore, it was found that social media content can also significantly influence purchasing decisions.

INTRODUCTION AND BACKGROUND OF STUDY

The impact of social media (SM) on business should not be underestimated as trends and a number of studies (e.g. Jacobs & Nakata, 2010; Universal McCann, 2008; Barnes, & Matson, 2008; SME Annual Report, 2007; Nielsen Company, 2010) have shown that SM, especially Facebook and Twitter, have been utilised extensively as business and marketing tools all over the world. Many studies in the United States

and Europe have provided evidence that SM has a positive impact on business, especially for small and medium enterprises or SMEs (Swallow, 2010: Lesley, 2012; Darban & Wei Li, 2012). Socialbakers (2014) and Google Analytics (2014) show in their reports that most large companies have already been fully utilising SM to expand their market reach and to improve customer relations. Nonetheless, the extent to which SM can be considered to be a persuasive technology in business remains to be determined. Furthermore, the impact of SM has not been very widely reported in the context of South East Asian Region.

Studies such as those conducted by Jacobs and Nakata (2010) and many others show that SM tools have been integrated widely in e-commerce and e-business for the purposes of marketing and customer relations. As a result, terms such as social commerce and social enterprise have emerged (Turban, Bolloju, & Peng Liang, 2011). Firms are now aware of the fact that social networking has become an integral part of consumers' behaviour and lifestyle. Some studies in Western countries have even indicated that SM such as Facebook can have a significant impact on purchasing decisions (Lesley, 2012; Darban & Wei Li, 2012). Therefore, SM can indeed be considered to be persuasive technology that can change the attitudes or behaviour of the users through persuasion and social influence (Fogg, 2003; Oinas-Kukkonen, & Harjumaa, 2008). The main purpose of this paper is to present a study which examines the impact and role of SM as a persuasive technology in the business environment.

Most studies of SM and its impact on business such as those mentioned earlier (e.g. Lee, 2013, Lesley, 2012; Darban & Wei Li, 2012) and several others such as Universal McCann (2008), Barnes and Matson (2008), and Deloitte (2007) were conducted in developed countries. Only a few reports (e.g. PCW, 2014; Chai Li, 2014; Hadadi & Almsafir, 2014) on the role of SM as a persuasive technology with regard to business in South East Asian countries like Malaysia, however, have been conducted. The extent to which SM can have an impact on purchasing decisions also needs to be researched further (Martinka, 2012). Thus, the following issues need to be addressed:

1. What is the impact of SM utilisation as a persuasive technology for business?
2. Can SM content persuade users to engage in business related activities?
3. Can SM content influence consumers in making purchasing decisions?

The aim of this study is to ascertain the impact of the usage of SM as a persuasive technology in the business environment. The main objective is to determine the perceived impact of SM as a persuasive technology for business purposes in Malaysia. Specifically, this study attempts to achieve three sub objectives as follows:

1. To determine the impact of SM in business;
2. To identify whether SM content can persuade users to engage in business related activities; and
3. To identify whether SM content can have an influence on purchasing decisions.

PREVIOUS STUDIES OF THE IMPACT AND INFLUENCE OF SOCIAL MEDIA

Many studies have been conducted to ascertain the impact of SM on business, most of which were performed in the US and European countries. Universal McCann (2008), for example, carried out an impact study of SM with 17,000 Internet users in 29 countries. It was found that SM can have a dramatic impact on a company's brands and reputation. The most significant SM tool identified in this study is a blog. It

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

was found that 34 per cent of the respondents posted opinions about products and brands on their blogs. In addition, 36 per cent had tendency to think more positively about brands and companies that have blogs. Another study by Barnes and Matson (2008) on the use of SM among the Inc. 500 in the United States reported that over one quarter of the Inc. 500 companies used SM extensively and perceived that the role of SM was essential in formulating a business/marketing strategy.

The impact of SM on business in Europe and United Kingdom (UK) has been widely researched. Deloitte (2012), for example, reported on the economic impact of Facebook in Europe and the UK. In this study, Facebook is said to have contributed to creating a total of 232,000 jobs as well as generating economic activity estimated at 15.3 billion Euros in 2011 in the European countries and Switzerland. In the context of the UK, Facebook was reported to have contributed to an overall economic impact of 2.6 billion pounds and had supported 35,200 jobs. This study also suggested that SM such as Facebook are particularly valuable for SMEs which represent the backbone of the European economy.

Several studies have attempted to look into whether SM can influence consumer behaviour and purchasing decisions. Martinka (2012), for instance, conducted a study of the impact of Facebook and Twitter communities on purchasing behaviour in the US. It concluded that, while the Facebook community can be said to have a significant influence on purchasing behaviour, in contrast the Twitter community had almost no influence. Li and Darban (2012) investigated the impact of SM on consumers' purchasing behaviour in food retail or in shops in Sweden. Unsurprisingly, it was found that SM has an impact on every step of consumers' purchasing decision process. This is mainly due to the user friendliness and convenient features of SM such as Facebook which allow consumers to interact easily with fellow customers and supermarket owners.

A number of studies related to social media impact were conducted in Malaysia. PWC (2013) for example, conducted a survey on 101 large and prominent companies and organisations throughout Malaysia. The findings show that majority of the respondents recognise the importance and potentials of social media as a business and marketing tool. Nonetheless, not many have a clear strategy and impact measurement initiatives for their social media activities. Shahizan, Norshuhada, Nor Laily, Sobihan Nur, and Mohd Samsu (2012) investigated the trends and perceived impact of social media on small and medium business in Malaysia. Using focus group method involving 21 participants who are mostly social media practitioners, they found that social media particularly Facebook, if used correctly with the right strategy, has great potential to become effective persuasive tool in business. In another study, Chai Li (2014) presents a review on the impact of social media on the banking sector in Malaysia. In this study, it was found that banks in Malaysia are already utilising social media particularly for customer relation purposes. There is also a study which looks into the impact of online advertising on sales which includes social media marketing. In this study, Hadadi and Almsafir (2014) surveyed the impact of online advertising on the sales of Proton cars among 40 expatriates in Malaysia. The result shows that the respondents are influenced by Proton's Web site followed by Proton's social media.

Despite a number of studies which had been conducted in Malaysia such as presented earlier, there is a need for more studies on the impact of SM as a persuasive technology. The studies reviewed earlier have some limitations which require further research. PWC's study (PWC, 2014), for example, only focuses on large and prominent companies and organisations which might not tell the true story about the impact of social media in general. Shahizan et al. (2014) on the other hand focus only on a small number of social media practitioners who are mostly owners of small businesses in their data gathering process. Hence both of these studies only look from the perspective of the business firms and business owners. In order to get a better picture of the trends and impact of social media on business, data should

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

also be gathered from the users or consumers' perspective. Similarly, the study by Chai Li (2014) also has a limitation mainly because the study is merely based on the secondary data and literature review. As for the study by Hadadi and Almsafir (2014), its main objective is to study the impact of all online advertising tools on Proton's sales and hence the scope is too wide and not specific to social media impact. Furthermore, the number of participants in the study is too small and concentrated on only a limited geographical area.

SOCIAL MEDIA AS PERSUASIVE TECHNOLOGY

The study of computers as persuasive technology is closely linked to the term 'captology'. This term describes the changes in attitudes or behaviour that result from human interaction with computers (Fogg, 2003). Specifically, captology investigates how people are motivated and persuaded when interacting with computing products (applications). Thus, a persuasive technology tool is defined as an interactive product designed to change attitudes or behaviour or both by making the desired outcomes easier to achieve.

The phenomenon of SM is increasingly spreading worldwide. SM is commonly defined or referred to as a social networking and marketing tool (Adrienne, 2007; Ai, 2009). In fact, it is a type of computer application that can serve as a tool which makes daily activities easier or more efficient to perform. SM can provide an interactive experience that influences, motivates and persuades people in specific ways. Henceforth, this study attempts to assess the extent of which SM can be used as persuasive technology tool in the context of business.

Persuasive Principles

The persuasive principles behind persuasive technology tools apply various strategies in order to change attitudes or behaviour. Fogg (2003) proposed seven principles which can be applied in designing persuasive technology which are reduction, tunnelling, tailoring, suggestion, self-monitoring, surveillance, conditioning, simulation, and social signals. These principles have been applied widely in designing various types of computer applications which include e-learning (Behringer, 2013), Web information retrieval (Lykke, 2009), Computer simulations (Joubert & Roodt, 2009), and database information system (Smink, 2012). Nonetheless, its applicability in the context of SM content design is still unknown. Hence, in this study, four of the proposed persuasive principles were adopted which are reduction, tunnelling, content tailoring, and suggestion. These four principles are considered closely relevant and suitable in the context of SM content design:

1. **Principle of Reduction:** Many psychological and economic theories suggest that humans generally seek to minimize costs and maximize gains (Vroom, 1982; Taylor, 2001). In the context of persuasive technology, this principle is defined as using computing technology to reduce complex activity to a few simple steps/tasks, increase the benefit/cost ratio of the behaviour and influence users to perform the behaviour. Raising the perceived benefit/cost ratio increases a person's motivation to engage in the behaviour more frequently. In this study, three dimensions of principle of reduction proposed by Fogg (2003) and Stacy (2000) are used as follows:
    a. SM content is simple;
    b. SM content is easy to understand;

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

c. SM content is straightforward;

2. **Principle of Tunnelling:** In the context of persuasive technology, this principle is defined as using computing technology to guide users through a process or experience which also provides opportunities for persuasion. Applying this principle can lead users through a predetermined sequence of actions or step-by-step events. In this study, two dimensions of principle of tunnelling proposed by Fogg (2003) and Plous (1993) are used as follows:
   a. SM content provides step by step instruction for acquiring products or services;
   b. SM content provides referrals to the originating company's website;
3. **Principle of Content Tailoring:** In the context of persuasive technology, this principle is defined as information provided by computing technology that is tailored to an individual's needs, interests, personality, usage context, or other factors relevant to that individual. For the SM to be successful in the business context, the product content or information designed should be tailored to the customer's needs, interests and cultural context. In this study, two dimensions of principle of content tailoring proposed by Fogg (2003) and Strecher et al. (1994) are used as follows:
   a. SM provides customized user interface to access its content;
   b. SM content provides customized content for consumers;
4. **Principle of Suggestion:** Computer technology will have greater persuasive power if it offers suggestions at opportune moments. Suggestion often builds up people's existing motivations to buy products and services in order to be well organized, healthy, and attractive to others. For the SM to be successful, the suggested action must be compelling and timely enough in order to be implemented. In this study, three dimensions of principle of reduction proposed by Fogg (2003), and James and Catherine (1994) are used as follows:
   a. SM content suggests information about similar products or services;
   b. SM content suggests information about complement products or services;
   c. SM content suggests information of special offers of products or services.

In short, the four persuasion principles of reduction, tunnelling, content tailoring, and suggestion are used in the context of this study as a basis for designing the instruments required to measure the perceived impact of SM as a persuasive technology in business.

HYPOTHESES DEVELOPMENT

Based on the outcome of the literature review and the preliminary analysis, several hypotheses were formulated for this research. A probability level of 0.05 was used to test for statistical significance.

There is an indication in several studies (see Shahizan et al., 2014; Chai Li, 2014) that SM content can have an impact on users' willingness to engage in business related activities. Furthermore, some studies found that SM content has powerful amplifying effect on business and hence, with the right social strategy, SM marketing can be successful (Barbara, 2012). Despite these findings, to what extent SM content can influence consumer behavior is rather inconclusive. Therefore, the following hypothesis is proposed:

H_0-1: SM content does not significantly persuade users to engage in business related activities.
H_a-1: SM content significantly persuades users to engage in business related activities.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

It has been argued earlier that several studies in Western countries found that SM can have a significant impact on purchasing decisions (Lesley, 2012; Darban & Wei Li, 2012). However, similar impact in the context of Asian countries such as Malaysia has yet to be widely recorded. Hence, the following hypothesis is proposed:

H_0-2: Purchasing decisions are not significantly influenced by SM content.
H_a-2: Purchasing decisions are significantly influenced by SM content.

SM has many features depending on their categories. SM networking site such as Facebook has multiple features which integrate all multimedia elements which include text, audio, images (photos), animated pictures, and video. Certain SM under content community category as proposed by Kaplan and Haenlein (2010) only focus on single or dual multimedia element. YouTube and Instagram, for example, fully utilise video and images (photos) respectively. Henceforth, there is a need to know whether SM content should integrate the usage of all these multimedia presentation elements or not. As such, the following hypothesis is proposed:

H_0-3: In purchasing decision making, combination of multimedia elements is less persuasive than a single element.
H_a-3: In purchasing decision making, combination of multimedia elements is more persuasive than a single element.

METHODOLOGY

This study employed a questionnaire survey method to ascertain the impact of SM as a persuasive technology in business from the perspective of SM users. The questionnaire was pre-tested for face and content validity by seven academics and was also pilot-tested by 22 social media users. The findings from the pilot test showed that the language used for all questionnaire items can be easily understood by laymen and the duration of time taken to complete each questionnaire is only about 15-20 minutes. However, there is a need to modify or update the questionnaire in terms of the items' arrangement or sentences and the choice of words. The final version of the questionnaire was sent to 2,000 SM users from all across Malaysia (divided by regions) out of which 1,200 responded, giving a response rate of 60%. Data from the survey were analysed quantitatively using descriptive statistics and several types of hypotheses testing.

Sampling and Population

The target population in this study was SM users in Malaysia. Since the target population is dispersed geographically across peninsular Malaysia and Borneo (Sabah and Sarawak), geographical clustering sampling was used to select the clusters. These clusters are based on five regions in Malaysia which are the northern, central, southern, eastern regions (Kelantan and Terengganu) and Sabah and Sarawak. Once identified, the simple random sampling was used to select the participants for each cluster or region.

The names and addresses of respondents were retrieved from a database of university students who were undertaking their internships in various companies all over Malaysia. A list of 5200 students'

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

names was generated from the database which was arranged by regions and states. Each name was then assigned a number. Random selection was then made by using an automated random generator to select 2000 potential respondents (i.e. 400 for each region).

Instrumentation

The questionnaire is divided into four parts, and will be discussed as follows.

Part A of the questionnaire identifies the trends of SM usage for business purposes among users. There are four items in this section which are adapted from several previous related studies (Brogan, 2010; Kang, 2009) and online SM marketing strategy surveys (Sterlzner, 2011; APTA, 2010; 6smarketing.com, 2011; Nonprofitsocialnetworksurvey, 2011). These items were reframed to suit the domain of study. The four items are type of SM used, medium to access SM, users' role while using SM, and purposes of using SM.

The objective of Part B of the questionnaire is to ascertain the impact of SM content as a persuasive technology for business customers. Ten items have been adapted from the constructs of Persuasive Technology theory by Fogg (2008) and reframed to suit the objectives of the study (see Table 1). There is also some focus on previous related studies such as Khalid, Barr, Noble, Biddle (2007). Fogg's four principles of Reduction, Tunnelling, Content Tailoring and Suggestion are used as mentioned earlier (Fogg, 2008). Table 1 shows the relationship between the questions (dimensions) in Part B and principles adapted. These items use a 1-7 Likert Scale to measure the respondents' level of agreement or disagreement (1 – Strongly disagree, 2 – Disagree, 3 – Somewhat disagree, 4 – Neither agree nor disagree, 5 – Somewhat agree, 6 – Agree, 7 – Strongly agree) adopted from Vagias (2006). In testing Hypothesis 1 (H_0:1), SM content mean value was derived from a construct of SM content which consisted of the ten dimensions (refer to Table 1).

Part C of this survey identifies the perceived impact of SM on business. In this study, the perceived impacts are from the perspectives of SM credibility, brand awareness, purchasing decisions and customer services, as proposed by several researchers in this area (Brogan, 2010; Kang, 2009; Smith, Wollen, & Zhou, 2007). All seven items in this part use multiple choice questions (YES/NO) where only one answer is allowed with the exception of item 1 (i.e. elements that can increase SM credibility) where respondents

Table 1. Part B survey items: SM persuasiveness principles and their dimensions

Items/Dimensions	Principles
1. Content about products/service in SM is brief.	Reduction
2. Content about products/service in SM is easy to understand.	Reduction
3. Content about products/service in SM is clear.	Reduction
4. Content of SM provides clear instructions on how to acquire product/service	Tunnelling
5. Content of SM provides a link to company's web site	Tunnelling
6. SM provides suitable interface to access content to the customers	Content tailoring
7. Content of SM provides suitable information to the customers	Content tailoring
8. Content of SM provides information about similar products/service	Suggestion
9. Content of SM provides information about relevant products/service	Suggestion
10. Content of SM provides information about great offers on products/service	Suggestion

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

can answer more than once. Table 2 shows the relationship between the items and the perspectives that they cover. In testing Hypothesis 2 (H_0:2), Chi Square test was used to identify the influence of SM Content (VAR1 in Part D of the survey) towards the other three dimensions (VAR2, VAR3 and VAR4) as depicted in Table 2.

Part D of this survey identifies the existence of SM as a persuasive technology. There are 3 items in this section. The first item (VAR1) involves identifying whether SM has been able to persuade or influence the user to buy any product or service before. This item uses multiple choice questions (YES/NO) where only one answer is allowed. This item (VAR1) is used to test H0:2 as mentioned earlier. Item two, which is used to test Hypothesis 3 (H_0:3), is related to the types of content in the SM (i.e. video only, text only, audio only, photos only, or combination of multiple media [video, audio, text, and photos]) that assists the SM users in persuading them to make their purchasing decisions. This item uses multiple choice questions where more than one answers are allowed. In testing H_0:3, cross tabs procedure was used to identify which type of SM Content is less persuasive in purchasing decision making (VAR2 in Table 2).

Item three identifies the types of SM that are most likely assisting them to make their purchasing decision. This item requires the users to rank the types of SM that contribute the most to purchasing decisions. These items are adapted from the American Physical Therapy Association (2010).

DATA ANALYSIS AND FINDINGS

Survey: Data Analysis Result

This section presents the results of the data analyses of the survey. The analyses were carried out using various statistical techniques such as descriptive statistics analysis, the One Sample Test (Compare Means), and the Chi-Square. The normality test was conducted using Exploratory Data Analysis (EDA).

Table 2. Part C survey items: Perceived impact of social media on business

Item	Perspectives	Items Tested in Hypothesis H2
1. What are the elements that can increase SM credibility?	Credibility	-
2. Have you ever been informed about a particular product/service through SM?	Brand awareness	-
3. Have you ever purchased a product/service after getting the information from or talking about it through SM?	Purchasing decision	VAR2
4. Have you ever changed a decision to purchase a product/ service after getting information from or talking about it through SM?	Purchasing decision	VAR3
5. Have you ever stopped purchasing a product/service after getting information from or talking about it thorugh SM?	Purchasing decision	VAR4
6. Have you ever filed a complaint about a product/service through SM?	Customer services	-
7. Have you got a feedback about your complaint through SM?	Customer services	-

Respondents' Demographic Information

Out of 1,200 questionnaires received, four were rejected due to incomplete data. The data from the remaining 1,196 questionnaire was then analysed accordingly. Table 3 provides the demographic information of the respondents in this study. Unsurprisingly, the majority of respondents (53%) were young adults aged from 20 to 30. This was followed by those whose ages were below 20 (29%), 31 to 40 (10%), and above 40 (8%). In terms of educational levels, 29% of the respondents had a Bachelor's degree, 25% had a diploma, and 20% had SPM certificates. The remainder were STPM leavers (15%), holders of Master/ PhD degrees (3%), and those with other qualifications (8%). The information on respondents' race was also obtained and it was found that the respondents were fairly represented by all major races in Malaysia. The majority of respondents (57%) were Malays, followed by Chinese (23%), Indian (10%) and others (10%). As for gender differences, both male and female respondents were almost equally represented in the study.

Social Media Usage

The findings (refer to Figure 1) show that Facebook is the most popular SM tool among the respondents (87.4%). The other widely used SM tools were YouTube (36.3%), Blog (25.9%) and Twitter (22.1%). Other SM tools are not commonly used by the respondents.

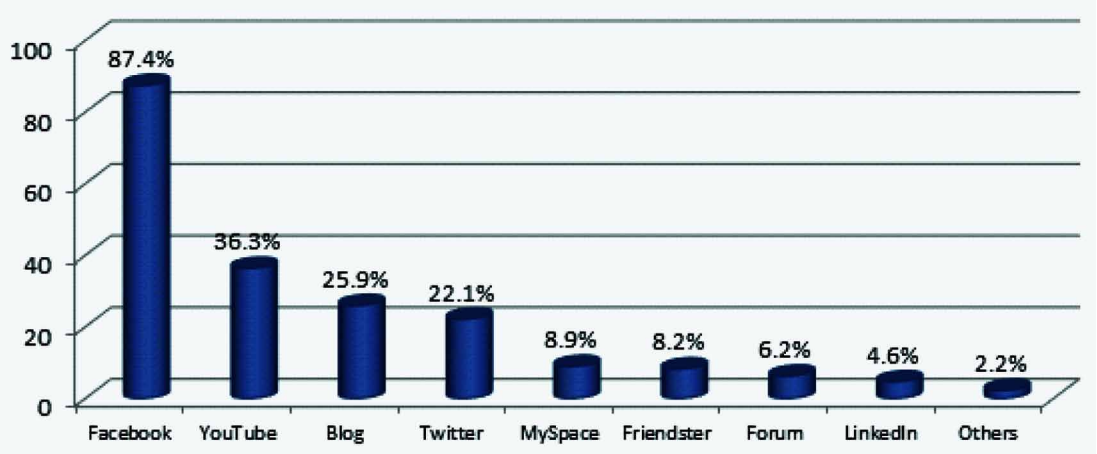
It is also imperative to ascertain information about the role of respondents when using SM. In this study, the majority of respondents use SM as either observers (58.2%) or followers (52.8%). 13.2% of the respondents, however, were involved in e-business as customers, which indicates that SM has the potential to become a successful e-business tool.

Table 3. Respondents' demographic information

	Item	Frequency	Percent
Gender	Male	633	53
	Female	563	47
Age	Total	1196	100
	Below 20	342	29
	20 – 30 years	631	53
	31 – 40 years	125	10
	Above 40 years	98	8
Education	Total	1196	100
	Postgraduate	35	3
	Bachelor	343	29
	Diploma	303	25
	STPM	178	15
	SPM	240	20
	Others	97	8
Race	Total	1196	100
	Malay	683	57
	Chinese	271	23
	Indian	123	10
	Others	119	10
	Total	1196	100

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 1. Type of social media tools used by respondents

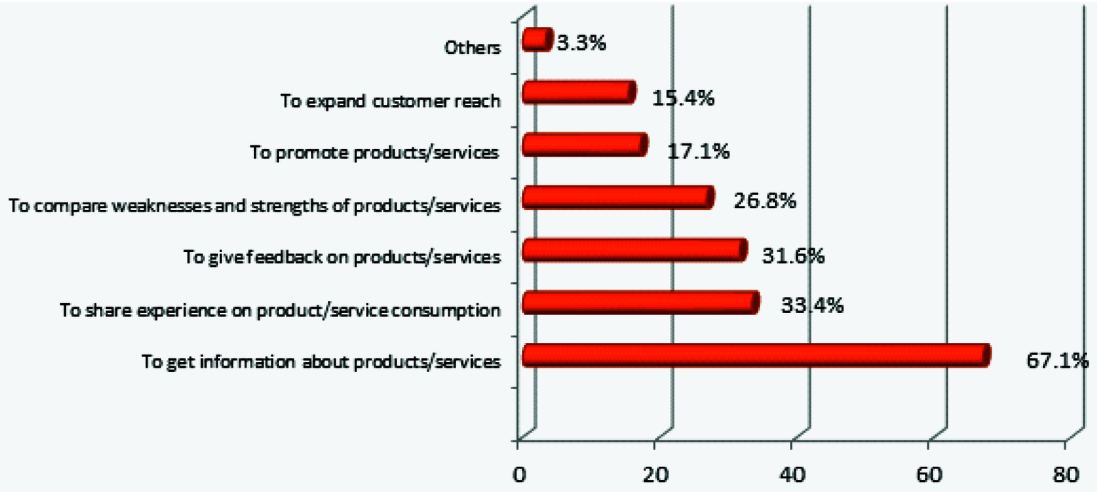


Respondents were also asked about the purposes of using SM. With reference to Figure 2, it can be seen clearly that most of the respondents used SM to obtain information about products or services (67.1%). In addition, respondents also use SM to share their experiences of products or service consumption (33.4%), to give feedback on products or services they had paid for (31.6%), and to compare the weaknesses and strengths of particular products or services (26.8%).

Social Media Impact in Business

The study shows that SM does indeed have an impact on business. Table 4 shows that the majority of respondents (75.9%) were aware of the existence of particular products or services obtainable through SM. Some of the respondents (43.6%) even bought products or services after getting information from SM. Surprisingly, a significant number of respondents (47.4%) had changed their minds about buying

Figure 2. Respondents' purposes of using social media



EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

products or services after following up the latest information or conversations through SM. Even worse, 47.7% of the respondents had stopped using a particular product or service after getting negative feedback about it in SM. This finding supports the claim that SM can, to a certain extent have an impact on business. Table 4 summarises the findings. The findings also indicate that most business organisations in Malaysia had begun to be aware of the important role of SM in business. This is supported by the fact that many of the complaints about products or services filed by SM users are being attended to by respective company representatives (68.4%).

Social Media as a Persuasive Tool

Although SM has only emerged recently, its popularity and various uses have increased tremendously. In the context of business, a significant number of respondents (73.2%) believed that SM could influence their purchasing decisions. Out of these, 29.7% even believed that SM could indeed persuade them to buy products or services. In terms of SM ranking, respondents rated Facebook as the SM tool which had the greatest impact on their purchasing decision making, followed by YouTube, Twitter, LinkedIn, blogs, Forum, Friendster, and MySpace as listed in Table 5.

Table 4. Social media impact on business

	Yes	No
1. Have you ever been made aware of a product or service through Social Media usage?	75.9%	24.1%
2. Have you ever bought a product or service after following the information or conversation from Social Media?	43.6%	56.4%
3. Have you ever changed a decision for buying a particular product or service after getting the information about it from Social Media?	47.4%	52.6%
4. Have you ever stopped using a particular product or service after getting negative information about it from Social Media?	47.7%	52.3%
5. Have you ever made complain about a particular product or service through Social Media?	28.9%	71.1%
6. Did you get feedback about your product or service complaints from fellow Social Media users or company's representative?	68.4%	31.6%

Table 5. Ranking of social media in terms of their importance and impact on purchasing decision making

SM	Rank	Impact on Purchasing Decision (8 = Greatest Impact, 1 = Lowest Impact)									Total(N)
		8	7	6	5	4	3	2	1	0	
Facebook	1	652	133	64	31	18	21	15	51	211	1196
YouTube	2	101	354	135	112	128	63	52	40	211	1196
Twitter	3	64	140	250	149	128	112	67	71	211	1196

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Normality Test

The normality test for the hypothesised data was completed using EDA. The basic EDA assumption for normality holds as the histogram was bell shaped, and the normal probability plot was linear while the skewness and kurtosis were zero.

Furthermore, the Box Plot (Box and whisker plot) was also performed for the data normality test. A box plot is a way of summarizing a set of data measured on an interval scale. It is a type of graph which is used to show the shape of the distribution, its central value, and variability. The picture produced consists of the most extreme values in the data set (maximum and minimum values), the lower and upper quartiles and the median.

In the data set of Hypothesis H_0:1, the box plot shows that the data set is normal as the box and whisker plot are balanced where the minimum value is 4, the median value is 5 and the maximum value is 6 (Refer Figure 3).

In the Histogram/Quartiles (percentiles) the data set shows that the data is normal, as illustrated in Figure 4. The histogram of one SM content dimension shows that the histogram was bell shaped, and the normal probability plot was linear as well as the skewness and kurtosis was zero.

Testing of Hypothesis

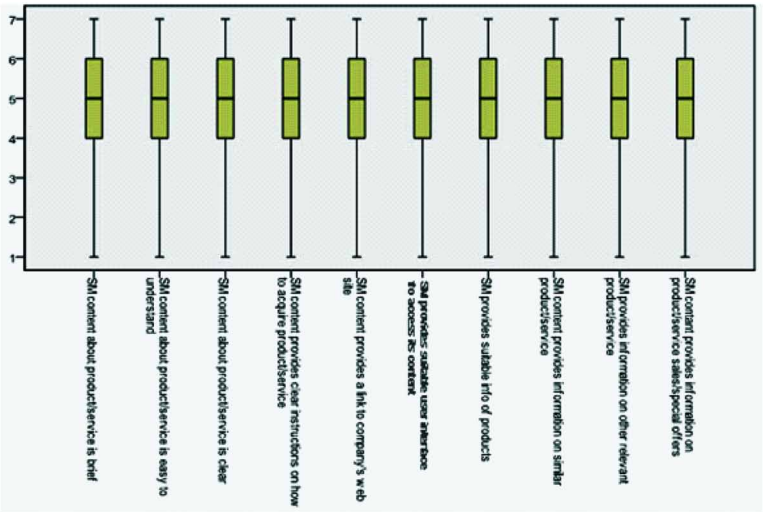
This section describes the findings of the analysis by referring to each of the three hypotheses stated earlier.

Testing of H_0-1

H_0-1: SM content does not significantly persuade users to engage in business related activities.

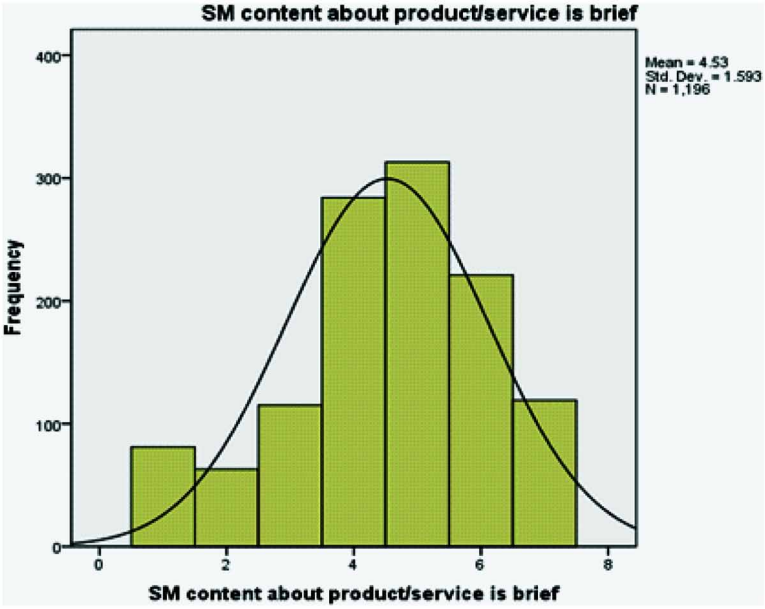
In testing H_0:1, a *t* test was conducted. Using the t distribution, the cutting value was located based on the degrees of freedom involved. This cutting value is used to decide whether the tested SM content dimen-

Figure 3. Box plot of data set (social media content dimensions)



EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 4. Histogram of data set (SM content dimensions)



sions can persuade users or not to engage in business related activities. The cutting value or baseline value in this test was a median value of an interval (measurement) scale which was 3.5 (see Figure 5) and the SM content mean value was derived from a construct of SM content which consisted of ten dimensions.

In testing H_0:1, the one sample *t*-test analysis indicated that SM content mean was greater than the cutting value as depicted in Table 6. The mean score for the SM Content (M=4.78) was greater than the cutting value (Base value =3.50). In this analysis, the confidence interval used was 95% or 0.05

Figure 5. Measurement for interval scale

1 – 1.99 = Unacceptable
2 – 2.99 = Below average
3 – 3.99 = Average
4 – 4.99 = Good (above average)
5 – 5.99 = Very good
6 – 7.00 = Exceptional
Note: Median value = 7.00 / 2
= 3.5

Table 6. Mean difference between baseline and SM content

One-Sample Statistics				
	N	Mean	Std. Deviation	Std. Error Mean
SM content	1196	4.78	.9915	.0287

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

significance level. The result in Table 7 shows that the significant value is 0.00. Therefore, the statistical results suggested that the null hypothesis, H_0:1, should be rejected. This means that SM content does significantly persuade users to engage in business related activities.

Testing of H_0-2

H_0-2: Purchasing decisions are not significantly being influenced by SM content.

Purchasing decisions regarding the testing of H_0:2 are measured by three dimensions as follows:

VAR2: Have you ever purchased a product/service after getting the information from or talking about it through SM?
VAR3: Have you ever changed a decision to purchase a product/ service after getting information from or talking about it through SM?
VAR4: Have you ever stopped purchasing a product/service after getting information from or talking about it through SM?

In testing H_0:2, a Chi Square test was used to identify the influence of SM Content (VAR1) towards the other three dimensions (VAR2, VAR3 and VAR4). All of the dimensions (VAR1, VAR2, VAR3 and VAR4) are a categorical data which justify the use of chi square to analyze the relationship among the variables. The Chi square is a non-parametric test of statistical significance for bivariate tabular (also known as crosstab) analysis. Any appropriately performed test of statistical significance is designed to establish the degree of confidence required to accept or reject the hypothesis. In this study, the hypothesis was tested with chi square to ascertain whether or not the three different dimensions (VAR2, VAR3 and VAR4) are different enough with the influence of SM Content (VAR1).

Table 8 shows cross tabulation table comparing the two hypothetical variables "the influence of SM Content" (VAR1) with "Decisions to purchase product or service after getting information from or talking about it through SM" (VAR2). The cells of the table report the frequency counts for the number of respondents. Within the sample, 423 of SM users had experienced making decisions to buy products or services after getting information from or talking about it through SM and agreed that SM Content influences the purchasing decision. Meanwhile, 485 of SM users had not experienced buying products or services after getting information from or talking about it through SM but agreed that SM Content influences the purchasing decision.

In this analysis, the confidence interval used was 95% or 0.05. As with the Chi-Square test result in Table 9, the significant value was 0.000. This means that the purchasing decision for category VAR2

Table 7. One sample t test

One Sample *t* Test						
	T	Df	Sig. (2-tailed)	Mean Difference	95% Confidence Interval of the Difference	
					Lower	Upper
SM content	166.637	1195	.000	4.778	4.721	4.834

*Table 8. Crosstab VAR1 * VAR2*

Crosstab VAR1 * 2				
		VAR2		Total (N)
		1.00 (Yes)	2.00 (No)	
VAR1	1.00 (Yes)	423	485	908
	2.00 (No)	98	190	288
Total		521	675	1196

*Table 9. Chi-square tests (VAR1 * VAR2)*

Chi-Square Tests (VAR1 * VAR2)					
	Value	**Df**	**Asymp. Sig. (2-Sided)**	**Exact Sig. (2-Sided)**	**Exact Sig. (1-Sided)**
Pearson Chi-Square	14.025[a]	1	.000		
Continuity Correction[b]	13.519	1	.000		
Likelihood Ratio	14.262	1	.000		
Fisher's Exact Test				.000	.000
Linear-by-Linear Association	14.014	1	.000		
N of Valid Cases	1196				

a. 0 cells (.0%) have expected count less than 5. The minimum expected count is 125.46.
b. Computed only for a 2x2 table

was significantly influenced by SM content. In another words, the content of SM can influence SM users to purchase products or services.

Table 10 shows cross tabulation table comparing the two hypothetical variables "the influence of SM Content" (VAR1) with "Changing of decisions to purchase products or services after getting information from or talking about it through SM" (VAR3). The cells of the table report the frequency counts for the number of respondents. Within the sample, 424 of SM users had changed decisions to purchase products or services after getting information from or talking about it through SM but agreed that SM Content influences the purchasing decision. Meanwhile, 484 of SM users had not changed the decisions to purchase products or services after getting information from or talking about it through SM and agreed that SM Content influences the purchasing decision.

*Table 10. Crosstab VAR1 * VAR3*

Crosstab VAR1 * VAR3				
		VAR3		Total
		1.00 (Yes)	2.00 (No)	
VAR1	1.00 (Yes)	424	484	908
	2.00 (No)	143	145	288
Total		567	629	1196

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

In this analysis, the confidence interval used was 95% or 0.05 (significance level). In the Chi-Square test result in Table 11, the significant value was 0.381. This means that a purchasing decision for VAR3 was not being significantly influenced by SM content. In simple terms, the content of SM cannot simply influence SM users to change purchasing decisions which were made prior to using SM.

Table 12 shows cross tabulation table comparing the two hypothetical variables "the influence of SM Content" (VAR1) with "Decisions to stop purchasing products or services after getting information from or talking about it through SM" (VAR4). The cells of the table report the frequency counts for the number of respondents. Within the sample, 415 of SM users had stopped purchasing products or services after getting information from or talking about it through SM but agreed that SM Content influences the purchasing decision. In the meantime, 493 of SM users had not stopped purchasing products or services after getting information from or talking about it through SM and agreed that SM Content influences the purchasing decision.

In this analysis, the confidence interval used was 95% or 0.05. In the Chi-Square test result in Table 13, the significant value was 0.015. This means that the purchasing decision for category VAR4 was being significantly influenced by SM content. In other words, SM content can influence SM users to stop purchasing certain products or services.

In conclusion, from the three Chi Square tests results in Table 9, 11, and 13 the significant values were 0.000, 0.381, and 0.012 respectively. Therefore, the statistical results rejected the null hypothesis, H_0:2 (based on the two samples of Chi Square test which were significant - VAR 2 and VAR4). This means that the purchasing decisions were being significantly influenced by SM content.

*Table 11. Chi-square tests (VAR1 * VAR3)*

Testing of H_0-3

H_0-3: In purchasing decision making, a combination of multimedia elements is less persuasive than a single element.

In the testing of H_0:3, purchasing decision making was based on five types of SM content which are video, text, audio, photos, and combinations of multimedia elements (video, text, audio, and photos). As from the extracted data from the Cross Tabs between the five types of SM contents and the dimension of purchasing decision making (VAR2) in Table 14, the highest frequency of SM content chosen by SM users are the type of combinations of multimedia elements which constituted 260 samples. Therefore in purchasing decision making, SM content which is being displayed using a combination of multimedia elements is more persuasive than a single element.

Table 14. Types of SM content and purchasing decision making

Type of SM Content	**VAR2: Purchasing Decision Making (Buy)**		**Total Respondents Who Bought Products or Services From SM**
	Yes(**N**)	*No* (**N**)

DISCUSSIONS, CONCLUSION, AND IMPLICATIONS FOR FUTURE RESEARCH

Overall Findings

This paper presents a quantitative study which attempts to determine the perceived impact of SM as a persuasive technology for business purposes in Malaysia. In general, the outcome of this study provides meaningful answers to the three research questions which are:

1. What is the impact of SM utilisation as a persuasive technology for business?
2. Can SM content persuade users to engage in business related activities?
3. Can SM content influence consumers in making purchasing decisions?

For the first research question, the finding clearly provides evidence that SM such as Facebook have the potential to become effective and persuasive tools for businesses. The majority of respondents had been using SM to get information (67%) or share experiences (33%) about products and services. In addition, it was also found that most of the respondents (75.9%) were made aware of the existence of particular products or services through SM. Furthermore, there is also evidence to suggest that respondents use SM to get feedback about product or service complaints (68.4%). All these provide a clear indication of the important role of SM in business, especially for marketing activities. This outcome is in line with several previous studies such as Lesley (2012), Darban and Wei Li (2012), Li and Darban (2012), and Statista (2013).

As for the second and third research questions, the findings from hypotheses one ($H_{0:}1$) and two ($H_{0:}2$) indicate that SM content, if designed effectively and interactively, can persuade people to engage in business related activities and to influence people to purchase products or services. In order to be effective, as this study has shown in the results of hypothesis three ($H_{0:}3$), SM content must be properly designed, relevant, informative, and should include the use of multiple media presentation platforms such as videos, audios, texts and animations. This finding is in line with a report by ComScore, Inc (2011) which states that SM goals can be achieved through the use of insightful and engaging content. Similarly, in order to develop engaging SM content, the use of multiple media presentations cannot be avoided.

This study also reveals that SM content is unlikely to change purchasing decisions which have already been made prior to using SM. The most interesting finding is that SM content can influence users to stop purchasing certain products or services. This means that conversations and discussions among SM users can have an impact on current customers with regard to certain products or services. The result of $H_{0:}2$ in this study revealed that purchasing decisions are being significantly influenced by SM content.

However, SM tools are plentiful and continue to emerge, and the impact of any one tool may be different from the others. A study by Martinka (2012), for example, indicates that Facebook can have an impact on consumer purchasing decisions, as also evidenced in this study, but that is not the case for Twitter. Hence, while acknowledging the important role of SM as a persuasive technology, companies should be cautious in selecting and utilising SM.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Implications of Study to Business and Research Communities

The findings of this research could be useful for the business and research community with reference to SM. The fact that majority of respondents in this study (75.9%) were aware of the existence of particular products and/ or services after getting information through SM clearly indicates that SM has already had a significant impact on businesses and that there is potential for SM to continue to be widely used in the future. Furthermore, the finding that SM content does significantly persuade users to engage in business related activities (the result of $H_{0:}1$) highlights the emerging role of SM as a persuasive technology in business. The fact that SM can have an impact on purchasing decisions (the result of $H_{0:}2$) should not be underestimated and should be fully utilised by firms. The outcome of this study further supports the findings of previous studies mentioned earlier which include Swallow (2010), Lesley (2012) and Darban and Wei Li (2012). In short, it can be said that the trends in terms of SM impact on business in Malaysia, as also identified in several other findings such as PWC (2013), Shahizan et al. (2012), Chai Li (2014), Hamdadi and Almsafir (2014), are not much different with what is happening in other countries especially in the Western world.

As for the research community, this study provides more evidence that Fogg's persuasive principles can indeed be applied in measuring the level of persuasiveness of computer mediated applications. It shows that the principles are not only applicable in the context of e-learning (Behringer, 2013), Web information retrieval (Lykke, 2009), Computer simulations (Joubert & Roodt, 2009), and database information system (Smink, 2012) as mentioned earlier, but it is also applicable in the context of social media research. In particular, the outcome of this study implies that the Fogg's persuasive principles of reduction, tunnelling, content tailoring, and suggestion (Fogg, 2003), can be utilised in measuring the role of SM as a persuasive technology. The instruments used in this study can be further tested and enhanced accordingly. Similar study can be conducted in different geographical and cultural environments. More hypotheses can be developed and tested to verify the finding of this study.

Limitations and Future Works

There are a number of limitations of this research which should be duly noted. First, the motivation and issues brought forward in this study are based on the analysis of very limited studies on SM especially in the context of Malaysia. Overtimes, the number of studies in this area will increase and therefore future research proposals can be better developed. Secondly, the study is only conducted in Malaysia and hence cannot be generalised to be applicable to all environments. Further efforts should be taken to ascertain the impact of SM on business in different geographical and cultural environments. Third, this study only applies Fogg's persuasive principles (Fogg, 2003) in developing and framing the instruments. Future work should also take into account other theories and models such as Cialdini's six principles of influence (Cialdini, 2006) to strengthen the instrumentations. Finally, this study also has some limitations in terms of its methodological approach. It employed the quantitative method in gathering the data. Using the mixed method approach may further strengthen the finding as the qualitative method enables the researchers to get in-depth information regarding the impact and role of SM in business. In addition, it would be worthwhile to include the sample from other stakeholders such as SM practitioners, business owners, and entrepreneurs in future research.

ACKNOWLEDGMENT

We would like to express our utmost gratitude to all those involved in making this research project successful. Among others are Malaysian Communication and Multimedia Commission (MCMC), Universiti Utara Malaysia, and the survey participants. We also appreciate the contribution from fellow research team members Dr Nor Laily Hashim and Mr Mohd Samsu Sajat.

Chapter 33
Conducting Survey Research Using MTurk

Silvana Chambers
The University of Texas at Tyler, USA

Kim Nimon
The University of Texas at Tyler, USA

ABSTRACT

This chapter presents an introduction to crowdsourcing for survey participant recruitment. It also discusses best practices and ethical considerations for conducting survey research using Amazon Mechanical Turk (MTurk). Readers will learn the benefits, limitations, and trade-offs of using MTurk as compared to other recruitment services, including SurveyMonkey and Qualtrics. A synthesis of survey design guidelines along with a sample survey are presented to help researchers collect the best quality data. Techniques, including SPSS and R syntax, are provided that demonstrate how users can clean resulting data and identify valid responses for which workers could be paid. An overview and syntax for conducting longitudinal studies is provided as well.

CONDUCTING SURVEY RESEARCH USING MTURK

Over the past 25 years, the Internet has progressively become part of how we live. It has changed the way in which we communicate and exchange knowledge. Consequently, the Internet has become a tool for conducting academic and organizational research (Callegaro, Baker, Bethlehem, Goritz, Krosnick, & Lavrakas, 2014; Granello & Wheaton, 2004; Oppenheimer, Pannucci, Kasten, & Haase, 2011). In the field of human resource development (HRD), for example, is not uncommon for findings from survey research to inform theory and/or practice (cf. Gubbins & Roussea, 2015; Shuck & Reio, 2011).

A growing trend in the psychological and behavioral sciences is the use of crowdsourcing for recruiting survey participants (Palmer & Strickland, 2016). Crowdsourcing is a technical innovation that refers to the process of obtaining content by soliciting contributions from a large and diverse pool of people, particularly from online communities. The use of crowdsourcing for academic research has increased over

the past decade (Harms & DeSimone, 2015). In fact, many reputable journals have published articles for which crowdsourcing methods were utilized (Palmer & Strickland, 2016). Today, multiple crowdsourcing platforms are available, facilitating the link between researchers and populations of potential participants (e.g., MTurk, SurveyMonkey Audience, Qualtrics Panels, StudyResponse, and CrowdFlower).

Despite its growing acceptance and capability of enabling researchers to reach large numbers of people, a recent study suggests that researchers have concerns, often unsupported, with crowdsourcing platforms; thus, they are skeptical to adopt crowdsourcing as a methodological tool for academic research (Law, Gajos, Wiggins, Gray, & Williams, 2017). One of the most popular commercial crowdsourcing services used by social science researchers to recruit participants is MTurk (Buhrmester, Kwang, & Gosling, 2011). Recent studies have found that data collected through MTurk were as good or better than data collected by more traditional survey methods (Behrend, Sharek, Meade, & Wiebe, 2011; Feitosa, Joseph, & Newman, 2015).

In this chapter, we offer a primer to researchers interested in using MTurk for survey research. First, we present an introduction to crowdsourcing for recruiting survey participants. Second, we present MTurk as a tool for conducting survey research, discuss ethical considerations, and compare it to other crowdsourcing services used for survey participant recruitment (i.e., SurveyMonkey, Qualtrics). Third, we discuss the limitations and benefits associated with MTurk. Fourth, we synthesize best practices for designing a survey to be deployed on MTurk and present an associated example. Fifth, we review the implications of collecting data from MTurk and provide R (see Appendix A) and SPSS syntax (see Appendix B) that may be helpful starting places for researchers who are new to collecting data from MTurk.

Crowdsourcing Survey Participants

In the information age, the availability of technological tools and their applicability to academic research have resulted in the boom of crowdsourcing platforms (Law et al., 2017). Currently, multiple commercial crowdsourcing services are available, allowing researchers to reach large populations of potential survey participants, for a fee. Unlike traditional survey methods in which time and budget are a constraint, crowdsourcing relies on the Internet for connecting researchers and survey participants quickly and cost-effectively (Cummings & Sibona, 2017). Although crowdsourcing is not a newly emerged tool for survey research, it is not yet widely used due to researchers' concerns regarding their knowledge of available crowdsourcing tools, and concerns regarding data quality (Law et al., 2017). Nevertheless, during the past decade, the number of articles published in academic journals using crowdsourcing platforms for survey research has increased by more than a hundredfold (Harms & DeSimone, 2015).

This chapter aims to help address concerns regarding knowledge of available crowdsourcing tools. Previous research has focused on addressing concerns related to the quality of crowdsourced survey data, and findings suggest that survey data obtained through crowdsourcing can be valid and reliable (Berinsky, Huber, & Lenz, 2012; Landers & Behrend, 2015). However, there are important considerations researchers must keep in mind with regards to sampling. Sampling is the process that involves the selection of a subset of a particular population with the purpose to infer the results of the sample to the general population from which it was recruited (Blumberg, Cooper & Schindler, 2014). Therefore, it is suggested that researchers carefully evaluate if the participants they can recruit through crowdsourcing platforms are sufficiently similar to their studies' intended populations in order to make generalizable inferences (Landers & Behrend, 2015).

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

MTurk Recruitment Service

MTurk, short for Amazon Mechanical Turk, is a service offered by Amazon.com, Inc. It was originally designed for internal purposes in which participants would generate descriptors (e.g., "modern," "vase," "ivory") for Amazon products, and in exchange, they received very small financial incentives (Landers & Behrend, 2015). Today, MTurk has evolved into the most popular commercial crowdsourcing service that connects researchers (requestors) with respondents (workers) via Amazon's online marketplace. MTurk recruits individuals for their marketplace by offering small researcher-paid financial incentives for HIT (Human Intelligence Tasks) completion (Buhrmester et al., 2011). Researchers have absolute discretion over the financial incentive their survey participants receive. Research on MTurk workers indicates that they are younger (millennials >50%), more educated (college degree >50%), and have lower income (*Md* = $20,000–29,999) as compared to the average U.S. population (cf. Berinsky et al., 2012; Feitosa et al., 2015; Smith, Roster, Golden & Albaum, 2015). Therefore, MTurk workers may not be suitable for all studies.

Horton and Chilton (2010) reported that the hourly wage of the typical MTurk worker is $1.38. However, several studies (e.g., Casler, Bickel, & Hackett, 2013; Shapiro, Chandler, & Mueller, 2013) reported rates two to three times as high. MTurk adds a 40% commission (20% for HITs requesting fewer than ten responses) to the HITs' total cost plus an additional 5% for Master workers, who are workers who have earned that qualification for consistently receiving positive feedback. MTurk allows researchers to choose "Premium Qualifications" options for selecting a specific pre-screened target population. Fees for specific target populations range from $0.05 (e.g., high school graduate, LinkedIn user) to $1.00 (e.g., foreign language fluency) (see Table 1). Therefore, the cost per survey response for a 10-minute survey targeted to the general U.S. population can range from $0.30 to $1.70. On the other hand, the cost for the same survey targeted to the female U.S. population would range from $0.80 to $2.20.

When determining the amount of financial incentives for a survey, recent research has demonstrated that higher incentives result in higher data quality (Litman, Robinson, & Rosenzweig, 2015;). In addition to data quality, there are ethical implications to the amount paid to survey participants. Studies revealed that it is not uncommon for MTurk workers to earn part of their living income from MTurk (Harms & DeSimone, 2015; Goodman, CryPaolacci, Chandler, & Ipeirotis, 2010); therefore, while they are considered self-employed and not protected by minimum wage laws, their compensation for survey completion forms part of their wages. Consequently, it is up to the researcher's judgement to determine what fair compensation is for the survey participants' time.

Similarly, in order to comply with Institutional Review Board (IRB) guidelines, when providing compensation, the compensation should be appropriate for the participants' time and effort and should not be large enough to be construed as undue influence. Harms and DeSimone (2015) suggested researchers use the U.S. federal minimum wage as benchmark for a fair compensation of participants' time. This can be done by prorating the U.S. minimum wage to the estimated duration of the survey

Other Recruitment Services

SurveyMonkey and Qualtrics are two of the leading crowdsourcing platforms for survey participant recruitment and distribution services used in organizational, marketing, and academic research. SurveyMonkey Audience and Qualtrics Panels provide survey responses from their online communities in

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

exchange for researcher-paid incentives/fees. SurveyMonkey and Qualtrics also provide online survey design and hosting software that allow individuals with basic computer skills to develop professional-looking surveys with relative ease (Brandon, Long, Loraas, Mueller-Phillips, & Vansant, 2013).

- **SurveyMonkey:** SurveyMonkey Audience (SMA) is a service that connects researchers with SurveyMonkey's online pool of members. Each SMA member completes a profile that includes demographic questions when joining a panel, which is used to identify potential participants based on the researcher's requested target population. SurveyMonkey charges additional fees for participant responses from specific target populations (e.g., gender, employment status, household income, etc.). Fees for specific target populations widely range, for example, targeting a demographic of full-time ($0.50), male ($1.00), government employees ($10.00) would add $11.50 to the per-response cost. Participants who complete surveys receive a $0.50–$1.00 donation to their charity of choice and, if offered by the researcher, a chance to participate in a sweepstake. The cost for the researcher varies based on the length of the survey. A 30-item survey costs around $3.00–$4.00 per response plus an optional, but recommended, sweepstake incentive of up to $500 (SurveyMonkey, n. d.). Survey completion rates and data quality have not shown consistency; therefore, studies that used SMA data have shown a wide range of usable response rates, including reported rates of 16% (Morris, 2013) and 95% (Cook & Lorass, 2013).
- **Qualtrics Panels:** Qualtrics Panels offers a more personalized service to data collection in which an assigned Qualtrics project manager assists the researcher in exploring the options that best fit the researcher's needs, which include, but are not limited, to identifying the best target demographics, survey length, and survey design. The cost to the researcher varies based on the length of the survey and target demographics. The base cost per response is $5.00 with a project minimum of $500 for a survey without specific targeting requirements. Specific targeting requirements (e.g., industry, employment type, educational attainment) increase the cost per response (Qualtrics, n. d.). It is not clear if there are fixed prices per demographic requirements, as Qualtrics provides a quote for the entire project after learning about the specific demographic target requirements and complexity of the project. Published studies have reported a wide range of usable response rates for data collected through Qualtrics, including rates of 20% (Hazen, Kung, Cegielkski, & Jones-Farmer, 2014) and 90% (Mohr, Lichtenstein, & Janiszewski, 2012).

Comparing MTurk to SurveyMonkey Audience and Qualtrics Panels

Consider a hypothetical example of collecting data from 300 U.S.-based, full-time working adults using a 40-item multiple choice survey that takes an average of seven minutes to complete. Given the hypothetical example, Table 2 depicts MTurk, SurveyMonkey, and Qualtrics' services and costs. Like SurveyMonkey and Qualtrics online panels, MTurk allows researchers to screen participants based on their desired population target and provides a wide pool of potential participants. Note that MTurk recently changed its participant screening functionality. In the past, MTurk allowed researchers to include a couple of screening questions prior to the start of the survey (cf. Chambers, Nimon, & McCann-Anthony, 2016). Participants who failed the screening questions did not receive payment for going through the screening questions. However, now, screening for a particular target population (e.g., gender, educational attainment, age group, employment status) must be done through the Premium Qualifications option. As discussed previously, this option, for an additional fee (see Table 1 for representative fees), connects researchers

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

with pre-screened participants that fit the desired population criteria. As shown on the hypothetical example on Table 2, collecting data exclusively from participants who are employed full time increases the cost per response by $0.35 for responses collected through MTurk and by $0.50 for responses collected through SurveyMonkey Audience.

In comparison to SurveyMonkey and Qualtrics, MTurk is the most cost-effective option for conducting survey research. In addition to a U.S. pool of participants, MTurk has a large international pool as well. However, despite the benefits of having a more diverse population, research (e.g., Berinsky et al., 2012; Paolacci et al., 2010) shows that having a large number of international participants makes MTurk samples less demographically representative of the U.S. population when compared with SurveyMonkey and Qualtrics. Additionally, participants from countries whose primary language is not English may produce survey responses with low reliability (Feitosa et al., 2015). Nonetheless, MTurk allows researchers to screen participants' location and nationality for free through its Worker Requirements feature (see Figure 1). Therefore, the risk of having international respondents can be mitigated in the survey design and deployment process.

Accounting for the differences previously noted, data quality and results obtained from MTurk samples are similar to SurveyMonkey and Qualtrics samples (Berinsky et al., 2012) as well as more traditional convenience samples (Berinksky et al., 2012; Buhrmester et al., 2011; Horton, Rand, & Zeckhauser, 2011; Mason & Watts, 2009; Paolacci et al, 2010). Additionally, an advantage of MTurk over SurveyMonkey and Qualtrics is that MTurk allows researchers to approve or reject payment on the basis of completion and data quality (Brandon et al., 2013).

Limitations of MTurk

A major objection to the use of MTurk for academic research is the threat to external validity (Crowston, 2012). External validity is "the degree to which the results obtained in a given study would hold true at other times, in other settings, or with other individuals" (Sacket & Larson, 1990, p. 430). However, the external validity of data collected via MTurk appears be an advantage rather than a concern as MTurk uniquely offers a wide range of diversity domestically and internationally (Behrend et al., 2011; Buhrmester et al., 2011; Landers & Behrend, 2015). In fact, the notion that online panels threaten the validity of a study's results is not based on empirical evidence, but is rather the result of an arbitrary categorization of data sources (Landers & Behrend, 2015). MTurk samples might be considered a threat to external validity only if the sample is not sufficiently similar to the intended population to draw conclusions that are generalizable to it (Yin, 2013). Therefore, it is important that researchers consider the characteristics of the MTurk population when selecting their studies' sampling approach.

Repeated participation is a concern that could threaten the internal validity of a study. However, it may not be a concern for organizational and HRD surveys in which participants are asked to share their opinions, feelings, or perceptions (cf. Chandler, Mueller, & Paolacci, 2014). While it is a concern when participants of a study are asked to perform cognitive tasks, it is perhaps reasonable to assume that participants may not change their opinions, feelings, or perceptions with more exposure to instrumentation (Landers & Behrend, 2015). Nevertheless, repeated participation of respondents in the same study should not be a concern as researchers using MTurk can design their HIT to prevent repeated participation (Chandler et al., 2014).

The use of financial incentives is a potential concern, as it could introduce systematic bias to a study (cf. Cobanoglu & Cobanoglu, 2003). Despite having an incentive for participation, the potential

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

for introducing participation bias in MTurk samples seems to be no different than traditional samples for which an incentive is provided (Hsieh & Kocielnik, 2016; Komarov, Reinecke, & Gajos, 2013). Although MTurk workers indicate financial incentives are the primary reason for their participation in HITs (Behrend et al, 2011), research found that MTurk samples provided similar responses to traditional samples (i.e., university students). Further, research (Landers & Behrend, 2015) suggests that the payment MTurk workers receive for completing surveys does not seem to be a source of bias. The use of financial incentives as a source of bias should only be a concern if financial incentives are theoretically linked to outcomes (Jenkins, Gupta, Mitra, & Shaw, 1998; Landers & Behrend, 2015). Furthermore, research (Chandler et al., 2014; Rao, Kaminska, & McCutcheon, 2010) indicates that financial incentives increase participation rates without decreasing data quality. Several studies have found that compared with traditionally sourced samples, researcher-paid MTurk samples show similar levels of data quality (Buhrmester et al., 2011; Chandler et al, 2014; Mason & Watts, 2009; Mitra, Hutto, & Gilbert, 2015). Furthermore, some studies found a positive correlation between the use of financial incentives and higher data quality (Litman et al., 2015).

High rates of non-response create a higher probability of statistical biases, which could represent a threat to the external validity of a study (Tomaskovic-Devey, Leiter, & Thompson, 1994). Consequently, response rates are of concern to scholars. A high response rate is associated with larger sample sizes, which result in higher statistical power and greater credibility (Rogelberg and Stanton, 2007). Therefore, to increase the precision of estimates and statistical power of a study, it is recommended to increase sample size (Thompson, 2006). Unlike SurveyMonkey and Qualtrics, MTurk uses a marketplace in which researchers publish their surveys to be accessed by Amazon's pool of workers. The unknown number of potential respondents who see the survey but choose not to participate makes it impossible to accurately calculate response rates. However, scholars argue that in survey research, response representativeness is more important than response rate. Therefore, response rate should be a concern only if it affects the representativeness of the sample (Cook, Heath, & Thompson, 2000).

Another source of concern is that MTurk gives researchers the option to approve or reject payment (Fleischer, Mead, & Huang, 2015; Paolacci et al., 2010). Although this can be seen as an advantage, it is also a potential risk. The subjective nature of responses used for organizational and HRD studies can make it difficult to justify payment rejections for straight lining or for using neutral responses for all items. Rejecting payment for completed surveys could violate Amazon's User Agreement and result in the researcher's account being reported. Furthermore, rejecting payment could potentially violate IRB guidelines, as investigators must honor incentives offered to participants who complete, are disqualified, or are unable to complete a survey through no fault of their own (45 CFR 46). There are, however, techniques in survey HIT design that can reduce the risk of getting poor quality responses. MTurk records workers' performance (HIT approval rate) and researchers have the option to design their HITs limiting participation of workers based on that criterion (e.g., 95% HIT approval rate).

It is noteworthy to reiterate that screening questions should not be built into the survey with the objective of disqualifying workers from participation. As noted previously, screening for a desired target demographic should be done through the Premium Qualifications feature available on the MTurk interface. According to Amazon's guidelines, workers who have accepted and completed a HIT should be compensated, unless they submit a wrong or unacceptable answer. A failed response to an attention check question constitutes an unacceptable response, straight lining does not. Researchers are allowed to include attention checks throughout their surveys and to reject payment to workers who do not follow instructions and fail an attention check.

Benefits of MTurk

Despite skepticism about this relatively new tool for data collection, research provides evidence that when following proper guidelines, MTurk can be a valuable tool for research (Law et al., 2017). MTurk offers an inexpensive and quick alternative to more traditional survey research methods, with advantages over other online panels (Brandon et al., 2013). MTurk workers produce quality data that show measurement invariance with other methods (Berinsky et al., 2012; Casler et al., 2013; Feitosa et al., 2015; Paolacci et al., 2010). Mturk is appropriate for social sciences research (Behrend et al., 2011; Buhrmester et al., 2011; Landers & Behrend, 2015).

For researchers using MTurk for one-time studies, it is important to note that large sample sizes can be achieved quickly. Berinsky et al. (2012) conducted several studies using MTurk for data collection and reported that at incentive levels of $0.75 and $0.50 per participant for a five-minute survey, they collected completed surveys ($n = 400$) within one and three days, respectively (Berinsky et al., 2012).

Like other traditional and non-traditional sampling methods, MTurk has advantages and disadvantages, which need to be evaluated against each specific research study. There are instances in which MTurk has advantages over traditional samples. MTurk workers are anonymous to researchers. Therefore, responses cannot be linked to identity, which represents a potential advantage for studies that involve sensitive questions. Institutional review boards are likely to treat studies that use MTurk participants as exempt from reviews (Paolacci et al., 2010). As well, the particular demographics of the MTurk population (educated millennial) may represent an opportunity for research. Millennials, who have redefined what being "social" means, are also known as "digital natives" (Prensky, 2001). Millennials continue to enter the workforce in large numbers and have been the subject of much research due to their connection to technology that makes them communicate, learn, and exchange knowledge differently than older generations (Hershatter & Epstein, 2010).

MTurk's capability of reaching international participants is also an advantage for researchers who wish to collect data from participants outside of the U.S. In the same way, scholars are able to filter the location of workers to U.S. workers only under the "worker requirements" preference; they could broaden their participant pool to include participants worldwide or select a specific country. Chua (2013) explored the effects of ambient cultural disharmony on creative thinking using participants from five different countries. Mason and Watts (2009) examined the relationship between financial incentives and performance using a sample of participants from 43 different countries. Eriksson and Simpson (2010) explored the relationship between gender differences and risk aversion using samples from the U.S. and India. These are just a few examples of multiple studies that have taken advantage of MTurk's international population.

An analysis of recent HRD academic literature revealed that, while still in the initial stages, MTurk samples are being used in published studies, more so than Qualtrics Panels or SurveyMonkey Audience samples (see Table 3). The analysis was conducted using Google Scholar to search for articles published on or after the year 2000 within each individual journal and using the keywords: "mechanical turk", "amazon turk", "mturk", "qualtrics", "qualtricspanels", "survey monkey", "surveymonkey". Articles returned by each search were examined individually to identify how study participants were recruited. This was done to ensure we had an accurate count of the participant recruitment service used, as MTurk can be used in conjunction with SurveyMonkey and Qualtrics. For example, there were cases in which search results for Qualtrics returned studies that had recruited participants through MTurk and used Qualtrics for designing and hosting the survey instrument (e.g., Jacquart & Antonakis, 2015; Waung,

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

McAuslan, DiMambro, & Miegoc, 2016). Therefore, results presented on Table 3 provide a current tally (as of July, 2017) of published studies in selected organizational and HRD journals that have used MTurk, Qualtrics, and/or SurveyMonkey for participant recruitment. An indication of the growing acceptance of MTurk for academic research is that of the 74 published studies that used MTurk samples, 63 of them were published on or after 2015.

Survey Design for MTurk

Despite all the benefits associated with collecting data using MTurk (e.g., cost, convenience, large pool of potential participants), the use of proper techniques for survey design and data collection can impact response rate and data quality. While MTurk provides a survey development tool, there are other online applications that are more user friendly and provide more customization tools and functionality (Holden, Dennie, & Hicks, 2013). Some of the leading providers of online survey software have been used in conjunction with MTurk (Casler et al., 2013; Holden et al., 2013; Smith et al., 2015).

For example, Qualtrics allows users to create surveys and generate reports through a user-friendly GUI (graphical user interface) and distribute them through several channels, such as MTurk. Qualtrics can be used on PC and Mac computers, mobile devices, and works with most browsers. Additionally, Qualtrics provides an easy way to provide unique identifiers for each completed survey, which can be used for data verification for accepting and rejecting payment for participants.

An example survey developed for MTurk data collection using Qualtrics incorporating the recommendations offered in this article is available at https://uttyler.az1.qualtrics.com/jfe/form/SV_dp1dBVZwd47cqCF. For the purpose of illustration, items in the surveyed are numbered. Note that the survey indicates official sponsorship by including the university name and logo on each page, which mitigates non-response bias (cf. Fan & Yan, 2010). The survey also includes a bot screening question (Q1 in example survey) and an informed consent page that may exit participants from the survey if bot screening question is not answered correctly or consent is not provided. Unlike screening questions that are used to exclude participants based on a target demographic, bot screening questions are used to ensure that the participant is an actual person who understands the English language. A unique survey completion code is generated for each participant that completes the survey, which can be used to request payment.

Data safety and usability of the survey are factors that can have an effect on response rates (Fan & Yan, 2010). This risk is mitigated by: (a) using survey software (i.e., Qualtrics) that is accessible by different browsers and computer platforms (Couper, Tourangeau, Conrad & Crawford, 2004), (b) protecting data by using a unique (not shared) ID and password to log in and storing data on secure servers (Kraut, Olson, Banaji, Bruckman, Cohen, & Couper, 2004), (c) not collecting participant identifying data and explicitly informing participants of it (Rogelberg, Spitzmüller, Little, & Reeve, 2006) (d) formatting the survey in a clean, easy to read manner, using paging instead of scrolling (Peytchev, Couper, McCabe, & Crawford, 2006), (e) using simple, unambiguous language for instructions (Dillman & Smyth, 2007), and (f) ensuring that the survey does not take too long to complete, preferably less than 13 minutes (Handwerk, Carson & Blackwell, 2000).

Common method variance (CMV) has been identified as a potential problem associated with research in the social sciences, particularly that involving self-reporting instruments that use a single instrument for independent and dependent variables data collection (Reio, 2010; Richardson, Simmering, & Sturman, 2009). To minimize the risk of CMV, procedures for strengthening its procedural design should be implemented (Podsakoff, MacKenzie, Lee, & Podsakoff, 2003; Reio, 2010). As seen in the example

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

survey, directions for the items (Q3 – Q9) indicate that there are no right or wrong answers and that responses remain anonymous to avoid evaluation apprehension. As implemented in the example survey, it is helpful to divide the survey into blocks (e.g., dependent variable block, independent variable block, and demographics block). The dependent variable block (Q4 in example survey) should be placed before the independent variable block (Q5 in example survey) to avoid item priming effects (Podsakoff et al., 2003). Scales within each block should be randomized or counterbalanced; however, it is not recommended that items from different scales are randomized indiscriminately, as it may disrupt the respondents' thought process and decrease the quality of data (Chang, Witteloostuijn, & Eden, 2010; Craighead, Ketchen, Dunn, & Hult, 2011; Podsakoff et al., 2003).

Despite the popularity of progress bars in online surveys, it is recommended that a progress bar not be used for MTurk data collection, as research (Villar, Callegaro, & Yang, 2013) shows that including a progress indicator in surveys that provide financial incentives is associated with increased drop-off rates. Conversely, faster completion rates have been associated with higher pay rates (i.e., $.75 for a 5–9 min. survey) (Berinksy et al., 2014). Higher pay did not seem to have an effect on data reliability in some studies (Buhrmester et al., 2011; Mason & Watts, 2009; Rouse, 2015); however, it did have an effect in some recent studies (Cummings & Sibona, 2017; Litman et al., 2015).

What could impact data quality when using MTurk is the potential risk of surveys being answered by artificial intelligence or "bots." To mitigate the risks of unreliable data due to bot-generated survey responses, a screening question should be presented to ensure that the participant is human and has an understanding of the English language (e.g., "What is the third word in this question: *How many stars are in the American flag*?"; Rouse [2015, p. 305]; Q1 in example survey). Additionally, to ensure that participants are paying attention to the survey, instructional manipulation checks (IMC) or attention checks could be included throughout the survey (e.g., "Please click on the little blue circle at the bottom of the screen. Do not click on the scale items that are labeled from 1 to 9"; Oppenheimer, Meyvis, Davidenko [2009, p. 871]; see item between Q3 and Q4 in example survey). These attention checks are placed in order to determine which participants are paying attention. As can be observed on the example survey provided, these questions serve as "speed bumps" to help participants focus, or re-focus, on the survey, as well as to help the researcher identify responses that may be adding noise to the sample and decreasing the quality of the data (Oppenheimer et al., 2009; Smith et al., 2015). Research suggests that that these questions can help the researcher determine the level of effort of the participant throughout the survey, which may fluctuate; therefore, it is advisable to include multiple attention checks throughout the survey depending on the survey's length (DeSimone, Harms, & DeSimone, 2015). The researcher should consider the trade-off of eliminating responses of participants who fail the attention checks. In multiple studies, researchers have eliminated responses that failed attention checks to avoid potential departures from normality and improve data quality (Mawritz; Greenbaum; Butts, & Graham, 2016; Peer, Vosgerau, & Acquisti, 2013). While eliminating those responses can improve the quality of the data and increase statistical power, it could also harm the external validity of the study (Oppenheimer et al., 2009).

Finally, the decision of demographic questions (Q5 through Q9 in example survey) placement should be made considering the nature of the survey as well as the distribution channel. Organizational surveys have a higher perceived psychological risk due to a closer connection between participants and survey sponsors, which increases participants' fear of being identified and fear of repercussion, thus increasing nonresponse and drop-out rates when demographic questions are placed at the beginning of a survey (Borg, Braun, & Baumgartner, 2008; Rogelberg, Conway, Sederburg, Spitzmuller, Aziz, & Knight, 2003). Therefore, it is recommended that demographic questions be placed at the end of the survey

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

when they are organizational or sensitive in nature (e.g., medical history, sexual orientation) (Colton & Covert, 2007; Teclaw, Price, & Osatuke, 2012). However, when using MTurk, it is reasonable to assume that most participants do not have a close connection with the researcher that would create a fear of repercussions for their survey responses. Therefore, it is recommended that demographic questions in organizational or HRD research surveys distributed using MTurk not be treated with extra sensitivity due to their organizational nature since there is likely no connection between the researcher and participants.

DATA COLLECTION USING MTURK

Upon completion of designing an electronic survey, survey platforms (e.g., Qualtrics, SurveyMonkey) provide researchers with survey links that can be shared with prospective participants. The survey link can be shared with the MTurk participant pool through a HIT. This section discusses the different aspects associated with collecting data using MTurk. First, we present MTurk's "Worker Requirements" feature for collecting data from target populations, including its newest option, "Premium Qualifications". Second, we review aspects associated with HIT design. Third, we discuss practices for evaluating data quality and paying workers. Last, we present an overview of how MTurk can be used for longitudinal designs.

Worker Requirements

Worker requirements (see Figure 1) act as filters that allow researchers to include or exclude workers from participating in HITs based on the researcher's specific demographic criteria. In addition to the Master worker requirement, which allows researchers to sample from workers who have earned a high percentage of approval from multiple previous HITs, researchers are able to narrow their worker population using three additional requirement categories: system qualifications, premium qualifications, and researcher-created qualification types.

- **System Qualifications:** System qualifications are filters for Location, HIT approval rate, and number of HITs approved (see Figure 1) that MTurk offers to requesters for free. Using these the option of filtering the location of workers to "United States (US)" researchers are able to achieve quality results that are representative of the population (Feitosa et al., 2015). Previous studies demonstrated that MTurk samples can be as representative of the U.S. population as traditional participant pools (e.g., students, convenience) (Berinsky et al., 2012; Buhrmester et al., 2011; Paolacci et al., 2010). MTurk screens its U.S.-based workers by collecting social security numbers in order to issue earnings statements that are subject to taxation, which provides evidence of the likelihood that when researchers opt for U.S. based samples, participants are truly from the U.S. population. Filtering location can also be used to sample international participants.

Further, using system qualifications to filter by HIT approval rate could increase the likelihood of getting quality data by designing HITs that limit participation of workers who have a HIT approval rate of 95 per cent, as it would indicate that they have a good reputation with other researchers (Barger & Sinar, 2011; Berinsky et al., 2012; Brandon et al., 2013).

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

- **Premium Qualifications:** Premium qualifications are filters that allow researchers to sample participants that fit specific demographic criteria such as gender, employment status, and educational, among many. In the past, the only filters available to researchers recruiting participants from MTurk were the ones in system qualifications. Any other target population was available by: (a) oversampling, in hopes that the desired demographic would be included within the collected data, or (b) placing a couple of screening questions at the beginning of a survey to disqualify participants who did not meet the desired population criteria. However, MTurk no longer allows researchers to use screening questions in their surveys. Through premium qualifications, researchers can choose up to two filters per HIT to narrow down their worker population. Table 1 presents a list of filters available through premium qualifications. The list includes the current fee associated with each, which is a per-response fee added to the survey cost paid to Amazon and is not included in the participant compensation. For a comprehensive list of current premium qualifications and their cost, please visit the MTurk marketplace.
- **Researcher-Created Qualifications:** MTurk allows requesters to create their own qualifications. The primary objective of creating these qualifications is to identify workers that have completed a HIT for the requester in order to include them or exclude them from participation in future HITs. Researchers have several options for assigning qualification types to workers who have completed a HIT: (a) manually through MTurk's Web interface, (b) using Amazon Web Services API, (c) using external software such as Command Line Tools (CLT) or R. This section explains how to assign worker qualifications manually through MTurk's Web interface, and in Appendix C, we provide the syntax for assigning qualifications using R. Chandler et al. (2014) provided the syntax for performing this task using CLT; therefore, we will not discuss that approach.

Researchers can manually assign qualifications to workers using MTurk's Web interface, which does not require any programming knowledge. As shown on Figure 2, using the Qualification Types option from the Manage tab, specific qualifications can be created. For example, researchers can use this option to identify workers who have successfully completed a specific survey. Once the Qualification has been created, researchers can download the .csv file containing the workers who have completed previous HITs using the Workers option from the Manage tab (see Figure 3). The downloaded .csv file contains a table with a row for each worker and several columns. The table will show two columns for each qualification type created by the researcher. Using the example shown on Figure 2 in which the qualification *Completed T1* was created, the file contains a column named CURRENT Completed T1 and another column named UPDATE Completed T1. Researchers should use column UPDATE Completed T1 to assign a value that identifies the workers that meet that qualification. Once values have been assigned to workers on the table, the file can be uploaded using the UPLOAD CSV button (see Figure 3). It is important to mention that qualification values for workers can be updated at any time. For example, a value of 1 can be assigned to workers who have completed a survey for time 1, a value of 2 can be assigned to those who have completed the second wave of the survey and so on. Researcher-created qualifications can also be used for identifying a specific demographic (e.g., gender, with children, advanced degree) that the researcher may want to sample in future studies.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

HIT Design

Research has demonstrated that crowdsourced data collected through MTurk can be effective provided that the HIT is designed carefully (Chandler et al., 2014; Kazai, Kamps, & Koolen, 2011). In order to design a HIT, the requester must first create an MTurk project using the New Project link under the Create tab (see Figure 4). An MTurk project contains all of the HIT's description, properties, HTLM and meta-data. The *Survey link* option allows researchers to create a project for collecting survey data through the MTurk marketplace using a survey designed and hosted externally (e.g., Qualtrics). Setting up a HIT entails determining the financial incentive for participants, as well as the number of assignments per HIT, the time allotted per assignment, HIT expiration and auto-approval times (see Figure 5).

Perhaps the most critical decision related to HIT design is the amount of the financial incentive for participants, as research has shown that MTurk workers' primary motivation for participation is financial (Behrend et al., 2011). Although getting participants in MTurk is not a big challenge, it can be time consuming for researchers that offer small financial incentives for surveys that take more time to complete as compared to others in the MTurk marketplace. To mitigate that risk and improve response rates, a researcher might consider providing a higher compensation rate (Berinsky et al., 2012; Rao et al., 2010). Note that higher pay rates have consistently been associated with faster response rates (Buhrmester et al., 2011; Mason & Watts, 2009; Rouse, 2015) and higher data quality (Cummings & Sibona, 2017; Litman et al., 2015). Researchers also need to recognize that potential participants are informed of the incentive amount and estimated completion time by the researcher (see Figure 6). Therefore, if a survey is wrongfully advertised to have an estimated completion time of an hour and has an incentive of $0.50, response rates may be lower than if the researcher had specified a more realistic estimated completion time of 5 minutes.

When defining the number of assignments per HIT, which is the number of unique workers requested for the HIT, researchers have the option of collecting responses for the entire project or breaking the project into smaller batches. Batches are the way in which HITs are posted to the MTurk marketplace. For example, if the objective is to collect 300 survey responses for a study, the HIT could be set up for 300 assignments and the batch could be published once, or it could be set up for 100 assignments for which three batches could be published separately. Batches are published using a project's HIT settings by clicking on the Publish Batch option (see Figure 7).

Batches are used to allow multiple copies of the same HIT to be available on the MTurk marketplace. One of the potential risks of using batches is repeated participation, which could threaten the validity of the study (Chandler et al., 2014). However, researchers can mitigate this risk by publishing one batch for the total number of assignments. It is possible to prevent repeated participation when using multiple batches of the same HIT by assigning a researcher-created qualification to workers who have completed the survey in a batch and modifying the worker requirements prior to publishing a new batch of the HIT. Figure 1 shows an example of how the researcher-created qualification *Completed T1* can be used for excluding participants from retaking a survey in a new batch. In this example, participants who have taken the survey have been assigned a value of 1 for the qualification *Completed T1*; therefore, they would not be able to participate when the new batch is published.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Evaluating Data Quality and Paying Workers

As mentioned previously, one of the advantages of MTurk over other crowdsourced participant recruitment services is that researchers have the option to automatically approve, or to review and approve or reject payment to participants based on completion or response quality, which is recorded on each worker's profile. This can be done by using the unique code identifier generated by Qualtrics (or other survey software platform) to match the responses from MTurk (see last screen in example survey when meeting the study criteria and completing the survey). However, rejecting payment to workers should be the last route for a researcher, as it could violate IRB guidelines. Another practice that can be used to improve data quality obtained through MTurk is awarding bonuses, which can only be done by using unique survey codes. The use of bonuses for good performance is a way to get more diligent responses, which not only encourages workers to provide good responses to get a bonus payment, but tacitly lets them know that the data will be reviewed prior to releasing payment (Barger & Sinar, 2011).

It is imperative to let participants know that the data will be inspected for quality and only complete surveys will receive a unique code that can claim payment. This is done through the HIT instructions provided to the MTurk community (see Figure 1), which can be seen by potential participants before they accept the HIT. Instructions should include language that explicitly informs workers that only those who pass the screening questions or attention checks will be able to complete the survey, which upon completion will generate a unique code that workers can use to get credit for the survey. Additionally, the researcher can inform workers about bonus offers and that the data will be checked for quality.

An example of syntax for data cleaning is included in Appendix A (R) and Appendix B (SPSS), which can be used to match the data file exported from Qualtrics to the data file from MTurk. This is done through the computation of a variable that identifies potentially unusable responses for deletion, such as the length of time of survey completion, straight lining, failed attention checks, and failed bot checks. The use of that feature simplifies the process of approving/rejecting payment; however, researchers should use their best judgment when deciding what to eliminate from the sample.

Following data cleaning, researchers can determine and indicate what workers approved for payment by downloading the batch results .csv file found under Manage Batches -> Review Results. Using the downloaded file, researchers indicate payment approval and/or rejection by placing an X under the Approve and Reject columns for each worker of a batch. The file can be uploaded using the Upload CSV button, which MTurk uses to release payment to approved workers from the pre-paid funds (see Figure 3).

Longitudinal Designs

MTurk has been successfully used for longitudinal studies (Berinsky et al., 2012; Buhrmester et al., 2011). After collecting data from an initial HIT, researcher can setup subsequent HITs setting the qualification requirement to participants who completed the initial HIT and send out an invite to all previous respondents, thus allowing a researcher to calculate response rates using the number of total surveys sent out. This technique can be used for longitudinal studies, as responses at different time points can be matched using unique participant identifiers.

After qualifications have been assigned to workers, researchers can conduct longitudinal studies using two approaches: (a) passively, without contacting workers or (b) actively, contacting workers directly. The first approach, done through the MTurk Web interface, entails recruiting qualified participants by

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

posting a HIT in the MTurk marketplace, restricted to workers who meet the Qualification (see Figure 1) and wait for them to find the HIT. Research demonstrates that the passive approach to collecting data for longitudinal studies is slower than the active approach and results in relatively lower response rates as well (Chandler et al., 2014).

The second approach involves actively contacting qualified workers to invite them to complete a survey. This can be done using the MTurk Web interface, which allows requesters to contact workers individually. However, in order to send emails to multiple workers or to send mass email invitations, researchers must use the Amazon API or external software, such as R. Response rates for longitudinal studies using MTurk in which researchers actively seek participation by emailing workers have been successful. Studies conducted a week, eight days, three weeks, and three months after the initial survey were in the range of 60% to 75% response rate (Berinsky et al., 2012; Buhrmester et al., 2011; Stoycheff, 2016).

After participants have completed responses a second time, another qualification type can be assigned to them or the value for the qualification type they already have, can be updated in order to identify participants that have completed more waves of a study. Appendix C provides the R syntax for conducting longitudinal studies using the MTurkR package (Leeper, 2017). Among its multiple features, the package allows researchers to assign qualifications, group workers, contact multiple workers by email to actively seek their participation in longitudinal studies, and award bonus payments.

Subsequent waves can repeat the previous steps using participants qualified by the researcher. Responses from different time points can be matched using unique participant identifiers. Researchers have several options for matching participant responses collected at different time points. Longitudinal studies that have used the passive approach, in which HITs have been posted to the MTurk marketplace, responses can be matched using the Qualtrics unique survey completion codes. These codes are matched with the MTurk Worker ID, which can be used to match responses at different time points. When participants of longitudinal studies are actively contacted through e-mail and provided with an external survey link, they can be asked to provide their WorkerID to receive a Bonus payment for their participation. An example of a survey designed for collecting data in longitudinal studies can be found at https://uttyler.az1.qualtrics.com/jfe/form/SV_0cwBM3iNZtp2oeN. This survey asks the participants to provide their WorkerID, which can be used to match responses to previously collected data. Payment for workers' participation can be granted through the Bonus option. Bonus payments can be granted through the MTurk Web interface for paying workers individually or through the MTurkR package in R for paying multiple workers simultaneously (see Appendix C).

CONCLUSION

While we have presented a compilation of best practices and ethical considerations for survey research using MTurk, we only addressed limitations associated with survey design and deployment. MTurk's strengths and weaknesses need to be evaluated as there is no one-fits-all solution when it comes to sampling approaches. However, despite its limitations, research (Buhrmester et al., 2011; Berinsky et al., 2012; Landers & Berend, 2015; Law et al., 2017) appears to support the use of MTurk as a viable alternative for scholars. One of MTurk's major advantages, as compared to other non-traditional participant recruitment methods, is that it may help overcome one of the barriers to data collection—access to quality data at low cost.

APPENDIX 1

Table 1. Current MTurk premium qualifications pricing for common demographics

Premium Qualification (Demographic)	Fee
Age group (18-25; 25-30; 30-35; 35-45; 45-55; 55+)	$0.50
Employment status (full time, part time, unemployed)	$0.35
Gender (male, female)	$0.50
Household income (<25K, 25K-50K, 50K-75K, 75K-100K, 100K+)	$0.50
Language fluency (Chinese, French, German, Spanish)	$1.00
Marital status (divorced, married, single)	$0.50
Educational attainment = High school	$0.05
Educational attainment = Bachelor's degree	$0.50
Educational attainment = Graduate degree	$0.65
Political affiliation (conservative, liberal)	$0.40

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Table 2. Comparison of online participant recruitment services

Service	SurveyMonkey	Qualtrics	MTurk
Cost - Hypothetical Case[a]			
Cost per participant	$5.50[c]	$7	$1.54[d]
Participant Incentive	$0.50 - $1.00 donation to charity of choice	Unknown	$0.85[e] in Amazon credit
Optional Incentives	$100 - $500 sweepstakes gift card	Not offered	Bonus awards
Project Total Cost[b]	$1,650[c]	$2,100[e]	$462
Payment Terms	Cost is determined by number of survey items and target population criteria. Full amount of project must be paid in function of total *finished* responses (including disqualified responses)	Cost is determined by length/ complexity of survey. Full project amount must be paid in function of total requested responses. Qualtrics replaces up to ~10% of unusable responses (based on quality and time spent on completion)	Cost is determined at the researcher's discretion. Pre-paid purchase of responses. Amazon holds the funds until the requester approves payment for responses completed to *reasonable satisfaction*. Researcher is not required to pay for incomplete, disqualified or poor quality responses. Pre-paid funds for rejected responses go back to the requesters account and can be used to purchase more responses.
Participant Pool	U.S., U.K., Australia.	Worldwide	Worldwide
Software/Survey Design	Researcher-built survey using SurveyMonkey software. Free basic survey building tools. $25/monthly fee for tools that can accommodate more advanced question types (e.g. block randomization, SPSS export)	Researcher-built survey using Qualtrics software. PM can assist in survey design. Individual licenses currently cost $500; however, most higher education institutions use Qualtrics, and through their licenses, access may be at no cost.	Researcher-built survey using MTurk software, which has limited functionality, or any other third party software.
Customer Support	Online	Personalized. Qualtrics assigns a PM to help throughout the project.	Online

Note. [a]U.S. based full-time employees (n=300). [b]Does not include optional incentives. [c]Cost obtained using SurveyMonkey's online pricing tool, includes the $0.50 per response fee for full-time employed participants. [d]Cost includes $.0.34 MTurk Fee and $.0.35 Premium Qualifications Fee for surveying full-time employed participants only. [e]Participant incentive prorating the U.S. federal minimum wage ($7.25) to the seven-minute duration of the survey. [c]Qualtrics does not publish online panel costs; costs were obtained through a call to their sales department. Information about services was retrieved from the SurveyMonkey, Qualtrics and MTurk websites.

Chapter 34
The Standardization of Down-Streamed Small Business Social Responsibility (SBSR): SMEs and Their Sustainability Reporting Practices

Laura Corazza
University of Turin, Italy

ABSTRACT

Scholars have begun to investigate the prevalence of Corporate Social Responsibility (CSR) within the context of small and medium-sized enterprises (SMEs). This paper studies the implementation of non-financial sustainability reporting tools in Italian SMEs as part of their Small Business Social Responsibility (SBSR) long supply chain compact with large multinationals. The fundamental finding of this work is that because of the down-streaming effect of CSR reporting from large companies to small ones, SMEs approach sustainability as a standard management practice. The sample is composed of 73 Italian multi-certified entities (SA8000/ISO14001/EMAS) that have published their sustainability report online between 2011 and 2013. Principal Component Analysis (PCA) was used to discover three otherwise un-observable underlying effects.

INTRODUCTION

In 2014, almost 99.8% of all European enterprises were small and medium-sized enterprises (SMEs). These SMEs employed around 87 million people and contributed 57.6% of the overall European economic value added (EU Commission website, 2016). At the same time, SMEs are responsible for up to 70% of the total environmental pollution generated on the planet (Eurobarometer, 2012). These facts have led to a growing awareness of SMEs' significant impact in financial terms, but also in terms of their global natural environment and societal impacts. Moreover, the entire planetary economy revolves around the contributions of SMEs.

The definition of what constitutes an SME varies among countries, and within the same country over time (Ferenhof, Vignochi, Selig, Lezana, & Campos, 2014). From among the available definitions, the European Commission has adopted Recommendation 2003/361/EC, which defines an SME according to three criteria: staff headcount, annual turnover and annual balance sheet. In particular, an SME is identified as an enterprise that employs fewer than 250 employees. From the financial perspective two criteria are added: an annual turnover not exceeding 50 million euros, and an annual balance sheet total not exceeding 43 million euros. In addition, an SME must be an autonomous enterprise, that is, an independent entity. An independent entity is a firm without governance links between the firm itself and other companies. Meaning, it does not have an ownership stake in other enterprises, and no other enterprises have a relevant stake in it. If there are any cross-ownership linkages, they are not able to exert a relevant influence on the governance structure of the SME.

As stated by the Global Reporting Initiative (GRI) and the United Nations Environment Program (UNEP), multinational companies, because of economic globalization, engage SMEs in their supply chain. These SME suppliers are actually often responsible for producing the bulk of the components and services sold under the multinational's brands (GRI and UNEP, 2008). Nowadays most of the economic, environmental and social impacts of a multinational business occur through this long supply chain, and most of these impacts are then obviously due to SMEs' behaviors (Carbone et al., 2012).

The retrieval of supply chain sustainability data is often a costly and difficult process because of the lack of systematization of data collection and reporting within SMEs. As pointed out by Vázquez-Carrasco and López-Pérez (2012), although there is a growing tendency to focus on Corporate Social Responsibility (CSR) as part of the self-regulatory strategies, tools, and practices of small business environments, there are few studies critical of the tools aimed at Small Business Social Responsibility (SBSR), and fewer still on the issues of understanding, measuring, improving and reporting sustainability performances at the SME micro-scale.

The purpose of this research is to add a contribution to SBSR studies by showing how a tendentious global standardization practice arises in SMEs facing sustainability reporting because of an earlier internal commitment to sustainability. The methodology applied in this paper is Principal Component Analysis (PCA). PCA is a statistical method used to analyse the interrelationships between a large number of variables. It seeks to explain these variables in terms of a smaller number of variables, called principal components, with a minimum loss of information.

The sample for the study was chosen from among Italian multi-certified entities. By multi-certified we mean an entity that has reached at least one Management System certification on environmental issues - the International Standards Organization (ISO) international standard for environmental management, ISO 14001, or the related Eco-Management and Audit Scheme (EMAS) - and also a social environmental system certification, that is, the SA8000 certification by Social Accountability International (SAI). The selected organizations need in addition have published a sustainability report online, and have had financial information available in the Italian business database AIDA. The temporal dimension is 2013 both for financial and sustainability information. The companies selected have already been investigated in an earlier study with respect to their different managerial behaviors towards CSR by Scagnelli et al. (2013). The earlier study did not however focus on the standardization of sustainability accounting and reporting practices addressed herein.

This paper seeks to give useful insights to practitioners as to the effective application of Social and Environmental Management Systems (SEMS) to increase SBSR. On the scientific level, this study

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

would like to contribute to the ongoing debate on the need for new researches and studies on the effects of standardization of sustainability practices at the SME level.

SMALL BUSINESS SOCIAL RESPONSIBILITY (SBSR)

Two decades of studies on SBSR have demonstrated a fallacy in the use of tools when downsizing CSR to smaller scale SME organizations (Tilley, 2000; Spence et al., 2003a; Fuller and Tian, 2006; Maurillo and Lozano, 2006; Jenkins, 2004, 2006; Cambra-Fierro et al., 2008). Even in the case of tools created and tailored for SMEs, if the SME entrepreneur does not immediately recognize explicit short term benefits, then the effectiveness of the tools is still compromised (M. P. Johnson & Schaltegger, 2016). The most widely adopted tools are those pertaining to the field of Social and Environmental Management Systems (SEMs), which are aimed at transparency and ethical practices (Testa, Gusmerottia, Corsini, Passetti, & Iraldo, 2015).

Compared to managers of large firms, the small managers/owner/entrepreneurs running SMEs often do not possess all the necessary tools, resources and knowledge to implement responsible sustainability strategies. Enderle (2004) notes in addition that international standards to implement CSR may prove inappropriate for smaller firms because they have been developed thinking of large businesses (Enderle, 2004). Bürgi (2010) has noted that SEMs do help SMEs address CSR issues in management practices, and Fatoki e Chiliya (2012) and Uhlaner et al. (2012) have tested this in empirical ways. When SMEs have interests in sustainability issues, they may also be encouraged to formalize their environmental management, and this in turn may help them raise the quality of their internal management. However, a lack of formalization, especially under communication perspectives, still remains (Graafland & Smid, 2015).

Relatively few studies have been made about the role of sustainable reporting practices. There is a substantial lack of data, and as a result these studies are mostly qualitative (Borga, Citterio, Noci, & Pizzurno, 2009; Del Baldo, 2010). Of course, as several authors have pointed out, the reason for the lag in the development of a more formalized quantititative approach is substantially due to the core features of SMEs. First, informality, or "pro-activity," because it usually originates from the voluntary involvement on the part of SMEs. Then "explicit Small Business Social Responsibility" (SBSR), because there is otherwise generaly a lack of disclosure (Matten and Moon, 2004; Fuller and Tian, 2006; Del Baldo, 2010). Third, "dependency." which is understood as a close correlation between the actions of the sustainability driver within the company, often the owner or the head of a family if the company is also a family business, and the personal attitudes of the owner (Testa et al., 2015).

The authoritarian-paternalist nature of the SME owner-manager is a consequence of the nature of a smaller SME business. It is defined by high personalization, local area operation, and dependency on internal sources of capital to finance growth (Vyakarnam et al., 1997). Related, Spence and Rutherfoord (2001) have proposed four frames of priority when pursuing the purposes of the SME. These priorities can be identified as: profit maximization; subsistence; enlightened self-interest; and social capital. Within these priorities, SMEs compete in a turbulent economic environment the same as larger companies. However, SMEs face their competitive pressures with more limited cash flow, less knowledge and time, and fewer human resources. Because of this, SMEs are often skeptical when faced with business ethics dilemmas and complex sustainability programs, and tend to perceive them as a business cost with no related benefit (Spence et al., 2003). This implies the attitude of SME managers is often to

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

adopt a myopic view of the future (Lepoutre and Heene, 2006) while multitasking busily during their day-by-day routines.

An SME requires an intense participation of the owner-entrepreneur in all areas, despite of their lack of specialized knowledge in certain areas (Nooteboom, 1994). Their constant involvement, passion and motivation, and their personal relations with the community, are all essential pillars for the long-term success of SMEs. Their community relations are built on trust, reputation, and a sense of consensus and legitimacy with identified stakeholders. These relations represent the lifeblood of SMEs, but only if properly managed. SMEs seek out these intangible assets, and the related resources and competencies are often embedded within the social capital of the firm (Perrini, 2006; Williamson, 2006; Russo and Tencati, 2009; Del Baldo, 2010; Russo and Perrini, 2010; Fassin et al., 2011). At the same time, the relationships between the owner-manager of an SME and their employees are often fluid, which enables control activities to be performed more informally (Rivera-Lirio and Muñoz-Torres, 2010). The intangible assets also include the company's strategic profile, in terms of initiatives and integrated behaviors scoped within the SME's overall business strategy; the culture of the enterprise; the processes of accountability aimed at improving systems for collecting and diffusing information; and the systems of corporate governance, that is, the systems for decision-making processes and internal control (Del Baldo, 2010).

On the theoretical level, the glaring lack of theories to explain SBSR has been noted by several papers. Only recently has the work of Spence (2014) and Wickert (2016) tried to address this issue. Spence (2014) provides a feminist perspective driven by the ethics of care. Wickert (2016) presents the political role of CSR in SMEs as something that goes beyond conventional notions of CSR, as one based on the traditional economic role of corporations acting as substitutes for public good providers (Spence, 2014; Wickert, 2016).

SBSR AND THE SOCIAL REPORTING PRACTICES

The number of SMEs that have shown an interest in taking part on sustainability initiatives and in voluntary sustainability or integrated reporting activities is constantly increasing (GRI and UNEP, 2013). In general, the decision to join a given sustainability initiative or to set up specific plans or actions in sustainability is personal and depends on the morals and personal values of the owners of the firm.

The term social accountability, or the synonym social accounting, involves the preparation and publication of an account that reports the interactions and activities of a company with reference to the environment, employees, local community, customers and other stakeholders and, if possible, the consequences of these interactions and activities (Gray, 1992). Accountability then, when taken as the reporting of the results derived from sustainable actions in a transparent way, reflects the strategic importance of business objective measurements, and can help achieve competitive advantages (Castka et al., 2004; Perrini, 2006; Del Baldo, 2010; Ahmad and Seet, 2009). Conversely, other studies have demonstrated that a lack of external communication over the sustainability commitment of SMEs has public opinion and stakeholders' effects that carry over negatively into the relationships between them and the company itself (Hörisch, Johnson, & Schaltegger, 2015; Jansson, Nilsson, Modig, & Hed Vall, 2015; Johnson, 2013).

It is well recognized that the participation of SMEs in global supply chains has been influenced in recent years by the CSR actions of global buyers, and that in both developed and less developed countries. It is even more common for large global companies to require the SMEs that comprise their supply

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

chain to embrace sustainability in a cost-effective way so as to cement their competitiveness. In the last several years, global buyers that have joined global CSR actions, programs and guidelines have also started to audit their long supply chain on sustainability topics. These audits of the supply chain have in turn encouraged SMEs to adopt managerial tools designed to provide the information their buyers require. The tools selected can be divided in categories: accounting and reporting tools; management accounting and control tools; governance tools; social capital tools; management systems certification tools; network tools; and policy and strategy tools (Johnson, 2015). Recently, software and web-tools have even been developed that seek to apply a vendor rating on competitiveness, and to provide data answering to the call by the Basel Committee on Banking Supervision (BCBS) to evaluate and report the reputational risk of banks (Johnson et al., 2016).

Social and Environmental Reporting (SER) is the process of communicating the social and environmental effects of an organizations' economic actions to particular interest groups within society, and to society at large. Social accounting may contain financial information, but it is more often a combination of qualitative and quantitative information. Social accounting extends the accountability of organizations and companies beyond the traditional role of providing a financial account to the owners of capital (Gray, et al., 1996; Gray et al, 1997).

Scholars have pointed out a correlation between corporate characteristics and social responsibility disclosures. However these studies have focused on large and often publicly listed companies (Cowen, Ferreri, Parker, 1987; Carbone et al., 2012). Concerning SMEs, Rusconi (1988, 2006) stated there are two possible reporting methods: the draft of a simple social report (with some "low-cost" data), or an aggregated report (supply chain reporting or a report that combins the interests of a group of SMEs). Still, studies on sustainability reporting at the smaller scale of SMEs are fairly rare, and the present contribution directly addresses this gap in the literature.

Previous research (Olitzky, Schmidt and Rynes, 2003) has found a positive correlation between environmental and social performance through a meta-analysis methodology. But few studies have been made using PCA aimed at mapping CSR performance while focused squarely on supply chain levels (Carbone et al., 2012). Furthermore, there is a substantial lack of studies completely coherent with the argumentation of SBSR, and those that do address the topic have been mostly qualitative (Battaglia, Bianchi, Frey, & Passetti, 2014; Borga et al., 2009; Del Baldo, 2010).

METHODOLOGY

In order to set up a sound foundation for the study, a sample composed of uniformly defined multi-certified SME organizations was used. Multi-certified companies have quality, social and environmental certifications like SA8000, ISO 14001 or EMAS, ISO 9001, and OHSAS 18001. SA8000, ISO 14001 and EMAS require specific reporting duties to initially obtain and later renew the management process they certify. This makes the sample used to carry out this study on SMEs homogenous, even though SMEs as a whole are a rather heterogeneous group (Hillary, 2004; Ferenhof et al., 2014).

In order to have their managerial systems certified, certified organizations need have reported their sustainability performance indicators using a formal communication tool, be it for sustainability reporting, or as an environmental declaration or communication. Consequently, these companies have some expertise with the processes, resources and knowledge needed to report sustainability information. So it is from an analysis of these reports that we reasonably derive our assessment of the state of the art

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

status of sustainability reporting by SMEs, including the factors influencing the reports and the scope and extent of the reporting itself.

Because of the lack of earlier studies with which to compare the outcomes of this study, an exploratory approach was used. The database used has Italian firms which have obtained at least one social management system certification (SA8000) and one environmental management system certification (ISO 14001 or EMAS), and have in addition published their sustainability accounts online, be it in the form of reports, communications, or declarations.

The first step was the merge of three distinct databases, those of ISO, EMAS and SAI.

The second step focused on the collection of the aforementioned sustainability reports for the period 2011-2013, but only after two years since completion in order to include any biennial reports. In 2011, these companies were 357 in number.

Next, the economic and financial analysis data for the 357 companies was obtained from Bureau van Dijk's AIDA databases and analyzed.

Especially when first attempted, sustainability reporting may incur considerable costs for data compilation, the reporting procedure definition, the data assurance, and the publication of the results. To overcome the problem concerning the retrieval of these many reports, we collected only reports that had been published online, a total of 73.

The resulting study sample of 73 SMEs can be defined as homogeneous in the sense that all the firms have implemented the same standard procedures to obtain their certifications; they successfully capitalized on their knowledge, as evidenced by having obtained their certification; and they also were willing and able to publish their reports online.

In order to evaluate the social reporting process as part of SBSR strategies, the model of contingent forces proposed by Contrafatto (2008) was applied. Contrafatto (2008) suggests that the process of social reporting is influenced by corporate, contextual and organizational factors. Table 1 includes a rationalization of the variables considered for this study, based on their previous adoption in the literature.

As evident from Table 1, apart from the traditional economic and financial variables, we added several variables. One for regulated reporting, called *RR*, which refers to the use of standard guidelines for the preparation of a sustainability report - be they mandatory reports or management system driven reports (EMAS reports, ISO 14001 policies, SA8000 filings). One called "self-defined methodology," for voluntary non-financial reports that do not follow a shared reporting framework or a model determined by external bodies, but may follow national reporting frameworks. And one for voluntary sustainability reports that follow an international shared reporting framework or international guidelines, for example Global Reporting Initiative (GRI) or United Nations Global Compact (UNGC) principles.

A Principal Component Analysis (PCA) was performed on each data set. Then these normalized data sets were merged to form a unique matrix, and a global PCA performed on this matrix. The individual data sets were then projected onto the global analysis to analyze and outline communalities and discrepancies between variables. After this, several variables were evaluated as not fundamental in explaining the total variance, and the database accordingly reduced to comprise only those variables that simplify the complexity of the observation without material loss of information (Eastment & Krzanowski, 1982). The 7 more significant explanatory variables identified are reported in Table 2.

The correlation matrix in Table 3 shows the initial linkages between the variables.

PCA results confirm that the structure of our data is consistent over time, thus allowing for global analysis. Table 4 reports the factors, the eigenvalues for each dimension.

LEV	73	-37,454	2820,149	198,601	556,304

(*) There is only one record of a company meeting the cutoff criteria of annual turnover under $50 million euros and annual balance sheet under $43 million euros, but it exceeds the 250 maximum number of employees limit as it is a large cooperative where shareholders are at the same time also employees.

The scree plot in Figure 1 shows the relative importance of the factors, the eigenvalues of the correlation matrix, in descending order of magnitude, and the percentage of cumulative variance.

Based on the methodology applied, three dimensions explain the majority of the variance, as illustrated in Table 5 and Figure 2.

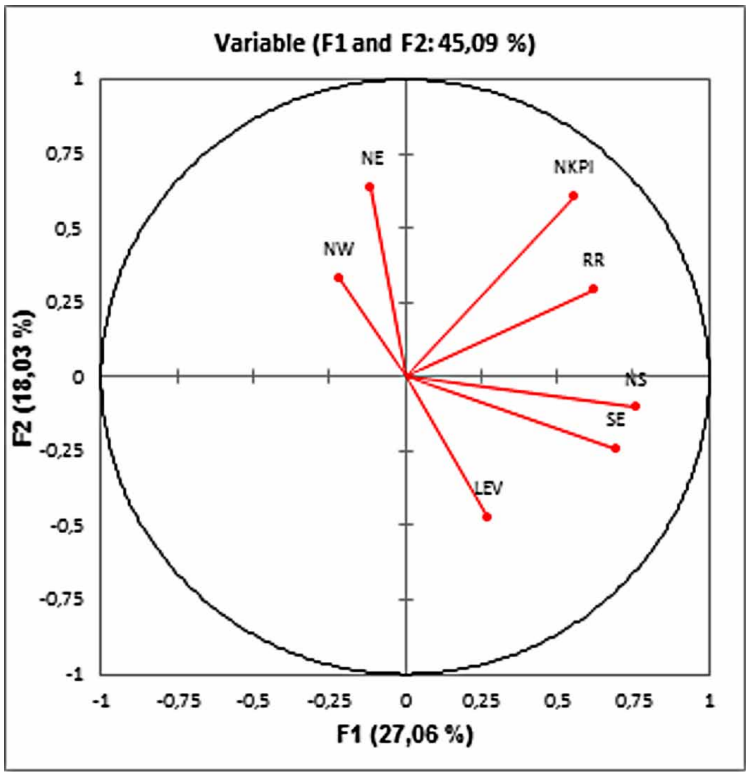
Figure 2. Three dimensions explaining majority of the variance



DISCUSSION

As seen in Table 5, the first component called F1 receives its major contributions from regulated reporting RR, the number of stakeholders NS, and whether there is stakeholder engagement SE. The pervasive credibility of the regulated report itself, the number of stakeholders identified in the report, and the presence of relationships with the stakeholders explain the first component. All three of these variables are linked to SBSR and in general to CSR. The growing awareness of the importance of stakeholder

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

engagement shifts the attention of the SMEs from traditional reporting structures and channels ("one-way communication" - companies just publishing a report without engaging with stakeholders) towards more stakeholder dialogue and other effective communication channels ("two-way communication"). The first component F1 really refers to the openness and transparency of the company. The more stakeholders influence and engaged in the SME's business activities, the more the report has been detailed according to international standards guidelines. In a sense then, this principal component F1 also deals with reputational capital.

Table 5 also shows that the second component F2 in strictly influenced by the number of employees NE and the number of accounted for Key Performance Indicators NKPI. The number of employees and the number of KPIs accounted for reflects the ability of the company to acquire specific know-how as part of the social reporting process. As noted above, within SMEs, employees are recognised as important stakeholders. This fact is evident in the mean value of regulated reporting RR. Table 2 shows the mean of RR is only around 3.164, very near to the inferior limit of 3.0 given to those companies preparing their sustainability reports according to solely social and environmental management system guidelines. This finding is evidence for the trapdoor effect of downsizing large company CSR reporting to the SME level. It appears there is a sort of standardization in social reporting practices in SMEs. SMEs are aware their social and environmental declaration is a normative aspect of the sustainability certifications they have, but they do not go further. Their reports are generally standardized and uniform in their application of the guidelines. The report content varies as the corporate dimension varies. For example, the more employees are covered by SA8000, ISO14001 and EMAS, the more the company provides indicators on them. This dimension is indeed explained by the know-how and the use of management systems as proper management accounting tools. When companies are well aware of the use of environmental management systems, then they raise their quality and more fully exploit the potentiality of their management system (Graafland & Smid, 2015).

Table 5 shows the third component F3 is influenced most heavily by net worth NW and total leverage LEV. These variables reflect the financial and capital dimensions of the SME. As also indicated by the literature presented above, F3 expresses the pressure from scarce resources and limited budgets on the SME's behaviors towards the social accounting implicit in their corporate social responsiblity sustainability reporting practices.

CONCLUSION

The use of integrated management systems allows companies to deal with social and environmental issues through more standardized and formalized processes. If a company acquires a social and environmental management system certification, it must create a report that shows it actually meets the guidelines it is supposed to adhere to. For example, if a firm has an EMAS certification, it has to report and account based on the EMAS reporting scheme requirements.

Whereas the adoption of a sustainability certification program is a voluntary decision, once adopted, the environmental accounting linked to the certification becomes compulsory. And if a firm then decides to add other voluntary Key Performance Indicators (KPIs), and so account for other societal or environmental issues, it makes progress towards a more voluntary approach to social accounting.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

We note again that the traditional and international sustainability reporting guidelines, such as the Global Reporting Initiative (GRI), the United Nations Global Compact (UNGC), and the Carbon Disclosure Project (CDP), were created with large corporations in mind, whereas SMEs prefer to exclusively report only information mandatorily included in their management system standard guidelines, roughly 15 indicators. SMEs tend to only report data mandated to be included in certified management system reports because they are annually audited on their reports by third parties. But to audit other voluntary data, companies would need to pay additional fees to the external auditors. Still, for SMEs, the audited validation of reportable data is fundamental because the first users of their data are their main customers, even if only indirectly through their membership in a long supply chain.

The results of our PCA analysis shown in Table 2 suggest that the economic and financial dimensions NW and LEV only weakly influence the attitude towards reporting activity. Regardless of the heterogeneity of the group of SMEs selected, companies publishing a sustainability report do not go beyond the required certification scheme. They do not adopt a more comprehensive vision of reporting. Instead, the Italian SMEs in this study stick to the simplest reporting possible, one that limits itself to only meeting the reporting rules required to obtain and maintain their multiple certifications. This observation is shared by the work of Johnson et al. (2016), which found that German micro-sized companies also stick to short-form, pre-defined sustainability check-lists.

One surprising result shown in Table 3 is the strong link between stakeholder engagement SE and the number of stakeholders NS. The geographical proximity between SMEs and their local environment appears to explain the ability of SMEs to interact closely with their stakeholders and obtain feedback input from them towards their reports. It appears then that in order to better manage the complexity of reporting sustainability issues in the long supply chain, the SMEs analyzed herein seem to adopt an integrated approach that combines social and environmental aspects. This tie-in could represent a significant threat to the voluntariness of Corporate Social Responsibility (CSR) because certification as revealed herein seems to encourage a more standardized and so universal approach. Additional research is needed to puzzle over the complexity of Small Business Social Responsibility (SBSR), and moreover to start thinking about SBSR from the ground up, possibly from a less imposed and regulated perspective, and more from a market-driven perspective.

Chapter 35
A Framework for Interfacing Unstructured Data Into Business Process From Enterprise Social Networks

ABSTRACT

The increased number of Enterprise Social Networks (ESN) business applications has had a major impact on organizations' business processes improvements by allowing the involvement of human interactions to these process. However, these applications generate unstructured data which create barriers and challenges to offering the data in the form of web services in a SOA environment, which again impacts negatively the business process. In this context, the authors propose a framework to interface ESN unstructured data into BP using text mining techniques. The Term frequency-inverse document frequency is used as a weighting schema in this framework. After that, the cosine similarity and k-mean are utilized to find similar values from different documents and cluster documents into groups respectively. The result of the evaluation of the framework shows promising results for retrieving social unstructured data. These results can be published into the SOA enterprise service bus using the RESTful web services.

1. INTRODUCTION

The most popular implementation of SOA is the web service. It enables business processes (BP) heterogeneous application to exchange data, communicate with each other and reuse functionality over the network. The availability of web services in SOA environments attracts organizations attention to applying the concept in new domains, such as e-business, social business and social networking domains.

Recent years have witnessed a growing number of business applications called Enterprise Social Networks (ESN). These applications can provide valuable information on running business process as they hold organizations' social data. With this data, organizations can socialize some business processes, which require human interaction or involvement. ESN also convert classical BP into more dynamic social BP. They enable internal employees to exchange experience, ideas or any topics that can enhance their organizations' BP. Moreover, ESN adopt web 2.0 features like user profile, follow, subscription, notification and streams. Therefore, embedding social data generated by ESN with business applications like customer relationship management (CRM) can integrate social and business activities through multi systems. Additionally, it simplifies the access of business and social processes from one source.

There are, however, some challenges related to the type of data generated by ESN as most of the data formed by the ESN is unstructured data. Unstructured data in ESN play an important role, as most of the ESN contents are stored in text format. For example, in user profiles, employees use text to update their professional experiences, and minutes of meetings are uploaded using text format. This data type constructs barriers to discovering knowledge from ESN in order to offer it as a web service in the SOA environment.

In this research, therefore, we propose a framework to interface unstructured data generated by the ESN into the business process using text mining techniques. The aim is to extract user expertise, project details, and any social information which can be used in daily business processes. Based on the result, web services will be generated and published into the SOA environment for reusability by BP applications.

The remaining of this research is organized as follows. Section 2 gives details about related works in the literature. Section 3 illustrates the framework followed by experiment and evaluation in section 4. Section 5 presents the conclusion and future work.

2. RELATED WORK

In recent years many research has been conducted in the field of text mining and social networks. Luo et al. (2016) introduced the double reading (DRESS) system by utilizing cloud-based technologies. They developed multiple subsystems to extract structured data elements from unstructured medical records. They developed three subsystems (LinkMR, LinkCore and LinkQC). These subsystems provide data acquisition, data security and data sharing. The authors validated their research with Kappa statistics to measure the blinded reproducibility discrete variables and continuous variable. As a result, DRESS shows a high reproducibility of 98% out of 100 patients study. It turns unstructured data into semi-structured big data by processing thousands of medical records in a few days.

The study conducted by Hong et al. (2016) used the cTAKES clinical Natural Language Processing (NLP) tool to annotate events and detect sentences. They developed a framework to transform free text diagnostic criteria into a structured Quality Data Model. Attributes of clinical diagnosis events were annotated and classified by a machine learning algorithm which is based on Conditional Random Fields

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

(CRF). The authors hypothesize that their approach can be generalized to other clinical knowledge. However, their work was limited to specific experiments of diagnostic criteria and they followed cTRAKES default configuration which affected the performance of converting free text into structured formats.

Sampathkumar, Chen and Luo (2014) used text mining to extract knowledge from unstructured text data. They present a system with three main modules: Information retrieval module, text processing module and information extraction module. The Information retrieval module is responsible for extracting useful information from data sources such as online forums using a web crawler. The text processing module processes the text data using Natural Language Processing (NLP) tools. However, the information extraction module is used to extract a relationship between entities of interest. The authors use Hidden Markov Model based text mining system to forecast the relationship between a drug and an adverse side-effect.

Chua et al. (2016) developed a method of analyzing diplomats' interactions and how to understand people before negotiating with them based on design science approach. The method depends on extracting critical information from sparse text. The method starts with preprocessing the text by removing stop words, lemmatize words and finally index words. After that, it calculates similarity based on WordNet. Finally, it generates sematic chains. The authors tested this method in 499 posts from Facebook and found it feasible to apply.

Other research, conducted by Kuncoro and Iswanto (2015) showed the efficiency and effectiveness of Term Frequency, Inverse Document Frequency (TF-IDF) in ranking the top 20 of the most followed Instagram accounts. The authors used text mining and proposed a methodology with three modules (retrieval, preprocessing, and ranking modules.) to find the keywords and ranking of image caption data posted in top 20 Instagram accounts. TF-IDF indicates that the highest ranking if the keyword is the main topic of the Instagram account. However, the authors miss the usage of TF-IDF in slang words and non-English languages.

Forss, Liu and Bjork)2014) developed a baseline system to extract people's hobbies and interest information from social media. The authors applied the TF-IDF term weighting method to determine the most common hobbies and interests. They found that key word extraction is more useful in social media, compared to sentence based extraction, since people in social media use unstructured texts. They combined keyword extraction with Name Entity Recognition and predefined dictionaries to have a broad scope.

Another framework proposed by Dang et al. (2016) retrieves fashion content from social network data based on the Vector Space Model and Supporting Vector Machine. The authors measured the importance of words in the test using TF-IDF and transformed the document text information into the Vector Space Model. Here, the authors used the Support Vector Machine algorithm to build a text classification model from a training set. The framework showed good results after it was tested with Facebook and Twitter datasets.

Kakisim, Ipek and Sogukpinar (2016) introduced a model to detect popular tags used by hackers and their followers in social networks. The authors used TF-IDF to obtain the most popular tags related to suspension groups. The outcome showed good results and figured out suspected profiles. On the other hand, Elghazaly, Mahmoud and Hefny (2016) used TF-IDF to obtain a document vector in Arabic text classification. The TF-IDF was used to weight the scheme and cosine measure was used to calculate the similarity of documents with training documents. As a result, TF-IDF showed good results even for Arabic text in social media. In contrast, Albadarneh et al. (2015) used an advance method by employing big data analytics to solve the problem of Arabic tweet authentication authorship. TF-IDF with bag of words approach was used to computer the weight of feature vectors of tweets. Moreover, Ling, He and Yingwei (2015) integrated TF-IDF with the TextRank algorithm to extract user interest from so-

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

cial networks and, based on the result, build an ontology based service recommendation framework. A common method in the above studies is that that authors use TF-IDF for text mining in their model and approaches, which proves its ability to return accurate results in field of social networks.

The medical field is another field, where researchers utilize TD-IDF for medical information text mining. Bouslimi, Ayadi and Akaichi (2016) retrieved medical images based on radiological social networks using the TF-IDF weight vector and bag of words approach. In similar research, Tefrie and Sohn (2016) built a model for to detect Ebola outbreaks based on twitter data and social network media. The authors used a bag of words and TF-IDF features to build the workflow of the system and successfully find optimal values for such outbreaks. Moreover, the study conducted by Markazi-Moghaddam et al.(2016) used TF-IDF as a weighting schema to measuring the performance of hospitals, based on social network analysis. However, to the best of our knowledge there are very little research has been conducted to extract user profile skills from ESN. This research will enable business processes to be socialized after identifying the users' skills.

3. THE FRAMEWORK

Figure 1 shows the details of our framework. It starts by crawling the ESN Uniform Resource Locator (URLs) to build the service corpus. These service corpuses are preprocessed to extract a set of keywords that are related to, and contribute to, business process and service functionality. These steps are followed by the TF-IDF module which provides the most important words in certain corpus. The results of weighting and ranking from extracted document are later used to build a web service based on the type of document (user profile information, project information, etc.). The following sections detail each step.

3.1. Web Crawler

A web crawler is used to access to the data source by retrieving document information from online sources such as ESN. Researchers refer to the web crawler as a web spider or web robot. This tool searches online data sources through a uniform resource locator (URL), and its hyperlinks.

In this work, our main data is user profile information, project information, minutes of meeting and business forums. So, the main function of the web crawler is going to be querying these types of data and keeping document information updated. Web crawlers vary from one provider to another and may consist of several main processes like a queuer, repository, parser or updater in order to provide an accurate result of the required documents (Costa et al., 2016).

3.2. Preprocessing

In the ESN field, text mining is used to prepare the textual data for analysis. In the literature, there are many methods for preparing the text before conducting further analysis. Some of these methods are "parsing the textual data, stemming and/or lemmatization, and vectorization, such as transforming the textual data into keyword vectors" (Song et al., 2016).

The real world of ESN data is inconsistent and is noisy as most of the contents are free text. There is, therefore, a need for data reduction and data cleaning using preprocessing methods. The preprocessing step's goal is to extract text from ESN user profiles and forums, and to process them into suitable

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

a format that can be weighted by the TF-IDF. Typically, this step consists of several Natural Language Processing (NLP) tools in order to prepare the text from ESN for the next step. In this study we exclude voice and video tagging.

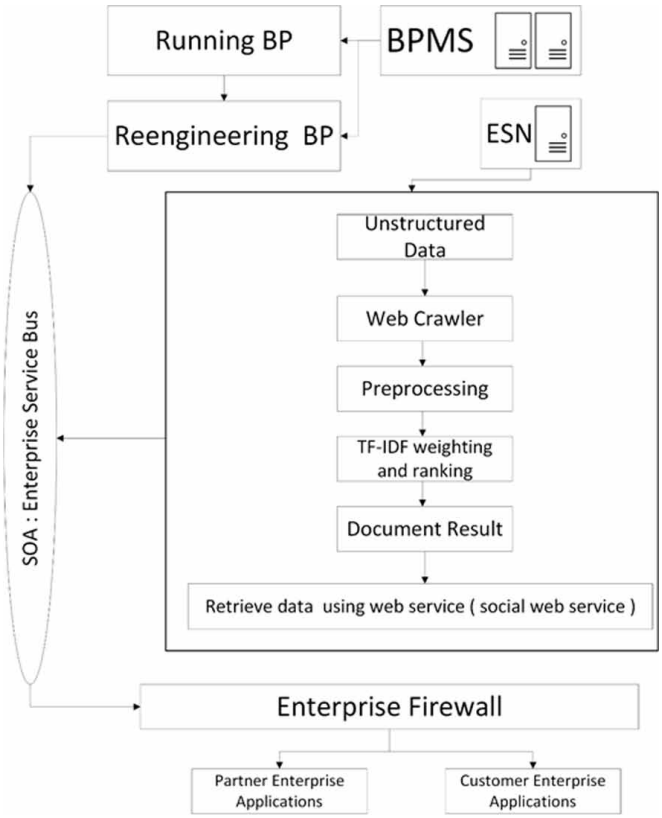
The ESN text is preprocessed as follows: 1. Tokenize text 2. Remove unwanted punctuation, 3. Filtering stop words, 4. Stemming words and 5. Index words (Figure 2 illustrates these steps). Similar processes have been used in text mining approaches like Snowball text mining systems and SMART Information Retrieval System (Chua et al., 2016).

Tokenizing a document in text mining is "the process of breaking a stream of text up into phrases, words, symbols, or other meaningful elements called tokens" (Verma, Renu and Gaur, 2014). This process identifies the most meaningful words in the document.

Filtering punctuation and stop words will accelerate the text mining by minimizing the number of words in the document. Stop words can be common words or domain specific. Removing common words like "the", "or", "is", can lead to a reduction in number of words in the document. However, attention should be paid to domain-specific stop words. In the information system domain, for example, general words such as "IT" or "PC" are not useful words when we seeking specific qualifications.

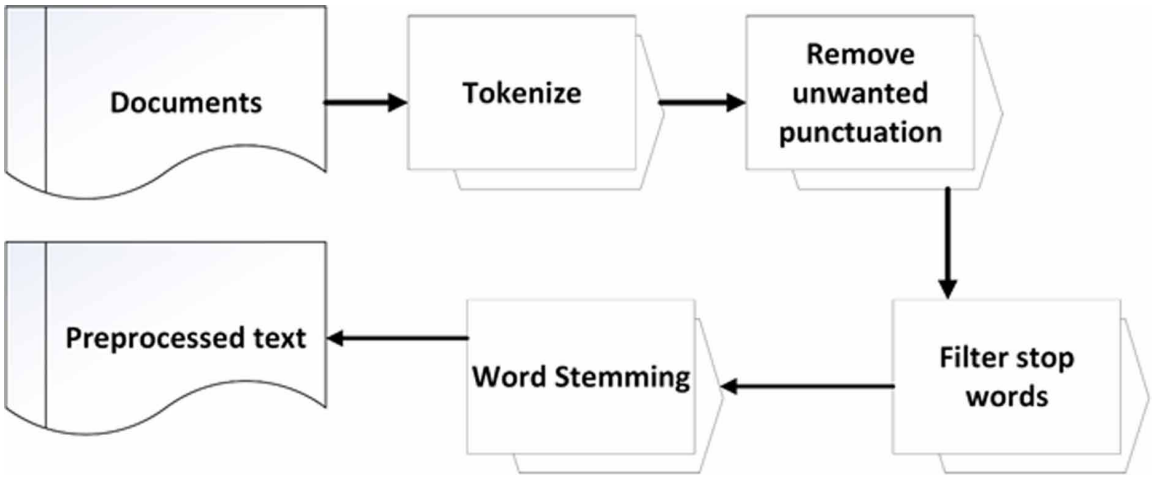
Word stemming is used in this research to return words to their root by reducing their inflectional forms. Many researchers have used word stemmers in text mining and information retrieval such as studies by (Kassim et al., 2016; Pallavi Reddy and Nara,2017; Çakir and Güldamlasioglu, 2016; M. N. Kassim et al., 2016). This process increases the accuracy of words and reduces variants. The stemming

Figure 1. The proposed framework



EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 2. The preprocessing steps



process removes prefixes, suffixes and infixes of words (Ignatow and Mihalcea, 2016). After this process has been applied to each word, the indexing process will assign an index number to each word in order to measure the frequency of its appearances.

3.3. Document Result

Documents are a set of information gathered from user profiles, project information or the minutes of meetings in the ESN. If document information satisfies the needs of the business process request, a web service will be generated from the result. For instance, a business process may fetch for certain project information from unstructured data using some key words. Once the required project is found from certain documents like minutes of meetings or a forum, a project title with basic information on this document will be generated in the form of a web service.

3.4. Web Service

In this framework, the RESTful web service is used as it is uses basic XML which makes it more flexible than SOAP and its response time and throughput are much better than SOAP (Kumari and Rath, 2015). Our previous work shows that the RESTful web service reduces the coupling between components and interaction latency even in a multi-tenancy environment.

3.5. Term Frequency-Inverse Document Frequency (TF-IDF)

In text mining, there are many methods for weighting schemes including Boolean weighting, tfc weighting, TF-IDF weighting and TF weighting (Jotikabukkana et al., 2016). Among these techniques, the TF-IDF is the most used and the popular technique for extracting words from documents and for text classification. The TF-IDF measures two statistics: the Term Frequency (TF) and Inverse Document Frequency (IDF). The TF divides the number of times the word found in the document by the total number of words in the same document:

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

$$TF\left(t,d\right)=\frac{f\left(t,d\right)}{\max\left\{f\left(w,d\right):w\in d\right\}}$$

$f\left(t,d\right)$ is the number of time the word "t" is found in the document "d", and $\max\left\{f\left(w,d\right):w\in d\right\}$ is the maximum number of words in the document.

The Inverse Document Frequency (IDF) measures how the word is important in a document(s). It can be expressed as follow:

$$IDF\left(t\right)=\log\frac{\left|D\right|}{1+\left|\left\{D:t\in d\right\}\right|}$$

From this equation, the term can be measured if it is important (rare) or just appears a lot of times in the document such as "a", "is", "and" or "this". "1+" is used in $1+\left|\left\{D:t\in d\right\}\right|$ to avoid any zero division operation. At the end the TF-IDF is calculated as follow:

$$TF-IDF\left(t\right)=TF\left(t,d\right)\times IDF\left(t\right)$$

3.6. Term Frequency Merging

The Term Frequency Merging is used to solve the problem of words appearing in more than one document. For each document, there are total numbers of words with different weights. For example, user's skill like "Exchange" in document 1 has a TF value of 0.6 with 200 total numbers of words. In contrast, the same word may have a different TF a with different total number of words in another document. Merging TF values of a specific word from different documents will not give an accurate result. In this scenario, the only way to solve this problem of finding the correct value of TF is to use vector normalization.

Vector normalization is used to identify the weight of words in certain corpuses. For example, a corpus can be a certain technology like (Microsoft) and words can be products like: "Exchange", "SharePoint" and "SQL". Word vector normalization is a way of normalizing (TF) as follows:

$$TF_{w(i)}=\frac{x_i}{\sqrt{x_1^2+...+x_n^2}}$$

where $TF_{w(i)}$ is the value of normalized word(i) and X_i is the number of occurrence of word(i). Summing TF values from different documents leads to the total number of words in the corpus.

Table 1 shows an example of three words: "Exchange", "SharePoint" and "SQL". TF with vector normalization is calculated from two different sources (user profile and discussion forums).

The value of normalization of these words from two different sources is shown in Table 2.

In the case where we have more than one resource of documents, we can use the cosine similarity technique to calculate the similarity values from different documents. The cosine similarity is expressed as:

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Table 1. TF values

		Exchange	SharePoint	SQL	$\sqrt{x_1^2 + \ldots + x_n^2}$
Source	User Profile (X)	10	6	5	12.6
	User Profile (Y)	10	6	6	13.11
	Discussion Forums	50	30	15	60.2

Table 2. Value of normalization

		Exchange	SharePoint	SQL
Source	**User Profile (X)**	10/12.6=0.79	6/12.6=0.47	5/12.6=0.39
	User Profile (Y)	10/13.11=0.76	6/13.11=0.45	6/13.11=0.45
	Discussion Forums	50/60.2=0.83	30/60.2=0.49	15/60.2=0.24
Total	**Total**	1.62	0.96	0.63

$$\left(\frac{a * b}{\|a\| * \|b\|} \right)$$

where *a* and *b* are the TF-IDF of each word of the document in the vector which can be expressed as:

$$\vec{a} = \left(a_1, a_2, \ldots\right) \text{ and } \vec{b} = \left(b_1, b_2, \ldots\right)$$

and $a * b$ is the Euclidean length between documents.

From the cosine similarity technique, we can find out the highest score of words from certain documents, which gives us the indication of the right document to be retrieved as a web service.

From the above example, suppose that a BP application runs this query to retrieve skilled people in the SharePoint field: “certified employees in SharePoint installed in SQL server”. This query gives us these word vectors as shown in Table 3.

From Table 4, we can conclude that user Y has more experience in SharePoint than user X as his cosine similarity score at 0.64 is higher than the 0.61 of user X.

Another widely used technique is K-means which groups similar documents into clusters by finding similar words in these documents. It is a clustering algorithm based on the distance between points. Similar objects are grouped together into a cluster based on the close distance with high similarity.

Table 3. Word counts of the query

Exchange	SharePoint	SQL
0	1	1

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Table 4. Cosine similarity

Source	Cosine Similarity
User Profile(X)	0.61
User Profile (Y)	0.64
Discussion Forums	0.52

The K-means algorithm works as follows (Aggarwal and Reddy, 2013):

- Choose data points *K* called "Centroids "to be a center of the cluster;
- Find the best centroids by choosing points in the center of a certain cluster or allocate data points to clusters based on existing centroids (see Algorithm 1).

4. EXPERIMENT AND EVALUATION

Evaluating any type of artifact including a framework should include integration of this artifact within a technical business infrastructure. There are various evaluation methods in the literature. The most appropriate evaluation method for this framework is the observational method where a case study can be investigated deeply in business environment (Von Alan et al., 2004). However, since this framework has not yet been fully implemented, the descriptive evaluation method will be followed where real scenarios will be taken from an existing company that uses ESN in its daily business besides their BP application. This scenario will demonstrate the utilization of the framework.

4.1. Scenario: The Innovation and Support Center (ISC)

4.1.1. Problem

The ISC provides information technology services to other Government organizations and citizens such as cloud hosting services, security services and technical support. The ISC decides to utilize its current internal information systems, which are hosted in the ISC private cloud, by adopting the SOA to fill the gap of some missing features in its systems and to enhance the collaboration and data exchange between systems and databases. The main goal is to redefine the BP to be more agile and flexible and to find new services, which can improve the business and its e-commerce and at the same time improve the maturity of the center.

Algorithm 1.

```
Choose K points as initial centroids.
     Repeat
               From K clusters: allocating data point to its closest centroid.
               Precompute clusters centroid.
     Until meeting criterion.
```

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

The ISC is using ESN that has a large amount of information about the organization and employees in the form of structured and unstructured data. Structured data can be found in the ESN database, while unstructured data is available in form of free text like forums, business minutes of meeting logs and user profiles. However, other systems such as the BPM system, ERP system and CRM system were implemented years ago, and operate mainly inside the organization.

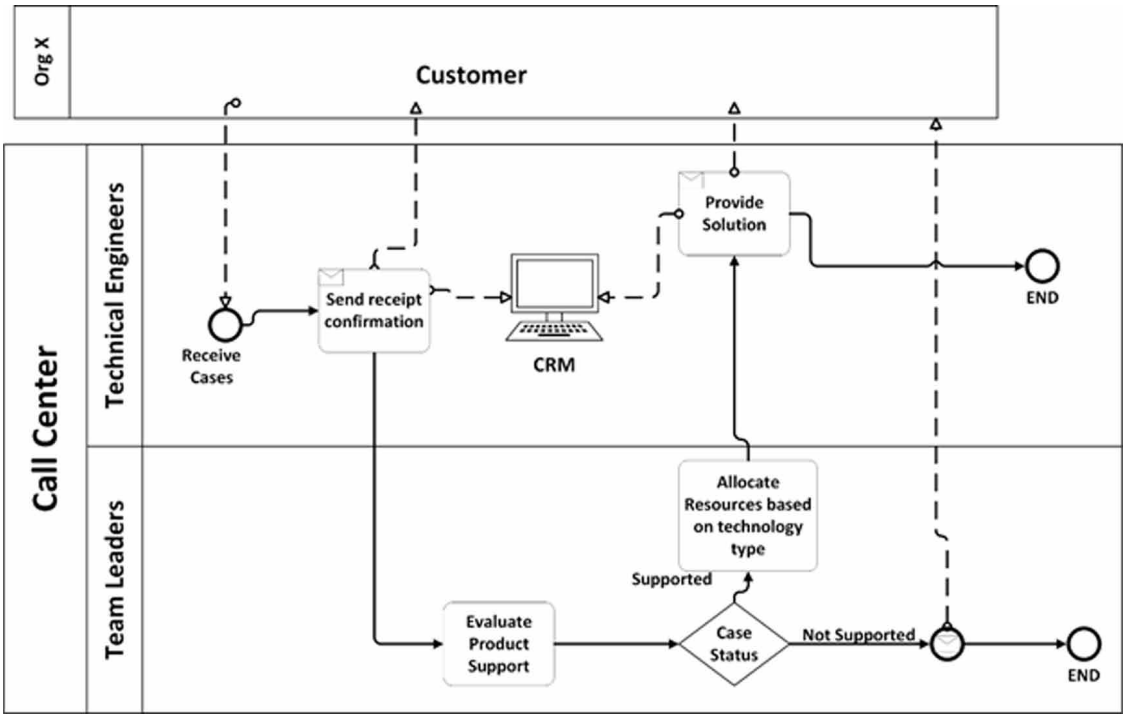
The ISC is willing to extract web services from ESN and reuse them into BPM, ERP and CRM after reengineering the BP and workflow to allow these systems to interact through web services in the SOA environment. The ISC needs to reuse the unstructured data generated in ESN user profiles and allow customers to interact with its employees according to their skills (obtained from ESN as a service) in specific products or technology. The only way to find proper resources from the user profiles is to use text mining techniques as explained in the next section.

Figure 3 shows the ISC current business process of the call center. It starts by receiving requests in the form of emails from the customers' side. In this process technical engineers record these calls in the Customer Relationship Management (CRM) System and send email confirmation to customers about the newly opened case. After that, team leaders evaluate case types manually and allocate human resources to start solving these cases. This BP slows the ISC revenue and return of investment in ESN as almost all processes are manually performed.

4.1.2. Solution

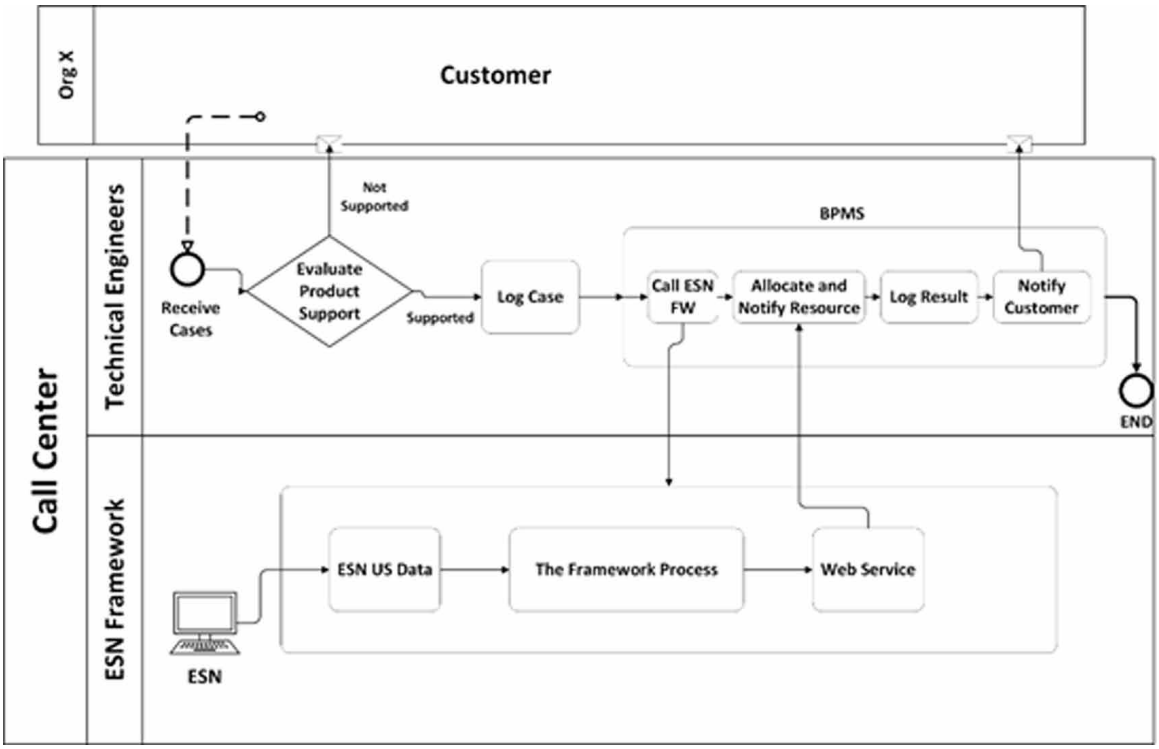
In our solution, we started by reengineering the ISC BP to align with our proposed framework as shown in Figure 4. After receiving requests from the customers' side, technical engineers evaluate the support

Figure 3. BP before reengineering



EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 4. The reengineered BP



eligibility before logging the case into the BP management system (CRM in this case). The CRM will start the business process by calling the proposed framework. This framework applies the processes as detailed in section 3, and provides the CRM with appropriate resources in form of web service.

In our experiment of this proposed framework, we retrieved user profiles from the ESN of the ISC which has 11 technical employees who are dealing with customers. We excluded administrative people. Each of these employees has a different field of experience in some particular technologies. An example is listed in Table 5.

Each employee profile is considered as a document set. These documents are preprocessed as explained in section 3 using an open source text mining tool (Rapid miner). After the preprocessing steps, the TF-IDF technique is used which generates TF-IDF values for each word in all documents. Table 6 shows the TF-IDF values of each word in each document. For instance, the highest TF-IDF value of the word "active" can be found in document 10, while Table 7 shows top words with how many numbers of occurrences in documents.

Table 5. Employee field of expert

Employee	Experience/ Field of Expert
Employee(1)	System Center, Windows Server 2008, Windows Server 2012, Windows Server 2016, TMG, Windows Security
Employee(2)	SharePoint 2010, SharePoint 2013, SQL Server 2008, SQL Server 2012, Active Directory, Windows Server 2008, Windows Server 2012, Windows Server 2016

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

According to those tables, the "Active Directory", "Windows Server" and "Exchange" are the most frequent words in the whole dataset. However, there is a similarity between documents for some words. For instance, the user profiles for Mohammed and Asim have the same value of total occurrences of the word "server". Furthermore, Mohammed's and Ahmed's profiles show the same number of occurrences of the word "windows". In this case, and to find the similarity of documents (close profiles to certain field of experience), the cosine similarity is used to compare all the retrieved documents. The sample result of cosine similarity in Table 9 shows that documents 4 and 6 have the highest similarity "1", followed by document 2 and 5 which has 0.761 similarity value. Evaluating documents 4 and 6 manually shows this result is accurate as illustrated by Table 8. In addition, after asking Asim and Ghalib about experience and daily work, it was found that they were doing the same tasks on a daily basis.

Moreover, the K-means algorithm is used to group documents that are similar to each other and to evaluate the results in Table 9. Running K-means with different k values (2, 3 and 4) shows more precise results, as Table 10 illustrates. The algorithm gives a better result when $k=4$ is compared to $k=2$. As shown in Table 10, when k=4, four clusters are generated and each cluster contains similar resources. After evaluating user profiles documents manually, we found that the result of K-means the clustering

Table 8. Documents 4 and 6 text

Document	Document Text	Profile
Document(4)	SharePoint 2010,Sharepoint 2013,SQL Server 2008,SQL Server 2012,Active Directory, Windows Server 2008,Windows Server 2012,Windows Server 2016	Asim
Document (6)	SharePoint 2010,SharePoint 2013,SQL Server 2008, SQL Server 2012,Active Directory, Windows Server 2008,Windows Server 2012, Windows Server 2016,	Ghalib

Table 9. Cosine similarity result

First Document	Second Document	Similarity	First Document	Second Document	Similarity
4	6	1	9	10	0.002
2	5	0.761	4	10	0.002
10	11	0.737	6	10	0.002
2	10	0.485	6	8	0.002
8	10	0.470	1	8	0.002
5	7	0.469	2	9	0.001
2	3	0.429	2	4	0.001
4	9	0.369	2	6	0.001

Table 10. Clustering model (k = 2, 3 and 4)

k = 2			*k = 3*			*k = 4*		
Id	**Label**	**Metadata_file**	**Id**	**Label**	**Metadata_file**	**Id**	**Label**	**Metadata_file**
1	Cluster_1	Ahlam.txt	1	Cluster_0	Ahlam.txt	1	Cluster_0	Ahlam.txt
2	Cluster_1	Mohammed.txt	2	Cluster_0	Mohammed.txt	2	Cluster_0	Mohammed.txt
3	Cluster_1	Ahmed.txt	3	Cluster_2	Ahmed.txt	3	Cluster_1	Ahmed.txt
4	Cluster_0	Asim.txt	4	Cluster_1	Asim.txt	4	Cluster_2	Asim.txt
5	Cluster_1	Fatma.txt	5	Cluster_0	Fatma.txt	5	Cluster_0	Fatma.txt
6	Cluster_0	Ghalib.txt	6	Cluster_1	Ghalib.txt	6	Cluster_2	Ghalib.txt
7	Cluster_1	Halah.txt	7	Cluster_0	Halah.txt	7	Cluster_0	Halah.txt
8	Cluster_1	Mubarak.txt	8	Cluster_2	Mubarak.txt	8	Cluster_3	Mubarak.txt
9	Cluster_0	Qais.txt	9	Cluster_1	Qais.txt	9	Cluster_2	Qais.txt
10	Cluster_1	Shabib.txt	10	Cluster_2	Shabib.txt	10	Cluster_3	Shabib.txt
11	Cluster_1	Suli.txt	11	Cluster_2	Suli.txt	11	Cluster_3	Suli.txt

result is very precise. The data related to "Exchange servers" comes under one cluster, the "security" set is the second cluster, "portal and SQL servers" related data are gathered into another cluster, and finally data related to "directory service" are grouped into the fourth cluster.

The cosine similarity shows that documents 4 and 6 are similar. At the same time the k-means algorithm indicates that both 4 and 6 documents occur in the same document where (k=2 or 3 or 4). The same applies to documents 2 and 5 where the cosine similarity value is close to one and they are in the same cluster. Moreover, cluster 3 consists of 4 documents (3/8/10 and 11) which are very similar if we refer to the cosine similarity values between (10 and 11), (8 and 11) and (3 and 10).

To conclude, cosine similarity and k-means provide the same results which validate the accuracy of returned results of the TF-IDF by grouping documents (user profiles) into clusters.

The next step is to retrieve user information from ESN user profiles and convert it into the RESTful web service before publishing it into internal service bus to measure the performance and quality of the web service.

5. CONCLUSION AND FUTURE WORK

Interfacing ESN unstructured data into BP is a major challenge facing organizations. In this research, we have developed a framework based on text mining to retrieve useful information from unstructured texts of the ESN. The framework crawls ESN by retrieving document information and preprocesses texts using tokenization, stop word removal and stemming. After that, weighting words using the TF-IDF algorithm is used to return the most frequent words.

At this stage, the framework is evaluated using a descriptive evaluation method. A real case study is taken from the industry and the TF-IDF technique in ESN is applied to user profiles to generate a TF-IDF value for each word in all documents. The result is evaluated using cosine-similarity to compare

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

and find similar experts in certain fields using user profiles. Furthermore, that, the k-means algorithm is used to find groups of documents that are similar to each other. Both cosine-similarity and k-means algorithms provide the same results which shows the accuracy of returned results of the TF-IDF.

In future work, the framework will be developed to retrieve useful information based on TF-IDF results in form of a RESTful web service and it will be published into internal service bus.

Chapter 36
Software Process Paradigms and Crowdsourced Software Development: An Overview

Nitasha Hasteer
Amity University, India

Abhay Bansal
Amity University, India

B. K. Murthy
Centre for Development of Advanced Computing, India

ABSTRACT

Production of quality software requires selecting the right development strategy. The process and development strategies for creating software have evolved over the years to cope with the changing paradigms. Cloud computing models have made provisioning of the computing capabilities and access to configurable pooled resources as convenient as having access to the common utilities. With the recent advancements in the use of social media and advent of software development through crowdsourcing, the need to comprehend and analyze the traditional process models of software development, with regard to the changed paradigm have become ever more necessary. The changes in the way software are being created and the continuous evolution in the processes of development and deployment has created a need to understand the development process models. This chapter provides an insight on the transition from the conventional process models of software development to the software development methodology being used to develop software through crowdsourcing.

INTRODUCTION

Software is a product and also a vehicle for delivering a product. Engineering of this Software is termed "Software Engineering". The term Software Engineering was coined at a NATO Conference in 1968 (Naur & Randell, 1968) and is defined as the systematic approach to the development, operation, maintenance and retirement of the software. The systematic approach enables the production of high quality software and focuses on the activities directly related to the production of the software and thus these activities form the core of a software project. The approach defines the tasks and the order in which they should be executed. The software development approach that we deploy plays a critical role in the quality of software being developed. A non-systematic development approach will produce software of low quality that may not meet user expectations and also might incur additional cost of development. Software engineers use software development models for creating fault free software that meets the requirements of the end users and is delivered within the pre specified time limit and budget. Following a non systematic approach and developing software without the use of development models, not only violates the budget and time deadlines but also results in creation of low-quality software that would be difficult to maintain.

Software development is a creative and ever evolving area. Organizations use various software development process models and methodologies for developing software. A Software Process Model defines the stages in which a project should be divided, order of execution of these stages, and other constraints and conditions on the execution of these stages (Pankaj, 2010). The process models are based on the paradigms of software development and have undergone evolution from their inception to the present times. From the first published water fall model in 1970 to the Agile Software Development Methodologies until the recent times, the software industry has seen the evolution over years to help the industry cope up with the changing scenarios. There exists some generic process models and many variations of these generic process models have been proposed and in practice a combination of different models may be used. A generic process model defines five key activities: communication, planning, modeling, construction and deployment (Pressman, 2014). Each generic model describes a process flow that describes the activities and tasks along with their sequence of occurrence.

The computing paradigm has seen a revolution with the advent and popularity of distributed computing. Gone are the days when organizations used to buy additional hardware to increase the computing capabilities of the systems. Cloud Computing has much changed the way organizations operate and do business. According to the definition given by the US National Institute of Standards and Technology (NIST), Cloud computing is a model for enabling ubiquitous, convenient, on-demand network access to a shared pool of configurable computing resources (for e.g., networks, servers, storage, applications and services) that can be quickly provisioned and released with minimal management effort or interaction of the service provider (Mell & Grance, 2011). This framework provides three service models and four deployment models. The service models are Infrastructure as a Service (IaaS), Platform as a Service (PaaS) and Software as a Service (SaaS). The deployment of the distributed network can be as a Public, Private, Hybrid or a Community cloud. The software that is created for the cloud is designed and developed to cater to the multi tenancy architecture. The task of creating such software requires process models and frameworks that could incorporate all the security requirements of the multi tenancy environment (Hasteer, Bansal, & Murthy, 2013). The development methods, tools and models for engineering cloud services needs attention and must be addressed to realize the potential of the technology completely as the cloud drives new needs.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Regardless of the model being used for development, it has always been important for all the team members to have a precise understanding of the software product developed and have coordination among them. In today's scenario, the social media has drastically changed the landscape of software engineering (Storey, Singer, Cleary, Figueira Filho, & Zagalsky, 2014). Social networking has made the creation of "virtual communities" possible through various web based hosting services. Social networking and social software are becoming prominent in every aspect of our life (Begel, Bosch, & Storey, 2013). People from all around the world have started demonstrating an unprecedented social behavior, wherein they are coming together and joining hands to perform tasks, usually for little or no money, that were once the sole province of employees. This phenomenon commonly known as 'Crowdsourcing', is sweeping through industries ranging from professional photography to journalism to sciences, to software development (Howe, 2006). The objective of crowdsourcing software development is to produce high quality and low cost software products by harnessing the power of the crowd. To meet this objective, the crowd workers who agree to work on the task are given some financial or social incentives. Large numbers of people coordinate and compete to solve complex problems. Through participation and closer coordination among large number of people and use of new computing and communication technologies it is possible to address a wide range of problems through crowdsourcing. Wikipedia is considered to be one such Technology Mediated Social Participation System(TMSP) (Kraut, Maher, Science, Olson, & Thomas, 2010).

BACKGROUND

Several studies in literature focus on different types of process models and their evolution. The choice of methodology for a software project has varied largely due to the diversity in nature and type of software applications. Technological advancements too have led to new paradigms of software development. The development of software by outsourcing it to different organizations has been in practice for quite some time now. But the use of cloud to outsource the development of software to a crowd is new and is relatively in its nascent stage.

The term Crowdsourcing was coined by J Howe in 2006 through his article 'The Rise of Crowdsourcing' in the wired magazine (Howe, 2006). Researchers have described Crowdsourcing as a problem solving model that makes use of collective intelligence and wisdom of the crowd. It has been termed as a flexible model that is applicable to wide range of activities from producing consumer goods and media contents to creating software. Many crowdsourced platforms are coming up to solve complex problems and facilitate the development of software. Organizations like RentACoder, oDesk, Elance, Topcoder, uTest adopt different approaches for crowdsourcing (R., A, & Eric, 2010). Most of these organizations serve as a liaison between the free lance software developers and the clients. They provide workforce to the clients and in return take payment of the same. Some organizations on the other hand provide the solution and get payment from the client for developing complete software from crowd workers. To understand the

role that social networking plays in software development, Andrew Begel et al. (2013) conducted interviews with leaders from GitHub, MSDN, Stack Exchange and TopCoder. The focus of these interviews was to understand these social networks, their features and to know the incentives given to encourage participation. Their work reveals the evolution, hurdles faced and the future of crowdsourcing software development.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

PROCESS MODELS

A 'Process' is defined as the collection of activities and tasks to be performed for creation of a Product. Activities describe broad objectives and tasks focuses on small and well defined objectives. The activities and tasks reside within a framework that describes their relationship with one another. These frameworks are termed 'Models'. A Process Model provides a useful framework and a roadmap for software engineering work to all concerned with the development of a product. It is defined as an abstract representation of a design process, which in turn is a structured set of activities required to conceive a full software system or parts of it.

Changes in technology and improvement in the hardware affects the process of software development. Any organization involved in development of the software requires choosing the right kind of process model for executing the project. Depending on the complexity of the software, nature and scope of the project and tools used for developing the software different process models are chosen. Due to the diversity in the nature of the projects, designers and developers many a times find it difficult to stick to one process model and may change the implementation of the model during the development process. The literature reveals many generic process models and also shows how these models have changed with time to cater to the changing development paradigms.

Classic Life Cycle Model

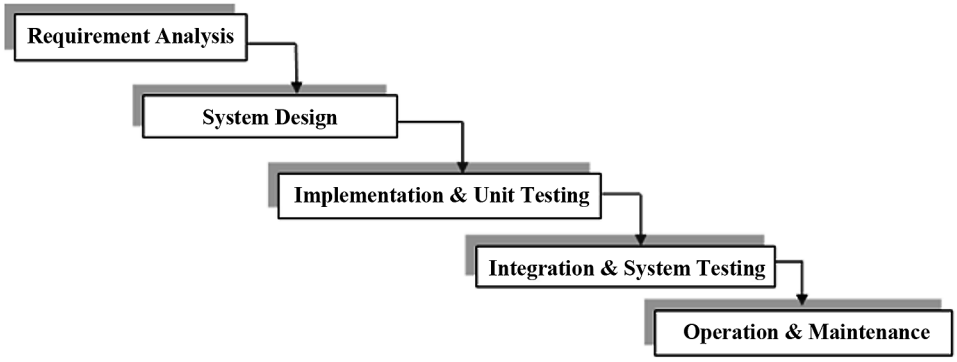
The classic lifecycle model, popularly known as the waterfall model or a linear model is one of the oldest and the simplest process models. The model follows a sequential approach to the development of software. The model was originally proposed by Royce in 1970 (Royce, 1970) and later has been modified depending on the nature of the activities. The phases of this model moves linearly from the specification of the requirements to design, implementation, testing and operation. The end of one phase and the beginning of the other is clearly marked in the model. The fundamental activities in the model are well defined and are as listed below:

- **Requirement Analysis:** The purpose of this activity is to define in detail the system specifications. The goals and constraints of the system are established in discussion with the customer during this phase. It focuses on analysis of the requirements and planning for them.
- **System and Software Design:** The purpose of this activity is to establish the overall system architecture. The phase focuses on identifying and describing the software system abstraction and their relationship.
- **Implementation and Unit Testing:** The implementation phase deals with converting the design to a set of programs and testing at a unit level ensures that each unit meets its specifications.
- **Integration and System Testing:** During this phase the individually tested components are integrated and it is ensured that the software meets the requirements.
- **Operation and Maintenance:** During the operations phase, the software system is installed and put to use. Maintenance phase involves correction of any errors that went unnoticed during the earlier phases of the life cycle.

The model is illustrated in Figure 1 and is a good choice for the projects where the requirements are well understood and the project is a routine type of project. Although very popular, this model has some

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 1. Water fall model

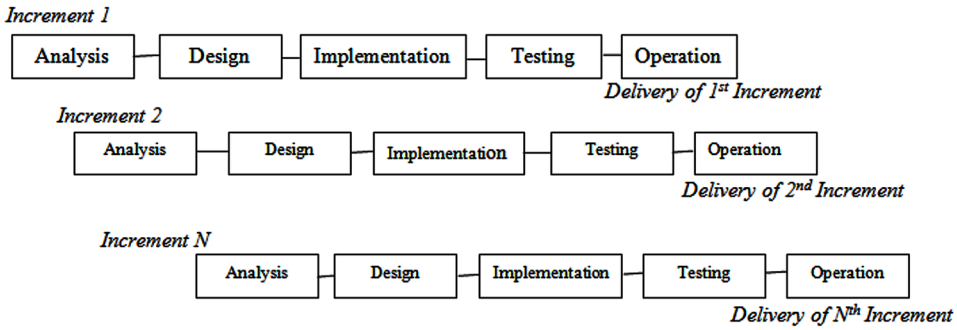


constraints. It is a rare possibility to have a smooth sequential flow of activities in case of real projects. Additionally, the model requires all the system requirements to be well defined at the start of the project that may not be feasible in most of the projects. Since the technology changes at a rapid rate and in case of a project that extends to few years, freezing of the requirements at an early stage might result in developing a product that would work on an obsolete technology. This model requires formal documents at the end of each phase. Further, since the developed product is delivered at the end, the working version of the software is not seen until late in the process. In today's world, development of software is fast paced and changes are frequent. This makes the use of waterfall model inappropriate in many cases.

Incremental Process Model

The incremental model combines the elements of linear and parallel process flows. The model applies the linear sequences in a staggered fashion. At the end of each linear sequence a deliverable increment of the software is produced. In this process model, the customers identify the services to be provided by the system. The requirements for the services that are to be delivered in the first increment are then defined in detail. The increment is completed and delivered to the customer and then further requirement analysis for the later increments is done. The model is illustrated in Figure 2. Though these models have lower risk of project failure because of a working version seen early, it sometimes can be difficult to map the customer requirements to a small sized increment.

Figure 2. Incremental process model



EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

AGILE MODELS

In the earlier decades of software development, software teams used to do work under defined roles and with the help of defined models and practices to execute a well defined plan. The traditional models that were used for development were rigid. In the present times, the resource, schedule, cost and other constraints are managed effectively with the help of agile methodologies. The Agile processes have a group of software development methods that focus on iterative and incremental development. These models replace high-level design with frequent redesign during the development process. All agile models are based on the incremental development and delivery concept and have different processes to achieve their objectives, though sharing the same set of agile principles. These models enable the development of high-quality, adaptive software by small teams using the principles of continuous design improvement and testing based on rapid feedback and change. Some of the popular agile models are Scrum, Extreme programming (XP), Crystal, Adaptive Software Development (ASD) and Feature Driven Development (FDD). The scope of this chapter focuses on detailed discussion on Scrum Based Development.

Scrum Development

For decades organizations have relentlessly pursued to create optimized and repeatable processes. Out of the many models of agile, scrum based development is one lightweight methodology that has been used to develop complex products since 1990 (Tuli, Hasteer, Sharma, & Bansal, 2014). Scrum based development uses an iterative and incremental approach to optimize predictability and control risk while developing software. The Scrum framework is transparent, is inspection based and encourages adaptability. It includes a set of Scrum teams and their associated roles. The process is time boxed and has a set of defined artifacts and rules (Schwaber, 2009).

Each Scrum Team has the following three important roles in a project:

1. **Scrum Master:** The Scrum Master acts as a facilitator whose job is to resolve obstructions and also to help in creating a self-organizing environment. He is responsible for ensuring that the process is thoroughly understood and rigorously followed.
2. **Product Owner:** The product owner is responsible for product vision, maximizing return on investments, prioritizing the product backlog, and also deciding whether to continue development or not under certain conditions. Product backlog is a list of customer-centric features. Product owner is responsible for maximizing the value of the work that the scrum team does and ensuring the completion of tasks as specified in the product backlog.
3. **Scrum Development Team:** The team is responsible for doing each and every task as assigned by the product owner within the sprint deadline. The composition of the team is usually small. A team of 5-7 members is made to carry out the development tasks.

The core of a Scrum is a Sprint, which is an iteration of one month or less that is of consistent length throughout the development effort. One sprint follows another and Scrum methodology uses time boxes to create and ensure regularity. Processes of Scrum that are time boxed are the Release Planning Meeting, the Sprint Planning Meeting, the Sprint, the Daily Scrum, the Sprint Review, and the Sprint Retrospective.

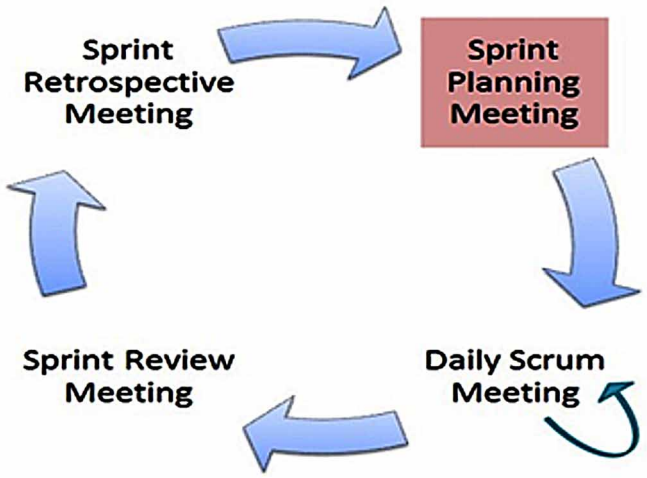
Scrum Master works with the customers and management to identify and establish a Product owner and then ensures that the Scrum team follows the Scrum rules and that the adoption process is smooth

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

and continuous. The Scrum teams are self organizing teams and are cross functional. The Product Owner has the responsibility of managing the Product Backlog. His responsibility is to ensure the value of the work that the 'Team' is contributing along with the prioritization of the Product Backlog. The members of the Scrum Development team are responsible for translating items of the Product Backlog into increments of deliverables at every Sprint. The members possess all required skills to create and deliver an increment. The optimal size of the team as specified earlier is generally from 5 to 7 members. Teams do not have sub teams and the composition of a team may change at the end of a Sprint.

Sprints are time boxed iterations. Sprints consist of the Sprint Planning meeting, the development work, the Sprint Review, and the Sprint Retrospective. There is no gap between successive Sprints and each Sprint has a goal which is an objective that covers a defined scope of a Product Backlog to be accomplished. The goal is met by successful implementation of the same. Product owner has the authority to cancel a Sprint, in case of a Sprint goal getting obsolete. During a Sprint planning meeting, the Product owner presents the top priority Product Backlog to the Scrum Team. Team figures out what functionality is to be developed during the next Sprint and how it can be developed. A list of tasks required to convert the Product Backlog into working software is formulated. It is called a Sprint Backlog. At the end of a Sprint, a Sprint Review meeting is held wherein the Product Owner identifies what has been accomplished so far. The Team discusses the issues encountered during Sprints and how they managed to solve them. The Team then demonstrates the work that has been accomplished. The Product Owner then discusses the Product Backlog as it stands, in the presence of the Scrum Master. The Sprint Review provides valuable inputs to subsequent Sprint Planning meeting. After the Sprint Review and before the next Sprint planning meeting, the Sprint Retrospective meeting is held. The purpose of the Retrospective is to inspect how the last Sprint went with regard to people, relationships, process and tools. The focus is to inspect Scrum team composition, methods, processes. Each Scrum development team meets daily for 15 minutes for a status check and to see the progress towards attaining the Sprint's goal. These Daily Scrum meetings helps to identify gaps, improve communication and promote quick decision making. The flow of various Scrum meetings in Scrum based development of software is illustrated in Figure 3.

Figure 3. Scrum meeting flow in Scrum based development



EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Following are the artifacts of the model:

1. **Product Backlog:** It is a list of prioritized requirements that are needed for the development of the end product.
2. **Sprint Backlog:** It is a list of tasks to turn the Product Backlog for one Sprint into an increment of potentially shippable product.
3. **Release Burndown:** It is instrumental in measuring remaining Product Backlog across the time of a release plan.
4. **Sprint Burndown:** It measures remaining Sprint Backlog items across the time of a Sprint.

The Product Backlog usually has User Stories and represents everything required to develop and launch a successful product. It contains list of all features, functionalities, enhancements, technologies, and bug fixes that consist of the changes that will be made to the product for its future releases. The items contained have attributes of description and priority. The Team modifies Sprint Backlog throughout the Sprint, as well as Sprint Backlog that occurs during the Sprint. The Sprint Backlog has a list of tasks the Team performs to turn Product Backlog items into an increment and it is a real picture of the work that the team plans to accomplish. A Burndown measures the remaining backlog over time. Sprint Backlog Burndown is a graph of the amount of Sprint Backlog work remaining in a Sprint across time in the Sprint. The Release Burndown graph records the sum of remaining Product Backlog estimated effort across time.

CROWDSOURCING

A revolution that marks the rise of online community made up of like minded individuals who work together or compete with each other to deliver solutions to problems is termed Crowdsourcing (Howe, 2008). One of the oldest known commercial crowdsourcing applications is Amazon's Mechanical Turk (AMT) that was launched in 2006. It is a market place for small tasks that cannot be easily automated (Ipeirotis, 2010). Crowd workers called 'Turkers' select 'Human Intelligence Tasks' (HITs) from this market place of work that matches their interests and abilities. This gives them freedom to work as per their convenience and also gain financial and social incentives. Some work for fun and others for gaining extra income or to earn a reputation. HITs on AMT platform are generally of the kind like characterizing data, transcribing spoken languages, or creating data visualizations. What makes crowdsourcing interesting is that virtually everyone and anyone can contribute. The proliferation of crowdsourcing practices indicates a new peer production paradigm (Doan, Ramakrishnan, & Halevy, 2011). It has been classified into various typologies based on its aim of practice. Typologies vary depending on whether the power of crowd is being used for solving complex problems (crowd wisdom), or for seeking a creative input (crowd creation), or for opinion polling (crowd voting), or for the purpose of outsourcing tasks (crowd production) and or for raising money (crowd funding) (Kleemann & Voß, 2008). Crowdsourcing is efficient with the right community at place and for gathering information quickly and effectively. It is inexpensive and can fill the information gap quickly.

Crowdsourcing as described earlier is also an emerging form of outsourcing software development. Software development process is revolutionizing from the usual outsourcing to an organization or a client to the outsourcing to the masses. The idea of crowdsourcing software development is to take the

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

services of voluntary online community to build software rather than taking the services of traditionally employed workers. Enterprises can outsource the task of developing software to the general crowd in either collaborative or competitive manner and can have access to scalable workforce. In a collaborative crowdsourcing environment, people collaborate to produce software products. Competitive crowdsourcing on the other hand is reward based.

Organizations can harness the power of crowd and take benefit of Crowdsourcing in order to produce quality software, and have reduction in the total cost incurred on the development process. Apart from these direct benefits, there are many other reasons why organizations would like to get software developed through crowdsourcing. Some of the benefits include rapid acquisition of the solution, identification of talent, and promoting diversity of ideas, broadening participation, better marketing and encouraging the use of some specific tools.

Software Application Development Methodology

Many platforms for facilitating software development through crowdsourcing are coming up. One such successful TMSP platform is TopCoder. TopCoder founded by Jack Hughes is one of the largest competition based software development portal that posts software development tasks as contests. The business model at TopCoder has been refined since its inception to accommodate the changes in the software industry. However its USP has always been the competition based software development approach (R. et al., 2010). The platform has an online community of digital creators who compete to develop and refine technology, various web assets, perform extreme value analytics, and develop mobile applications for customers. This commercial crowdsourced platform has seen significant growth in its community members in the past few years, which itself speaks volumes about the popularity of the platform. Many organizations are using the services of this platform, to develop low cost software. The platform has also been successfully used to develop spaceflight software for small satellites among many other projects. SPHERES Zero Robotics is an initiative of DARPA to develop spaceflight software through crowdsourcing (Nag, Heffan, Alvar, & Lydon, 2012). It is a project between MIT, Aurora Flight Sciences and TopCoder that is supported by NASA and DARPA. It is a robotics programming competition in which students learn to a write a program for controlling a satellite in space with the help of a graphics or a C editor. The robots are miniature satellites called SPHERES. The participants compete to win a technically challenging game by programming their strategies into these miniature satellites. Thousands of developers compete during the contests hosted by TopCoder to creatively design a web interface for these students and assemble the software components to build a robust framework to allow satellite control.

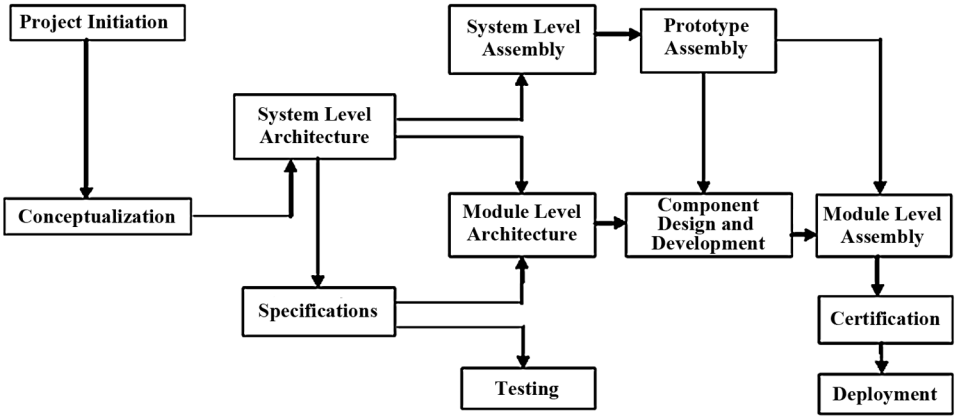
TopCoder provides mechanisms and infrastructure to manage and facilitate the creation of problem statements and their solutions. A platform manager is assigned to each project who closely works with the client to formulate the problem and host it onto the platform in the form of competitions. This model of software development is known as a 'Competition Based Development Model'. The software application development methodology being used by the TopCoder platform is illustrated in Figure 4.

Software Development Phases of Competition Based Development Model

The application development process of a competition based development model progresses in phases. Each phase is executed through a competition or a series of competitions and the winning entry serves as an input to the subsequent phases. The client of a crowdsourced platform may use an existing com-

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 4. Software application development methodology at crowdsourced platform
Source: Company Docs.



ponent from the platform catalogue or request for creation of a new component. There are six broad phases namely Conceptualization, Specification, Architecture, Component Design and Development, Testing and Assembly.

- **Conceptualization Phase:** The development begins with the Conceptualization phase. The competitions under this phase are conducted to identify and document the needs and ideas of all the project stakeholders. The competitions under this phase may commence by either running a series of studio competitions to create graphical conceptualization artifacts like Storyboards, Wireframes and Prototypes, or a series of Conceptualization contests to create a Business Requirement Document and High-Level Use Cases.
- **Specification Phase:** The Specification phase deals with the formulation of application requirements in as much detail as necessary in order to accomplish the goals for the creation of application module. The high level use cases that are identified during Conceptualization contests are assigned to modules during System Architecture phase, and during the Specification phase all the individual scenarios that make up those use cases are broken up in text and graphical form with the help of UML Activity Diagrams.
- **Architecture Phase:** There is a System Level and a Module Level Architecture phase of software development. The competitions at a System Level Architecture phase accepts the business requirements and prototype defined in Conceptualization phase as input to define the overall technical approach that will be employed to meet those requirements. Module Level Architecture Phase defines the lower level technical design of an independent module of a larger application. This phase is responsible for defining the components and their interactions that will implement the requirements for a particular module.
- **Design and Development Phase:** During the component design phase, competitors get an opportunity to clarify any unclear requirements and define technical details for implementation. Component design competitions take the component requirements developed during the architecture phase as input and produce a detailed component design specifications from the same. After the component design competition is completed, the detailed component design specification acts

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

an input into Component development competition phase. During the component development competition phase, the component is actually implemented.

- **Testing Phase:** The competitions in the testing phase provide a mechanism for verifying that all of the requirements that were identified during the initial phases of the project were properly implemented and that the system performs as expected. The test scenarios developed through these competitions ensures that the requirements are met end-to-end.
- **Assembly Phase:** The System Assembly phase hosts competitions to create the foundation for the application. This includes creating the build scripts that will be used throughout the application as well as incorporating all identified components into the shell that implements the application's cross-cutting concerns.

Most Crowdsourced platforms in general effectively handle the security and Intellectual property issues that might resist the potential clients from using their services. Company sources reveal that customers who are not familiar with the security and privacy policy of the platform may have apprehensions in choosing the platform initially (R. et al., 2010). Crowdsourced platforms produce white papers on their security and privacy policies to attract new customers and communicate their processes to them. These papers reveal in detail the confidentiality policy and the approach to software development being used at the platform. The platforms also allow the clients to generate test data sets to be used during the competitions and keep anonymous names for their organizations to ensure privacy. The competitors or the contestants too are allowed to set their privacy policies at the platform.

Benefits of Competition Based Development Model

The competition based development model has successfully created software for the use of individuals and organizations. Some of the benefits of the competition based development model with regard to a project in an organization are as listed below:

- The time and cost needed to hire, train and fire people are lowered.
- The cost of networking, communication and infrastructure is reduced.
- The participants possess diverse skills and experience there by creating innovative solutions.
- The individual's interest and choice of working on a particular problem increases the chances of submitting solutions as per the deadline.
- The solutions to the problems are not dependent on individuals.
- The intensive review process ensures the selection of the best and quality work as a winning solution.
- Winning solution is rewarded with a fixed pre decided amount only if the solution meets the specifications and is delivered on time there by reducing cost of development.

There are numerous benefits that crowd workers realize so as to be active participants in the competition based development model. Individuals are keen to participate as competitors either to spend quality time on the internet for fun or to earn extra income. The social and financial incentives gained by competitors are often a driving factor for continuous participation in the competitions at a crowdsourced platform. The flexibility of working as per their convenience and having no requirement of reporting to their bosses is an attraction for many.

Cloud Based Software Crowdsourcing Architecture

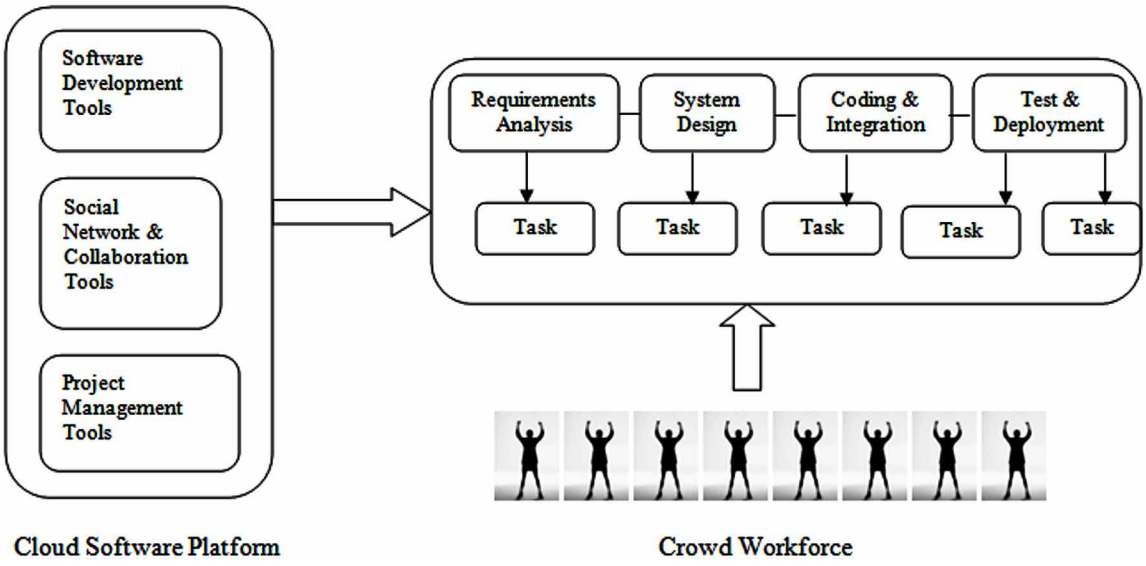
The distributed development of software through crowdsourcing needs reference architecture to facilitate the development process. The cloud based software crowdsourcing reference architecture proposed by Wei-Tek Tsai et al (Tsai, Wu, & Huhns, 2014) has the following components or elements:

- Cloud Service Management dash board to help system administrators and software crowdsourcing organizers.
- Collaboration and communication tools, such as a distributed black board system to enable participants to participate in discussions.
- Software development tools for modeling, simulation, code editing and compilation, design notation and documentation and testing.
- Tools for raking participants and displaying scoreboards.
- Cloud Payment tools and credit management tools.
- Repository of software modules, specifications, architectures, and design patterns for possible reuse.

The reference architecture for a Cloud Based Software Crowdsourcing system that encapsulates the above stated elements is as shown in Figure 5. The use of architecture can enable the achievement of the ultimate goal of developing high-quality and low-cost software products.

With the use of a properly specified Platform-as-a-Service (PaaS), software project managers can establish a customized cloud software environment to facilitate software crowdsourcing process. A manager can make use of software networking and collaboration tools to create a reward mechanism to motivate the crowd workers. Depending on the scale of development and value of the software product,

Figure 5. Reference architecture Cloud Based Software crowdsourcing
Source: Internet Computing, (Tsai et al. 2014).



EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

a project manager can specify the appropriate budget to attract as many talented developers as possible and provision computing resources to sustain their activities.

The manager uses project management tools to coordinate development tasks among the crowd workforce by ranking individual's expertise and matching their skills with the different task levels and types. For a specific software project, manager sets up a virtual system platform with all the necessary software development gears to assist crowd workers with their tasks. Social Network and Collaboration tools can prove to be of great use for creating virtual teams and generating skilled crowd workforce.

ISSUES AND CHALLENGES

Crowdsourcing offers both advantages and disadvantages. With regard to Crowdsourcing in general, one of the challenges is development of trusted sources and platforms. It is not possible to examine all the contents and restricting who posts data online defeats the entire purpose of crowdsourcing. Participants are humans and as a common saying goes 'To err is human'. It might be false to assume that there is no error in the information provided. Unfortunately, the hard fact is that the accuracy of information is an assumption most of the times. Another big challenge is publicizing a crowdsourcing platform and establishing a network of volunteers. The publicizing task requires resources that might be a scarcity. Higher participation rates translate into a greater volume of data and managing this process may become tedious.

Stol and Fitzgerald (Stol & Fitzgerald, 2014) have identified six key concerns for crowdsourcing software development. According to them decompositions of tasks, coordination and communication, planning and scheduling, knowledge and intellectual property, quality assurance, motivation and remuneration are important and relevant in the context of software crowdsourcing. The challenges of a competition based Development Model are as listed below:

- Formulating a proper work flow design by decomposition is an area of concern. The appropriate decomposition of the tasks into smaller units and establishing a workflow design is a challenge specifically with regard to software. Understanding complex interfaces and interdependencies to decompose the problem into smaller tasks by the platform mangers in order to host the competition could be challenging.
- Establishing proper Coordination and Communication among the participants is another challenge. The competitors who compete and submit their solutions are not a part of the crowdsourced platform. Coordination between the platform manager and all the competitors is an issue that needs to be handled effectively as interdependent tasks are performed by different competitors.
- Planning and scheduling of the competitions need to be handled effectively for timely delivery of the product. Once the competition and deadline has been scheduled, it is the difficult for the platform manager to intervene and expedite the development for meeting any demands of the customer for early delivery of the product.
- Quality of the end product might be of concern. Findings in the literature (Peter, Laura, Sara, & Haakon, 2013) suggest that more the number of contestants, poor is the quality of the work delivered. It is sometimes considered that crowd mostly consists of amateurs; hence the quality of work is their least concern. Also, there could be disagreement about a solution for any published problem. Kittur (Kittur, 2010) distinguished 'subjective' tasks for which there is no single right

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

answer, and 'objective' tasks that can be easily verified. Even if the submitted software fulfills a set of requirements, there still could be disagreements regarding certain functionality or the scope of a task.

- Another important concern could be of intellectual property. Organizations might be hesitant to provide too many details for certain tasks. The risk of losing competitive advantage by sharing and putting up many details for everyone to see on a common platform with regard to the project is a challenge for adopting competition based development model.
- Motivation and remuneration is considered to be another challenge and the topic has received enough attention in the field of software engineering research. Motivational factors can be external or internal to the tasks.

RESEARCH DIRECTIONS

Many software development models and methods have been proposed to assist organizations in their software development process: from the traditional waterfall approach to the recent and highly popular agile methods. Crowdsourcing can be incorporated into conventional software development processes and can contribute to any software development phase (Tsai et al., 2014).

Crowdsourcing continues to advance and solve increasingly complex issues (Greengard, 2011). It has generated interest amongst software engineering researchers worldwide and scientists are attempting to solve complex problems through crowdsourcing. Researchers across the globe are working on various aspects of crowdsourcing software development.

Techniques to formulate reward mechanisms in order to minimize cost have been an area of active research. The work of Dominic and Milan (Dipalantino & Vojnovic, 2009) demonstrated the relationship between incentives and crowd participation at a crowdsourced platform. Many researchers have compared features offered by various crowdsourced platforms. The work of M Vukovic (Vukovic, 2009) proposes a taxonomy for classification of crowdsourcing platforms, and evaluates a number of existing systems against the set of identified features.

One of the prime challenges for crowdsourcing software development as discussed in the earlier section is the decomposition of the tasks into microtasks. Thomas D Latoza et al (Latoza, Towne, Adriano, & Hoek, 2014) developed an approach to decompose programming work into microtasks. They proposed the coordination of work through tracking the changes to a graph of artifacts, generating appropriate microtasks and propagating change notifications to artifacts with dependencies. They implemented the approach in a Cloud based IDE CrowdCode.

Scientists are investigating the age, skill set and demographics of crowd workers to propose models best suited for development of the software at crowdsourced platforms. The work of Wenjun Wu (Wu, Tsai, & Li, 2013) examines software crowdsourcing processes including TopCoder and AppStori. The work also identifies the min max nature among contestants as an important design element with regard to creativity and quality. The strategic behavior of contestants at a crowdsourced platform has been analyzed by Archak (Archak, 2010). The research found that individual specific traits along with project requirements and project payment are significant predictors of the final project quality. He found significant evidence of strategic behavior of contestants and the study reveals that high rated contestants face

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

tougher competition. The research conjectured that the reputation and cheap talk mechanism employed by TopCoder platform positively effects the efficiency of simultaneous all-pay contests and this approach should be considered for adoption in other crowdsourcing platforms as well. In their work Zhenghui and Wenjun (Hu & Wu, 2014) applied the famous game theory to model two player algorithm challenges at TopCoder to study the competitive behavior of contestants.

It is changing the way organizations handle complex problems and issues. Research in future can focus on solving issues with regard to multiple winners at a crowdsourced platform. Another area that needs attention is how cloud infrastructure can be well utilized for hosting scalable application development environment for dynamic, task specific crowd teaming.

CONCLUSION

Software development requires a disciplined engineering approach to create cost effective and quality software. Development of quality software requires creative skills along with sound technical expertise. The emerging crowdsourcing practices would inspire new research directions and give new dimensions to stimulate while ensuring high quality of the developed software products. With social networking getting so predominant in our daily life, future would see more integration of the social networks with the creator networks and crowdsourced software development platforms. While our traditional models aim at providing a systematic way to develop software, one cannot overlook and deny the emergence of successful open source projects where there is no existence of a predefined process. Platforms that promote crowdsourcing software development would have to incorporate flexibility in terms of scaling up the resources and building a trust among stakeholders for the wide acceptance of this development methodology.

KEY TERMS AND DEFINITIONS

Human Intelligence Tasks: Human intelligence tasks are a variety of simple tasks that humans can accomplish better than computers. One of the common examples of such tasks is the identification of some attributes in multiple images.

IaaS: Infrastructure as a Service (IaaS) model of Cloud provides the capability to the consumer to provision processing, storage, networks, and other fundamental computing resources so as to be able to deploy and run software that can include operating systems and applications. The consumer does not manage or control the underlying cloud infrastructure but has control over operating systems, storage, and deployed applications and some limited control of select networking components.

Multi-Tenancy: A term used for a software architecture where a single instance of an application serves multiple customers. Each customer or a group of customers is called a tenant. Multi tenancy applies to all the three layers of a cloud.

PaaS: Another service model of Cloud computing. In Platform as a Service (PaaS) model the capability provided to the consumer is to deploy applications onto the cloud infrastructure. These applications can be either *consumer created* or *acquired* applications created through programming languages, tools and services supported by the provider. The consumer does not manage or control the underlying cloud infrastructure including network, servers, operating systems, or storage.

SaaS: One of the service models of Cloud Computing. In Software as a Service (SaaS) model of Cloud Computing the service or the capability provided to the consumer is to use the provider's applications running on a cloud infrastructure. The applications are accessible from various client devices through either a thin client interface, such as a web browser (e.g., web-based email), or a program interface. The consumer does not manage or control the underlying infrastructure or individual application capabilities.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Technology Mediated Social Participation Systems: Systems that involve the participation of people, communication tools and actions to transform and build new systems. These systems are centered toward better engagement of people with diverse experiences, perspectives, skills, motivation and knowledge and to create new systems.

USP: Unique Selling Proposition (USP) is a concept of marketing that is used to explain a successful pattern of an organization.

Chapter 37
Disruption and Deception in Crowdsourcing

Agnieszka Onuchowska
University of South Florida, USA

Gert-Jan de Vreede
University of South Florida, USA

ABSTRACT

While crowdsourcing has become increasingly popular among organizations, it also has become increasingly susceptible to unethical and malicious activities. This article discusses recent examples of disruptive and deceptive efforts on crowdsourcing sites, which impacted the confidentiality, integrity, and availability of the crowdsourcing efforts' service, stakeholders, and data. From these examples, the authors derive an organizing framework of risk types associated with disruption and deception in crowdsourcing based on commonalities among incidents. The framework includes prank activities, the intentional placement of false information, hacking attempts, DDoS attacks, botnet attacks, privacy violation attempts, and data breaches. Finally, the authors discuss example controls that can assist in identifying and mitigating disruption and deception risks in crowdsourcing.

INTRODUCTION

Organizations can use crowdsourcing to take "a function once performed by employees and outsourcing it to an undefined (and generally large) network of people in the form of an open call" (Howe, 2006). Crowdsourcing has emerged as a viable alternative business model that focuses on problem solving and production provided by the distributed network of individuals (Brabham, 2010). It potentially has many benefits (Howe, 2016; Bonabeau, 2009; Cox, 2011; Bommert, 2010; Xiao & Carroll, 2015), it can be more cost-effective than having traditional employees perform certain tasks. It also supports knowledge sharing, makes knowledge more accessible and more useful to the crowd. It enables organizations to get access to a wide and varied collection of opinions and ideas, which can reduce bias in decision-making. It allows organizations and governments to directly engage with customers and citizen. Although crowdsourcing is still evolving as an organizational and societal phenomenon, its potential demonstrated is

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

by data from the crowdsourcing market: 15 major crowd service providers almost tripled their revenues from US$140.80Min 2009 to US$375.70M in 2011 and the global enterprise crowdsourcing market growth rate reported 75% growth in 2011 compared to 53% in 2010 (Lionbridge, 2013).

Yet, several challenges threaten the usefulness of crowdsourcing as a reliable organizational problem-solving approach. For example, there are challenges concerning the ownership of crowdsourced products or the perceived lack of quality standards related to crowdsourced goods or services (Lasecki, Teevan & Ece, 2014) (Floren, 2012). Moreover, recently crowdsourcing sites have emerged with the intention of causing harm online. A rapid increase in malicious crowdsourcing service sites (also known as crowd-turfing sites) has been observed in countries like China, the US, and India (Wang et al., 2012). Such sites recruit individuals that for a small payment post false negative restaurant reviews, write biased political comments, or post false advertising (Wang et al., 2013). There are also examples of legitimate initiatives that have been attacked by individuals seeking to achieve profits from exploiting the crowd-sourcing ventures: In 2016 users posted false reports of blocked road traffic in their neighborhoods on a crowd-sourced app Waze to deflect some of the traffic flow from the places where their lived (Hendrix, 2012).

As crowdsourcing is increasingly becoming one of the ways in which organizations execute projects and support decision-making, disruptive and deceptive use of and responses to crowdsourcing initiatives need to be better understood and mitigated. It is unclear what harm might be caused to individuals and organizations by potential deception in crowdsourcing. For example, scholars are also unsure how disruptive the effects of crowdsourcing pranks and deceptions are on organizations. It is also unclear what are the physical or emotional effects of deceptive or violated crowdsourcing efforts on its contributors or beneficiaries.

Both crowdsourcers and crowdsourcing providers must be aware of existing threats and threats that may develop in the future. Currently, the biggest challenge that crowdsourcing providers and consumers faces concerns the number of crowd participants whose malicious behavior is difficult to detect and control (Cox, 2011). Thus, the primary motivation for this study is to understand intentional disruptive and deceptive behavior in crowdsourcing contexts. Our main objective is to identify emerging risks that are related to crowdsourcing deception. We discuss recent examples where crowdsourcing websites were attacked or abused by malicious activities. Finally, we propose an organizing framework of risks that result from these security violations and deception cases.

This article is structured as follows. First, we discuss previous research on disruption and deception in crowdsourcing environments. Next, we present our study's method. We then present the categorization of the identified disruption and deception incidents and analyze the identified cases using defined risk pattern clusters according to the CIA triad. We discuss potential controls ways to mitigate the identified issues. Finally, we discuss the implications of the study, its limitations, and directions for future research.

BACKGROUND

Past research on cyber threats and deception in crowdsourcing has focused on different issues. For example, Dwarakanath et al. (2016) focused on crowd trustworthiness in crowdsourced software development initiatives. They proposed a taxonomy of trustworthiness and existing methods to build trust in a crowd. They showed that macro-tasks that require specific skills are related to a high level of untrustworthiness. They also found that workers' poor reputation had a strong impact on trustworthiness. Other findings showed little correlation between monetary benefits and trustworthiness.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Kamoun et al. (2015) created a Risk Breakdown Structure (RBS) of crowdsourcing projects where they mapped risk factors pre-defined crowdsourcing project lifecycle phases. Among the set of defined risks, the researchers identified Technology Risk, which they described as "Performance/security issues with the selected crowdsourcing platform", which they then tied to Evaluation Phase of a crowdsourcing project. The paper also defined potential undesirable outcomes related to Technology Risk that could be manifested as network performance issues, security breaches, privacy threats or result in legal disputes and litigation.

Stefanovich et al. (2014) analyzed the ability of crowdsourcing systems to cope with attacks. Based on the data collected from DARPA's Shredder Challenge, the researchers identified attack mechanisms and analyzed how users recover from such attacks. They argued that while participants can recover from errors in the long term, the attacks still affected participants: after being attacked, participants develop a notion of not being able to influence malicious behavior. It thus appears that victims of malicious behavior often suffer from motivational challenges to get involved in tasks. Consequently, their task efficiency tends to drop as well. Lasecki et al. (2014) found similar motivational challenges as a result of crowdsourcing threats: they found that the more malicious tasks appear in a crowdsourcing environment, the less willing users are to participate in such tasks. Their study further showed that even simple tasks are subject to online manipulation and can be a target for information distraction.

Harris (2011) raised the issue of ethics in crowdsourcing design and analyzed the examples of crowdsourcing initiatives that intentionally would not conform to ethical standards. In his paper, he examined how crowdsourcing contributes to unethical behaviors and activities such as posting fake online reviews. He listed social engineering, human computation tests as well as "attack and run" techniques as three disruptive phenomena, which can potentially be used to unethically support crowdsourced initiatives. In the same online reviewing context, Fayazi et al. (2015) investigated how to uncover crowdsourced manipulation. The researchers created a sampling method to track down items, which received manipulated online reviews. Their method also aims at identifying and removing users who post false reviews from affected crowdsourcing platforms. Similarly, Chen et al. (2016) described crowdsourcing tasks where the provision of new information (exploration) is often distorted and exploited, because the verification part of a crowdsourced task is neglected. The researchers built an agent-based model that helped them balance exploitation and exploration in crowdsourced search tasks where time plays a critical role.

Shiller (2017) and Hemingway (2013) underlined that especially crowdfunding initiatives are susceptible to subtle forms of deception because of manipulative aspects of human behavior. Shiller claimed that the risks of crowdsourcing are underestimated and proposed that Crowdfunding initiatives should be regulated by governments. In turn, Hemingway proposed that securities crowdsourcing in the United States should be regulated by the CROWDFUND Act to control potentially disruptive group decisions of crowd investors.

Liu et al. (2017) proposed an encryption-based framework for spatial crowdsourcing that ensures locations of crowd contributors are not disclosed to any party. The framework also ensures that crowdsourced tasks are assigned to workers based on proximity of the location of each task. What is more, the proposed framework ensures the privacy of data for both problem owners and crowd contributors.

Liu et al. (2017) further analyzed Community Question Answering (CQA) Portals and proposed combined factor graph model (CFGM) that helps to detect deceptive answers and questions on crowdsourcing websites.

Crowdsourcing users can also create fake identities (Sybils), which, when multiplied, can be used to boost the perpetrators' reputation. Cheng et al. (2005) presented a frame-work to assess robustness

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

of reputation mechanism to Sybils. Like flagging fake identities, researchers have also focused on flagging fake or inappropriate content. Kayes et al. (2015) built a classifier that detects abusive users of community-based question/answering platforms. Their findings show that flagging suspicious content by the users works effectively as a crowdsourced monitoring function. Moreover, the researchers found that flagged users received more attention but often were not perceived as toxic to the community. On the contrary, flagged users who posted questions received a higher than average level of response compared to questions posted by ordinary users.

In turn, Wolfson et al. (2011) analyzed data security-related areas, where crowdsourcing and the law are likely to intersect in the near future. They discuss possible challenges related to the deployment of crowdsourcing and claims that crowdsourcing misuse is highly tied to issues with data security.

In terms of theoretical background, we identified theories from Criminology that support the discussed phenomenon. Below we discuss four Criminological theories that have proven to be effective in explaining cyberviolations and could potentially be useful to uncover the motivations of offenders in crowdsourcing. Due to the lack of exposure to potential perpetrators in this research, we focus on Routine Activities Theory, which we analyze in the Method section.

Akers's Social Learning Theory (Akers, 2009) as well as Gottfredson and Hirschi's General Theory of Crime (Gottfredson & Hirschi, 1990) have both been used to explain perpetrators' motivations to commit crime. Social Learning Theory helps to explain how offenders can be influenced by third party interactions. In turn, the General Theory of Crime looks into how levels of self-control affect criminal behavior of an individual. Social Learning Theory integrated with General Theory of Crime applied by Burruss et al. (2013) has demonstrated that social learning process was the strongest predictor of software piracy. Agnew's General Strain Theory (GST) (Agnew, 1992) argues that people exposed to strain can feel anger or frustration, which in turn can push them to turn to criminal activity. Patchin and Hinduja used GST to find a direct relationship between strain and cyberbullying (Patchin & Hinduja, 2011).

Routine Activities Theory (RAT) was formulated by Cohen and Fehlson (1979) to explain the connection between crime and routine activities. RAT takes into consideration three core elements (motivated offender, suitable target and the lack of capable guardian), which are a part of every crime. As far as cyberviolations are concerned, there have been numerous studies that successfully deployed RAT in an online environment. For example, Holt et al. (2016) used RAT to discuss the cybercrime victimization phenomenon. The researchers found that political structure of a nation or the existence of substantive technological infrastructure in the nation is correlated with a likelihood of malware attacks at a national level.

As can be seen, research on cyber threats and deception in crowdsourcing is fragmented. Apart from the separate studies on cyber and deception threats to crowdsourcing discussed above, we were unable to identify any study nor a theory exploring the scope of the problem or addressing the problem from a holistic perspective by taking a full range of threats into consideration. The next section describes our research method to collect and analyze practical examples of cyber threats and deception in crowdsourcing in order to develop a holistic framework of the different types of such threats.

METHOD

The development of a structured overview of cyber threats and deception in crowdsourcing took place in three steps. Each step is detailed below.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

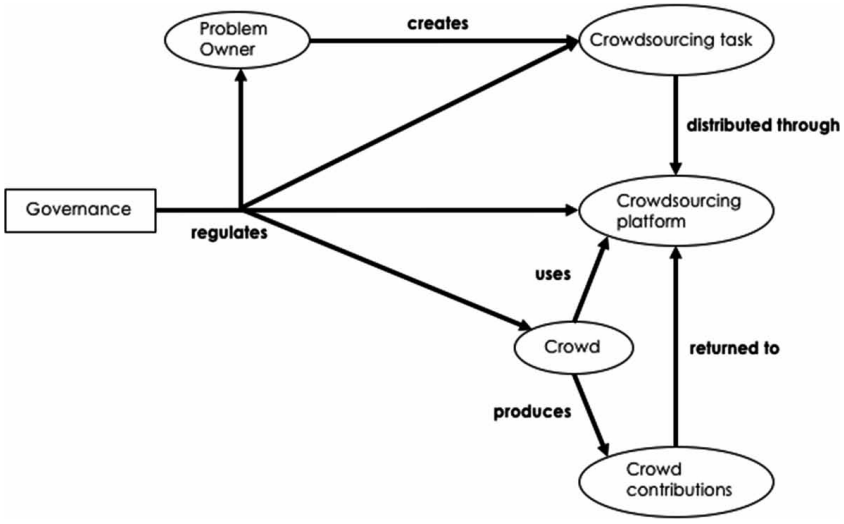
Crowdsourcing Organizing Framework

We first conceptualized a crowdsourcing effort in terms of the relevant elements that can be distinguished. The purpose of this conceptualization is to collect relevant information about examples of malicious crowdsourcing efforts. Thus, our conceptualization is an example of a Theory for Analyzing, which is "used to classify specific dimensions or characteristics… by summarizing the commonalities found in discrete observations… when nothing or very little is known about the phenomenon in question" (Gregor, 2006). Our conceptualization is based on past definitions of crowdsourcing (e.g. Howe, 2006), previous models (e.g. Pedersen et al., 2013) and past research (e.g. Dwarakanath et al., 2016).

Our conceptual model of a crowdsourcing effort consists of the following elements that are likely to be attacked by an offender (Figure 1):

- **Crowdsourcing Task:** The work assignment for which contributions are solicited. Crowdsourcing tasks are also referred to as problems or challenges. We captured information that would characterize the task that was at the center of a deceptive crowdsourcing incident;
- **Crowd:** The individuals (crowd workers) who perform the task. In the deceptive crowdsourcing context, crowd-related issues concern malicious human behavior as well as the identification of mechanisms that might initiate such behavior;
- **Crowdsourcing Platform:** Connects the crowd and problem owner. When capturing crowdsourcing deception examples, we focus on risks and vulnerabilities related to the platform or its management;
- **Problem Owner:** Defines a task, posts it on a platform, and provides data and tools for task completion. For our analysis, we focus on information related to the problem-owner's context concerning risks that were initiated by problem owners or caused by their negligence;
- **Governance:** The policies, reward structures, and moderation of the crowdsourcing effort. We collected information on the governance mechanisms used in the incidents and related vulnerabilities, e.g. lack of quality control;

Figure 1. Conceptualization of a crowdsourcing effort



EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

- **Crowd Contributions:** Outputs from crowd members when they have completed their tasks. We captured information regarding potentially disruptive or deceptive input, e.g. intentionally false information, and its' effects on the crowdsourcing results.

Identification of Deceptive Crowdsourcing Incidents

Next, we conducted a structured literature and web search for examples of deceptive crowdsourcing incidents. We scoped our search as follows. First, we focused on examples from academic or practice publications, including web publications, from the last 10 years. As crowdsourcing is a relatively young phenomenon, we did not expect to find examples that go back earlier than 2007. Second, we focused only on legitimate (legal) crowdsourcing efforts that had become target or victim of malicious intent. During our search, we found examples of a distinct type of malicious crowdsourcing called "crowdturfing" (Wang et al., 2012; Wang et al., 2013) where the effort is purposefully organized to cause harm. Crowdturfing problem owners reward a crowd to perform malicious activities, e.g. putting negative comments on competitors' products' websites. Yet, our focus is on crowdsourcing efforts that fall victim of malicious activities, such as cybersecurity breaches or deception.

To find examples of incidents, we performed a wide search using academic (Google Scholar, ABI/INFORM Global) and general (Google) online search engines. We determined search terms in two steps: We first identified search terms that we felt would best reflect our phenomenon of interest. Then, from the relevant publications we found, we identified additional synonyms and other content search terms. We performed a final search with the additional terms to find further publications. Our final search terms list includes terms such as "crowdsourcing deception", "crowdsourcing threats", "cybersecurity crowd-sourcing", "open innovation challenges", "online labor market challenges", "public participation gone bad", "online contest gone bad", "hacking of crowdsourcing webpages", "crowdsourcing controversy", "crowdsourcing cyber violations", "crowd deception crowdsourcing", "crowdsourcing breaches", "cyberattacks on crowdsourcing pages", "crowdsourcing went wrong" and combinations of constituent terms. For each example that we identified, we collected available information per the elements of our conceptual model. As our objective was not to create a comprehensive library of every reported incident, we did not capture information on incidents that could be considered identical in nature as others that we recorded already. For example, descriptions of malicious prank attempts on crowdsourcing websites are relatively common so we only included a few in our set of incidents.

Extracting Deceptive Crowdsourcing Types

For the final step we looked for commonalities among the different incidents that we recorded to identify distinct types of cyber threats to crowdsourcing. We used Routine Activities Theory to define and categorize vectors of attack. We focused on 'suitable targets' part of the theory and identified the platform, the crowd and the crowd contribution as the main vectors of attack. Then, we tied identified cyber threats to the respective crowdsourcing elements (nodes) presented in Figure 1. Next, we used the Confidentiality-Integrity-Availability (CIA) triad to sort the threat types in terms of what part of the triad was at risk. We used the CIA triad as this one of the most popular cybersecurity frameworks. Next, we defined specific risks involved in each type of crowdsourcing threat and for outlining examples of controls that can assist in preventing the risk or mitigating the risk's impact when it materializes.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

RESULTS

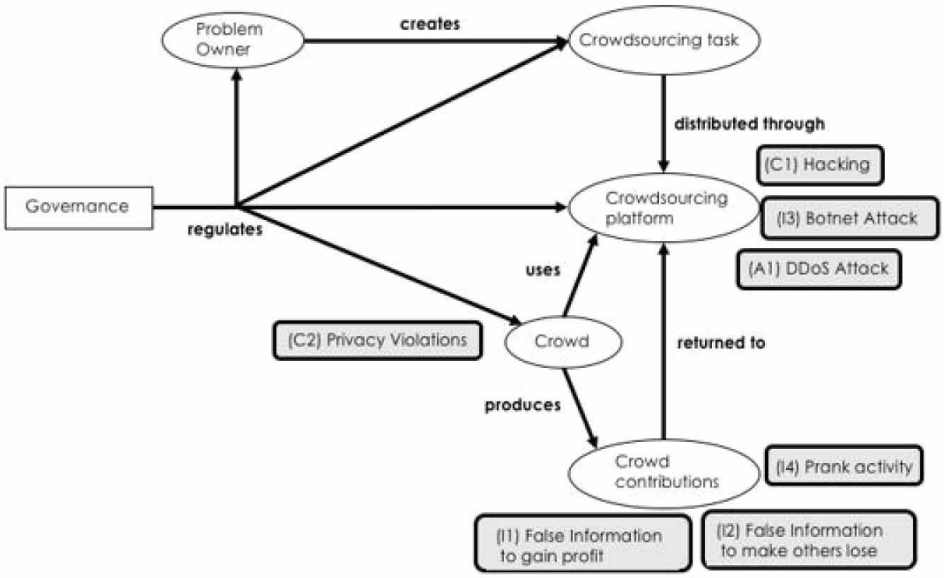
Crowdsourcing Incidents

Our search of publications and online sources yielded a variety of real-case incidents that are detailed in the Table 3 in the Appendix. We included 18 incidents in this overview; similar incidents were left out due to page limitations. For each incident we captured relevant information from the publication or online source according to the elements of our conceptual model.

The overview of the incidents shows that half of the Confidentiality-related incidents were related to privacy violations caused by the placement of sensitive data online. All incidents related to Integrity breaches were caused by the placement of false information intending to gain profit, willingness to make other participants lose, or disruption of crowdsourcing initiative using prank information. The only malicious incident type identified as an Availability-issue was related to DDoS attacks, which intend to disrupt the secure flow of information. Table 1 gives an overview. Table 2 gives an overview from the victim's point of view.

We realize that the identified collection of malicious and deceptive activities is unlikely to be exhaustive. Companies that fell victim to deceptive crowdsourcing efforts may be reluctant to publicly share information about the experience. Still, the collected incidents show an interesting pattern. We observe that all cases were either related to the placement of false information, sharing of sensitive information, the disruption of secure information flow or intentional deceptive action aimed at undermining crowdsourcing initiatives. User deception by provisioning of false information, disrupting the content of correct information or denying access to correct information appeared to be most common. Figure 2 showcases the risk types.

Figure 2. Risk types related to a crowdsourcing effort



EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Table 1. Identified risks types: Offender's view

Type	Risk Description	Key Benefit for the Offender
C1. Hacking crowdsourcing site (e.g., theft of private information)	Loss of trust among stakeholders; financial loss; reputational loss impacting future investors decisions; penalties if the information gets stolen	Private information gets compromised and can be used to carry out online fraud e.g., unauthorized credit card payments or hacking of online bank accounts
C2. Privacy violation	Legal privacy violation due to sharing of unverified or sensitive information between the crowd members; reputational loss; regulatory or legal penalties	Private information that is often voluntarily shared by crowd members (e.g., medical information) gets compromised and can be used to carry out online fraud e.g., unauthorized credit card payments or hacking of online bank accounts
I1. Placement of false information (e.g., rerouting of the traffic) – perpetrator gains, victim is exposed to potential harm or might not be aware that has been victimized	Website becomes unreliable, users might not be willing to use the service any more	Perpetrator achieves intended tangible goal, e.g., the traffic gets rerouted from perpetrator's neighborhood,
I2. Placement of false information to make others lose or to cause harm to others (e.g., competitions)	Website becomes unreliable, users might not be willing to use the service anymore; Financial losses are likely to follow	-Victim is worse off than the offender, e.g., victim loses a contest while offender wins the same contest - Victim encounters tangible damage, e.g., financial losses, damage of personal reputation
I3. Botnet attack to bring false results, e.g. placement of false traffic information	Website becomes unreliable, users might not be willing to use the service anymore; Financial losses are likely to follow	Perpetrator achieves intended tangible goal, e.g., the traffic gets rerouted from perpetrator's neighborhood,
I4. Prank activity in crowdsourcing contests	The crowd that places wrong or erroneous information 'for fun' puts the organizer at risk of needing to retract the contest. Financial losses and damage of the organizer's credibility are likely to occur	Offender gains satisfaction from disrupting others' work; as a result of a prank attack, most crowdsourced campains/ contests get shut down
A1. Botnet attack (DDoS)	DDoS attacks negatively impact availability and performance of crowdsourcing sites and can lead to negative financial consequences as well as destroy the image of the site	Victim's crowdsourced initiative is put on hold until the platform is back and running (by this perpetrator can win competitive advantage)

Confidentiality Risks and Controls

A further analysis of the incidents that are related to confidentiality resulted in two types of malicious crowdsourcing risks. The first concerns the hacking of crowdsourcing sites. Crowdsourcing sites appear to get hacked for the same reasons as other online services, e.g., theft of sensitive data such as user names, email addresses, and shipping addresses. For example, criminals hacked Kickstarter to collect sensitive data including passwords, phone numbers, email addresses, and credit card details. The crowdfunding site Patreon was hacked for user names and their addresses. When considering the risks related to hacking crowdsourcing sites, there are at least two consequences to the disclosure of sensitive and private data. First, there may be financial implications due to penalties that the site owner might need to pay if the information gets hacked. Second, there will be reputational damage, as the hack will cause a loss of trust among existing and future crowd members and problem owners. Controls for this risk should aim to prevent successful hacking attempts and, if a hack has taken place, limit its impact. To mitigate hacking-related risks, the crowdsourcing field should focus on technological measures (e.g.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Table 2. Identified risks types and controls objectives: Victim's view

Type	Risk Description	Control Objective	Control Examples
C1. Hacking crowdsourcing site (e.g., theft of private information)	Loss of trust among stakeholders; financial loss; reputational loss impacting future investors decisions; penalties if the information gets stolen	Reduction of successful hacking attempts. Reduction of hacking impact/recovery planning effort	Regular patching of platform software and user applications that support the crowdsourced service; strong password policy; continuous education of all stakeholders on avoiding hacker attacks; recovery plans/ communication plans, regularly reviewed; encryption of private information; reduce amount of PII data collected
C2. Privacy violation	Legal privacy violation due to sharing of unverified or sensitive information between the crowd members; reputational loss; regulatory or legal penalties	Prevention of privacy violation cases	Verification of information sourced from non-official channels; prevention of sensitive data sharing; providing forms to report inappropriate data; regular user education on sensitive data protection
I1. Placement of false information (e.g., rerouting of the traffic) – perpetrator gains, victim is exposed to potential harm or might not be aware that has been victimized	Website becomes unreliable, users might not be willing to use the service any more	Preventing the spread of false information; Minimization of the damage brought by false information Keeping the data consistent and accurate – in case the issues are found the data is rectified	Analysis of recurring patterns for data input; analysis of outliers/ inconsistent data; identification of instances where the entry of false data is possible; monitoring and assessment of crowd behavior; flagging type of controls – people can report false information; cross referencing of entered information with other data sources, e.g., traffic reports; introduction of policies that allow the removal of users who were caught with entering false data; introduction of delay between collecting the information and posting it on the website; limiting the number of entries from a single user/ single area and reviewing the information that comes from the same source
I2. Placement of false information to make others lose or to cause harm to others (e.g., competitions)	Website becomes unreliable, users might not be willing to use the service anymore; Financial losses are likely to follow	Preventing the input and/or the dissemination of false information; minimization of disinformation efforts; keeping the data consistent and accurate	Monitoring and assessment of crowd behavior; monitoring of inconsistencies in information inputs; online monitoring – statistical sampling techniques; allowing participants to raise concerns in case they spot problems on a webpage; introduction of immediate action that follows false information entry, e.g., perpetrators are banned and their profiles are removed from the system; verification of identity before users post information or take part in competition
I3. Botnet attack to bring false results, e.g. placement of false traffic information	Website becomes unreliable, users might not be willing to use the service anymore; Financial losses are likely to follow	Keeping the data consistent and accurate	Continuous automated data checks, recognition of suspicious patterns; implementation of technological solutions that identify or prevent automatic scripting; use of analytics to recognize patterns, to analyze where the site is approached from and to monitor Internet traffic
I4. Prank activity in crowdsourcing contests	The crowd that places wrong or erroneous information 'for fun' puts the organizer at risk of needing to retract the contest. Financial losses and damage of the organizer's credibility are likely to occur	Keeping the data consistent and accurate	Monitoring and assessing crowd behavior; verification of user's identity before they can post information on a website or take part in an online competition; remove false information; banning people; enabling of possibility to flag suspicious content by users
A1. Botnet attack (DDoS)	DDoS attacks negatively impact availability and performance of crowdsourcing sites and can lead to negative financial consequences as well as destroy the image of the site	Prevention of DDoS attacks; early detection of DDoS attacks; reduction of impact of DDoS attacks	Reactive: Event monitoring of hosting infrastructure, rerouting of unwanted internet traffic, continuous automated data checks, recognition of suspicious network flow patterns; Proactive: installation of firewalls, monitoring the history of network flows, deployment of multiple Internet Service Providers, recovery plan in place in case the attacks cannot be prevented

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

regular platform patching, encryption of information stored on website servers), behavioral measures (e.g. implement strong password policies), and governance measures (e.g. recovery plans, communication plans, and limited collection of personal information).

The second type of Confidentiality risks is related to privacy violations through voluntary sharing of personal data. For example, Netflix released anonymized user records as part of its "Netflix Prize" Contest. The PatientsLikeMe website users' personal data on taken medications and illness symptoms was scraped by Nielsen and used for further business analysis. Both incidents refer to the disclosure of sensitive data, which can cause risks such as the violation of privacy of crowd members, harm the site's reputation, and result in penalties imposed on website owners.

Examples of controls to prevent privacy violation cases include the verification of information that is sourced from non-official channels, regular education of users on ways to protect sensitive data or enabling corrective forms on the site so that users who spot inappropriate data can flag it accordingly.

Integrity Risks and Controls

Our analysis of the integrity-related incidents revealed four distinct types. The first type concerns the intentional placement of false information with the goal to increase the perpetrator's gains and expose victims to potential harm. In this situation, victims are often unaware that they have been wronged. For example, when someone enters false information on a traffic site to move traffic away from their neighborhood, others' trips may be rerouted causing unnecessary delays that they are unaware of. Risks related to this type include the crowdsourcing site being perceived unreliable over time causing users to cease contributing to it. Controls should primarily focus on preventing false information being submitted and minimizing the consequence of false information. Examples of such controls include the analysis of recurring patterns for data input, analysis of outliers or inconsistent data, cross referencing of entered information with other data sources, and policies focus on swift removal of user profiles who were caught entering false information.

The second type concerns the placement of false information to make other crowd members lose or to cause harm. This type occurred several times at DARPA crowdsourced competitions. The competition results were affected as perpetrators entered false information to frustrate other competitors' work on the crowdsourced tasks. The key risk related to such action concerns crowdsourcing efforts becoming unreliable so that users become reluctant to use the service. Controls to mitigate this risk focus on preventing the dissemination of false information, minimizing disinformation efforts, and maintaining consistency and accuracy of information that has already been uploaded. Control activities include monitoring and assessing crowd behavior, monitoring for inconsistencies in contributions, and assessing selected contributions using statistical sampling techniques. Also, controls could be considered that allow crowd members to raise concerns when they spot problems. Individuals making false contributions should be banned immediately and their profiles and contributions should be removed from the system. Another control concerns identity verification before users are allowed to post information or enter in a competition.

The third type concerns the placement of false information on a crowdsourcing site through botnet attacks. This type is different from the previous two because of the technological nature of this type of threat. Waze was hit by a botnet attack when students created false automated profiles to influence traffic information and reroute the traffic. The main risk related to malicious automated behavior is that websites

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

become unreliable so that users no longer use the services anymore. Possible controls to mitigate botnet attacks include analytics to recognize patterns in registration and data input and technological solutions that identify or prevent automatic scripting.

The last Integrity-type concerns prank activities. Crowd members may contribute wrong, erroneous, or even objectionable information "for fun". This may force the problem owner to retract the contest. Consequently, financial losses and damages to the organizer's credibility are likely to occur. The following controls can assist in keeping data consistent and accurate: monitoring and assessment of crowd behavior, user identity verification before allowing participation in the contest or making contributions, swift removal of false information, and enabling users to flag suspicious content by other users.

Availability Risks and Controls

The only availability type that emerged from our collection of incidents concerns DDoS attacks caused by botnets. An example is project on Crowdsourced Satellite Imagery, which was taken down by a botnet DDoS attack. Risks related to DDoS botnet attacks include limited availability and performance of the crowdsourcing site resulting in financial and reputational loss. Reactive controls include event monitoring of the hosting infrastructure, rerouting unwanted Internet traffic, continuous automated data checks, and monito-ring suspicious network flow patterns. Proactive control examples include firewalls, monitoring the history of network flows, deploying multiple ISPs, and creating recovery plans in case of successful attacks.

DISCUSSION AND CONCLUSION

The purpose of this study was to identify emerging risks related to disruptive and deceptive behavior in crowdsourcing contexts. Through an extensive search of academic and online sources, we gathered recent examples of incidents where crowdsourcing sites were attacked or abused. We identified the CIA element at risk for each incident. We observed that most unique real-life incidents were related to intentional deceptive actions such as placement of prank information, placement of false information, unauthorized disclosure of sensitive information or disruption of the secure flow of information. Based on the collected incidents, we derived an organizing framework of distinct risk types concerning disruptive and deceptive crowdsourcing. The framework consists of two risk types for Confidentiality issues, four risk types for Integrity issues, and one type for Availability issues. The framework further outlines possible controls to mitigate the risk types in terms of preventing the risks or containing the damage once the risks materialize.

Our findings have implications for research in crowdsourcing deception and cybersecurity. Crowdsourcing threats appear to be predominantly related to social engineering attacks. Descriptions of deceptive activities dominated in our collection of incidents. This shows a need for more in-depth research on human factors related to the motivations and behaviors of cybercriminals and cyber perpetrators that target crowdsourcing. For this purpose, the framework that we developed provides an initial outline for a structured research program into the nature and effects of malicious and deceptive crowdsourcing activities. The framework can assist categorizing past research and identifying gaps to be addressed in future studies. Furthermore, it can be used as a starting point for researchers theorizing about anteced-

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

ents to malicious and deceptive behavior in crowdsourcing. Furthermore, through the future collection of crowdsourcing incidents, the framework can help identify commonalities between certain types of incidents in terms of behavioral and contextual factors.

Furthermore, in this paper we identified breaches that can be attributed to unethical behavior. Ethical or unethical decisions are influenced by factors tied to individual attributes and cognitive abilities of a decision maker (Bommer et al., 1987). Therefore, what is ethical in one context can be perceived as unethical in other contexts. Following Kim and Werbach's (2016) research on gamification, the implementation of crowdsourcing initiatives should also focus on an objective evaluation of their ethical dimension. Therefore, although we do not prescribe the ethical guidelines or criteria in this paper, our findings could contribute to the evaluation of ethical boundaries in the crowdsourcing environment.

From a practical perspective, the incident examples and organizing framework can provide guidance for organizations that are considering using crowdsourcing for their business needs and for crowdsourcing providers to assess and strengthen their control framework to mitigate deception threats. For instance, results indicate that risks are predominantly linked to reputational and/or financial loss. Both Confidentiality risk types refer to privacy violation risks that are likely to damage a crowdsourcing platform's reputation and result in fines. The Integrity risk types are related to the loss of reliability and reputation that crowdsourcing platforms face when their sites are flooded with false information. This will ultimately cause users to abandon them. The Availability risk type impacts platform performance and directly leads to loss of profits due to the unavailability of a crowdsourcing site. Another practical implication relates to the need for the crowdsourcing industry to consider setting up a mechanism through which they can (anonymously) share cyber and deception incidents. An organized library of incidents will support learning about potential risks and will ultimately strengthen the security of the industry as a whole. For instance, a secured platform to collect crowdsourcing deception incidents would assist businesses to learn to recognize and avert deceptive actions.

LIMITATIONS AND FUTURE RESEARCH

A key limitation of our study is that we likely were not able to collect an exhaustive set of incidents. First, crowdsourcing is still a relatively new phenomenon so additional risk types may emerge in the near future. Second, organizations may be aware of the occurrence of deceptive actions so incidents go unreported. Finally, some organizations are likely to be reluctant in sharing detailed information on incidents out of competitive and reputational considerations.

Future research directions include addressing the limitations of this study by expanding the collection of incidents through interviews with crowdsourcing service providers. Also, future research may focus on issues such as the extent to which risk awareness deters organizations from employing crowdsourcing, whether certain tasks are more vulnerable to deception than others, and whether crowdsourcing efforts are more vulnerable to deception in certain cultures than others. The analysis of the problem from a perpetrator's stance could lead future research towards exploring offenders' motivations for committing deceptive and disruptive actions. Structured surveys or qualitative interviews could be particularly helpful to gather the information about motivations of the offenders. What is more, further investigation of the problem with the use of Routine Activities Theory could be used to increase guardianship through e.g., proposing new governance structures or policies, since crowdsourcing has very few capable guard-

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

ians at the moment. Finally, theoretical research could investigate the underlying cognitive mechanisms why people who aim to deceive others online, e.g., why do people post false information and what are the reasons for choosing crowdsourcing crowds as target victims? Such research could be informed by criminology theories (Holt & Bossler, 2016), for example, Social Learning Theory could be used to explain how prank activities' or Sybil attacks' offenders are motivated by other crowd members to commit described violations. General Theory of Crime could be well applied in the analysis of self-control levels of individuals who get involved in prank activities.

APPENDIX

Table 3. Disruption and deception incidents in crowdsourcing

Type and Task Description	Crowd	Crowdsourcing Platform	Problem Owner	Governance	Crowd Contributions	CIA Triad	Source
I1. Sybil attack – people posting false data on crowdsourced map system Waze	Users posted false reports of a wreck, speed trap or other blockage in their neighborhoods to deflect some of the traffic flow	The app detected a saboteur only after two weeks of daily false information posts				Integrity – wrong data was put into the system to redirect the traffic away from the local neighborhood	Hendrix, 2016
I2. DARPA Red Balloon Challenge – false locations of balloon placements were submitted across teams	False locations were submitted across the teams				False locations' goal was to confuse other participants	Integrity – wrong data strongly influenced the quality of information	Chen et al., 2016
I2. DARPA Shredder Challenge required participants to put shredded documents together. Some of the crowd workers sabotaged the initiative by repeatedly undoing the work delivered by other crowd workers	A crowd of attackers piled up the pieces of the jigsaw and sabotaged genuine users' work making it much more complex, as they had first to unstack the pieces and then search for correct matches				Inserted input contributed to creation of a wrong result, long term impact of the attacks resulted in decrease in participation	Integrity violation – provided data computed false results	Stefanovich et al., 2014
I4. Prank designs submitted to Henkel challenge – the designs got voted to the top ranks and consequently the company had to retract public voting	Intentionally pranked designs confused the voting crowd		Henkel decided to sort out some suggestions		Users had maliciously influenced the vote; wrong input was placed on site	Integrity – data provided resulted in the cancellation of the voting	Fuller, 2012
C2. Netflix released hundred million anonymized user records as part of its "Netflix Prize" Contest. User records became known after they were combined with other information to find the identities of the users in the dataset				Data, when combined with external information disclosed user identities		Confidentiality – data containing identities of the contest participants was disclosed after being combined with publicly accessible information	Wolfson & Lease, 2011
C1. Hacking attack on crowdsourcing page to collect sensitive data incl. passwords, phone numbers, email addresses and credit card numbers (Kickstarter)				Lack of sufficient security measures to hacking attempt		Confidentiality – Kickstarter user data was hacked	BBC News, 2015 Linesh, 2014
I4. Mountain Dew Campaign poll was bombarded with unusable names proposals	The crowd started posting offensive proposals in the contest for a green-apple infused soft drink name				Offensive campaign results shut initiative down	Integrity – provided prank data forced the organizers to close the campaign	Rosenfeld, 2012

continued on following page

Table 3. Continued

Type and Task Description	Crowd	Crowdsourcing Platform	Problem Owner	Governance	Crowd Contributions	CIA Triad	Source
C1. Crowdfunding site Patreon was hacked for users' names, email, posts, and shipping addresses				Site's user database got hacked		Confidentiality - hackers accessed users' names, email, posts, and shipping addresses	Franceschi-Bicchierai,2015 BBC News, 2015
I2. Police officers flooding Waze app with false information on their activity to make the app's information less useful to drivers	The crowd (police) entering fake data on Waze app					Integrity – false information provided aiming to spread disinformation	Bode, 2015
I3. Botnet attack on Waze	Two students created fake Waze accounts to create fake traffic jams					Integrity – false information provided aiming to spread disinformation	Tufnell, 2014
I4. Internet polls steered off track by the voting crowd into outrageous results	E.g. prank responses on polls related to naming ships, bridges, products, planets or voting for concert spots for musicians					Integrity – prank poll responses aiming to spread disinformation	Rheenen, 2016 Watts, 2017
I3. Robo-voting that skewed public polls, e.g. Time 100 Most Influential People		Polls sabotaged by automated scripts (bots) that submit-ted multiple votes				Integrity – voting results were skewed	Roberts, n.d. Lamere, 2009
A1. DDoS attack on PopVote, Hong Kong Democracy voting website in June 2014		PopVote hosted by Amazon Web Services, Cloud-flare and UDomain. All hosting services hit by large scale DDoS attacks				Availability – the goal was to take the website down	Paganini, 2014
A1. Project on Crowdsourced Satellite Imagery taken down by DDoS attack		Site sourcing images of sensitive geographical sites taken down by a DDoS attack				Availability – the website stopped working	Niller, 2016
A1. Reddit site became unavailable because of DDoS attacks		The website was hit with DDoS attack				Availability - Reddit site experienced an outage	Kaplan, 2013

continued on following page

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Table 3. Continued

Type and Task Description	Crowd	Crowdsourcing Platform	Problem Owner	Governance	Crowd Contributions	CIA Triad	Source
I2. Failed hunt for the Boston Bomber	After Boston bombing attack, the crowd attempted and failed to accurately identify the offenders				Wrong information on suspects on Reddit and Twitter resulted in crowd searching for innocent people	Integrity – wrong input data created wrong output and resulted for the chase of innocent people	Buchanan, 2011
I2. SketchFactor application crowdsourced crime and public safety reporting perceptions, not facts		Platform for users to browse reports of "sketchy" behavior and crowdsource their own stories was accused of racism and profiling				Integrity - the data available on SketchFactor compared with actual crime data revealed few clear overlaps	Dewey, 2014
C2. PatientsLikeMe users' personal data on taken medications and illness symptoms was gathered by Nielsen	Nielsen opened personal accounts on the app and copied personal data from chatrooms and on bulletin boards.					Confidentiality – although there was no privacy violation, Nielsen found a way to extract app's users' data	Edwards, 2010
A1. Reddit and Kickstarter sites became unavailable because of DDoS attacks		The websites were hit with DDoS attack				Availability - Reddit & Kickstarter experienced an outage	Crosbie, 20170
I4. Crowdsourced promotional McDonald's campaign gets negative customer reviews	Former employees and customers shared their personal horror stories and jokes related to their McDonald's experience.					Integrity – data provided resulted in the cancellation of the campaign within two hours of the start.	Usitalo, 2015
I4. NYPD crowdsourced online campaign attracts police critique	Instead as asked by NYPD to share images of positive interactions with local officers, users uploaded images of citizens being forcefully searched, beaten, handcuffed or killed					Integrity – failed PR campaign instead of expected positive online crowd reactions	Oh, 2014 Shelly, 2016

Chapter 38
Social Entrepreneurship and Social Inclusion in Peru: A Case Study

Piedad Cristina Martinez
Corporación Universitaria del Caribe, Colombia

Erick Oswaldo Salazar
Universidad César Vallejo, Peru

Armando Miguel Buelvas
Corporación Universitaria del Caribe, Colombia

ABSTRACT

The objective of this chapter is to explore social inclusion in Peru from a case of social entrepreneurship located in Peru. The main factor associated with social exclusion in Peru is poverty, while the factors associated with social inclusion are advances reached in education, job creation, creation of social enterprises and consolidation of an ecosystem for the creation of companies. The main characteristics of the entrepreneur are the ability to identify context and opportunities, perceived self-efficacy, not fear of achieving their visions and goals, the need to generate social change, the ability to participate in networks and a high level of training. The main characteristics of social entrepreneurship are the creation of social value and innovation, provide a quality service and the benefits granted to its clients, facilitate access to a decent job or the creation of their own company; the access to social security through an employment contract; and salary that may allow them to access the necessary resources to achieve their well-being.

INTRODUCTION

In Latin America and the Caribbean, from 25 to 30 million people are in danger of falling into poverty by income, which is equivalent to more than a third of the population that left poverty since 2003. Therefore, the main priority is to protect the population in a situation of vulnerability and to address the exclusions faced by millions of people who never left the poverty-income situation or multidimensional poverty (NUDP, 2016).

Peru is described as a country in a situation of consolidation of democratic governance, where more than half of the population was in poverty, highlighting the historical persistence of a marked Inequality and exclusion. Therefore, it was understood that only with a great joint effort of state, private sector, civil society and international cooperation, some of the goals of the Millennium Development Goals, drawed for 2015, could be achieved.

Thus, during the decade of 2000, Peru experienced improvements in economic and social development, with annual economic growth of 5% (becoming the second fastest growing economy in Latin America, according to the World Bank). In December 2012, the economy had grown during 40 consecutive months (an unprecedented milestone in national history that makes it the leader of the region), and even the global economic and financial crisis that began in 2008 had a relatively minor impact on Peru (NUDP, 2013).

The lack of employment opportunities in the 1990s in Peru pushed people to seek their own jobs and create their own business, motivated by necessity, without resources or public policies to support entrepreneurship. Therefore, some changes were implemented in Peruvian legislation that contributed to the consolidation of the ecosystem for entrepreneurship, giving rise to social entrepreneurs who seek to solve the problems that most afflict society, especially related to education, transportation, hygiene and health (Gestion, Economy and Business Journal of Peru, 2015).

However, this growth has not been enough to close the various social and economic gaps (infrastructure, productivity, education, health and decent employment) and benefit equally all regions and populations in the country (NUDP, 2013). And there is still a lot to progress in supporting entrepreneurship in Peru, considering that, according to the National Institute of Statistics and Informatics (INEI), an average of 853 companies are created and 469 are closed per day, without considering the informal sector (Gestion, the newspaper of economy and business of Peru, 2015).

In this context, some authors agree that social entrepreneurship has always existed, taking into account historical personalities such as San Francisco or Gandhi, who achieved important social changes through their work, which is analogous to that of entrepreneurs today. Thus, social entrepreneurship as a movement evolved in response to the major global forces that have changed living standards around the world in the 1990s, creating more opportunities for people to generate change.

Examples include Hull House, Boy Scouts and the Salvation Army. As pioneering social entrepreneurs, two successful examples stand out: the Grameen Bank, created by Muhammad Yumus, and the Bangladesh Rural Advanced Committee (BRAC), created by Fazle H. Abed (both organizations originated in a disaster in Bangladesh that devastated the country: a cyclone and the civil war), on the belief that their results would be more compelling if they broke with the patronizing aid pattern and followed a new method based on trial, error, and emphasis on outcomes. Academically, the first course in social entrepreneurship was initiated by Greg Dees in 1994 at Harvard University and research in education of social entrepreneurship by Debbi Brock and Ashokas, Global Academy for Social Entrepreneurship, documented by 350 professors in 35 countries. Other initiatives include scholarship programs at schools such as Harvard and New York University, social enterprise courses and social planning competitions at many leading business schools, and partnerships between universities and social organizations that allow students to interact with social entrepreneurs, such as the Reynolds Program in Social Entrepreneurship, at the University of New York (Bornstein and Davis, 2010).

Since then, the phenomenon of social entrepreneurship has generated many works, most of them conceptual and qualitative, that study and delimit the concept, reveal the main characteristics of social

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

enterprises, focus on the ethical aspects of social entrepreneurs, look for theoretical frameworks, analyze the legal forms of social enterprise or deepen the differences between the social entrepreneur and the commercial entrepreneur (Martínez and Rubio, 2012).

Nevertheless, poverty persists, despite the progress made in the field of social entrepreneurship and the substantial amount of development funds allocated to meet the social needs related to it, indicating that traditional development initiatives by governments and International organizations fail to achieve their objectives (Seelos, et al., 2010).

It highlights the importance of social entrepreneurship and social inclusion since the 1990s and the need to continue research in contexts characterized by diverse social gaps, inequitable growth, the absence of a state of Welfare, and major social, economic and cultural changes (the emergence of the private sector, accelerated development of industries, urbanization and technology, as well as the increase of social problems, among others), with the aim of contributing to Vacuum identified in the existing literature in this area and generate tools that contribute to the design of public and private policies, aimed at promoting social entrepreneurship, especially in those societies eager for solutions to their economic, social and environmental problems.

OBJECTIVES

Explore social inclusion in Peru from a case of social entrepreneurship located in Trujillo, Peru, which provides training and certification services for operators of heavy machinery for agroindustry, mining and construction. Specifically, to describe the organizational characteristics of the social enterprise analyzed, characterize the social entrepreneur studied, and describe the characteristics of the clients of the social enterprise analyzed and their social inclusion through the perceived benefits of the social enterprise analyzed.

BACKGROUND

Social Exclusion

There is a wide range of definitions that exist on poverty. Ravallion (2004), for example, argues that poverty exists in a society when one or more people do not have an economic level of well-being that allows them to have reasonable minimum standards regarding society. However, Atkinson and Bourguignon (1999) indicate that the problem of poverty can be seen as inadequate availability of resources. For its part, the World Bank's World Development Report (2008) states that poverty is a pronounced loss of well-being, while Sen (1985) gives a qualitative definition of poverty, pointing out that it is the lack of capacity and rights.

Some authors, such as Dollar and Kray (2000), argue that growth reduces poverty. And Ravallion (2001) expresses the link between the number of poor people and growth, given that the higher the number of poor people the lower the rate of growth.

On the other hand, Alkire and Binat (2009) present five approaches to poverty, which have been adopted by different countries and authors to identify the challenges they face in order to combat it:

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

- **Physical Quality of Life Index (PQLI):** Measures the quality of life in a country, by combining the average of three statistics (basic literacy rate, infant mortality and life expectancy at the age of one year), all of them equally weighted on a scale of 0 to 100.
- **Human Development Index (HDI):** Defined by the United Nations Development Program (UNDP, 1990), it measures the quality of life as a weighted combination of three domains (life expectancy/health, literacy/ educational level and GDP per capita), taking into account the variables that allow the appreciation of a dimension of well-being related to: the number of literate adults and combined matriculation ratios as indicators of the knowledge dimensión, the life expectancy at birth as an indicator of a healthy life and the Gross Domestic Product (GDP) as an indicator of the standard of livin.
- **Basic Needs Approach (BNA):** Expands the needs included in the poverty measure as a multidimensional way of measuring welfare, considering a household living in extreme poverty if one or two of these indicators are present: 1) Homes in Inadequate Housing: housing deficiencies expressed in relation to the physical conditions of housing; 2) Homes in Homes Without Basic Services; 3) Households with Critical Overcrowding (groups living in households with more than three persons per room; 4) Households with High Economic Dependence: this is an indirect indicator of income levels; and 5) Homes with School Truancy (includes households with at least one child between the ages of 7 and 11, who do not attend formal school). However, the approach does not specify a priori how to choose or how these indicators should be weighted.
- **Integrated Rural Development (IRD):** Focused on small and medium farmers, it seeks to take them beyond subsistence agriculture through the implementation of a comprehensive set of interventions. It was implemented mainly in developing countries.
- **Integrated Development Programs/Planning (IDP):** It was mainly an area-based approach. It was implemented to decentralize decision-making and spending at the local level to fight poverty at the local level.

As can be seen, these definitions and indices focus on the problem of lack of access to basic material goods, and it is possible to affirm that the multidimensional study of poverty or well-being is far from the one-dimensional approach, since the latter does not allow appreciation the interaction between variables, contexts, people, political limitations and the role of the public sector, among others.

In fact, the capacity argument, endorsed by Sen (1985), has taken place in most countries today, not only because of the criticism of income as a welfare proxy and the multidimensional approach offered by this concept, but rather due to the interest of creating conditions that help to generate the self-realization of the people. However, the multidimensional approach also fails to provide a perfect perspective of development because of the difficulty of involving many variables and exploring them in detail, the latter being important for policy implications. Finally, Noorbakhsh (1998) stresses that development is not only about expanding people's choices but about expanding them in a fair, national and international way and exercising them wisely.

In order to overcome the one-dimensional analysis of poverty, from the purely economic perspective, the concept of social exclusion arises, whose advantages are summarized in: 1. It is framed within a paradigm of social interpretation, including the relational dimension; 2. It is an integral and multidimensional perspective, which includes, besides the material dimension of poverty, the socio-cultural and political dimensions; 3. Recognizes the heterogeneity of the phenomenon of poverty; and 4. Presents a dynamic

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

approach focused on processes and factors leading to exclusion. From this perspective, the phenomena of poverty and exclusion are not analogous, because they present different foundations. Poverty implies the dissatisfaction of certain basic needs, that is, it identifies a condition of life of deprivation according to what is considered necessary for the human being and in accordance with the current patterns in the society in which the human being lives. While exclusion does not refer primarily to the individual, it is a fundamentally social phenomenon, which indicates the impossibility of society to integrate all people and, therefore, the existence of a conglomerate that materially and symbolically is outside (Uribe - Echavarría ECLAC, 1998).

The concept of social exclusion thus emerged in Europe in 1974, when the then Secrétaire d'Etat a l'Action Sociale de la République Française, René Lenoir, referred to 10% of the marginal and "socially disadvantaged" that, at that time, had been excluded from the Benefactor State. Subsequently, the concept of social exclusion began to be used in academic and public discussion to refer to a wide range of situations from which people can be "excluded", such as: "a livelihood; safe and permanent employment; income; property, credit and land; minimum levels of consumption; education, skills and cultural capital; Welfare State; citizenship and legal equity; democratic participation; public goods; nation or dominant race; family and sociability; humanity, respect, personal fulfillment and understanding "(Sen, 2000).

Therefore, this stigmatizing and narrowly social perspective of social exclusion was overcome in the 1980s because the term became the center of French debates about the nature of the "new poverty" associated with technological change and economic restructuring (Rodgers et al., 1995). For, in these societies of the new modernity, social exclusion is a concept that best describes the metamorphosis undergone by the social question, as Castel (1997) points out, because the traditional poverty becomes a form of exclusion, due to the the changing economic and social context that characterizes advanced technological societies, emerging threats to social integration and, therefore, new areas of social exclusion.

According to Claassens and Zelic (2011), this nature of the new poverty gives rise to other types of social exclusion such as economic exclusion, exclusion from social services, and social exclusion from life and civic and social networks. The European Commission, for example, defines social exclusion as a process by which it ensures that those at risk of poverty and social exclusion access the opportunities and resources necessary to participate fully in economic, social and cultural life, and enjoy a standard of living and well-being considered normal in the society in which they live.

Social exclusion does not equal poverty. Rather, it refers to the process of social disintegration, in the sense of a progressive disruption of relations between the individual and society, as a consequence of the increase in long-term unemployment –particularly unskilled workers and immigrants–, the inability of young people to enter the labor market for the first time, family instability and isolated single-family households, the growing number of homeless people and the increasing tensions and periodic violence in low-cost housing settlements on the periphery of cities. As a consequence, the European Commission adopted social exclusion as a central theme in the formulation of social policy, linking it with the idea that this is the inadequate realization of social rights, making it visible in the work of the Observatory on National Policies to Combat Social Exclusion, which defined social exclusion in relation to the social rights of citizens... to achieve a basic standard of living and participation in greater social and occupational opportunities in society (Rodgers et al., 1995).

In Latin America, the concept began to be used quite forcefully in the 1990s, in the context of the return of democracy and the launching of a new generation of social policies for overcoming poverty (Duhart, 2006).

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

According to the above, the definitions of social exclusion are framed in different perspectives, such as: economic social exclusion, exclusion of social services, social exclusion of life and civic and social networks (Claassens and Zelic, 2011).

Economic exclusion marginalizes individuals in the distribution of economic resources, hinders the development of people's opportunities, skills and competences, which help them to respond to their needs and exercise their rights, allowing them to make decisions to reach the standards Of life and the quality of life they value. In addition, economic exclusion limits the population's access to the labor, financial, housing, and goods and services markets, leading not only to income poverty, but also to reducing access to services such as education, health care and social security, which often results in social exclusion and degradation or loss of skills and competencies. However, participation in economic life does not always lead directly to economic inclusion, rather, access to decent work is one of the most important conditions because it can lead to improvements in other areas of life.

The social exclusion of social services refers not only to the availability of services and the quality of services, but also to the accessibility and affordability of different population groups to social protection systems, including social assistance, social security benefits, social services, social work and counseling services as key sources of support of last resort. Therefore, social services can help to deal with the consequences of exclusion and can also work against some of the factors of exclusion, such as extreme poverty and exclusion from the labor market or poor working conditions.

The social exclusion of life and civic and social networks refers to the denial of participation in different aspects of political, cultural and civic activity, as well as participation in the electoral process, freedom of expression and association and access To justice and information.

Similarly, Rodgers et al. (1995) has adapted the analysis of social exclusion to the realities of developing economies, emphasizing three forms of exclusion:

- **Exclusion of Goods and Services, Which Affects Living Standards:** Usually being a problem of location, knowledge, connections and ability to pay.
- **Exclusion From Subsistence:** Being threatened by the exclusion of land or other productive assets or goods markets.
- **Exclusion of Security and Human Rights:** A precondition for overcoming economic exclusion.

Also, when applying the analysis of social exclusion to contexts of developing countries, several important issues arise (Rodgers et al., 1995):

- The deeply hierarchical nature of many countries, which reinforces the historical conditions of exclusion.
- The influence of modernization as a dominant development strategy in many countries since the 1960s, which resulted in clear patterns of socio-economic differentiation and exclusion of entire regions and social groups.
- The endemic exclusion, in many cases, of both the basic needs and the basic rights, suffered by the majority of populations.
- The ingrained exclusion of certain socio-economic and ethnic groups, such as women, illiterates and indigenous peoples.
- The geographical exclusion of regions that historically, for ethnic or political reasons, have never been the center of national development.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Therefore, Buvinic et al. (2004) point out that indicators for measuring social exclusion and inclusion can be grouped into seven general categories:

- Measures of poverty, which include the depth of poverty and inequality measurements.
- Access to quality social services (including health, education and housing) and productive resources (land, capital, technology).
- Access to physical infrastructure (water, sanitation and transport, for example).
- Access to and participation in labor markets.
- Indicators of social participation and social capital.
- Indicators of justice and political participation.
- Indicators of violence (including homicide) and victimization.

Thus, the common characteristics of excluded populations are usually (Buvinic et al., 2004):

- **Invisibility:** Socially excluded groups are invisible in official statistics (censuses and government surveys).
- **Poverty:** The poverty of socially excluded groups is permanent rather than transitory and - unless specifically addressed through a wide range of social investments - persists for generations, condemning individuals to poverty.
- **Stigma and Discrimination:** Produced by the poverty and disadvantages that result from social exclusion. Stigmatization associates the human differences shared by a group with negative attributes that separate them from other individuals and significantly influences the distribution of life opportunities. Discrimination is a frequent consequence of stigma and may be the result of social imposition or "self-discrimination," in which the heritage of past discrimination discourages individuals from applying for certain jobs, attending health centers or defending their rights.
- **Cumulative Disadvantages:** When people have two or more of the characteristics that lead to the exclusion of groups.

According to the above, many authors agree that education and social entrepreneurship are determinants of social inclusion. Education, because it contributes to growth and economic development, and the improvement of well-being in an economy, because it facilitates the absorption of technology, based on the accumulation of human capital; determines growth and convergence between countries; reduces the poverty rate; increases participation in civil society; reduces income inequity; and facilitates social mobility through job opportunities and wage increases (Benhabib and Spiegel, 1994; Pedreño, 2008). And social entrepreneurship, because it contributes to the solution of the social problems that afflict society, as discussed below.

Social Entrepreneurship

Social entrepreneurship emerges as a trend in which civil society, community and social capital have entered high politics, since in the 1970s the European Welfare States adopted a different orientation to the universal, implicit in the model Institutional redistribution of welfare, reintroducing individual responsibility and belonging, rather than public responsibility and citizenship, as the foundation of modern Welfare States. The reorientation of Welfare States in the direction of privatization and accession is not

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

only favoring private and individual responsibility. It is also generating a new role for civil society and creating a new and improved space for collective and solidarity movements that influence the future evolution of the Welfare State. The paradox is that social enterprise and social entrepreneurship can be seen not only as elements of a privatization process but rather as a manifestation of the power of civil society (Hulgard, 2010).

In this sense, Mair and Martí (2006) consider social entrepreneurship as a process of creating value through new combinations of resources, mainly aimed at exploring and exploiting opportunities to create social value, stimulate social change or meet new social needs.

Similarly, the GEM Special Topic Report Social Entrepreneurship (2015) defines the Social Entrepreneurial Activity (SEA) as any kind of activity, organization or initiative that has a particularly social, environmental or community objective, which could include the provision of services or Training for socially disadvantaged or disabled people, activities to reduce pollution or food waste, and the organization of self-help groups for community action, among others.

Likewise, Hulgard (2010) argues that social entrepreneurship can be defined as the creation of a social value that is produced in collaboration with individuals and organizations of civil society, that participate in social innovations that usually involve an economic activity. This definition is based on four criteria: social value, civil society, innovation and economic activity.

Social value establishes that social entrepreneurship is linked to the creation of value, which can be, for example:

- **Broad and Global:** It works with a global mission to improve access to basic education, health, drinking water and social justice.
- **Narrow and Global:** Whose goal is to end global poverty.
- **Narrow and Local:** As the goal of creating better schemes for ethnic inclusion in specific local communities; and
- **Broad and Local:** As the goal of improving participatory citizenship and institutional capacity through the use of bridging and linking social capital in disadvantaged areas.

The criterion of civil society is important to distinguish social entrepreneurship from social activities in the commercial private sector and in the public sector. It can be located at the intersection of the public sector, the private sector and civil society. The innovation criterion is included because the social entrepreneurship activities imply the development of a new approach to solve a social problem, generating an economic impact, and not for the ambition to create a company. Finally, the notion of economy is relevant for all actors in the activity: for the entrepreneur, who assumes an economic risk; and for the participants, who can benefit from better health, social services production, community development, and access to work, etc.

According to the above, Choi and Majumdar (2014) propose the conceptualization of social entrepreneurship as a cluster due to the multiple subconcepts identified as (1) creation of social value, (2) social entrepreneur, (3) organization Of social entrepreneurship, (4) market orientation, and (5) social innovation.

On the other hand, Alonso, González and Nieto (2015) indicate that the main aspects in which the authors agree, when defining social entrepreneurship are:

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

- Its main mission is to contribute to the welfare of society.
- It addresses social problems and pressing social needs.
- It has the potential to produce significant changes in perceptions, policy formulation, or implementation of social changes in the public sector.

However, the conceptual confusion state that some authors attribute social entrepreneurship only to non-profit organizations, while others describe it as lucrative enterprises run by non-profit organizations, organizations with permanent financial losses, philanthropic type, or those business activities with a social objective (Alonso, González and Nieto, 2015). Or they classify social enterprises into three types: nonprofit social enterprise, hybrid social enterprise and for-profit social enterprise (Martínez and Rubio, 2012).

Characteristics of the Social Entrepreneur

Social entrepreneurs are people who have vision, creativity and determination, but their motivation lies in the generation of deep and lasting social change, and not for personal benefit. Outstanding entrepreneurs have innovative solutions and have the potential to make a significant positive change in society. Also, social entrepreneurs innovate in a product or service that in use becomes a social reality (Contreras and González, 2010).

Some authors consider that –irrespective of whether they adopt a legal form for profit or not for profit– social entrepreneurs' organizations are unique, because they imply a hierarchical ordering of social and economic value, by which social value takes precedence over the generation of economic income (Seelos et al., 2010).

Similarly, the GEM Special Topic Report Social Entrepreneurship (2015) defines the social entrepreneur as an individual who initiates or directs any type of activity, organization or initiative that has a particularly social, environmental or community objective.

In this way, social entrepreneurs share certain qualities (Bornstein and Davis, 2010):

- The ability to overcome apathy, habit, misunderstanding and disbelief, while facing a heated resistance.
- The ability to change behavior, mobilize political will and continuously improve their ideas.
- The ability to listen, recruit and persuade.
- They foster a sense of responsibility and a sense of ownership of change among those with whom they work.
- They are comfortable with uncertainty and have a high need for autonomy.
- The ability to gain joy and celebrate small successes, when they will face adversity along the way.
- Successful social entrepreneurship involves well-established behaviors that can be acquired.

Martinez and Rubio (2012), meanwhile, indicate that the literature highlights the importance of taking into account, when analyzing this phenomenon, a series of objective variables, such as gender, age and educational level. And cognitive, such as perceived opportunities, perceived efficacy and fear of failure. In this way, social entrepreneurship is an activity of young men, in which there is a natural

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

predisposition of the female group towards this type of activity, the training level is usually not high, it emphasizes the perceived self-efficacy or feeling of possessing the necessary skills to carry out a business initiative, and feel the ability to do more with less, preventing fear from keeping you from achieving your visions and goals.

Finally, from the perspective of the GEM Special Topic Report Social Entrepreneurship (2015) the following characteristics of the social entrepreneur are presented:

- Social mission, creation of value and capture of value.
- The commercial side of operating in the market: offering a product or service among the leaders of social enterprises.
- Innovation.
- Reinvestment of benefits.
- Measures impact among leaders of social enterprises.
- It combines key elements in a narrow definition of social entrepreneurship.

Research Method

The methodology used in this research is the case study, given the state of conceptual confusion detected in the existing literature on social entrepreneurship and social exclusion, and the scarcity of research on this phenomenon. For the case study is appropriate for contemporary issues, because it has the following distinctive features (Yin, 1989: 23):

- Examines or inquires about a contemporary phenomenon in its real environment;
- The boundaries between the phenomenon and its context are not clearly evident;
- Multiple data sources are used; Y
- A single case can be studied as well as multiple cases.

Similarly, Chetty (1996) indicates that the case study method is a rigorous methodology:

- Suitable for investigating phenomena that seek to respond to how and why they occur.
- Allows you to study a specific topic.
- Ideal for the study of research topics in which the existing theories are inadequate.
- It allows to study the phenomena from multiple perspectives, rather than the influence of a single variable.
- It allows to explore in a deeper way and to gain a wider knowledge on each phenomenon, allowing the appearance of new signals on the emerging themes; and
- It plays an important role in the investigation, so it should not be used merely as the initial exploration of a given phenomenon.

The case studies can be simple or multiple, depending on the number of cases to be studied, for which Yin (1989: 28) proposes a typology that establishes four basic types, depending on the number of cases and the different levels of analysis:

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

- The single case or unit of analysis.
- The single case with main unit and one or more sub-units.
- Multiple cases with main unit of analysis.
- Multiple cases with main unit and one or more sub-units within main.

In this study we selected a single case and several units of analysis, that is, the World Trainer social enterprise as a single case, the company as the main unit of analysis, the entrepreneur as the second unit of analysis and the clients as the third unit of analysis.

Taking into account that "the objective of the theoretical sample is to choose cases that can probably replicate or extend the emergent theory... and the number of cases must be added until the saturation of the theory" (Eisenhardt, 1989), the following criteria were established for the selection of the sample:

- Be a social enterprise.
- Directed to vulnerable populations.
- Satisfying the assumptions of the theories addressed.

The World Trainer case is a social enterprise aimed at vulnerable populations located in Trujillo, Peru, and satisfies the assumptions of the social entrepreneurship approach and social exclusion.

Considering that Yin (1989, p. 29) recommends the use of multiple sources of data and compliance with the principle of triangulation to guarantee the internal validity of the investigation, allowing to verify the data obtained through different sources of information, sources and information instruments used are the following:

- Structured interview applied to the entrepreneur.
- Survey applied to clients.
- Structured interview applied to allied companies.
- Survey applied to graduates.
- Observation of the Company.

SOCIAL ENTREPRENEURSHIP WORLD TRAINER (WT)

Context Characteristics

Peru is described as a country in a situation of consolidation of democratic governance, where more than half of the population was in poverty in the 1990s, highlighting the historical persistence of a marked inequality and exclusion. Therefore, it was understood that only with a great joint effort of state, private sector, civil society and international cooperation could some of the goals of the Millennium Development Goals, set for 2015 (NUDP, 2013) be met.

Thus, during the decade of 2000, improvements in economic and social development were made, which led to significant progress in the reduction of total poverty to 36%, significant reductions in chronic child malnutrition and infant mortality, a high presence of women in Parliament and job creation. In

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

fact, between 2000 and 2012, there was a notable growth in production, allowing for positive changes, such as greater access to basic social services and reduction of monetary poverty. Between 2000 and 2010, it achieved an average annual economic growth of 5% (the second fastest growing economy in Latin America, according to the World Bank). In December 2012, the economy had grown 40 consecutive months (a milestone unprecedented in national history that makes it the leader of the region). And even the global economic and financial crisis that began in 2008 had a relatively minor impact in Peru (NUDP, 2013).

According to the National Institute of Statistics and Informatics (INEI), in the year 2015, Peru has a population of 31'151,643 inhabitants, revealing the following social indicators, according to the main indicators of Exposed in the theoretical framework (PQLI, HDI, BNA, QLI):

- **Monetary Poverty:** 22.7%.
- **Extreme Poverty or Misery:** 4.3%.
- **Human Development Index (HDI):** 0.734 below the global average (0.744) and the Latin American and Caribbean countries (0.748), ranking 84th out of a total of 187 nations evaluated.
- **Unsatisfied Basic Needs (NBI):** 19.4% of households have at least one NBI; 6.5% of the population lives in houses with inadequate physical characteristics, 7.4% in overcrowded housing, and 8% in homes without sanitary facilities; 13% of households are without public water supply, 27.3% do not have a public water service, and 5.8% do not have electricity by public network.
- **Households with Children Who Do Not Attend School:** 0.6%, this indicator has improved, considering that in 2004 and 2005 it stood at 3.8% and 3.7%, respectively.
- **Net Enrollment Rate of the Population Aged 3 to 5 Years:** 80.1%.
- **Net Enrollment Rate of the Population Aged 6 to 11 Years:** 91.4%.
- **Net Enrollment Rate of the Population From 12 to 16:** 94.4%.
- **Illiteracy Rate of 15 Years and Over:** 6.3%.

From the economic and social dimension, Peru's growth has been based on the richness of the country's natural resources and the export of raw materials (especially minerals) in a global context of favorable prices; the significant development of economic sectors, such as agro-export and tourism, among others; the responsible macroeconomic and fiscal management that has characterized the economy in the last two decades; low inflation rates (2.65% in 2012); the largest budgets for public investment; the accumulation of international reserves; significant flows of foreign investment; reduction of external debt; improvements in public policies and social programs; important innovations in terms of public management and social programs to improve the quality of public investment and prioritize care for vulnerable groups, including children; and greater involvement of civil society organizations and communities in the implementation and monitoring of public policies.

However, in the 1990s, the lack of a policy to support entrepreneurship, coupled with the lack of employment opportunities, pushed people to seek their own jobs and create their own business, motivated by the need, giving rise to some successful entrepreneurs who have become good referents for other entrepreneurs. In this way, some changes were implemented in Peruvian legislation that have been consolidating the ecosystem for entrepreneurship, identifying many profiles of social entrepreneurs that seek to solve the problems that most afflict society, especially related to education, transportation, hygiene and health (Gestión, Journal of Economy and Business of Peru, 2015).

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Characteristics of the Entrepreneur

Luis Francisco Salazar Montoya was born in Trujillo, Peru on March 27, 1974 (currently, he is 42 years old). He studied primary and secondary in the school Perpetuo Socorro and obtained the degree in Business Administration in the Universidad César Vallejo.

At the age of 21, before finishing college, he felt the need to earn and save money in a short time to create his own company, making the decision to go to work in the United States for a year, where he found employment in the salad processing area of a restaurant and in the maintenance area of a golf course.

After completing his university studies in 2000, he found work at the AT & T company dedicated to telecommunications, where he worked for only six months because he wanted to start his own business and decided to dedicate himself to the cultivation of asparagus for two years, taking advantage of the opportunity that at that time it was a very profitable business.

In 2000, Luis married Gamin Gamarra Marinés, with whom he dedicated himself to the production of milk for four years. They started the business with three cows, until reaching about 100 cows, but later, when the business stopped being profitable they decided to sell it. With the money obtained from the sale of the milk business and the financial support of the father of Marinés, they bought the construction company VILBOD S.A.C., which belonged to Marinés' cousins, who gave them payment facilities.

The fixed assets of VILBOD S.A.C. were a backhoe and a van, which they leased to companies belonging to the construction industry. In this business, Luis Salazar began to build his network of contacts with entrepreneurs of the region, through the purchase of spare parts and necessary tools for the company. He continually asked them what they needed, until they realized that the companies in this industry needed to hire certified heavy machinery operators, and that is when they came up with the idea of creating a heavy equipment operator training company.

Therefore, the experience acquired by Luis in the construction company VILBOD SAC, the low profitability that this company generated, as well as the established network of contacts with family, friends and entrepreneurs in the construction, agroindustry and mining sector, prompted him to take the decision to sell the company VILBOD SAC and found WT.

WT Organizational Characteristics

WT was born in 2012, with the aim of increasing the availability of skilled labor for the mining, agroindustrial and construction industry, providing short-term technical training to young people from vulnerable populations who can not access higher education and a formal employment with a good salary, that allows them to improve their economic status, their well-being and that of their families.

Given the lack of technicians in Peru and the need for these industries to hire skilled labor, a hundred thousand foreign technicians have been admitted to Peru, mostly from Spain, Chile and Argentina, while about one million young professionals from Country are out of work because, in this case, they require more technicians than engineers, for example. Therefore, technical training has emerged as an opportunity for industries that demand skilled labor, and for young people belonging to vulnerable populations who can access the labor market in the short time.

WT began its training activities on January 27, 2013, with a group of 35 students, showing good reception from the outset, despite the few but strong competitors on the market.

At first, WT only had a backhoe and a 4x4 truck. The rest of the machinery used in the practices were rented (front loader, crawler excavator, hoist), as well as the quarry where the practices were performed.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

The latter, located in a distant site of Trujillo, so the company had to bear the costs of transporting the students by taxi.

Transportation and rent costs diminished the profitability of the business, but little by little Luis acquired the machines with resources from the company and a loan from his father-in-law, of whom Luis comments: "He was the one who supported me unconditionally, from the beginning I believe in myself and In my projects, he was with me in the good and the bad, that's how we started with the company, and he stayed with us giving us his support during the growth of it."

Luis's wife is a business administrator, and comments: "Now together we manage the company, we could say that we achieve a good balance, in the sense that Luis is the dreamer, he gets excited by opportunities because he is enthusiastic about projects or business fast (which is very good, because it is the first step), but I put the pinch of reality and analysis. I think that balance makes us take good decisions so far. For his part, Luis comments: "we work as a team, she is more dedicated to administrative activities and I to the operational activities of the business."

In 2014, WT bought a vehicle to transport the students and in 2015 they acquired a quarry for rent located in Trujillo, just 10 minutes from the company, allowing them to save time and transportation costs. Likewise, at the end of 2014, he acquired the necessary machinery for the practices, with capital from savings, small bank loans (especially for the maintenance of the machinery) and help from a family member.

In 2014, WT expanded geographically through a project in the municipalities of HUAMACHUCO and TAYABAMBA, both located in La Sierra Liberteña, with the aim of providing the people of La Sierra with the opportunity to train as operators of heavy machinery, without having to move to Trujillo, except to develop the practices. The teachers had to move to these municipalities for the development of the classes, during a year that lasted the project, managing to train approximately 150 students. In addition, they have a project in the city of JAGUEY, located two hours from Trujillo, to train a group of young people in heavy machinery. However, the company has a wide coverage, since the majority of the students come from the valleys of CHAO, VIRU, CASA GRANDE and CASCAS, among others, as well as the environs of Trujillo and La Sierra Liberteña, characterized by having a large vulnerable population, due to the difficulty in accessing higher education and developing skills that enable them to develop in society.

The mission of WT is to contribute to the socio-economic development of the region of La Libertad, through training in Safety, Maintenance and Operation of Heavy Machinery for the mining, construction and agribusiness sector and department stores in the public and Private, with suitable professionals, learning by doing methodology, and specialized machinery.

Its vision for 2020 is geared towards being recognized at the national level as a leader in the training in Safety, Maintenance and Operation of Heavy Machinery for the mining, construction, agriculture and transport logistics sector, in the public and private sector, with professionals Training, information and communication technology (ICT) mediation, specialized machinery, and state-of-the-art technology.

In this regard, says the entrepreneur: "We are the institution that best practice practice before the competition, since we own our own machines, while other companies have to rent, increasing the cost of training."

On the other hand, WT promotes its services through the local radio, with publicity during the weekend, every half hour, and flayers in the office and where the radial coverage does not have reach.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

When a group finishes the courses, WT makes a closing in a country restaurant near the city, offers a dinner and they realize a championship of soccer, with the objective of to strengthen the bonds of brotherhood with its graduates.

WT has a small and functional organizational structure, composed of the manager, the academic-administrative coordinator, a secretary, teachers, and instructors.

Incomes from WT indicates that these have doubled over the four years of existence due to (Table 1):

- Responding to the needs of the sector.
- Quality and differentiation of your services.
- Low prices on the market.
- Satisfaction of its customers.

The programs and services offered by the company WT are:

- Technical training in heavy machinery.
- Supply of heavy machinery operators to companies in the mining, agroindustrial, construction and government sectors.

The technical training of heavy machinery has a duration of one year and comprises four courses of four different machineries, with a duration of three months each:

- Backhoe Loader.
- Mounting load.
- Front loader.
- Backhoe Crawler.

The classes take place on Sundays from 8:00 a.m. to 2:00 p.m., but because some students work or live in other municipalities, the classes are theoretical-practical, virtual.

The theoretical classes include the modules presented in Table 2 and are guided by professional engineers from the Universidad Nacional de Trujillo and the Instituto SENATI - Trujillo. These are

Table 1. WT incomes 2012-2016

2013 (New Soles)	2014 (New Soles)	2015 (New Soles)	2016 (New Soles)

developed in the Instituto de Educación Superior Pedagógico Público INDOAMÉRICA, through a collaboration agreement.

The practical classes are carried out in the quarry located in Trujillo, with each of the machines, in a personalized way (student by machine), most are guided by experienced graduates, who are given the opportunity to work as Instructors.

Once they finish their studies, WT performs the intermediation between the companies of the mining sector, agroindustrial, construction and governmental and its graduates, articulating the necessity that they have to hire operators of certified and productive heavy machinery, with the necessity that the graduates have of access to decent employment. A service that does not have cost, since its purpose is to support the graduates to their insertion in the labor market. Each year about 300 young people are trained and certified, which corresponds to seven promotions a year, approximately, which are working on agroindustry projects in La Sierra, the mines of LA ARENA, LA BARRIK, LA PODEROSA, MARZA, MINEROS HORIZONTE, GOLFI, CASA MARCA, among others, road infrastructure works of the municipalities, and construction companies.

Today WT has a database of clients that frequently request young people with capacity to operate heavy machinery and within its main allied companies they stand out: CORPORATION STAURUS SAC (CS), HUANCHACO ALCALDÍA AND CONCESIONES JCV.

CORPORACIÓN STAURUS SAC (CS) is one of WT's main customers and allies. He has 30 years of experience in the purchase, sale and repair of heavy machinery. It currently has three business units:

- Commercialization of machinery and industrial, heavy and transport equipment of the most globally recognized brands. It offers rental services, integral maintenance and repairs for the same type of equipment.
- Projects for the design and construction of civil works, such as roads, bridges, buildings and industrial plants, electrical, hydraulic, pneumatic and engineering structures.
- And marketing of parts, spare parts and components for machinery and industrial equipment, heavy and transport, as well as tires, filters and lubricants throughout the national territory.

The mission of CORPORACIÓN STAURUS S.A.C. Is to meet the integral needs of its internal and external customers, based on sustainable development and continuous improvement in all its processes; Working constantly to develop a warm, motivating environment and promote staff development; And taking care of and respecting the environment in all operations and generate profit to its shareholders.

Its vision is to be recognized as one of the best companies that operates in the sectors of heavy machinery, construction and related services, in the national territory. It has a qualified and multidisciplinary team of professionals with high talent, extensive skills and experience in civil and industrial projects; Dedicated to the design, planning and execution of works, protecting the environment, with permanent qualification as a strategy of competitiveness in the sector.

CS has its own fleet of trucks of the brands Volvo, Scania, Iveco; Water and fuel tanks of the Mercedes Benz and Freightliner brands; as well as yellow line machinery such as crawler tractors, front loaders, crawler excavators, backhoes, Caterpillar, John Deere, Komatsu, Volvo. All, properly equipped and with support and maintenance of the marks, complying with standards of work in mines, construction and earthmoving. It owns own mechanical workshops with ample facilities and has the close and permanent collaboration of the representatives and technical experts of the marks, to achieve high standards of operative availability and security in the maintenance of equipment park.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Its main customers are: Pesquera Hayduk S.A. Agroindustria El Rocio S.A., Cerro Prieto Agricultural S.A., Provincial Municipality of Faustino Sánchez Carrión Operations, and Logistics SAC, belonging to the sectors of mining, agroindustry and construction.

According to the manager of CS, there is a need in the market for operators of heavy machinery and WT is positioned as an academy, along with two or three more in the country, distinguished by the guarantees and seriousness offered by providing them with the appropriate personnel for the Handling of heavy machinery, because they receive good training, respond in all fields of action, safety and management of machinery, and obtain a very good level of customer satisfaction.

The employment relationship of the heavy machinery operators graduated from WT is done through contracts with each company. The proposal of salary is presented to the operators, who is generally very good and, if they are interested, they sign a contract between 1 and 1,5 years, plus social security, due to the Peruvian mining legislation requires regulation of Security and hygiene mining: safety of workers in case of accidents, as well as waste management.

Contracts vary depending on the work. If the operator shows good results, the contracts continue. For each contract two or three operators are required. If outside the city, they also provide security and housing for the duration of the contract, which vary from 1 month to 1 year, but are recommended for another job.

CS contributes to the country's growth, since many young people do not have the opportunity to enter higher education and employment, and these courses allow them to generate income for their well-being. Therefore, both companies (WT and CS) contribute to social inclusion through employment and training, contributing to the well-being of young people and local communities.

Regarding the future of the training sector for heavy machinery operators, the manager of CS believes that "there are several that have appeared in the market, but the company that provides a better service remains." The best advertising is the image. WT is located in very satisfactory place. There are two to three companies that belong to the sector of training of heavy machinery operators and in this region there is another academy in Huanchaco, but the young people formed by WT are characterized by their positive attitude towards work, their values and desires to work.

Government of Huanchaco

Huanchaco is a 20% beachside district. 80% of the population lives in the rural area; a vulnerable area of poverty and extreme poverty in which many young people who do not have access to education live, which increases their vulnerability.

There is an institution that provides services for the heavy machinery owned by the Mayor and WT is a solid company, the second in the district, which offers a technical career in three years, giving the municipality the possibility of having skilled labor for their works. The City Hall uses all kinds of machinery, for example, the excavator to do the works of water sanitation and sewerage. At the moment, they are in the bidding process to change the sewage networks, to make a pumping chamber with 12 meters of depth, and to install the pipe, with the use of the excavator. For this, operators, assistants, a work and maintenance team for the machinery are required.

The municipality has its own machinery for these works, but is insufficient, and sometimes must contract through various modalities. For example, contracts at all costs, in which the contractor puts the machinery, personnel, and fuel. And direct management contracts, in which the Mayor puts the pipeline

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

and the contractor puts the machinery, depending on the work. However, they do not dredge beaches because it requires special machinery and they are not qualified for it.

Poverty rates in Huanchaco are the main cause of vulnerability of the population, but there is a need for skilled labor and the use of heavy machinery, so that WT has been able to contribute to improving such poverty by offering young people the opportunity to train in a shorter time (3 to 12 months), without having to wait three years to operate a machine, since it requires practice and theory. WT offers training in three, six and twelve months. That is to say, it is the shortest race, faster, economic, and generates immediate labor inclusion. Well, a university requires 5 or 6 years of training to be able to enter the labor market. Thus, for example, a teacher leaves the university with a salary of 1,500 nuevos soles and study between 5 or 6 years, while a heavy machinery operator is better paid, with approximately 2000 nuevos soles, on average. "Since they come into practice are very good and supervision is constant."

The productivity and performance of operators is very good and measured through the progress of the work. To date, there have been no cases of poor performance evaluation. However, there are no programs from the municipality and central government that promote technical training through scholarships, which would be a good strategy. In this sense, the Mayor's Office supports young people who do not have the resources to study, with a discount that directly grants WT as consideration, through the existing partnership between both companies. For 80% of the population living in rural areas, 40% of the families are dedicated to recycling under precarious conditions, in the sanitary landfill of the entire province, called Centro Poblado El Milagro. Another part of the population is dedicated to raising pigs, farms and crops of corn, papaya, passion fruit, cacao, and watermelon. Those who are engaged in the cultivation of corn also use heavy machinery and WT has contributed to the training of some young people in this area who are engaged in agriculture.

Most of the works carried out by the Mayor's Office in Huanchaco are road infrastructure and rehabilitation projects in rural areas (such as irrigation channels for crops and aqueducts, for example), financed by their own budget and some by the Ministry of Finance. In these works, WT offers the technical support and the supply of operators of heavy machinery.

Concepciones JCB

This Company sells equipment to small companies that constantly request heavy machinery operators, which are supplied by WT through the cooperation alliance of both companies. In this sense, WT has filled the gap in the market, related to the training of operators that small companies can contract for their operations and constitutes an opportunity for training and salary for young people with limited economic resources, as well as for the economy Of its municipality.

The level of satisfaction of Concepcion JCB customers regarding the performance of heavy machinery operators supplied by WT is very good, indicating that they receive good training, without this requiring a high investment in education. They also receive a good salary, sufficient for their needs and above the minimum wage (800 nuevos soles), despite the low investment made in their training, be so young and have such a short career.

In addition to the mining sector, young people trained in WT can work in the agricultural industry for export. In the same way, they can access employment in other industries that use the backhoe machine that has high fungibility, since it allows to perform multiple jobs.

Customer Characteristics and Social Inclusion

The main clients of the WT company are:

- Young people between 16 and 35 years of age who require training as operators of heavy machinery; Y
- Workers with experience in operation of heavy machinery that require certification.
- WT students are mostly young people with an average age of 25 years, 91% are men and 9% are women, 75% are single, 5.6% are married, 16.7% live in free union, 2.8% are separated from their partners and 69% do not have children.
- The follow poverty indicators were found:
- **Housing:** only 13.9% have their own home, 8% in rented housing, and most live with a relative (78%).
- **Social Security:** 56% do not have any type of social security, because only 26% have a formal contract with a company and the rest, works through a verbal and occasional contract, having to resort to the financing of the enrollment By the company WT through a direct credit that allows them to pay through monthly installments.
- **Education:** 53% have completed high school, 25% have completed technological studies, 5.6% have incomplete secondary schools, 11% complete primary schools, 2.8% have incomplete primary schools and only 2.8% have studied University students.
- **Employment and Wages:** 78% worked before starting their studies in WT, increasing to 89% when they start the internship period because it allows them to find a job. In this way, 55% have a monthly salary of less than 800 nuevos soles, 26% earn 850 nuevos soles and only 19% have salaries between 851 and 1,700 nuevos soles.

At the end of their studies in WT, 59% of these young people aspire to work in companies belonging to any sector (public or private), 15% in the public sector and 27% in the private sector, preferably in the mining sector because Wages are among the highest in the market. Therefore, the salary expectations of 77% of these young people are between 851 and more than 1,700 nuevos soles, taking into account the opportunities of employment relationship that WT offers them, through the intermediation with the companies of the sector construction, mining and agribusiness.

A similar situation arises with the income of their parents, being that of the 78% that works, 50% obtain a salary of less than 800 nuevos soles, 18% has a salary of 850 nuevos soles, 22,7% 851 and 1,700

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

nuevos soles, only 9% obtain monthly between 1,701 and 3,400 and more than 3,400 nuevos soles. This is due to the fact that 48% of their parents only attended high school and 31% did technical studies. Fifty per cent of the mothers work, but 67 per cent receive a monthly salary of less than 800 nuevos soles and the rest receive a salary of 850 nuevos soles. Only 2.8% of parents own businesses.

On the other hand, 49% of the graduates are men and 51% are women, 73% are single, 12% are married, 9.8 are union members and 5% are separated. 66% have children and 34% do not have children.

Regarding poverty indicators, according to the theoretical framework, the following were obtained:

- **Education:** 56% finished high school and only 7% have higher education. The rest have incomplete primary education (2.4%), complete primary (7%), incomplete secondary (4.9%), technical (2.4%) and incomplete secondary education (2.4%). 63% studied in WT with direct credit and the rest with financial institutions and other sources.
- **Housing:** 50% of the young graduates live with a family member, 28% have their own homes and 22% are rented. An improvement in these results can be detected, since they can access decent employment and a good salary.
- **Employment and Wages:** 90% of the graduates found employment at the end of the studies in WT, of which 34% have a verbal contract, 17% have a work contract, and only 17% have an indefinite contract. The others have a verbal contract, for 1 year, indefinite.

Taking into account that 59% of the parents of these young people do not work, 33% of their parents have a salary of 800 nuevos soles, 50% have a salary of 850 nuevos soles, and only 5% have their own business. The salary aspirations of the majority of graduates are to obtain a salary between 851 and 1,700 nuevos soles. In this way, 100% indicate that they met their expectations with the studies studied in WT and 81% said that their living conditions and those of their family improved after completing their studies in WT.

Some testimonies from the graduates confirm the contribution of WT to social inclusion, through training and certification of skills in the operation of heavy machinery. One of them, only 21 years old, has been able to create his own business consisting of the production of asparagus for export, cultivating a 7-hectare plot of land owned by his parents and with machinery that he rents to an uncle. This business has allowed him to improve his income and his well-being.

Another graduate says that before studying at WT he worked as an agricultural technician and when he saw his friends who operated heavy machinery, he proposed that one day he would learn to have his own company. He entered to study WT and when he finished he created his own business of agricultural inputs for the cultivation of maize and other products. In addition, he works in a condominium construction company, called TBC.

Ana Cristina is a young graduate who was motivated to study in WT for reference of some friends who studied in WT and listening to the publicity in the radio. Although at the moment he works in another activity, he aspires to dedicate himself to the operation of heavy machinery and to have his own company, once his current employment contract is completed.

In the opinion of the graduates, the experience demonstrated through the years of work experience, is a fundamental factor to obtain a contract of work, since this allows them to continue developing the skills acquired in WT.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

ISSUES, CONTROVERSIES, PROBLEMS

The context in which WT is embedded is characterized by diverse social gaps and the absence of a welfare state (as evidenced by poverty indicators), inequitable growth (as indicated by the HDI), and Great social, economic, and cultural changes in Peru (accelerated growth of the economy and the reduction of poverty), confirm the arguments of Rodgers et al. (1995) when referring to social exclusion from the realities of developing economies, where the emphasis is on the exclusion of goods and services, exclusion from subsistence, and exclusion from security and human rights.

Peru has a deeply hierarchical nature that reinforces the historical conditions of exclusion and the endemic exclusion of both the basic needs and basic rights suffered by the majority of the population, which hinder their development, preventing the growth achieved during the (Infrastructure, productivity, education, health and decent employment) and benefit all regions and populations of the country (NUDP, 2013).

On the other hand, the GEM special report social entrepreneurship (2015) indicates that the average prevalence rate of entrepreneurship among entrepreneurs currently trying to start a social enterprise in the 58 GEM economies is 3.2%, Ranging from 0.3% (South Korea) to 10.1% (Peru). Nevertheless, much remains to be done to support entrepreneurship in Peru, taking into account that according to the INEI, an average of 853 companies are created and 469 are closed per day, without considering the informal sector (Management, the economy and business journal Of Peru, 2015).

In addition, there are advances in education that allow us to glimpse the achievement of Peru's goals in inclusion, growth, economic development and welfare improvement, given the instrumental nature of education, because it facilitates the absorption of technology, Based on the accumulation of human capital; Determines growth and convergence between countries; Reduces the poverty rate; Increases participation in civil society; Reduces income inequity; And facilitates social mobility through job opportunities and wage increases, according to Benhabib and Spiegel (1994) and Pedreño (2008).

Within this context, the WT entrepreneur has created an innovative solution that seeks to solve immediate social problems and mobilizes their ideas, capacities, resources and social agreements necessary to achieve a sustainable social transformation, according to Alvord et al. (2004). Therefore, Luis has achieved: 1) identifying the current context 2) identifying an opportunity and developing a new proposal of social value to challenge the balance, and 3) establishing a new balance that alleviates the needs Of the most disadvantaged groups through the creation of a stable ecosystem that ensures a better future for the group and society, as indicated by Martin and Osberg (2007).

Therefore, the characteristics of the WT entrepreneur, especially his ability to explore new job opportunities and start-ups in different industries and contexts, confirm some of the theoretical assumptions, such as: the influence of some cognitive variables, such as Perceived self-efficacy or feeling of possessing skills to carry out a business initiative, as it happens with the commercial entrepreneur; to be aware of the social importance of their work and to feel able to do more with less, preventing fear from preventing them from achieving their visions and goals; their ability to detect an opportunity and satisfy some need not met by the state, gathering the necessary resources (usually people, often volunteers, money and other assets) and using them to generate social change; and to seek sustainable large-scale change through the application of new ideas other than those applied by governments, non-profit organizations, and businesses to address social problems as expressed by Martínez and Rubio (2012) and GEM (2015).

However, Luis's professional training does not allow to corroborate the assumption that the training level of social entrepreneurs is not usually high (Dess, 2001).

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Therefore, WT is instituted as a social enterprise that emerges as an opportunity to respond to the needs of young people who lack a level of economic well-being that allows them to adequately access certain resources, causing them a pronounced loss of well-being, and (1994), Atkinson and Bourguignon (1999), the World Development Report World Bank (2008), and Sen (2000).

Similarly, WT emerges as an opportunity detected in the need for skilled labor in the construction industry, mining and agribusiness, both in the private sector and in the public sector; And the need for short-term and low-cost training of young people belonging to vulnerable communities. These findings confirm the arguments of Gatica et al. (2012) that social entrepreneurship is a process and the opportunity to create value for society, generating a change or impact in the community, either through the creation of products and services, or through new business models or new organizations, driven by the actions of an individual, a collective or various organizations that operate in a given context.

The characteristics of WT coincide with those identified by authors such as Mair and Martí (2006), GEM (2015), Hulgard (2010), and Alonso, González and Nieto (2015) who highlight value creation and social innovation, through new combinations of resources to explore and exploit opportunities, stimulate social change or meet new needs Social or socially disadvantaged individuals or organizations, through an economic activity which may be the provision of services or even training.

Likewise, WT's institutional philosophy is in line with the principles of social inclusion outlined by the European Commission that this is a process by which it is ensured that people who are at risk of poverty and social exclusion, Access to the opportunities and resources necessary to participate fully in economic, social and cultural life and enjoy a standard of living and well-being considered normal in the society in which they live.

Within the strengths of WT are identified the leadership in costs, because it has its own machinery and a quarry for lease near the city, while similar companies must resort to the rent of the same, The quality of the training of operators of heavy machinery, due to custom practices, which has generated confidence and satisfaction among companies in the construction, mining and agribusiness sector; The network of entrepreneurs, family and friends that the entrepreneur has built has facilitated the financing of his company and the employment relationship of his graduates. And one of the main strategies adopted by WT is to expand coverage to other regions of the country through projects and the hiring of skilled labor (university teachers and experienced instructors).

The characteristics of WT clients reflect that they belong to vulnerable populations, taking into account the indicators defined by different agencies and authors to measure poverty (IPQL, HDI, BNA, QLI), which are factors associated with exclusion Social. Especially when they can not access safe and permanent employment; income; Property, credit and land; Education, skills and cultural capital; Family and sociability; Parent education; Health services; And housing, distribution of resources; The development of opportunities, skills and competences, which help them to respond to their needs and exercise their rights, allowing them to make decisions to reach the standards of life and quality of life they value, as well as expand their options in a fair, Nationally and internationally and exercise them wisely, according to Sen (2000), Claassens and Zelic (2011), Rodgers et al. (1995), Buvinic et al. (2004) and Noorbakhsh (1998).

In this way, WT's contribution to social inclusion in Peru is shaped by the benefits obtained by young people who access their training, training and certification services as operators of heavy machinery, allowing them to acquire skills in the short term and at low cost To access a decent job or to create their own company, to access social security through a work contract and a salary that allows them to access the necessary resources to achieve their well-being.

SOLUTIONS AND RECOMMENDATIONS

The education indicators denote the challenge that Peú must face in order to overcome the illiteracy rate of 15 and over, through literacy programs aimed at the population that could not access education before the year 2000. As the net rate of school enrollment of children and young people are at acceptable levels, and still need to improve schooling of children from 3 to 5 years of age.

From the different regions of the country, private and public policies are required to promote the creation of commercial and social enterprises aimed at solving the needs of society, such as special lines of credit, entrepreneurship training, agility of procedures for the creation of companies, among others.

The country also needs to make progress in the design and supply of technical and technological training programs for the labor market, covering the demand for skilled labor in the different industries in the country.

It also recommends the creation of scholarships for young people belonging to vulnerable populations to study technical and technological programs in those fields of training of skilled labor required by companies belonging to the strategic industries of the country.

FUTURE RESEARCH DIRECTIONS

- Effects of education on social inclusion.
- Quantitative studies on the influence of social entrepreneurship on social inclusion.
- Identify the types of social entrepreneurship in Peru.
- Factors that determine social exclusion in Peru.
- Identify the types of social exclusion that exist in Peru.
- Characterize vulnerable and socially excluded populations in Peru.

CONCLUSION

Poverty and unsatisfied basic needs determine define vulnerable communities in Peru that are socially excluded. Nevertheless, education ratios are promising in terms of achieving goals related with inclusion, growth, economic development and improved wellbeing.

It was confirmed that WT customers belong to vulnerable communities, taking into account variables used to measure poverty such as: permanent employment; income; property, credit and land; education, attitudes and cultural capital; family and parents´education, health services and shelter, among others. Services offered by WT aim to help young people from vulnerable communities to access decent employment to improve their quality of life and hence to overcome social exclusion that results in less resources available to them. WT also contributes to develop opportunities, skills and competences of individuals and hence fulfill their needs and exercise their rights.

The main features of the social entrepreneur analyzed in this chapter include: education level, the ability to create innovative solutions to social problems through the identification of in-context opportunities; perceived self-efficacy; consciouness about the social relevance of his/her work; being able to do more with less; avoiding fear as a barrier to reach their visión and goals; being able to cover a social need

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

unsatisfied by the Government; gathering required resources and using them to generate social change; aiming for sustainable social change at a greater scale through the application of new and different ideas to those applied by governments, charities and companies, to address social problems.

The main features of a social entrepreneurship like WT are value creation and social innovation through new combinations of resources designed to exploit opportunities and stimulate social change. This is achieved through strategies such as cost leadership, location advantages, quality of services, participation in networks, geographical and offer diversification and trained personnel to provide services.

KEY TERMS AND DEFINITIONS

Graduates: Students who completed their studies in an educational institution.

Huanchaco: Historic spa, world surfing reserve, world famous for the legendary caballitos de totora and Peruvian city located on the Pacific Ocean in the District of Huanchaco, which integrates the metropolitan area of Trujillo in La Libertad Region and forms part of the Moche route.

Quarry: It is a mining operation, generally open pit, in which are obtained industrial, ornamental or arid rocks. They are usually small farms.

Sierra Liberteña: Region where two of the poorest districts of Peru are located: Curgos, in the province of Sánchez Carrión, and Condormarca, in the province of Bolivar. It reaffirms itself as one of the most convulsed areas of the country due to the coexistence of illegal drug trafficking and mining, levels of extreme poverty and physical disconnection.

Trujillo: The capital of the Peruvian department of La Libertad, the most populated city in northern Peru and the third most populous city in the country.

Chapter 39
Value Creation in Business-to-Business Crowd Sourcing

Nina Helander

Jari Jussila
Tampere University of Technology, Finland

ABSTRACT

In knowledge society the utilization of social media as a communication channel between people, groups and even companies is increasing. Current innovation and social media research has already shown the potential of crowdsourcing in the business-to-consumer (B2C) markets. The authors argue in this paper, however, that crowdsourcing has a great and yet partly undiscovered potential also in the context of business-to-business (B2B) markets. In order to get the full potential, a more detailed understanding of the logic of value creation in crowdsourcing activities between multiple stakeholders in B2B context is needed. This paper presents an exploratory study that is carried out as an empirical netnography-based multiple case study. The study opens up potential future research avenues by starting the discussion of value creation logic in B2B crowdsourcing. Practical implications are created through cases revealing what kind of value companies have already been able to gain from crowdsourcing in B2B context.

INTRODUCTION

The increasingly important managerial paradigm, "open innovation", emphasizes the importance of the efficient use of all available resources, knowledge and information. Besides the resources and knowledge inside the company borders, it emphasizes the significance of utilizing particularly the resources and knowledge residing outside the company borders. This is because valuable innovation-related knowledge is being increasingly widely distributed to different actors, organizations (e.g. companies, customers, suppliers, universities etc.) and communities.

Crowdsourcing (Howe, 2008) is relatively novel, but increasingly important ways to involve customers, end users and their expertise and knowledge in innovation. Crowdsourcing can be broadly defined, according to Howe (2008) as an "act of taking a job traditionally performed by a designated agent (usually an employee) and outsourcing it to an undefined, generally large group of people in the form of an open call". Crowdsourcing can be utilized for instance to identify new business opportunities and new product ideas, to deepen relationships with consumers and customers, and to enhance collaboration not only inside but also between companies and other parties (Burmann, 2010; Chesborough, 2011; Whitla, 2009). However, in order to achieve novel, but useful ways of working together in business-to-business (B2B) relationships, companies should understand carefully the value created in crowdsourcing activities from different perspectives of engaged actors, such as direct customers and suppliers. According to Gillin and Schwartzman (2011) the best operating B2B relationships are symbiotic in terms of e.g. mutual engagements and alignment, which are rooted by aspiration, needs, and challenges of both parties. We also highlight the role of social media in creating new potential for crowdsourcing: crowdsourcing can be carried out in many ways, but nevertheless crowdsourcing has gained novel interest due to new possibilities and value creation options created by various approaches provided by the social media.

The current lack of organized and analyzed case evidence and examples for companies operating in B2B markets, and developing products for other companies in particular, makes it difficult for managers to estimate the possibilities of crowdsourcing in B2B relationships. Some characteristics of the B2B sector, such as B2B's having typically far fewer customers than business-to-consumer's (B2C's) (Gillin & Schwartzman, 2011; Geehan, 2011), often make it difficult to locate sufficiently large crowds of customers for crowdsourcing purposes. Due to the differences between B2B and B2C markets, the currently available academic studies that almost merely present crowdsourcing examples and analysis results from companies operating fully or mainly in B2C markets, are useful as examples only in a limited way to B2B markets and relationships.

Based on earlier studies (Jussila et al., 2012; Kärkkäinen et al., 2011; Kärkkäinen et al., 2012; Simula & Vuori, 2012) we argue, however, that there is a great potential related to crowdsourcing use in the context of B2B markets and relationships. In order to get the full potential, there is a need for a more detailed understanding of the logic of value creation in crowdsourcing activities between multiple stakeholders in business-to-business context. We argue that crowdsourcing- related value creating networks can be better designed to provide significant value for the suppliers, customers and other network members on the basis of increased understanding of crowdsourcing- related value creation.

In the recent marketing literature, the conceptualization of value has divided to two differentiated main streams: the other deals with the value of products and services, while the other focuses on the value of buyer-seller relationships (Lindgreen & Wynstra, 2005). Our perspective of value creation is based on the latter stream as we utilize the function viewpoint presented by Walter et al. (2001) as an analysis tool for the value creation. We are particularly interested to analyze the value the supplier company gets from crowdsourcing, not so much to the motivation of the single individuals to participate in the innovation process nor to the value from the customer organization's viewpoint, which is already more covered viewpoint in most of the recent value creation analyses (see e.g. Möller & Törrönen, 2003).

Thus, the goal of this exploratory study is to understand how crowdsourcing has been used and can be used in business-to-business relationships to create value for the focal supplier company. We will carry out an empirical netnography-based multiple case study, in which we examine crowdsourcing use and value creation in the context of business-to-business relationships. We analyze the empirical data

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

through a theoretical framework that is based on Walter et al.'s (2001) value function analysis framework, which can be used to understand especially the value created by different value functions. The research seeks answers to the following research question: what kind of value is crowdsourcing able to create in B2B relationships in regard to value functions, particularly from supplier's perspective?

The structure of the paper is as following. After the introduction we will define crowdsourcing and its role in B2B relationships, as well as some of the major challenges related to B2B use of crowdsourcing. We thereafter define our value creation viewpoint, as well as the framework of value functions used in the analysis. These theoretical considerations are then applied in an empirical study, which consists of six different types of crowdsourcing cases in B2B relationships. Before opening up the findings from the empirical study, we introduce our netnography- based research approach. The paper is concluded by discussing the results and the contributions of the study as well as presenting the potential further research avenues.

LITERATURE REVIEW

In this section the essentials of crowdsourcing from the business-to-business viewpoint are firstly discussed. Then the theoretical bases of value creation are shortly opened up and followed by the presentation of the value function framework.

Crowd Sourcing in Business-to-Business Context

In current crowdsourcing literature the crowdsourcing definitions have varied from very specific notions to broad generalist concepts depending on the subjects or the scopes of research projects. To unify the vague group of definitions Estellés-Arolas and González (2012) studied over two hundred documents, related to crowdsourcing, and found 40 different crowdsourcing definitions which they used to form one universal interpretation to act as a theoretical base: "Crowdsourcing is a type of participative online activity in which an individual, an institution, a non-profit organization, or company proposes to a group of individuals of varying knowledge, heterogeneity, and number, via a flexible open call, the voluntary undertaking of a task."

We adopt Penin and Burger-Helmchen's (2011) concept of open call as a call in which everybody can (at least in principle) answer the call - individuals can participate in addition to restricting the call within firms only, as well as non-profit organizations, or communities of individuals. We will further specify the 'B2B crowdsourcing', drawing from commonly cited crowdsourcing definitions, rather extensively as "companies operating in B2B markets, using crowdsourcing in any way to their business benefit", thus not necessarily the B2B's starting or making the actual crowdsourcing call themselves, or only between companies (as name "business-to-business" might refer). Thus we will follow in this study the generic format of B2B crowdsourcing provided by Kärkkäinen et al. (2011) as "participatory online activity, carried out via an open call, in which companies operating in business-to-business markets propose themselves or aim to benefit in some other way from voluntary provision of A from B in C purpose, benefiting from this in D sense" in which: A = concepts, ideas, information, knowledge, funding or other resources; B = a group of individuals of varying knowledge, heterogeneity and number, consisting from individuals from any companies, organizations, non-profits, intermediaries, communities or individual

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

professionals, C = new product development (NPD), innovation process, marketing, sales, new business development, etc.; and lastly, D = cost reduction, quality increase, increased customer orientation and customer understanding, time-to-market time reduction, sales / profit increase.

The markets, the customers, the products and product development have several differences between the business-to-business and consumer product sectors (Hanna et al., 1995; Von Hippel, 1988; Holt et al., 1984; Geehan, 2011; Urban & Hansen, 1993) that have an effect on utilization of crowdsourcing, too. Firstly, since the amount of customers is generally much smaller in B2B´s (Geehan, 2011), the use of crowdsourcing in B2B relationships and in the development of B2B products is quite rare and in many ways more limited, compared to the use in B2C´s. Second, in the context of innovations and B2B´s, legal contracts and IPR –issues can become challenges in the free revealing of product or business ideas in the inter-organizational innovation collaboration (Marjanovic et al., 2012; Nordlund et al., 2011) and may thus seriously limit the usability of crowdsourcing between B2B companies and their business customers. Third, concerning closely the theme of value creation, the ways to motivate and engage business customers and partners is very different from motivating and engaging consumers (Tickle et al., 2011) for crowdsourcing purposes.

Due to the above characteristics, the currently available academic studies that almost merely present B2C crowdsourcing examples are useful only in a very limited sense to B2B's. For the same reasons, many companies and managers have serious doubts against the usefulness of crowdsourcing in the B2B sector. Taking the above B2B and B2C differences into consideration, it is fair to presume that also the various types of crowdsourcing approaches, such as the ones that are carried out by means of social media and Web 2.0, should take these differences carefully into account when planning and implementing approaches for the business-to-business sector companies.

Value Creation and Value Functions

In order to analyze the usefulness of an innovation, such as crowdsourcing in business-to-business context can be understood, we need to be able to identify and measure the value created by the utilization of the innovation. However, measurement and even the identification of "value" is not an easy task. This is due to the multifaceted and complex nature of value; it is a concept that is commonly used by both academics and actors in the field, but it is often rather unclear what is actually meant by it in different contexts (Ford & McDowell, 1999; Helander, 2004).

As already stated in the introduction part of this paper, marketing literature has made a division in value discussion to two main streams: the value of products and services, and the value of buyer-seller relationships (Lindgreen & Wynstra, 2005). In this paper, we will apply the latter one with the chosen viewpoint of value functions (Walter et al., 2001). However, another interesting distinction that has been made within the value creation literature is the division between value creation processes and value outcomes (Gummerus, 2013). When focusing on the value creation process perspective, it is important to understand that the process of value creation will differ based on whether value is created by an individual, an organization, or society (Lepak et al., 2007). In the current study, the first two levels, an individual and an organization are present, as use of social media based crowdsourcing is studied in B2B context (organizational level) but is in the end realized through individuals that participate in the crowdsourcing. Referring to the perspective of value as an outcome, a commonly presented view of

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

value is to understand it as the trade-off between benefits and sacrifices (Lapierre, 2000; Parolini, 1999; Ravalad & Grönroos, 1996; Slater, 1997; Yadav & Berry, 1996) which can be both monetary and non-monetary (Walter et al., 2001). The use of crowdsourcing in B2B context strives mostly for monetary value, as the ultimate objective for companies is to create profit for their owners. Nevertheless, there is also a great non-monetary value potential included in crowdsourcing for companies, such as gaining new ideas, concepts, information, knowledge, or other resources (Kärkkäinen et al., 2012). These kinds of non-monetary values may be in the long run even more important, because in the end, they may create the biggest value and turn also into direct monetary value e.g. in the form of new market areas, new product/service innovations or even as the key enabler of company growth.

Walter et al. (2001) have conceptualized value creation as a set of direct and indirect functions of customer relationships from the supplier's perspective. Direct functions bring value that is easier to measure financially and to realize in the relationship between the company and its relationship party, e.g. the customer or the supplier. Indirect functions, on the other hand, also include the third parties, and the outcomes are not as straightforward to measure financially. The functions of a customer relationship refer to performed activities and employed resources of the customer that the customer is contributing to the relationship and as such also to the wider network (Walter et al., 2001).

The value functions introduced by Walter et al. (2001) introduced are the following:

Direct-Value Functions

- **Profit Function:** Refers to the profit gained from selling product(s) to a customer.
- **Volume Function:** Refers to selling volume of products to customers, which help to exceed necessary minimum utilization of the supplier's capacities.
- **Safeguard Function:** Refers to the possibility of 'guaranteeing' a level of business that serve as insurance against crises or difficulties with other customers.

Indirect-Value Functions

- **Innovation Function:** Refers to the possibility of product and process innovation with a particular customer.
- **Market Function:** Refers to the possibility of acquiring information about potential new customers, initiation of contacts with new customers and receiving referrals and/or recommendations to potential new customers from a particular customer.
- **Scout Function:** Refers to the market, competitor and other information that can be acquired through a particular customer.
- **Access Function:** Refers to gaining access to relevant other actors through a particular customer.

The direct and indirect value functions have been used either completely or in part for example to study the impact of information technology deployment on trust, commitment and value creation in business relationships (Ryssel et al., 2004), information technology competence and value creation in supplier-customer relationships (Walter & Ritter, 2005), and the practices and functions of customer reference marketing (Jalkala & Salminen, 2010). We found no previous studies that have studied value functions in the context of B2B crowdsourcing.

EMPIRICAL STUDY

In this section we will firstly present the research methods and the case selection, and then discuss the findings from the empirical study.

Research Approach

We applied netnographic research principles, designed for studying online communities (Kozinets, 2002), on the observation of textual discourse in selected social media- based crowdsourcing platforms, and the media (platforms) themselves related to our research goal. The subject area of observation of textual discourse was specifically value creation functions and the role of social media in crowdsourcing in B2B customer relationships, and the media studied were the identified and selected crowdsourcing platforms, where the conversation that produced the studied textual discourses took place.

Netnography was chosen as a research method as it is specifically designed for online community studies (Kozinets, 2002). Netnography is a qualitative, interpretative research approach that adapts the traditional, in-person ethnographic research techniques of anthropology to the study of online communities and cultures created through computer-mediated social interaction (Bowler, 2010; Jupp, 2006; Kozinets, 201; Kozinets, 2002; Kozinets, 1998). Netnography extends the traditional notion of field and ethnographic study, as well as ethnographic cultural analysis and representation, from the observation of co-located, face-to-face interactions to technologically mediated interactions in online networks and communities, and the culture shared between and among them (Bowler, 2010; Kozinets, 2010). However, netnography as a research method is simpler, faster and timelier than traditional ethnography, and it is also more naturalistic and unobtrusive than for example surveys or interviews (Kozinets, 1998). Netnography provides procedures for participant observation in the online environment, that include investigating appropriate online communities for a study, and entering the online community and culture; collecting and analysing the data; ensuring trustworthy interpretations; conducting ethical research; and providing opportunities for the feedback of community members (Bowler, 2010; Jupp, 2006; Kozinets, 201; Kozinets, 2002; Kozinets, 1998).

According to Kozinets (2010) the simplified flow of a netnographic research project includes the following five steps: 1) definition of research questions, social sites or topics to investigate; 2) community identification and selection, 3) community participant-observation and data collection (ensure ethical procedures); 4) data analysis and iterative interpretation of findings; 5) write, present and report findings and/or theoretical and/or policy indications. These steps were also followed in the present study. Firstly, we formulated our research questions and identified suitable crowdsourcing platforms that can be studied from B2B supplier perspective. Secondly, to collect data and to sample related crowdsourcing platforms with the specific subject area (cf. Rokka, 2010), a participant observation (Lewis et al., 2009) was used as a part of our netnographic approach to identify the concrete company cases of supplier crowdsourcing in B2B context. The observation included registrations to several online crowdsourcing platforms, browsing through the available textual discourses, and identifying, observing and analyzing the role of social media and the value functions of crowdsourcing in customer relationships from the supplier's perspective. The approach included also following various links to secondary sources (e.g. company websites and online discussion forums) in order to gain comprehensive knowledge about the crowdsourcing platforms. During the observation we adapted Gill and Johnson's (2002) role of "complete

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

observer" with some characteristics from "observer as participant", as we did not take part in the actual crowdsourcing tasks, but did not deliberately hide our presence on the platforms, either.

The studied supplier's utilizing these six crowdsourcing platforms in value creation in B2B customer relationships were Intuit, SAP, Formlabs, Dell, Bombardier and Lürssen Werft (See Table 1).

The gathered observation data was interpreted by following content analysis principles and the results of the empirical study are presented in the following section.

Results of the Empirical Study

In this section, the empirical results concerning value functions of crowdsourcing within the selected cases are discussed. Firstly key results of each of the cases is opened up and in the end of the section the results are summarized through each value function according to the model of Walter et al. (2001).

Firstly, in the case of Intuit the *profit* function played a key role. In Intuit, the integration of social media based customer support crowdsourcing platform Live Community into TurboTax software product not only enabled reduced costs of customer support (Hinchcliffe & Kim, 2012), but also enabled the company to *scout* tax knowledge of its customers in terms of providing answers to questions posed by the community. Furthermore, by providing the customer a tool to crowdsource solutions to their tax problems, Intuit was able to *safeguard* its business by retaining customer relationships and preventing product abandonment. The crowdsourcing platform and the new way of doing customer support can also be considered as a process *innovation* reducing e.g. the need for increasing staffing in traditional telephone and email –based customer support. In Intuit Turbotax Live Community communicating through social media had significant role in value creation in terms of scouting tax information from customers. For example the TurboTax for Business had 219 answered questions about income-related issues in the Live Community. Not only asking questions, but answering and completing others answers on the problems was enabled by the social media -based platform. Completing in terms of commenting, giving helpful votes to answers and subscribing to updates are valuable social media roles for scouting relevant tax information from the supplier's perspective.

In the case of Formlabs, the Kickstarter crowdsourcing platform specialized in crowdfunding enabled the supplier of 3D printers to ensure necessary *volume* of orders and funding from customers in order to set up full-scale manufacturing. The go-ahead decision for the supplier to setup full-scale manufacturing was based on threshold of $100,000 funding from customers (Kickstarter, 2012). From the supplier's

Table 1. Selected cases representing social media-based online crowdsourcing platforms

Company and Social Media- Based Online Crowdsourcing Platform	The Observed B2B Product Related to Customer-Supplier Relationship	Industry
Intuit TurboTax Live Community	TurboTax for Business tax software	Software and professional services
Formlabs Kickstarter	3D printer	Manufacturing
Dell IdeaStorm platform	Developer laptop	Computer hardware
SAP Community Network	Enterprise resource planning software	Software (B2B)
Bombardier YouRail	Interior design for trains	Rail-equipment manufacturing
Lürssen Werft GrabCAD	Dampening device for wind breaker doors	Shipbuilding

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

perspective the role of crowdsourcing was to enable both *volume* and *safeguard* value functions at the same time in the customer relationships. Furthermore, in the Formlabs case the new kind of communication channel enabled by social media played the most important part in crowdsourcing funding from the Kickstarter platform. The platform enabled to communicate the funding project to a wide audience (e.g. more than 600 000 followers in Twitter) and to observe in realtime how much funding and related product orders were placed by the customers (Kickstarter, 2012).

In Dell's case the *innovation* function was the primary value function in crowdsourcing; through their Dell IdeaStorm crowdsourcing platform, they received a great number of innovative product and process ideas of which a rather large amount has already been implemented (Dell, 2012). Related to the observed Storm Session event organized in IdeaStorm platform Dell received 153 product development ideas from direct customers. Furthermore, in the Dell case, the *scout* function was also significant when crowdsourcing the customer needs and requirements for the developer laptop. As a supplier of computer hardware and software Dell received 88 well documented needs of the customers, some which were commented by other customers, and also rated. For Dell the connecting role of social media provided an opportunity to learn more from potential customers and also as means to contact the contributors in further phases of the development of the product.

In the case of SAP through the *scout* function was enabled huge amount of contributions to knowledge base of SAP Community Network, SAP receiving more than 100 000 contributions to knowledge base by community members including customers, end-users, and partners (SAP, 2013; Yolton, 2011). For SAP, the communication possibilities offered by social media had significant role in creating value by scouting the market, and product knowledge of SAP's customers, end-users and partners. Social media played also a key role in the creating value by more easier and faster *access* to finding the right experts for a given business situation.

Similarly in Bombardier's and Lürssen Werft's case the role of crowdsourcing was primarily to create value through *innovation* function. Bombardier received 4298 new interior design concepts for product innovation to their innovation competition in YouRail crowdsourcing platform (Bombardier, 2012; Haller et al., 2011) and Lürssen Werft received 62 models for product innovation of windbreaker doors in challenge organized in GrabCAD intermediary crowdsourcing platform together with GrabCAD experts (GrapCAD, 2012). Through GrabCAD Lürssen Werft was able to communicate the product innovation challenge to more than 500 000 mechanical engineers in the GrabCAD community, all potential supplier's for the company. The 62 models submitted by the engineers, received a number of comments and likes from the community to support decision making of ideas. Social media was also used to combine content, e.g. from YouTube, to more clearly illustrate the function of product innovation ideas and models for the supplier. For Bombardier, social media can be seen to have a valuable role on both to the quality of the crowdsourced concepts and for the evaluation of the crowdsourced concepts. Commenting of the concepts for new interior designs for trains was active, with a total of 8582 comments received to 4298 designs. Even more active was the rating of the concepts, Bombardier having received 26617 ratings to the concepts helping the jury to evaluate the winning designs.

The Table 2 that illustrates crowdsourcing value functions is by no means exhaustive, but rather aims to point out few examples of each value function by case examples. It is noteworthy, that by utilizing crowdsourcing business-to-business companies have been able to create value simultaneously by several direct and indirect value functions.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Table 2. Case examples of crowdsourcing value functions from supplier perspective

Value Function	Description of the Function	Case Example of Received Supplier Value
DIRECT		
Profit	The financial value of profits a relationship generates	Intuit TurboTax biggest increases in sales taking place after the launch of Live Community, which in part indicates the benefits of social media based customer support crowdsourcing platform in increasing profit of TurboTax product.
Volume	Relationships guaranteeing a certain operating volume	Formlabs achieved its volume goals for production of different price category 3D printer kits and for minimum required funding ($100,000) from customers, e.g. $2,299 for basic 3D printer kit and $8,000 for personalized kit.
Safeguard	Reliability and continuity of a relationship	Intuit used the customer support crowdsourcing platform to safeguard its business and to prevent product abandonment by proving platform for the customers to ask questions and receive replies from Intuit or other customers as needed.
INDIRECT		
Innovation	Creating innovative development ideas through relationships	• Dell received 153 product development ideas from direct customers to their developer laptop in directed Storm Session event organized in IdeaStorm platform lasting from May 6 – Sep 16 2012. • Bombardier received 4298 designs and also 26617 ratings and 8582 comments on competing submissions in their innovation competition organized in YouRail crowdsourcing platform. • Lürssen Werft received 62 models (STEP files or AutoCAD compatible drawings) for new dampening device for wind breaker doors for large mega yachts in challenge organized in GrabCAD crowdsourcing platform in approximately one month.
Market	Accessing new areas and getting contacts to new partners through existing relationships	SAP gained information about potential new customers from SAP Community Network; more than 100 000 individuals joined the SAP Community Network with the first two years, and eight years after its founding the network consists of over 2.5 million registered users (including customers, prospects, partners and independent experts); with 1.5 million unique visitors / month.
Scout	Creating value through information	Intuit tapped into its customers tax knowledge by integrating customer support crowdsourcing platform Live Community into its TurboTax product, enabling users to solve users problems that often were more knowledgeable than company's own agents; for example the TurboTax for Business has 219 answered questions about income-related issues, 412 answered questions about deductions and 142 answered questions about balance sheet.
Access	Creating value through partner contacts	SAP has used an internal people finder application that takes advantage of social analytics aimed at both external social media and internal tools to find the right expert for a given business situation, thus making it possible to crowdsource contacts to important persons

DISCUSSION

We were able to find a number of different types of interesting and useful applications of crowdsourcing in a large variety of different application areas in B2B relationships, which demonstrate the usability of crowdsourcing in the very scarcely studied and understood context of business-to-business sector. In general, the tasks that the studied B2B suppliers had crowdsourced were quite complex, which, much in contrast to common B2C crowdsourcing tasks, were very demanding in regards to the needed variety and depth of competences (e.g. mechanical engineering expertise in Lürssen Werft case).

When answering our research question, what kind of value is crowdsourcing able to create in B2B customer relationships from supplier's perspective, our explorative study showed that the suppliers of B2B's that were involved in crowdsourcing activities have been able to make use of crowdsourcing in many ways in creating value in their B2B business interrelationships. The analysis (see Table 2) demonstrated that in the discovered B2B crowdsourcing approaches we found impacts to both all the direct

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

value functions as well as all indirect value functions. The studied crowdsourcing platforms and related crowdsourcing approaches have been used to create value for the focal crowdsourcing supplier simultaneously by several direct and indirect value functions. For example, in the case of Intuit, the company was able to innovate its customer support process by enabling the customers to crowdsource tax advice from each other. Crowdsourcing lead to several benefits for Intuit that were related to direct and indirect value functions. The direct value functions of crowdsourcing included profit in terms of increased profits from product and service offerings, and safeguards in terms of avoiding product abandonment and retaining customer relationships. The indirect value functions of crowdsourcing included scout function, in terms of receiving tax knowledge from customers, and innovation in terms of process innovation of customer support, that also reduces the amount of traditional support needed.

CONCLUSION

This study explored value creation logic of crowdsourcing in B2B relationships. Based on our study we can conclude that the benefits of crowdsourcing in the context of B2B relationships are evident. Value is created through the more easily measured direct functions, but what is notable, especially through the more indirect functions, such as innovation or market function. This dominance of indirect value functions may in part explain why to this date the value of crowdsourcing in B2B context has not yet been realized enough well among companies. In general, indirect value is something that is hardly measurable or even identifiable, and thus this kind of value and benefits are not usually as visible as the direct functions are. However, due to the netnographic research approach and observation methods of the current study, we were able to identify especially the indirect value created by crowdsourcing in B2B relationships.

On the other hand, partly due to the selected methodology of netnographic observation, first, we were not able to make conclusive observations about potential value creation trade-offs, sacrifices or negative impacts to value creation, but some preliminary potential negative impacts to sustainable value that we came up with in the analysis included for instance that in certain cases, competitors may gain the same information and use it in their own product development and business development. Since the central aims of our study did not focus on the negative impacts of social media, we will leave this analysis to be done in the future research. Second, we could not directly observe the direct value function impacts of social media, except for the Formlabs case. This does not, however, mean that such impacts would not exist in the studied or other cases, but instead these could be reached by use of other research methods. The challenge in this kind of analysis is to find the appropriate methods to measure which financial impacts are created by crowdsourcing and which are related to other actions of the company. Thus, further research is needed to complement our study with other methods, such as direct interviews of companies that are practicing B2B crowdsourcing through social media- based crowdsourcing platforms.

Future research should complement these results by interviews of case companies to uncover the value functions that were not possible to observe by means of netnography, as well as for instance the potential negative impacts of crowdsourcing and social media to value functions. Due to the exploratory nature of this research and research methods, further studies should be carried out to further confirm the preliminary case-based results. Especially longitudinal studies to discover the long-term benefits and impacts of crowdsourced products on the profitability, compared to internally developed products, should be carried out. In addition, based on the finding of this exploratory study, we see as one central further research area to be covered in more detailed level the potential negative impacts/costs of crowdsourc-

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

ing, such as e.g. IPR risks. This kind of analysis would enable evaluation of the total tradeoff between benefits and sacrifices brought by crowdsourcing in B2B contexts. In addition, based on the increased understanding of the value creation logic of crowdsourcing in B2B relationships, analysis of the business models of B2B supplier crowdsourcing could also be achieved in future studies.

Although a lot remains still to be studied around the theme of crowdsourcing and social media, some practical implications has already been achieved in this paper. The managers of companies that operate in B2B markets and produce B2B products can utilize the recognized and analyzed social media- based crowdsourcing approaches as useful models for facilitating their own open innovation activities and experiments. They can for instance pinpoint examples of crowdsourcing use in B2B relationships, which support best the strategies of their own companies, for instance increasing the profitability, related to direct value functions, or innovation, related to indirect value functions.

Chapter 40
Applying Business Solutions to Social Problems:
Social Co-Operative and Its Business Model – Evidence From Poland

Martyna Wronka-Pośpiech
University of Economics in Katowice, Poland

ABSTRACT

Although research on social entrepreneurship has been expanding in recent years, the literature regarding business models in the context of social enterprises is still limited. This chapter explores the issues of business models in both profit and nonprofit contexts and discusses how value, being both the foundation and the overall outcome of the business model employed, is created. It begins with the background on the characteristics of social enterprises. This is followed by the conceptualization of business models and their components designed to account for their unique. Then a case to illustrate it is presented. The objective of the chapter is twofold. First, it is to analyse how nonprofit business models are different from its for profit counterparts (at the conceptual level) and to introduce relevant analytical framework. Secondly, the chapter aims at providing a case based on the particular model of a social enterprise in Poland (social co-operative) in order to investigate whatever the business models for profit firms could be applied in the social enterprises.

INTRODUCTION

Starting from the 1990s, a process of reorientation of social policy in the direction of activating support recipients might be observed in Europe. The new approach is referred to as active (or activating) social policy (APS) (Rymsza, 2007, p. 178). Such a shift is occurring both at the level of individual countries and in the structures of the European Union (Van Berkel & Hornemann Møller, pp. 15-44). The basic principles of APS comprise: (1) the preference towards the principle of public participation, i.e. the incorporation of beneficiaries of social programmes into active social life, even at the cost of limiting the level of social security; (2) the activation of the recipients of support through dissemination of vari-

ous forms of supported employment, especially social entrepreneurship; (3) concentrating the support on the unemployed who are able to work (or likely to regain such an ability); (4) the change in the type of delimited goods rather than the reduction of the scale of social transfers: the redistribution of work instead of the redistribution of benefits; (5) going beyond the traditional ideological divisions between supporters and opponents of the welfare state; (6) the cooperation with non-governmental organisations, in particular with nonprofit entities and organisations operating in the social economy sector (Szarfenberg, 2007, p. 412; Vis, van Kersbergen & Hylands, 2011, pp. 346-350; Rymsza, 2013, pp. 125-135). In addition, Europe's reorientation toward supporting programmes aimed at activating beneficiaries has led to the rediscovery of social entrepreneurship, and, together with it, of the achievements of the social economy movement of the late 19th and early 20th century and the interwar period. Currently, we are witnessing the second wave of interest in the social economy.

In the 1990s, both in the literature and public discourse, two concepts of the emergence of social economy entities appeared. The literature frequently refers to such a mechanism as social entrepreneurship. The entities of social economy, that is social enterprises, are defined as institutions and organisations that primarily wish to pursue a social mission and achieve social objectives (Shaw & Carter, 2007, p. 423). The concepts of social entrepreneurship in Europe were shaped under the influence of an intensive development of the third sector, its professionalization and the development of the so-called new social economy, focused on integration with labour market. In the U.S., the development of these ideas was subject to the influence of economic universities, such as Harvard Business School, and the theory of social change (Nicholls, 2006, p. 3). In the case of the American concept, entities of social economy are shaped by the market, as innovative solutions aiming at sustainable social change. The European concept focuses on a group, the collective process of creating social economy entities, in which an important role is played by democracy, and it is evident in the choice of leadership, management, and the participatory role of each member. An important issue that makes both approaches distinct is the role of a leader, or an initiator of a social enterprise. The American concept assumes utmost importance of an individual, a charismatic leader, the so-called social entrepreneur, who has solid, measurable characteristics and predispositions that increase the probability of success of such an undertaking in the future (Defourny & Nyssens, 2010, pp. 43-48).

The need for social economy and social entrepreneurship arises also from the fact that traditional political and economic solutions are no longer good enough to guarantee a minimal quality of life to a rising number of people. Therefore, social economy appears as an answer to the increasing disproportions between the rich and the poor and a response to the exclusion of large social groups from mainstream social life. Its goal is to create social enterprises, as well as new social entrepreneurship culture, oriented primarily at inclusion of marginalized groups through active participation in it. The specificity of this sector of the economy stems from the fact that it associates economic activities with social objectives (Perrini &Vurro, 2006; Rymsza, 2007; Thompson, Alvy & Lees, 2000). One of the objectives of social entrepreneurship is job creation, which, as well as being a key component of economic growth, is an essential tool for poverty alleviation. Social entrepreneurship can thus address two important aspects of the UN Millennium Development Goals: economic development and poverty alleviation. It also refers to the objectives of the Europe 2020 strategy, which sets out a vision of Europe's social market economy for the 21st century and puts forward three mutually reinforcing priorities:

- Smart growth: developing an economy based on knowledge and innovation;
- Sustainable growth: promoting a more resource efficient, greener and more competitive economy;

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

- Inclusive growth: fostering a high-employment economy delivering social and territorial cohesion (European Commission [EC], 2010).

The growing importance and recognition of social enterprise in recent years puts pressure on their success and efficiency in their governance. This in turn encourages taking a closer look at business model for social enterprises, as they not only may explain competitive advantage and performance, but also are the logic of the organisation, the way it operates and how it creates value for its stakeholders (Demil & Lecocq, 2010). Taking the above-mentioned facts into consideration, the purpose of this chapter to identify and explore the components of a business model for social enterprises. This will be done by: (1) analysing how nonprofit business models are different from its for profit counterparts at the conceptual level, (2) introducing relevant analytical framework, and (3) providing a case based on the particular model of a social enterprise in Poland (social co-operative) in order to investigate whatever the business models for profit firms could be applied in the social enterprises.

THEORETICAL PERSPECTIVE ON SOCIAL ENTERPRISE

According to Perrini and Vurro (2006, p. 74), the literature on social entrepreneurship might be divided into two main streams: one positions social entrepreneurship in the nonprofit theory, while the other characterizes it as a new interdisciplinary phenomenon. What connects these two points of view is that they both stress the aspect of tackling important social problems (Austin, Stevenson & Wei-Skillern, 2006, p. 13). And so, on the one edge, there are authors such as Boschee (1998), Boschee and McClurg (2003) or Dart (2004). They include social entrepreneurship within the scope of research on nonprofit organisations, arguing that this concept might be explained as "the latest innovation" in the functioning of social enterprises, and then justified by the interest of nonprofit entities in managerial competence and in the market-based approach, taken in order to improve their operational efficiency and productivity. In this perspective, a social enterprise and social entrepreneurship are treated as "a set of strategic answers to turbulence of environment and to situational challenges that nonprofit organisations face nowadays" (Dacin, Dacin & Tracey, 2011, p. 1206). Therefore, social entrepreneurship is seen as the third sector's response to an altered situation which might seem dangerous at the macro level: a predicted collapse of the welfare system, increasing financial pressures on organisations working for social goals, rising costs in many areas of the social sector, and the reduction of public and private grants and subsidies (Dees & Elias, 1998, pp. 165-178). At the other extreme, one might enumerate the advocates of extended theories of social entrepreneurship, such as Thompson, Alvy and Lees (2000), Hockerts (2005), and Mair and Martí (2009), who believe that the phenomenon may be regarded as a new, independent and largely interdisciplinary field of research. They highlight the quality of social entrepreneurial initiatives, treating it as the basis for the field. In this spirit, they define a social entrepreneur as an innovator, capable of making an active contribution to social change, through creativity and attitude towards innovation – that is, typical features of the classical entrepreneurial process (Perrini & Vurro, 2006, p. 76).

All researchers, however, seem to agree on the fact that the key to understanding this concept lies in the field of business entrepreneurship and in J. Schumpeter's theory, which forms the basis of social entrepreneurship (Mort, Weerawardena & Carnegie, 2003, p. 80). What social and business entrepreneurship have in common is a strong inclination for innovation and change, as well as the ability to perceive unmet needs and the resulting opportunities for entrepreneurial activities (Short, Moss & Lumpkin,

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

2009, pp. 172-176). In other words, projects in the field of social entrepreneurship are often innovative and – like purely business-like venture – they become agents of change, as well as the driving force of social and economic progress (Leadbeater, 1998, 58).

Considerable discrepancies exist as to the meaning of a social enterprise, which might be said to be the result of historical circumstances of the creation of this type of phenomena in different countries, as well as its economic nature. A social enterprise is a common example of a hybrid organisation (Battilana & Lee, 2014; Haigh & Hoffman, 2014; Michelini & Fiorentino, 2012). Battilana and Lee (2014, p. 400) define 'hybridity' as "the state of being composed through the mixture of disparate parts". According to Haigh and Hoffman (2014), social enterprises combine elements from for-profit and non profit fields as well as mixing market- and mission-oriented beliefs to address social issues. Based on the proposal included in the UK government document, social enterprise can be defined as an institution that runs business activity, sets primarily social goals, reinvests the earned surplus for those purposes in the business or in the community, rather than being driven by the need to maximize profits for shareholders and owners (DTI, 2002). According to Leś (2004, p. 7), it combines the characteristics of a non-governmental organisation and a market entity, creating new jobs and setting additional goals of sustaining these jobs and providing services to local communities. Pearce defines it as "all the economic entities that have a social objective, are not oriented towards the generation and distribution of capital, and have a democratic and measurable structure based on joint governance" (Pearce, 2003, p. 190). Haugh also sees a social enterprise as a collective term defining organisations acting for social objectives. They share the commitment to finding solutions, based on commercial experiences, which will allow them to pursue social goals and reinvest profits from the operations with the benefit for the community (Haugh, 2006, p. 5). Thompson and Doherty (2006, p. 403) define them as organisations that apply business solutions to address social problems, while Deloitte (2014, p. i) proposes a wide definition describing a social enterprise as "a corporate entity that exists primarily to promote public benefits using business strategies, and financial capital, and offering innovative ways of operating for social and/or environmental purposes". According to Yunus, Moingeon and Lehmann-Ortega (2010, p. 311), a social enterprise is a new organisational form, originating from somewhere between a for-profit and a nonprofit organisation, designed and operated just like a 'regular' business enterprise, with products, services, customers, markets, expenses and revenues (p. 311). The main difference, however, is the fact that social enterprises attempt to create social value instead of delivering a dividend to shareholders.

Given the complexity of the phenomenon and the numerous interpretative disputes throughout the world, the EMES network provides nine guiding criteria that an organisation should meet to be closer to 'an ideal' type of social enterprise (Defourny & Nyssens, 2013). These are: continuous provision of goods or services, undertaking economic risk, hiring paid employees, a clear goal oriented towards the benefits of a local community, bottom up initiative, high level of independence from other organisations, nonprofit distribution, participative nature of the enterprise and decision making not based on share in ownership (rule: one man-one vote). Generally, the characteristic organisational forms that social enterprises adopt depend on the existing legal frameworks, on the political economy of welfare provision, and on both cultural and historical traditions of nonprofit development in each country. As a consequence, the social enterprise sector nowadays may comprise both new typologies of organisations, as well as traditional third sector organisations. What is more, various different terms are used interchangeably such as social businesses (Molyneaux, 2004), social-purpose businesses (Cooney, 2011), community enterprises (Tracey, Phillips & Haugh, 2005), and social ventures (Sharir & Lerner, 2006). All that makes social enterprises difficult to define and categorize. However, regardless of the legal form, their

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

principal purpose is not to generate commercial profit, but above all, to create workplaces for people at risk of social exclusion and professional marginalization and engage in delivery of social services and work integration services for disadvantaged groups (such as people with disabilities) and communities (Wronka-Pośpiech & Frączkiewicz-Wronka, 2014). As a key actor undertaking efforts to address many complex issues that the world faces today, it also focuses on providing a benefit to society as a whole rather than just the owners of the enterprise. Such an agenda makes the social enterprise an ideal vehicle for addressing the global concerns of the environment, healthcare, education, culture, economic growth, and poverty alleviation.

SOCIAL ENTERPRISES IN POLAND

In Poland, despite eight years of legislative effort, social enterprise is still an umbrella concept and neither official definition of social enterprise exists, nor a legal construct has been introduced into the system (Ciepielewska-Kowalik, Pieliński, Starnawska & Szymańska, 2014). An attempt to provide a definition of a social enterprise has been recently made in the draft National Programme of Social Economy Development (KPRES, 2014), which defines social enterprise as an entity demonstrating the following characteristics:

- Carrying out business activity with clear organisational boundaries and own financial reporting.
- The objective of business activity is either:
  - Social and employment integration of people at the risk of social exclusion (operationalized as employing a minimum of 50 per cent of staff from among those at risk of social exclusion or at least 30 per cent of disabled); or
  - Providing public benefit services while at the same time fulfilling pro-employment objectives.
- No distribution of profit or financial surplus among shareholders/partners; using profits or financial surplus to increase company capital, and in a certain share for:
  - Social and employment integration, in case of enterprises with pro-employment objectives; or
  - Providing public benefit services for the local community where an enterprise operates.
- Democratic governance or at least consultative role of employees and other stakeholders; and a salary cap for managers.

As highlighted in "A map of social enterprises and their eco-systems in Europe, Country Report: Poland" (EC, 2014, p. 2), The National Programme (KPRES, 2014) assumes the adoption of an Act on Social Enterprise which would introduce a social enterprise status enabling organisations to register as social enterprises on condition that they fulfil certain conditions. Nowadays in Poland a number of organisations with diverse institutional forms have many of the distinctive features of social enterprises and are often referred to as such in the public discourse. The broad spectrum of social enterprises consists of the following types of organisations (EC, 2014, p. 1):

- Non-profit organisations, including foundations, established in order to implement socially or economically beneficial activities and self-governing non-profit voluntary associations that perform revenue-generating activities.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

- Co-operatives for the disabled and blind (being a specific subgroup of labour cooperatives) and social cooperatives established to promote the social and professional reintegration of their members into the labour market.
- Vocational enterprises for the handicapped (ZAZ), objective of which is carrying out rehabilitation activities (rehabilitation of disabled, especially with severe disabilities) along with economic activities.
- Vocational therapy workshops (WTZ), which can be established by associations, foundations and other organisations and its primary objective is therapy and rehabilitation of disabled.
- Social integration centres (CIS) and social integration clubs (KIS), which organise educational programmes for people at risk of social exclusion and support individuals and their families in re-establishing and maintaining their ability to participate in the life of the local communities.
- Limited liability companies or corporations that pursue a public benefit mission (so-called non-profit companies).

These legal and organisational forms, as the authors of "The first ICSEM Working Paper" remark, can be grouped in the three models of social enterprise (Ciepielewska-Kowalik, Pieliński, Starnawska & Szymańska, 2014, p. 8-9). Each of them derives from a different pillar of organisations that stay close to a set of EMES classical social and economic criteria for a social enterprise. These models of social enterprise are model 1 (traditional cooperatives and social cooperatives), model 2 (entrepreneurial non-profit organisations such as foundations, associations and other voluntary organisations), and model 3 (work and social integration social enterprises such as social enterprises for the disabled or social enterprises for wider group of persons threatened by social and economic exclusion). It should however be born in mind that, in spite of corresponding to the notion of social enterprise, most of existing in Poland legal and organisational forms do not fulfil all the EMES criteria. For instance many associations and foundations in Poland do not employ paid staff (relying on volunteers) and hardly do they conduct economic activity in a strict sense. Other entities such as ZAZ, CIS, KIS or WTZ do fulfil EMES criteria but they have no legal form and usually exist within third sector organisations, mainly associations and foundations (Ciepielewska-Kowalik, Pieliński, Starnawska & Szymańska, 2014, p. 8). They are also mostly relying on public funding instead of generating sufficient income being a result of collective efforts of their members and workers in the market. Therefore, in the light of EMES classical definition, only polish social co-operatives fulfil the criteria of a social enterprise. A social cooperative is an adaptation of the cooperative legal form and is characterized by the features of a social enterprise recognized at the European level:

- Combination of social and economic functions in their operation;
- Non-profit distribution constraint;
- The principle of democratic, shared management, based on a general rule of cooperative movement, stating that a cooperative is an association of people and not capital;
- High degree of autonomy. (EC, 2014)

In Poland, specific legal framework for social cooperatives exists that is Act on Social Co-operatives dated 27 April 2006. Polish social cooperatives are based on the models of social cooperatives in Italy, referred to as work integration social cooperatives and aiming at social and economic integration of individuals who are exposed to social and economic exclusion (such as long-term unemployed or the

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

ones with low employability, the physically or mentally disabled, and other marginalized groups such as the homeless, alcohol and drug addicts, ex-convicts, refugees) (Starnawska, 2014). Many existing social cooperatives dedicate themselves to inner-city community renewal by providing sustainable employment – including living wages, job training, and benefits – to hard-to-employ individuals. Therefore, they work towards social and work reintegration of their members, via creation of new jobs to help the disadvantaged return to the labor market (Act, 2006). According to polish legislation, the minimum number of founding members is five in case these are natural people, and two in case these are legal persons (NGOs, public authorities, church units) (Starnawska, 2015, p. 83). Social cooperatives can benefit from state subsidies, particularly from the employment fund when created by or for socially excluded people. According to the most recent data, there are about 1312 social cooperatives in Poland. What can be observed is a significant growth in their number as in 2009 there were 187 social cooperatives, in 2010 – 276, in 2011 – 425, and in 2015 – 1266. This significant growth is the result of the support granted to setting up social enterprises with the investment of public money, mainly European funds. These funds, aimed to fund jobs for newly established social enterprises, have proven to be a great incentive for socially or economically excluded individuals.

SOCIAL ENTERPRISES AND VALUE CREATION

Nowadays the concept of value, which is of particular importance to business organisations, is also slowly gaining recognition among researchers of nonprofit organisations, because the ability to generate value, such as educational or cultural value, is the measure of an organisation's social utility, and, ultimately, it translates into support which the organisation obtains from its environment (Koźminski & Jemielniak, 2008, p. 430). Furthermore, this ability might be described as the energy driving a nonprofit organisation to take action. For this type of organisations, the original idea of value had to be modified, because of the need to characterize the activities of these entities by means of not only economic, but also social issues. The economic aspects belong to the classical canon of the basics of microeconomics and macroeconomics, and combining them with the social side of business is difficult, might be considered in various ways, and generates controversy; hence the need for research in that field. As a result, various attempts were made to answer the question of how to assess the results of the operation of nonprofit entities, not only financial, but also in the broader sense, including results hard to quantify, expressed by the value that they have for their clients, e.g. social cohesion or reducing marginalization, as well as how to configure the business model as a consequence of this assessment. It is clear that in the course of the development of society, the preferences regarding value alter; hence the need to keep re-determining what the genuine priority is at the time. With the knowledge of what is defined as value at a given time, organisations can plan their activities so as to obtain the support of stakeholders, and thus valuable resources. For organisations, this results in the need to correctly identify the needs of their stakeholders, and internal antecedents of the business model, in order to formulate it properly. Moore and Khagram (2004, p. 3) indicate that the identification of value is closely related to the task environment, because this is where the evaluation whether the value delivered to society is indeed significant actually happens.

Social enterprises, public organisations or non-governmental organisations often emphasize that they do not operate for profit, which means that the rules that govern typical businesses are not applicable. It is hard to fully agree with this statement, because if an organisation has a well-tried way to create, deliver and use value, it must also have a business model. Social enterprises do not generate financial returns for

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

investors or owners, yet they do need to create value in order to finance their goals by means of donations, grants and revenue from services. In turn, public organisations receive financing from taxes, fees and income from services, but they are also responsible for creating value for citizens. Non-governmental organisations pursue their mission by focusing on generating social good rather than financial return on investment, but they also need a stable business model to achieve economies of scale. In the case of social enterprises it can be assumed that their primary goal is to create social value through the performance of tasks and the fulfilment of a social mission. Since they are different than commercial enterprises in, among others, their desire to support social change, the framework of organisational effectiveness will vary (Herman & Renz, 2008, 344). Performing the tasks of an organisation and completing its mission should result from the creation of fundamental decisions and actions that shape and indicate what an organisation does and why it does it. A social enterprise must be able to fulfil its mission and to have such legitimacy in the community that will enable it to reach a size sufficient for having a significant impact on society. Inevitably, the proper management of relationships with stakeholders plays a crucial role in the legitimacy and the settlement of obligations imposed (Ospina, Diaz & O'Sullivan, 2002, p. 9). Achieving financial stability, although important, is only a means to the ultimate objective, which is to achieve a positive impact on the current situation.

Therefore, in order to recognise how social enterprises build and use their resources to offer their customers and/or beneficiaries better value, it is necessary to focus on employed business models. Understanding how it determines the tactics available to the enterprise to cooperate with or compete against others derives from proper describing of the value offer to a group or groups of customers, including the definition of basic resources, processes (activities), as well as the external relations of the enterprise. Of course, dualism of the objectives of social enterprises must be reflected in the business model. Only by proper designing and employing business models can social enterprises achieve a competitive advantage position relative to their business, make the most of opportunities, be able to solve social problems, and contribute to the welfare of the people.

BUSINESS MODEL AND ITS CONCEPTUALIZATION FOR SOCIAL ENTERPRISE: DETERMINANTS AND COMPONENTS

The concept of 'a business model' – due to globalization, the use of information technology in activities, and the increasing complexity and turbulence of the world – permanently entered the practice and theory of management in the last decade of the 20th century. The concept itself is young and, because of its interdisciplinary nature, frequently challenged. Academics have started to study business models more scrupulously in the last 15 years. However, it is worth mentioning that in the fifties Drucker (1954) already emphasised the importance of a business model that could answer the following question: who is your customer? What does the customer value? How do you deliver value at an appropriate cost?

Several definitions of business models have been proposed in the literature. Firstly, taking into consideration its semantic meaning, model is the simplification of reality, and business is the activity related to value creation (Palo & Tähtinen, 2011, p. 378). According to Timmers (1998, p. 4), a business model stands for "an architecture of the product, service and information flows, including a description of the various business actors and their roles; a description of the potential benefits for the various business actors; a description of the sources of revenues". Chesbrough and Rosenbloom (2002, p. 529) speak of "the heuristic logic that connects technical potential with the realization of economic value". Amit and

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Zott (2012, p. 42) define a business model as "a system of interconnected and interdependent activities that determine the way the company does business with its customers, partners, and vendors". Afuah and Tucci (2001, p. 3) propose the business model as unifying construct for explaining competitive advantage and firm performance and define it as "the method by which a firm builds and uses its resources to offer its customer better value and to make money by doing so". Casadesus-Masanell and Zhu (2013, p. 464) see business models as the "search for new logics of the firm, new ways to create and capture value for its stakeholders, and focusing, primarily, on finding new ways to generate revenues and to define value propositions for customers, suppliers, and partners". Markides (2006, p. 20) speaks of the discovery of fundamentally different business models in existing businesses: "to qualify as an innovation, the new business model must enlarge the existing economic pie, either by attracting new customers into the market or by encouraging existing customers to consume more." Teece (2010, p. 172) mentions "the essence of a business model is in defining the manner by which the enterprise delivers value to customers, entices customers to pay for value, and converts those payments to profit." Most scholars agree that the business model emphasizes a system-level, holistic approach to explaining how firms do business, that is how value is created and captured (Zott, Amit & Massa, 2011). It has also been stated that a well-tailored and successfully implemented business model can generate large amounts of money, while the wrong kind can lead to a business failure (Gibson & Jetter, 2014). In summary, the author follows Demil and Lecocq (2010) and define business model as the logic of the firm, the way it operates and how it creates value for its stakeholders.

Many researchers when defining a business model focus on specifying it main components. For example, Timmers (1998) points to:

- An architecture for the product, service, information flows, including a description of various business actors and their roles;
- A description of potential benefits for the various business actors;
- A description of the sources of revenues.

According to Afuah and Tucci (2001) components of the business model include customer value, customer segments, scope of products and services, pricing, revenue sources, connected activities, implementation, capabilities, and sustainability. Hedman and Kalling (2003) propose "causality related components" of a business model being: 1) customers, 2) competitors, 3) offering, 4) activities and organisation, 5) resources, 6) supply of factor and production inputs, and 7) the scope of management. The last component is supposed to cover the dynamics of the business model over time and the cognitive and cultural constraints that managers have to cope with. Newth (2013) suggests diversifying between qualitative and quantitative components of business model. In the first group she lists a value proposition, strategic resources, and dynamic processes, while in the second group – revenue sources, cost structure, and profitability. According to Johnson (2010), a business model consists of four elements: the customer value proposition, the profit formula, the key resources, and processes. One widely used framework for mapping business models is the Business Model Canvas (BMC) presented in 2004 (Osterwalder & Pigneur, 2004). Osterwalder and Pigneur (2010, p. 14) define a business model as "the rationale of how an organisation creates, delivers and captures value". In their conceptualization, a business model focuses on four major areas for consideration: infrastructure, offering, customers, and finances with nine sub-areas, which are in line with the process of making money by a company. These are:

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

1. Target customers, which include the segments of customers to whom a company wants to offer value;
2. Value proposition, which presents a general view of a company's products and services that create value for a specific customer segment.
3. Distribution channel, which explains the diverse means through which the company communicates with and reaches its customer segments to deliver a value proposition.
4. Customer relationship, which describes the type of links a company forms between itself and its different customer segments;
5. Key Resources, that allow an enterprise to create and offer a value proposition, reach markets, maintain relationships with customer segments, and earn revenues.
6. Key Activities, which explains what actions are required to create and offer a value proposition, reach markets, maintain customer relationships and earn revenues.
7. Key Partnerships, which outlines the network of cooperative agreements with other organisations that are essential to efficiently offer and distribute value;
8. Revenue streams, which portrays the way a company makes money through a variety of revenue flows.
9. Cost structure, which sums up the monetary consequences of the company's means employed in the business model (Osterwalder & Pigneur, 2010).

Each sub-area of the BMC template describes relevant activities. Infrastructure embraces key activities (i.e., value chain), key resources and the partner network. Similarly, the offering comprises the value proposition as proposed by the organisation. Customers include the description of the segments, channels, and type of customer relationship being used. Lastly, finances cover the cost structure and revenue streams. All of the above-mentioned elements compose a business model.

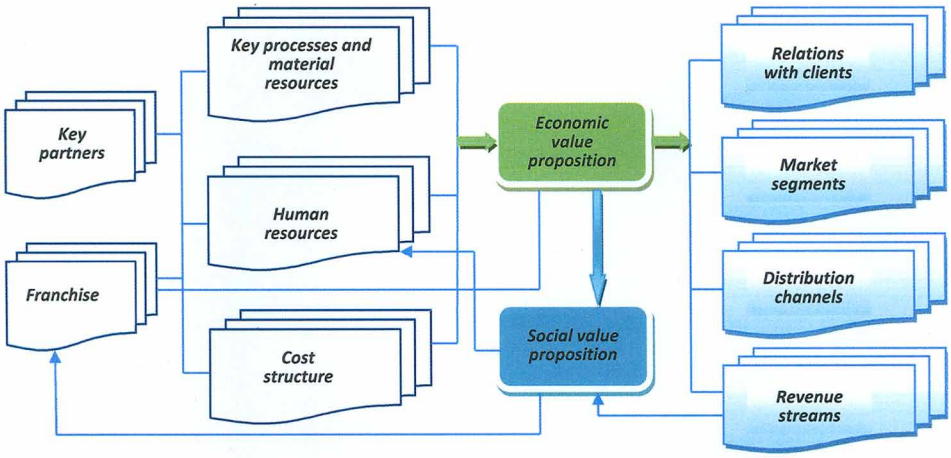
Although knowledge on business modelling in the profit sector is still at its early development stage, one can say it has recently gained ground. At the same time, the social enterprise business model was not given its well-justified attention. The business models of social enterprises are in the first place oriented to resolving social and environmental issues. In this vein, profit generation is not always the predominant concern of social entrepreneurs. Therefore, one of the fundamental questions every manager must ask: "How do we make money in this business?" (Magretta, 2002, p. 87) should be rethought and revisited. A variety of concepts relating to the notion of the business model indicate the need for understanding how value – which is both the foundation and the overall outcome of the business model employed – is created in organisations. In social enterprises, the equivalent of value may be social value, defined as "the degree to which a social enterprise is socially useful" (Głowacki & Jelonek, 2013, p. 11). Social usefulness, in turn, is the degree to which these entities accomplish the goals that are assigned to them. Wilson and Post (2011) acknowledge that understanding the business model of a social enterprise is what makes the achievement of the social mission possible. Although social enterprises create value and earn money at the same time, the goals might be prioritised differently compared to classic for-profit business models (Wronka-Pośpiech & Frączkiewicz-Wronka, 2014). Even though how social entrepreneurs manage to create value without always generating profit in their enterprises raises interest among researchers, the literature regarding business models in the context of social enterprises is still limited. Similarly, the experiences that can be set as good practices and used to create sustainable, positive action patterns for social enterprise are also limited. The matters of social enterprise business models, with their unique nature particularly highlighted, were presented by Czemiel-Grzybowska (2010, pp.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

120-121), according to whom this nature results from: (1) the formulated social goals; (2) economic objectives expressed outright (understood as an attempt to obtain a certain level of revenue from sales of products and services, as well as bearing economic risk); (3) democratic management; and (4) social property. One of the few propositions is the one by Yunus, Moingeon and Lehmann-Ortega (2010), who identify four components of a social business model: (1) the value proposition (the stakeholders and the product/service), (2) the social profit equation (the social profit and the environmental profit), (3) the value constellation (the internal value chain and the external value chain), and (4) the economic profit equation (the sales revenues, the cost structure, and the capital employed). However, Wilson and Post (2011) criticize this approach and claim that this idea lacks the direct mechanism for organisations to be able to properly address social issues. Another approach is suggested by Lee (2015, p. 285), according to whom a social enterprise business model is "a decision-making framework for developing logically coherent activities to support social mission- driven value creation and formulating strategies to sustain competitive advantage". In his paper, he describes six logical business model components, which interact in order to generate social and economic value. These are: (1) Value Proposition, (2) Legal and Governance Structure, (3) Market Scope, (4) Networked Activities, (5) Resources, and (6) Sustainability (Lee, 2015, p. 286). The components are divided into two levels: the foundation level (value proposition, legal and governance structure, market scope, and networked activities) and the performance level (resources and sustainability). There are also several variants of the Business Model Canvas for social enterprise, one advantage of which is the fact that, due to its flexibility, it can be modified for specific applications or new types of business forms, such as nonprofit and social enterprises (Gibson & Jetter, 2014). Obviously, the BMC cannot completely capture the specificity of social enterprise business model. Both researchers and practitioners point out to the necessity of adding other components in order to understand how social enterprise creates, delivers and captures value. There are several variants of the Business Model Canvas for social enterprise, such as GoGreen Portland, which proposes adding Problem and Impact and Measurements. Problem component focuses on the specific problem the enterprise wants to solve, while Impact and Measurements addresses the social/environmental impact that social enterprise wants to achieve (GoGreen Portland). Smith (2012) suggests that in order to avoid confusion in having Donors and Beneficiaries in one canvas, a social enterprise should create two different variants of BMC. The first one bases on Osterwalder's Canvas but has specific focus on Donor's perspective, while in the second one Value Proposition is replaced by Impact Metrics. Another modification is the one by Social Innovation Lab (2013), in the proposition of which Value proposition is altered into Social and Customer Value Proposition, Impact Measures is added in Value Proposition component, Customer Relationship is replaced with Type of Intervention, and Surplus component is added to the BMC framework. The latter focuses on how surpluses have to be reinvested into the mission, addressing on of the specific features of social enterprise. Also, Michelini and Fiorentino (2012), in order to identify the main difference between the social and inclusive business models, propose to broaden BMC framework with the ecosystem (such as governance, the value chain, skills, and the network partners), the market (the customers and the distribution) and the economic features (revenue management). Another proposition of components by Brzóska and Jerzok (2014) who points out to (1) the generated social value, (2) human resources (employees), and – if applicable – (3) supporting the activities by social franchise (Brzóska & Jerzok, 2014, pp. 68-69). The latter might be treated as external resources available for use, but also as an offer to other businesses, constituting new social value. In Polish conditions, adopting the franchise model to social enterprises might be seen as an innovative approach. The proposition developed by these authors is presented in the figure below.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 1. Social enterprise business model
Source: Brzóska & Jerzok, 2014



Even though Osterwalder and Pigneur (2010) claim that the Business Model Canvas includes all important elements of a business, one may argue that in the case of social enterprises one important aspect is overlooked, namely a social mission. In the model of Brzóska and Jerzok (2014), this issue is partly addressed by including a social value proposition as one of the components. This is a significant alteration, as many earlier studies have proved that a social mission is incorporated inside the entire value chain of a social enterprise, and that it creates the DNA of the enterprise (Austin, Stevenson & Wei-Skillern, 2006; Doherty, Haugh & Lyon, 2014; Wilson & Post, 2011). The following section illustrates the application of proposition by Brzóska and Jerzok (2014) using the example of a business model of the existing social enterprise.

THE IDENTIFICATION OF THE BUSINESS MODEL FOR A SOCIAL COOPERATIVE OPERATING IN POLAND

As noted previously, in the light of EMES classical definition, only social cooperatives fulfil the criteria of a social enterprise in Poland. Therefore, the author decided to provide a case to illustrate how the business models for profit enterprises could be applied for social enterprises. Due to the fact that specific features of social cooperatives (such as social and economic integration of its members) are taken into consideration it is reflected in the presented business model. As the topic of the business models for social enterprises generally lacks empirical research, the presented data could enrich existing research with a wider perspective.

The social enterprise that is the subject of this case operates as a social cooperative in one of the major Polish cities with the population over 300,000. The cooperative presently employs 7 people with a severe or moderate level of disability, those aged over 50 and/or possessing substantial life experience. They look after the elderly and disabled (but not bedridden due to carers' own limitations) and win contracts for distributing leaflets (by public tender), however the latter activity is treated as marginal. It is important to note, that the author has a good working relationship with the organisation having

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

served there as an external strategy consultant for social cooperatives. Additionally, author's hands-on experience in empowering trainees working in the non profit sector through counselling, consulting, coaching and strategy development has equipped her with a perspective relevant to this study, allowing for successful data collection, on one hand, and facilitating communication with the cooperative, on the other hand. This approach is in line with Van de Ven's (2013) engaged scholarship, which emphasizes the co-production and co-ownership of the research process and challenges visions of academics as the sole knowledge producers and drivers of academic inquiry (Dempsey & Barge, 2013, p. 671). In addition to the data collected in the course of the study the author also used her own experiences and personal notes from the period of time when she had been working with the social cooperative. This is in line with Eisenhardt (1989) and Yin (2003), who value the possibility of the joint use of different data collection techniques. To sum up, in order to gather data for the case two semi-structured interviews with the management were conducted between March and April 2016 (one face-to-face, the other on the phone). In order to complement primary data, secondary data were used as well (the social cooperative website, newspaper articles, and annual reports).

The following section contains description and analysis of the social cooperative business model broken down into components. The author have used proposition of components presented by Brzóska and Jerzok (2014) basing on the Business Model Canvas template.

Customer Segment

Who is the social co-operative customer and for whom value is created?

The main ordering parties of care services are local government of the district (*powiat*) and the commune (*gmina*) as well as individual persons. In the case of the local government, the basic forms of concluding contracts are competitions and tenders, the completion of which provides social cooperative with regular orders (contracts are signed by communal social welfare centres for a year or two). Unfortunately, in this case, the price obtained for an hour of service is much lower than in the open market, as a result of the limitations of communal budgets, as they have to provide welfare services to a increasing number of clients. In the case of individuals, obtaining a direct request for a service from clients requires prior „reaching out" to them but at the same time it guarantees higher payment received for the same type of service. These are the most important clients, particularly because they are in most cases acquaintances (a neighbour's mother, a husband's aunt, etc.). The weight of caring for people in need of others' help permanently or temporarily is placed upon their family, and when the family cannot provide proper care, it is placed on entities prepared for this, including social cooperatives. An increase in demand for care services is also associated with the change of the family model, aging population, prolonged retirement age, and the migration of the younger generation.

Economic Value Proposition

What specific Value proposition does the social cooperative address to its customer segment?

Help and support in the form of care services is organised in the homes of ill, elderly or disabled people. In this way, the clients' basic physiological (biological) and psychosocial needs are fulfilled. By providing daily hygiene and care as well as preparing meals, social cooperative employees assist in meeting everyday needs. The offer of care and assistance services for people with disabilities alleviates the problems of old age, or visual, auditory and kinaesthetic deficits. A vast majority of other entities

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

operating in the market of care services are individuals. Since social cooperatives write out bills for services they perform, expenditures on care for people with disabilities provided at their home may be partially refunded, as granted by the law.

Social Value Proposition

What specific public/social value does the social cooperative address to local community where it operates?

Initiatives taken by social enterprises are assessed positively as long as an organisation pursues values shared by a given community. This ensures the fulfilment of the needs that the community perceives as significantly improving the quality of life. Through the presence at and around clients' home, social cooperative employees respond to their need for security and stability, as well as the vital psychosocial need of social contact and feelings. They also provide contact with the outer world to people suffering from loneliness, who require assistance due to elderly age, illness or other reasons. Moreover, activities performed by social cooperative sometimes positively influence the changes in a family in the case of an illness of one of its members. However, the most important social value created involves providing employment to people with a severe or moderate level of disability, those having life experiences and/or 50+.

Key Resources

What resources the social cooperative needs to make sure their business model works effectively?

The provision of care services requires no additional equipment, other than client's personal objects. Anti-pressure sore mattresses, grab bars, booms, climbing frames, toiletries and household equipment composes a client's equipment. Social cooperative employees do not need special means of transport to provide this kind of services, and if some matters have to be settled at the office or a medical facility, public transportation is used. Office work, accounting, and managing require the equipment present in most households, i.e. a computer, a printer, a phone.

Human Resources (Employees)

What competences and personality traits should the social cooperative's employees possess to make sure their business model works effectively?

The fundamental and indispensable resource is people with great empathy. No one knows more about the needs of the elderly or the disabled than these people themselves, or people in a similar situation. For each client, one caretaker is required. Therefore, there need to be at least 5 caretakers (in Poland the legal status of a social cooperative requires that at least 5 people join it as members at its inception), however currently the cooperative gives employment to 7 people. The ladies who had had other occupations so far or had not had the appropriate qualifications to become a professional caretaker or a disabled person's assistant all volunteered at a local social care institution. Many free trainings are available on caring for persons permanently immobile or assistance to a disabled person. Social welfare centres, projects with ESF, Red Cross and other professional training institutions organise such courses. As it was already mentioned, the social cooperative employs people with a severe or moderate level of disability. Thus, this business model can be used to activate the disabled, and those aged over 50 and possessing substantial life experience.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Key Activities

What activities the social cooperative has to undertake to make sure their business model works effectively?

The basic premise of the cooperative's activity is „self-sufficiency". Accounting is performed within a part-time employment contract (1/2 FTE). The cooperative's manager is employed part-time (1/2 FTE). The establishment of the board consisting of 3 members might be seen as almost direct management, when considering 7 people on the staff. No activity is outsourced. One could say that key activities are connected with management, organisation and promotion of the cooperative. The key process in the operations of the cooperative are the monthly meetings of all members of the cooperative, which might also be seen as the board meetings extended to comprise other staff members. It is the time to speak their minds, discuss their concerns, analyse a monthly financial situation of the cooperative, exchange information on current and future potential clients, etc. It is important that these meetings take place outside the cooperative's premises. Independent public space (facilities made available particularly for non-governmental organisations) and the time of appointments (beyond service hours) make the meetings effective, integrating, and facilitative in solving emerging conflicts but also in fostering mutual trust.

Key Partners

Who are the social cooperative's key partners and suppliers who enable to create value for their customers?

Both partners and stakeholders of the cooperative are set within the local environment, as the co-operative originates from it. This local community provides the cooperative with potential customers. Municipal authorities and local administration are one of the most important stakeholders, as has already been proven in the past – it was the local administrator who has announced a competition for the provision of services related to the distribution of advertising materials for tourist information centers, airports, etc. The cooperative won the competition and we have been providing these services for 5 years. Therefore, good relationships with the local government might make the municipality the cooperative's key ordering party in the future.

Relations With Clients

How does the social cooperative has to build relations with clients to make sure their business model works effectively?

Relationships with major clients are based on trust and emotional bond. Clients once acquired become attached to „their" caretakers, resistant to the activities of the cooperative's competition, and less motivated by price in their choices. Loyalty and empathy are the only price paid by the cooperative's employees.

Channels

What channels can the social cooperative use to deliver their product or services to customers?

Buzz marketing and the reputation that the cooperative has earned for itself work well in care services. They are the most effective and do not require any financial outlay. In the first year of activity, in order to secure a continuity of services, the cooperative submitted a tender in response to a competition announced by the local authorities. This way, they obtained clients from a list provided by Municipal

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Social Welfare Center. The business approach adopted by the cooperative involved conducting the price calculation that allowed them to provide care services both through the municipal welfare centre and in the open market.

Revenue Streams

In return for what, how much and in what way does the social cooperative receive financial means from customers?

The cooperative's clients, i.e. individuals using care services, give their payments in cash to the caretaker, and she submits the money to the cooperative's teller desk. The rate per hour charged for care services in the open market in the city where the cooperative operates is now at the level of PLN 10-15. Payment due dates depend on when clients receive their disability/retirement pensions. The Municipality Office pays for distribution services via a bank transfer within 14 days from service provision, as agreed in the contract. Public funding, i.e. the State Fund for Rehabilitation of Disabled Persons, is an important revenue source for the cooperative. This is a partial refund of salaries, as the cooperative employs people with a severe or moderate level of disability. The funding results from the regulations of the Law on Social and Vocational Rehabilitation and Employment of Disabled, and will continue until the law remains in force. This is ca. 40% of the cooperative's revenue. If treated as a reimbursement of salaries or increased costs of employment of persons with disabilities, this has an impact on the level of prices for care services the cooperative provides. This supports them in being competitive and enables financial independence.

Cost Structure

What are the fixed and variable costs of the social cooperative's business model?

Due to the service nature of activities, 80% of the costs are salaries and benefits associated with them (social security contributions). It is the work of caretakers and disabled people assistants that generates the highest costs, but these are direct costs (salary for 1 hour is 10-15 PLN). It is the positive side of this business model because the funding is not allocated in stock, frozen in misguided investments, or in products for which there is no demand.

The presented social cooperative is aimed at social integration of people with a severe or moderate level of disability (aged 50+) through work. It pursues its objectives by creating employment and providing care services as well as distributing leaflets. Apart from creating *economic value* for customers such as high quality service, it also creates *social value* (creates employment for hard-to-employ individuals) and positively influences changes in customers' families. The social cooperative's model is targeted both at individual persons and ordering parties of care services such as local government and the commune. Given the fact that nowadays aging, the migration of the younger generation and prolonged retirement age are not fads but reality, such clear and definite *customer segments* seems to be reasonably set out. With respect to *key resources*, apart from tangible resources and equipment present at clients' houses, the cooperative relies heavily on knowledge to deliver value proposition. The primary sources of knowledge for the analysed social cooperative are life experiences of its members, practise gained during volunteering at a local social care institution, and free trainings (such as i.e. assistance to a disabled person) provided by social welfare centres, Red Cross and other professional training institutions. In terms of *human resources* the ultimate and imperative resource is people with great empathy

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

who constitute the social cooperative. To separate the functions of a manager and an accountant, and to ensure the proper functioning of the cooperative, part-time employment (1/2 FTE) is devoted for each function. The additional 1/2 of working time is dedicated to the substantive work as an assistant to a disabled person. Such a model, i.e. combining the work of a manager and a disabled person's assistant, an accountant and a caretaker works very well, and reduces unnecessary administrative costs. A part-time manager and a part-time accountant (1/2 FTE per each) support 6 FTEs of caretakers/assistants. The number of staff devoted to care/assistance only could still be increased. *The key activities* in the social cooperative are management, organisation and promotion. These activities can be divided further into supervision of financial resources, setting work schedules for employees, organization of work in the cooperative, promotion and managing relationships with stakeholders. No activity is outsourced. *The key partners* strongly influence proper functioning of the social cooperative. Therefore, it is necessary to manage relationships with stakeholders such as municipal authorities, local administration, social welfare centres and customers themselves. Trust and competence are the key *customer relationship* features characterising analysed social cooperative. As the local government might be perceived as key ordering party in the future, good working relations are also of crucial importance. *The channels* of value delivery differ depending on the customer segments. Face to face contact or conversations over the phone are used as a channel to reach or update families of clients to whom social cooperative provides care services. In terms of providing care services through the municipal welfare centre more formal channels of communication are requisite, resulting from the fact that as at first public entities are required to issue requests for proposals. Generally, marketing is based on customer recommendations and promotion by befriended organisations, housing cooperatives, parishes, family members and friends, which makes maintaining professional relations with these actors vital. Social cooperative has various *streams of revenues* and financial support. Firstly, individuals using care services or their families pay caretakers in cash. The second stream of revenue comes from Municipality Office who pays for distribution services after the service is provided. In order to balance revenues it is necessary to ascertain that arrangements concluded with social welfare centre are secured, making sure to verify which price per hour of care ultimately wins the tender. An important and relatively stable source of revenue is also the State Fund for Rehabilitation of Disabled Persons. Possibility to use this source is a consequence of the fact that social cooperative employs people with a severe or moderate level of disability. *The costs structure* of the analysed social cooperative covers the operational expenses for managing it, including remunerations. Distribution services for the city generate material costs associated with the use of a private car for business purposes, but the price calculation of the service is very favourable, and the work done by one of employees is very profitable. However, due to rather low profitability of the business model, it is necessary to minimize costs.

SOLUTIONS AND RECOMMENDATIONS

The objective of the case presented above was to illustrate how business models for profit enterprises could be applied for social enterprises, which use both customary and innovative business models to achieve a social and environmental impact and/or meet sustainability goals. Below the author deepens the subject and uses the Business Model Canvas to present the analysis of 16 business models, prepared in collaboration between managers of social enterprises and experts within PI-PWP Replikator project co-financed by the European Union (Brzóska, Durczok, Jerzok, Zarębski & Żbik, 2014). The analysis

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

of the aforementioned business model leads to the conclusion that in the area of (1) *economic and social value proposition* the managers indicated what specific value is targeted at a selected customer segment. This part of the business model focuses on proving that the activities taken by a social enterprise have real significance for the local community and contribute to the achievement of social cohesion. In the area of (2) *customer segments*, a manager specified who the customer of a social enterprise is, and for whom value is created. The emphasis was on properly identifying the groups of the beneficiaries of social enterprises. What appears significant in the created models is holistic thinking, consisting of broadening the field of results, and not only relating the results to those who work in a social enterprise, but also showing how and what activities impact the quality of life of the local community in which the organisation operates. The area concerning (3) *customer relationships* enables to define how to acquire, enhance and retain the value of customers in the long term. The main activities that managers in social enterprises indicated are related to establishing prestige and trust, and contribute to the networking and cooperation in local communities and among local authorities. In the area of (4) *channels*, it was identified which channels can be used to provide customers with products or services offered by social enterprises. In this area, it is crucial to take into account the means of communication that social enterprises employ to communicate with the potential recipients of services and/or products. The proper preparation of content for the area concerning (5) *the revenue streams* allows the estimation of for what, how much and how a social enterprises will receive funds from their customers, as well as support from their stakeholders operating in the task environment. The area of (6) *key activities* allows for the instantiation of measures that should be taken by a social enterprise in order for the planned business model to operate well. It is also necessary to determine (7) *key resources* (tangible, intangible and human resources), which will contribute to this. The fact that social enterprises are unique players in the market means that it is extremely important for these entities to correctly identify (8) *partners*, i.e. all organisations that support and assist in the implementation of planned activities and proceeding towards achieving the objectives. In the area of defining the business model, a manager has to consider who are the key partners and suppliers owing to whom a social enterprise creates value for its customers. The last area in the business model specifies (9) *the cost structure*, and mainly shows the breakdown into fixed and variable costs.

The study revealed that social enterprises operating as a social cooperatives could use the concepts and elements of business models characteristic to for-profit enterprises. However, both presented case and the abovementioned analysis of 16 business models reveals the need to expand the Business Model Canvas framework with additional components, as it overlooks some aspects in the context of social enterprises. Therefore, it needs to be modified to be more adjustable to social enterprises reality such as creating social value (primarily aiming at addressing and satisfying unmet social needs). In this vein, the author suggests that the social mission – being its reason for existence – should be reflected in the business model of a social enterprise. Taking into consideration the distinctive features of social enterprises, the social mission should be the integrating driver of the business model. Furthermore, BMC framework should also be extended with component addressing the benefits for social enterprise customers, being the social/environmental impact that social enterprise wants to achieve.

FUTURE RESEARCH DIRECTIONS

Although the work accomplished by social entrepreneurs is not new, the current momentum behind the movement provides significant base and data for further observations. As theoretical consensus on the

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

business model concept either in profit or in non profit contexts has not been reached yet, future research is needed. It may for example seek to empirically explore differences in the nature of business models and their components depending on the legal and organisational form of social enterprise (for instance how the components of a business model differs between work integration social enterprises and non-profit organisations, as well as the implications these differences have for managers). Given the fact that social enterprises are culture-specific, socially embedded, and community-tied, future research in other countries should also be undertaken. Conducting more empirical research such as case studies could help understand the research subject in other situations or contexts. Such studies can also offer important insights for social entrepreneurs, who consider social franchising and replicating business models of successful social enterprises. Another interesting research avenue is examining whether social franchise and replicating business models help social enterprises in achieving market success and reduces risk of market failure. Due to the special role that social enterprises play in economies, the adoption of the engaged scholarship perspective would be beneficiary as it is committed to utilizing the resources of academic inquiry for practical concerns and useful ends. As Boyer (1996, p. 21) argues, the scholarship of engagement is a mode of inquiry "connecting the rich resources of the university to our most pressing social, civil, civic and ethical problems".

CONCLUSION

The development of social entrepreneurship is exceptionally important from the point of view of every national economy because social economy subjects, including social enterprises, constitute a reservoir of resources inaccessible to other forms of activity. These resources can be used to the advantage of local communities, as they play an important role in the implementation and provision of public and social services, and they can also be used in the process of building a democratic and civil society (Hausner 2008, Wygnański 2007). It is worthwhile to invoke here Ducker's words and vision formulated far back in the 1980's, when he pointed out that in the 21st century the condition of the organisations operating in the public and social sector would determine the condition of the economy as a whole. Therefore, nowadays it is crucial to search for the rules and routines of management, which transplanted from the private sector to the public and social sectors (especially to social enterprises), will stimulate the increase in the efficiency of the latter organisation.

Social enterprises are a unique form of entrepreneurship and business, because they meet both social and economic objectives, and in such a way that the economic results are largely channelled to help the organisation's employees and achieve a social mission. In the case of self-financing of social enterprises, the fulfilment of these goals is possible only if they are competitive. In some countries, for example in Poland, only scarce external funds are available to support social entrepreneurship development (apart from public funds and some additional support given to social enterprises). This leads to the situation in which social enterprises are not only grant-dependent, but also self-insufficient. To support their social value, social enterprises should pursue their activities in a thoroughly entrepreneurial way (Chell, 2007). It can be achieved through the development and application of appropriate business models, which is especially important if an organisation operates in an open market.

Previous studies investigated business models from a rather static point of view portraying them as a set of coherent interrelated core business model components. However, Demil and Lecocq (2010) propose a more dynamic transformational approach, which portrays a business model as a tool to manage change

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

and innovation in the organisation. This is in line with Teece (2010), who points out that organisations should actively seek and consider improvements to their business models constantly, which means it should be an ongoing process enabling the adaptation to the turbulent and ever-changing environment. The ability to do that may actually be crucial to creating competitive advantage in the future. The author is convinced that applying the business model perspective would also have a positive influence on stronger legitimacy of social enterprises in the society and economy. As Margretta (2002, p. 87) points out, a business model is the story of the business you tell if you are asked what your company is doing. The skillful and deliberate use of business models could help social entrepreneurs tell this story in a more engaging and convincing manner.

The business model itself could also be considered as a framework of educational nature, as it shows business activities in a clear way and facilitate effective decision making with regard to operational and strategic activities in which social entrepreneurs engage. As Lee emphasises "through the development of a business model, social enterprises will be able to understand their business better, find ways to enhance their competitive advantage, and lay a ground work for implementation-oriented business planning" (2015, p. 295). Accordingly, the participation of social enterprises' employees in the development of such models could enable them to better understand the current or planned activities, but also unleash their creativity and innovation, as reflected in the value proposition.

KEY TERMS AND DEFINITIONS

Business Model: The logic behind the enterprise, the way it functions and how it creates value for its stakeholders.

Business Model Canvas: A common language for describing, visualizing, assessing, and changing business models.

Business Model for Social Enterprise: Decision-making framework necessary for developing consistent activities to support social mission-driven value creation and formulating strategies to sustain competitive advantage.

Social Enterprise: An operator in the social economy whose main objective is to have social impact rather than make a profit for their owners or stakeholders. It operated by providing goods and services for the market in an entrepreneurial and innovative fashion and uses profits to achieve social objectives. It is managed in an open and responsible manner and, in particular, involves employees, consumers, and stakeholders affected by its commercial activities.

Social Cooperative: A specific form of cooperative work. It is an association of people at risk of social exclusion (including: long-term unemployed, the disabled, addicts or the homeless). Within its activities it combines both economic and social functions. The main objective of social cooperative is social and professional reintegration of its members.

Stakeholders: Those groups without whose support the organization would cease to exist and who has an interest in the value created by the organisation.

Social Impact: The effects (improvements) an organization has on society.

Chapter 41
Knowledge Creation, Management, and Dissemination in Impact Communities

Ana Melro
University of Aveiro, Portugal

Lídia Oliveira
University of Aveiro, Portugal

ABSTRACT

This chapter's mission is to reflect on the steps taken by knowledge (creation, management, and dissemination) in an impact community (IC). Also, it aims to analyze how this knowledge can be capitalized by the IC itself, as well as other ICs, through the replication of good practices. To this end, importance is attached to several stages of the existence of knowledge in an IC: 1) individual knowledge, which each single person carries and integrates into an IC when he/she becomes a member; 2) the combination of all the individual knowledge, which forces one to think in a knowledge management; 3) the moments of knowledge sharing; and 4) the internal and external dissemination of this knowledge. These last two dynamics—sharing and dissemination—result in a replication and multiplication of existing knowledge in an IC.

INTRODUCTION

Communities of Practice (CoPs) are aggregations of people who mobilize their energy to solve common problems through social learning processes. Among other goals, one of the most privileged of belonging to a CoP is the knowledge sharing, which takes place after its creation and is maximized with its internal and external dissemination.

One of the areas that is currently being explored is the creation of CoP by social entrepreneurs, the so-called Impact Communities (IC), that is, groups of people whose goal is to change the territory through social problems' resolution. They are IC because the creation of value for society is their ultimate purpose, as well as the promotion of change, and this takes into account the direct, indirect beneficiaries and other stakeholders, as well as the use of local resources and / or sustainability, innovation and growth.

Nowadays, Social Innovation is an area where more and more academics and practitioners dedicate their studies and interest. The development of the area has been such that it has moved on to a new phase of creation of IC, spaces where local people gather together to contribute to the socio-economic and cultural territory development.

IC are fed by the definition of CoP with respect to its scope and form, but in material terms they present specific contents, also considering the specificities of its members: social entrepreneurs. The IC arise from the spontaneous desire of social entrepreneurs to come together as a group, to jointly discuss and try to solve problems they face in the development of their initiatives and / or present good examples of managing initiatives. What unites these people in an IC is the desire to find solutions to social problems and transform the territory where they operate. This is the particularity of IC in relation to CoP, the interest is not only self-centered (sometimes this doesn't exist at all), but often it is to solve a problem that affects the environment, someone known, a particular group, or other.

What are the strategies for creating, managing and disseminating knowledge in/of IC? What are the strategies of knowledge internal transfer? How do territories benefit from this knowledge, by becoming Smart Territories as a result? What role for Media and Information and Communication Technologies?

These questions are always an issue in an Impact Community, whether in a conscious way, with procedure manuals being prepared and distributed; or in an unconscious way, bringing some chaos to the IC (in)formality.

Considering the specificities of people belonging to an IC, some concerns have emerged that underline the importance of this chapter:

1. The small number of social entrepreneurs in Portugal (2015 numbers of the Global Entrepreneurship Monitor[1], refer to about 2.9% of the total population) may mean that integration into an IC will make social entrepreneurs' scale of action grow larger because together they are more and because the range of action becomes more embracing;
2. The large number of organizations in the third sector, according to the Cooperativa António Sérgio para a Economia Social (António Sérgio Cooperative for Social Economy)[2] are about 55,000, which implies that, in Portugal, organizations of a more caring nature are replicating more problems and needs than solutions;
3. The lack of funding for innovative social initiatives (mostly justified by the non-compliance of Social Security parameters) often means the difficulty in Social Entrepreneurship initiatives to guarantee their continuity;
4. Given the dispersion of Social Entrepreneurship initiatives, it implies that they do not communicate and are not known, so they do not share problems, solutions or good practices;
5. The lack of knowledge of sharing and communication collaborative tools results in working in niches that does not allow to leverage more and better solutions.

Considering the aforementioned concerns, the paper has four main objectives:

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

1. To reflect on the creation of IC in the Portuguese context, but with a proposal of replication in countries with similar characteristics;
2. To reflect on knowledge creation in the IC, analyzing the cycle, which roles are assumed by the members and what manifestations are perceived throughout this knowledge creation;
3. To evaluate the knowledge management in the IC, if it is and how it is carried out and suggest knowledge management frameworks;
4. To reflect on the knowledge dissemination, to foster the internal and external sharing practices of the crested knowledge in an IC through the suggestion of a specific framework for this purpose, using existing technological tools.

In a period of increasing demands in terms of process flexibility and information sharing, it is important that these two dynamics - flexibility and sharing - are carried out in a thoughtful and articulated way with other dynamics. IC, being informal spaces of collaboration, need more processes' codification, so that the information transfer, when necessary, is carried out without entropy and in such a way that the knowledge creation, management and dissemination are carried out and ensure the extraction of the maximum potential of existing knowledge and allow openness for latent knowledge to be exposed.

For the accomplishment of this chapter several phases will be crossed, the first is the systematic review of literature on IC creation; on knowledge creation, management and dissemination in the specific context of IC; the role of information and communication technologies in the knowledge management and dissemination. The second phase is the analysis of the potential creation of IC in Portugal, using the Portuguese Social Entrepreneurship initiatives and social entrepreneurs' characteristics. The third phase is the analysis of the implementation of an IC pilot, from the moment of its creation, through the motivations of the social entrepreneurs for belonging to the IC, to the strategies of communication and knowledge sharing, realizing which critical success factors are important for the maintenance of an IC.

It is intended with these methodological steps to understand the emergence of an IC and its maintenance, but above all, the knowledge creation, management and dissemination, in order to answer the questions: what is the key element that triggers the creation of an IC? How knowledge sharing occurs within an IC? How are the existing knowledge and the sharing / dissemination of good practices / knowledge in an IC perceived? What importance is given to knowledge management in an IC?

BACKGROUND

Social Innovation and Entrepreneurship

The first reference to the concept of entrepreneurship was done by Jean-Baptiste Say, and defined as the transfer of economic resources from a small area to one of greater productivity and income (Say, 1841). A few years later, in the twentieth century, Schumpeter (1949) dedicated his interests to the same concept, pointing out that entrepreneurs are agents of change who explore new forms (or old, but with the application of some novelty) of production, and organization of the business or industrial sector (1949).

Central to the distinction between traditional / commercial and social entrepreneurship is the mission. In 1998, Gregory Dees explained the concept of social entrepreneurship by referring that it includes the characteristics pointed out by Say, Schumpeter and others (Peter Drucker, 1985; Howard Stevenson, 1991), but also include the adoption of a mission that contributes to the creation of social value. The

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

social mission (and the search for results) is then the engine for the search for innovative processes, sustainable solutions and continuous learning (Dees, 1998).

Mort, Weerawardena and Carnegie (2003) concluded that social entrepreneurship has a multidimensional nature, since it consists of a number of interrelated attributes or dimensions and exists in multidimensional domains. The authors analyzed the concept considering the latent model of Law, Wong and Mobley (1998). Thus, social entrepreneurs are motivated by a social mission (as Dees, 1998 had already stated); have a balanced judgment when faced with moments of complexity; they always look for opportunities to increase the value created for the beneficiaries of their solutions; finally, they make decisions using innovative instruments, in a proactive way and with some degree of risk (Mort, G. S., Weerawardena, J., & Carnegie, K., 2003).

In 2004, Mair and Martí defined social entrepreneurship as:

a process involving the innovative use and combination of resources to pursue opportunities to catalyze social change and / or address social needs (Mair & Martí, 2004).

That is, they include the innovation factor, the existence of an opportunity and the promotion of social change.

A few years later, Martin and Osberg (2007) defined social entrepreneurship as having three essential components: the identification of a group of causes that creates exclusion, marginalization or suffering situations of a segment of humanity; the identification of an opportunity to act in the solution of the problem encountered; and the achievement of a new balance which would eliminate or reduce exclusion, marginalization or suffering situations of the target audience or even of a wider group of society (Martin & Osberg, 2007).

Santos (2012) wrote the definition of social entrepreneurship that IES-Social Business School[3] would use until the present moment and that gives meaning to the way the association develops its work, as well as to the evolution of its training offer. According to the author,

the process of social entrepreneurship enables the second invisible hand of the economic system, this one based on other-regarding rather than self-interest. By pursuing their regard for others and addressing opportunities for value creation in a distributed way, social entrepreneurs drive the economy closer to an efficient outcome by systematically identifying neglected problems with positive externalities and developing mechanisms to incorporate these externalities into the economic system. (Santos, 2012).

As for the concept of social innovation, Phills, Deiglmeier, and Miller (2008) describe it as a more efficient, effective and sustainable solution than existing solutions to solving a social problem, which seeks above all value creation for society (Phills, J. A., Deiglmeier, K., & Miller, D. T., 2008).

At this point, it is understood that social entrepreneurship and social innovation are two concepts easily confused in their similarities and that, for this reason, they are mentioned side by side, considering the way they complement each other, rather than the differences that separates them.

The difference between Social Entrepreneurship and Social Innovation is that the first one is considered as being more stable, lasting and sustainable, with a vision of profit making, even if it has a social mission of reinvesting in the solution to solve social problems.

Social Innovation is more dynamic, related to the constant search for new ideas, products and services. As Mulgan (2006) points out,

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Social innovation refers to innovative activities and services that are motivated by the goal of meeting a social need and that are predominantly diffused through organizations whose primary purposes are social. (Mulgan, 2006).

The similarity between the two concepts is the social mission, both have as purpose to solve problems of a specific territory or group of people. In fact, Social Entrepreneurship often seeks Innovation to bring some change to the existing balance (Phillips, Lee, Ghobadian, O'Regan, & James, 2015). And, because of the similarity, which is what most characterizes also the two concepts, they often arise associated, Social Innovation and Entrepreneurship.

IMPACT COMMUNITIES AND KNOWLEDGE

Communities of Practice (CoP) are understood as

a group of people who share a concern or a passion for something they do, and learn how to do it better as they interact regularly (Wenger-Trayner & Wenger-Trayner, 2015).

It is the authors' belief that CoP are a powerful tool for project development, as they give the agents of change the opportunity to learn and improve through the regular interaction and sharing practices.

When a group of social innovators and entrepreneurs come together, informally or formally, Impact Communities (IC) emerge. The purpose is to solve social problems in a given territory, to find answers to some problems encountered when trying to implement initiatives in the field. What Toivonen (2013) defines as Social Innovation Communities (SIC).

SIC are defined by the author as,

a perplexing entity that escapes easy categorization: it is heavily networked but not to definable simply as "a network"; practice-focused but not a community of practice (in Wenger's sense); an ecosystem-builder yet not an ecosystem; and concerned with collective processes but not with centrally coordinated "collective impact" (Toivonen, 2013).

SIC are:

an emergent collaborative organization characterized by entrepreneurial projects, loosely shared changemaking cultures as well as online/offline spaces; it continuously facilitates informal but productive interactions between relatively diverse actors, most of whom share an interest in social innovation (in a broad sense) and in open collaboration beyond the bounds of any single organization or narrowly defined issue. (Toivonen, 2016).

The article focus on the concept of IC, since the interest are SIC, but with the evidence on the impact that these produce in the territory, on the positive change produced. Thus, groups of social entrepreneurs that meet, face-to-face or virtually, with the ultimate goal of developing the territory where their initiatives are implemented. This development happens because the solution found for social problems aims to create a positive impact on people and, consequently, on the territory.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Impact is the direct or indirect change caused by some given action. A time to learn and share those learnings it's also important for social entrepreneurs to achieve their goals.

Moreover, because of what it is the definition of IC used in this research, one understands that the way people gather and share knowledge will help create a bigger positive impact in society, result of social entrepreneurs work.

Knowledge production is the result of established connections between individuals: it makes no sense to analyze these connections - the network - or even knowledge production as if they are isolated elements, but rather as being in permanent interaction since all actors contribute to the same end.

By actors, one consider individuals, objects, institutions, technology, and all that is involved in the knowledge production network (Latour, 2010). Moreover, as Latour states,

that means that whenever you wish to define an entity (an agent, an actant, an actor) you have to deploy its attributes, that is, its network. To try to follow an actor-network is a bit like defining a wave-corpuscle in the 1930s: any entity can be seized either as an actor (a corpuscle) or as a network (a wave). It is in this complete reversibility – an actor is nothing but a network, except that a network is nothing but actors – that resides the main originality of this theory. Here again, network is the concept that helps you redistribute and reallocate action. (Latour, 2010).

The Actor-Network theory proposed by Bruno Latour (2005) and Michel Callon (1986) is, by its scope, applicable to any scientific area, namely, communities' communication processes. In this perspective, what was interesting was precisely to consider that each link is important for communication to be carried out and that the IC has the desired result - the result here being the creation of value for society through the resolution of social problems. Both IC members (internal and external - in this case IES-SBS), as well as the technological tools available, human resources, local organizations and the organizations where IC members work, the environment and the established relationships among the members are important actors in this network that allows communication and, consequently, knowledge production and Smart Territories development.

Knowledge creation, management and dissemination are processes that occur when several factors are combined. One of them, and the most important, is the existence of human critical mass capable of thinking the world and finding ways of changing it for the better, in this specific case, Social Entrepreneurship.

MAIN FOCUS OF THE CHAPTER

Knowledge Creation in Impact Communities

[…] *in a community that exhibits connectivist dynamics, knowledge is not merely distributed from one person to another, but is rather emergent from the communicative behaviour of the whole* (Downes, 2012). This citation lists structural concepts for the article development: community; Learning Theories, namely, connectivism; knowledge and communication, with several points in common and of interrelation between all of them.

The teaching-learning process requires the existence of an emitter and a receiver, since it is performed through a communication dynamic. Those emitter and receiver may not be singular, but a collective of people. Teaching-learning can happen from one to many, one to one or even many to many. Thus, it

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

implies the existence of a community, an IC, where the teaching-learning process occurs, which is the knowledge creation. For this, it is considered that the process must be adaptable, not linear but interactive, with a strong dynamic component of fluid-acquisition and constant transmission.

Education and communication for/of entrepreneurship has a relevant role in established networks, through the various living environments, that promote and allow the emergence of learning collective environments, more or less structured, but always with the purpose of promoting learning, knowledge creation, the connection between people and knowledge. Education for entrepreneurship is at the same time effective in a media ecosystem, in which ICTs induce and promote the immaterial approximation of actors, generating collective learning environments.

Learning generation is the transfer of a set of data and information that gathered in a coherent and consistent way, produce knowledge. This only gains the utility that underlies it (even by the definition that is attributed to it) when transformed into moments of sharing and construction: effective learning with behavior changes.

Allied to what has just been mentioned, and the definition of Social Innovation and Entrepreneurship used in this chapter, if, on the one hand, the learning generation and sharing are important variables to generate change; on the other hand, it is necessary that this learnings generates local dynamism and territorial development.

IC are, therefore, (1) spaces for the knowledge creation, as a result of the interaction of their members and; (2) spaces for sharing such knowledge with members or others with the same interests and contribute to change. The Communities are directed towards the outside, hence their aim is to contribute to (3) revitalizing their members (solving problems that may arise in the development of their initiatives or encouraging action in the community) and the territory and, consequently; (4) territorial development, which should be the objective underlying the constitution of a Community and its action over time.

Knowledge Management in Impact Communities

Learning spaces are being perceived since late 20th century. Although original and interesting ways of learning have always existed, only in that period specialists start to think about the deep changes needed so that learning can be flexible, spreadable and shareable.

Knowledge generation exists because once existed data and information. In fact, every territory is a living space of data and information relevant to the understanding of its evolution. But the action of man is necessary for these contents to be managed and disseminated.

Furthermore, the learning generation is precisely the transformation of a set of data and information without utility in a coherent and consistent knowledge. This, in turn, it only gains utility when transformed into sharing and building moments: the effective learning.

Allied to what was mentioned and to Social Entrepreneurship, there is the felt need for local change, through the resolution of social and/or environmental problems. Thus, if on the one hand, knowledge generation and sharing is an important variable to promote change; it is also necessary that that knowledge creates local dynamics and territorial development.

And when a group of people get together with the same purpose, in this case, to produce social change, then the focus should be on the territory development where they perform their activities. Thus, it is necessary to bear in mind which goals are intended to achieve at the micro level (the IC) and at the macro level (the society), having a deep knowledge about the territory, its existent problems and solutions.

Knowledge Dissemination in Impact Communities

The concept of Network Learning Communities was used to express the relationship created and existing between individuals belonging to a community, as well as the learning processes that are being promoted, extending in time and disseminated in space, especially with the Information and Communication Technologies (Rajagopal, Brinke, Bruggen, & Sloep, 2012).

The role of media in knowledge dissemination produced within the IC and social relations can be seen in a constructivist reading (Cole, 2003; 1996; Vygotski, 2007; 1934), since artifacts are now mediators of most human activities. Technological change supposes changes in habitus (Bourdieu, 2010; 1979), and in turn, technologies and their uses are modified by changes in the same habitus and, consequently, in individuals.

The Internet is responsible for facilitating communication, both internal and external. E-mail is now the privileged medium for exchanging ideas, responding in a labor and training contexts. But it is also with the use of the Internet that true collaborative communities are created. Crumlish and Malone (2009) agree that social experiences that have been unleashed can be a very enriching way of generating content, new products, business models or even productive processes, so companies are starting to accept the creation and use of social networks and incorporating them as another mode of production (Crumlish & Malone, 2009). According to Almeida (2012) there are three essential aspects in the existence of these networks and in the use of electronic mail: communication that exists, the fact that it is an important business tool and because it is an auxiliary of E-learning (Almeida, 2012).

Thus, among the advantages of using Web 2.0 we have the following: computers and smartphones include the emergence of more knowledgeable, critical and demanding citizens; the relevance attached to informal learning and innovation, the blurring of hierarchies and the shift to network-based heads. And among the disadvantages are: the possible weak participation of some individuals who feel less knowledgeable about the technologies, and thus excluded from the communication process, it may even be delivered to some elites, who in a way repress participation and collaboration; the lack of privacy; and the risk of poor participation. (Fernandes, Mozzicafreddo, & Cardoso, 2010).

The emphasis should not be placed on technology, but on culture, facilitating and encouraging the use of technology, but always on a logic of favoring the more flexible and less labor-intensive realization of work and training practices (Fernandes, Mozzicafreddo, & Cardoso., 2010). Collaboration, teamwork, information flows management, speed, efficiency, automation of repetitive tasks, minimization of their duration, innovation, personal and professional enrichment, are some keywords of the network communities of this millennium.

Schaffers, Brodt, Pallot, Prinz, and Instituu (2006) show that there are four types of support guaranteed in what the functions performance is related: what happens in the same time and space; what occurs in a different time and in a distributed space, but both predictable; when time and space are different and unpredictable; and, finally, the workplace in which employees are aware of time and space. The transition from one category to another takes place through a greater or lesser media usage, especially mobile technologies, through which it is possible to attend meetings at a distance, respond to emails, participate in discussions, as well as being part of collaborative work communities (Schaffers, H., Brodt, T., Pallot, M., Prinz, W., & Instituut, T., 2006).

The way in which the relationships between individuals are developed has changed over the years, making close what is distant, allowing those who are distant to participate. This is one of the great

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

advantages of implementing communication processes based on communication technologies and the model of Schaffers et al. (2006) is an example of this. Technologies should be the means to facilitate communication between members, whether in the same space or not, be it synchronous or asynchronous communication, communication with the outside world or between members.

SOLUTIONS AND RECOMMENDATIONS

IC are defined as spaces where learning is generated and disseminated; are open to this dissemination, sharing and interaction; promote the development of people and the territory; are therefore a way of creating value for society. (Putz & Arnold, 2001). Thus, as tools that serve the IC, ICTs are perceived as mediators in these processes of learning and social interaction (Moreira, Costa, & Vieira, 2016); promoters of knowledge sharing; places where knowledge can be accessed, just as the recognition of territories as intelligent and sustainable is made public.

Geographical dispersion of Social Innovation and Entrepreneurship initiatives, as well as the lack of mechanisms that allow the knowledge of these initiatives to be created, has as a consequence the fact that sharing and cooperation is not always a practice among the initiatives or even the entrepreneurs. More than that, and except some cases, working alone, lack of communication and even the lack of similar solutions in close territories are the most common problems when analyzing work practices (Sacchetti & Campbell, 2014).

But how can social entrepreneurs be the creators of their own community, even with the support and knowledge of specific organizations as IES-Social Business School? The goal is to put social entrepreneurs in communication, sharing learning and knowledge disseminating, through a hybrid learning strategy, combining online and offline communication.

The solution considers the ICT tools available to this effect, since it takes into account the geographic dispersion of the Community, the location and the contact points between its members. It also takes into consideration the proficiency in the use of ICT by these same members and the time of existence of the IC itself, including the importance of maintaining face-to-face contacts at frequent intervals.

For communications that seek to bring the elements together and continuously over time, you can turn to Facebook. In fact, this is a tool that is suggested to use since the beginning of the IC existence, since it encourages the sharing of varied information and can be added and withdrawn members at any time.

For scheduling face-to-face meetings, email is an excellent tool, complemented by Facebook and event sharing. In this way, the objectives of the meeting, the location and the hours can be added, as well as sharing some important document for the meeting preparation. To enhance the presence of those who are further away geographically, it is suggested to use skype.

But there is still the issue of the IC dissemination in the territory and the work developed and it is considered that the use of newsletters is a quick way to disseminate what has been done and even to have a perception of that work by IC members.

The strategy involves combining several tools and modes of action in each one of them, being the email, a social network, a synchronous online conversation tool and the newsletters. This combination is what guarantees that the knowledge dissemination exists and sharing and the learning generation occurs.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

FUTURE RESEARCH DIRECTIONS

The IC creation are drivers of the learning process of many to many, where communication can occur face-to-face or virtually, by using sharing and online conversation tools (such as skype).

Through the IC, its participants will be able to share challenges, experiences, solutions, knowledge, learning and work together if there are synergies between initiatives. Basically, legitimacy is conferred on all those who are part of the Community, since the goal is not the transmission of knowledge but the sharing, everyone will have something to add and learn (Gilchrist, 2009).

In order to indicate future work, it is considered that the relationship between the Big Data concept, Open Data practices, Social Innovation and the development of Smart Territories would be a very relevant area, understanding how the learning Collective Environments of social entrepreneurs, combining existing information about the territory and citizens, could promote better decisions of the initiatives and, consequently, the resolution of a more sustainable way of the problem.

Engagement is an important part of an IC whether upstream or downstream. As mentioned by Elkjaer (1999), only a full participation in the community activities can guarantee a sense of belonging. And this sense of belonging guarantees the IC sustainability.

ICT support the characterization of IC as open spaces, or open learning networks (Mott, 2010) and consequently as personal learning networks (Rajagopal, K., Brinke, D. J., Bruggen, J. Van, & Sloep, P. B., 2012). ICTs are important to feed the involvement and learning in an IC today, considering the importance they assume in the lives of individuals, but also the importance they have for people who are connected 24/7, increasing the feeling of belonging.

ICTs also allow the transmission of knowledge among SIC members and, as referred by Bradbury and Middlemiss (2015).

If a participant's knowledge has been passed on to other generations, then it re-mains in the shared repertoire of the community when they leave. The passing-on of knowledge, therefore, contributes to the association being able to sustain itself in the long term (Bradbury & Middlemiss, 2015).

It is understood that established networks that promote the emergence of more or less structured IC have a preponderant role, but always with the purpose of promoting learning, knowledge ant its dissemination, and the connection between people. IC guarantee the sense of belonging and concrete and achievable action, through the pursuit of clear goals, stable and permanent in time. To this end, it is desirable that they make use of the existing ICT, which can be important aids to the achievement of all the above conditions, and also to help people who are geographically distant feeling that belong to the IC, and are not inhibited of collaborating, participating and communicating.

CONCLUSION

As said in the beginning, this article intended to:

1. To reflect on the creation of IC in the Portuguese context, but with a proposal of replication in countries with similar characteristics;

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

2. To reflect on knowledge creation in the IC, analyzing the cycle, which roles are assumed by the members and what manifestations are perceived throughout this knowledge creation;
3. To evaluate the knowledge management in the IC, if it is and how it is carried out and suggest knowledge management frameworks;
4. To reflect on the knowledge dissemination, to foster the internal and external sharing practices of the crested knowledge in an IC through the suggestion of a specific framework for this purpose, using existing technological tools.

Those objectives intended to produce knowledge on how ICs can be an important tool for the development of more sustainable, efficient and effective Social Entrepreneurship initiatives. As a consequence of this and of knowledge sharing, networks and Smart Territories will arise.

Therefore, there are some important final considerations to present at this stage:

- ICs are spaces of learning and knowledge sharing;
- IC empower people to develop more efficient, effective and impactful initiatives;
- Social Entrepreneurship has the potential to create Smart Territories and improve its inhabitants quality of life;
- ICTs are important tools that, when combined, promote the three previous conclusions;
- ICTs contribute to the development of ICs, since it allows them to be spaces of communication, share and learning in a broader sense of time and space (Galbraith, B., Cleland, B., Martin, S., Wallace, J., Mulvenna, M., & McAdam, R., 2013).

There are several transformations that have taken place over the years in society. Two of them have been discussed in the chapter, intersecting each other by the potential they bring to each other: the importance attributed to the way of solving social problems, through Social Innovation and Entrepreneurship and the integration of communication technologies in labor processes.

Joining Social Innovation and Entrepreneurship (SIE) and communication technologies we have all the potential brought to the constitution of IC, with new forms of communication between people who are distant, efficiency in productive processes of social problems solving and, consequently, territorial development. These are the so-called IC.

The great motivation to belong to an IC is to learn. Learning is the engine of the constitution of an IC. But this is also a negative aspect, because being IES-SBS the bridge between the moments that made the entrepreneurs know each other and the constitution of an IC, there is a certain dependence on the search for knowledge and learning. IES-SBS, as being the promoter of the IC, is frequently called to intervene in several training moments, what was intended to be avoided.

ICs are one of the best ways to learn and disseminate knowledge, especially when taking into account its implementation the communication processes, which should be open, flexible and efficient, so that they can also promote ways of working with these three characteristics.

Furthermore, it is understood that ICs, being spaces that reflect and act on the territory through social entrepreneurs, have a preponderant role in the transformation of territories into Smart Territories. IC promote, as mentioned, reflection and action in very specific aspects, social and / or environmental

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

problems, meaning that they are a point of contact between several central areas: economy; mobility; environment; people; living; governance.

IC mobilize economic agents to solve social problems related to mobility, environment, life, people, acting directly and indirectly on the governance model of all spaces, organizations and entities.

KEY TERMS AND DEFINITIONS

Cooperation: The process through which people are open and put in practice ways of sharing data, information, and knowledge. This can include processes, privileged information regarding a territory, a person or groups of people. The goal is to share and work together, mostly to achieve a common goal.

Impact Communities (IC): Spontaneous groups of people, and what makes them arise is the sharing of common goals, be it the answer to a concrete problem, the finding of solutions, the sharing of experiences, the contribution to the improvement of a territory, the search for personal enrichment, or learning sharing, among many other factors, but always with others in the constructive sense.

Information and Communication Technologies: Information is acquired through the processing of previously created data or the joining together of several different data that, in turn, after the treatment

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

of information, become knowledge. While communication has its essence in communication and not in the content. Technology is what mediates the transmission of information and communication between an artifact and the user.

Information Sharing Practices: Similar to the previous one, however, this practice does not include the necessity of working together. This is understood as a way of developing a framework that allows actors to access information in a more efficient way.

Knowledge: Exists when an amount of data is transformed (after its analysis) into information and this information is again transformed and then related to other information(s) to provide knowledge. The transformation and relation of groups of information provides knowledge. It is the sharing process that provides the knowledge existence.

Social Entrepreneurship: The path a person follows to change their society or community, increasing the positive impact of his/her actions by solving a societal problem. It is important that the initiative has a concrete and sustainable business model be as much extended in time as possible (considering the possibility of replication), but also seeking its own extinction (it means the problem is solved). Furthermore, it should enable its target population to continue that positive path (and this includes being consulted, being part of the solution, and aim to end the problem they are facing) in an innovative way (different from the main alternative solution).

Social Innovation: The process of being constantly looking for new processes, products, and ways of doing. It is different from the previous concept because it is more dynamic and does not consider the need to make money that guarantees the idea sustainability.

Chapter 42
Professional and Business Applications of Social Media Platforms

Kijpokin Kasemsap
Suan Sunandha Rajabhat University, Thailand

ABSTRACT

This chapter provides an overview of the challenges and benefits of social media across various industries. The use of social media has created the highly effective communication platforms where any user, virtually anywhere in the world, can freely create the content and disseminate this information in real time to a global audience. The chapter argues that professional and business applications of social media platforms can enhance business performance toward reaching strategic goals in the digital age. What are keeping various industries awake these days? Why are social media applications important to various industries? How do social media platforms apply for professional and business perspectives across various industries?

INTRODUCTION

The diffusion of social media has opened the new possibilities for the targeted stakeholder communication (Saxton & Guo, 2014). Social media is recognized as a new platform which can be used as a competitive marketing tool by business organizations (Hassan, Nadzim, & Shiratuddin, 2015). Social media is used as an information source, including information related to risks and crises (Westerman, Spence, & van der Heide, 2014). Social media technology initiates the new ways of consumers' interactions in modern business with firms (Olsen & Christensen, 2015). Social media tools can be used by business organizations of various sizes and types as a marketing tool (Birkner, 2011). Carr et al. (2015) found that social media information is useful for marketers as they can directly track the consumer responses to marketing campaigns, product performance, and the changes in consumer sentiment toward a brand.

This chapter aims to offer a consolidated view of the business applications of social media. The extensive literature of social media applications provides a contribution to practitioners and researchers by describing the professional and business applications of social media platforms to maximize the business impact of social media applications in terms of customer relationship management, customer retention, product marketing, cost control initiatives, public relations, and sales.

BACKGROUND

In recent years, social media has gained popularity and attracted a great deal of attention among researchers and practitioners (Gan & Wang, 2015). According to Bernabe-Moreno et al. (2015), social media started as a space where could interact with other users, share content, and express their personal views. Social media comes in various forms, such as social networking sites (Facebook), blogs, microblogs (Twitter), collaborative projects (Wikipedia), content communities (YouTube), virtual social worlds (Second Life), and virtual game worlds (World of Warcraft) (Olsen & Christensen, 2015). Social media has changed the way that people interact with each other and with companies (Hanna, Rohm, & Crittenden, 2011).

Social media is the major component of social applications in organizations (Atzmueller, 2012). As the Internet users experience the usefulness of social media, it encourages the immense adoption of the medium and enables the Internet users to gain the power over information selection, thus affecting their behavior and attitude (Durukan, Bozaci, & Hamsioglu, 2012). Internet users have many options concerning their intention to use social media, due to the availability of hundreds of social media sites with the different features and user groups (Zolkepli & Kamarulzaman, 2015). Social media space becomes a common place for communication, networking, and content sharing (Paniagua & Sapena, 2014).

SOCIAL MEDIA PLATFORMS IN BUSINESS PRACTICE

Overview of Social Media

Social media provides a participatory media environment based on the interactive Web 2.0 platform (Hwang & Kim, 2015). The application of Web 2.0 has helped in the growth and public popularity of social networks and has created a new world of collaboration and communication (Pookulangara & Koesler, 2011). The rise of Web 2.0 has enabled customers to effectively act and react on what companies are doing (O'Reilly, 2007). Web 2.0 promotes the interactive information sharing, interoperability, user-centered design, and collaboration on the World Wide Web, thus allowing users to interact with other users (Click & Petit, 2010). Berthon et al. (2012) indicated that Web 2.0 technologies have three effects: a shift in the locus of activity from the desktop to the Web, a shift in the locus of value production from the firm to the consumer, and a shift in the locus of power away from the firm to the consumer.

As social media becomes the popular news platforms, journalists and news organizations have been keen to capitalize on their potential to build and maintain audiences (Lee, 2015). Organizations need to use social media sites to communicate with their audiences and to engage in dialogue on a regular basis (Sisco & McCorkindale, 2013). Social media can serve as platforms to address sustainability issues (Nwagbara, 2013). Twitter, Facebook, and other social media sites are recognized as the platforms for the networks of friends (Auer, 2011). Talent management makes a company more competitive in

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

business competition. A company that has super talented employees always produces better products or services compare to competitors that only have employees with average talent. The right use of social media can strengthen talent management programs to create social and cooperative work environments in modern organizations.

Social media includes seven resources: identity, conversations, sharing, presence, relationships, reputation, and groups (Kietzmann, Hermkens, McCarthy, & Silvestre, 2011). As people spend more time on the Internet, managing reputation on social media becomes crucial for public relations (Ott & Theunissen, 2015). The Internet of Things (IoT) is all about connecting physical objects to the Internet and enabling them to communicate with each other. The IoT in social media context can be used to bring people together based on their needs toward increasing business performance. Communication organizations (e.g., advertising and public relations agencies) try to incorporate social media into their campaigns to catch up with the new media trend (Li & Tsai, 2015). Social media has had a significant impact on human resource practices and has been the basis for employment decisions that have resulted in litigation (Drouin, O'Connor, Schmidt, & Miller, 2015).

Employers are using social media as a mechanism to screen the potential job candidates (Curran, Draus, Schrager, & Zappala, 2014). The increasing use of social media at work offers organizations new opportunities for employee learning on the job (van Puijenbroek, Poell, Kroon, & Timmerman, 2014). Social media is the new communication channel in migration networks (Dekker & Engbersen, 2014). Motivations regarding individuals' use of social media develop social relationships and gain information (Nadkarni & Hofmann, 2012). Because of the range of motivations, the diversity of social relationships, and the vast quantity of subscribers, personal social media usage has become intertwined with the workplace (Drouin et al., 2015).

Social media serves as the important tools for facilitating interpersonal communication, business, and educational activities (Ephraim, 2013). Facebook and other social media platforms have been recognized as delivering the promise of the socially educational experiences for students in undergraduate, self-directed, and other educational sectors (Friesen & Lowe, 2012). In education, web-based social media applications can be applied to knowledge management, organizational learning, electronic learning (e-learning), mobile learning (m-learning), educational computer games, game-based learning, distance education, teacher education, and teacher professional development. Teaching strategy plays a key role in supporting students in moving from using social media in order to support coordination and information retrieval to also using such media for collaborative learning, when appropriate (Hrastinski & Aghaee, 2012).

Purposive value, self-discovery, entertainment value, social enhancement, and interpersonal connectivity are the fundamental requirements that are broadly adopted for the online media (Cheung, Chiu, & Lee, 2010). Social media technology can enhance the improved organizational productivity by fostering the communication and collaboration of employees which aids knowledge transfer and makes organizations more profitable (Kasemsap, 2014a). The use of social media creates the opportunity to turn organization-wide knowledge sharing in the workplace from an intermittent, centralized knowledge management process to a continuous online knowledge conversation of strangers, unexpected interpretations, and dynamic emergence (Majchrzak, Faraj, Kane, & Azad, 2013).

Social media is the boundary-spanning tool that can be used to build and increase the companies' absorptive capacity (Ooms, Bell, & Kok, 2015). The capability of social media in building brand in the global marketplace is practically important in modern advertising (Kasemsap, 2015a). Social media marks a huge range of the personalized cloud computing platforms and functions of interaction on the Web

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

(Bianco, 2009). Many benefits of social media can be achieved through the utilization of technologies, such as cloud computing and virtualization (Kasemsap, 2015b). Researchers and practitioners should recognize the importance of cloud computing toward gaining sustainable competitive advantage in global supply chain (Kasemsap, 2015c). Applying data mining techniques to social media can help provide insights into group behavior and divulge a group's characteristics by identifying a group, developing a profile for a group, revealing the sentiment of a group, and detailing a group's composition (Barbier, Tang, & Liu, 2011).

Health science literature has seen a surge in research on social media (Lis, Wood, Chiniara, Biskin, & Montoro, 2015). Social media provides patients a platform to exchange their drug use experiences (Yang, Kiang, & Shang, 2015). The nature of health communication globally changes as more people rely on the Internet for health information (Gallant, Irizarry, Boone, & Kreps, 2011). The use of social media for health information sharing is expanding among patients, physicians, and other health care professionals (Shcherbakova & Shepherd, 2014). Greaves et al. (2013) stated that young adults post on physician or health care rating sites (e.g., Yelp.com and Healthgrades.com) to indicate the opinions on the areas for improvement in the health care industry. Social media allows patients to discuss and rate their satisfaction with health care procedures (Domanski & Cavale, 2012).

Public health professionals can use social media in their efforts to assess health needs, set policy, and communicate health concerns as they focus on protecting and improving the health of the community (Smith & Denali, 2014). Physicians and patients increasingly use social media technologies, such as Facebook, Twitter, and blogs, both professionally and personally (DeCamp, 2013). Social media constitutes a major part of the online search results for information about health and medical matters (Yang, Li, & Kiang, 2011). Health care research can benefit from taking advantage of the social media-related rich information resource (Fichman, Kohli, & Krishnan, 2011). Web-based communication tool development that engages the electronic patients can better guide the effective health care strategies and promote the participatory medicine (Batta & Iwokwagh, 2015). In health care, the utilization of social media is beneficial to health information technology (HIT), electronic health record (EHR), and telemedicine.

In today's new media environment, publics are increasingly connecting with the political groups through the new media technologies (Sweetser, 2011), while social media platforms have been promoted as a mechanism for engaging the key stakeholder groups, disseminating campaign messages, and increasing the candidate support (LaMarre & Suzuki-Holbrecht, 2013). Informational uses of social media are expected to explain the political expression on social media platforms and to promote the political participation (Gil de Zúñiga, Molyneux, & Zheng, 2014). Social media technology provides individuals and small groups with the powerful resources for the rapid political mobilization (Bekkers, Moody, & Edwards, 2011).

The adoption of social media appears to have engendered the new paradigms of public engagement (Lovejoy & Saxton, 2012). The potential for social media to enhance, support, and motivate the engagement in the political process generates the excitement among the political elites (Housholder & LaMarre, 2015). Social media predicts the traditional offline engagement, such as voting (Bakker & de Vreese, 2011). Twitter is an important medium for political activity recognized as a predictor of election outcomes (Tumasjan, Sprenger, Sandner, & Welpe, 2010). Social media is associated with the online debates (Williams, McMurray, Kurz, & Lambert, 2015). For example, social network analyses of bloggers (Adamic & Glance, 2005) and Twitter users (Conover, Goncalves, Flammini, & Menczer, 2012) have revealed that online political debates are often highly polarized.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Professional and Commercial Impact of Social Media

Social media affects business performance through four channels: social capital, revealed preferences, social marketing, and social corporate networking (Paniagua & Sapena, 2014). Business performance focuses on the financial, operational, and corporate social performance capabilities (Venkatraman & Ramanujam, 1986). Financial performance indicators include sales level and growth, profitability, and stock price. Financial performance indicators (e.g., share prices) depend on the market's information and expectations on the firm (Froot, 1989). Corporate social performance depends on the firm's ability to establish the honest relations with society, with the special attention to reputation and brand (Paniagua & Sapena, 2014).

Many companies seek marketing and business opportunities through social media platforms (Paniagua & Sapena, 2014). Social media has changed how society communicates and organizes itself (Aral, Dellarocas, & Godes, 2013). Social media has dramatically changed how people obtain the information (Liu, Wu, Li, & Li, 2015). Social media users' activities can be used to predict the firms' financial performances (Yu, Duan, & Cao, 2013). Companies have embraced social media because of its potential for engagement and collaboration with consumers (Hudson, Roth, Madden, & Hudson, 2015). Through social media, marketers can gain the rich, unmediated customer insights, faster than ever before, and can foster the customer loyalty through networking (Hudson et al., 2015). Increasing customer loyalty obtains greater profitability because loyal customers provide long-term revenues and reduced costs in the retail supply chain (Kasemsap, 2016a). Managing social networking sites is high on the list of priorities for a lot of businesses that are eager to find more effective ways to reach, learn about, and engage customers in the new product development (Roberts & Candi, 2014).

Organizations place a high value on social media tools as an important part of the strategic marketing mix (Dixon, Martinez, & Martin, 2015). Many researchers have suggested ways that managers can leverage social media by shaping the customer discussions (Kaplan & Haenlein, 2010), and others have offered strategies for measuring the success of social media marketing campaigns (Hoffman & Fodor, 2010). Luo et al. (2013) discovered that social media metrics are the major indicators of firm's equity value. Sul et al. (2014) collected data from public Twitter posts about S&P 500 firms and stated that the positive or negative emotion of tweets about a specific firm are correlated with the firm's stock returns. Yu et al. (2013) indicated that overall social media metrics have a stronger relationship with the firm's stock performance than do the conventional media.

Social media preserves the relevantly valuable portions of life, especially reasoning, play, and exchange of ideas (Elder, 2014). While Facebook service is free, its business model is based on advertising (Ballings & den Poel, 2015). Consumers tend to trust their friends and contacts in social media over the advertisement displayed by business organizations (Woodcock & Green, 2011). Mangold and Faulds (2009) indicated that social media tools combine the features of traditional integrated marketing communications tools (IMC) (business organizations communicate with the users) with word of mouth (WOM) marketing (users communicate with each other) in which marketing managers cannot control the content of some information.

Social media has resulted in the changes to the strategies and tools utilized by business organizations to communicate with users (Hassan et al., 2015). The implications of the social media platforms for public relations and marketing are to improve the visibility, image, and branding (Neill & Moody, 2015). Interaction in social media is much more attractive forum in which information can be presented in various forms, such as the sharing of experiences, videos, and comments from friends. Forums for

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

sharing information and experiences can shape the customer's perceptions of the product offered by business organizations (Hassan et al., 2015). Social media is valuable due to the potential to increase the product demand (Moran & Gossieaux, 2010).

Channels in Social Media and Its Impact on Business Performance

Social media affects business performance through four channels: social capital, revealed preferences, social marketing, and social corporate networking (Paniagua & Sapena, 2014). The social capital channel represents the extent to which social media affects the firms' relationships with society. Although companies are now less constrained by a single social order, corporations face the public scrutiny through social media (Fieseler, Fleck, & Meckel, 2010). Brammer and Pavelin (2006) tied the corporate reputation to the online platforms and corporate social performance. The revealed preferences channel represents the extent to which social media exposes the customers' likings.

Social media enables the development of knowledge value chain to customize information and delivery for a technological business growth (Kasemsap, 2014b). Firms have adopted social media as an essential part of their marketing mix (Mangold & Faulds, 2009). Regarding social marketing channel, social networks, blogs, microblogs, and communities approach customers with the interactive objectives, such as conversation, sharing, collaboration, and engagement (Weinberg & Pehlivan, 2011). The social corporate networking channel represents the extent to which social corporate resources (e.g., relationships and groups) are transformed into operational performance capabilities.

Regarding social media-related online reputation management, corporate reputation is the significant parameter in the supplier selection process by the potential customers (Walsh, Mitchell, Jackson, & Beatty, 2009). Customers are more likely to select companies with a positive corporate reputation, and are willing to pay more for their products (Graham & Moore, 2007). A positive corporate reputation can establish the market entry barriers for competitors, promote the customer loyalty and retention (Nguyen & Leblanc, 2001), and enable a company to attract more customers (Gardberg & Fombrun, 2002) toward gaining the higher market value (Smith, Smith, & Wang, 2010). A positive corporate reputation can protect a company in the times of crisis (Shamma, 2012). An effective reputation increases the stakeholders' willingness to invest in a company, since it enables the company to attract higher quality employees and to gain the better returns (Chun, 2005).

Social media establishes a great opportunity to develop and maintain relationships with customers (Yadav & Arora, 2012). Engagement in the social media activities is correlated with corporate reputation (Dijkmans, Kerkhof, & Beukeboom, 2015). Accomplishing a high level of customer engagement enhances the company's reputation and brand loyalty (Hollebeek, 2011) and purchase decisions (Patterson, Yu, & de Ruyter, 2006). The relational consequences of customer engagement include commitment, trust, customers' emotional brand attachment, and customer loyalty (Brodie, Ilic, Juric, & Hollebeek, 2013). Tourism firms can utilize the customer engagement as a counterweight to competition on price only, to attract more customers, and to develop the customer loyalty (Bowden, 2009). Regarding social media, tourism firms are empowered with more real-time customer insight in order to personalize and localize their interactions with customers and increase the effectiveness of their marketing strategies (Sigala, 2015).

Twitter and microblogging are the significant social media channels regarding business information sharing among individuals, firms, and public. Twitter and microblog conversations can easily be gathered from Internet services to create graphs representing the interactions between the entities in the online community (Corley, Farber, & Reynolds, 2012). Microblogging platforms play a critical role in infor-

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

mation dissemination (Alexander & Gentry, 2014). Microblogging platforms allow users to bypass the intermediate channel of information distribution between firms and public (Liu et al., 2015). Blogging and social media play an important role in the recent calls for reform and change (Aman & Jayroe, 2013). YouTube is a public video-sharing website where people can experience varying degrees of engagement with videos in order to maintain social relationships (Lange, 2007).

Tourism is a main industry that is at the forefront of Internet adoption and online transactions in global business (Werthner & Ricci, 2004). The changes of visitors' needs and attitudes have increased the volume of information that tourism destinations have to analyze in order to stay competitive in a changing tourism market (Kiráľová & Pavliceka, 2015). If the tourism destination wants to enforce on the highly competitive global tourism market, it must be observable from the competition (Porter, 1996). Tourism destination will be effectively appreciable with the well-developed communications strategy with the focus on social media (Kiráľová & Pavliceka, 2015). The content of blogs and stories is extensively generated by visitors who have experienced the tourism destination, so that the information is based on the visitors' opinions and perceived experiences (Kiráľová & Pavliceka, 2015).

To develop information connections, individuals are using a variety of technologies to access content and join virtual communities on various social networking sites (Heinrichs, Lim, & Lim, 2011). With the development of IT, social media plays an important role in crisis communication (Veil, Buehner, & Palenchar, 2011). Social media creates the interactive platform that allows various hospitality suppliers and guests to stay connected during the times of crisis (Sigala, 2011). Social media can link the hospitality organizations with the key decision makers in the industry and general public during the times of crisis (Sellnow, Ulmer, Seeger, & Littlefield, 2008).

Understanding the content generated on social media is required for both marketing and crisis management purposes (Coombs, 2014). Many hospitality organizations have to develop their presence in the digital environment, in order to build the favorable brand image and manage the customer relationships (O'Connor, 2010). The effective interactions and conversations on social media can considerably contribute to the co-creation process of guests' service experience, and influence other people's travel decisions through electronic word of mouth (eWOM) (Park & Allen, 2013). Social media acts as the influential source to detect the signals for potential crises, the meaningful tool to monitor the public discourse, and references to understand how the public perceives the crisis (Pennington-Gray, London, Cahyanto, & Klages, 2011).

Facets of Social Media Applications in Business

Social media provides companies a new platform to interact with their customers (Wu, Sun, & Tan, 2013). While traditional commercial information (e.g., advertisement and promotion) is becoming decreasingly effective (Sethuraman, Tellis, & Briesch, 2011), customers tend to increasingly rely on the peer customer opinions available online (Park, Lee, & Han, 2007). Social media can effectively support the marketing of performing arts organizations with regard to promotion and communication, stimulation of WOM, market research and innovation management as well as reputation management (Hausmann & Poellmann, 2013). Social media is the use of Web-based and mobile technologies to turn communication into interactive dialogue (Bhanot, 2012). Social media technology has enabled blogs and other social networking forums to rapidly develop (Mucan & Özeltürkay, 2014). Through social media, potential customers express their likes or the tastes that rationalize an agent's observed actions (Beshears, Choi, Laibson, & Madrian, 2008).

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Social media enables consumers to access product-related information from commercial and non-commercial sources (Cao, Meister, & Klante, 2014). Social corporate networking tools (e.g., customer relationship management and electronic business) are the major assets to increase the operational performance (Trainor, Andzulis, Rapp, & Agnihotri, 2014). Customer relationship management becomes one of the most important competitive business strategies in the digital age, thus involving organizational capability of managing business interactions with customers in an effective manner (Kasemsap, 2015d). Regarding social corporate networking channel, electronic business (e-business) revolutionizes the procedure of effective communication between internal and external customers in modern business (Kasemsap, 2015e).

The adoption of social media as a marketing tool is a marketing strategy that can save the business costs (Kirtis & Karahan, 2011). Social media performance focuses on new product development, product quality, product marketing, operating efficiency, and customer satisfaction (Paniagua & Sapena, 2014). Social media-related information affects the product marketing performance and branding in global marketing (Woodcock & Green, 2011). In tourism industry, social media allows the tourism destinations to contact visitors at the relatively low cost and higher levels of efficiency that can be achieved with more traditional communication tools (Kaplan & Haenlein, 2010). The social marketing channel represents the extent to which social marketing resources (e.g., conversations, sharing, and presence) are transformed into financial performance capabilities (e.g., sales) (Paniagua & Sapena, 2014). Customers' social media activities and interactions can affect their consumption intentions toward influencing the firms' sales (Phang, Zhang, & Sutanto, 2013).

Social media platforms are extensively used for the purpose of information seeking (Kim, Sin, & He, 2013). The most prevalent motives for companies to use social media involve enhancing trustworthiness, brand attitude, and customer commitment (Weinberg & Pehlivan, 2011). Customers have shifted their information seeking behavior related to products and services from offline sources to electronic word of mouth eWOM, such as social networking and review sites (Gruen, Osmonbekov, & Czaplewski, 2006). In today's world of Web 2.0, eWOM has materialized as a phenomenon of critical interest to marketers (Williams, Crittenden, Keo, & McCarty, 2012). Social media platforms (e.g., Facebook and Twitter) provide a substantive part of eWOM (Dijkmans et al., 2015). Social media-based relationships lead to the desired outcomes, such as positive WOM (Hudson et al., 2015).

Regarding public relations, Breakenridge (2012) indicated that the eight roles related to public relations' management of social media involve the developing employee policies, internal collaboration, technology testing, pre-crisis management, relationship analyzer, reputation task force, and master of metrics. Public relations' reputation management includes five core components: predicting potential problems, anticipating threats to the organization, minimizing surprises, resolving any issues that do arise, and preventing crises (Wilcox & Cameron, 2012). Gurau (2008) suggested a cross-functional approach to managing social media activities should collaborate with customers, employees, investors, the media, and social community.

Challenges and Implications of Social Media for Practice

Social media is increasingly implemented in the business organizations as tools for communication among employees (Leonardi, Huysman, & Steinfield, 2013). Active social customers set the social trends and

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

agendas in the various range of topics, from economics to the environment and the entertainment industry (Shirky, 2011). With the enormous interest in social media sites, customers are assumed to be actively contributing to marketing content (Heinonen, 2011). Marketing through social media has an impact on the customer equity and intentions to purchase the product (Kim & Ko, 2011). Social media marketing, which uses social networks to enable the content sharing, information diffusion, relationship building, and fans cohesion (Cheung & Lee, 2010), is an influential marketing method. Social media marketing programs usually center on efforts to create content that attracts attention and encourages readers to share it across their social networks toward competition in the global marketplace (Kasemsap, 2016b).

Executives should be aware of the origination of the social media threats from the complaining process (Benson & Morgan, 2015) and should extend their resources toward reaching targets to manage various forms of social media complaints (Gregoire, Salle, & Tripp, 2015). Social media presents challenges and risks to reputation and security, such as confidentiality breaches (Johnston, 2015). The increasing progress of social media over privacy in the digital age has provided an opportunity to introduce students to the legal risks of using social media in the workplace (Binder & Mansfield, 2013). Online reputation management involves interacting with people online, creating shareable content, monitoring what stakeholders are saying, keeping track of their dialogue, addressing negative content found online, and following up on ideas that are shared through social media (Dijkmans et al., 2015).

Effective dissemination of information becomes an essential factor in the success of social media marketing (Chang, Yu, & Lu, 2015). Communication technologies are bidirectional (Camarero & San Jose, 2011). Both marketing managers and Internet users provide messages, targeting individuals and social alignments that include their links or relationships (Chang et al., 2015). Communication technologies (e.g., bulletin board systems for collecting public opinion, blogs for sharing personal messages, and interactive social media) can gain the message diffusion and cohesion through social media marketing (Karnik, Saroop, & Borkar, 2013). Search engines are the foundation of the Internet. Links to individual's content on Facebook, Twitter, LinkedIn, Google+, YouTube, and other social media sites help the search engines understand what websites are credible and should be ranked for what keyword phrases.

Social media makes the global communication easier and cheaper than ever (Gillin, 2007). With the widespread adoption of mobile devices and location-based services, social media allows users to share the information of daily activities (e.g., check-ins and taking photos), thus promoting the role of social media as a proxy for understanding the human behaviors and complex social dynamics in the geographic spaces (Cao et al., 2015). Content sharing, personal commentary, and private life broadcasting have emerged as the distinct elements of social media (Özgüven & Mucan, 2013). Companies are building and maintaining the social media public pages to improve their social network salience, promote the interest in their organizations, and establish the relationships with the online public (Parveen, Jaafar, & Ainin, 2015). Social media becomes less complex and more accessible where young and older people can share the content and interact through social media (Alabdulkareem, 2015).

Social media platforms are necessary for leaders toward promoting leadership, leadership development, and leadership communication in modern business. Social media gives leaders the power to greatly increase this level of engagement by really listening to the voices of stakeholders, then taking tangible actions based on those suggestions. The activities of social media aiming at achieving these goals are referred to as online reputation management, which can be recognized as the development of positioning, monitoring, measuring, talking, and listening as the organization engages in a transparent and ethical dialogue with its online stakeholders (Jones, Temperley, & Lima, 2009).

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

FUTURE RESEARCH DIRECTIONS

The classification of the extensive literature in the domains of social media platforms will provide the potential opportunities for future research. The topic of social media-related information security will be the important future research direction. Social media platforms are universal for personal and professional settings (Benson & Morgan, 2015). Practitioners and researchers should further study the applicability of a more multidisciplinary approach toward research activities in implementing social media in terms of knowledge management-related variables (e.g., knowledge-sharing behavior, knowledge creation, organizational learning, human capital, and collaborative competency). Concerning business education, collaborative competencies in professional social networking are significant at all ages. Younger students can gain business opportunities, while older graduates are less confident in utilizing social media platforms (Benson & Filippaios, 2015).

CONCLUSION

This chapter aimed to highlight the importance of social media in commercial domain and the multifaceted applications of social media. The differences between traditional and social media are defined by the level of interaction and interactivity available to the consumer. Business units (e.g., marketing, supply chain, retail, finance, IT, human resources, sales, hospitality, tourism, and customer service) should realize the potential for applying social media tools to facilitate organizational innovation, create brand recognition, hire employees, gain profits, improve customer satisfaction, enhance customer loyalty, and promote customer lifetime value. Social media becomes a powerful tool in the way businesses reach, attract, and engage customers, employees, and other stakeholders in a timely and effective manner.

With the advent of Web 2.0, social media platforms (e.g., Facebook, Twitter, and blog) are the advanced technology and can be utilized to encourage various functions, such as customer relationship management, customer service, entrepreneurship, internationalization, branding, marketing, tourism marketing, product development, advertising, cloud computing, electronic commerce (e-commerce), e-business, electronic retailing (e-retailing), electronic procurement (e-procurement), electronic government (e-government), mobile commerce (m-commerce), mobile payment (m-payment), human resource management (HRM), digital libraries, and education.

The adoption of social media introduces a new communication channel that must be monitored and managed. Depending on the number and type of social media sites, executives and social media users should be educated and trained to have digital literacy and IT competency to effectively manage social media platforms. Utilizing social media is required for modern organizations that seek to serve suppliers and customers, improve business performance, strengthen competitiveness, and obtain consistent success in the digital age. Therefore, it is required for modern organizations to investigate their social media, establish a strategic plan to regularly check their practical advancements, and immediately respond to the social media needs of customers in modern organizations. Professional and business applications of social media platforms can enhance business performance toward reaching strategic goals in the digital age.

KEY TERMS AND DEFINITIONS

Blog: The website, similar to an online journal that includes chronological entries made by individuals.

Facebook: The name of a social networking service and website, launched in 2004.

Internet: The worldwide computer network that provides information on many subjects and enables users to exchange messages.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Social Media: The website and application considered as collectively constituting a medium by which people share messages, photographs, and other information, especially in the online communities based on shared interests.

Social Media Marketing: The methods for advertising products, services, or brands using the Internet, by attracting the interest of groups of people who discuss them, make suggestions about them.

Technology: The use of scientific knowledge to solve practical problems, especially in industry and commerce.

Twitter: The website where people can post short messages about their current activities.

Web 2.0: The name for all the Internet features and websites that allow users to create, change, and share the Internet content.

ABSTRACT

Technical University of Madrid, within the Spanish context, has profited of the introduction of a System of Internal Quality Assurance to build a road on the grounds of previous work on the culture of ethics in engineering. This way may drive the students training to incorporate in their curricula instruments leading to the recognition and acquisition of social responsibility. The road is paved with various educational elements, either mandatory such as the Mentoring project (aiming to minimize the gap in the transit between high school and university from a logistical point of view), or optional such a set of three: Monitoring (a system of academic support for improving the performance of in the students in their learning outcomes when face difficulties), Service Learning and Social Entrepreneurship, Ethics and Values in Engineering. This strategy combined with the convergence to the European Higher Education Area allows the selection of students able to integrate in their professional assets the idea and the commitment of making the human development more sustainable.

INTRODUCTION

The chapter describes a process of integrative learning in teaching engineering on ethical dimensions to attain social responsibility of the trainees. This experience has been carried out in the School of Mining and Energy of the Technical University of Madrid (ETSIME).

The authors are aware that the introduction of teaching ethics in engineering lasts since long. As a matter of fact, a consultation in Google on this topic carried out in the summer of 2015 reached approximately 50.900.000 hits.

Most of the relevant results concern to experiences in institutions from the United States. The examples of the School of Mining at Boulder in the University of Colorado under the leadership of Carl Mitcham (1989) or the project "Introducing Ethics Case Studies Into Required Undergraduate Studies Engineering Courses" at Texas A&M University as a result of the collaboration of the department of Philosophy and the Department of Mechanical Engineering (NSF Grant Number DIR-9012252) to cite a few are worth to illustrate the model of the United States for these educational programs. Both are characterized by the collaboration between philosophers and engineers and are based essentially in the case studies methodology.

The chapter narrative delineates the trajectory followed in the School of Mining and Energy Engineering *(ETSIME)* of the Technical University of Madrid to achieve an integrative learning process. It begins with a short review of the introduction of the system of quality and accreditation in Europe. It is followed by work carried out at ETSIME by incorporating the teaching of Ethics and Values, a process which has driven to the incorporation of social innovation, social entrepreneurship and service learning as applied instruments of the ethics field. A first appraisal of the results of these interventions is presented.

BACKGROUND

The initiative undertaken by ETSIME a decade ago was originally aimed at following the model of the USA institutions. However the evolution of the teaching ethics program in the School of Mining and Energy of UPM under the Spanish context revealed the need to introduce changes from the model along the path. The initial proposal was turned out into the integrative learning toward social responsibility for introducing in teaching engineering as illustrated in this chapter.

The reflection on how to build the ETSIME strategy started by looking at the milieu conditions and the essential role played by the System of Internal Quality Assurance (SIQA) under the framework of the European Higher Education Area (EHEA). The axes underlining the evolutionary process of Bologna (1999) since the Sorbonne Declaration (1998) to the London declaration (2007) were aimed at assuming a common strategy for attaining the goal of cooperation and guaranteeing the quality of the process. This strategy was assigned in the London meeting (2007) to the so called Group E4 and it is based on five measures which might influence the elaboration of the future program of studies and hence the shaping of the academic disciplines and titles. These five measures are outlined as follows:

- Development of SIQA in the institutions.
- Elaboration of the suitable common norms, procedures and directives.
- Establishment of a European Register.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

- The autonomy of the universities to select the organism for accreditation.
- Recognition of the competence of the Member States for their acceptance of evaluations and extraction of conclusions to enhance their policies in Higher Education.

On the grounds of these measures, a landscape may be drawn in where it is possible to encounter actions at national level as well as actions with international compensations

- Each country will hold accreditation competencies for their universities.
- The accreditation task in national contexts is defined as the main initiative to be performed at that level.
- At the university level, the implantation of well contrasted mechanisms of accreditation is important inasmuch as they may serve to validate the quality of the teaching and the research programs as well as the academic and institutional management.
- Emergence and relevance of accreditation activities on studies programs performed by international organizations in the corresponding academic fields (in our specific case, engineering).

Some incentive measures for European cooperation may be foreseen on the basis of mutual confidence.

Under such strategies designed for accreditation in the EHEA, it seems of particular relevance the launching and establishment of a European Register - following the indications of the meeting at Bergen (2005) - of the different organizations for accreditation and SIQA, which may fulfill a series of the demands required.

ASSOCIATIONS AND AGENCIES FOR QUALITY

The European Association for Quality Assurance in Higher Education (ENQA, 2000) is an umbrella organization which represents its members at the European level and internationally, especially in political decision making processes and in co-operations within stakeholder organizations. Full Membership of ENQA is composed of European quality assurance agencies or other quality assurance organizations of 26 countries (Austria, Belgium, Bulgaria, Croatia, The Czech Republic, Denmark, Estonia, Finland, France, Germany, Holy See, Hungary, Ireland, Kosovo, Lithuania, The Netherlands, Norway, Poland, Portugal, Romania, Russia, Serbia, Slovenia, Spain, Switzerland and United Kingdom.) in the field of higher education that have been operating and conducting actual quality assurance activities for at least two years.

The Spanish Case vs. Other European Countries

Spain is represented in ENQA by the Spanish National Agency (ANECA) and six regional agencies from the corresponding Autonomous Regions. In Table 1 there is information on their origins by ascending order of foundation, the dates for acquiring the respective condition of full member of ENQA and their ownerships.

The National Agency for Quality Assessment and Accreditation of Spain (ANECA) was created after other regional agencies by the conservative government of President J.M. Aznar in 2002 (Decree of July 19) with a different status as a public national organization but with some prerogatives for the personal

involved in the Agency's direction and management concerning salaries and status as compared to the civil servants in Spain. With these circumstances of origin, the ANECA has adopted, from the onset, a structural, bureaucratic working agenda, giving more weight to the "paper work" for evaluations than to the direct experts' intervention, though evaluation visits are also applied but separated in time of the accreditation procedures. The line of action of ANECA is based on the agency programs addressed to validate two dimensions: the academic one and that of the management in broad sense.

In Figure 1, some European Quality Agencies, their names and membership are depicted in a timeline. It shows that the agencies from Spain, Holland and Norway were created at the later stage.

Quality European Certificate for Engineering Studies

The guarantee of quality in the engineering domain is awarded by the EUR-ACE label.

The EUR-ACE label is a certificate given by an authorized agency by the European Network for the Accreditation of Engineering Education (ENAEE) to a university with regard to an engineering degree or master that has been evaluated according to a series of defined standards in agreement with the following principles: quality, relevance, transparency, recognition, and mobility as referred in the European Higher Education Area (EHEA).

In Spain this EUR-ACE label is awarded by ANECA through the "ACREDITA PLUS" program in collaboration with the Professional Associations of Engineers.

Quality American Certificate for Engineering Studies

ABET Accreditation Board for Engineering and Technology, Inc.

ABET (1980) is a nonprofit, non-governmental organization recognized by the Council for Higher Education Accreditation (CHEA). ABET is recognized as the worldwide leader in assuring quality and stimulating innovation in applied science, computing, engineering, and engineering technology education. ABET accredits the quality of university programs in engineering. The most prestigious universities, such as MIT, Harvard or Stanford have also been awarded this ABET accreditation. It certifies the quality of qualifications in response to the requirements of the major professional engineering associations worldwide.

This certification is an international recognition of diplomas for Spanish engineers. Accreditation assesses, among other aspects, training of teachers, students, staff, and facilities. Equivalence at Masters Level with American studies in these disciplines is recognized.

ABET accredits only complete programs, no specific qualifications, departments, schools or institutions. Accreditation is guaranteed by a maximum of six years. For renewal of accreditation, the institution must request another evaluation.

SYSTEMS OF INTERNAL QUALITY ASSURANCE IN SPANISH UNIVERSITIES

This analysis stems from the context of a Spanish case, and is rooted in the teaching programs of an institution of higher education, the School of Mining and Energy of the Technical University of Madrid, but the intention is to spread and debate it internationally.

This chapter arises from a System of Internal Quality Assurance (SIQA), which has to be adopted by each Educational Center with the aim of advising the governing bodies of each institution. This system of quality management based on continuous improvement is directed to enforce a coherent and aligned policy with the quality ideals of the Center.

As a secondary purpose, the implementation and maintenance of the processes necessary for the development of such a SIQA is worthy of mention. This system will determine the main priorities for improving teaching, research and management activities by gathering information, as well as by promoting studies or surveys to measure the effectiveness of the implemented activities.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Once these premises have been established, an analysis of the basic elements that will support actions may proceed, and these premises may raise essential issues to be addressed. At this point the Educational Center is able to define to society and stakeholders what will be its mission, which will be the institutional values to be conveyed, and what might be the strategic foresight to raise essential issues.

Taking the aforementioned strategy as a general framework, each and every University Center could then define the scope and educational offer that will meet the demands of society, not only through the transmission of knowledge, but also through demonstration of their commitment to social progress.

Engagement with training and professional development of the faculty members should be focused on an array of values. These values can be preserved by applying quality plans and including them in the design of the curricula. Generally speaking, these values are the following:

- Active respect for others, encouraging participation, trust, responsibility, cooperation, solidarity and joint action.
- Professional honesty.
- Freedom of ideas and beliefs.
- Defense of equal rights and opportunities.
- Contribution to scientific, economic, cultural and social development.
- Projection of the reputation of the Center and the University.
- Connection of the Center to its immediate surroundings.
- Transparency and accountability in management.

Taking into account these values, the objectives of the Spanish Educational Center, that is our case study, can be classified into three main groups:

1. Obtaining an education of excellence, whose purpose is to prepare students to become top professionals, with skills and capabilities to face continuous changes and advances in technology while meeting growing social demands.
2. Supporting the scientific and technical development by applying research projects to respond to the demands of different industrial sectors. Those demands should be primarily defined through a close relationship with firms and other involved shareholders.
3. Promoting the continuous improvement of the Center in order to assess its human resources, material resources and services. Through the establishment of a Quality System with a performance record within the process of guaranteeing the quality of a Center, the stakeholders must be clearly identified and join around common goals. It could be assumed by each University that these stakeholders are: students, Administration and Service staff, Teaching and Research staff, Companies and Suppliers. It is also important to identify the responsible actors in charge of managing the information flows to and from the stakeholders, amongst which are the members of the management teams, commissions and different government bodies. Finally, it is essential to have supporting agents that will strengthen the lines of defense. For this purpose, foundations, Advisory Boards and University-Enterprise Units usually provide high quality results.

In brief, a SIQA can be defined as the ensemble of the interrelated Center elements, through which the Center is managed in a planned manner in order to pursuit satisfaction and continuous improvement of the service offered.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

This system must be supplemented by a number of additional documents such as procedures, records and information systems. At the first level the compliance with the requirements contained in the proposal for getting the accreditation must be ensured. The application for the syllabus accreditation has to be submitted to the corresponding assessment agencies.

SIQA design may be based on higher level proposals, and thus more demanding. These proposals are defined below. In any case, these procedures will facilitate the verification of future college degrees, since the SIQA serves the regulatory requirements for authorization and registration of Degree and Master.

In Spain the "quality" of a University Center should have three levels of depth to ensure full integration of all procedures.

- The first level sets quality according to national standards aimed to ensure a minimum level within our education system. It concerns mainly the processes proposed by the Center, but it also allows certain impact on the educational process (e.g. ANECA and VERIFICA).
- The second level implies an increase in quality and has a national approach. At this stage an array of skills and fundamental processes have to be considered. (E.g. ACREDITA PLUS and AUDIT).
- The third level is addressed to the international accreditation and implies the effort of University to reach a state of excellence that guarantees its quality at all levels (e.g. EURACE and ABET).

The different academic qualifications, recorded in the VERIFICA statements, define a set of specific and generic (or transversal) competencies that have to be achieved by graduates at the end of their studies. From this approach, the easiest way to achieve the goal is to start with the first level developing those skills in classroom. Following the verification process, the acquired skills are verified by the pertinent assessing body for Degree and Master.

DEVELOPMENT OF SOCIAL SKILLS THROUGH A SYSTEM OF INTERNAL QUALITY ASSURANCE

School of Mining and Energy (ETSIME): Technical University of Madrid (UPM)

In order to cope with the specific case of SIQA at the School of Mining and Energy of the UPM, the strategy established a set of guidelines to address the verification processes of the curricula with regard to the teaching and assessment of specific and transversal skills. Besides, a minimum of activities to promote the development of social skills, connected to technical skills (specific) was required as a practical procedure (or exercise).

The ETSIME assumes that those social skills go beyond the usual topics integrating the degree or the specific branch studies. Instead, students should also be trained in a range of skills and values that could enable them to behave as citizens committed to others and allowing their projection into the "common goods" that will conform the scenario of their professions (Environment and Society) (Martín & García-Laso, 2014).

Ethical Dimensions and Dynamics in the Teaching Program in Engineering

Introduction to the Teaching on Ethics and Values

Though the ethics issue is develop in the last section of the chapter developed in the last section of the chapter dealt at the last part of the article, it must be pointed out that ethics has been the onset and the skeleton for building the road for allowing the integrative learning program to circulate into the academic curriculum at the School of Mining and Energy of the Technical University of Madrid (ETSIME and UPM).

The study of ethics was introduced in the 2006-2007 period with the establishment of a Chair on Ethics and Values in Engineering funded by the FACT Foundation and thanks goes out to the strong bet on this initiative made by the Director of the School at that time, Professor Alfonso Maldonado.

Promotion of the Ethics Curriculum

The original idea was the promotion of the studies on ethics in engineering in an innovative and interdisciplinary way.

Due to the background in ethics of the Chair director, grounded on his dual career as an experimental scientist and a philosopher of science and technology, the program proposal was supported by blending the scientific method and the analytical reflection.

Along the phase of promotion, a process of research and analysis on the dimensions and dynamics of ethics took place, paying attention to what have been their main trends in the course of human development. The process started from the moral philosophy approach with reference to Aristotle and the Nichomachean Ethics (Aristotle, 2004), then went into the current professional ethics (deontology) and the social responsibility in corporations (Cortina, 2013) to finish with those movements focusing on the human relationship with nature and the concept of happiness as the utilitarian ethics pursues (Singer, 2002) or the ethics of responsibility as proposed by Hans Jonas works (1994). The academic and scientific, non-administrative, direction of the chair was assumed by Professor Muñoz Ruiz. The incorporation of Prof. Muñoz Ruiz, a former molecular and cellular biologist and strong supporter of the theory of evolution as a framework for ethics (Muñoz, 2015) has driven the teaching program at ETSIME to the field of social intelligence (Walker & Foley, 1973; Goleman, 2006).

The Educational and Experimental Frame

After the promotional phase, the course on Ethics and Values in Engineering began under the framework of Science, Technology and Society studies (STS) as EMR (one of the authors and director of the course) assumed, on the basis of his previous experiences that this academic activity could fit under the STS umbrella. The implementation of this logic implied that the lectures should be delivered by an interdisciplinary group and then, colleagues from the STS field, namely science philosophers, were invited to lecture.

Unlike the United States model programs for teaching ethics, we learnt from this experience that the educational dialogue between professors of philosophy and engineering students - even the motivated ones, as are in principle those attending our courses- is not easy. As a matter of fact, the Chair director had his own experience in the same direction, reaching the conclusions that the necessary theoretical topics

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

had to be taught by wrapping them with practical references (social, political, in the media) to attract the student's interests and attention to gain satisfactory evaluation outcomes. Therefore, it was decided to focus the frame of the course on the consequentialist ethics inspired in the principles of responsibility, empathy and compromise, based on cost/benefit analysis in a wide sense not limiting it to the economic perspective, and being applied case by case. Moreover, this process has evolved to approach the ethics educational and experimental dynamics by using the concept of interethics or interrelated ethics of the different stakeholders involved (Muñoz Ruiz, Flor Ortiz, García Laso & Martín Sánchez, 2011). After the reflection on the outlined issues, the frame of the teaching course in Ethics and Values in Engineering was revised by introducing changes in the staff of professors as well as in the topics being taught. According to the interethics concept, we have developed the ethical consequentialist approach resorting to the application of additional concepts such as those of science policy and governance in relation to science and technology, sustainability, and risk policies.

The Emergence of the Unit on Social Entrepreneurship, Ethics, and Values in Engineering

The transformation of the Chair into the Unit on Social Entrepreneurship, Ethics and Values in Engineering, referred usually as UESEVI, is the result of a series of institutional changes: in the directive staff of ETSIME with the arrival to this post of professors Benjamin Calvo first and José Luis Parra after; the loss of the initial funding support; the recognition that the move of ethics teaching to a more applied orientation could be an asset for a better integration of the students; and the strategic decision of the ETSIME directorate to incorporate the UESEVI activities into the Quality program of Mining.

This resulted in a transformation of the staff in charge of UESEVI: the senior (DAMS) and the second authors (AGL) assumed the educational and administrative direction of the Course on Ethics and Values in Engineering and its practical applications (Social Entrepreneurship and Service Learning). The other three authors (AMvDE, ELP, and MCC) were incorporated from the CIEMAT Unit of Research on Scientific Culture while EMR kept the liaison with the ethics domain and the overall academic direction of the course.

The institutional reshaping contributed also to significant changes in the curriculum with the inclusion of new areas for thought and action such as Social Economy, Social Entrepreneurship and Service Learning. New professors coming from economy and social entrepreneurship areas were invited to teach in order to provide insights into new visions and mission of the economic science and politics. Two of them have been selected by us as particularly relevant for the success of the UESEVI teaching program: José Manuel Pérez "Pericles", a pioneer of Social Entrepreneurship in Spain, whose activities have been recognized by ASHOKA Spain (Drayton, 2006) as being Senior Social Entrepreneur and Alicia Chavero, member of the H2i Institute, where she is working in the link between creativity and innovation.

This new orientation provided an opportunity to detect the increasing interest of the students for the socio-economic impacts of the application of new visions of the ethical dimensions and dynamics we are engaged to teach and adopt as action rules for the future graduates in engineering. Following this, the frame of the Ethics and Values course was enriched by adding to the initial STS perspective the concept of spaces. The spaces proposed to better comply with the UESEVI objectives were two: one blends Resources (natural, energy), Environment and Society to be integrated under the acronym REMAS, the other harmonizes Resources (natural, energy), and Environment and Economic impacts to be referred as REMARE (from the Spanish names).

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

The evolution along the decade of existence of the UESEVI teaching program on Ethics and Values in Engineering has allowed to increase the recognition of academic credit by the directorate of the Technical University of Madrid and has led to the proposal to develop a clear strategy for promoting the acquisition of transversal and horizontal skills.

The Involvement of the Trainees

The implication of the trainees during the Course on Ethics and Values in Engineering has been one of the main objectives of the teaching program since its inception.

The attainment of this objective has been achieved by providing the students with an evolutionary path in their studies. In the first part of the course, the more theoretical one, the students have been continuously asked to intervene in the dialogue atmosphere established from the beginning by the lecturers. Regarding the theoretical issues being dealt with in this first part, the trainees have been requested to go in depth by following the topics in the Power Point presentations shown in the USEVI ´s web, as well as to delve into them thanks to other sources of information such as Google or in articles of some journals and newspapers also incorporated into the web of UESEVI.

The second half is addressed to introduce the students in practical instruments and interactive issues, such as social economy, social entrepreneurship, innovation and creativity in order to prepare them for the final goal of the course. This goal is the design, preparation, promotion and presentation of a project on Social Entrepreneurship, and therefore the demand for students to be active is even more imperative. Moreover, the students have to think about values, identify some of them and extract the most appreciated as a particular outcome of this period. During the process, the students have to cooperate working in teams and arriving to agreement on the topic and the instrumental organization of the Social Entrepreneurship Project (SEP). Together with the individual values that arises from the personal reflection, the process of SEP preparation impulses the emergence of collective values such as leadership, empathy and justice.

A collateral aim of the process is the elaboration of a catalogue of values that may be classified in order of importance or preference leading to the outlining of what could be called “An ecosystem of values”.

Table 2 collects the SEP developed and presented by the students of the UESEVI program.

Service Learning

The Service Learning represents the last section of the road that drives the engineering students towards an educational space rich in transversal skills and social compromises through the courses on ethics and values. This activity seems very relevant for the purposes of this publication since it embraces two of its goals: first, the need to stress the application to the professional life of the outcomes of a well-documented and innovative teaching process in ethics and values; second, the intention to contribute to the active involvement of the trainees in the multisectoral and interdisciplinary way of learning undertaken in ETSIME.

The introduction of the service learning as well as its dissemination in Spain is indebted to the pivotal role of Roser Batlle (2010). She has focused in the educational reform of the youths essentially at the first and middle levels and she declares: “doing something good for the community, helping others, is also one of the most efficient methods of learning”. The success of the promotional effort carried out by Roser Batlle has led also to the establishment of a Spanish Network for Service learning that is extending its efforts to university education programs.

Table 2. Social Entrepreneurship Projects presented by the students of the UESEVI program

Year	Title	Social Objectives	Destiny
2010-2011	Extension of the social activities with the recognition of credits.	To help society providing knowledge on the grades of the UPM	Students from UPM and Society
2011-2012	Reshaping of the court of ETSIME	To improve the space For the students during their rest periods	Students and personnel of ETSIME
2012-2013	•System for recycling in ETSIME •Better use of the photocoping system in ETSIME	•To improve the environment •Optimizing resources	• Society and ETSIME • Society and ETSIME
2013-2014	•Extension of the coffee shop at ETSIME to facilitate the consumption of home prepared food. •Monitoring •Data base of ETSIME projects	•To improve the space For the students during their rest periods •Welcome actions •To improve the relationship university – firms and graduates.	•Students and personnel of ETSIME •Students in the first of ETSIME •University – firms and graduates
2014-2015	• Museum of energy efficiency • Additional training courses	•To diffuse to the society the energy branch of the grades in ETSIME. •To improve the training of the engineers in relationship to the labour market	•Society •Students of ETSIME

Source: UESEVI

However, the academic and intellectual roots of the Service Learning initiative were explored in retrospective. The term retrospective refers to the fact that the innovation specified by the service learning initiative has been incorporated into UESEVI by an apparent reverse path to the logics of the academic world: it was first introduced as a practice following the lines designed and promoted by Roser Batlle, then we were interested in delving into the historical and philosophical roots of this innovative educational instrument. The author of reference was John Dewey, already recognized as leader of the ethics intervention in education along the Ethics and Values part of the integrative system of teaching we are discussing (Dewey, 2001). This task has allowed us to identify that this way of uniting school success and social commitment is anchored in the seminal work of John Dewey, the leading proponent of the American school of thought known as "pragmatism". Among the prominent influence of John Dewey in the field of educational reforms, we consider worthy to present some insights around his position in ethical and social theory. Enthusiast as he was of the Darwin evolution theory, we found significant intellectual convergences with the North American philosopher. In fact, in his social and ethical work, Dewey pointed out the need for an experimental approach which had to avoid the conservatism of the dogmatic approaches that inhibit the intelligent adaptation of human practice to the ineluctable changes in the physical and social environment. Ideals and values must be evaluated with respect to their consequences.

There are, in our opinion, underlying references to consequentialist ethics and even a preliminary evocation for the need to take into account the interrelationship between ethics (interethics). Therefore these results are satisfactory by observing the links and convergences of the current teaching program with John Dewey previous thoughts together with the dynamics and dimensions that have evolved from his seminal intervention in the reform of the educational system.

Moreover, as a further step in fostering the active intervention of the students, we selected the field diary as a useful instrument for assessing the evolution of the values acquisition and extraction of the trainees. From this exercise, we may conclude that the most relevant values recognized by the students after experiencing the service learning experience are: collaboration, empathy, compromise and (social) justice.

SOCIAL DIMENSIONS: THE UNIT FOR SOCIAL ENTREPRENEURSHIP, ETHICS AND VALUES IN ENGINEERING (UESEVI)

The convergence towards the European Higher Education Area (EHEA) has been a good opportunity to set, through SIQA procedures, the culture on Ethics and Values that had already existed in the ETSIME since 2006.

ETSIME involvement in the process of developing SIQA procedure has taken advantage of the strategy designed by the Unit for Social Entrepreneurship, Ethics and Values in Engineering (UESEVI) to enhance social learning through a program based on gathering of training practices on Mentoring, Service Learning (i.e. practice of learning through experience -*practice field*- with the supportive service –volunteering-) and Ethics and Values in Engineering (social consciousness).

This has been carried out under the umbrella of specific consequentialist ethics, which has been developed and adopted to meet the vision and mission of UESEVI. The resulting applied ethics, named interethics, is a hybrid sustained on the principles of an ethics of responsibility (and commitment), while its dynamics stands in a case by case, cost-benefit analysis taking into account the ethical dimensions of the actors involved to get social sustainable action (Muñoz, 2006-2014). The UESEVI team works to educate persons in values that may adapt their professional performance towards a social leadership in the general field of education as well as in the case of engineering students. This innovative educational approach could be of special relevance to ensure that advanced technologies influence positively human development.

Actions in the Path Towards Quality

The year 2009 was an important one in Spain for the verification process of the degrees leading to the acquisition of professional competencies of the Mining Engineer (R.D. 1393/2007). This process was grounded on the last propositions and recommendations of the National Agency for Quality Assessment and Accreditation of Spain (ANECA) in its action aimed to evaluate (VERIFICA program) the proposal of the study plans designed and presented in agreement with the European Higher Education Area (EHEA).

The overall curricula, as proposed by the universities, have been focused, among other points, on the quality criteria that each center has decided to establish for a good functioning.

In the case of the School of Mining and Energy Engineering, a unified criterion was adopted to emphasize those actions that may minimize the leap the students encountered when moving from secondary school to university.

This gap was known before the introduction of the new curricula (Ávila, 2010) and to deal with it, a series of actions were proposed in a centralized way.

These actions were established on a voluntary basis. The students willing to attend were enrolled in courses of a month with both the Administration and Services Staff (PAS) and the Teaching and Research Staff (PDI from the Spanish) of the respective centers. Another action launched to narrow the gap was the so called “starting point”, based on the Moodle teaching platform to level the contents of the courses where certain deficiencies were detected.

Both actions were prepared for the pre-Bologna schedule (calls in February, July and September). At present, the Bologna schedule (calls in January, June and July) is completely established, a circumstance that does not allow to carry out a zero course. This is leading to overlap between the formal training and

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

the starting point (Table 3). A zero course includes material which connects the studies of secondary school with the material expected at the first university level course.

The current action from UESEVI's point of view is not centered on the acquisition of specific skills, but it is rather focused on the development of mechanisms to help and orientate the new trainees that are based on mentoring (Mentor Project) and subsequently in academic support (Monitor Project) supplied by students from higher courses. It is assumed that the trainees learn better in a friendly and stimulating "milieu" and it has been found that the senior students are well equipped and motivated to provide valuable help to their colleagues of the first course.

The Mentor and Monitor Projects

These two projects had been conceived as orientation actions in the formal teaching program in search of quality. This has been also the option taken in the School of Mining and Energy Engineering. It has been experienced during the program development that the projects might play an even more important role if both were incorporated into the general strategy for training in general and social aptitudes (Muñoz Ruiz et al., 2011). And since then, the Mentor and Monitor Project have become not only instruments for the orientation initiatives but also have evolved to become the beginning of a strategy aiming at introducing the trainees from the onset of their admission in the knowledge of social competencies.

The Mentor Project

The goal of this project is to improve the welcome and orientation process of new trainees through the accompaniment of students from higher courses who have passed the situation of reception (they are "mentors") and the training in seminars about social skills that may help to make face to the university degree period, promoting a greater personal and academic development. This activity may be credited with ECTS credits.

In the course of the five year period from the introduction of the Mentor Project in the School of Mining and Energy, it has been found that the organization in four levels of participation (coordination, form master, Mentor and "Mentorized") may introduce some problems in the follow up of the training process. It is believed that the mentoring program relies on the interchange of knowledge between pairs. According to this philosophy, the program must be improved and thus the coordination should be carried out by students in good cooperation with the professional tutors. The tutors contribute their experience on the university, the knowledge on the functioning and mainly providing real information on the means.

Table 3. Actions in the path towards quality of the School of Mining and Energy Engineering (Pre-Bologna and Bologna period)

On the basis of this argument, the decision was taken to introduce the figure of "Coordinator Students" (Figure 2).

The figure of the "Coordinator Student" trainee is that of one student that has already experienced the Mentor project, has also been acting as mentor for developing the training in social skills and who knows the dynamics of the project, the characteristics of the center and the personal integrating the PAS and PDI collectives.

The Monitor Project

The Monitor project is intended to ease the integration into the University of the Newly Incorporated Students ("Mentorized") providing academic support to them in the first course. This support is transferred through students who have already passed with satisfaction the subjects (A or A+ grade) and who have shown abilities to help other colleagues to pass the subject (monitor) with the help of a form master. This activity may be also be credited with ECTS credits.

This project was developed as a pilot one during the period 2014-15 and was conceived as complementary to the mentor project. It originated as an initiative of Social Entrepreneurship presented by the trainees that studied the course on Ethics and Values in Engineering (see before and Table 4) during the previous period 2013-14.

At present, the project has a structural organization of four levels (coordination, form master, monitor and "monitorized") but in the same plane as for the case of the Mentor project, it would be advisable to establish a fifth level of participation with a figure similar to that of Coordinator Student. It is foreseen that this experience be applied in all subjects where the evaluation process reveal low rates of approval or high rates of abandonment. Initially it has been designed for subjects of the first course, though it could be applied for subjects with similar rates of success or abandonment in higher courses

Objectives of the Reception Actions for Receiving Students

- Train the veteran students in leadership by means of an activity of academic, social and administrative orientation to the new trainees, this process being completed with seminars for training on social and transversal skills.
- Implicate the two staff groups, PAS and PDI, in the reception process of new trainees and in the training of transversal competencies of the veteran students.
- Establish a tool to detect the needs and motivations of the students who are involved in the programs through the satisfaction inquiries.
- Train the veteran students in social and transversal skills by the practice of the previously mentioned activity of academic orientation to the "Mentorized" group.
- Promote the values of compromise, personal/social responsibility with regard to all involved in the process of training (PDI, PAS, Coordinator Students, Mentors, "Mentorized", Monitors and "Monitorized").
- Generate an environment of collaboration and companionship among all the members of the university community what eases the building of a network aimed at fostering the professional results of the graduates.

Phases and Participants in the Reception Actions for Receiving Students

The programs oriented to welcome the students are divided into the following phases

Table 4 shows the phases integrating the projects as well as the participants who benefit from them. It is worthy to recall that in both projects, Mentor and Monitor, the participation of the trainees (newcomers and veterans) as well as the teaching work performed by the tutorial professors is essential.

Results of the Experiences of the Orientation Actions in the ETSIME

The analysis of results reflects the observation and modification in each one of the process, thus allowing the independent evaluation. Due to the fact that the two projects have a different time frame, the results

Table 4. List of participants in the reception actions in every one of the phases of the projects

Stages	Phases	Mentor Project	Monitor Project
Preparation	•Planning of training and seminars •Diffusion of the activities •Selection of veteran students •Captation of students of first course	•Coordinators •Coordinators and Coordinator Students •Coordinators •Mentors	•Coordinators •Coordinators and Form masters •Coordinators and Form masters •Monitors and Form masters
Execution	•Training of veteran students •Administrative support / Academic support to the students of first course	•Professors and Psychological Assistance Service •Mentors, Tutorial and Professors	•Tutorial professors •Monitors and Tutorial professors
Evaluation And Closure	• Procedure evaluation • Recognition of ECTS credits to the veteran students • Closure of and reflection from the project	• Mentors, "Mentorized" and Form masters •Form masters and Coordinators • Coordinators, Tutorial professors, Coordinator Students, Mentors and "Mentorized"	•Monitors, "Monitorized" and Form masters • Form masters, and Coordinators • Coordinators, Tutorial professors, Monitors and "Monitorized"

Source: own elaboration

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

of the Mentor Project are shown before, followed by those of the Monitor Project. Finally, a comparison of the data of the two projects during the 2014-2015 courses is shown.

Results of the Mentor Project

This section collects the results of the implantation during the five last years. A reflection on the deviations undergone during this process and the interactive process to the SIQA is outlined as follows.

The participation of the different stakeholders has been changing during the five years period of the program (Figure 3). As can be seen, the number of mentors has reached a peak with the minimum of 10 mentors from the start in the 2010-2011 courses to the 40 reached in 2011-2012. In the following years the number has been stabilized around 30 mentors. In relation to gender distribution, men exceed women in the first to courses whereas after 2012-2013 the situation appears to be more balanced.

In relation with mentors, the pre-Bologna status predominated till the 2013-2014 courses. After, the post-Bologna number increased. This data is consistent with the differences in enrollment of both types of students in each period.

Regarding the "Mentorized" trainees (Figure 4), their number has increased since the outset of the program (2010-2011) as an experimental activity with 21 students (76% women and 24% men). This pattern is inverted from 2011-2012 onwards with higher percentages of men, ranging from 66% in 2013-2014 to 72% in 2014-2015. All the students integrated in the program belonged to the post-Bologna status. This is consistent within the process of implantation of this action of reception.

The incorporation of the Coordinator Students began in 2012-2013 with four women from the pre-Bologna status, then followed with two (man and woman) in 2013-2014 to end with two girls students in 2014-2015. There are no differences in the incorporation of Coordinator Students in relation with the nature and characteristics of the studies plan. The participation of the teaching and research staff (PDI)

Figure 3. Number of mentor's trainees

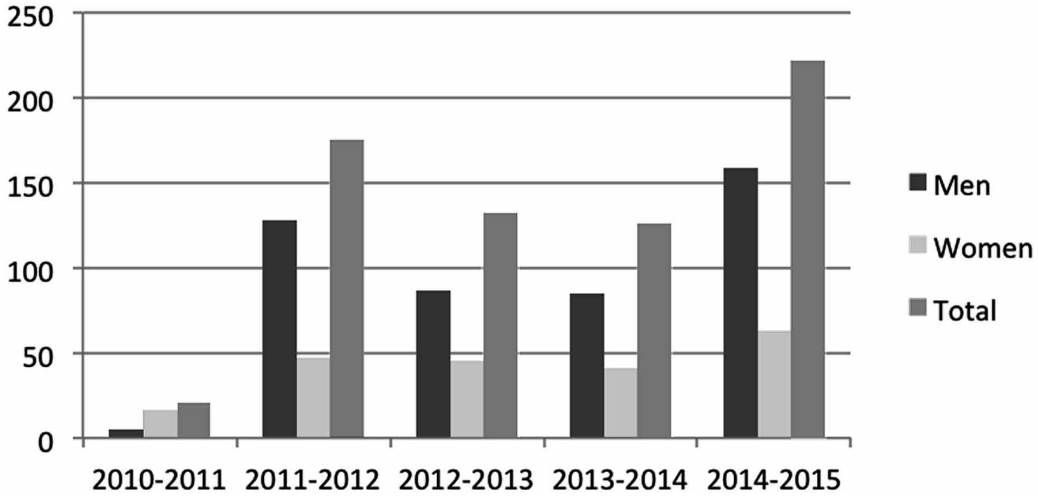
EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

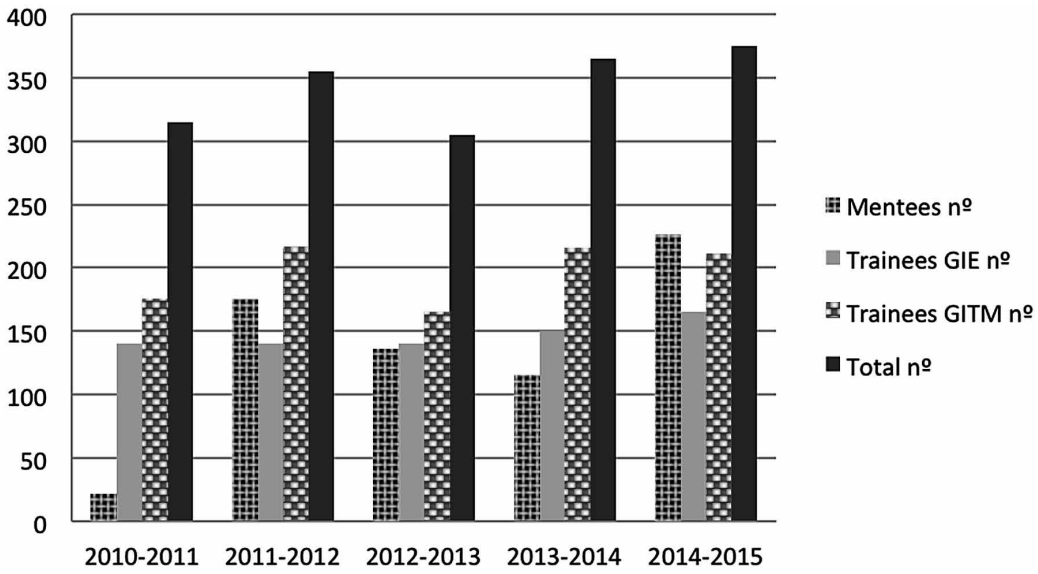
Figure 4. Number of "Mentorized" trainees
Source: Own elaboration



has also been increasing since the beginning: from two professors in 2010-2011 and 2011-2012 till 6 professors in 2012-2013 and 9 professors in 2013-2014, with 7 men and 2 women. Currently there are 11. The intervention of the PAS collective has been constant and uniform, collaborating in the program with two secretaries and a computer expert to give support for the Moodle platform.

Following with the statistical indicators, it is worth noting the high percentage of "Mentorized" students who have decided to pass to the status of mentors (>70%). A comparison (Figure 5) between

Figure 5. Comparison between the number of "Mentorized "students and the students enrolled in the different degrees of ETSIME
Source: Own elaboration



EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

the number of students having entered into the mentor project as "Mentorized" and the variation in the number of enrolled students does not reveal any parallelism or relation between the two data.

Concerning the different productive populations involved in the project (Figure 6), the figure shows an evolution that leads to an optimization of the stakeholders. In fact, it must be emphasized the high number of mentors enrolled in the course 2011-2012, when the process was in a preliminary state and the general opinion of the mentors on the teaching program was of distrust. With the evolution of the program, the training activities were optimized what implied the reduction in the number of mentors to attend the needs of the "Mentorized" trainees.

Results of the Monitor Project

The first edition of the project was launched as a pilot phase in the course 2014-2015 (Figure 7). In spite of this short life span, with the subsequent limitations to assess the project from the perspective of the concept and platform of SIQA, it has been possible to check that the Monitor project offers positive results

Figure 6. Comparison between the different productive populations involved in the Mentor Project
Source: Own elaboration

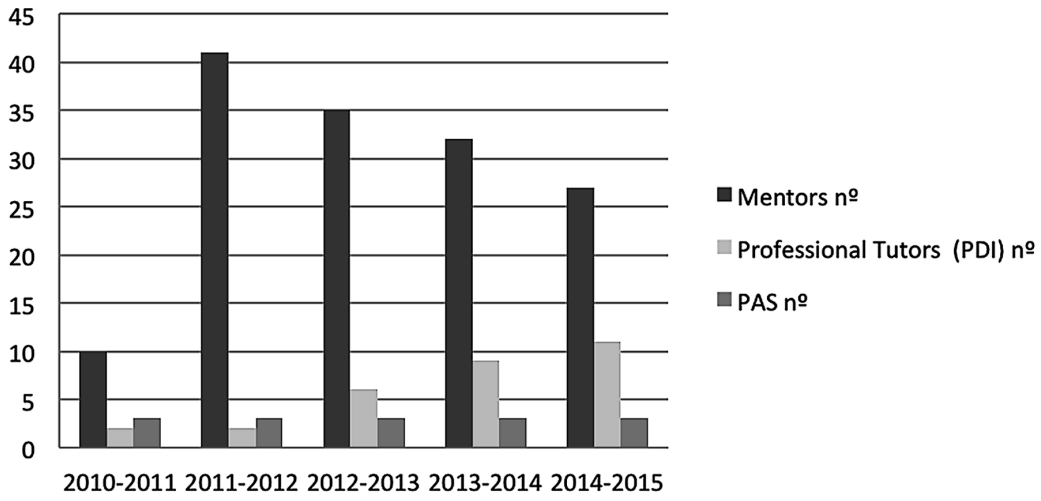


Figure 7. Number of monitor's trainees (2014-2015)
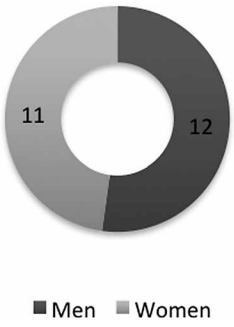
Source: Own elaboration



EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

with respect to critical issues such as the increase in the pass rate and the reduction in the rate abandon. At the time of designing the current degrees (pre- Bologna), the pass rate were fixed at 70%, a figure that allowed students to reach graduation in five years period as an average. In the pre-Bologna period, the duration of the formal five years degrees extended to an average of 9 years. Taking into account that most of the academic problems appear during the training of the subjects of the first cycle, projects like the Monitor seem to contribute to reduce the time frame employed by the students to graduate.

The participation of students monitored in the program may change depending on the activities performed by monitors. From a methodological point of view, it is interesting to include a control group, one that has not taken part in these designed activities, in order to be able to compare the results and the improvements achieved.

The best activities evaluated are those that affect the entire group and compare efficiency results between different years. In this case, we take into account that the admission cut off of students each year is different, but the absolute average calculated for each year is very similar.

Taking into account this caveat, the authors have focused on the lessons learned from students of two groups with different average in 2013-14 and 2014-15. Figures 8 and 9 illustrates how the number of passing students in the group with higher admission marks has increased since the Monitor Project's implementation from 70% in 2013-14 to 73% in the period 2014-15. The number of passing students in the group with a lower admission mark has increased from 42% in 2013-14 to 62% during the year 2014-15; this result shows clearly the great rate of improvement due to the monitor effect in students with lower admission marks.

With this project has not been possible to reduce the number of students that do not even go to the exam, so this is an objective that the SIQA needs to review in order to design strategies to solve this problem.

General Reflection

ETSIME has designed a series of actions to host the new students. They include hosting seminars in which the installations and their functioning are shown to the students, but also the development of

Figure 8. Greater input note group (2013-2014 vs. 2014-2015)
Source: Own elaboration

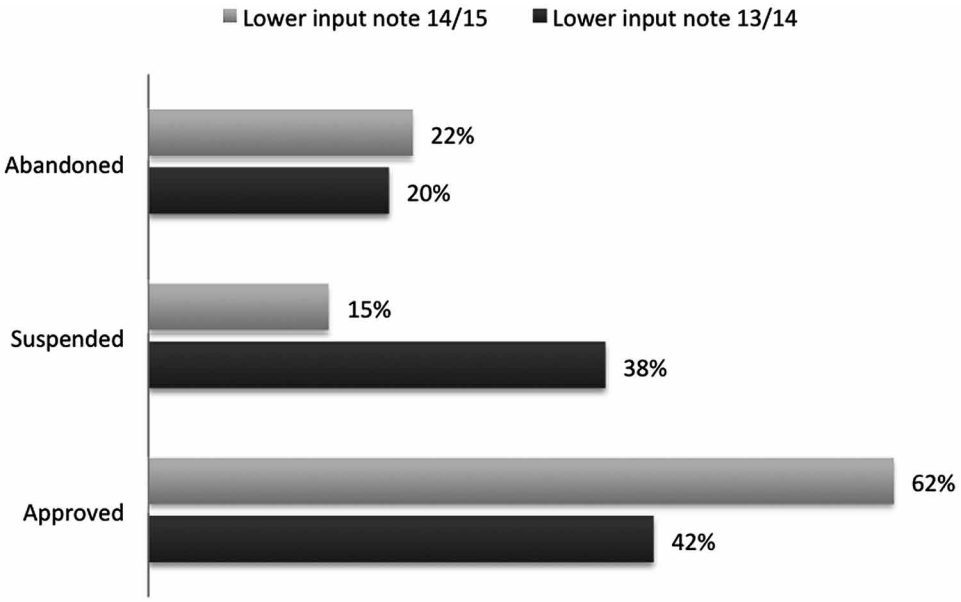
Figure 9. Lower input note group (2013-2014 vs. 2014-2015)
Source: Own elaboration



generic and specific skills designed in the curricula and measured through the SIQA. The authors consider that these actions have shown to be appropriate. They also consider relevant to highlight how the different competences of the degree are addressed by the projects Mentor and Monitor. In that sense, it could be said that the generic skills are widely developed in the Mentor Project and in the subjects of the degree program, while the specific skills are developed through the subjects and are completed with the Monitor Project.

FUTURE RESEARCH DIRECTIONS

On the grounds of the integrative learning process and its success, the ETSIME-UESEVI strategy will continue its path on the basis of three pillars:

1. The application of an evolutionary trajectory to combine theoretical and practical approaches to the teaching of engineering.
2. Attempts will be made to integrate the education and research activities by exploring the new dimensions and dynamics of the consequentialist ethics as it is being applied in the ETSIME-UESEVI program. The goal is to include this new perspective into the Geoethics movement to contribute to sustainability of natural resources and to gain better social benefits of the exploitation of these resources.
3. The use of social entrepreneurship and service learning initiatives that represent the practical side of the integrative learning process, as a source and as a reservoir of new outcomes for better development of the future engineers.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

The authors also would desire to attain two more ambitious goals:

1. Expand the integrative way of teaching promoting the interrelated application of the following concepts and frames: evolution and ethics, social responsibility, social economy (including branches like ecological economy and some kind of biological economy, social entrepreneurship and social learning practices. The objective is to achieve social intelligence (Figure 10).
2. Develop programs that may foster students' vocations for STEM careers.

In summary, ETSIME-UESEVI will pursue an innovative educational program embedded with innovative social parameters.

CONCLUSION

While recognizing limitations and imperfections during the Bologna process, from the case presented in this chapter derives the idea that the SIQA strategy has evolved as a valuable driver of change in order to train students in transversal and specific competencies.

From the review of the situation and evolution of the Bologna process that has been conducted in this chapter, and taking into account the dimensions of quality and accreditation that define this process, it seems that Engineering offers very positive results in relation to the objectives of SIQA.

The case study model is an instrument used and recognized in studies aimed at training managers and professionals in business, and in economic and financial fields (Business Schools, diplomas and university degrees in Marketing and Commerce, all of them examples of entrepreneurial success in USA). The application of this model to a more social objective, as is a Higher Education process managed from a public institution, has reinforced the rational of the authors searching for international diffusion of the process. This program has been oriented to the teaching of engineers by including social issues as ethics, values, and concepts and practices of social economy and social innovation, and has obtained very positive results.

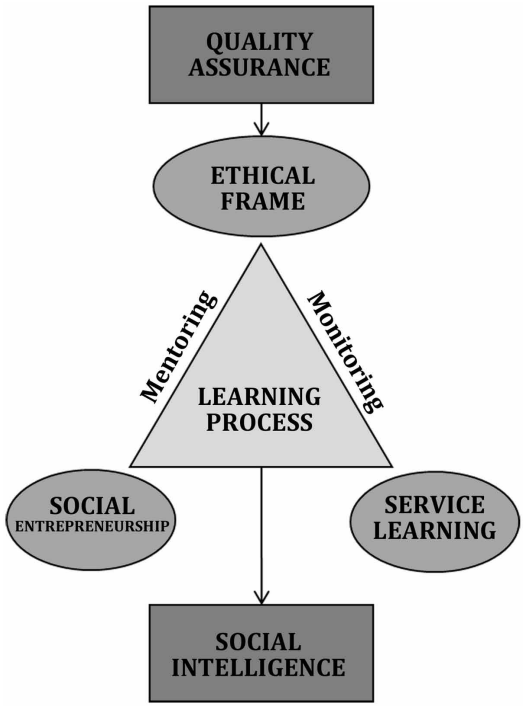
The examples provided in this chapter show the integration of the teaching on ethics and the actions oriented to facilitate the adaptation of the new students of Mining and Engineering (an outcome of the quality objective) with the successful application of Social Entrepreneurship, creative innovation and Service Learning. This integration represents a first and important evidence of the good results provided by the integrative learning trajectory. And thus leads to the incorporation of the ETSIME teaching program in the aims of social intelligence (Figure 10).

This concept of integrative learning may be assimilated to the one of "educational ecosystem" that the authors wish to propose. The concept of ecosystem is becoming a mantra and so applied very frequently, but not properly in scientific terms, to design innovation and market projects and strategic issues. However, in the case study presented here and with regard to the field of education, the use seems in principle well substantiated: throughout the trajectory, there are coevolution and integration of the different phases and shareholders. All these results contribute to the recognition of values such as cooperation, empathy, and social justice. This recognition leads to social responsibility of the graduates.

A consultation on Google Academic provides an indirect and additional assessment of the ETSIME initiative. The introduction of the wording "integrative learning in teaching ethics in engineering" provides

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 10. From Quality Assurance to Social Intelligence through Integrative Learning
Source: Own elaboration



40.000 results, while the consultation of the terms "ethics teaching in engineering" offers 440.000 hits. Nevertheless, none of the results that appear in the first cluster resembles the ETSIME program. This fact indicates that this kind of program is a potential and appropriate initiative for innovative developments in a HE quality strategy.

ACKNOWLEDGMENT

The authors and their institutions acknowledge the support of the Caja de Ingenieros and the Gómez Pardo Foundation. The help of Elena del Valle, a student of the Ethics and Values in Engineering, in the preparation of the section on the Monitor Project is highly appreciated.

KEY TERMS AND DEFINITIONS

ACREDITA PLUS Program: The main objective of the new ACREDITA PLUS program (2010), namely, to avoid the multiplicity of processes so that degree programs can obtain both national accreditation and a European/international quality label through best use being made of synergies between the two QA processes.

ACSUG: Agency for Quality Assurance in the Galician University System was legally established on 30 January 2001 as a consortium between the Regional Government of Galicia and the three Galician universities. ACSUG has full legal personality and the necessary independence to be able to achieve its objectives to rigorous standards fully respecting university autonomy.

AQU: The Catalan University Quality Assurance Agency, AQU Catalunya, is the main instrument for the promotion and assurance of quality in the Catalan higher education system. AQU Catalunya is entrusted with the assessment, accreditation and certification of quality in the universities and higher education institutions in Catalonia.

AUDIT Program: ANECA in cooperation with two other regional agencies, AQU and ACSUG, have developed the 'Assessment of Internal Quality Assurance Systems in Higher Education' (AUDIT program). The purpose of this initiative, which is addressed to all the university colleges and faculties that offer university education, is to provide guidance in designing internal quality assurance systems integrating all the activities implemented up until the present time related to degree programs quality assurance. Even though these orientations are addressed to university colleges and faculties, some relevant elements are of a transversal nature and belong to the university institution as a whole (i.e. issues referred to the hiring of academic staff, material resources and general services, etc.).

Group E4: Composed by the European Association for Quality Assurance in Higher Education (ENQA, 2000), the European Universities Association (EUA, 2001), the European Association of Institutions in Higher Education (EURASHE, 1990) and the European Students' Union (ESU, 1982).

Social Competencies: Those extending the ones taught in the specific degree or branch and that are attending to train the students in a series of knowledge dimensions and values which may allow them to behave as citizens assuming compromises with people as well as acting responsibly on the common goods that will fashion their Professional scenario (Environment and Society) (García Laso, 2014).

VERIFICA: Program evaluates the proposals of study plans (curricula) designed in line with the European Higher Education Area.

This research was previously published in the Handbook of Research on Quality Assurance and Value Management in Higher Education edited by Walter Nuninger and Jean-Marie Châtelet, pages 279-302, copyright year 2016 by Information Science Reference (an imprint of IGI Global).

Chapter 44
How Do UK B2C High-Tech Start-Ups Utilise Innovation Through Social Media to Improve Business Performance and Outcomes?

Raja Yahya Alsharief
King Abdulaziz University, Saudi Arabia

ABSTRACT

This article describes how social media in the business world today has been one of the major trends that highly affects business transactions worldwide. Existing literature focused on how businesses can leverage social media to better interact with their customers, and how to use of social media by companies to drive innovation. However, not mush had been done to examine how B2C high-tech start-ups utilise innovation through social media to improve business performance. As such, this article attempts to fill a research gap that examines the extent of social media usage by B2C high-tech start-ups in London to drive innovation and hence improve their performance and business outcomes. Due to the complexity of innovation as a concept, qualitative research was chosen as an appropriate method to understand the view of high-tech start-ups on the matter using semi-structured interviews.

1. INTRODUCTION

The rise of social media in business has been one of the major trends in recent years. However, the existing literature within the field focused mainly on how businesses can leverage social media to better interact with customers and encourage them to participate in new product development (Martini et al., 2014; Bugshan, 2015). Meanwhile, any researchers had identified a fundamental need for entrepreneurs to build communities and relationships through social media, internet marketing, viral marketing and e-marketing tools in order to draw knowledge and ideas. Among these researchers and scholars: El-

Gohary and El-Gohary, 2016; Kask and Linton, 2013; El-Gohary et al, 2008; El-Gohary, 2009; Ma, et al., 2014; El-Gohary, 2012; El-Gohary, 2011; El-Gohary, 2010; Hamad et. al., (2016); Hamad et. al., (2015); Raghubansie et. al., (2015); El-Gohary and Eid (2013); Eid and El-Gohary (2013); El-Gohary et. al., (2013); El-Gohary (2012b); El-Gohary (2012c); El-Gohary and Eid (2013b); El-Gohary and Eid (2012); Millman and El-Gohary (2011); El-Gohary (2010); El-Gohary (2010b); El-Gohary (2010c); El-Gohary et. al., (2009); etc.). However, existing literature falls short of fully exploring the implications of social media as a form of innovation for businesses and how it can be leveraged to improve business performance and outcomes.

While building on existing research, this study will aim to address this topic and analyse the extent to which the use of social media as an innovation tool can contribute to an organisation's success. The study will specifically focus on high-tech Business to Consumer (B2C) start-ups. The term high-tech has been used to describe industries, as well as products of these industries and people who work in this sector. According to Mohr, et al., (2010, p.10); high-tech can be defined as 'engaged in the design, development, and introduction of new products and/ or innovative manufacturing processes through the systematic application of scientific and technical knowledge.' This study focuses on the high-tech industry because existing literature has not focused on this particular industry.

2. LITERATURE REVIEW

2.1. Innovation in Business

Innovation encompasses changing or refining business processes, ideas and products to make them more effective with the underlying idea of making the business more successful (Colombo & Grilli, 2007; Mergel, 2012). Innovative businesses are more productive which is often reflected in their overall performance (Backes-Gellner & Werner, 2007; Zolkepli & Kamarulzaman, 2015). Existing literature further suggests that innovation enables the business to be more flexible and adaptable in a rapidly changing environment (Sahut & Peris-Ortiz, 2014; Criado, et al., 2013).

Innovation now plays an even important role in an arena influenced by fast technological advancements (Ooms et al., 2015; Mount & Martinez, 2014). Innovation should be entrenched within the strategy of the business and should be reflected in the culture. This enables everybody working in the corporation to contribute towards the creation of innovative ideas (Kask and Linton, 2013; Ma et al., 2014).

It is vital for start-ups to create a team of employees who are creative and innovative thinkers (Fritsch & Aamoucke, 2013; Hall & Wylie, 2014). Start-ups should conduct analysis of the market environment, determining what customers want and need, and gain more insight into their competitors (Festel, 2013; Audretsch, et al., 2014). This analysis in previous decades was carried out using traditional approaches such as using research agents. The growth and popularity of the internet has now made such analysis convenient, fast, detailed and affordable (Colombo et al., 2014; Bugshan, 2015).

2.2. Social Media

The concept of social media is one that companies have leveraged to help them succeed in various areas of their business (Colombo & Grilli, 2007; Mergel, 2012). This sub-section discusses the evolution of information exchange and the increased use of social media by businesses to improve their outcomes.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

The extensive usage of the internet has led to augmented acceptance of social media. There has been an argument in the literature around the definition of social media. However, the most common definition was given by Kaplan and Haenlein (2010, p. 61), which states 'social media is a group of internet-based applications that build on the ideological and technological foundations of Web 2.0, and that allow the creation and exchange of user-generated content.' In the business realm, social media has become a significantly important avenue where businesses use various formats to improve different aspects of their business processes (Backes-Gellner & Werner, 2007; Zolkepli & Kamarulzaman, 2015).

Adequate research material exists on social media particularly in connection with the increased use of online platforms (Sahut & Peris-Ortiz, 2014; Criado et al., 2013). Technological advancements over the years have resulted in traditional approaches to information flow being passed by easy access and faster spread of information via the internet. Meanwhile, social media allows and facilitates collaboration between customers and the business.

Technological advancements have proved to be instrumental towards the development of new enterprises as alternative entry points into different industries have made traditional barriers to entry irrelevant (Groen, et al., 2008; Chesney & Lawson, 2015). Uber has quickly established a huge customer base in over 35 cities globally by increasingly leveraging technology (Price, 2015). However, it did not have to overcome the traditional barrier to entry of acquiring several hundred vehicles and hiring several hundred drivers.

Consequently, an innovative idea enabled by technology allowed the start-up to effectively enter the market via an alternative and previously unexplored route. Though existing literature mainly focuses on the role of social media in improving the marketing abilities within organisations, limited work has been carried out to determine its role in improving the innovation abilities of businesses (Caliendo et al., 2015; Barnes & Jacobsen, 2013). The next sub-section aims at establishing this link amongst social media and innovation, providing an overview of current literature and how this study aims to address the gaps in this area.

2.3. Using Social Media for Innovation

The linkage between social media and innovation in business has become inseparable. In the past, a solo inventor would create a common scenario breakthrough solution working in isolation. However, these days are now long gone (Bugshan, 2015). In today's world, problems have become increasingly complex. Hence, solving them in a solo effort is less effective as it limits the speed at which the solution would be produced.

These complex problems are multi-faceted and require collaboration between people with broad expertise. Collaboration allows drawing from a diverse skillset to enhance the solution so that it addresses the problem from all angles. Successful innovation requires ideas and knowledge to be exchanged (Caliendo & Kritikos, 2010; Henrekson, 2014).

This should be accompanied by the ability to manage and organise information in such a way that gives the entrepreneur the ability to mine the value of innovation (Kösters, 2010; Filieri & Alguezaui, 2014). Incorporated within this environment is the underlying need to build communities and relationships, which entrepreneurs can draw knowledge and ideas from. This is where the concept of social media as an overall tool for innovation starts to prove beneficial for start-ups (Kask and Linton, 2013; Ma, et al., 2014).

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

2.4. Advantages and Disadvantages of Social Media

The incorporation of social media within the company's overall innovation strategy provides further benefits. Without a doubt this is what many start-ups have come to embrace (Colombo, et al., 2014; Bugshan, 2015). However, existing research also suggests some disadvantages surrounding the use of social media for innovation. The benefits of social media in the business world have started to be recognised. A large number of companies already use social media tools and services for product innovation to some extent (Colombo & Grilli, 2007; Mergel, 2012).

The welfares such companies gain from the application of social media within the innovation strategy often include creative ideas for products or services offered and a much faster time in launching a product or service in a market. Products or services are also adopted quite quickly due to the high level of interaction and involvement from the early stages of product development and design through social media (Backes-Gellner & Werner, 2007; Zolkepli & Kamarulzaman, 2015).

Other benefits that are well documented in the existing literature include reduced product costs as well as lower development costs of the products (Sahut & Peris-Ortiz, 2014; Criado, et al., 2013). The low production costs emerge from the fact that there are fewer defects and minimal changes to the product requirements and concept. Since the requirements are generated through involvement and interaction with the users and customers in the first place, the rate at which the product will have to be changed generally tends to be much lower (Ooms, et al., 2015; Mount & Martinez, 2014).

3. METHODOLOGY

Methodology is an important phase of research as it helps clarify the precise practices that should be followed in order to obtain the required data (Saunders, Lewis and Thornhill, 2009). A qualitative method is undertaken in this research because it helps to understand the nature or quality of a phenomenon as opposed to a quantitative method that focuses on how much (Punch, 2013). Jankowicz (2005) argues that a qualitative strategy helps to ensure that the research has a balanced focus on the data collected and not just a focus on numbers. This section will attempt to explain the philosophical approach applied, choice of research design, data collection techniques, sampling strategy, method of data analysis, and ethical considerations.

3.1. Philosophical Approach

Qualitative research is assumed to be more suited to theory building (Myers, 2013). However, it can also be used to test theory. This study primarily employs inductive reasoning by starting 'bottom-up' and collecting data through face-to-face interviews. It then attempts to investigate and analyse the data obtained in the light of existing theory. The approach is based on the collection of empirical observations that are not limited by the need to test theories and hypotheses. This helps to facilitate the interpretive position and develop general observations about the specific situation (Hussey and Hussey, 1997). It also helps balance focus between data and qualitative observations (Jankowicz, 2005). The inductive qualitative research approach has been chosen over the deductive approach, as the former is more open-ended and exploratory in nature. Therefore, it allows for a deeper understanding of the social aspect of the study.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

As mentioned earlier, the study employs a qualitative research method and starts by investigating the underlying epistemology to guide the research. A breadth of literature has been consulted in order to build the basis for knowledge and understand its limitations. Orlikowski and Baroudi (1991), following Chua (1986) suggests three categories for qualitative research: positivist, interpretive and critical. While research epistemologies are philosophically distinct, these distinctions may not be as clear in the practice of social research (Lee, 1989).

However, this study takes an interpretive approach towards qualitative research. It does not aim to predefine dependent and independent variables but focuses instead on the complexity of human sense-making through research and interviews (Kaplan & Maxwell, 1994). It attempts to understand phenomena through the meanings that people assign to them (Boland, 1991; Orlikowski & Baroudi, 1991). The area of the use and effects of social media spans across various social and organisational phenomena. Therefore, it cannot be studied using the research methods and tools of the natural sciences. This is because the human phenomenon of subjective understanding has no counterpart in natural sciences (Lee, 1994). The study involves the author speaking the same language as the people being interviewed in order to obtain an in-depth understanding of the area. The author recognises that it is as much a 'subject' and an interpreter of social situations as the people being studied (Giddens, 1976).

While the positivist philosophical position assumes that scientific methods are considered one of the best ways to find the truth (Jankowicz, 2005), it rigidly applies paradigms and approaches from the natural sciences (Remenyi et al., 1998). Therefore, it misses out on addressing the fact that opinions and interpretations beyond data also hold significance (Caldwell, 1980). In contrast, the interpretive research approach chosen is designed to gain enough understanding of upcoming outcomes from the research goal by focusing on the nature of the research environment and context (Jankowicz, 2005). This makes it of great value given the complexities surrounding the use, effect and implications of social media on various business functions and customers.

Looking at the area of social media in high-tech B2C start-ups, the author's research question is concerned with how social media can be used as a tool in order to improve business performance and outcomes. As discussed in the literature review section, this study aims to fill a research gap and aspires to provide the vehicle for exploring the usage of social media as a beneficial tool for high-tech start-ups.

3.2. Research Design

Myers (2013, p.19) stated that research design is considered as a 'road map' for the entire research. The researcher has used both primary and secondary data in this study. Primary data was used in collecting data from interviews as information was obtained directly from the interviewees to improve the findings of this research. On the other hand, secondary data was gathered from existing sources such as, books and journal articles (Carter and Little, 2007). These have been included in the literature review to provide a deeper understanding of existing studies and theories on the research topic.

3.3. Data Collection

According to Saunders, Lewis and Thornhill (2009), data collection must be appropriate to the philosophical position and approach. It must therefore be aligned with the interpretive and qualitative approach. Five high-tech start-ups have been chosen to collect data for this paper. These start-ups are currently

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

supported by a start-up accelerator that provides funding, office spaces and mentoring in addition to other services. The Head of Partnerships and Events at the start-up accelerator was the initially approach and was explained the purpose of the research. An approval was subsequently received and a connection was made between the researcher and the start-ups who were willing to participate in the study.

A qualitative method was chosen to prepare this study because this research focuses on obtaining detailed and highly relevant answers to ensure effectiveness. This could only have been possible through interviews. As described by Adamson & Holloway (2012), Patton (2002), Hallberg (2013) and Myers (2013), choosing interviews as a method for data collection provides the best results because it enables the researcher to obtain in-depth answers from the participants, which cannot otherwise be obtained using other methods, such as observations.

Semi-structured interviews were chosen as the most suitable style of interviewing. It provides the ability for more solid and in-depth answers. Most questions are designed in an open-end form to help the researcher in guiding the participants of the purpose of the questions when required (Bryman and Bell, 2007; Irvine, Drew and Sainsbury, 2013). Moreover, it was essential to make the interview questions as simple and flexible as possible in order to give the participants the chance to state their points of view comfortably.

3.4. Sampling

A sample of five start-up companies was chosen to collect data from for this study. They are high-tech B2C start-ups based in London. Each one of them specialises in a novel product or service. Examples of the products include next generation sleeping pillows and bike navigation systems. On the other hand, services include diabetes monitoring application, wine lovers service and a unique film events application.

The interviews were conducted with the start-up founders in London. The approximate time the interviews took was between 10 and 23 minutes. Two interviews were conducted on August 5, one was conducted on August 6, and the final two were conducted on August 7. High-tech B2C start-ups have been chosen as they have not been studied previously to find out the implications of social media as a form of innovation and how it can be used to improve their performance and outcomes.

3.5. Data Analysis

The author analysed the data using top-down and bottom-up approaches. Top-down approach means that the author will analyse data from the literature review. Conversely, a bottom-up approach involves collecting data from the author's findings (Myers, 2013). Current research has a combination of both approaches because the topic of social media and innovation also exists in the literature (top-down). However, there is a gap this research will try to fill by focusing on the high-tech B2C start-ups industry in London which none of the literature have explored before (bottom-up).

Coding has also been employed as an approach. Usually coding is used to categorise data that is common as it is a more convenient way to relate, compare or identify any information when analysing data (Miles, Huberman and Saldaña, 2013). Coding can be in a form of numbers, words or sentences. However, in this research coding was used on the request of anonymity by participants. Hence, details of participants from the start-ups have been coded as A, B, C, D and E.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

4. ANALYSIS AND FINDINGS

Data collected from the interviews is the primary source of data and will be analysed in a manner that would agree, disagree, or build on the literature review provided earlier. The interview is based around thirteen research questions. Interview responses from each of the five interviewees will be analysed. This will allow for answering the research question by comparing and contrasting answers with each other, while relating to the literature review in order to reach to a conclusion.

Since the data collected for this research is through interviews, some answers from the respondents would necessitate additional questions to keep the answers relevant to the questions being asked. This would also allow for keeping the analysis objective from the research point of view. In order to do this effectively, the author has to bear in mind that the focus is on three main aspects: the degree of reliance on social media for innovation in start-ups, the ways entrepreneurs use social media, and their perception of social media.

4.1. Interviews

Interviews with the start-up founders are the primary data source for this research. Therefore, a detailed analysis for every question will be provided to allow for thorough understanding and consequently a clear conclusion. A sample of the full interview questions and detailed answers will be provided in the appendices (See Appendix B&C). Every question will be mentioned along with the relevant findings and its link to the literature review.

The respondents interviewed are all entrepreneurs who have their own in the high-tech domain and are described as a B2C business. In this research, the respondents' names have been anonymised on their request and will be coded as respondents A, B, C, D, and E.

4.2. A Brief of Participating Start-Ups

In order to obtain a more objective analysis of the data collected and to allow the reader to get an in-depth understanding of the analysis, the products and services with their features and uses will be briefly mentioned. Respondent A's start-up makes a product that connects people by using their real-time heartbeat and plays it in into a pillow. Respondent B's product revolves around cycling security. Respondent C provides an application that allows people to get information on movies showcases and buy tickets. Respondent D provides a diabetes management application which helps diabetics control their sugar levels and improve their health and wellbeing. Lastly, respondent E's offering involves selling winery products online on the internet.

4.3. Analysis and Findings

4.3.1. Social Media Representation for Start-ups

Researchers have identified the need for entrepreneurs to build communities and relationships through social media in order to draw knowledge and ideas (Kask and Linton, 2013; Ma, Sian Lee and Hoe-Lian Goh, 2014). All respondents agreed that social media is needed for their business and see it as an important tool that a business needs. However, the respondents' view of the degree of importance that

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

social media holds was varied. Respondent A has mentioned that social media is an essential tool and a necessity for her start-up, as her product idea was a video the respondent uploaded which went viral. Respondent B has elaborated on the use of social media as a powerful tool and its role as share point of the business, to attract potential investors, and for receiving feedback. It was also mentioned to be a cost-efficient way to target certain demographics. This emphasises on the high importance that respondent B gave to social media for a start-up. Respondent E has mentioned that social media helped the business to grow and increase its exposure to the online customers leading to about 2000 daily engagements with customers over social media platforms. This high exposure rate enabled her to better understand customers' demands, communicate effectively with them, and get more knowledge about the various parties involved in the market the respondent operates in.

The responses from A, B and E are synonymous with the findings of Groen, Wakkee and De Weerd-Nederhof (2008) as well as Chesney & Lawson (2015): the benefit to start-ups of obtaining a better understanding of their ecosystem through developing business intelligence using social media. On the other hand, respondent C viewed social media as one of the business channels that is used to make sales rather than an information feedback loop or knowledge source. Therefore, the respondent solely viewed social media as a source of increasing sales. Respondent D described social media as an effective channel for communicating with customers without mentioning social media effect on business growth.

4.3.2. Benefits From Using Social Media and Platforms Involved

The responses to questions two and three have been combined to provide a more meaningful analysis. Those two questions attempt to allow respondents to further elaborate on their answers to the first question. According to the literature review, technological advances have led to the widespread of social media usage (Sahut & Peris-Ortiz, 2014; Criado, Sandoval-Almazan & Gil-Garcia, 2013), making it an important place for business process and leading to its use for various reasons and ways (Backes-Gellner & Werner, 2007; Zolkepli & Kamarulzaman, 2015).

Respondent A stated a use of social media to 'mainly engage with people that are waiting for the product', and to make those potential customers contribute to the product development process by sharing their ideas and thoughts. This could involve asking if new features can be added to the smart pillow and whether or not the person receiving the heartbeats can tell if there is another person on the same bed. The respondent also mentioned that social media acted initially as a marketing tool that led the marketing team to make a plan to attract more customers through social media.

Respondent B stressed on the use of social media as a means to communicate with existing users on developing the products as well as being a source of strong referrals for the business, a critical source for fundraising through the use of Kickstarter (fundraising platform), and a cost-effective way of targeted demographic marketing.

Respondents A and C mentioned the use of social media and categorised it according to the social media platform used that is best for the audience being targeted. Moreover, they also mentioned the key role social media plays in communicating information to investors, employees, partners, and customers in terms of general or specific marketing.

Respondents D and E use social media to engage in market research to learn about customers and competitors. They also use it for customer service purposes to help resolve problems and to communicate information to staff members. Moreover, social media was identified as an easy and efficient way to expand the customer base and interact with customers to obtain feedback that provided insight for

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

product development. It was also recognised as a very strong marketing tool that benefitted the business to sell its products and receive requests from partners in the industry to sell products on behalf of them.

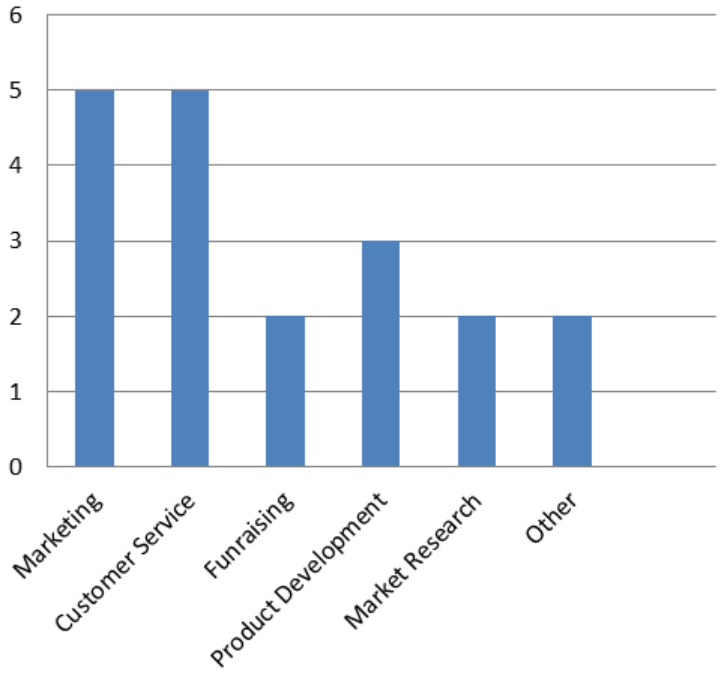
The use and benefit from social media for start-ups was evident from the interview responses. This clearly establishes a positive case for social media's benefit and use by start-ups. This is similar to its benefit for larger corporations as identified by Ooms, Bell and Kok (2015), who investigated large high-tech companies and found that social media can be used as a boundary-spanning tool to build and increase an organisation's absorptive capacity.

Respondents A, B, and E specifically pointed out how social media enabled a better reach to customers, making traditional barriers to entry irrelevant despite operating in different industries. All respondents believe that social media has facilitated better and cost-effective customer service and communication. Moreover, it also enabled the collaboration between customers and the business, which are results that match the findings of Groen, Wakkee & De Weerd-Nederhof (2008) and Chesney & Lawson (2015).

Figure 1 highlights the relative use and importance all respondents gave to social media in terms of marketing and customer service through feedback. Product development was another use that three respondents highlighted as an area of benefit. These findings conform to existing literature by Martini, Massa and Testa (2014) and Bugshan (2015) which focused on how businesses can leverage social media to better interact with customers, ask them questions and encourage them to participate in new product development.

Two respondents highlighted the use of social media as a market research tool that enables them to understand the customer needs and competitors. Fundraising was another identified benefit for two start-ups, while other use was for communicating with the business staff and partners.

Figure 1. Use of social media



EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

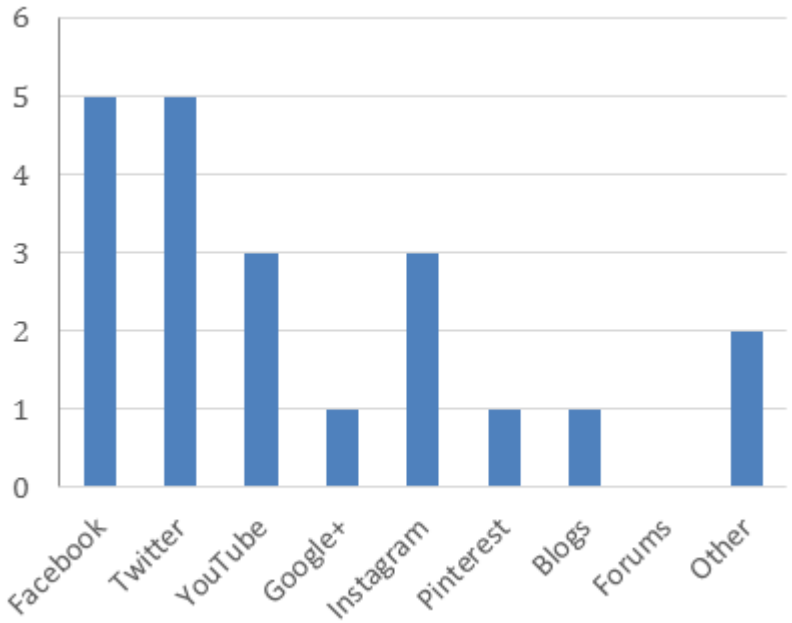
4.3.3. Social Media Platforms Used and Reasons of Usage

This question attempts to highlight the different social media platforms used by start-ups and whether usage of specific platforms would be fundamental for all start-ups. The respondents were given the following list of social media platforms to choose from:

- Facebook
- Twitter
- YouTube
- Google+
- Instagram
- Pinterest
- Blogs
- Forums
- Other

Figure 2 shows that all respondents primarily use Facebook and Twitter as basic social media platforms while providing different levels of emphasis on the relative reliance on such platforms. It was noticed that Instagram and YouTube are the third most common platforms used. Respondent C seems to be an active user of five social media platforms that appears inconsistent with their response of considering social media to be of mediocre important to their start-up. However, the respondent did mention that Google+ is not considered a real source of information and feedback as the respondent considers it to

Figure 2. Social media platforms used



EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

be a 'weak platform'. Moreover, the respondent considers Facebook to not be very effective advertising and that it is heavily flooded with advertisements that users do not want to see.

The respondent did mention Twitter and Instagram to be far better tools for reaching out to customers. Respondent D uses a blog called Medium.com in addition to Facebook, Twitter and Instagram. Respondent B uses Kickstarter and LinkedIn for fundraising and feedback, while Twitter is used more for defensive mechanism than for marketing. Respondent E is the most active user of various social media platforms with more than six platforms that include Flipboard.com, Scoop, and others. Respondent E provided a ranking of her considered importance of platforms from the most important to the least as follows: Twitter, Facebook, Instagram, Pinterest, and LinkedIn.

The findings from this question draw upon several conclusions that can be related with previous literature on start-ups as well as on established firms. According to Perleberg (2015) and Scheepers et al. (2014), social media provides a platform for start-ups that can help them innovate and improve business processes and product offerings at a lower cost. Perhaps it is intuitive to figure out that the most used platforms by the respondents are actually the most used ones by consumers, owing partly to their convenient usage.

The findings also show that LinkedIn is not used extensively as the respondents' business model is B2C, which does not make LinkedIn the best platform to focus on. Additionally, the use of blogs and forums is not popular among start-ups since they require dedicated resource for managing and updating on an ongoing basis. In contrast, well-established companies have the luxury of resource and a variety of products and/ or service offerings, leading to the investment of extra resource to make commercial sense.

4.3.4. Degree of Product/ Service Reliance on Social Media

Figure 3 shows that forty per cent of respondents rely on social media to develop and improve products/ services that they offer to customers. This conforms to the findings of other researchers which conclude that products or services are also accepted quite quickly due to the high level of interaction and involvement from the early stages of product development and design through social media (Backes-Gellner & Werner, 2007; Zolkepli & Kamarulzaman, 2015).

Figure 3. Reliance on social media to change/provide product/service

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

However, other respondents gave different answers that also confirm that this social media reliance by start-ups is skewed by industry and mostly used in the financial sector more than others like medical services sector, as reported by Barnes and Jacobsen (2013).

The respondents gave different answers due to different reasons. Respondent B did not provide an answer since his product did not launch yet. Therefore, social media plays no role in providing/ changing the product, as it has not yet reached the market. Respondent C does not rely on social media platforms because his business has its own application that the respondent believes is a more effective tool to communicate with customers. Respondent E gave a half-way agreement and mentioned that social media for her business is not a huge deciding factor for contributing towards product or service development.

4.3.5. The Link Between Social Media and the Business Model for Start-Ups

The responses to questions six and seven have been combined to provide a better-rounded analysis. The literature review mentions a study carried out by Groen, Wakkee and De Weerd-Nederhof (2008) that suggest four types of functions based on social system theory used by entrepreneurs to develop high-tech start-ups. These are goal attainment, pattern maintenance, social networking and economic optimisation. The study mentions that all of the four functions require development up to certain level for the start-up to succeed. Although the four types cannot be applied to the study at hand, social networking and economic optimisation could relate to the respondents' answers. The current use of social media as a tool to increase communication and reach would imply the use social media as a major component in a start-up business model.

The interview responses reveal that eighty per cent of respondents have applied social media from day one but motives for each respondent might slightly vary. Respondent B mentioned that the first thing that the respondent was active in was social media and as mentioned earlier, without social media the need for his product would have never materialised. This puts social media at the heart of the business model for this respondent. Respondent C stated that the early adoption of social media is a sign of being serious and active in your business. So the use of social media leads to an enhanced presence of the start-up in the market and in front of consumers. In other words, social media is vital for business exposure to the public for this respondent. Respondent D mentioned that social media was included due to acknowledgement of its key role in running the business.

Respondent E mentions that social media was a must have since a start-up has a small budget and social media proves to be cost effective with minimal upfront costs to set up. This was based on the respondents who recognised the application of the social systems theory on various levels. However, respondent A answered that the most important factor to the business model was making profit and selling a product and justified not adopting social media by saying 'you never know how seriously the investor would take me if I put social media as a method', in the early business stage.

4.3.6. Social Media Problems and Remedies

According to information gathered by KPMG.com (2015), the usage of social media carries potential risks that employers need to be aware of. Those risks involve insufficient training to staff that would lead to misrepresentation of advertising material or miscommunication such as poor response to complaints over social media platforms posted by customers and third parties. This in turn may potentially have a negative effect on the brand image. Sixty per cent of the respondents agreed to experiencing problems

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

that originated from the use of social media while forty per cent disagreed. Respondent A mentioned that due to the nature of the product offered by the business, some negative emotional comments were made by customers and stated that 'you can't control a riot'. This expressed the business' inability to deal with these kinds of problems and risks. Respondent D blamed miscommunication to be the reason behind those problems, while respondent E called it 'bad press'.

However, both respondents D and E agreed that those problems have to be dealt with and resolved by communicating with customers to understand their complaints and working on resolving them. As for respondents B and C, they stated social media to not bring problems and related this with several factors. These factors include the fact that their businesses have been operating since a short time period, the ability of social media to help the businesses obtain feedback that reduces customers' dissatisfaction, and social media being of partial use to the business according to respondent C.

4.3.7. Business Innovation Using Social Media

According to the literature review, Social Capital theory has been used in several areas to explain how innovation is created through managing relationships among individuals and organisations. Forty per cent of the respondents agreed that social media generates innovation through learning and interaction with customers. Respondent D further added that social media does not only help with customers but also with various stakeholders and allows for more innovation through establishing communication channels with them. This finding also builds on the results concluded by Groen, Wakkee & De Weerd-Nederhof (2008) and Chesney & Lawson (2015), which state that start-ups have managed to benefit from social media by developing business intelligence that helped to better understand customers and the entire business ecosystem.

Sixty per cent of the respondents disagreed with the role of social media in generating innovation. Respondent B stated that 'it is definitely not the biggest thing in the business' and respondent C claimed that social media contributes as much as only five per cent to innovation process. However, these respondents agreed that social media helps in improving the product and understanding customers' needs better through feedback that conforms to earlier studies in the area.

Despite the fact that respondents had different viewpoints on relating social media with innovation, the responses of all respondents pointed out that social media helps in communicating and obtaining feedback. This is aligned with the findings by Kask and Linton (2013) and Ma, Sian Lee and Hoe-Lian Goh (2014), who mentioned that the use of social media as an overall tool for innovation starts to prove beneficial for start-ups.

4.3.8. Social Media Investment Payoff

The literature review included several findings that highlight the added value from using social media from an investment viewpoint. Such findings include those by Perleberg (2015) and Scheepers et al. (2014), which revealed the ability of social media to provide a platform that can assist start-ups to innovate and improve business processes and product offerings at a lower cost.

Another finding revealed that the most vital element within the area of innovation is knowledge and the processes of gaining access to such knowledge (Fritsch & Aamoucke, 2013; Hall & Wylie, 2014). According to studies by Binet & Facchini (2015) and Isaacs (2014), this kind of innovative knowledge

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

in today's fast paced world is found inside the heads of people such as customers, suppliers and other stakeholders rather than in an organisation's database servers.

All respondents stressed on the importance of social media as a worthwhile investment and that it helps the business significantly. This clearly relates to studies mentioned previously. However, viewpoints and reasoning behind the use of social media has varied from one respondent to another. Although respondent A stated that 'in today's world one would struggle to grow a business without it', the respondent emphasised the need to balance the use of social media with normal business activities that keep the business operating properly. Respondents B and C affirmed that social media is a must for start-ups provided with the proper knowledge on how to use it to innovate, such as getting information from customer feedback to improve the product or service. Respondent D mentioned the use of metrics to establish a cost-benefit analysis and decide which social media is best to use. As for Respondent E, the respondent mentioned, 'it's pretty much a time investment', which is favourable for a start-up where little or no money is invested. Respondents D and E's answer to this question is reflective of the existing literature regarding the low cost of social media usage.

4.3.9. Views on Social Media as an Edge/ Burden in a Competitive Market

According to the literature review, Zolkepli and Kamarulzaman (2015) pointed out in the results of their study that the adoption of social media is driven by several factors that include the ability to innovate through providing businesses with relative advantage and computability. In other studies, Ooms, Bell & Kok (2015) and Mount & Martinez (2014) found that the use of social media improves the overall business performance and competitiveness. However, only forty per cent of the respondents viewed social media as a source of competitive advantage as they are more active on social media platforms than their competitors. Due to the nature of this study, which focuses on high-tech start-ups, sixty per cent of the respondents gave neutral opinion on social media, where it can be either serving as a competitive advantage or as a burden.

Respondents A, B and C viewed social media to be of no effect on their businesses since they own a unique product that has no direct competitors. While respondent B explained that social media might provide a means of spreading the business idea during its early stages. Respondent A viewed it as an effective tool in obtaining knowledge about competitors. On the other hand, respondents B, C and E view social media as being a burden in the long run where dedicated staff will be needed when the business grows bigger.

4.3.10. Future Potential for Social Media on Start-Ups

In the literature review, the research work of Caliendo & Kritikos (2010) and Henrekson (2014) provided recommendations to start-ups and industries to pay increased attention to the third circle of innovation – the customers and users circle, which social media plays an important role in forming, according to Kask and Linton (2013) and Ma, Sian Lee and Hoe-Lian Goh (2014). Moreover, Colombo, Grilli & Rossi-Lamastra (2014) and Bugshan (2015) concluded that the integration of social media within the company's overall innovation strategy provides further benefits, which intuitively many start-ups have come to embrace.

All respondents agreed that social media would continue to be used by their businesses to remain competitive. The respondents acknowledged that social media is vital in terms of acquiring customers'

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

feedback and improving their ability to learn about the demand in the market. Respondent A referred to impact of social media on her business saying, "…it's going to be massive upon launch…" which reflects the relative importance of the role that social media will play for her business, specifically offering low-cost marketing tools. Respondent E hoped that more specialised social media platforms would be available to accommodate the medical nature of the product provided by her business.

4.3.11. Exclusive Online Selling Over Social Media

According to Sahut & Peris-Ortiz (2014) and Criado and Sandoval-Almazan & Gil-Garcia (2013) in the literature review, there has been an increased use of social media due to the spread of online platforms. However, there is no adequate research to shed light on whether businesses have the tendency to provide exclusive online product launches. However, Crick (2012) and Yang, Weng & Hsiao (2014) found that the introduction of new technologies in today's world means that detailed customer data can be obtained with minimal effort and cost which may be a reason for a business to seek exclusive online selling.

All respondents agreed to the ability of social media to provide increased exposure to a business in marketing and selling its products. However, none of the respondents mentioned selling exclusively to online customers and insisted on initially selling physically to them. Respondent A mentioned that her business will be selling first to social media followers, while respondents B, D and E mentioned that social media will be their primary selling point. Respondents B and C mentioned that social media will allow for target selling through a proper channel and based on demographics after paying social media providers a fee.

In summary, considering the research findings, several concepts become clearer in this study. One of the most obvious findings is that social media is considered to be an essential tool in the business model of start-ups, specifically in high-tech start-ups. This is due to its ability to expand reach, update in real-time, and do so with relatively low operating costs compared to conventional marketing channels. Findings also reveal that high-tech start-ups do not rely on social media to provide a product/service. In fact, social media is primarily used as an effective and efficient feedback loop that enables entrepreneurs to understand their customers and the market. In addition, entrepreneurs are aware that in a B2C model, a relationship over the social media could create an opportunity to obtain feedback that is more thorough. However, this opportunity needs to be managed proactively as it can otherwise expose an organisation to reputational risk.

Perhaps the most interesting finding in this study reveals that most entrepreneurs view social media's contribution to their business innovation to be dependent on the ability to learn from customers, receive and apply feedback. However, there was minimal emphasis on this innovation to lead to new products/services. In fact, all entrepreneurs in this study believe that social media will continue to play an important role in their business in the near future, with some already planning to give a certain degree of product exclusivity to online customers.

5. CONCLUSION

This study contributes to the research in several aspects. The first is that it focuses on innovation that is driven by social media in B2C high-tech start-ups. It specifically highlights innovation as a broad spectrum in terms of its applicability such as customer feedback, market reach, product development,

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

and marketing. Thus, the findings of this study reveal that innovation is perceived differently depending on the stage that the business is in: infancy as opposed to a mature organisation. More interestingly, the findings also reveal that the perception of innovation differs within start-ups depending on the phase that a business would be undergoing.

According to Ooms, Bell and Kok's (2015) investigation of large high-tech companies, social media can be used as a boundary-spanning tool to build and increase an organisation's absorptive capacity. This can be linked with the earlier mentioned discussion that well-established businesses could use social media to harness the full spectrum of innovation because those businesses already have a large portfolio of products or services. Hence, they can develop, introduce and adjust a product or service based on social media. On the other hand, majority of start-ups originate from a single innovative product or service that entrepreneurs build their business model around. This has rendered social media innovation for start-ups to generally revolve around customer feedback, market reach, and marketing. Moreover, the findings of the study reveal that innovation through social media also differs among B2C high-tech start-ups in terms of business status where pre-launch start-ups exhibited a degree of dependency on social media to develop and adjust their product or service. However, start-ups that have already launched limited the use of social media innovation to customer feedback, market reach, and marketing.

The social system theory was tested by Groen, Wakkee and De Weerd-Nederhof (2008). This can be applied to high-tech start-ups in two aspects. These are social networking and economic optimisation. However, goal attainment and pattern maintenance cannot be related to this study because those start-ups are either at pre-launch status or started a couple of years ago. Consequently, the findings of this study fill the gap on the extent to which B2C high-tech start-ups use social media to drive innovation. This concluded that innovation for these kinds of start-ups is perceived as feedback, market reach, and marketing rather than product development or capturing innovative ideas for products and/ or services.

Other findings in this study revealed the overall sentiment of the respondents. It showed that they give relatively little importance to the overall role of social media when it is linked to innovation. For example, respondent C provided a small percentage (five per cent) for social media to be linked to innovation in terms of feedback and customer service. The author thinks that this sentiment can be considered inaccurate yet acceptable as the concept of innovation is still evolving as a new topic that is not fully comprehended by the majority of start-ups, thus rendering it unclear.

5.1. Research Limitations and Future Recommendations

Due to the tight timeline assigned for this study, the sample size had to be kept small. The sample size could potentially have been increased if additional time was available. This could have allowed the author to obtain a better understanding and a more in-depth analysis. From the author's point of view, respondents lacked a full understanding of the meaning of innovation, which led to limited answers. This can partly be attributed to the nature of the industry the respondents operate in. They might have viewed innovation from a high-tech point of view which could explain why majority of the respondents did not consider social media to be of great influence on their innovation. Combining this with the earlier discussion in the conclusion reveals how innovation as a holistic concept is still unclear to businesses in the high-tech start-up industry. Thus, a further investigation on this topic in the future would result in a richer dataset as the concept of innovation would hopefully have become clearer by then.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

While there are advantages of conducting semi-structured interviews, they also come with their drawbacks. They are time consuming especially when analysing and transcribing the collected data. Moreover, the language of the interviewee could sometimes be unclear in terms of accent and words given which could be hard to understand. There could potentially be a lack of trust from the interviewees in exchanging information especially when the interviewer does not personally know them before. On the other hand, qualitative research can lack transparency when collecting information. This could present difficulties to the writer in analysing findings unlike quantitative research could be more reliable in this aspect.

ABSTRACT

Access to agricultural markets and marketing information are essential factors in promoting competitive markets and improving agricultural sector development. The agricultural sector employs majorities in developing countries and contributes greatly to its development. Unluckily, majorities of the farmers are smallholders living in rural areas and thus, lack appropriate access to markets for their products and also, they are deprived of agricultural market information. As results, farmers are exploited by middlemen who offer low prices for their agricultural produce. This study presents the best way for the agricultural stakeholders to obtain easily agricultural market information service. This study presents a novel agricultural market information system which was implemented using some concepts of crowdsourcing. Crowdsourcing allows sellers to broadcast whatever produce they want to sell and customers are allowed to submit their requests using either SMS or web.

INTRODUCTION

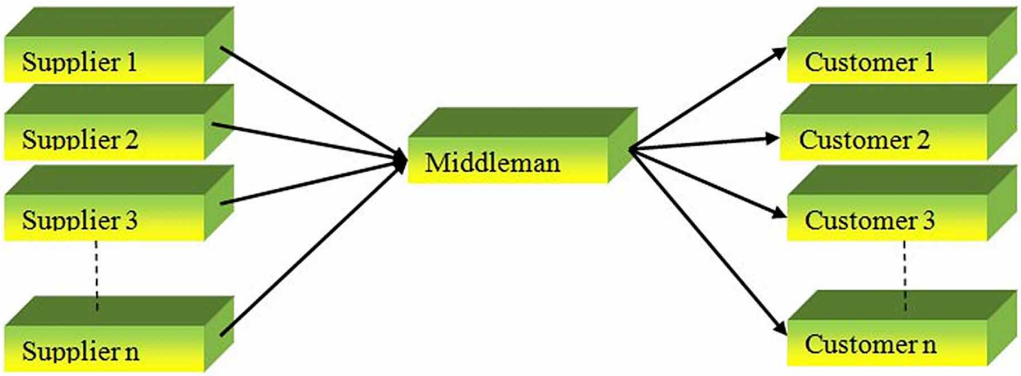
Agricultural information interacts with and influences agricultural productivity in a variety of ways. It can help to inform decisions regarding land use, labour, capital investment and farm management. Agricultural productivity can arguably be improved by relevant, reliable and useful information and knowledge (Barakabitze et al., 2015). Hence, the creation of agricultural information (by extension services, research, education programs and others) is essential to organizations that facilitate the collection and dissemination of such information to farmers who in-turn can exploit the market potentials, thereby managing the continuous changes in the agricultural production system. Therefore, there is a need to understand the functions and use of agricultural information systems (particularly agricultural market information systems) in order to improve these systems using emerging technologies as well as techniques for sourcing and advertising agricultural produce in markets (Demiryurek et al., 2008). Crowdsourcing for marketing information is one of the novel techniques in marketing. Gatautis and Vitkauskaite (2014) define marketing as "a process dedicated to relations with customers' establishment, facilitating exchanges and leading to both sides satisfaction". According to Lui (2007), different ways of marketing products include face-to-face marketing, virtual world, online marketing and crowdsourcing. Each of the mentioned approaches in marketing has its own advantages and disadvantages. Crowdsourcing platform in marketing is more advantageous since it can be integrated into all functions of the marketing. It can be used to involve customers from product design, product development, product advertisement, promotion and marketing (Lui, 2007; Whitla, 2009). Thus, crowdsourcing can change the market configurations as well as change how end users (i.e. customers) are involved during the development of a product or good to be sold in markets.

Gatautis and Vitkauskaite (2014) and Whitla (2009) present different functions which can be provided by crowdsourcing platform during the marketing of activities, namely: product management, pricing, distribution management, communications management, Marketing planning and Marketing research. In his seminal article on examples of crowdsourcing as an approach for problem solving, Brabham (2008) concludes that crowdsourcing platform provides a model capable for aggregating talents/wisdom, leveraging creativity or innovation while reducing the costs and time needed to solve different marketing problems. Market problems that are related to product management, pricing, distribution, communication, planning and research could be addressed through effective engagement of people in the crowds (Gatautis and Vitkauskaite, 2014; Whitla, 2009). This is the reason Britton et al., (2013) define Crowdsourcing as "a distributed problem-solving technique leveraging the efforts of a group, known as "the crowd". Further, Britton et al., (2013) explain that crowdsourcing allows a project to be defined and volunteers to be invited so as to contribute to problem solving in form of micro-tasks. The volunteers involved in micro-tasks solving are dispersed and may not necessarily be members of the organization owning a project. In order to solve such a problem, an organization needs to have a specific approach or framework to use while addressing the problem in participatory manner. According to Erickson et al., (2012), there are different approaches or frameworks for crowdsourcing that are grouped according to functional themes, namely: 1) common tasks performed by the crowd, 2) crowd serving as a think tank, 3) crowd assuming unique roles in specific locations, crowd serving as a platform to address organizational challenge, and 5) engaging the crowd to add value to organizations

In agricultural marketing activities, middlemen or intermediaries are introduced to facilitate matching of agricultural products with buyers. These middlemen are better equipped with marketing information and conditions they use in promoting their roles (Figure 1). Middlemen play key roles of trading,

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 1. Supplier - middleman - customer relationship (Moi University, 2017)



distributing and delivering agricultural products to markets. They also act as guarantors of quality in markets when there is uncertainty with respect to the good being traded (Biglaiser 1993; Biglaiser and Friedman, 1994; Li, 1998; Van Driel, 2003; Rao, 2008). Furthermore, these middlemen also known as dealers or brokers can help to reduce the cost of market search. Johri and Leach (2002) demonstrate how market-dealers can improve market efficiency by increasing the quality of the match between buyers and sellers in a heterogeneous market. Rubinstein and Wolinsky (1985) claim that market dealers shortens the time between transactions because they have a higher possibility of matching buyers and sellers.

Description of the Problem

The roles of intermediaries in providing marketing services particularly to smallholder farmers have not been received positively by many (e.g. Enete, 2009; Keys, 2005; Scheuermeier, 2007). Some perceived them as parasites who exploit farmers by taking away a large share of the benefit accrued from the sale of crops by taking advantage of farmers' unawareness of market prices. Intermediaries could cheat farmers by taking advantage of their lack of knowledge of market prices, poverty and weak bargaining power arising from illiteracy and low social status, on the one side, and monopsony or oligopsony types of marketing system, on the other (Lightfoot and Scheuermeier, 2007). Roy (2012) noted that intermediaries often flout market norms and their pricing lacks transparency and thus their presence reduces the returns of farmers substantially.

Existing literatures reveal that the issue of exploitation of famers by middlemen is not new, and it has been observed for years (Bauer and Yamey, 1968; Enete, 2009; Keys, 2005; Scheuermeier, 2007). Keys (2005) noted that middlemen constitute a "real face" in the otherwise "hidden hand" of the market. Poor access to markets by farmers is an outcome of lack of market information, poor or lack of road infrastructure connecting markets, and lack of means of transportation. Lack of market information has some consequences to farmers selling their agricultural produces: farmers may fail understand the real market price of farm produce, know whom to sell their produce to and, identify alternative markets for their produce. All these factors encourage the existence and operations of middlemen in agricultural marketing. Existence of middlemen in agricultural marketing and poor access to agricultural markets and market information have some related effects to farmers: poor returns after selling their farm produces,

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

low farm productivity, discouragement to engage in agriculture, poor investment in agriculture, hunger in rural areas, and poverty.

Problems of poor access to agricultural markets and market information are prevalent in developing countries including Tanzania. Majorities of farmers in Tanzania are smallholders living in isolated rural areas characterized by poor road infrastructures; lack of electricity and safe water; poor or lack of transportation means; poor or lack of communication networks; and poverty. Due to these factors, smallholder farmers tend to rely on nearby markets as sole markets for their farm produce or sell the produce at their homes. Also, agricultural traders and middlemen visit rural areas to collect and purchase farm produces and transport such produce to town markets (district, regional and zonal) or export to other countries (Magesa *et al.,* 2014).

Cases where farmers are exploited by greedy traders and middlemen have been cited by many scholars. In Mozambique, Rodrick et al. (2002) report that cashew nut growers only receive 40 to 50 percent of the border price, even after border taxes are allowed for. They go on to note:

It is clear that the marketing channels for raw cashew nuts remain imperfectly competitive. Farmers' incomes are depressed not only by transport and marketing costs, but also by the market power exercised by the traders. (Rodrick et al., 2002: p.120).

It has been argued that, the greedy market dealers contribute to poverty in developing countries (Magesa et al., 2014). Chau and Goto (2009) claim that in rural areas, middlemen make excessive profits because of their market power. These dealers take products from farmers at a relatively low price, exaggerate prices, and increase the financial burden to the final consumers. The more the middlemen and commission agents in the supply chain are the higher the price of the product (Oguoma et al., 2010). In this kind of exploitation, only the middlemen are the ones benefiting, leaving producers and consumers in a poor state. From another perspective, market brokers are considered as a threat to food security, Oguoma et al. (2010) assert that middlemen discourage genuine investors in agriculture because they hardly get fair pricing from them. It is argued that the real profit goes to the middlemen who buy agricultural products at very low prices and sell at high prices to buyers.

Several investigations have been undertaken to identify whether having access to appropriate market price information can give more power to smallholder producers in developing countries. Findings real varied outcomes: According to Svensson and Yanagizawa (2009), Uganda experienced 15% increase while in Rwanda no effects was observed. In Tanzania, farmers have strong relationships with particular middlemen that they cannot even change and choose a different one if dissatisfied; therefore, for them having being informed about market prices does not help the situation (Molony, 2008).

Some of the challenges which hinder farmers towards adopting ICTs in agricultural activities include: Lack of relevant technology, poor infrastructure and language constraints, limited access to updated agricultural information, economic hardship, inappropriate input and output prices, unconducive policy environment to support the adoption of appropriate agricultural ICTs, lack of appropriate incentives, poor access to credit and limited capacity to monitor agricultural activities (Barakabitze et ., 2016)..

The identified drawbacks pertaining to poor access to agricultural markets and market information require an integrated approach combining conventional ways of communicating agricultural market information and ICT based solutions. Therefore, in this study agricultural market information system (AMIS) is proposed and implemented. AMIS provides the easiest way where farmers are able to enter and add their products to the system. Since the proposed approach is a web based system, sellers can

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

therefore advertise the products so that they can be easily viewed by different people from different places. When new products are in the market, all the registered users of the system are notified automatically through their e-mail address about the presence of new product. This enables both AMIS users to get the updates of the products. This process of notifying users (i.e. crowds) and getting their views is called crowdsourcing. Also, farmers can use text messages (SMS) as a tool to submit their products into the AMIS for sale. This makes the products available to all parties while allowing the traders to see the information using the web or via SMS.

RELATED WORKS

According to Murugesan (2013), crowdsourcing application in East Africa ranges from those in web, social media, Internet based applications / portal / platform to mobile based system. The crowdsourcing applications in East Africa have been implemented in different sectors such as education, agriculture, health, environment and social. According to Murugesan (2013) paper, the most notably crowdsourcing platform in East Africa are:

1. **M-Farm:** Which provides up to-date market information to link farmers and buyers through a marketplace and to report on current agricultural trends (mfarm.co.ke).
2. **iCow:** A mobile app that helps dairy farmers manage their cows more sustainably in Kenya (icow.co.ke).
3. **Ushahidi Platform:** A tool that allows users to crowdsource information using multiple channels, including SMS, email, Twitter, and the Web.
4. **Ushaurikilimo:** A crowdsourcing platform for e-extension (Sanga et al., 2016).

The crowdsourcing applications are becoming common not only in East Africa but also, in other countries in Africa such as Zambia, Congo, and Ghana (USAID, 2013). Literature review presents reasons why few sellers and buyers are attracted to adopt and use crowdsourcing platform (Hossain, 2012). For example, Cui (2013) presents the weakness of the crowdsourcing platform which was developed. From Cui's study, even though there are user generated contents for markets / market information but in many applications involving crowdsourcing platform, the location of user is not known. Thus, there is a need to incorporate WebGIS in crowdsourcing platform. Thus, such crowdsourcing platforms which allow user to supply the information can be geo-referenced with Global Positioning System (GPS). Thus, there is a need for more studies to be conducted on this emerging field in computer science.

PROPOSED SOLUTION

AMIS provides a simple interface for maintenance of agricultural product information. It can be used by agricultural institutions or agricultural firms selling agricultural products to maintain the records pertaining agricultural products.

The creation and management of accurate, up-to-date information regarding agricultural products is critically important in different aspects. AMIS deals with all kind of product details, buyers' and sellers'

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

details and related market reports. It tracks all the details related to the purchase of products on a daily basis. The software developers of AMIS embedded fundamental principles of marketing (Röling, 1988).

AMIS is then integrated to the instant market access system (mAMIS) that utilize the SMS capability of the system. They connect using database matching. wAMIS and mAMIS share database using web service connection (Figure 2).

Figure 2 present a context diagram of AMIS which includes both wAMIS and mAMIS. Since mAMIS works separately but integrated to wAMIS then this paper will discuss the wAMIS in detail and leaving out the mAMIS for now. The mAMIS was just used to obtain data from the mobile based SMS from the customers and farmers only.

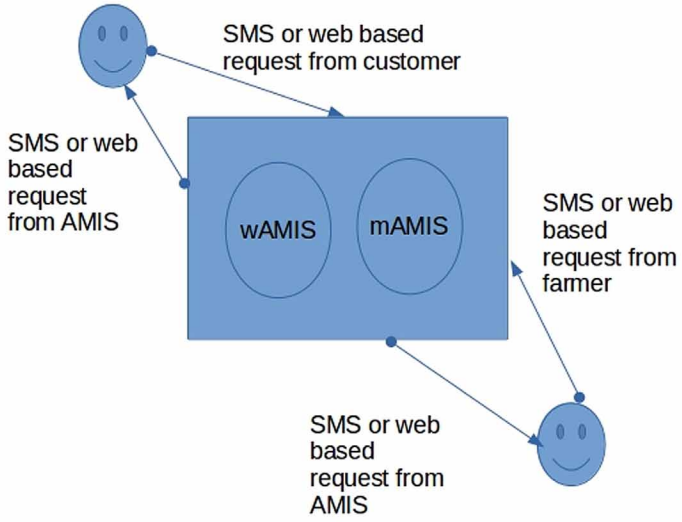
Research Method

This study adopted a mix of qualitative research and quantitative research methods. Qualitative researchers aim at gathering an in-depth understanding of human behavior and the reasons that govern such behavior. The discipline investigates the "why" and "how" of decision making. Besides this, the researcher also examines the phenomenon through observations in numerical representations and through statistical analysis. Along with questionnaires that were administered to respondents for the statistical representation of the findings in the study. interviews with the respondents and a few experts in this field was also conducted.

Sample and Sampling Method

he simple random sampling approach was adopted to obtain a more scientific result that could be used to represent the entire population. Farmers and buyers were randomly selected to reduce the potential for human bias in the selection of cases to be included in the sample. As a result, the simple random sampling provided us with a sample that was highly representative of the population being studied. The

Figure 2. Conceptual diagram of AMIS



EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

respondents were interviewed using questionnaires that were structured to solicit relevant information from each category of the respondents.

Participants

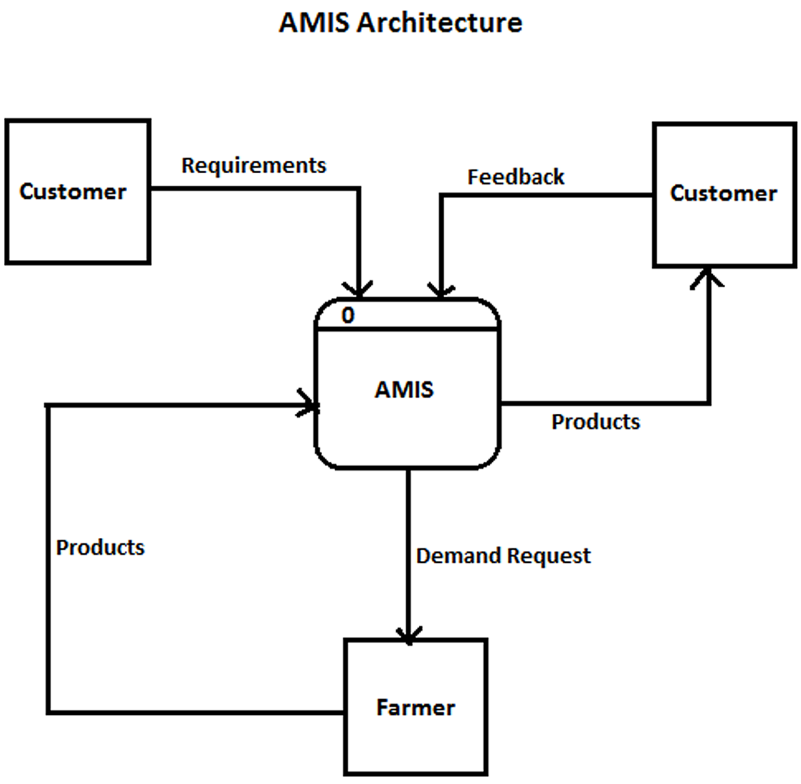
Participants were 100 farmers, most of them from farms around SUA. 150 buyers mostly from Morogoro area near SUA. A majority of the participants were male (60%) and 40% were female. Also, a majority of the participants were Tanzanian (85.8%) as a minority were farmers of foreign origin.

Design

The purpose of system design was to plan for a solution to the problem specified by the requirements document. It comprises of a detailed description of how the implementation would be organized. It was considered the most vital section of software development as any bad or good design would result to a bad or good system. The design stage included architectural design, detailed design, interface design, security design and database design.

Architectural design aimed to identify the modules that should be in the system, the specifications of these modules, and the interaction between the modules in order to produce the desired results. The specifications were carefully analyzed and a module structure that has the desired functionality was produced (see Figure 3).

Figure 3. Context diagram of AMIS



EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

See Figure 3. AMIS includes the connection and view of the farmer and the customer (Agricultural products' traders). The design allows the farmer to submit products and a customer to see the product. A customer can request for products and farmer can see the products too. The integration with wAMIS is not seen in this architecture as it works inside the AMIS system as one system.

Detailed design was broken down into 3 major modules as follows:

Front-End Design **c**omprised of the user interface which links users and the system. Users could interact with the AMIS by using the series of interactive web pages as displayed through the web browser.

Application Tier Design for providing communication between the client and the server. PHP scripting language was used to fetch user queries from the browser into the database and retrieve the relevant materials back to the user on the web page. In order for the PHP to work Apache web server with PHP scripting language was installed.

Back–End Design comprise of the Database. In the database is where information about users and products is stored so that users can access them through front-end's user interface. MySQL as the database server was used.

AMIS has mAMIS which provide alternative access to AMIS information using SMS. They share the architecture but wAMIS has web based view while mAMIS provide SMS capability access to AMIS (Table 3).

AMIS Entity Relationships

Figure 4 shows the Entity Relationship Diagram (ERD) which indicates the actual relationships existing in AMIS database. The proposed system has 8 entities that store information of the users, products and orders.

AMIS Cloud Source Information Collected

The farmers and customers were required to submit online or via SMS different types of the information. This information includes: location of product, price, amount, validity and contact information (Figure 5). mAMIS provides capability to submit payment methods too.

Field User Satisfaction Research Data Collection

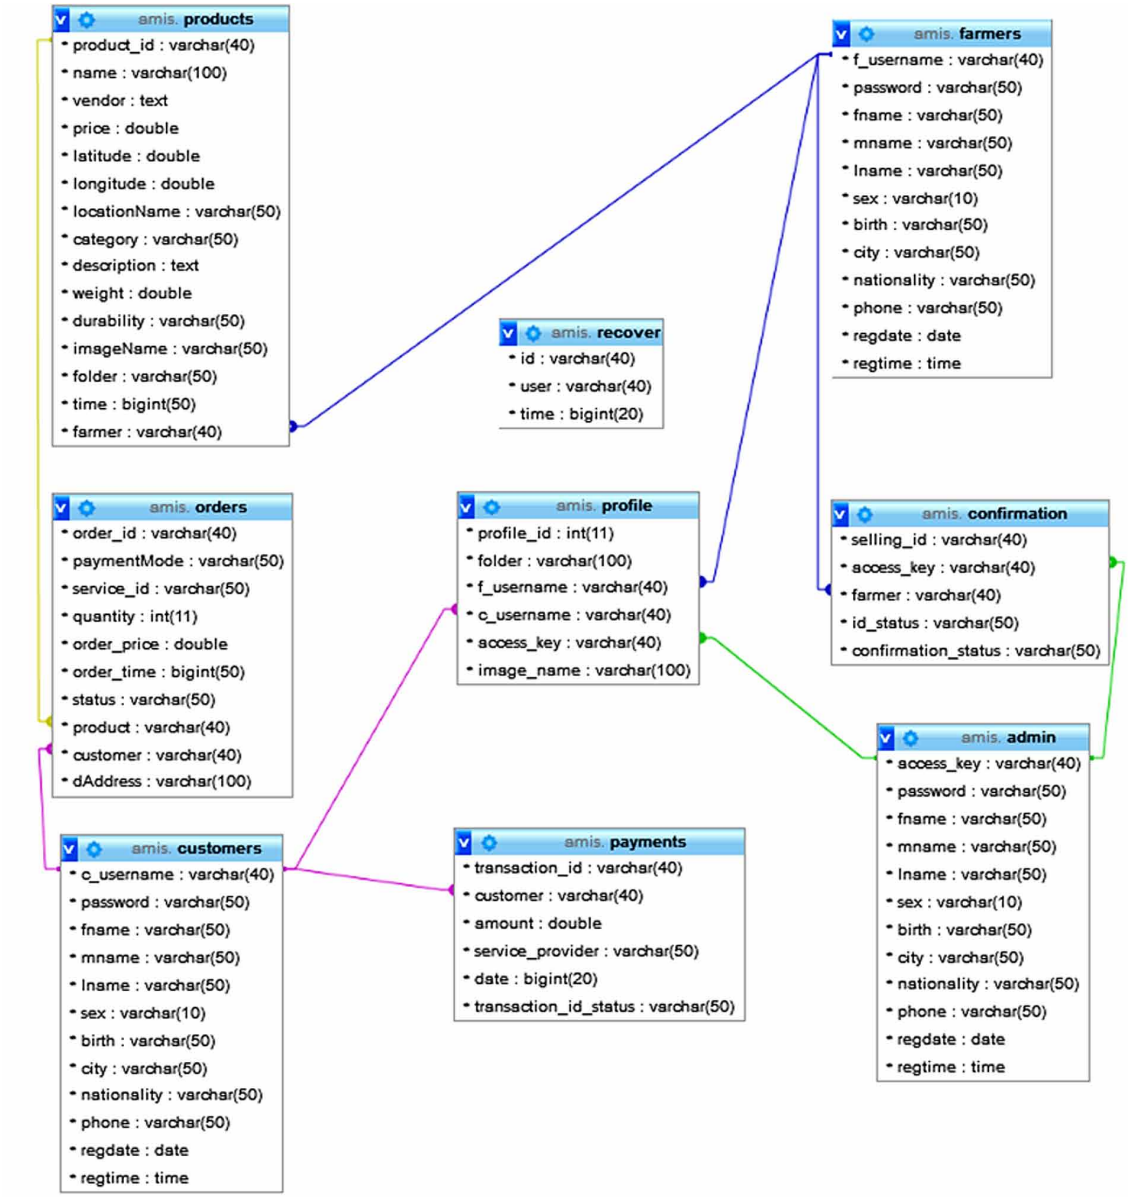
Participants were given a sheet of paper consisting of a list of questions to be answered. Farmers were given a list of fourteen open ended questions related to farming and selling activities. Buyers/customers were given a list of ten open ended questions related to their activities with system together with products of interest. After this process, answers for both questionnaires were collected and analyzed in order to identify user requirements.

RESULTS AND DISCUSSION

During the study, it was found that 80.3% of users who participated in the sample preferred a web based system where users could register themselves and perform different functions within the developed system. Among users who responded to questionnaire,45.0% were farmers selected from different areas,

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 4. AMIS entity relationship diagram



50.7% were customers and buyers of the agricultural products from different areas and 4.3% were other users who had adequate knowledge of web systems and database.

The above information is summarized in the following Table 1.

Development of database that would be used to store and manage end-user data was done with the aid of Software Requirements Specifications (SRS) and ERD in Figure 3. The basic building blocks of all data models are entities, attributes relationships and constraints. The database proposed consists of six tables which are used to store information about users and products. The first table stores particulars of farmers where different personal details are recorded such as names, date of birth, contacts etc. The

Figure 5. AMIS cloud source information collection

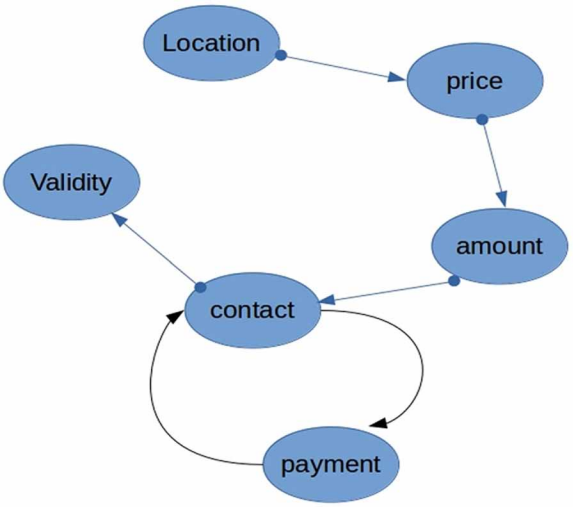

Table 1. Summary of users who prefer web based system

Category	Male	Female	Percent
Farmer	27	18	45.0%
Customers	36	40	50.7%
Others	15	17	4.3%

second table stores similar information of buyers. The third table stores particulars of products where product name, vendor, price, location (latitudes and longitudes), weight, durability and product descriptions are recorded. The forth table stores details of system administrator of the system which include access key that will allow admin to login in to the system. The fifth table stores payment details of the products when purchased by the customer whereas the sixth table stores orders of the product as made by the customers. Other extra tables are proposed by the database admin including the one for recovering passwords, another one for confirmation of sellers in the system and the other for storing profile details of the user.

Development of different graphical user interfaces that would be used by the user to input information to the system and receive feedback from the system was also done. Interfaces for the developed system are as detailed in subsequent sections.

Index Page

This is the first interface (available in amis.esy.es/) in which every user interacts when visiting the system (Figure 6). This interface consists of the lists of the available products for sale which are being advertised by the sellers. It consists of products with their pictures at the center and list of products' category on the left column where a user can click to the product of interest in order to view the product in detail.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 6. Homepage of AMIS

Product Purchasing Interface

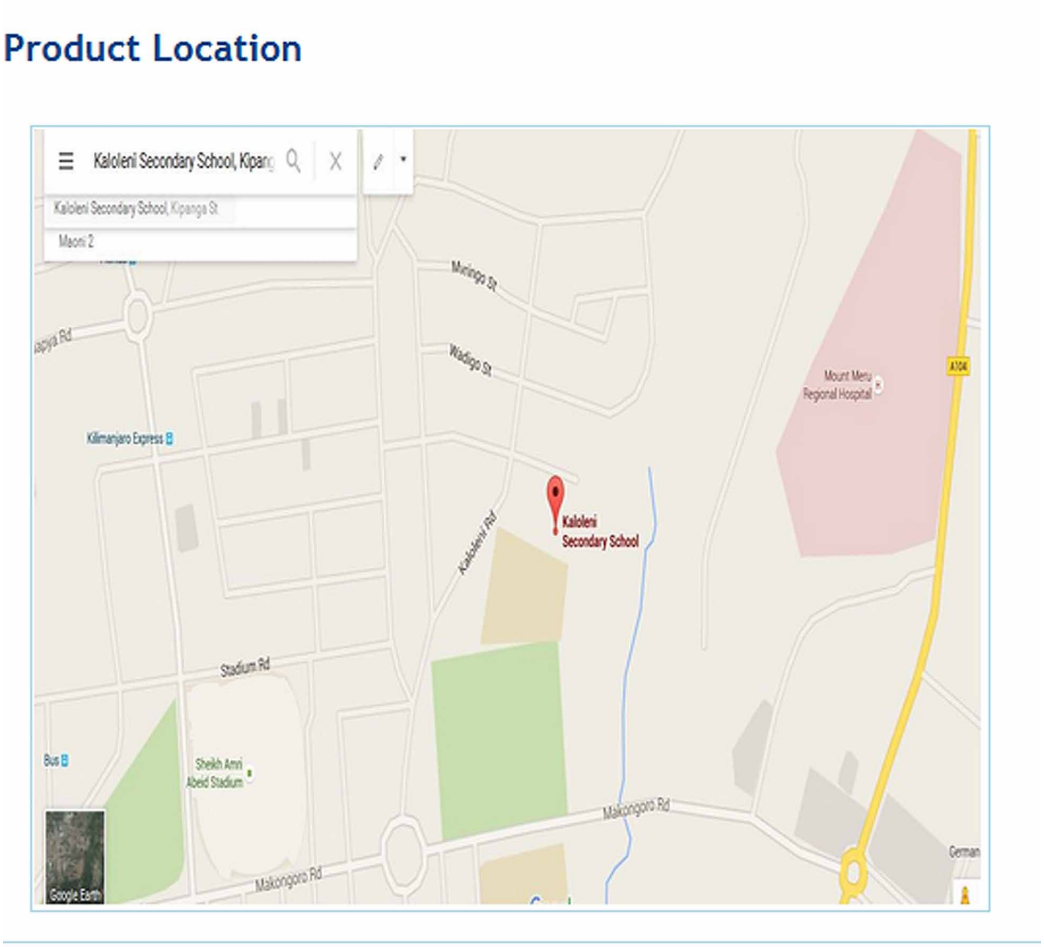
This interface is where customer will be required to enter some information in order to purchase. This information includes quantity of product to order, payment mode, service address and delivery address (Figure 7). All this information is required for proper and quick delivery of the products.

User Interface

This interface allows the users (customers and farmers) to register to the system. At the first time, users should register themselves by providing their personal details as well as the system details which are required during the registration process. Also, the users will be required to provide the email address

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 7. Map of market for information displayed on AMIS



and password. It also contains a drop-down list where users should provide their login category that is either customer (buyer) or seller.

Other interfaces that was also proposed are Add new product interface, View products interface, View orders interface, Order confirmation interface, Deleting account interface, User profile interface, and System Administrator interfaces.

Development of security design of the system for securing the sensitive information stored in the database e.g. usernames and passwords was also done. Information stored in the database, was hashed using MD5 hashing algorithm.

Cloud-Source Knowledge Base

This system collects all the information from the users (customers and farmers) and matches the information so as to enable interactions and transactions between the farmers and customers. This allows the farmers to obtain good deals from the customers directly. Most of the information is stored in a cloud

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

database allowing farmers to make easy reference of the past history of the best customers and give them opportunities to get new customers too.

The system allows researchers to monitor market information and develop best ways that will allow farmers and government to maximize the agricultural production with open systems.

CONCLUSION

The method used in the development of AMIS was the rapid prototype approach because it enables the developer to design a system which is user friendly and interactive. The prototype was first developed and users made some changes as per their requirements.

Some of users tested its usability and it was followed by the collection of more user requirements that were included in subsequent version of the system. This process was done repeatedly until the users were satisfied with the developed system.

Finally, in order for the users to interact with the developed system, dynamic web pages were created to make communication with the database easily by registering their information and viewing the information stored in the database.

A more comprehensive study to exploit the full benefits of the new technology in this field of market information system is highly recommended. This may be able to identify deficiencies in the design and content and therefore improve upon the existing system. The university should tap into the developed system so as to maximize the potential benefits of crowdsourcing agricultural marketing information.

Chapter 46
The Impact of Social Networks on "Born Globals": A Case of De-Internationalisation

ABSTRACT

This paper aims to explore the role and impact of entrepreneurs' social networks on the internationalisation of "Born Global" firms, in particular, its de-internationalisation process. The research is based on a case study approach and adopts a series of face to face and online qualitative longitudinal interviews. It provides some useful insights into the relationship management of "Born Global" entrepreneurs and unveils some negative impacts of social networks on the initiation of 'de-internationalisation'. The study reveals the importance of online social networks, high-tech communications and contemporary management techniques for "Born Global" entrepreneurs.

INTRODUCTION

Many managers and entrepreneurs, particularly in "knowledge intensive" firms, are seeking international business growth in a more proactive manner than before (Bell et al., 2004, Child and Hsieh, 2014). More and more firms are engaging in international operations in the early days of their establishment (Oviatt and McDougall, 1994, Bell., 1995, Knight and Cavusgil, 1996, Jones, 1999, Knight, 2000), They are

the so-called "Born Globals" (Rennie, 1993, Knight and Cavusgil, 1996), "Global Start-ups" (Oviatt and McDougall, 1994), or "International New Ventures" (McDougall et al., 1994).

Since Small and Medium enterprises (SMEs) have limited resources and knowledge, and different managerial styles, the experience and knowledge gained from the study of large corporations cannot be directly adopted and utilized by their smaller counterparts (Calof and Beamish, 1995, Mejri and Umemoto, 2010); The main purpose of this research is to explore networking knowledge and experiences from "Born Global" entrepreneurs who are embedded in their social networks and relationships.

This paper examines the roles of social networks, one of the most important aspects of the internationalisation of SMEs(Styles et al., 2006). It investigates a "knowledge-intensive" rather than "traditional labour-intensive" firm. A small high-tech firm in the South East of England was selected because of the considerations of methods, time-scale, and resources.

The remainder of the chapter is structured as follow: Firstly, we review relevant literature, where we critically analyse the existing internationalisation theories and research activity in this field. Consequently, we develop the research problem. Secondly, we present the research objectives and research questions. Thirdly, we discuss the methodology. Fourthly, we analyse the data from the case company. We then move on to discuss the findings and, in the light of previous theories with the aim of constructing new frameworks for understanding the internationalisation of "Born Global" SMEs. Finally, we reflect on the importance as well as the limitations of this study and suggest an agenda for future research.

LITERATURE REVIEW

There are various definitions of internationalisation (Calof and Beamish, 1995, Liesch et al., 2014), one of the most common, by Benito and Welch being "the process of increasing involvement in international operations" (Benito and Welch, 1997). Since internationalisation is multifaceted, the subject has been addressed with differing perspectives and a variety of approaches have been used to study the phenomenon. The limitations of the economics-based approach are its over-simplification of the organizational decision-making process and the adoption of rational underpinning assumptions (Calof and Beamish, 1995). Behaviour-based process theories have been criticised as being too reactive (Autio and Sapienza, 2000) and over-orderly, like "rings in the water" (Madsen and Servais, 1997). They are inefficient in explaining the internationalisation of SMEs, particularly the "Born Global" phenomenon, which refers to a firm's engagement in international operations from the early days of its establishment (Jones, 1999, Rialp et al., 2005). Network-based theories, which consider the advantages of a network of relationships, provide more multilateral elements than their prior economic- and behaviour-based theories (Johanson and Vahlne, 2003), and can explain the different behaviour of SMEs, which is ignored by the previous approaches mentioned. Yet, as Axelsson & Agndal (2000) point out, even such theories have not considered the importance of personal-level social networks (one's relations and contacts with others). Even in the limited literature about the influence of social networks on the internationalisation of SMEs, factors impeding internationalisation and the phenomenon of de-internationalisation have been ignored (Chetty. and Campbell-Hunt., 2004, Benito and Welch, 1997).

Current empirical studies about "Born Global" social networks have produced varied and often quite contradictory results due to over-reliance on quantitative methods (O' Donnell and Cummins, 1999, O'Donnell, 2014). These studies can be further divided into two main categories: those belonging to the rational perspective and those belonging to the embedded perspective. The rational perspective high-

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

lights a personal network as a lever which always provides additional resources, whereas the embedded perspective perceives the personal network as both a lever and a plug, as something the entrepreneur is embedded in for better or for worse (Klyver and Schott, 2003). Most of the existing studies adopt a rational perspective, such as for example, social relationships helping entrepreneurs minimize the risks and uncertainty of new markets (Ellis and Pecotich, 2001); social relationships can play a role as mediators and door-openers to new international business relationships, i.e. introduce potential exporters to the international actors (Komulainen et al., 2006) etc. Therefore, a need to research entrepreneurial networking in the internationalisation of SMEs from an embedded perspective occurs. Previous network studies mostly seem to take a rational perspective. Social relationships are not only a "lever" that affords the entrepreneur with additional and useable resources for forthcoming activities (Klyver and Schott, 2003), but also a "plug" that makes start-up for internationalisation less viable. Thus, current propositions of driving forces, enablers and initiators will inevitably incur criticism and be challenged. De-internationalisation refers to any voluntary or forced actions that reduce a firm's international activities (Benito and Welch, 1997, Vissak and Francioni, 2013). Previous study, such as Komulainen et al.(2006) has discovered the benign role of social networks at the beginning of internationalisation process. The literature, therefore, would benefit from more understanding into how social networks influence both the internationalisation and de-internationalisation of firms.

RESEARCH OBJECTIVES AND QUESTIONS

We intend to investigate the roles of the social network in initiating not only the internationalisation but also the de-internationalisation of a Born Global high-tech firm. This central research objective can be broken down into four sub-research questions as follows:

1. How do social networks influence an entrepreneur's introduction to potential international partners and business opportunities?
2. How do social networks influence an entrepreneur's information processes in acquiring potential international business partners?
3. How does an entrepreneur build his/her social networks in order to initiate the internationalisation/ de-internationalisation process?
4. How does an entrepreneur manage his/her social networks for the initiation of internationalisation/ de-internationalisation?

METHODOLOGY

Prior studies on SME networks focus on structural dimensions, such as size, range and density (Aldrich, 2001, Aldrich et al., 1989). However, studies in this area have mainly employed quantitative methods and provided little understanding of the content of network relationships. Case studies are suitable for addressing the "how and why" questions set up for the proposed research. For the study of relationship networks, case research, subjectivist or relativist approaches have been deemed as the best option (Easton, 1995). Coviello (2005, 2015) argues that case studies are particularly suitable for research that relates

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

to networks, in the sense that, it helps generate insights into social dynamics and the operations of both the firms and the entrepreneurs over time.

Stenbacka (2001) and Yin (2003) argue that small size, inductive approach and case study strategy may achieve more analytical or theoretical generalization rather than statistical or population generalization for a deeper understanding of people's behaviour and motivations. The selection of an appropriate case helps to define the limits for generalising the findings. Based on this suggestion, a "Born Global" small firm in the South East England was selected. The case firm, IA's business activities were international in nature. It was founded as an internationalisation accelerator to help other companies internationalize their business. Because it is rare, a phenomenological approach is considered the most appropriate.

Data collection involved interviews, analysis of company documentation, and consultation of public databases, and researcher observation. Three stages of data collection have been deployed as showed in Table 1.

Although the study firm, from here on to be called 'IA', is a small sized company, its management team has sophisticated international business experience, a sound educational background, a wealth of professional knowledge, and experience of working for big corporations. They have extensive company documents and records which include business plans, management diaries, memos, and minutes of meetings. They also have a web page displaying information in both Chinese and English languages. The present study adopted personal interviews to collect primary data. The research procedure involved a series of interviews; an initial open-ended face-to-face interview, a second telephone and online re-interview and a feedback interview. The personal, face-to-face interviews gave the opportunity to the researcher to probe if anything should be unclear or require further discussion (Zikmund, 1994). The semi-structure interview addressed the research problem themes and helped explore new issues during the study (Saunders, 2011). Telephone and online instant message conversations were used to explore hitherto unexplored and underexplored and newly identified questions which emerged following the initial interviews. This was very useful in supporting the data collection in the instances where participants could not be available for data validation and feedback.

Table 1. The procedure and contents of data collection/analysis

Stage & Purpose	Primary Data	Informant & Outcomes	Secondary Data
1. Introduction & informant consents	Initial telephone interview	The Entrepreneur (gained an initial picture of the case firms and prepared information for further interviews)	Data from FAME,
2. Interviews	a) Face to face interview b) Business plans, management dairies, transaction records and minutes of meetings	The entrepreneur (provided information from his perspective)	Company websites and press releases
	Online interview via MSN online interview	The entrepreneur and his family	
3. Follow up information seeking and Validity checking	MSN online interview	The entrepreneur	
	a)Feedback interview b)Company research reports and clients' profiles	The entrepreneur and his family	

Note: With the participants' consent, interviews were digitally recorded and later transcribed and analysed.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

The analyses of case study evidence followed the initial literature review, identification of research gaps and the development of research questions. This analytic strategy helped to ignore weak or spurious data to focus attention on relevant data. It is expected that such a process of analyses could help to generate useful findings that would contribute to in-depth understanding and reliable theory development. In order to improve the validity of this study, the chapter describes the study firm's context in detail to ensure more clarity. Credibility was also enhanced through the supply of relevant information to participants before interviews. Individual interviews, discussion, and document analyses in parallel have been used as a form of methodological triangulation. The main researcher was able to speak both Chinese and English and could, therefore, check the validity of primary and secondary data collections from Chinese and English-based sources. Several discussions about the analyses and results were conducted with the contact persons in order to verify or refute findings, and different investigators have reviewed the draft chapter.

An interview diary was kept, and the use of digital document folder was incorporated in the protocol and served as a database (Yin 2003). At the outset of this study, the researchers emphasized the importance of maintaining confidentiality of the discussions and protecting the anonymity of respondents throughout. The interview took place in the university meeting room and a Chinese office making the atmosphere open, warm and friendly. The study invited an assistant, second interviewer to act as an external investigator during data collection and analysis process so that any misunderstanding or misinterpretation of language would be minimized.

THE CASE STUDY

The Case Firm

IA is a high-tech business service firm. IA's business concept was generated in 2002. At that time, the entrepreneur identified that there was no "market acceleration" service which provides small information and communication technology (ICT) companies in the UK to accelerate their internationalisation into the Asian market.

According to IA's business plan, the vision of the business was to become known as the leading Asian market entry specialist for Western ICT companies within five years. Its mission was to provide cost-effective and accelerated market entry capabilities to its clients. IA helps clients to raise profile, build up sales channels and generate revenue. The company's unique selling proposition (USP) is to help its clients generate fast revenue from the Asian market whilst limiting their risk, costs and uncertainties, during the process of internationalisation.

IA provided four types of services as indicated below:

1. **Market Research:** Before small ICT companies enter the Asian market, IA will help them to perform a viability test which identifies chances of success. It can provide information such as existing demand, channel players, competition, product substitutes, other local requirements and the level of investment needed to launch and support products/services. IA also uses its networks to advise clients on how to select local partners including joint-venture partners, distributors, value-added resellers, and software developers or service providers.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

2. **Marketing Services:** These small ICT firms may have insufficient capabilities to promote their products and services. Therefore, IA can provide marketing services for presenting their companies to Asian audiences in local languages and in a way which is effective in the target market. These marketing services include translation of manuals, user interfaces, websites and documentation, presentations, press releases, web marketing including web site design, search engine optimisation, newsletters, email campaigns, event management, public relations, product launches.
3. **Sales Services:** IA can operate as its clients' local sales contact in their selected market. It can adopt either a direct sales approach or provide support for the selection, appointment and management of partners. The sales services include selecting and appointing distributors, resellers and service providers, identifying and negotiating with joint-venture partners, conducting end-user sales programme, telesales programme, training programme, product demonstrations, and pre-sales consultancy.
4. **Representation:** IA is also able to take responsibility for its clients' business in China by providing a comprehensive and fully managed sales, marketing and technical support operation, effectively becoming their branch offices. By doing so, IA will help their clients to establish their market position faster. IA is willing to share its virtual office in China (VoiC) with its clients. This service provides its clients with a Beijing office address which they can put on their websites. It provides them with Chinese web pages which are optimised for Chinese search engines. It handles enquiries on their behalf in Chinese and writes a summary of each enquiry in English for clients to respond to if they wish to.

EVOLUTION OF RELATIONSHIPS DURING INTERNATIONALISATION.

The Relationships With Internal Business Partners

In 2002, the entrepreneur, hereon called Mr. EB developed the business concept for IA and discussed this with his former subordinate, hereon called Mr. BH in Beijing China. They both agreed that this high-tech ICT "market acceleration" service would have a great potential for international China-UK high-tech businesses. Their social relationship was the main component of the formation of the company. However, like every new partnership, there were initial conflicts and disagreements which had caused some serious problems for the further development of the company.

Another business partner, Mr. S was a distributor for company CR, Mr. EB's former employer. He had over 20 years working experience in selling IT products and solutions to large Indonesian, Singaporean and Malaysia organizations such as government departments and banks. At the time of the study, he was an associate of IA in South East Asia. He contacted Mr. EB in a proactive manner and they were setting up a new subsidiary company for IA in Singapore.

The Relationships With Clients

IA currently has two kinds of clients; (1) direct clients (paying clients) who pay for IA services and commission based clients who are only willing to pay IA an agreed percentage of sales revenue.

IA currently had three commission based clients: T, a British electronic transaction service company and B, a British designer and manufacturer of landline and wireless telephone equipment and A, an

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

American Instant Messaging (IM) technology company. IA's two direct clients include R, an American software specialist for university accommodation and conference service management and F, a software company providing electronic document solutions.

In the business relationships above, the most important one in terms of revenue was the relationship with company R. Mr. EB met R's sales director Mr. Cr. on Europe's foremost global online networking platform, www.openbc.com. At that time, they did not know about either one's business; they talked about computer technology problems on the Bulletin Board Service (BBS) forum openly. They also talked about personal interests such as golf and travel. In August 2004, they discovered that they would both attend the same exhibition in Bangalore, India and arranged a meeting. The first time they met each other face-to-face was at the end of 2004. The sales director Mr. Cr. was very happy to introduce Mr. EB to the CEO of the company R. they had dinner together after that introduction. When Mr. Cr. and the CEO of R visited London, Mr. EB picked them up at the airport and treated them sequentially. Mr. EB elaborated on the potential business opportunities in China. After a couple of follow up conversations and discussions, they formulated a five stage strategic plan from market research to product launch and sales in China.

Mr. EB met A's CEO Ca. in the Infosec exhibition at London's Olympia, which is Europe's Internet & Network Security show which features over 200 exhibitors from around the world. Before Mr. EB visited the exhibition, he identified some fast growing ICT companies which had not exploited the Chinese market. He did this by browsing their web pages and making some cold calls to make further enquiries. Following that, he successfully built up business contacts with the CEO of company A and formed and signed a co-operation framework agreement. Mr. EB's commented on his relationships with Ca that: "The relationship is still very 'matter of fact'. He seems just interested only in talking about business and keep the relationship shortly within a planned agenda. We had short conversations and meetings since that first meeting in London. I had only spent one evening with Cr. having dinner at an Indian restaurant near the airport. I sometimes find this style difficult."

Mr EB was still employed at his previous place of work when he started his business and only ended his life as an employee when he realised the full potential of his business and the fact that he needed full attention for his own business. The other three clients are the current or former customers of Mr. EB's previous employer. According to Mr. EB, he thinks that these relationships are business orientated rather than social orientated. "I have to be partial to my [previous] boss' clients. I cannot push them, sometimes these relationships are my burdens because I am unwilling to let my [previous] boss know that I am doing business with his clients. Actually, none of them is my major clients now."

The Relationships With Local Partners

IA's external partners in China include the potential dealers, distributors, original equipment manufacturers (OEM), outsourcing and licensing partners, buyers, software testing, localization co-operators etc.

BH's social relationships are playing a main role in the business development process. For example, one of his friends Lz, the owner of the company, offered to share office space for free and also introduced some potential business partners to IA. One of these partners is a well-known software outsourcing company. BH's social networks also helped IA to bring some potential partners in the Beijing region. However, BH's social networks have some regional restriction because most of his contact people are mainly in Beijing and North East China. Occasionally, Mr. EB suggested potential contacts that might bring some useful information for IA. BH seemed uncomfortable to contact people outside his existing

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

contacts and networks. In addition, some of his friends, e.g. Lz, in his social networks had caused some trouble for IA cooperation with other companies.

In other parts of the Asian market, Mr EB's social networks have also reached India, Singapore, Korea and Japan. These social networks provide local contacts and business information for IA. The most significant social relationship is Mr. JPH, the vice president of a Korean distributor. Mr EB has a good relationship with Mr. JPH. Every time Mr. EB visits Korea, they had dinner and Karaoke together. In return, Mr. EB also entertained Mr. JPH and his wife quite a few times while they visited Singapore. When Mr. JPH's daughter came to the UK to study at a London university Mr. EB helped her many times. Therefore, Mr. JPH became an important family friend of Mr. EB. Mr. JPH had also helped Mr EB a couple of times to check up on IA's potential business partners and had helped to prevent some potential cheats.

The Relationships With Common Interest Groups and Professional Service Providers

Mr. EB's accountant Pa helped IA not only to perform the company's registration but to also advise on international tax issues, shareholder's agreements, the annual accounts etc. Mr. EB's solicitor Ps helps IA look after their intellectual property rights (IPR), company strategy, and international business contact issues and so on.

Also, IA benefits from Mr. EB's relationships with his friends in the European market acceleration business and in his consultant networks, www.abcol.com and internet common interest group association, www.linkedin.com and www.openbc.com. "I need to meet new people because my existing social networks do not always have the experience and knowledge of international business."

THE SOCIAL RELATIONSHIPS EVOLUTION PROCESS

The Establishment of Social Relationships

The present analysis is based on Ellis (2000)'s classifications of origins of business relationships: planned networking, business-social networking and non-business social relationships. As an entrepreneur of a "Born Global" firm, Mr. EB has built up his social networks through different approaches. The most common way to originate social relationships for the case entrepreneur is through activities related to his work. His relationships with former colleagues, clients, distributors are the main sources for his social networks. Another popular way to build up his relationships with people is through attending exhibitions and conferences, for example, Infosec, London; IT.com conference, Bangalore, India. Mr EB has also developed his relationships with people through some business events, for example, his relationships with the Russia businessman Ir was built up in one Chamber of Commerce London Event. This relationship actually provides our case entrepreneur with emotional and commercial support for IA's development. In addition, he builds up social relationships with people on some internet chat rooms and professional BBS forums, such as www.openbc.com, www.linkedin.com and www.abcol.com. Also, he benefited from his position in his previous immediate employment which provided him with the opportunity to

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Table 2. An illustration of some important social networks in IA's internationalization process

select some potential clients from his employers' client base. In the case study, only the relationship with one client, company A, was built up through a planned cold-call. Important relationships were generated after leaving employment to focus fully on IA and its internationalization.

The Maintenance and Transformation of Social Relationships

For the case entrepreneur, the most popular methods used to contact his social networks is through the internet, i.e. email, Skype[1], MSN[2], ICQ[3]. He also manages his social network data by using some software programmes and a customer relationship management (CRM) system, which helps him to record and categorize his social contacts, to remind him of the time and location when they first met, the main contents of the last conversation, people's birthdays, wives and kids' names and so on. He admits that he will probably contact these people at least once every two months by telephone. Occasionally, he will contact people such as accountants and solicitors through post due to some original paperwork that cannot be done through electronic documents. Moreover, he takes business trips to visit his existing or potential business clients and partners frequently.

The value of Mr. EB's relationships is to provide his clients with contacts in his networks for new markets. For instance, European colleagues Ir helped IA reconstruct its business concept and operational models. The relationships with different Asian countries led to his ambitions to set up subsidiaries in those countries. Some of his business relationships had been transformed into family friends, for example, Mr. JPH. Some pure social friendships, for example, the online social relationships with Cr had become a business-social relationship. "Actually, I don't really make a distinction between social, personal and business exchange relationships. I am a social person and tend to treat everybody as a friend." Most of the important people in his networks with respect to the internationalization process have ICT market knowledge. He had some comments on relationships with people who come from different countries, for example, he thinks that many American businessmen tend to keep their relationships purely business orientated.

The Enhancement and Impairment of Social Relationships

Not all of Mr. EB's relationships could go further. It requires the efforts from both sides. According to the interviews, Mr. EB's relationship with his business partner BH was impaired because of some disagreements and distrust. This actually caused de-internationalization (Chetty 1999, Benito & Welch, 1997). "Maybe BH does not want other people to know that he is doing our business. I asked him to host our company webpage in China to optimize Chinese search engines. It took ages for him to respond and he has not finished until now."

Another example, when BH was looking for a distributor for the company F in China, one of his friends, Mr. Lb, introduced a potential customer to IA. However, Lb asked our case entrepreneur to help his son to get a job in London which is difficult to do because of various reasons. The social relationships had been impaired after Lb realized that Mr. EB was unable to help. On the contrary, some relationships have been enhanced due to the frequent communication, for example, Mr. S is going to set up an IA subsidiary in Singapore soon. "I need to prepare incentives to stimulate some of my relationships, and I also need to understand when and how I have to stop my relationships with what kinds of people. Otherwise, it will influence my business"

Information About International Business Opportunities

From Table 2 it is evident that social networks play roles as "lever" and "plug" in facilitating the access to international business opportunities. An illustrative quote from our case entrepreneur suggests that:

"I have experienced some strong criticisms from my social networks in the identification and evaluation of international opportunities, particularly for some complicated, brand new, innovative ideas when I communicated to people in my social networks that lack similar knowledge and which are outside their experience. It is difficult to make them understand the business opportunity; what do we want, and what is the opportunity. They bring some wrong information when we were evaluating the opportunities. For instance, when we discussed the business concepts of T who provides electronic transaction through its web page service rather than traditional software, BH was unable to understand what kind of opportunities there are. He brought some wrong market information; wasted time and money and almost lost this contact. In my case, a lot of business opportunities cannot be delivered due to the limitations of my existing social networks."

However, not all these criticisms have negative results. Some of the criticisms helped IA reconstruct its business model to reassign resources and also modify targets:

"When we first started up our business, we contacted a lot of clients who are commission based only. I thought that they should be my main concern and clients. I talked to Ir who is doing a similar market acceleration business in European... He criticized my business concepts and commented that it is the worst thing for a market acceleration company. If I do so, you must be mad or desperate. I disagreed with them for a while. Finally, it had been proven that it is true. It wasted a lot of my time and efforts to do the pre-internationalization research for my clients without any returns. Now I am targeting more on some well-funded companies with great growth potential and did not consider entering the Asian market yet. They would like to pay for my service directly. After my conversation with Or, I understand how to present ourselves to potential clients. How to show them some baits; show them that they need to pay IA to get things done; show them some 'real opportunities' e.g. some profitable potential customers in the Asia market. Make thing happen is what our organization want. It took me a long time to reach this stage. Without the criticism from my social networks, it might have taken even longer."

Information About International Business Partners

The most important relationship for IA is the one between the co-directors. At the time of the study, the relationship between Mr. EB and Mr. BH was deteriorating. Some disagreements, complaints and doubt emerged and the company was in a crisis. Mr. BH was not only Mr. EB's subordinate but also his personal friend. They had a close and trusting friendship, however, this close relationship had been changed since they formed IA with equal joint ownership and directorship. EB chose BH as his Chinese partner only because he had worked with BH for a long time and assumed that the friendship would translate into a good business partnership.

However, EB discovered that BH lacked the required transparency, honesty and commitment to make the business partnership work. For example, he found out that BH was involved in some projects with other people. In the process of delivering IA's project, BH did not finish what he said he would do. He was unwilling to work full time for IA even though EB would like to pay him a higher salary. In addition, although EB wanted to conduct the in a transparent and open manner, there were some suspicious financial expenditure issues from the side of BH. The situation therefore led to disagreements. Although

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

IA China Ltd had been registered in the UK, it had not been registered as a formal company in China because BH did not want to pay tax and administrative fees to the Chinese Authorities. In addition, BH's job commitment and performance were below what was expected. For example, when EB was taking a vacation, his mobile messaging, which was connected to his email mailbox showed that there was an important inquiry which came from an important client, company R. Then, he reminded BH by email and asked for a response. When EB came back to England from the holiday, BH was yet to deal with the inquiry and a phone call to him at the time showed that he was sleeping on the job at 3:00pm local time.

Such complete disregard to clients and poor attitude to work led to the erosion of confidence. This led to EB considering the option of ending the partnership to seek a new partner who would be more qualified and committed to setting up subsidiaries in other Asian countries. EB argued that: "Social relationships can provide me with an easy way to find business partners. However, it is not always the case. We need to consider whether these potential partners have the capabilities to help you develop your business. Are they the best ones for you?" This led to EB to conclude that entrepreneurs cannot over-rely on their social relationships in seeking international business partners. They needed to develop the profiles of their prospective partners by researching extensively on their suitability. For example, resources, knowledge, experience, reputation, capability, complementary information etc. are important if the partner is to help the business succeed and grow.

Introduction to Potential International Partners

The establishment of IA China Ltd's Beijing office thanks to BH's social relationship with his friend Lz, an entrepreneur who had an office in Zhong GuanCun Industry Park. Lz shared his office with IA without charging a fee. BH kept a very close personal relationship with Lz. Through Lz's introduction, IA was able to increase contacts, for example, Ensemble, an important Beijing software company providing software testing and localization services. However, after the 2006 Chinese New Year, there were some financial conflicts between Lz and Ensemble. Due to BH's close social relationships with this friend, Ensemble tried to disengage the co-operation with IA. "Guanxi" in China plays a vital role between business partners. BH and our case entrepreneur attempted to explain and appeal to the CEO of Ensemble that Lz is not a shareholder of IA's business. They had to go virtually rebuild the relationship. They had to spend a lot of money and time, for example, buying dinners and gifts for the CEO's wife etc. The situation with rebuilding the relationship with Ensemble delayed the implementation of their strategic plan.

ANALYSIS AND DISCUSSION

The Answers of the Research Questions

1. **Building Social Networks:** On the initiation of internationalization, an entrepreneur can utilize both "relationship sediments" that date from a number of years back (Axelsson and Agndal, 2000) as well as some new networks, which have been built up more recently. The entrepreneur of the case firm had built up his relationships with people who are important for the internationalization process through various ways. Personal relationships and contacts generated from his previous place of work, whilst some specific preference were given to selecting people who have worked

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

with him and have similar industry backgrounds. Marketing events, such as exhibitions or Chamber of Commerce activities are usually a starting point for developing networks and building relationships. Online social networks are other important resources for developing networks. Developing online relationships are important for supplementing other approaches to building social relationships. This finding supports earlier research results related to building online social relationships (Cummings et al., 2002). Anderson and Jack's (2002) findings also show that social relationships and social capital development are not only based on commercial transactions but can also be built and/or maintained through a variety of forms of online relationships.

2. **Management of Social Networks for the Internationalisation Process:** The case entrepreneur relied on his solid educational and technical background to dictate preference and use of technical software programmes such as personal information management and customer relationships management (CRM) systems to manage complicated social networks. In order to overcome some barriers such as time difference and expenditure on telecommunication fees, the reliance of the information and communications technologies such as the use of Internet Instant Message services can reduce cost whilst at the same time enhancing customer satisfaction. Maintaining frequent contact with existing and potential contacts would bring more value to organisations. In the networks management process, some business-orientated relationships have been changed to personal socially orientated ones. Development and interaction of social relationships is an ongoing process and not necessarily a purposeful act (Jack and Anderson 2002) and this can, of course, have benefits, as well as disadvantages. The relationships between the entrepreneur and his clients can prove that social relationship enhancement, on the one hand, increases entrepreneurship and initiates the internationalization. On the other hand, impaired relationships with previous clients could be deemed as an initiator of *de-internationalization*. Existing literature has not adequately highlighted the effect of impaired relationships on de-internationalisation.
3. **Social Networks, Information Acquisition and International Business Opportunity:** The case entrepreneur's social networks bring business opportunities from his current clients, as well as from online social networks, a finding which is consistent with previous studies by Ellis and Pecotich (2001) and Komulainen et al (2004). Some New Venture Internationalisation (NVI) theories (Oviatt and McDougall, 1994) suggest "Born Globals" have the capabilities to seize the cross-border opportunities unseen by competitors, which fits the case company. This empirical data also supports Holmlund and Kock's (1998) findings that personal contacts initiate internationalization. However, the empirical data from the interview has also pointed out the barriers and criticisms from the entrepreneur's social networks. These barriers and criticisms also have both positive and negative results, as already identified in previous literature (Klyver and Schott 2003). For "Born Global" firms in the high-tech sector, firm innovativeness enhances business opportunities; however, the opportunities in the sector are often complex and not easily understood. Therefore, only a limited number of the members of entrepreneurs' narrow social networks would have the requisite knowledge and experience to perceive such opportunities. In the case study, friendships between the entrepreneur and a Russian counterpart in a similar business who is actually playing a mentor's role in IA benefited the latter in terms of the business opportunity identification and evaluation processes. This also agrees with Mainela's (2002) previous study of the importance of friendships and social relationships in the internationalization.
4. **Social Networks, Information Acquisition and Potential International Business Partners:** Social networks of an entrepreneur are made up of personal trust, mutual sympathy, and confidence

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

(Komulainen et al., 2004, Komulainen et al., 2006). In the case study, these relationships can be both enhanced and impaired and this depends on the balance between exchange and expectation. Having the co-entrepreneur as a partner and utilizing his social networks is one of the most important elements to access foreign business networks. This can be interpreted using theoretical frameworks such as Crick and Jones's (Crick and Jones, 2000) contacts pattern and Johanson and Vahlne's (2003) individual level psychic distance. In creating the entrepreneurial venture, the entrepreneur of IA selected the co-entrepreneur as a partner because they had known and worked with each other for years. These are the opinions that had been studied by some scholars previously (Holmlund and Kock, 1998, Ellis, 2000). Previous studies emphasized that uncertainties and risks of internationalization could be minimized by social relationships (Ellis and Pecotich, 2001). However, the case entrepreneur had occasionally regretted his selection of partners from his network of social relationships. On the contrary, he thinks that this is the riskiest thing. "If he is an employee I can fire him, but if he is already my friend, it will be very difficult to get rid of them." He thinks that entrepreneurs should always be realistic about the challenges involved in determining how a business partner is selected.

5. **Social Networks and Introduction to Potential International Partners:** Komulainen et al (2006) point out that social relationships can mediate or open doors to new business relationships, i.e. introduce the potential exporter to the international actor. However, in our case study, the co-entrepreneur's friend (a referee) had quite an opposite effect, i.e. that of being a 'door shutter' for IA to an important localization partner. At the beginning, when their relationship was still harmonious, the references provided for IA increased. However, when this referee's reputation declined and the relationship with the localization partner was damaged, the relationship between IA and the localization partner also deteriorated. Thus, damage to the reputation of the profile of the referee in local business networks decreased the initial credibility and legitimacy within a market.

FINDINGS FROM THE CASE STUDY

The Other Side of Social Networks: Internationalization and De-Internationalization

The present study has identified a weakness in the research of internationalization of the firm and notes that absence of adequate de-internationalization literature. Although scholars had already observed this phenomenon (Chetty, 1999, Benito and Welch, 1997, Calof and Beamish, 1995), however, the reasons and causes of this phenomenon have not been studied in depth yet. In the case study, the impairment of social relationships seems to be playing an important role in the process. A research proposal of social influence of de-internationalization may have a prosperous future.

Another finding of social relationships in the internationalization is its negative effects for the "Born Global" SMEs. As already mentioned, current literature emphasizes the positive benefits generated by social networks towards internationalization performance. Particularly in high-tech sectors, people in social networks might misunderstand high-tech international opportunities and thereby end up providing inaccurate market information. People within social networks might not be qualified to be business partners. Without careful scrutiny, forming partnerships with members of social networks could adversely affect a business when challenges arise. In particular, challenges related to trust between partners and

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

the lack of motivation that may arise from a partner can easily throw the company into crises. In addition, the damage of relationships with a low profile or bad reputation local partner can also damage the credibility, reputation and legitimacy of a company which could lead to suspicions or bias from potential international business partners. The ongoing relationships between references and the people they introduce to entrepreneurs have a very strong impact on all parties. In sum, the negative impacts from social networks will lead to the initiation of de-internationalization. Figure 1 shows a new framework adapted from Komulainen et al (2006) on the influence of the social network in the start-up of the internationalization from an embedded perspective.

Managing Relationships in the Internationalisation of Small 'Born Global' Firms

In high-tech sectors, quite a few international businessmen will normally have both good marketing education and high-tech knowledge background. These might be the starting point for the outward-mindedness of the "Born Global" entrepreneurs (Crick and Jones, 2000). These people have their own social networks and preferred ways of making friends and getting along with other people. In the case study, some internet communication tools have been adopted by these high-tech people for a long while. Some software programmes have been used to deal with the complicated social relationships from different countries and different industries. However, current literature does not throw adequate light on the influence of networks and relationships on the internationalization small "Born Global" high-tech firms.

Figure 1. The social network influence in the initial internationalisation from an embedded perspective
Notes: developed and integrated with Komulainen et al (2006)'s model

The Importance of Internet and Online Relationships

The importance of the online relationship for entrepreneur of "Born Globals" firms is revealed in the case study that suggests that online relationships developed into social oriented as well as business-oriented relationships which encouraged cooperation and the establishment of a strong and lasting business relationship. Consequently, online relationships might actually supplement or substitute existing social relationships to help "Born Globals" firms to overcome the limitations of existing social networks.

PRACTICAL PROBLEMS

The relationship problem between co-directors is the biggest drawback. Although the case company was registered as a private limited company, its operation is more like a partnership. There are some control problems within the company because of the equal share of the business partners. For the studied company, the communication between two partners is not transparent because they began to distrust each other and the partners were not adequately transparent with their activities within and outside the company. Without trust and the free flow of information between partners maintaining social networks and business contacts with both local and international clients become more challenging. This occurs because the partner, without the benefit of full information, may not understand the needs and business concepts of existing and potential clients adequately. This could, inadvertently, lead to loss of business opportunities. It is therefore extremely important that partners communicate effectively about the needs of their clients to ensure that the absence of one partner could not lead to loss of important business contacts or potential business.

LIMITATIONS

Although our study reveals new perspectives on the impact of social networks on "Born Global" firms, with a specific focus on the high-tech SMEs we note that there are areas of the study that could be strengthened to improve our understanding of the phenomenon under study. The findings of the current study have some notable limitations: First of all, the research is based on a single firm case study and opens the findings to well-known limitations of case study research. The rigor of case study research is one of the main concerns (Yin, 2003). Some equivocal evidence or biased views might also influence the direction of the findings and conclusions (Yin, 2003). This is a single case study to explore the social relationship in the initial start-up of internationalization for a "Born Global" high-tech firm in ICT sector. The findings may not necessarily work in other contexts, for example, other industries, non-Chinese markets, and traditional manufacturing firms. Our inability to check responses with other interviewees limits the strength of some of the findings. The study could not do so because the interviewee of the case company suggested that the researcher should not approach other respondents and informants outsides his company due to privacy, trade secrets and business etiquette issues. This means our current study is deficient in being able to provide sufficient variance and data triangulation as suggested by Yin (2003). There are also limited available public secondary data of the case company that could provide additional supporting evidence, given that the case study company was still in the early stages of its initial start-up.

CONCLUSION AND FURTHER RESEARCH

The dominant theme in the internationalization of SMEs, particularly, "Born Globals" literature has paid little attention to the influence of social networks. However, even within the limited studies, almost all of the research focuses on the merits of social networks. This research was motivated by the insufficient knowledge about the negative effects of social networks on the de-internationalization of "Born Global" firms. The present research focused on a rare case of a small high-tech firm in the UK whose business is purely internationally orientated. We investigated how social networks influence its initiation of the internationalization process. The analysis of the case firm uncovered some potentially negative effects of social networks. Some elements of social networks formation, such as online social networks and relationships management system deserve more research attention. There is a need for further research to investigate "unsuccessful factors" or "pitfalls" of social relationship in order to generate a guideline for entrepreneurs to minimize their errors. The social networks impact on "de-internationalization" should receive researchers' attention. From the research findings above, there also a need to explore the influence of online or internet social networks on the "Born Global" internationalization process in depth.

The findings of the present research suggest that every entrepreneur base their internationalisation strategy on prior experience and perception. Actions are based on perceptions, therefore, the internationalisation process occurs to a large extent in the international entrepreneurs' minds. Furthermore, social networks play a big "plug" role in the initiation of internationalisation which could be, in fact, preventing the international start-up process, particularly in rapidly growing "Born Global" firms. Further theoretical contributions of the present study include the exploration of a potentially negative influence of social networks on the internationalisation that has been ignored from a rational perspective; the identification of online social networks towards the internationalisation and the significance of high-tech communication and management techniques support in the growth of "Born Globals". From the case study, the de-internationalisation phenomenon can be described as a negative result which can be triggered by social networks impairment.

KEY TERMS AND DEFINITIONS

Born Global: Firms are engaging in international operations in the early days of their establishment.
Case Study: A research strategy investigating a phenomenon within its real-life context.
De-Internationalisation: Any voluntary or forced actions that reduce a firm's international activities.
Entrepreneurs: Those business owners launch and run a new company.
Impairment: The state or fact of being impaired or damaged.
Negative Impact: Those drawbacks and obstacles decreasing a company's performance.
Social Networks: One's relations and contacts with others at the personal level.

ENDNOTES

1 Skype™ is a programme allowing telephone conversations via the Internet. Calls to other Skype™ users are free as well as calls to regular telephone and mobile telephone numbers all over the world are at a low rate.

2 The .NET Messenger Service is an instant messaging system developed by Microsoft. It works together with Microsoft's Passport system to allow users to send messages to each other online.

3 A chat program that can be set to notify the user when friends are online; it seeks out friends of the user so messages and files can be exchanged.

Chapter 47
Re-Inventing the Social Business Model:
New Opportunities for the Third Sector Organizations in Italy

Dario Cavenago
University Milano-Bicocca, Italy

Laura Mariani
University of Bologna – Alma Mater Studiorum, Italy

ABSTRACT

The recent global economic crises and the decline of the traditional welfare state are challenging the development of third sector organisations involved in the provision of public services. With the support of the Italian case and the experiences of different Italian third sector organisations, this contribution highlights how organisational survival and growth require reinvention of the business model, commencing with the concept of social, economic and environmental sustainability. The scope of third sector organisations depends on the type of government, the stage of economic development, the model of civil society, the existence of philanthropic traditions and the law and regulation. All these variables affect the business model of third sector organisations. This chapter contributes to the third sector knowledge in Italy and concludes with a discussion on solutions that are able to incentivize the use of entrepreneurial principles, stimulate networking, cooperation and growth while maintaining the relationship with the territories.

INTRODUCTION

The global economic crises, and the decline of the traditional welfare state, are two important challenges that third sector organizations (TSO) are facing. In particular, the survival and the growth of these organizations require the re-invention of their business model, starting from the concept of social, economic and environmental sustainability.

The Italian Third Sector has some peculiarities that make this case emblematic (Borzaga & Fazzi, 2011; Mariani & Cavenago, 2013; Ranci, 2015). On one hand, the institutional context, characterized in the past by a farraginous regulatory framework, is now evolving toward a model in which the barriers between nonprofit and for profit sector are reducing progressively. On the other hand, the Italian TSO have to reduce their structural dependence from the public sector.

The theoretical framework aims at defining the task environment of TSO operating in regulated institutional contexts. Welfare societies, in fact, rely on a complex mix of different providers (state, markets, family, and TSO). At the same time, changing welfare discourses have opened up space for new partnerships, divisions of labour, and responsibilities between these actors.

In particular, the development of Third Sector depends on several institutional conditions. The type of Government (Kerlin, 2013; Lee, 2010), the stage of Economic development (Kerlin, 2013; Lee, 2010), the model of civil society (Salamon & Anheier, 1998), the existence of philanthropic traditions (Wang & Morgan, 2011), and the regulation – legal frames, tax reduction, transparency, accountability - (Wang & Morgan, 2011), can affect the governance structure and the business model of TSO.

According to Lecy and Van Skyle (2012), many of the theories of nonprofit sector size are descriptive and reactive, while the understanding of the drivers of opportunity for TSO are still unexplored. Consequently, scholars need to empirically address a set of questions about how TSO develop adaptive and responsive strategies to turbulence, opportunity, stability, and growth. This chapter aims at contributing to fill this gap.

Combining the literature on the density of Third Sector at system level, with those on the strategic management of individual TSO, several emerging issues for the development of sustainable social business models are identified.

The results can be significant for similar contexts, characterized by the presence of a "Welfare Partnership model" with both a civil society strongly involved in the provision of welfare services, and a strong dependence of TSO from public funding. In particular, a relationship between regulation features, and growth of Third Sector emerges, and such relationship is mediated by the ways in which TSO design and re-invent their own business models.

BACKGROUND AND LITERATURE OVERVIEW

This study builds a framework to investigate the current trends emerging in TSO institutional and social context, and its main consequences on the development of renewed business models. In this context, the definition of nonprofit proposed by Salamon and Anheier (1997) is adopted. The authors identify the five core structural or operational features – namely:

- Formal constitution;
- Non-governmental basic structure;
- Self-governing;
- Non-profit-distributing;
- Presence of voluntary activities or resources.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

These features distinguish TSO from other types of social institutions. More specifically, this contribution focuses on TSO that – providing welfare services – have a more or less important relationship with the public administrations.

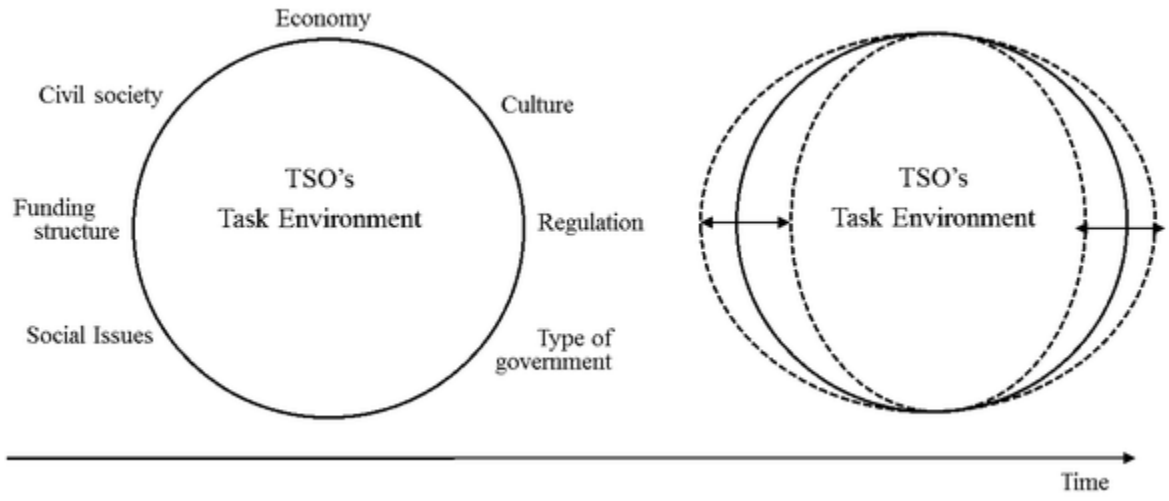
In order to support the framework development, the background of this work aims at explaining the effect of the social-institutional context on the development of Third Sector, and the effect of such conditions on the implementation of their business models.

The observed variation in TSO across countries and regions suggests the importance of social and institutional context in their development. Contextual conditions define the dimension and the characteristic of the Third Sector in each country. In particular, given specific institutional and societal boundaries, TSO have a potential environment in which they can fulfil the organizational mission through the offer of their own Value Proposition. The formation and growth of TSO in a particular country are likely to be influenced by the characteristics of its civil society, its economic situation, and they are defined by its legal and regulatory framework. As a consequence, changes in the institutional environment – due to reforms and public policies - affect the growth (or reduction) of the Third Sector (Figure 1).

With a specific focus on welfare characteristics, the density and development of Third Sector depend on the characteristics of civil society (Salamon & Sokolowski, 2010): the larger is the contribution of civil society, the larger is the Third Sector dimension. Furthermore, according to dimension of the welfare states, the services provided by TSO can vary. Salamon and Sokolowski (2010) describe five models: Liberal, Welfare Partnership, Social Democratic, Deferred Democratization, and Traditional.

- **Liberal Model:** The civil society is large because of greater reliance on private services in the face of a relatively small welfare state. Government funding is limited and there is a sizeable reliance on private support.
- **Welfare Partnership:** Civil society is still large and involved in the provision of welfare services, however funding is characterized by a large share of government revenue, rather than private resources.

Figure 1. Institutional context and Third Sector evolution
Source 1: Cavenago, D & Mariani, L (2016)



EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

- **Social Democratic:** Civil society can be large but limited to expressive roles in the advocacy, sports and culture industries. This is due to a sizable welfare state that both funds and delivers social services.
- **Traditional Countries:** The civil society is small and it is characterized by the persistence of traditional forms of helping. With the government providing little support even for welfare services, TSO focuses on antipoverty services, through the financing of international aid.
- **Deferred Democratization:** Civil society remains small due to repressive and neglectful policies of a State. With little government support, therefore, the Third Sector relies on both fees where it provides services for the upper class, and international aid where it serves the poor.

Other contributions highlight the relationship between the dimension of Third Sector and societal characteristics such as diversity and the structure of social capital.

- **Diversity:** The relationship between society diversity and Third Sector development can be explained through the government failure theory (Weisbron, 1977, 1986, 1988). According to this theory, when a society is diverse the median voter preferences are not sufficient to satisfy the demand of different groups for different social services. Preferences that result from diversity in a society are referred to as heterogeneous demand, that can be faced by specialized TSO. The features of diversity that have been considered include variables of racial diversity (Corbin, 1999; Matsunaga & Yamauchi, 2004), immigrant populations (Paarlberg & Gen, 2009), and religious diversity (Salamon, Hems, & Chinnock, 2000; Brooks &Wilson, 2007).
- **Social Capital:** The development of social capital and Third Sector development seems to be positively related. Social capital refers to connections among individuals, social networks and the norms of reciprocity and trustworthiness that arise from them (Putnam, 2000). Social capital is a variety of different entities consisting of some aspect of social structure, and facilitating certain actions of individuals who are within the structure (Coleman, 1990). The extent of social capital depends on citizens engagement in public affairs, community volunteerism, community organizational life, informal sociability, and social trust (Putnam, 2000).

Finally, nonprofit laws and regulation are among the most important factors in determining the size and scope of Third Sector in many countries (Salamon & Flaherty, 1996). In particular, the regulatory framework that defines the sector and the agenda of governments for the sector are central factors (Borzaga & Fazzi, 2011; Haddad, 2011; Schneider, 2013; Wang & Morgan, 2011; Heurlin, 2010).

Changes in the institutional environment and societal structure do not affect exclusively the density of TSO in a specific context, but they also affect the behaviours of these organizations. According to the neo-institutional theory, organizations are influenced by the society in which they work and they have to change and adopt the norms of this society to conform to external expectations about what forms or structures are acceptable (DiMaggio & Powell, 1983; Meyer & Rowan, 1977). Therefore, individual TSO preserve their legitimacy by incorporating (or appearing to incorporate), the new practices, norms and values: if the organization is not viewed as legitimate, its survival is thought to be at stake (Dowling & Pfeffer, 1975).

However, under a strategic perspective, TSO do not suffer passively the external pressure; rather, they interact with their own environment determining the conditions of their development and growth,

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

which are strictly related to a balanced and positive relationship with the external conditions. In particular, each TSO selects a certain segment of the external environment, defined by institutional and social contexts, and it carries out certain types of transaction with it (Normann, 1977). Within a wider regulated environment, TSO select a specific task environment, and they also choice the type of transactions to undertake there. Therefore, on one hand, the complex environment of the TSO is characterized by different actors and interdependencies whose effects are (partially) inevitable, but, at the same time, these interdependencies are the result of their choices. With reference to the changes of regulation in Japan, the reforms favorited the growth of TSO number, but they also incentivized new approaches of business, and TSO became more active in their relationship with public agencies. They have started identifying community problems, crafting policy solutions to those problems, and participating actively in implementing solutions in the perspective of public-private cooperation (Haddad, 2011).

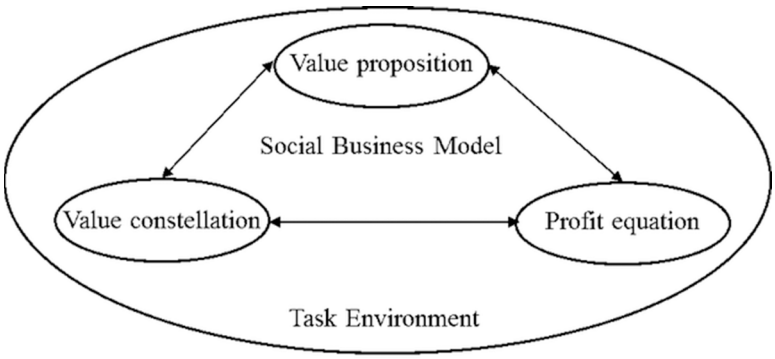
Within a potential environment – bounded by institutional context and societal characteristics – the TSO can develop their own social business idea, actualized into a specific social business model. In defining the business idea, TSO have to maintain the coherence between three different components (Normann, 1977): the external environment and its needs, the offering of the organization – or Value Proposition –, and the internal factors (organizational structure, resources, knowledge and capabilities, systems, values). This concept of business idea is systemic in nature and the relation to the external environment depends on the offering, which in turn is dependent upon firm-internal factors.

The implementation of a social business idea by TSO, can be represented through the components of their business model. The concept of business model has attracted the researchers' attention in the last years and, although there is no consensus as to its definition, literature uses to distinguishing its three major components: the product/service proposed to customers, the way the company is organized so as to deliver this product and service to its customers, and the revenue model (Chesbrough & Rosenbloom, 2002; Zott & Amit, 2008)

In this work, the definition of business model adopted is those proposed by Yunus, Moingeon and Lehmann-Ortega (2010) that, focusing on the experience of Greeman Bank, emphasizes the role social value, which is particularly significant for TSO (Figure 2).

According to this model, the components of business model are the Value Proposition, the Value Constellation, and the Profit Equation, composed of social and economic profit equations.

Figure 2. Environment task and business model
Source 2: Cavenago, D & Mariani, L (2016)



EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

- **Value Proposition:** It includes the identification of TSO' users, and it summarizes the characteristics of the value provided, as well as the relationships with the users. The Value Proposition of each TSO focus, alternatively or simultaneously, on the provision of services aimed at facing the needs of different categories of users, the development of social innovation, and the accomplishing of representational activities (Salamon et al., 2000).
- **Value Constellation:** It includes the way in which services are provided through both the internal value chain and external partners support. With a specific focus on the role of services provision, the Value Constellation of TSO can be presented through the description of the services' content, and the main phases of the provision process of a welfare service: (1) access; (2) screening; (3) intervention planning and implementation; (4) monitoring in progress; and (5) follow up (Mariani & Cavenago, 2013). The access phase represents the first contact between the TSO and the user, where the organization provides information on the service and reduces any barriers which could compromise the overall service supply. Organizations are then involved in the screening phase, which allows the evaluation of individual needs. The planning and implementation phase consists in formulating objectives, identifying the necessary resources, defining the timing and implementing the intervention, while in-progress monitoring is carried out so as to keep the objectives fixed during planning. Finally, follow-up procedures consist of periodical check-ups in the post-service stage. In all the phases, the role of the client/user is crucial. In the provision of welfare services, in fact, the co-production process is essential for service effectiveness, and the clients' behaviour has a significant impact on the final quality of the supply process (Pestoff & Brandsen, 2013; Prahalad & Ramaswamy, 2004). All the phases of service provision process are not necessary implemented by an individual TSO. Frequently, in fact, TSO act toward an embedded networking approach, based on stable and intense connections among different institutions, sharing reciprocal trust. The network model is adopted by many TSO with the aim to tackle with greater efficiency the needs of their users through institutionalized ties with social services, public administration, hospitals, advice bureaus, primary care bureau and other actors through formal and informal connections (Mariani & Cavenago, 2013).
- **Profit Equation:** It is the financial translation of the other two – Value Proposition and Value Constellation –, including the value captured from the revenues, and costs structure. Profit Equation can be furthered decomposed into Social Equation, which summarizes the desired social profits through a comprehensive eco-system view, and the Economic Equation, which targets the full recovery of both costs, and capital. The expenses of TSO are directly related to the structure of the offer – personnel cost, depreciation of equipment, supplies, financial expenses and so on –, while the revenues of TSO are strongly related to the overall institutional context that determined the weight of public financing on the overall revenues. A general criterion usable in order to assess the sustainability of Profit Equation is considering if it has been managed in a balanced manner. The need to fulfil the social mission still maintaining a financial and economic balancing is a precondition for the sustainable development of TSO. In particular, TSO are called to maintain a clear identity and focus tied to social mission with better means of measuring nonprofit performance in order to reconcile financial and mission-related performance (Young, 2005).

THIRD SECTOR IN ITALY: TOWARD THE RE-DESIGN OF BUSINESS MODELS

To assess of the effect of the task environment on the business models of TSO, the evolution of nonprofit sector in Italy is proposed.

Methodology

In order to build the Italian case study, a documental analysis has been conducted. In particular, the case draws upon content analysis of the relevant regulation and the literature on the Third Sector and welfare system in Italy, combined with the assessment of demographical and economic trends. Table 1 includes the description of the sources used for the development of the case study.

Furthermore, the study draws from research actions and field investigations conducted over the last years by the authors in several Italian TSO belonging to different regional welfare systems.

The information has been assessed by two researchers, who selected, separately, the emerging themes affecting the business model of TSO, classifying them under the business model component: value proposition, value constellation, and profit equation. Discrepancies on both themes' selection and themes' classification have been discussed, with the aim to concord a common judgement. To align the information, and gain other perspectives some control interviews with a selection of academics and professionals of the Italian Third Sector have been conducted.

Historical Context of Italian TSO

Characterized by a progressive reduction of public spending for welfare services, as well as by the introduction of recent reform that should simplify the overall fragmented regulatory framework, the Italian TSO has to face different new challenges. Toward the description of the evolution of Third Sector in Italy, as well as the presentation of TSO task environment, this contribution highlights today and future challenges for these organizations.

In Italy, until the end of the Eighteenth Century, social protection was provided by private TSO, financed by private citizens and local authorities. The most important TSO were the *Opere Pie*, a form of Charities owned and managed by different congregations of the Catholic Church. *Opere Pie* were present in the country even prior to unification, providing benefits to the poor, as well as social and health services. In 1861 there were about 18.000 of them. These organizations were private charitable institutions with estate consisting mainly of legacies and donations acquired over the course of the century.

Between 1866 and 1890, the Italian state passed laws aimed at confiscating the estate of various religious orders and congregations also forcing the *Opere Pie* to submit to state control. In 1866, in a first attempt to reduce Catholic influence over public life, the Parliament passed the act suppressing 1.800 religious orders and congregations and confiscating their property. The buildings expropriated were allocated to local authorities for use as schools, hospital and other welfare institutions. Consequently, the Italian state assumed regulatory responsibility for private social welfare for the first time in its history. The autonomy of TSO both in the choice of objectives and activities, as well as their management were drastically reduced (Defourny & Borzaga, 2001).

At the beginning of Twentieth Century the construction of the Italian public welfare continued. The expansion of the state's functions in the field of welfare strengthened during the Fascist period, with the introduction of compulsory insurance against invalidity, public pensions and maternity. At the same time, Fascism eliminated any form of self-organization by new organizations, included TSO, in the context of welfare services. The regime also attacked workers movement and second level organizations, replacing them with a single body closely controlled by the Fascist Party. The Civil Code, approved in 1942, confirmed the residual role of TSO.

The end of Fascism and the approval of the Constitution (1948) marked a change in the conception of TSO and welfare state through the introduction of a Universalist type of welfare, and the recognition of the role of civil society and TSO as important actors of the social welfare.

Three phases characterize the evolution of Third Sector in Italy from 1980 to 2005: pioneering, expansion, and institutionalization (Borzaga & Fazzi, 2011).

- **Pioneering Phase:** It stated with the development of the new Third Sector in 1980s. A renewed sector of nonprofit organizations emerged, characterized by voluntary associations. Due to lack of regulation able to envisage a regulatory framework consistent with the activities of the new types TSO, some promoters adopted the cooperative form in order to promote 'social-purpose cooperatives' (Borzaga & Fazzi, 2011). Until the beginning of the 1990s, the new TSO had been developed with a high degree of autonomy in their choice of what services to furnish and what needs to satisfy, focused mainly on the assistance and support for persons in need who were inadequately served by public policies. During this first phase, in 1987, the Italian Parliament also approved the regulation of NGOs (Law 49/1987).
- **Expansion Phase:** It started at the beginning of 1991s, when law 381/91 on social cooperatives and law 266/91 on voluntary associations were enacted. These laws recognized, for the first time, both the social and public function of TSO engaged in the production of welfare services and the work integration of disadvantaged people. Since 1991, the amount of public expenditure on social services increased and the number of TSO underwent impressive growth. Public financing rapidly became the principal source of funding for TSO, and the issue of a more efficient allocation of public resources became more pressing: public authorities started applying for more competitive selection criteria. During the Expansion Phase, the regulation for foundation banks (Legislative

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Decree 153/1999), and Socially Oriented Not-for-Profit Organizations - ONLUS – (Legislative Decree 460/1997) have been introduced. With the attempt to provide a clear legal context in which place the activities of TSO, the introduction of ONLUS regulation was aimed at giving a sharper definition to the characteristics of TSO and to guarantee them support, above all fiscal benefits. The main characteristics of the Legislative Decree 460/1997 was the introduction of a list of sector/services in which TSO have to operate in order to obtain fiscal benefits.

- **Institutionalization Phase:** It started in 2000, through the approval of a new national law on social services (L. 328/00) aimed at recasting the Italian system of social services on the basis of the principle of greater equity and on more precise planning procedures. Contracts between TSO and public authorities became more formalized, and new rules and more prescriptive organizational criteria were widely employed to manage the social services system. In particular, greater use was made of competitive procedures for service contract, the intention being to select the cheapest suppliers. During this phase, the Italian Parliament also approved the law n.383/2000 aimed at introducing the Association of social promotion: TSO promoting solidarity services as well as social aggregation through the pursuit of social and cultural activities.

In 2005, the introduction of the regulatory framework for social enterprises (D.lgs 155/2006) represented, for the first time in the Italian history, the attempt to rationalize the Italian regulation of nonprofit organization. The process for the introduction of the Social Enterprise figure has been recently closed with the approval, by the Italian Parliament of the Third Sector reform, as described in the next section.

The Task Environment of TSO in Italy

The first dimension of Italian TSO that affect their business models is the relationship with the Government. Similar to other West European countries, Italy has a strong welfare state, and the Italian civil society sector is considered to be a Welfare Partnership model in which TSO are involved in the provision of public services (Kerlin, 2013; Salamon & Sokolowski, 2010). The relationship between TSO and Government is characterized by a weak cooperation with regard to objectives and planning, but there is a strong functional interdependence between the two sectors and consequently each supports the other (Ranci, 1994). Central and local governments depend on Third Sector for the provision of public services and TSO depend on the public sector for financing their activities. The strong relationship with the governments have determined a Third Sector characterized by a significant number of TSO providing welfare services. Table 2 includes some highlights on the structure of Third Sector in Italy, with a specific focus on education, healthcare, and social services.

In Italy, there are about 301,000 TSOs (Istat 2011). The welfare sector, with a smaller number of units (17.1% of the total TSO), has the higher inflows of cash (29.7 million) equal to 46,5% of the total inflows of Italian TSO, and it also employs the majority of paid workers (74.2%). Looking at the income statement revenues (Table 3), the private sources account for 66% while the public sources represent 34%, demonstrating a significant contribution from the public. Public funding is significant, especially in welfare sectors: healthcare (68%), social assistance (56%) and education and research (42%). For almost a third of TSO operating in the welfare, public funding is over 50% of total revenue. Despite the financial dependence of the Third Sector from the public sector is still significant, the recent economic crisis has marked the reduction of the welfare state, and this reduction is also translated into a gradual downsizing of the state contribution for TSO. Table 3, provides a composition of TSO revenue.

The evolution of the cash inflows from 2008 to 2011 (Table 4) show the public budget cuts to TSOs. In particular, a reduction of revenue arising from the public contracts funded with local and central government grants.

Together with a strong relationship with central and local governments, the second dimension of the task environment that affect more strongly Italian TSO' business models is the regulatory framework that is characterized by the existence of laws overlaps, on one hand, and an activity-centred approach in producing regulation, on the other hand. Modern TSO are based on the Italian Constitution approved in 1948 that promotes and protect the citizens self-organizations. More recently, in 2001, the role of Third Sector in Italy has been strengthen through the incorporation, in the Italian Constitution, of the principle

of subsidiary, together with the increase of regional autonomy, stating that public institutions at different levels of government should favour initiatives by individuals and civil society organizations aimed at addressing public needs (Colombo, 2008). Italian Constitution coexists with the antecedent regulation of the Civil Code of 1942 including the laws that define the general framework of TSO. From the Expansion Phase, the Italian law evolution has been characterized by the progressive introduction of special regulation, aimed at filling the gap in the Civil Code regulation in order to answer to societal changes. In particular, the Civil Code defines the main figures of TSO: Association, Foundations and Co-operatives.

Associations represent the most common form that the civil society can assume when self-organizing for a certain purpose. Foundations are furthered characterized by the disposability of assets devoted to a specific social aim, finally, cooperatives are firms owned, controlled, and operated by a group of users for their own benefit. Indeed, the special regulation introduces the frameworks for NGOs, voluntary organizations, Sports clubs, social cooperatives for the provision of welfare services (type A) or for integration of disabled people in the labour market (Type B), Banking foundations, corporate foundations. Associations for social promotion, and nonprofit organizations of Social Utility (ONLUS). ONLUS regulation, in particular, aims at defining the enabling characteristics of TSO for the access to preferential taxation as well as to public founding. In this context, the regulation of Italian Third Sector highlights different levels of overlaps: the first one between Civil Code and special regulation figures, and the second one among special regulation.

Crossing the Civil Code framework with the special regulation, different configurations of TSO emerge, in particular, in order to provide specific services, or operating in a specific area, a certain combination of Civil Code framework and special regulation is required (Table 5).

Furthermore, special regulation tends to list the services that can be provided under a specific legal form determining an activity-centred approach in the definition of TSO that is reinforced by the ONLUS

Table 5. Civil code framework and special regulation intersection

Type of Organisation	Associations	Foundations	Cooperatives
Voluntary organizations	Solidarity activities		
NGOs	International cooperation in developing Countries		
Association for social promotion	Promotion of social aims		
Social cooperatives			Provision of Healthcare, Social and Educational services (type A), and Services favouring the access to labour market for disabled (type B).

regulation which includes a list of services that can be provided in order to access tax reductions and public financing.

Finally, a third level of overlap concerns, finally, the coexistence of Civil Code, special laws, and specific industry regulation: TSO work often in public regulated industries (i.e. healthcare, social services, labour market, education) in which the government regulation adds an extra layer of formalities to be completed. This also adds the need to coordinate the instances of various actors and bodies (for example, the juvenile court, the social workers, school districts), as well as the need to fulfil additional law enforcements, at different levels.

Focusing on the limitations to non-voluntary employment and commercial activities, governance models, and earning distribution, Table 6 offers a further representation of the complexity of Italian TSO framework of regulation. In particular, it is highlighted, here, how the provision of a wider range of services could be difficult under a unique legal form.

The Effect of the Task Environment on Italian TSO Business Models

The complex regulatory framework – joined with the strong dependence of Third Sector from public financing – affects the traditional business model of Italian TSO. Table 7 summarizes the major challenges that the TSO have to face in order to design and implement their business models in Italy, with reference to the Value Proposition, Value Constellation, and Profit Equation.

Table 6. Limitations of special regulation

Type of Organisation	Employees	Volunteers	Commercial	Governance	ONLUS	Dividends Distribution
Voluntary organizations	Paid work is excluded (art. 2, L. 266/91).	No Limitation	Revenues from commercial activities lower than 66% of total expenses.	Democratic governance model	Onlus by operation of law	Excluded
NGO	Conditions regulated by the law for overseas staff (L. 125/2014)	Conditions regulated by the law for overseas staff (L. 125/2014) as well as by the regulation of Community service (Voluntary Service). Decree 77/2002	No Limitation	No Limitation	Debated: Onlus by operation of law (according to L.49/1987) or On request (according to L. 125/2014)	Excluded
Association for social promotion	Prevalence of Volunteers on Employees	No Limitation	Commercial activities has to be ancillary, subsidiary, and related to the fulfilment of the institutional aims.	Democratic governance model	On request	Excluded
Social cooperatives	No Limitation	Max 50% of the associated	No Limitation	Democratic governance model	Onlus by operation of law	Max equal to the legal interest

Table 7. Challenges for Italian TSO business models

	Dependence on Public Financing	Activities Centred Approach and Regulations' Overlaps
Value Proposition	Effect of goal displacement	Limitation of potential clients/users
Value Constellation	Public sector as the most important external relationship	Growth through nonprofit group
Profit Equation	Low diversification of revenues	Increase of cost of coordination due to: the management of the group; different legal fulfilments

Source 6: Cavemago, D & Mariani, L (2016)

As regards the effect of the prevalence of public financing on overall revenue sources, the first consequence on the business model, evidently, concerns the economic Profit Equation composition, which is characterized by a limited diversification of sources. The concentration of revenues implies a substantial lack of autonomy, as well as the increase in the risks for organizations whose development depend on the tenure for a relationship with the public administration.

Literature suggests that the dependence on any one type of income, including private contributions, commercial activity, or government funding can produce a goal displacement (Eikenberry & Kluver, 2004; Froelich 1999; Salamon & Anheier, 1998) affecting the Value proposition itself. The need of public administration for equitable treatment of the public, accountability, and standardization can limit the TSO responsiveness to the needs of user, and service variety, inducing TSO to take on functions that are not central to their initial purpose and, consequently, to modify the characteristics of services delivered.

The effect of goal displacement on the TSO Value constellation can imply changes in the operating activities in order to answer the government pressure for higher professionalization and bureaucratization. In this context, TSO business model has to be designed with the aim to reduce the risk to lose their administrative autonomy, still maintaining their unique character, avoiding to mirror the structure and behaviour of government agencies. With regard to the effect of the regulatory framework on the business model of Italian TSO, the main challenges concern the need to manage different legal forms, simultaneously, in order to both fulfil legal requirements, and operate, at the same time, in different fields. The activities centred approach implies that the scope of services able to be supplied under a specific regulatory frameworks, defined in advance and this reduces the niches of potential clients/users.

In order to avoid these barriers, Italian TSOs have traditionally resorted to the implementation of nonprofit organizations' groups. Since the operating activities of Italian TSOs are significantly reduced by the relevant regulation, strategies of service differentiation cannot be applied within a specific legal form. Rather, it is necessary to resort to combinations of different legal forms. The consequence is the emergence of nonprofit organizations groups that - under both a common label, and same leadership- carry out various activities in different sectors.

The effect of activities centred approach and regulations overlapping on the Profit equation of TSO is a general rise of coordination costs. Coordination costs, also referred to as organization costs (Masten, Meehan, & Snyder, 1991) or management costs (Demsetz, 1988) are the implicit costs of managing resources within organizations (Alston & Gillespie, 1989). Examples of coordination costs include administrative overhead, the costs of monitoring employees, and bureaucratic inefficiency (Anderson, 1985; Masten et al., 1991).

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

In the case of Italian TSOs, the increase of coordination costs relates to the need to lead and manage the group of nonprofit organizations that, under different legal labels, have to fulfil the same end goal. With increasing complexity due to both the need to manage a group, on the one hand, and the need to face the multilevel requests of public administration, on the other hand, the requirement of integration and coordination increase. In particular, when complexity is low, hierarchy and organizational routines are enough to manage coordination, while when complexity rises, coordination requires additional tools such as working groups, ad-hoc task forces, and staff members specifically dedicated. The final effect is the overall increase of coordination costs.

SOLUTION AND RECOMMENDATIONS

At the end of May 2016, the Italian Parliament has approved the reform of the Third Sector (hereafter "the Reform") under the law 106/2016, in order to face the limitation of the fragmented framework, as described in previous paragraph. The opportunities provided by the Reform are here discussed with the aim to identify potential solutions and recommendations for the development of sustainable business models in Italian TSOs.

A crucial step will take place within 12 months from the Reform, the period after which the Government is required to issue decrees that will implement the Reform. In the meantime, several initiatives that could affect the business model of Italian TSO can be identified.

These changes can be summarized into: (1) simplification of the overall framework, (2) revision of TSO' activities list, (3) opening to a participatory governance model of public services, (4) and re-design of Social Enterprise's framework (Table 8).

With reference to the first point, the Reform lists some initiatives aimed at simplifying the TSO' regulatory framework. These includes the reorganization and revision of the rules relating to Third Sector through the Unified Code of nonprofit organization, which is going to collect and coordinate all existing provisions. Furthermore, the Reform involves the reorganization of both the registration of TSO, and other bureaucratic fulfilments, through simplified procedures. The collection of existing legislation into the Unified Code - which coordinates the rules of the Civil Code with that special laws, as well as special

Table 8. Reform effects on TSOs

	Simplification	Scope Enlargement	Participatory Governance	Social Enterprise
Value Proposition		Access to new forms of responsible business new categories of users		New categories of clients
Value Constellation		Review of core processes	Public Administration as a partner.	Introduction of new managerial competences Reduction of the use of nonprofit group
Profit Equation	Coordination costs reduction	New source of revenues		Coordination costs reduction New source of revenues

Source 7: Cavemago, D & Mariani, L (2016)

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

regulations among themselves - can lead to a reduction of the overlaps mentioned above. Therefore the effects of simplification could have a positive impact on TSO business model through the reduction of coordination costs and, consequently, through the improvement of Profit Equation balancing.

Referring to the second point, although the Reform still maintains the "activities centred" approach of the entire regulatory framework, this also opens to a more flexible definition of the sectors. The Government is asked to identify the list of activities of general interest, civic purpose, and solidarity that the TSO have to play in order to access to different benefits. However, the Reform mentions the need to perform periodic updates to the list. In this way, it enables the TSO to take into account emerging social needs previously not considered, through the provision of innovative services in new industries (i.e. social housing and the fair trade). The increasing trend of nonprofit activities can lead to an even more significant impact on the business model of the TSO, for all three dimensions. In terms of Value Proposition, the greater scope can lead TSO to invest in new forms of social responsible business facing, in this way, the needs of new categories of service users. The effect of this expansion on the Value Constellation could involve changes in the phases of service provision, which influences the revenue composition of the Profit Equation.

As for the opening of participatory governance models, the Reform calls for greater involvement of TSO in policies. In particular, it envisages the enhancement of the role of TSO in the programming phase, at the local level, for both social services, and the protection and enhancement of cultural heritage, landscape and environment. In particular, the Reform recognizes and incentivizes the networks of TSO in order to increase their representation with the public administration.

According to the perspective of the participatory governance models, TSO are engaged in policies' definition, the consequence is the shift from the direct provision of solutions to public issues by local administrations, to a situation where the solutions are reached through mobilization of a variety of actors. Such involvement implies a renewed role of TSO whose behaviour is oriented by the national or local policies of the public administration, which, in turn, receives stimulation from a Third Sector that is particularly receptive to its territory's needs. The implication on the TSO' business model concerns, primary, the Value Constellation, with specific focus on the characteristics of TSO external relationship. Public administration has the opportunity to change its role from end-payer for public services, to those of peer-partner: the relationship between TSO and Government can turn from buyer-contractor to co-producers, and the way that the TSO relate with the public administration would be inspired by criterion of collaboration and mutual trust.

Finally, the Reform aims at modifying and implementing the previous – not compelling – regulations of the social enterprise. Approved in 2005, previous legislation had a marginal impact on the Italian Third Sector, probably because of the substantial lack of specific incentives. The approved reform integrates the regulation defining the social enterprise as a private organization that carries out business activities for the typical purpose of the nonprofit. The social enterprise may resort to legal forms for businesses, but allocates its profits primarily to achieve the social purpose.

Furthermore, it has to adopt procedures for responsible and transparent management by promoting greater involvement of stakeholders. The initiative that will be implemented in order to promote the diffusion of social enterprises in Italy will be a strategic opportunity both for existing TSO looking for alternative private resources, and for new social start-ups whose growth may be favoured by more flexible regulatory frameworks.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

The existing TSO moving toward the new framework of social enterprise could expand their Value Proposition through the identification of new categories of receivers. In particular, in a more entrepreneurial perspective, social enterprises have the opportunity to expand the scope of traditional TSO by targeting, in addition to the users of welfare services, also to customers in the market environments. For example, supporting the development of alternative forms of welfare - such as corporate employee welfare services - the TSO may offer assistance services to for-profit organizations. Corporate employees welfare services, in fact, often includes services typically provided by TSO such as personal services connected with sickness, bereavement, domestic problems, elderly and retired employees, or group services consist of sports and other social activities.

The use of social enterprise form by the TSO also leads to potential changes in the Value Constellation. First, whenever the conditions for the transition from the previous regulatory framework to those of the social enterprise would be accessible, the TSO, from a theoretical point of view, could simplify its governance model, by reducing the appeal of the nonprofit group, and the direct consequence would be the reduction of coordination costs. The social enterprise's regulatory frame provides that social business can be carried out regardless of the legal category, also drawing the shapes of the Civil Code specifically provided for for-profit organizations.

The second effect on Value Constellation regards, indeed, the need to introduce within organizational boundaries, new managerial skills that typically do not belong to the Third Sector, but whose development is needed as a pre-condition to successfully compete in free markets. Apparently, the shift to social enterprise is not an obvious choice for TSO, however this is an opportunity that would allow them to get an effect of diversification of revenues, with positive effects on the Profit Equation and, more generally, on the organizational autonomy of the medium-long term.

CONCLUSION

The literature highlights how TSOs in the Italian context are defined by the social and institutional contexts. Social and institutional contexts affect the business model development of TSOs. In particular, the effect of the task environment on TSOs is in contrast to the neo-institutional theory. A resilient Third Sector that, throughout history have survived in less favourable periods have grown over time through public financing, albeit in the presence of a fragmented legislation.

TSOs, however, are facing contraction of welfare expenditure and they are compelled to review their traditional business models. The transition of traditional TSO toward forms of social entrepreneurship can be a viable solution. In such a hybridization process, TSO business models must reflect organizational solutions incentivizing the use of entrepreneurial principles to organize, mobilize and manage for the creation of economic and social value. At the same time, through networking and cooperation, TSO can improve partnership building with other TSOs, for-profit organizations, and public sectors, shifting from the contractor-supplier approach to the co-production.

To cope the activities centred approach that characterizes the Italian TSO should move towards the growth and new opportunities approach and the identification and measurement of social impact. TSOs should develop internal managerial skills and measurement of impacts to grant the alignment of different stakeholder aims and to improve partnership and networking. At the system level, the shift from the welfare state model to an entrepreneurship social welfare model should be seriously reflected upon.

KEY TERMS AND DEFINITIONS

Institutional Context: System of bodies, rules, regulation, policies, procedures and processes that characterize the task environment of a third sector organization.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Profit Equation: Translation of the Value Proposition and Value constellation in terms of benefits and costs. It can be furthered decomposed into Social Equation and Economic Equation.

Social Business Idea: Outcome of an entrepreneurial sensitivity in identifying an emerging social need and the related sustainable answers.

Social Business Model: Actualization of a social business idea through the identification of the value proposition, value constellation and a sustainable profit equation.

Social Context: Combination of demographical, religious, racial diversities, and social capital peculiarities that characterize the task environment of a third sector organization.

Task Environment: Setting in which third sector organizations develop their business idea through a business model. The boundaries of this setting are defined by the institutional and social contexts.

Value Constellation: Ways in which third sector organizations provide their services through both the internal value chain and external partners support.

Value Proposition: Summaries of the characteristics of the value provided by the organization, as well as the relationships with the users.

Chapter 48
The Permissibility of Crowd Funding Within South Asia:
A Comparative Analysis of South Asian Jurisdictions

Michael D'Rosario
Deakin University, Australia

Aaron Busary
Hyveminds Pty Ltd., Australia

Kairav Raval
Hyveminds Pty Ltd., Australia

ABSTRACT

The chapter will extend upon the extant literature by considering the permissibility of crowdfunding practices within the South Asian region. There is a genuine dearth of research considering these matters, with little research considering the history and permissibility of crowdfunding methodologies within the noted nations. As such the contribution of the chapter is twofold, firstly it represents amongst the first coherent assessments of the use of crowdsourcing based fundraising methodologies within the South Asian region. Secondly it responds to the dearth of research considering the legal permissibility of such practices within the noted nations, while also contrasting the regulatory models of India, Bangladesh, and Sri Lanka with the regulatory models evidenced within selected OECD countries and pertinently the recently reformed model of regulation within the United States, specifically chapter 12 of the Jobs Act (2013).

AN INTRODUCTION TO CROWDFUNDING

Crowdfunding is best understood as the process by which a web based organisation seeks to procure funding from the general public through a web portal, the web portal enables unrelated business enterprises seeking capital to make equity within their entities available to investors. This was not permissible given the restrictions placed on public fundraising by the SEC Act.

As asserted, Crowdfunding was largely motivated by individuals and organisations promoting profit motivated initiatives through crowdsourcing platforms, and also by the potential benefits to entrepreneurs associated with creating more enabling pathways to accessing startup capital. The existing crowdsourcing platforms (consider Kickstarter, IndiGoGo and similar platforms) limited promoters to accepting donated monies, or selling items for defined sums, with the provision of equity or profit sharing impermissible. However many treaded a unfamiliar and perhaps unexplored path between soliciting general support on behalf of project owners, and offering the possibility of equity sharing which may be conceived to be a security offering, under the technical definition.

The Need for Crowdfunding Provisions and the Howey Test

While it may not be apparent there is a critical distinction between individuals soliciting for support through web based portals, and offering items in exchange for such support and individuals and organisations making equity or profits from a venture available for distribution in exchange for monetary support (Securities and Exchange Commission v. W. J. Howey Co, 1946) . While many crowdsourcing models do not involve the issuance of securities in the conventional sense they may be in direct contravention with the Securities and Exchange Commission Act. N D Pope in 2010 noted that some for profit crowdfunding models may be in contravention of the SEC Act, under the rubric of Howey (Pope, 2010).

Additionally prior to the enactment of the JOBS Act, firms wanting to employ crowdfunding techniques when acting in accordance with SEC legislation faced an additional set of challenges. As such the impact of such reforms within the U.S. cannot be understated. The proposed chapter shall consider the permissibility of crowdfunding within the South Asian region with a pertinent focus on India, Sri Lanka and Bangladesh. The chapter is best described as a study in comparative law, considering the regulator provisions enacted within the United States and Australia, and contrasting the evidenced approaches within India, Bangladesh, Nepal and Sri Lanka.

Introduction to Title III of the Jobs Act (2013)

The introduction of the Jumpstart our Business Startups (JOBS) Act was a response to a significant economic slowdown evidenced in the United States. The Act while seemingly focused on job creation is in reality focused on enabling smaller enterprises to avoid onerous securities provisions enacted post the depression. Though the primary motivation behind the act was the easing of regulatory burdens for smaller enterprises, the act provides significant relieve to both small and large enterprises by exempting them from a broad range of seemingly burdensome regulatory pronouncements.

The bill received strong bipartisan support notwithstanding its' significant ramifications, and its unique nature. Proponents of the Jobs Act believe that it will bring much needed system liquidity to emerging organisations starved of capital due to the restrictive lending practices of the banks brought about by sectors recent conservatism. Title III of the Jobs Act is referred to as the Crowdfund Act, and represents perhaps the most intriguing part of the reform program. The provisions found within title III of the Act, enable the use of crowdsourcing methodologies in procuring start-up capital. While such methodologies have been employed within other sectors, to procure resources to address defined needs, perhaps most notably in the charitable sector, and more recently ingeniously in funding artistic works

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

and consumer products, such approaches would be considered unlawful under the Securities Act (1933) and the Securities Exchange Act (1934). As such procuring capital has been a problematic exercise for start-up entities.

The recently enacted crowdfunding exemptions make the use of crowdsourcing methodologies possible within the capital market. The enacted provisions enable small start-up entities to procure capital through crowdfund offerings that exempt such offerings from registration. The provisions also exempt qualifying websites from broker registration, thus enabling the qualifying website to facilitate the collection of capital on behalf of the entity. The crowdfunding simplification provisions (herewith the Crowdfund Act) attempt to facilitate and actively support the use of crowdfunding techniques for capital raising through the enactment of section 4(6) offering registration exemption for capital raisings of equal to or less than $1 million. This exemption is enabled to the extent that individual investor restrictions are maintained; essentially that no investor exceeds the investment cap placed upon their crowdfund investments. The investment caps are based on net worth of prospective investors as well as income levels, though some ambiguity exists about which threshold prevails.

In facilitating these significant changes, the provisions create a regulated new entity form; the so called 'funding portal'. This new regulated entity sits somewhere between a broker, a closely regulated and scrutinized professional and a crowdsourcing website. The new intermediary must register as a funding portal, unless a registered broker. This new entity classification will undoubtedly bring with it a significant amount of ambiguity, given the 'broker like' role such intermediaries will play in the marketplace.

Bradford notes that the new provisions leave many ambiguities and inconsistencies for the courts to resolve. The mandatory disclosure requirements are asserted to be far too onerous and needlessly complicated and expensive for the small offerings that they are designed to facilitate. It is evident that these new provisions necessitate critical analysis; as such analysis is necessary to further understanding of this pertinent set of reforms. The current study shall afford a critical analysis of the most recent reforms considering a number of the ambiguities that exist in relation to the Acts in their present form.

The Origins of Crowdsourcing

Jeff Howe broadly considered the originator of the term crowdsourcing, describes crowdsourcing as a movement akin outsourcing, a source of low cost labour, whereby everyday people use their spare time and capacity to address problems, generate new content and even engage in high level R&D activities (Howe, 2006). Crowdsourcing is perhaps best understood as a distributed problem solving process. While under the original Howe (2006) definition the terminology was taken to mean the procurement of various services employing the internet as a form of replacement labour market, crowdsourcing is generally associated with the creation of content, ideas and solutions through the internet, though is not always associated with a replacement source of labour.

Crowdsourcing models have been used within a number of different sectors in response to a number of unique challenges. The models have been employed successfully within the music industry (Bandfund), to fund the fabrication of consumer electronics (Kickstarter) and to enable the competitive analysis of complex datasets (Kaggle). However to highlight only recent examples of the use of crowdsourcing models alone, would appear to pay scant regard to the use of such models prior to the advent of the internet. Charitable organisations have employed crowdfunding models to respond to a number of charitable causes,

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

while political entities have used comparable models to raise funds for political causes. Crowdsourcing models existed well before the advent of the internet, but the internet has certainly served as a powerful enabling force, with such models now ubiquitous on the internet, and creating 'disruption' within a number of industries. Prior to the enactment of the JOBS Act, crowdsourcing models were limited in the manner with which they could procure funds. (Taku 2012) asserts that current crowdfunding platforms have generally adopted business models designed to avoid characterisation as a sale of security.

Kickstarter is arguably the most well-known of the crowdsourcing platforms, originally conceived as a web hosting service for what could be described as creative projects, but grew into something much larger, incorporating journalism, technology, and consumer products. Individuals seeking support lodge projects with Kickstarter that are evaluated based on the criteria set but the platform. If accepted the projects are listed publically on the entity's website and the site users can make contributions to the project. The platform requires that the project conveners offer something to the users that contribute to their project. The platform does not allow the parties raising money on the platform to share the proceeds of the projects with donors, nor can they provide equity to donors. Yet increasing a fine line was evident between the activities of crowdsourcing websites that enabled parties to raise development funds and early venture capital providers. Consider crowdsourcing websites for musicians such as Sellaband.com, promoters of this venture asserted that 'bands might let you get a cut of revenues'. Such claims draw into question whether the activities of the users of the platform constitute selling services, goods or whether they would be considered investments under the Howey test. This is highly likely given the broad applicability of the Howey test.

It is arguably this collection of issues that generated political interest in crowdfunding models, and their potential use as capital funding models, or equity raising models (and consequently their potentially deleterious impacts if left unregulated).

Reward-Based Crowdfunding

Reward based crowdfunding ranks amongst the most common forms of crowdfunding. Reward based crowdfunding entails the provision of non-monetary rewards being provided to crowd funders for their participation.

Equity-Based Crowdfunding

Unlike reward based crowdfunding, equity-based crowdfunding entails the raising of financial funding through crowd based mechanism. The funds raised bestow ownership rights onto the holders of equity funding.

Credit-Based Crowdfunding

Credit-based crowdfunding links Prospective borrowers with lenders. Lenders and Borrowers join lending clubs/platforms first lodging their credit requirements, which are then matched with groups of lenders/investors willing to meet their credit terms.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Equity vs. Non-Equity Crowdfunding

Crowdfunding is best understood as the process by which a web based organisation seeks to procure funding from the general public through a web portal, the web portal enables unrelated business enterprises seeking capital to make equity within their entities available to investors. This was not permissible given the restrictions placed on public fundraising by the SEC Act. For the purposes of disambiguation it should be duly noted that, this chapter is concerned with equity based crowdfunding.

As asserted, Crowdfunding was largely motivated by individuals and organisations promoting profit motivated initiatives through crowdsourcing platforms, and also by the potential benefits to entrepreneurs associated with creating more enabling pathways to accessing startup capital. The existing crowdsourcing platforms (consider Kickstarter) limited promoters to accepting donated monies, or selling items for defined sums, with the provision of equity or profit sharing impermissible. However many treaded a unfamiliar and perhaps unexplored path between soliciting general support on behalf of project owners, and offering the possibility of equity sharing which may be conceived to be a security offering, under the technical definition (see Sellaband).

The Need for Crowdfunding Provisions and the Howey Test

While it may not be apparent there is a critical distinction between individuals soliciting for support through web based portals, and offering items in exchange for such support and individuals and organisations making equity or profits from a venture available for distribution in exchange for monetary support. While many crowdsourcing models do not involve the issuance of securities in the conventional sense they may be in direct contravention with the Securities and Exchange Commission Act. Pope (2011) noted that some for profit crowdfunding models may be in contravention of the SEC Act, under the rubric of Howey.

Additionally, prior to the enactment of the JOBS Act, firms wanting to employ crowdfunding techniques when acting in accordance with SEC legislation faced an additional set of challenges. Spring Street Brewing Company, sought to raise fund from the public through a DPO under regulation A of the Securities Act. The entity sought to raise USD 5 million and eventually raised approximately 2 million. Alan Klein the founder of the brewer Spring Street claimed that the entity faced a number of challenges when seeking to sell equity through a direct public offering over the internet. Klein's claimed the entity's experience could only be claimed to be a qualified success, noting the relatively poor conversion rate from those perusing the firm's prospectus online and eventually agreeing to participate in the DPO (Pope 2011). Klein asserted that the issues associated with the rate of conversion could be attributed to a number of critical factors, but they could be broadly defined as issues associated with information asymmetries, trust and reputational challenges, all of which could be addressed through the participation of trusted partners. Klein asserted that the absence of "an intermediary that is in the business of evaluating a company, doing due diligence, and putting its reputation on the line with the company reputation" was in part the reason for the outcome (ibid, 2011).

Pope (2011), claims that the most significant lesson to be taken from the Spring Street experience is that intermediation is not critical to the success of small fundraising activities, of less than 1 million. On the contrary it is asserted herein that the moderation of information asymmetries is critical to the ongoing participation of micro-venture capitalists, and that the role of intermediaries is critical to this. Moreover, the reporting standard associated with a Regulation A listing appears to assign greater

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

responsibilities than the new crowdfunding provisions. While intermediation may not be critical to the procurement of a smaller quantum of capital, this should not diminish the onus placed on entities to ensure adequate disclosure. Failure to do so would potentially encourage 'boiler room' type scenarios that may have a deleterious impact on the overall model and prospects of crowdfunding under its current guise, in the long term. The pertinent securities' provisions and critical new crowdfunding provisions are considered presently.

AN ANALYSIS OF THE KEY PROVISIONS

The Securities Act (1933)

The existing securities provisions were enacted largely as consumer protections in the aftermath of a major financial crisis. The Securities Act (1933), arguably the first major regulatory apparatus concerned with the sale of securities, came in response to the stock market crash of 1929. The legislation sought to ensure that investors were adequately informed about investment opportunities; emphasizing disclosures aimed at helping investors make informed decisions. Prior to its enactment the sale of securities within the U.S. was governed by state laws. The adequacy of such provisions was called into question by the crisis that ensued, and the enacted provision sought to restore investor confidence in the financial system and in particular in the securities market.

The provisions sought to protect consumer interests by mandating higher levels of disclosure than were commonplace at the time of enactment. The 1933 Act necessitated that firms register a formal disclosure document to investors where securities were to be made available to the public. This meant that investors could access consistent high quality information from firms and make more informed investment decisions. The Act made unlawful any security offering that was made absent of the full disclosure document. Exemptions to the key provisions (Section 5) were possible under certain circumstances.

The Securities Exchange Act (1934)

The Securities Exchange Act (1934) gave rise to the Securities and Exchange Commission (SEC). In comparison to the 1933 Act, the 1934 Act is concerned more with periodic disclosures than the matter of registration. The critical change that came with the 1934 Act was the need for ongoing disclosures. The Securities Act, was concerned with the registration of securities and a formal disclosure document, the prospectus, and as such targeted at disclosures relating to fundraising and the conception of the company. The 1934 Act went further to consider secondary market trading activity.

Any company listed on a national securities exchange must find accord with the Act. In addition companies not listed on a national exchange may be required to be compliant with the 1934 Act, if they exceed certain shareholder or asset threshold levels. The asset threshold for triggering compliance was revised from $5 million to $10 million. The additional shareholder trigger remains at 500 shareholders (s12, s13, & s15). The act necessitates that companies lodge information with the SEC periodically (the quarterly 10-Q, and the annual 10-K), in addition to making known any matters deemed material to the entity, in an ongoing manner (Form 8K reporting). The 1934 Act also increased the obligations placed on entities serving as an intermediary in relation to the purchase or sale of securities. As such brokers and other intermediaries involved in the sale of securities must find accord with the Act.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

The Sarbanes Oxley Act

The Sarbanes Oxley Act (2002) (SOX) sought to improve standards associated with public companies, boards, management groups and accounting firms. The bill was seen largely as a response to a number of corporate failures, and accounting and financial scandals. The frequency with which these scandals arose, caused investors and regulators much consideration and served and the impetus for the reviews which led to the SOX reforms.

While the Act brought with it a significant number of sweeping reforms, for the sake of brevity, herein the provisions relevant to reporting requirements assigned to newly registered entities shall be considered. The relevant reporting provisions contained within s.404b, were the source of much debate given that they were perceived to be unnecessarily onerous by many, particularly in relation to smaller 'start-up' entities. Title 3 of the JOBS Act responds directly to s.404b.

Consider s.404 (b) "With respect to the internal control assessment required by subsection (a), each registered public accounting firm that prepares or issues the audit report for the issuer shall attest to, and report on, the assessment made by the management of the issuer. An attestation made under this subsection shall be made in accordance with standards for attestation engagements issued or adopted by the Board. Any such attestation shall not be the subject of a separate engagement." The provisions necessitate those newly conceived entities' meet significant initial reporting requirements presenting significant fixed compliance costs on such entities. These regulations are claimed to present significant operational headaches to the organisational leaders of newly created entities. Moreover, the pronouncements are claimed to unduly expensive for smaller entities.

THE CROWDFUND ACT (2012)

Title three of the JOBS Act, the CROWDFUND Act ranks amongst the most controversial in recent memory. Depending on the jurist consulted the act will have minimal impact or rank amongst the most impactful and disruptive. While the bill received strong bipartisan support there appears to be little consensus about the value of the reforms.

The motivation for the legislative reforms remain clear, the supporters of the bill, believe that it will serve as an enabling force helping smaller entities secure much needed capital during what has been a challenging time for global capital markets. The reforms seek to make the procuring capital by emerging enterprises more straightforward while also lessen the burdens placed on smaller public entities through recent consumer protections reforms. Specifically, the reforms respond directly to the specific capital raising restrictions within the Securities Act (1933) and the Securities Exchange Act (1934), and the reporting requirements associated with Sarbanes Oxley (2002). The reforms also enable non broker entities to serve as intermediaries, with a new entity classification conceived, affording a unique delineation to this new status of entity differentiating it from a 'broker' as defined by the Securities and Exchange Commission Act (1934).

Exemption From Registration Under the Securities Act

The new exempt entity may make use of crowdsourcing methodologies, enabling the creation of crowdsourcing micro-capital platforms. Critically section 4(6) of the act specifically exempts from registration

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

entities raising equal to or less than $1 million. Exemption is only available to the extent that specific restrictions on private investor's caps are maintained, where investor caps are a function of either income level or an asset threshold level.

Exemption From s.404 of the Sarbanes Oxley Act (2002)

Another key reform is the roll back of the requirements of Sarbanes Oxley for smaller entities with revenues of less than 1 billion from the noted requirements of s.404 (b). This represents amongst the most significant changes to securities and company law emanating from the Act. The reform reduces the burden placed on new entities

Adequacy of Disclosure, and Consumer Protections

The Securities Act (1933) and Securities Exchange Act (1934) were both motivated by a desire to protect investors and promote enhanced disclosure. The provisions do however place a number of onerous requirements on entities trying to procure start-up capital, serving as an impediment to many start-up entities. The enacted reforms seek to respond to the challenges faced by start-up entities by creating simpler mechanisms through which capital can be procured.

However a number of theorists remain critical about the enacted reforms. Many fear that by diminishing the requirements placed on entities engaged in capital raising activities, and by enabling the participation of non-broker entities in capital raising activities, the potential for misconduct is greater. Of particular concern is the potential for boiler room type effects that would undermine any confidence engendered in the market mechanism and have a deleterious impact on investors generally. Further concerns relate to the adequacy of due diligence conducted in the first instance by 'funding portals' the non-broker intermediaries critical to the new scheme. Many are wary about the capacity of funding portals to complete this important task. Clearly given that such entities are not required to be brokers, and possess broker registration, this is certainly not an unwarranted concern. Further concerned parlayed by theorists and foreign regulator bodies include the uncertainties associated with returns from crowd funded investments given that there will be limited disclosure information released by entities seeking funding through crowdfunding initiatives, than entities securing funding through non crowdfunding based capital raisings.

The Potential Impact of Equity Crowdfunding Models on Capital Markets Beyond the U.S.

Sorrenson & Stuart (2001) assert that venture capitalists focusing of the provision of early stage funding focus their attention largely on local markets, given their comparative advantage in local markets. As such some theorists might contend that the impact of crowdfunding provisions within the U.S. will have a limited impact beyond U.S. markets, however such an assertion appears to be flawed. The claims of Sorrenson & Stuart (2001) are largely based on the advantage venture capitalists possess within their own geographic region, and a corollary of this assertion would be that the search costs associated with accessing opportunities beyond their own market make broader searches prohibitively expensive. Their advantage diminishes within different geographic territories because their knowledge is likely greatest within their own territory.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

As such it is plausible that the recent enactment of the crowdfunding provisions will have an impact on the venture capital market beyond the U.S. One possible implication is that many companies registered in less developed markets will find it more challenging to procure venture funding, within their own polities and as such may feel a greater pull to the U.S. market where opportunities to raise early stage funding are greater. While it is certainly true that such a draw already exists particularly in relation to many high technology companies, the implementation of crowdfunding provisions would appear to incentivize such movement further.

Firms operating within markets where limited venture capital is available might find themselves squeezed out by rival firms incorporated within the U.S. This is because the crowdfunding provisions reduce the discover costs associated with startup enterprises incorporated in the U.S. thus affording U.S. startups a distinct advantage over foreign firms. Foreign venture capitalists can now access opportunities within U.S. markets, with discover costs substantially lower than costs associated with investing in other markets.

EQUITY CROWDFUNDING WITHIN SELECTED OECD COUNTRIES

Australia

In light of the significant discussions taking place globally in relation to crowdfunding models, ASIC released guidance to clarify arrangements that may be regulated by ASIC under the Corporations Act (2001) and the Australian Securities and Investments Commission Act (2001). The commentaries suggested that a number of posited crowdfunding models may be unlawful under the Corporations Act and ASIC Act.

ASIC Commissioner Tanzer asserts that "Crowd funding, as a discrete activity, is not prohibited in Australia nor is it generally regulated by ASIC'. 'However, depending on the particular crowd funding arrangement, ASIC's view is that some types of crowd funding could involve offering or advertising a financial product, providing a financial service or fundraising through securities requiring a complying disclosure document. These activities are regulated by ASIC under the Corporations Act and ASIC Act and may impose legal obligations on operators of crowd funding sites and on people using those sites to raise funds. 'We want to make sure anyone involved in crowd funding is aware of these obligations to ensure they operate within the law and don't potentially expose themselves to penalties under the Corporations Act or ASIC Act'

The briefing also emphasised a number of risks associated with crowdfunding, and served as a cautionary note to those seeking to avail themselves to opportunities within the market. As part of its broader crowdfunding monitoring activities, ASIC detailed a number of risks associated with crowdfunding activities;

1. A risk of fraud being carried out through crowd funding websites. Website operators can help manage this risk by doing background and credentials checks on project creators to help minimise the opportunity for fraud.
2. A risk that funded projects are not completed and the project sponsors do not receive the rewards promised. As well as background and credentials checks, the website operators can manage this risk by assessing the viability of the project before it is posted on their website, requiring the proj-

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

ect creator to provide more information on how and when they complete the project and consider requiring the project creator to report periodically through the website on their progress in implementing the project.

3. A risk that the money collected is lost due to the fraud or bankruptcy of the website operator before the money is passed on to the project creator. The website operator can manage this risk by holding all crowd funding money in a trust account separate from its own assets, avoiding excessive holding periods and implementing appropriate internal controls to ensure withdrawals are appropriate.

In relation to whether a crowd funding initiative is considered lawful the following appears pertinent. A crowdfunding initiative that merely procures gifted or donated sums without the possibility of a return may not be considered unlawful under the ASIC Act (Indeed a number of such vehicles/entities exist and operate within Australia, such as IndeGoGo and Kickstarter). This factor is amongst the most pertinent, the nature of the reward provided by the project promoter would be critical to whether an initiative would be considered unlawful. The nature of the reward offered and the structure of the crowdfunding offering would determine whether the arrangement would require an Australian Financial Services license, whether it constitutes a managed investment scheme pursuant to Chapter 5C of the Corporations Act, or whether it constitutes a fundraising activity under Chapter 6D of the Corporations Act.

Given the underlying realities of the Australian regulatory framework in relation to fundraising the CAMAC released a number of commentaries, most notably an exposure draft pertaining to the viability of crowdfunding models within Australia. Their proposal called for a change in the regulatory model. Essentially their proposition entailed changing Chapter 5C and 6D of the Corporations Act, to enable crowdfunding. More specifically, the CAMAC posited the following amendments to regulatory pronouncements;

1. That investors are permitted to invest a maximum of AUD $2500 into a company; with the sum of crowdfunding investment not exceeding an annual investment cap quantum of AUD $10000.
2. That companies are allowed to lawfully raise up to AUD 2 million during any 12 month interval.
3. That the issuing entity be required to change its entity status, from the conventional Pty Ltd status, to a new Exempt Public status as a precursor to fundraising.
4. That only “exempt public companies” would be able to raise equity capital through equity crowdfunding based mechanisms.

EQUITY CROWDFUNDING WITHIN SOUTH ASIA

Sri Lanka

The Securities and Exchange Commission of Sri Lanka is the primary financial markets regulator. The Sri Lankan SEC first established under Securities and Exchange Commission of Sri Lanka Act No. 36 of 1987, and is the main regulator of the Colombo Stock Exchange (CSE), as well as Stock brokering firms and brokers directly. The entity also regulates financial market intermediaries, as well as publically listed companies and agencies providing ratings services. While no formal guidance has been offered by the Sri Lankan Securities and Exchange Commission, given the regulatory apparatus in effect, it is evident

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

that crowdfunding as a discrete activity is unlawful under the Securities Act (2008) and the Securities Exchange Commission Act (2007).

The Securities Act (2008) is modelled on judicial pronouncements from the UK. In respect to the matter of the legality of crowdfunding within Sri Lanka the following is pertinent. A crowdfunding initiative that merely procures gifted or donated sums without the possibility of a return may not be considered unlawful under the Securities Act (2008). This factor is amongst the most pertinent, the nature of the reward provided by the project promoter would be critical to whether an initiative would be considered unlawful. The nature of the reward offered and the structure of the crowdfunding offering would determine whether the arrangement would require licensing, and whether it constitutes a managed investment scheme pursuant to the Companies Act, or whether it constitutes a fundraising activity under the Companies Act.

In relation to non-equity and non-debt based crowdfunding there have been a number of examples. The New York based Crimso has launched in Sri Lanka, and as received much positive press, with several funded initiatives. Additionally a number of Kickstarter and IndeGogo listings originate from within Sri Lanka indicative of the general level of interest in this new model of fundraising. There has been a dearth of discussion within Sri Lankan parliamentary dialogue in relation to crowdfunding activities. The Sri Lankan securities agency has not released commentary on equity crowdfunding.

Nepal

The major financial sector reforms within Nepal occurred in the 1980s. HMG/N and Nepal Rastra Bank have been implementing comprehensive Financial Sector Reform Program since 2001. HMG/N has strongly pursued financial sector reform across all aspects of the financial services sector. Nepali securities regulations do not provide for the permissibility of crowdfunding. The Companies Act, 2063 (2006) does not consider the matter of crowd based funding or posit alternative models of disclosure. The relevant Act, the Securities Act 2007 does not permit non broker intermediaries to engage in capital raising related activities as is permissible under U.S. securities legislation. The act was framed at a time when alternative fundraising methods such as equity crowdfunding were envisaged. In exercise of the power assigned through section 116 of the Securities Act, 2007, the Securities regulations and issue registration legislation was established. The legislation is silent in relation to crowd based fundraising methodologies. Equity crowdfunding as a discrete activity remains prohibited within Nepal.

The Foreign Investment and Technology Transfer Act, 1992 was formulated to promote the mobilization of capital to increase the competitiveness of Nepal's workforce and natural resources endowment. The act was amended in 2000, though the matter of equity based fundraising was not considered.

There has been little dialogue within Nepali Hansard in relation to crowdfunding activities. Moreover there has been little conjecture of such matters within the popular media within Nepal. Unlike the Indian securities agency SEBI, the Nepali agency has not issued any exposure drafts or memorandums in relation to equity crowdfunding. The absence of a local equity crowdfunding portal has meant that there is unlikely to be the same level of awareness and consequently impetus for equity crowdfunding.

Bangladesh

Within Bangladesh, the Securities and Exchange Commission (SEC) was established in 1993 under the Securities and Exchange Commission Act, 1993. The enacted model entails the Chairman and Mem-

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

bers of the Commission being appointed by government, with the afforded respopnsibility to manage and administer securities legislation, notablty the Securities Act 1993. The Bangladeshi Securities and Exchage Commission is a statutory body, under the auspices of the Ministry of Finance.

The primary exchange, the Dhaka Stock Exchange was estabhished in 1954 (generally known as DSE). Post independence with the establishment of Dhaka Stock Exchange (previously known as the East Pakistan Stock Exchange) capital mrket indermediaries commenced activities within Bangladesh. The conception of the Investment Corporation of Bangladesh paved the way for fourther development and reform within the Bangladeshi financial services sector, and increased participation within the capital markets.

The Securities Act (1993) is silent in relation to crowdfunding type methods. The Securities Act (1993) is modelled on judicial pronouncements from the UK. In respect to the matter of the legality of crowdfunding within Bangladesh the following is of particular importance. A crowdfunding initiative that merely procures gifted or donated sums without the possibility of a return may not be considered unlawful under the Securities Act (1993). This most pertinent consideration is the nature of the reward provided by the project promoter would be critical to whether an initiative would be considered unlawful. The nature of the reward offered and the structure of the crowdfunding offering would determine whether the arrangement would require licensing, and whether it constitutes a managed investment scheme pursuant to the Companies Act, or whether it constitutes a fundraising activity under the Companies Act.

India

India has actively pursued financial liberalization for the past three decades. The current governor of the Indian Central Bank, Mr. has been championing financial sector liberalization since accepting the office in September. The Governor has frequently asserted that financial sector reform serves as a mechanism through which greater economic growth and pro poor advancement can be achieved. “Change is risky”, he has asserted, “But as India develops, not changing is even riskier.”

Indeed SEBI have been advancing such arguments as well. SEBI the Indian Securities agency has been the most proactive regulatory agency within the South Asian region in relation to equity based crowdfunding, encouraging dialogue and requesting public commentary. It is evident that crowdfunding as a discrete activity would be prohibited under Indian securities legislation. Pursuant to the Companies Act 2013 and additional SEBI regulations pertaining to disclosure; the SEBI (Issue of Capital and Disclosure Requirements) Regulations, 2009 (ICDR), the raising of funds through a crowdfunding based mechanism would be considered unlawful. In light of recent development globally, SEBI asserted a desire in elicit more comment and discussion from within the Indian business community in relation to crowdfunding. The drafting of the discussion paper titled “Consultation Paper on Crowdfunding in India” is the first step in this regard, with SEBI asserting that no clear determination has been made in relation to either the desirability of crowdfunding provisions, and their potential enactment in the future. Rather SEBI has sought to stimulate debate into whether further revisions to the Companies Act 2013 would be amiable, and support economic growth and development, in line with the position of the Minister of Finance.

The actions of SEBI appear to be the most proactive, and consultative of any agency within the South Asian region. The move is pertinent in light of recent changes to the Companies Act 2013, which arguably make fundraising through private placements more challenging and rigorous. The revisions to the Companies Act 2013 appear pragmatic in light of events light the Sahara Ltd fundraising effort, but they do have the unintended consequence of making smaller fundraising efforts more challenging. The

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

SEBI exposure draft in many respects is a response both to the global movement pertaining to crowdfunding and equity crowdfunding in particular, but it also serves as a counterpoint to the revisions to the Companies Act 2013 pertaining to private placements.

It is noteworthy to acknowledge that the Companies Act 2013 does afford mechanisms through which securities offers can be extended to Qualified Institutional Buyers. Ostensibly these provisions may prima facie, provide for the raising of equity capital through crowdfunding type schemes, albeit the existing provisions do no specifically address crowdfunding mechanisms. As such reform is required for crowdfunding to be formally enabled.

Under the SEBI introduced proposal SEBI would register approved platforms to operate as crowdfunding platforms, akin to the non-broker entity model enacted in the U.S. Firms would then be permitted to raise to Rs 10 crore during a given financial year through listing on the crowdfunding platform. Again in line with the U.S. framework and the CAMAC proposal, given the underlying risk associated with such mechanisms the mechanism will not be available to all investors, with only accredited investors permitted to participate in any equity fundraising. Logically the agency will permit institutional investors, companies, High Net worth Individuals and financial sound investors to participate in a fundraising call. The crowdfunding investment level would be capped consistent with the CROWDFUND Act and the CAMAC proposal albeit at a lower investment level of Rs 60,000 or 10 per cent of individual/ entity's net worth.

As such, this study has evidenced that crowdfunding legislation has not been enacted within any South Asian jurisdiction, with India the only nation to strongly conjecture and post draft legislation for public comment. Given this fact it is pertinent for policymakers within other South Asian jurisdictions to consider the potential viability of crowdfunding legislation within their polities. It would appear that only SEBI has afforded due credence to these matters, having released an exposure draft for public comment modelled on the U.S. pronouncements. Moreover the Indian markets have a greater level of understanding of crowdsourcing methodologies given the success of crowdsourcing entities within India, and more recently the success of non-equity based crowd funders such as Kickstarter within India.

CONCLUDING REMARKS

Herein it is contended that much can be learnt from the American experience, and while some hesitation may exist in relation to the adoption of similar provisions with Australia, to not afford due consideration to such provisions would be inapt. The implementation of the crowdfunding provisions will be closely followed by jurists and policymakers alike. If the crowdfunding legislative reforms have little to no impact on capital raisings and the market for venture capital, then the it is unlikely that analogous pronouncements would be impactful abroad, but the U.S. experience presents South Asian policymakers and regulators with a worthwhile opportunity to observe the impact of what is arguably one of the most significant small business reforms in living memory.

There will always be a regulatory contest between innovators and regulators appearing as a dialectic process. The process of innovation and regulatory cycle may be steadily gaining pace, as information and communications technologies continue to disrupt an ever increasing number of industries.

Edward Kane employed a Hegel (Kantian) dialectic approach in when describing the divergence and convergence that occurred between regulators and those the laws intend to regulate. Kane essential claim was that the dialectic process commenced with a regulatory framework, to which there was a response

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

of regulatory avoidance, and subsequently regulatory change. We then observe a series of repeat iterations potentially going through an infinite number of cycles. As such in the view of Kane regulations are merely artefacts that motivate regulatory avoidance, and innovative new approaches to enable avoidance.

Kane (1972) asserts that creativity tends to be more evident amongst those seeking to avoid regulation, and that regulation is arguably a reactive device rather than a proactive mechanism. Essentially the core thesis proffered by Kane (1972) is that "regulation immediately begets avoidance… and there's much more creativity on the avoidance side, much more opportunity to play, to make moves that the regulators have to address. So we're always behind, until we get new regulation, which addresses some of the problems of the past, but that immediately starts the process all over again."

This situation is certainly true of the matters discussed within this paper. The Securities Act (1933) and Securities Exchange Act (1934) as regulatory apparatuses served their purposes well, however also served to stifle capital raising activities amongst SMEs, to the extent that the costs associated with raisings made the use of certain capital raising techniques.

Information and communications technologies have served as an enabling force, responding to this regulatory cycle from a bygone era. The internet and platform based crowdsourcing models have created alternative mechanisms through which resources can be procured.

The U.S. congress has sought to use these potential sources of disruption to the financial services sector as enabling tools to create employment opportunities and fund innovation. The JOBS Act notwithstanding some procedural uncertainties represents a remarkably forward thinking approach to the unique practices being adopted by platform sellers. Crowdsourcing models had the potential to supplant and potentially contravene securities legislation and rather that allow this to happen unabated, the lawmakers have enacted a policy that will seek to define how such practices are manifest in society.

The potential economic benefits are clear; if the increased costs associated with restricted/limited information disclosure are greater than the economic benefits associated with entities securing funding then then policy will have a deleterious impact on society. But the policymakers should be lauded for working with innovators to ensure the best outcome for emergent entities, and society as a whole. Striking a balance between the often dichotomous demands of commercial innovators, their rivals and the interests of consumers can be particularly problematic, and while the pronouncements enacted may be contentious they appear to strike the correct balance, finding that appropriate middle ground. While the policy appears to reside on the equidistant point along the spectrum that represents the interests of innovators/emergent entities and broader society, its effect remains to be seen, and will be followed with close interest.

Chapter 49
Transformation of Business Through Social Media

R. Venkatesh
VIT Business School Chennai, India

Sudarsan Jayasingh
VIT Business School Chennai, India

ABSTRACT

Social media are widely used in regular operations of many companies, including start-ups, small, medium and large organizations. The Social media are fundamentally changing the way we communicate, consume, collaborate and create. It creates one of the most transformative impacts on business. The most significant consequence of social media has been the shift of power from the institution to the individual. These shifts in the consumer-brand relationship have thrown up new challenges and opportunities for business organization. Social media have transformed the ways businesses from marketing and operations to finance and human resource management. Increasingly, social media are also transforming the way businesses relate to workers, allowing them to build flexible relationships with remote talent, to crowdsource new ideas, or to engage in micro outsourcing. Social media are increasingly being used in organizations to improve relationships among employees and nurture collaboration and the sharing culture. The purpose of this research is to explore the major changes which have taken place in organization because of social media.

INTRODUCTION

Social media are widely used in regular operations of many companies, including start-ups, small, medium and large organizations (Bell& Loane, 2010). The business environment in tandem with the technological developments has undergone an amazing transformation. Social media is a phenomenon that has transformed the interaction and communication of individuals throughout the world. It have transformed consumers, societies, and corporations with wide spread access to information, better social networking and enhanced communication abilities (Kucuk & Krishnamurthy, 2007). Social media is ‘‘a group of internet based applications that builds on the ideological and technological foundations of

Web 2.0, and it allows the creation and exchange of user-generated content'' (Kaplan & Haenlein, 2010, p.61). Social networks are defined to be websites which link millions of users from all over the world with same interests, views and hobbies. Blogs, YouTube, MySpace, Facebook are examples of social media that are popular among all level of consumers (Sin, Nor & Agaga, 2012).

Worldwide, the social network user base is expected to increase from 1.47 billion in 2012 to 2.55 billion in 2017 (eMarketer, 2014). Social media usage in India as number of internet users in India reached 302 million users by December 2014 (EY, 2015). India is a key market for social media giants active as social media users in India grew to around 106 million and India is among the top three countries in terms of number of people using Facebook (100m+ users), whereas Twitter is seeing an increased user base of over 33 million (EY, 2015). The increased mobile web penetration is also seen as a key contributor to increased growth in active social media usage — 84% Facebook's 100 million users in India access it from their mobile devices. 81% of the brands surveyed considered Facebook to be the most important platform, while almost 48% of surveyed brands think that Twitter is the second-most important platform to be on, closely followed by YouTube (43% surveyed brands considered it to be the third–most important channel). Businesses are also establishing their own YouTube channels while actively producing, curating and distributing video content for promotional material and showcasing new developments for the brand. Meanwhile, Vine, the latest entrant in social media platforms, concentrates on short six second video snippets that can be shared using Facebook or Twitter.

The popularity of social media sites has also spread to companies and firms as part of their strategies. Research studies shows that 93% of Fortune 500 companies have accounts on social media sites (Barnes, Lescault & Holmes, 2015). 21 percent of Fortune 500 corporations had corporate blogs, 78% use twitter, 74% has Facebook, 84% has joined Glassdoor, 93% use LinkedIn and 13% use Instagram. More than 70 percent of organizations operating around the world are now active on social media (KPMG, 2011). Companies across variety of industries such as automobile, travel and tourism, banking and financial services, retailers, airlines fashion and education and many more using social media to tap opportunities in the market. The use it to build brands, promotions, product development, customer service, employee engagement and recruitments etc. In many organizations, the number of social media-specific roles is limited. Simply Measured survey of over 350 social media marketers found that 65% of teams have between 1 to 3 people dedicated specifically to social media (Simple Measured, 2015).

Now, ecommerce has come to occupy a centre stage in the way people transact business including shopping for clothing, accessories, fashion products, smart phones and consumer durables. It is clear that the mind set of an entire generation of shoppers (mostly young upwardly mobile people) is getting focused more on online purchases. Also, technology has made it easier for consumers to carry out financial transactions (netbanking, usage of credit & debit cards etc.). Web 2.0 is has transferred the Internet to a social environment by introducing social media, where individuals can interact and generate content online line (Lai & Turban, 2008). The aim of this research is to examine the role of Social Media (YouTube, Blogs, and Twitter etc.) and Social Networks (Facebook, Google, LinkedIn) and kind of business transformation takes place due to it.

E-COMMERCE TO SOCIAL MEDIA COMMERCE

The power of social networking is such that, the number of worldwide users is expected to reach some 2.5 billion by 2018, which is around a third of world's population (Statistic, 2015). An estimated half a

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

billion of these users is expected to be from China alone and approximately a quarter of a million from India. The region with the highest penetration rate of social networks is North America, where around 60 percent of the population has at least one social account. As of 2015, over 70 percent of the United States population had a social networking profile (Statistia, 2015). Table 1 clearly shows that Facebook leads in number of active users, which is followed by YouTube.

The complete dynamics of eCommerce has changed over the last few years where people have started using the power of social computing. The ecommerce companies instead of mainly focusing on direct marketing and sales, retailers have started networking to reach out to a bigger mass, and using social connections to interact with people they would not have reached earlier (Bhattachary, 2015). Social media has brought in a huge change in the way businesses and customers interact. Customers have direct contact with merchants and can engage in real time with a retailer. The consumers can verify the authenticity of the brand, compare online with other similar products and then finally can make a decision. Retailers add social network plugins to their online applications to enable users to be interactive. In such cases, users have the option to login using their social networking credentials instead of creating a new profile which becomes cumbersome to maintain. Retailers start campaigns with incentives for sharing and referrals.

When shoppers make purchases, they are encouraged to share the name of the online store or their experience with their friends. In return they get loyalty points or rewards, which encourage repeat buying. When buyers share product or store related information or experience, their friends get to see it on social networks. This stirs interest among buyers' connections/friends to know more about the product and they can simply click on the link and visit the same store. Sites like Tumblr, Pinterest, Instagram, and Wanelo are becoming online catalogues for shopping ideas, fashion tips, and wish lists. Friends of buyers are also offered incentives or discounts to purchase, so they buy what they want and save some money. This expands customer base and creates awareness about the product among more people in the chain. In the whole process, retailers gain new customers, shoppers get rewards, and friends save money hence it's a win-win for everyone in the circle (Bhattacharya, 2015).

Pinterest and a handful of other platforms are started a phenomenon known as "social shopping"—a clever blend between typical social media and e-commerce experiences. The concept of social commerce was developed by David Beisel to denote user-generated advertorial content on e-commerce sites, and by Steve Rubelto include collaborative e-commerce tools that enable shoppers "to get advice from trusted individuals, find goods and services and then purchase them" (Cohen, 2011). Social commerce is defined as a form of Internet-based social media that allows people to actively participate in the marketing and

Table 1. Social networking sites activity in November 2015

Social Networking Sites	No of Active Users (Millions)	Activity
Facebook	1,550	1001 Million daily active Facebook users
YouTube	1,000	300 Hours uploaded every minute and 1 Billion+ views each day
Instagram	400	70 Million Photos per Day
Twitter	316	500 Million Tweets per day
Tumblr	230	110.1 Billion Tumblr Posts
Pinterest	100	1 Billion boards created

Source: Statista, 2015

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

selling of products and services in online marketplaces and communities (Stephen & Toubia, 2010). Social commerce is a part of ecommerce that involves social media, which supports social interactions and user contributions to assist online buying, and selling of products and services. The social commerce term was introduced in November 2005 by Yahoo, which describes collaborative shopping tools like shared pick lists, user ratings and other user-generated content-sharing of online product information and advice. According to survey it was found that 35 percent of online consumers have made a purchase based on an advertising they saw on a social network (Statista, 2014).

Social shopping sites integrate social aspects, such as product sharing and front-facing user engagement. Examples of Social commerce include photo-sharing social networks such as Pinterest or Polyvore, or highly curated e-commerce sites with strong social components such as Etsy, Fab or Fancy. Niche services such as Airbnb, which is a social platform providing individuals to rent living spaces short-term lodging have also taken advantage of social networking features. Social networks are moving towards social shopping, with nearly every major network implementing buy buttons. According to recent data from Addshoppers, Pinterest is pushing about one-quarter of social commerce for their retail clients (Knight, 2014). Pinterest allows brands to showcase product as well as increase organic reviews and conversation. Social media sites are trying to cash in on their users by directing them to online shopping, but Pinterest& Twitter are poised to allow people to buy items they see on the site, where people share images of art projects, recipes and fashion items. Instagram has its own social commerce, expanding its advertising platform to allow businesses to offer a number of options including "install app," "download," "learn more," "sign up" and "shop now," feature. Just clicking on the button will take the user to either a section of the advertiser's mobile website in Instagram's in-app browser, or the Google Play store or Apple App store in the case of 'install app.' Social login, buttons and pins are some of common features of social commerce and Table 2 lists the common features and its meaning.

The transition from retail commerce to e-commerce has been gradual, but from e-commerce to social commerce is happening at a rapid pace with more and more users getting comfortable to shop with their mobile phones and while catching up with friends. Nonetheless, the share of social commerce is

Table 2. Common social commerce features

Social Commerce Features	Meaning
Social Login	Social login, also known as social sign-in, is a form of single sign-on using existing login information from a social networking service such as Facebook, Twitter or Google+ to sign into a third party website in lieu of creating a new login account specifically for that website.
Facebook Like Button	The Facebook "Like" button is a feature that allows users to show their support for specific comments, pictures, wall posts, statuses, or fan pages.
Pinterest Buyable Pins	Buyable Pins are a simple, secure way to buy products they discover on Pinterest. Using the new Buy it button, consumers that use Pinterest will soon be able to shop and securely checkout with the products they find on Pinterest - all without ever leaving the app.
Google Button	Google +1 button shows that you like or agree with something.
Rating and Review Button	A Review button has been added to certain types of Facebook Pages. Users have long been able to post recommendations on Facebook Pages known as Places Pages. A Places Page is one that includes a physical address and allows check-ins. These can be local businesses, entertainment and sports venues, restaurants, or any business that lists a physical location.
Product Recommendation	Recommendations feed displays the most recommended content on your site, using actions (such as likes) by your friends and other people.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

still relatively small (less than 5% of total e-commerce sales) according to Morgan Stanley, indicating huge scope for growth. In 2014, the estimated global social commerce revenue is projected to amount to 20 billion U.S. dollars and grow to 30 billion U.S. dollars in 2015 (Statista, 2015). Facebook is the top social commerce platform, driving more than two-thirds of mobile e-commerce traffic and boosting social media's quickly growing share of e-commerce web traffic. Facebook accounts for 50% of total social referrals and 64% of total social revenue (Smith, 2015). Despite the continued hype around social media, retailers are still figuring out how to best drive sustainable e-commerce purchases via social media. According to the Internet Retailer's Social Media 500 report, the top 500 retailers earned $3.3 billion from social shopping in 2014, a 26 percent increase over 2013, and well ahead of the average 16 percent growth rate for E-Commerce. The LoginRadius analytics research team has analyzed our 150,000+ customer websites 72% use Facebook login, 20% use google+ login and 3% use Twitter (LoginRadius, 2015). Social networks have become a vital component in the way people communicate. But this social networks will impact the way we as consumers currently shop and will have a big impact on the future of commerce.

SOCIAL MEDIA AND MARKETING PRACTICES

Marketing is essential to most businesses and is generally the most important aspect of any business strategy. Around 2 billion people worldwide use some form of social media which is around 28% of the world population (Simple Measured, 2015). Marketing via social is a priority for more companies than ever before. Social media may serve as a channel for many marketing activities including customer relationship management, customer service, buyer research, lead generation, sales promotion delivery channel, paid advertising channel, and branding. Today businesses realize that if they wish to reach their prospects and customers, their online presence in social media is a foundation of their overall marketing strategy. Social media marketing is the marketing strategies that organization employs in order to be a part of a network of people online. Social media has impacted and modified traditional marketing activities and communications. The unique aspects of social media and its immense popularity have revolutionized marketing practices such as advertising and promotion (Hanna, Rohan & Crittenden, 2011). Social Media applications like Facebook, LinkedIn, Twitter, WhatsApp&Viber are being increasingly used by both marketers and consumers to transact, build awareness of products & services and brand building. Online social networks (Facebook, MySpace, Twitter, YouTube, virtual communities, etc.), where individuals as members, construct public profiles to share their knowledge and their experiences, to post information about themselves and have contact with others who exchange and share similar interests (Cheung & Lee, 2010).

Customers are smarter than ever they are socially engaged and well informed. This new kind of buyer, Customer 2.0, develops opinions of our brands without ever viewing a single advertisement or listening to a sales pitch (Cognizant, 2014). Customer 2.0 can learn anything he/she wants to know about our products or services through social media. Social media websites provide an opportunity for businesses to engage and interact with potential consumers, encourage an increased sense of intimacy with consumers, and build all-important relationships with potential consumers (Mersey et al., 2010). Companies use these tools also for effective sales promotion and customer relationship management (CRM). Social media has also influenced consumer behavior from information acquisition to post purchase behavior such as dissatisfaction statements or behaviors about a product or a company (Mangold

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

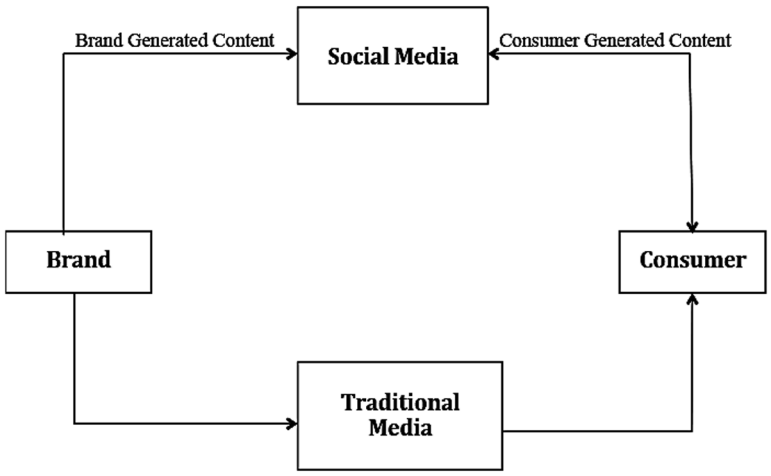
& Faulds, 2009). Social media has also influenced consumer behavior from information acquisition to post-purchase behavior such as dissatisfaction statements or behaviors (Mangold & Faulds, 2009) and patterns of Internet usage (Ross et al., 2009; Laroche et al., 2012).In the context of the digital era, the term "consumer engagement" typically includes the ways in which consumers and constituents engage with brands, companies or organizations through digital channels, such as the brand's website, blogs, social networking sites, and videos.

Marketing Communication on Social Media

Research studies showed that the communication by brands on social media positively affected brand equity and relationship equity (Kim & Ko, 2012). Brand's social media activities can be used to increase brand aware-ness and brand liking, promote customer engagement and loyalty, inspire consumer word-of-mouth communication about the brand, and potentially drive traffic to brand locations on and offline (Ashley & Tuten, 2015). Media propagation has changed the ways in which advertising messages are delivered and received. Due to the high costs incurred in delivering a mass audience, advertisers are moving away from television and investing in alternate media, such as social network sites, to reach their target customers. Advances in social media offer unprecedented opportunities to target consumers in increasingly personalized ways. The emergence of Internet-based social media has made it possible for one person to communicate with hundreds or even thousands of other people about products and the companies that provide them (Mangold & Faulds, 2009). Advertising and Brand Building using Social Media Social-network advertising enables brands to reach both mass markets and niche markets while targeting specific segments using the segmentation tools offered by sites (based on user behaviors and demographic data).

Today marketing communication is linked with the flow of communication through social media and traditional media. Figure 1. illustrates the new social media brand consumer communication model. The traditional media communication is mostly one way but social media communication is mostly two-way communication. The social media have both consumer generated and brand generated content. Facebook's

Figure 1. Social media brand- consumer communication



EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

emergence as an important marketing channel has largely due to brand pages as they establish direct communication with their fans and customers. Facebook fan pages allow a brand to create an online community of brand users through the social networking site. Brand can post an item of content on its page, and reach is the number of people who receive an impression of a piece of content. Ninety-six percent of Interbrand Top 100 Global Brands have a dedicated Facebook accounts and 94% posted content in the month of April. 50 million businesses are now using Facebook Pages, up from 40 million in April 2015, and more than 2.5 billion comments are made on these Pages per month (Facebook, 2015). The number of social networks a brand is active on dependents on the brand's audience is actively participating. The monthly active users (the number of people who sign in each month) for each of these networks provide context into why brand interest is so high.

Many top brands now maintain a Facebook page from which they serve posts and messages to connected users. This is a form of free social media marketing that has increasingly become a popular and important channel for marketing. Jayasingh & Venkatesh conducted a research to find the Facebook brand page activities for Indian brands. They selected 134Facebook Indian Brand Pages, categorized into their respective industry and then monitored the daily interaction by fans based on the type of posts. The total

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

number of posts of 134 selected brand pages is 12,925 and total interaction is 21,591,353 (Jayasingh & Venkatesh, 2015). Table 3. Facebook brand page interactions presents the total number of post, type of post and its overall interaction. The finding shows that average interaction is highest for offers and least for links. 89.5% of the posts are photos, which is followed by videos.

According to Cisco by 2017, video will account for 69% of all consumer Internet traffic. Videos are now making it into every interaction we're making online. From the launch of live video feeds on Twitter, the continued popularity of video on Facebook and Instagram, and the accessibility of high definition video on every mobile device. Video is the most powerful marketing tool being utilized now. People respond to the encapsulated storytelling modality of video on news and entertainment sites, as well as e-commerce sites of all kinds. Video can be used to convey corporate culture, introduce a new product, and even as a reputation management tool. YouTube is the leader in online video, and the premier destination to watch, share, and promote original videos online. YouTube is fully integrated with Google AdWords for video, leveling the playing field for businesses that want to reach new customers with online video.

Social media marketing has grown both in popularity and importance. Social media is no longer reactive function but it is integrated closely with many other marketing activities, and its share of attention, budget, and staffing needs is only continuing to grow (Simply Measured, 2015). Their survey of over 350 social media marketers found that 65% of teams have between 1-3 people dedicated specifically to social media. In 2015, there are an estimated 76,000 social media-marketing professionals in the workforce (Simply Measured, 2015). Social media activities can be difficult to quantify, and 60% of the marketers surveyed listed "Measuring ROI" as their top challenge (Simply Measured, 2015). The revolution of social media has a significant impact on the cooperation between organizations and consumers. The consumer's role has undergone a change from passive to co-creators of value.

Customer Relationship Management in Social Media Era

Web 2.0 tools reshaped the traditional CRM processes transforming them into CRM 2.0, by identifying and solving customer service issues, using forums, wikis and others (Schroeder, 2013). The social media influence the degree to which customers can engage with a company, and that the customer's level of engagement both affects and is affected by the company's approach to each of the three components of traditional CRM — acquisition, maintenance, and termination (Malthouse, Haenlein, Skiera, Wedge & Zhang, 2013). Social media and other new technologies have also enabled consumers to filter out advertising and compare prices with competitors from anywhere with mobile devices, and distribute positive or negative brand messages to a global audience. CRM must evolve if it is to survive in this marketplace, by producing contact points that engage the consumer and provide value to both the company and consumer (Malthouse et al., 2013). The technological developments and the growth of social media are also making possible innovative forms of business interaction and activity involving new types of business relationships. Social CRM integrates social media with CRM to optimize the social interactions with customers. Users, social media consumers and potential customers are demanding instant communication gateways. Social media will not replace CRM but bring forth a new generation of tools to support these social customers.

Customer service is undergoing a major evolution, with online communication moving away from private, anonymous, one-to-one channels toward public one-to-many channels that are mobile, social, and attached to real identity. Social customer service is rapidly becoming the new, critical channel to drive satisfaction and loyalty. Social media has already reached a high level of maturity as a communication

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

channel. The business case for introducing social media customer service is supported by consumer research studies, which show that customers prefer using social media for its ease and speed of response when compared to traditional phone and email channels. Social care is different from traditional voice, email and chat support because social care conversations are public, often permanent and can easily go viral. The connection research showed that 37% of customers prefer using social media for customer service inquiries over traditional methods like telephone calls. Social listening is a study on real life social media conversations. The TCS research shows that companies spend an average of about$19 million on social media activities in 2013 and, on average, employ 56 people to plot their social strategy, listen and respond to consumer comments on public sites, and handle other tasks to stay in tune with social media discussions about their brands, products and practices (Tata Consultancy Services, 2015).

Social selling is when salespeople use social media to interact directly with their prospects. It is the process of developing relationships as part of the sales process. Today this often takes place via social networks such as LinkedIn, Twitter, Facebook, and Pinterest. Social Selling is gaining popularity in a variety of industries, though it is used primarily for B2B (business-to-business) selling. The main components of social selling are social prospecting, personal branding, employee advocacy and social relationship management. According to research findings, 75% of B2B buyers are influenced by information found on social channels, and 97% of the time cold calling is ineffective. Research has shown that the use of social media has a significant positive effect on sales. Salespeople using social media experience 78% greater sales than similarly situated salespeople not using social media. Social CRM is the new buzzword for businesses as they can reach out to customers online through social platforms like Twitter and Facebook and in turn, build loyalty and belief in their brands. The key advantage of social media is that it makes the businesses to respond quickly. Many companies today monitor online conversations about their brands and its competitors.

Risk and Monitoring Social Media

Although Social networks can help companies spread good news fast, it can also spread bad news just as quickly. Moreover, if customers want to vent their anger on your product or service, they can use your social network account. Managers need to understand how to handle those situations quickly and effectively. Also, as social media is not as widely moderated or censored as mainstream media, individuals can say anything they want about a company or brand, positive or negative. Today's customers act, and react, at lightning speed to your latest products, pricing plans and sales channels. They spread the word about their good and bad experiences with comments captured across a dizzying range of platforms. Social media command center is simply a dedicated area where a company's social media team can monitor and engage social conversation around their brand and market. The command center of the future is: valuable information that travels seamlessly between individuals, teams and locations. Contextual data that shows what is happening related to the brand and why its happening, allowing teams to make informed decisions. They demonstrate the work and results of your brand's social initiatives, then showcase these insights to other employees within the company.

But marketers need to quickly and cost-effectively collect social media data from various sources, analyze the data, and understand the results before sudden market changes undermine sales or damage their brands. This rapid response requires the discovery, extraction, cleansing and integration of a wider range of data than ever before. When rumors on social media threaten a product's reputation, or a complaint about an out-of-stock product signals an inventory crisis, marketers and brand managers

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

need detailed information immediately. They must be able to analyze and correlate many more types of customer data, sense danger and opportunity in their customers' experiences much more quickly, and response much more effectively than ever before. It also requires social media tracking and analytic tools, natural-language processing to draw insights from text, advanced predictive analytics to aid decision-making and easy-to-use dashboards and reports.

SOCIAL MEDIA AND HR PRACTICES

Social Media has changed the today's human resource practices. The Wipro research findings shows that social media can be used in three areas Internal Branding, Collaboration and Communication and Hiring were considered almost equally suited for use of social media, with Internal Branding favored the most (Wipro, 2012). Most jobs are currently being recruited through social media and many organizations now use active recruiting, essentially becoming their own headhunters to locate potential future employees (Wipro, 2012). For example, the website Glassdoor.com, an employee feedback and job seeker forum site, allows members to provide "inside" information on company cultures, employees and salaries. Members rate their own organizations on various characteristics, and these data are then searchable by other users on the site. Information posted can be seen by other employees, customers or competitors. Even if an organization has no official social media presence, its employees may be creating one (Ployhart, 2014). Social media allows HR executives to monitor the activities of their employees. If employees are posting to their personal social media accounts during the day and those posts do not relate to work, or relate in a negative way, then the company can enforce its social media policy. Some companies allow employees to use social media throughout the day so long as their posts relate to the company in a positive way (Vassallo, 2015).

Traditionally organization use break room suggestion boxes, employee hotlines and closed room meetings to record employee concerns. Due to social media, employees can now share their experiences and suggestions as well as the bad experience in social media sites. A survey by the Society for Human Resource Management (SHRM) mentions that 54% of HR professionals believe it is very important for job aspirants to be present on LinkedIn and 33% believe it is somewhat important (Ring, 2015). Human Resource Department in organization use social media for employee communication, corporate branding, background checks, emergency notification etc. Social networking can potentially be a great tool for resolving questions or problems. With a large network at your fingertips, chances are someone out there has the answer or an idea.

Social Media and Recruitments

Talent acquisition is one of key area within many companies to use the social media. In the past, to recruit employees, organizations advertise opportunities in the newspaper; engage a recruitment consultant or, post jobs online via the company website or on popular job boards. This 'passive approach', as many claim, is on the way out. One of the biggest advantages of human resource managers using social media on the job is that it makes the recruiting process easier and more successful for the company. HR managers can post job openings on all the company's social media sites, including links to the listings on the company website. This makes it easier for the company to get the notice out to the public when jobs become available and for candidates to apply for those open jobs. Companies are also seeing more suc-

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

cess using social media to recruit new employees as they can browse the social media sites of potential candidates to determine if he or she will fit in with the company culture (Vassallo, 2015). 69 percent of HR departments now use social media channels such as LinkedIn, Twitter and Facebook to assist with the recruitment process (Bennett, 2013)

Cybervetting refers to the practice of viewing social networking sites such as Facebook and Myspace, blogs and microblogs like Twitter and using search engines like Google and Yahoo! to obtain information about job applicants or to monitor current employees. Science Daily Research study on cybervetting shows that the majority of the individuals conducted cybervetting as part of their evaluation of a job candidate. Over 90 percent of companies use social media to recruit (Perkins, 2015). Much of this recruiting (94 percent) is currently focused on LinkedIn. About two-thirds of recruiters utilize Facebook when looking for people to fill positions, and just over half of hiring managers use Twitter to recruit. Mostly, these recruiters use social media to support traditional hiring channels by searching for candidates, posting jobs, and vetting applicants. The data shows that 55% of Job Seekers use social media for job search purposes (among Recruiters, the percentage of use for HR professional purposes were around 73%). In this regard, LinkedIn is largely the most used social networking site (35%) followed by Facebook (17%) (Zanella & Pais, 2014).

Social Knowledge Management

The social media exponentially increasing these interactions, a new paradigm must be created to manage the explosive growth of knowledge associated with social interactions. The organization have shifted to social media that connect people, break down silos of information and reach beyond the boundaries of the office to enable to creation of innovative practices that re-ignite the collective intelligence. The primary goal of knowledge management is to "improve organizational performance by enabling individuals to capture, share, and apply their collective knowledge to make optimal decisions…in real time" (Smith & Farquhar, 2000, p. 17). The disruptive force of social media is forcing organizations to rethink their traditional knowledge management paradigms. Informal social networks have always existed in organisations but remained largely hidden. The emergence of social networking technologies makes the informal networks visible. Social networking websites can be one of the fastest ways to obtain information. Social networking websites provide an opportunity for management to have faster contact with their subordinates. If there is an issue that needs immediate attention, a manager can send a message through social networking websites and the internet to their employees to get the information they need to make a decision (Baker, Buoni, Fee & Vitale, 2015). "Organizations are actively leveraging the power of social networks to find new business opportunities, new groups of like-minded individuals and companies, and new sources of industry specific wisdom, advice and expertise" (Wilson, 2009). Social networks can act as a tool to help the company reach out to both potential employees and customers.

Another way social media has impacted human resources is that companies are now beginning to communicate with their employees using social media. Some companies will talk to employees on Twitter to discuss company events so the public can learn about them. Other companies use messaging apps such as Google Hangouts to talk with employees in one location or all over the world (Vassallo, 2015). CEOs who learn how to harness the power of social media can greatly improve the flow of information among their employees, while managing shared knowledge with their partners in unexpected new ways. This appealing outcome is fast becoming the norm for a new breed of cutting-edge Social CEOs (Drumwright, 2014). Social CEOs use internal crowdsourcing to identify knowledge assets or informa-

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

tion resources from a distributed pool of contributors within their companies, or from their partners and suppliers. Crowdsourcing tools include open surveys and user-generated knowledge systems to aggregate and share the information (Drumwright, 2014). Employees can contribute, comment and vote on mutual ideas about how to improve business tasks and services. Through this application of collective intelligence, the best ideas soon bubble up to the top. Enterprise social networking tools offer community and collaboration features like profiles as a core component, blogging, bookmarking, RSS, wikis, and the creation of self-defined, self-managed online communities.

The importance of external contacts and networking was illustrated in a study by Cross & Kartzenbach, which found that around 90 percent of the information used for decision-making by senior company executives came from their informal networks rather than formal reports or databases (Cross & Katzenbach, 2012). Web 2.0 tools influence training processes since information is becoming user driven and companies face transitions toward shared data, user generated content, and user experience. As a result, training activities are not bound to a specific geographical location or time frame: webinars take place all over the world and blogs, RSS filters, forums, wikis, and podcasts may enhance the training experience (Smits & Mogos, 2014).HR Managers must recognize that social media important parts of their organization. The information no longer flows in one direction from the sender to the receiver; instead users now generate their own content. This has created new opportunities that can also add value for HR departments.

FUTURE RESEARCH DIRECTIONS

The usage of social media is evident from this study by both organization and consumers. Opportunities for further research include, continued study of social media adoption in various industries and how it transforms the traditional business processes. The future research need to be conducted to find out how businesses today adopting social media and measure its impact on customer and employee relationships. Researchers should also attempt to understand what types of social media initiatives work best for organizations of different industries and what business functional area is best suited for this new channel. Additionally, the social media communication channel should be tested in the field to check if it can deliver measurable business results for small, medium as well as large corporation.

CONCLUSION

Social media have fundamentally transformed the relationship among business, employees and consumers. The companies need to accept that today's business model is consumer driven and developing strong relationships with customers through engagement on social media platforms can help achieve business growth. The variety of social media touch-points provides greater opportunities to influence the consumers buying process at different stages. It's clear that social media have most significant impact on the day-today work for many customer-facing activities. It is necessary for today's organization to engage more employees, customers and external partners through social media, then achieving benefits and measuring them in a systematic way. It is clear that many more organizations will be adopting social media to achieve additional value from this new channel. Social media has not only opened new ways of communication and distribution throughout all industries, it also created new business models, which

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

relay on participative communication in real time. As business functions are digitally transformed and new technologies become more fully integrated into everyone's jobs, it is increasingly important for all workers to have high degrees of digital literacy.

Keeping the customer engaged and managing them both emotional and physical, in term of time spent and the frequency of usage and interactions with organization are very important today. Social media has become an integral part of the consumer pre-purchase and purchase decision. The consumer now has convenient channel for expressing his views and also viewing others views in a public space. The social media has changed the world of technology as well as business, with the last few years. The revolution of social media has a significant impact on the cooperation between organizations and consumers. The consumer's role has undergone a change from passive to co-creators of value. It has become necessary for the business to understand this change and embrace this new technology.

KEY TERMS AND DEFINITIONS

Customer Engagement: Consumer engagement is defined as the interactions between a brand and its customer.

Customer Relationship Management: Customer relationship management (CRM) is a term that refers to practices, strategies and technologies that companies use to manage and analyze customer interactions and data throughout the customer lifecycle, with the goal of improving business relationships with customers, assisting in customer retention and driving sales growth.

Cybervetting: Cybervetting refers to the practice of viewing social networking sites such as Facebook and Myspace, blogs and microblogs like Twitter and using search engines like Google and Yahoo! to obtain information about job applicants or to monitor current employees.

E-Commerce: Is the buying and selling of goods and services, over an electronic network, primarily the Internet.

Internal Branding: Internal Branding is the set of strategic processes that align and empower employees to deliver the appropriate customer experience in a consistent fashion.

Social Commerce: Social commerce is a subset of electronic commerce that involves social media, which supports social interaction, and user contributions to assist online buying, and selling of products and services.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Social Media: It is a collection of online communications channels dedicated to community based input, interaction, content sharing and collaboration.

Social Media Marketing: Social media marketing (SMM) is a form of Internet marketing that utilizes social networking websites as a marketing tool.

Social Shopping: Social shopping is an e-commerce methodology in which the shopping experience is shared with a social network of friends and contacts.

Chapter 50
Turning Marketing Students into Active Citizens:
The Learning of Consumption and Social-Related Marketing in Thailand

Krittinee Nuttavuthisit
Chulalongkorn University, Thailand

ABSTRACT

This chapter discusses the learning of consumption and marketing within the context of social-related issues. The objectives are to expand dimensions of marketing education into a wider perspective beyond the economic focus to the social domain. Exploring the different contexts can help uncover a deeper perspective beyond general concepts of consumption and marketing. Moreover, considering the social aspect can enhance a longer perspective of business beyond current profit maximization, particularly in the 21st century with its emphasis on sustainability. The learning process can follow the four main steps of understanding the problem, introducing the solution, engaging participation (with real actions to support the project or organization), and evaluating output and outcome. These processes are elaborated together with examples of real practices and summarized learning derived from the classes conducted in Thailand. Not only can this benefit the students, but also the overall business and the society by turning marketing students into active citizens.

INTRODUCTION

The 21st century demands people who can understand and manage the balance of people, planet, and profit realities. To create business people who have a good grounding in understanding beyond business knowledge to appreciate cultural literacy, ethics, analytics, and sustainability, it is better to begin early with education. With today's focus on more collaborative efforts, it is crucial to develop people who can become active citizens. For business school students, this means their contribution not only in donating allocated profits (aka philanthropy), but also incorporating social development into their everyday practices. Furthermore, society has recognized the need and called for action from the business sector to take part in improving social conditions.

"Consumption and Marketing" is the subject fundamental to most businesses, particularly marketing, since it involves analysis of consumer behavior and its implications for developing marketing strategies. Overall, the topic includes how to explore and interpret consumer psychology, sociocultural influences, and consumer decision-making. With its essence of understanding relevant groups and delivering values matching their demands, this subject of Consumption and Marketing is in fact applicable to many other contexts such as international relations, technological advancement, and social development. For instance, many countries have been focusing on acquiring soft power through the promotion of cultural values, entertainment, or commercializing products and services in other countries. This concept is based on the ability to influence others by way of cooperating rather than the traditional coercion (aka hard power) (Nye, 2004). Thus, understanding Consumption and Marketing is central to the programs. Another example is the technological advancement of alternative energy, which relates to the way in which people consume and save energy as well as success of marketing efforts in breaking into the dominant fossil fuel market. For social development, Consumption and Marketing can be utilized to stimulate changes in people's behaviors, for instance, bike riding and recycling to reduce global warming.

Realizing the importance of Consumption and Marketing and its implications in different contexts, this chapter aims to connect the subject to the goal of developing business school students who seek to generate meaningful initiatives beyond achieving business profits to creating real benefits to society. Particularly, the chapter features summarized concepts of how to organize the learning and engage students' participation in social development projects. Based on the classes conducted in Thailand, where active citizenship has become a principle concern, this specific case approach demonstrates both overview perspectives of Consumption and Social-related Marketing and example practices related to the country's contextual situations.

CONSUMPTION AND MARKETING IN SUPPORT OF SOCIAL DEVELOPMENT

Social development refers to the need to put people first in attaining sustainable growth and a better quality of life. With its central role to address complex relationships between societies, states and communities, social development requires collective efforts of all stakeholders where all can contribute according to their interests and capabilities. In the past, the business sector was generally viewed as the source of donations since business operations tended to be disconnected from social development activities. Therefore, their allocated resources were mainly contributions, in cash or in kind. In the early days, the concept of corporate social responsibility (CSR) began with the goal of upholding ethical practices in managing business and later extended to the acquisition of resources and production of products and services with considerations of public benefit. Table 1 explains the development of CSR. Over time the practice has become integral to the corporate strategy. Therefore, it is evident that more businesses are now organizing their own initiatives to support social development while there has been increased use of business knowledge in a variety of social development projects.

Consumption and Marketing is one of the areas in business practice that can directly yield benefits in support of social development. The subject involves an interrelated relationship between analyses of consumption behaviors and development of marketing to satisfy the needs, wants, demands, or desires of target consumers and hence produce returns (e.g. sales, profits). The focused topics include understanding of "consumer psychology" which refers to the internal influences (i.e. motivation, perception, learning,

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Table 1. The development of CSR

Though it is claimed that CSR is not a new development, the publication of Howard R. Bowen's book, Social Responsibilities of the Businessman in 1953 seemed to mark the beginning of this concept. Bowen explicitly called on business leaders to always uphold ethical principles in making business plans and decisions. In 1954, Peter Drucker stated in his widely recognized book, The Practice of Management, that the practice of public responsibility must be considered as one of the major goals of business development. From the firm basis initiated previously, CSR in the 1960s continued to be extensively discussed, mainly in terms of the meaning of CSR and its relevance to the economy. This extended the notion of CSR beyond general ethics. William C. Frederick, in his article "The growing concern over business responsibility" (1960), referred to the responsible use of society capitals (e.g. natural resources, cultural assets) in furthering the business and the economy. Joseph Mcquire, supported this broader view of CSR in his book, Business and Society (1963) and suggested that business should take into account the general public beyond the markets and matters related to the specified business only. Others, such as Milton Friedman, the author of Capitalism and Freedom (1962), argued that the responsibility of business is to maximize profit for the shareholders. This is consistent with the comment by T. Leavitt from the Harvard Business School who emphasized that corporate welfare makes good sense as long as it makes good economic sense. In this period, CSR was mostly analyzed at the macro socioeconomic level, and there were some questions about the economic value of CSR since it could not be calculated directly as could other business transactions. Entering the 1970s, the debates continued with some attempts to reach a compromise. While Milton Friedman insisted in his 1970 article titled "the social responsibility of a business is to increase its profits", he remained open to the possibility that some acts of social responsibility could lead to long-term profit for the company. On the contrary, Keith Davis, stressed the "Iron law of responsibility" (1967) and explained that when the company does not adhere to social responsibility, it will lose its considerable position in society to the other businesses who will assume such responsibility instead. Despite the opposite standpoints, it is observed that both recognize that benefits for business can simultaneously yield benefits to the society. This is regarded as the enlightened self-interest model that demonstrates the transformation of CSR from normative ethics to a concrete understanding of its causes and effects. With the more specific approach, CSR in the 1980s moved towards more micro-analytical perspectives with a focus on stakeholder engagement. Thomas M. Jones proposed in the article, "Corporate social responsibility revisited, redefined," to emphasize the process of CSR rather than the input and output as illustrated earlier. During that time, Peter Drucker revisited his view from the 1950s and wrote the article, "The new meaning of corporate social responsibility" (1984), suggesting the shift from viewing CSR as a general principle to a strategy that can enhance better returns for business. Subsequent research supported the concept with evidence of a direct relationship between social contribution and business performance. Tangible and clear benefits led to the expansion of CSR from the 1990s until now with continued studies in both academic and practical aspects which suggest that CSR is essential to business profitability. Thus, CSR has now become one of the core business functions central to the corporate strategy rather than being a separate, additional unit.

attitude, personality) that affect consumers' decision-making processes. Motivation is the driving force within individuals that impels them to consume. Next, consumption is based on what consumers perceive to be reality including information from both sensory input and subconscious perception. During consumption, consumers continually learn or acquire knowledge that serves as feedback and provides the basis for future, related behavior. Consumers then form an attitude or a learned predisposition to behave in a consistently favorable or unfavorable way with respect to a given object in a specific situation. The inner psychological characteristics both determine and reflect consumer personality, which explains how a person responds to the external environment, for instance, marketing strategies.

Besides the internal influences, there is a wide range of external factors in "consumer sociocultural backgrounds" such as culture, cross-culture, subculture, and social class. Culture represents the sum total of learned beliefs, values, and customs that serve to direct the consumer behavior of members of a particular society. However, globalization drives the impact of cross-culture which describes the similarities and differences between the consumers of different societies or nations. Next, members of the same society may be segmented based on subcultures such as generation, gender, ethnicity, and religion. Consumer society may also be categorized according to different social classes which indicate consumers with relatively similar social status and lifestyle.

Consumer sociocultural backgrounds and consumer psychology both play important roles in "consumer decision-making." During the process of decision-making, consumers must recognize that a need exists, make a pre-purchase search, and evaluate alternatives before deciding to try, and later repeat purchases

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

if they are satisfied in the post-purchase evaluation. This information becomes consumers' experience and serves to influence their future behaviors.

Though theories of consumer behavior, with the three major aspects of consumer psychology, sociocultural background, and consumer decision-making, are mainly developed based on the business perspectives, learning this subject can also support the other missions. In this case, it can help identify target a group of people to engage in social development, analyze their behaviors and prepare strategies that can persuade them to take action. These implementations of Consumption and Social-related Marketing are demonstrated in initiatives ranging from charity-based activities (e.g. fundraising) to more business-oriented functions (e.g. selling merchandise to raise funds for social causes) and finally the development of a new model such as social enterprise, which combines a business practice with social development concept.

Fundraising is one of the major means of gathering support from people who want to help further social development. From a business perspective, soliciting donations can be quite challenging and different from normal selling practices because donors must be sold on supporting the causes rather than the benefits of any products or services. The strategy must engage learning of the social issues, which can sometimes be too distant and complicated, and persuade belief in the efforts to realize some additional benefits beyond the good deeds. Fundraising strategy has been extensively studied by the non-profit sector. But recently it has been extended to integrate learning of other relevant subjects, e.g. consumption and marketing, and digital marketing, which can promote advancement of both social administration programs and marketing education. An example from a world-famous campaign in 2014, the ice bucket challenge, demonstrates how awareness of the Amyotrophic Lateral Sclerosis (ALS) disease was raised via direct learning i.e. dumping a bucket of ice water on one's head to experience numbness caused by the disease. Additionally, by filming one's own act, donating, and sending a clip to challenge other nominated participants to do the same, this strategy, combining altruistic, entertaining, self-congratulatory, and social motives, has become one of the most successful viral marketing and crowd funding campaigns. It was reported that the ALS Association received almost 80 million USD from 1.7 million donors in one month, while the organization raised only 64 million USD funds in the whole of 2013 (TIME, 2014).

Next, the subject of Consumption and Marketing can be used in more applied business initiatives such as selling merchandise as part of fundraising strategies. Currently many social development organizations are trying to become more independent and sustainable by not relying solely on donations or grants but selling products or services to generate income. An example is the sale of UNICEF cards and products which reached a historical high performance of 77 Million USD in 1995 (UNICEF, 2014). But with the change of consumption (e.g. on-line communications), this business has declined and UNICEF has decided to change the business model from centralized, in-house operations to third-party licensing and local sourcing. This helps increase the variety of products that suit local consumer interests, and brings better returns on investment, while leveraging the brand equity. A similar idea can be observed in cause-related marketing when a business sells specific items (e.g. limited editions) with the communicated objective of raising funds for some identified social cause. An example is Product Red launched in 2006 that has since become one of the largest cause-related marketing campaigns with a number of global companies (e.g. Apple, Nike, Coca-Cola, Starbucks, Gap) featuring their products with the red color and licensed brand, (PRODUCT)^{RED}, stating the portion of their profits to be donated to the Global Fund to help eliminate HIV/AIDS in Africa. It was reported that Product Red has contributed 150 Million USD to the Fund (Global Fund, 2010).

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Finally at the business model level, Consumption and Marketing can be applied in operating a social enterprise that is a business, either for-profit or non-profit by its structure, working to achieve the goal of social development rather than maximizing returns for shareholders. The definition of social enterprise remains quite broad, from running a normal business but allocating a major part of profit to address social causes to running a business operating with the goal of addressing social causes at the same time. An example is Grameen Bank, the Nobel peace prize-winning microfinance organization in Bangladesh working to provide small loans to the underserved people who do not have access to formal sources of finance to be used in pursuing normal livelihoods, such as self-employment. Unlike the conventional financial institutes, Grameen Bank does not require collateral but utilizes mutual trust among community members to drive success of high repayment. This social enterprise was recognized for its efforts to create economic and social development from grass roots with the performance of more than seven million borrowers averaging 100 USD each in 2006, when the award was received (Nobel prize, 2014).

With the greater impact of understanding and applying Consumption and Marketing in support of the broader contexts such as social development, business schools are therefore responsible for promoting such knowledge and skills among their students in order for them to become meaningful human resources in society. However, despite the significance of this subject, it is not always easy to engage business schools students, or any other people, to become active citizens. Based on the continual efforts in conducting Consumption and Marketing classes in Thailand and attempts to engage students' participation in social development, this chapter discusses how to facilitate such learning with the objectives of expanding *dimensions* of marketing education into a *wider* perspective beyond the economic focus to the social domain. Exploring the different contexts can help uncover a *deeper* perspective beyond general concepts of consumption and marketing. Considering the social aspect can enhance a *longer* perspective of business beyond current profit maximization to the emphasis on sustainability. It is necessary to clearly communicate these objectives to students in order to promote real and strong interest in advancing their studies while, at the same time, contributing to the development of active citizenship.

LEARNING CONSUMPTION AND SOCIAL-RELATED MARKETING: THE CASE OF THAILAND

Thailand is a Southeast Asian country with a population of approximately 67 million. The country was an absolute monarchy for over seven centuries until the 1932 Revolution that led Thailand into the era of democracy with a constitutional monarchy. The movement towards Western modernity (e.g. in politics and economics) was criticized as being abrupt and alien to most people at that time. Hence, during the early phase of democratization, the country still depended on the authorities while ordinary people were not much involved in the country's development as they believed that the government could exercise power in their best interests. It was the civil uprisings against oppression in the 1970's that gave rise to the power of the people. Though people's participation was given more emphasis, barriers in the Thai political context still resulted in rather inefficient bureaucracy with the domination of entrenched interest groups (Rigg, 1991) such as the army, politicians, civil servants, and business tycoons. Most efforts were aimed at advancing the country's economic growth capitalizing on the country's abundant resources and its strategic location in the region.

In spite of the growth of Thailand's economy, this approach seemed to disregard human and social development. Like many emerging countries, Thailand is facing the problem of the increasing gap between

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

the rising growth of economy and the lagging improvement of social standards. Evidently the advancement of the business sector and economic expansion does not translate into better quality of life for most people but in fact creates further problems of inequality. In Thailand, the problem of income distribution seems to be enduring, with the top 20% earning more than half of the income share (54% in 1998 and 55% in 2007) and the bottom 20% earning less than 5% (4.58% in 1998 and 4.3% in 2007). In terms of social inequality, there exist variations in the quality of the social services (e.g. education, healthcare) provided to Thais depending on their socioeconomic status. Some disadvantaged groups, especially the poor, have restricted access to the judicial system, administration process, and public resources. While those who can earn more seek better opportunities to improve their standard of living, those at lower levels of the pyramid are left with minimal welfare benefits. This can potentially cause separations and breakdowns not only on a national, but also on a global scale in today's interconnected world.

Nevertheless, the economic progress of Thailand continued until the financial collapse in 1997 leading to the major Asian economic crisis. Realizing the need to focus on sustainability, subsequent programs were redirected towards incorporating all aspects of political, social, and economic development. Unfortunately, though this effort was intended to engage all relevant stakeholders, only a few influential groups (particularly from the business sector) participated still with the aim to take advantage of the country's policy at large. To gain support from the general public, more emphasis was placed on short-term returns in relation to some political agendas (aka populism). The mismanagement has yielded disorder and fragmentation in the country as witnessed in the continual civil unrest over the past few years until the military government took control in 2014.

Currently the major sentiment in Thailand is that everyone is accountable for the country's development. From the business perspective, many businesses have now taken serious steps to advance their efforts in CSR. Prayukvong and Olsen (2009) suggested that many companies in Thailand are involved in philanthropy and there is a dramatic increase in CSR discussions, initiatives, awards, and workshops, as well as institutes such as the Corporate Social Responsibility. Wellbeing research involving 100,000 people in Thailand (Khon Thai Monitor, 2012) revealed a lack of satisfaction with business involvement, specifically in the creation of substantial and long-term benefits for society. Comments suggested the need for businesses to reevaluate their approaches such as changing from event-based CSR activities organized by the CSR department to engaging everyone in the company and combining CSR into their everyday practices. Thus, it is crucial to let business people become aware, prepare, and collaborate to tackle challenges in other aspects such as social development. Particularly with the rather close-knit, collectivistic society of Thailand, business and other sectors are quite interrelated. As witnessed, many business persons have become key opinion leaders in matters of sociopolitical development and they are compelled to join forces in solving multiple problems in the country. Moreover, with the less structured establishment of social welfare and benefits, well-designed socially and environmentally responsible products and services can to a great extent influence the wellbeing of the general public. Therefore, promoting business engagement in improving the social conditions can significantly contribute to the better development of the country. These various efforts represent a good platform to learn about Consumption and Social-related Marketing in Thailand.

Additionally, due to unique characteristics of Thai culture, learning from this specific context can help advance descriptive understanding of the subject. For instance, one of the most important cultural values, inculcated in the dominant influence of Buddhism, is to be considerate and try to help people who are suffering (Vichit-Vadakan, 2002). Merit making is widely practiced through philanthropy, charity, sponsoring, volunteering, or sharing. It is believed that this might help improve conditions in the future

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

of this or the next life. Thus, it is evident that Thai people can be quite generous in giving, from small-scale responses to begging, to large-scale disaster donations, with no doubt or query about the cause and how the money is being handled. When interacting with other people, it is important to maintain smooth relationships and avoid causing inconvenience or trouble (aka *kreng-jai*) to others (e.g. by asking for detailed information or monitoring processes). The prompt willingness to share can help speed the initial efforts but at the same time inhibit the continued cooperation because of less concrete engagement. As a result, Thailand is ranked in the top 5 countries according to the 2012 World Giving Index, averaging 76% of people in the country donating money in the month prior to interview, but achieves a lower level of active citizenship with only 18% of people engaged in volunteering (Charities Aid Foundation, 2012).

This leads to intertwined problems such as dependence on the authorities and corruption because people rely on the materialistic means (e.g. money) rather than volunteering which requires more understanding and engagement in the development process. It is stressed that civic participation can help promote greater efficiency, more accountability and transparency of resource allocation and development in society (Fung & Wright, 2001). Hence, increasing active citizenship is the key to genuine and sustainable poverty alleviation, as it can enhance ownership and commitment among diverse groups of people (Chambers, 1983), promote collaborative networks, and finally help reduce the mounting problem of inequality that has been present strongly among communities with passive citizens.

TURNING MARKETING STUDENTS INTO ACTIVE CITIZENS OF THAILAND

Realizing the importance of promoting active citizenship in Thailand, it seems quite natural that the youth would be the right target because they are more open and full of energy. Similarly at the global level, Youth and active citizenship are widely discussed as the young people are perceived as 'citizens in the making' (Marshall, 1950, p. 25) and therefore they have become the main target of policies to increase active citizenship over the past decade. The recent research of 4,000 young people, aged 18-25 years, in Thailand illustrated that more than half expressed their desire to see change in society and specifically demanded that the country's leaders practice good governance with no corruption for the people's benefit (Khon Thai Youth Monitor, 2014). Interestingly, while the youth in Thailand are aware of the problem as well as the need to improve the nation, when asked about their contribution, more than half mentioned passive roles such as not causing problems to others and being a good student, explaining that they are too young to make a difference.

From a business school perspective, there is a serious need to foster students' (who represent the leaders of the younger generation) active engagement. However, it is recognized that learning must be carefully designed so that students become motivated and engaged in understanding and applying the subject (i.e. Consumption and Marketing in this case) in support of the broader context such as social development. As proposed by Jansen, Chioncel, and Dekkers (2006), educating active citizenship can be achieved by linking the context of practice to the content of learning. Students should learn to critically analyze information about the particular context in conjunction with overall situations. Next, they should be facilitated opportunities and access to experience a wide range of citizenship activities as well as how to monitor and evaluate the practices. This chapter proposes that the learning process can follow the four main steps of understanding the problem, introducing the solution, engaging participation (with real actions to support the project or organization), and evaluating output and outcome.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

In the following section, these processes are elaborated together with examples of real practices and summarized learning derived from the Consumption and Marketing classes conducted at the Sasin Graduate Institute of Business Administration, Thailand (AACSB, EQUIS). The main approach for this course is to facilitate opportunities for students to attain hands-on experience from group assignments to in-class exercises, fieldwork, and projects. These various initiatives present broader opportunities to explore the different pedagogical approaches. Moreover, with a mixture of local students (half of whom have been educated in Western countries) and foreign full-time and exchange MBA students, the discussion also sheds light on the topic of cultural diversity.

Step 1: Understanding the Problem

Understanding the social problem is fundamental to any further development. A deeper view of the issue can lead to more opportunities to overcome the challenges while producing more active citizens who can identify the options and limitations inherent in social development practices. But how to connect with business/marketing students who may not be familiar with, or have little interest in, many social subjects can be difficult. To elaborate on current situations and explain major causes of the problem, both macro perspectives (e.g. impact on relevant stakeholders) and micro perspectives (e.g. personal stories of the affected group) are needed. The macro view can help emphasize the importance of the matter and bring it closer to students' lives, while the micro stories can help move them emotionally.

An example is derived from the case of Yaowawit School described in Table 2. Yaowawit is a boarding school founded to care for orphans from the Tsunami in 2004 and later expanded to include other disadvantaged children. When discussing the case, students were first provided with macro information about the large-scale troubles that many unfortunate children are currently facing in the country, ranging from poverty to low quality of education, psychical and mental health problems. These have consequently led to a multiplicity of entangled social concerns such as drug addiction, violence, crime, all of which can eventually affect everyone's lives. Like most case studies, many claimed solutions to these problems lie in education. Yet there has never been enough support from government welfare alone. Looking closer at the micro perspectives of Yaowawit children's backgrounds, all have been subjected to various kinds of trauma from a young girl being abused by family members to a homeless boy wandering around to find food from garbage. Hearing so many of these stories (with due respect to the children's privacy and confidentiality) immediately engages students into serious concern about the situation and the need to take part in tackling the problems of this vulnerable group in society.

Learning from the Yaowawit case suggested that it is important to make students feel involved and accountable for the situation. While both macro and micro perspectives are needed, cultural differences among students could also play an important part. It was observed that students with Western backgrounds (e.g. growing up or studying in Western countries) seemed to pay attention to learning about the overview (macro) information such as inquiring about education policies, and foster care systems while those of the Asian (i.e. Thai) background seemed to be moved by the individual (micro) stories. With regard to CSR perspectives, it was suggested that the Western ideas seemed to focus on laws and disciplines whereas Thai concepts are based on the individual's spirit (Prayukvong & Olsen, 2009). Nevertheless, both perspectives have their limitations as the macro information can be too distant and create the perception of the problem being too large to handle while the micro, emotional information can be too personal and susceptible to change. Therefore, to gain thorough understanding of the problem both perspectives must be combined in order to reach both cognitive and emotional commitment.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

It should also be recognized that there might be different segments of business/marketing students who have different degrees of interest in social issues. Thus, in the initial stage some students may show hesitation or even resistance to participation. However, all must be encouraged with the underlying belief that everyone wants to be a good active citizen when opportunity allows. Additionally, true learning about consumption and social-related marketing requires real practice or first-hand experience beyond conceptual analyses in the classroom.

Step 2: Introducing the Solution

After contemplating the social problem, the students should then be introduced to selected development projects with supporting information such as background, vision, mission, main tasks and responsibilities. Besides this general information, the discussion must also incorporate the management aspect of the project or organization such as strengths and weaknesses, opportunities and threats, strategy development, implementation (marketing/communications, operations, human resources, financial management), and performance evaluation. Organizing this in the form of case discussion with specified challenges can stimulate dialogue with students and lead to more engaging questions (Ackerman, Gross, & Perner, 2003). While content about the social interventions is important, it should be emphasized here that the purpose of learning for this group of business/marketing students is in the implication of consumption and marketing to support such an approach. Therefore, the focus is not on discussing social work but the relevant management, specifically marketing, areas such as how to communicate the program in order to attract interest and gain collaboration from stakeholders, and how to generate more revenue from donations and businesses.

Examples derived from the classes indicate that there can be quite a few challenging issues stemming from students' investigation of the management of social projects or programs. Business school students particularly can be goal-oriented and focus on effectiveness and efficiency (Vansteenkiste, Lens, & Deci, 2006). while many social development organizations are running with the goal to promote other aspects (e.g. wellbeing) regardless of high operating expenses and low returns on investment. For instance, when discussing the management and operation of Yaowawit, many students directly or indirectly criticized the school's premium offerings from resort-like facilities to extra learning of English, sports, and computer training. Such dialogue is in fact quite helpful as it can lead to better understanding of the school's concept, which believes that basic education is not enough for these disadvantaged children to find their own ways of breaking out of the vicious cycle of problems. They need extra qualifications to move forward so they can hold their own in the future.

This process also helps highlight concerns or reservations that students may have regarding the social development project, while the Q&A provides opportunities for students to learn about any queries they may encounter and how to handle them in the next step. Jansen, Chioncel, and Dekkers (2006) stressed the need to promote communicative interaction in resolving conflicts of interest and interpretation as it helps building participatory competencies of active citizens, while learning to question any rationales behind the current practices can raise awareness of the context-bound nature of the social developments. In this case, arranging discussion in the dialogue format can serve as a platform to exchange different and constructive perspectives. As an example in the abovementioned case of Yaowawit, the vision of the German founder, Mr. Philipp Graf Von Hardenberg, was that every child deserves to receive the best possible chance and the school should foster a positive attitude in the children to strive for a quality life so they can maximize their potential and eventually can lend a hand to others in need. Yet, in the

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Table 2. Yaowawit School case

The Tsunami of December 2004 caused widespread devastation in the southern part of Thailand. The tidal wave swept away lives, properties, and hope. Many people were left homeless after 58,550 homes were destroyed and another 6,824 homes were damaged. In addition, 882 children were orphaned. But just as these unfortunate victims were sinking down under the devastating effects of the tidal wave, they were pulled back to life by many helping hands. One of the efforts was through the kindness of the Children's World Academy Foundation which aims to provide education, (food and shelter) and living support to children in need between four and eighteen years of age. Mr. Philipp Graf von Hardenberg, an entrepreneur and the founder of this organization, initiated the Yaowawit public welfare boarding school opened in April 2006.

I believe that the most important parts of my vision were and are …one, the children must be able to break out of the vicious circle of poverty by receiving a fundamentally first class school and vocational education. Two, Yaowawit School must be a project mainly run and supervised by Thai people. And lastly, Yaowawit School must be able to generate its own income so all people involved feel responsible for the future of the project. – Philipp Graf von Hardenberg, Founder

Hardenberg's attempts, together with support of several friends and partners, made possible the realization of the Yaowawit School project. The school, situated on a large 22 hectare plantation in the village Kapong, is approximately 125 km north of the city Phuket and about 65 km east of the tourist spot KhaoLak. The school is located in an orchard outside Kapong village with a unique landscape of hills and valleys, tropical forests, creeks, lakes, and gardens.

Yaowawit School was originally designed to support children and orphans who suffered from the tsunami aftermath. Later it was extended to include disadvantaged children living in poverty or tolerating unacceptable social circumstances, e.g., being forced into a life of begging or prostitution. The school mission is to provide a community of well being and care where children can obtain a first class education and practical training. The curriculum is designed to meet Thai educational standards, the students' needs, and the regional situation. Children will not only learn the required academic subjects but also acquire practical skills, craftsmanship as well as entrepreneurial spirit and knowledge. Students will grow up and learn bilingually, in Thai and English, as well as learning from an early age how to use computers and the internet. To provide a firm foundation for the future, students of Yaowawit will receive practical training in areas that complement Southern Thailand's businesses such as farming and tourism.

Currently, the Yaowawit School has about 130 children and is accepting around fifteen kindergarten children every year. Each month, the school has to bear expenses of approximately at 30,000 USD, of which fifty percent is for salaries and the other fifty percent is used for food, gas, electricity, etc. To date, the school has relied mainly on income from fund raising. However, an ever increasing scarcity of resources and many unfortunate events around the world has made it more difficult for the Yaowawit School to rely solely on international donations.

Realizing the need to stand on its own, the foundation and the school started, as planned from the beginning, projects that can help reduce costs and have the potential to generate income. Among these, farming is a high priority because it is one of the most important businesses in southern Thailand. In the school plantation, children learn about agricultural ecology and at the same time produce food to supply the school's meals. These agricultural products such as latex from rubber trees and palm oil are expected to provide financial returns in the future. Yet the school is concerned that an abundant supply and competitive market will make it difficult to bring profit particularly the school is located far from the downtown leading to heavy transportation costs. While the school is struggling to find more sources of income, its expenses soar because more children are accepted and the older ones are entering the level of education which the school is not yet ready to provide. Sending them to other secondary schools nearby requires additional funding for transportation, food, and personal expenses.

Because PhangNga province is well known for its beautiful national parks, islands, and beaches, the tourism business attracted Hardenberg's interest because it can not only generate income but will provide the children with lucrative jobs in the future. Before the tsunami, over two million people per annum visited the province with the peak at 2.89 million people in 2004. Almost 65% of these visitors were foreigners, 53% from Europe (particularly Scandinavians, Germans, and Swiss) and 33% from Asia. For international visitors, the main purpose of their visit was pleasure (about 95%) while the domestic visitors' ratio was pleasure (70%) and business (30%) e.g., meetings, seminars, company visits, exhibitions. Most tourists who choose PhangNga prefer seclusion and a peaceful time with their families. With the significant effort of both private and public sectors to rebuild tourism businesses after the tsunami, the situation has improved remarkably with more domestic tourists traveling to PhangNga. Most international visitors are still Europeans with many from Germany, Scandinavia, and the UK, while the Asians are mainly from China, Hong Kong, and Taiwan.

Early in 2007, Yaowawit School initiated a small hotel project, Yaowawit Lodge, with two mutual objectives; to provide practical training for their children in the hospitality business and to generate income to cover the school's running costs. Because tourism is a significant business sector in the southern part of Thailand, it is good to support young Thais to find career opportunities in this field. The first phase of this business had four buildings with a total of twelve guest rooms as well as a guest lounge and a lobby with a restaurant located in the school's commons building. Currently students participate in the hotel operation as part of their education on a voluntary basis. Trained staffs instruct them in English communication, manners, and service. Children also learn directly from practice in the housekeeping, laundry, and kitchen units. For other activities, hotel guests can walk to the school's plantation and orchard. They can also take an excursion tour with children guiding them to visit neighboring villages only 5 km away. Guests can also visit the two temples in the village that cooperate with Yaowawit School.

eyes of many people living in the developing countries, they see many more children who can barely make ends meet each day and they are familiar with projects running at minimal cost. Such a difference between helping children to survive versus to thrive must be addressed because it involves the different business models and management/marketing strategies. The group discussion concluded that Yaowawit School must project clear positioning of being a place to create social change agents who can not only lift themselves up but create a ripple effect on others. This would then justify the need to engage premium services. But it was found that such a distinct concept would be well accepted only among certain groups of people in Thailand, as reflected in almost 100% of donations coming from abroad. This can be explained by the social psychology theory which indicates that individuals from collectivistic cultures are motivated to avoid failure while those from individualistic cultures are motivated to pursue success in life (Lockwood, Marshall, & Sadler, 2005). Though this understanding can help plan segmentation and targeting of potential donors, to achieve sustainability it is necessary for social development projects to also promote local involvement and contribution (Greensmith, 2002). This leads to further discussion on how to respond to such issues. The next process explains one of the efforts to engage participation among business school students and other relevant stakeholders.

Step 3: Engaging Participation

Though the sharing of ideas about how to tackle challenges of project management can already be considered a good contribution to social development, the matter still requires concrete action beyond thinking and making plans. Thus, in this stage students are engaged in activities with platforms designed to facilitate their learning and the implications of consumption and marketing, while at the same time producing results (e.g. raising funds) to support the social project or organization. Examples are activities to solicit donations or applied business practices such as selling souvenirs prepared by the organization and taking part in social enterprise projects with opportunities to learn the total business process.

From the case of Yaowawit School, prior discussion illustrates the need to promote more local involvement and contribution. At the basic level of donations, students are engaged to plan and activate fundraising activities with reference to strategies such as friend raising, special events, direct marketing, sponsorship, and customer (i.e. donor) relationship marketing. Realizing the need to overcome some reservations among the locals who may not buy into the school's concept (i.e. to thrive rather than to merely survive), the students thought that direct experience would be one of the main mechanisms to enhance learning of this different model and to encourage support. With the chosen target segment of business people in their networks, students decided to organize a charity event to bring the group to join various activities at the school ranging from touring the site and its neighboring community, to farming, and teaching children extracurricular subjects. The event resulted not only in significant funds raised but also future opportunities to invite business groups to interact with the school.

Summarized learning from the activity was that students seemed to be uncomfortable with soliciting donations particularly with the tough proposition of Yaowawit School and no urgent circumstances (e.g. natural disaster) to endorse the activity. This is congruent with the current situation worldwide of lacking good personnel, resources, and management systems in the field of fundraising (Bell & Cornelius, 2013). Hence, most strategies implemented (at least in Thailand) are through personal networking. Though this approach may produce fast and easy returns, it is mostly restricted to interpersonal relationships rather than the real causes and the projects. Additionally, this method makes it difficult for new organizations

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

with limited connections to successfully reach donors, and cannot yield long-term benefits. Students came to the conclusion that in this context it was good to begin with personal networks but then to continue through some other systematic approaches to fundraising.

Next, besides asking for donations, students were encouraged to practice selling items or merchandise from the social development organizations to generate additional revenue. While Yaowawit School was still in the early stages of product development (e.g. lemongrass tea from the farm), students were introduced to other projects from UNICEF (selling souvenirs such as stationary and greeting cards) and the Thai Red Cross (selling commemorative coins to raise funds for the new building of the King Chulalongkorn Memorial Hospital), both of which have a variety of products and price ranges. Each group of students would begin by selecting and analyzing their target segments before planning and conducting marketing strategies. To enhance learning of diversity, students were assigned to work with different groups of consumers, arrange a different mix of products (souvenirs) and pricing, and sell products at different venues. In all cases, supporting materials (e.g. official brochures, banners, receipts) were provided to endorse credibility of the activities and avoid students incurring expenses.

Summarized learning from these activities is mainly derived from opportunities to directly interact with real markets and customers, particularly those whom students may not be familiar with such as the lower income group, or the older people who can become supporters of these projects. From their experience of being in the market students, particularly those with an international background, could observe cultural differences. Amusingly, those students who could not speak Thai became magnets through their attempts to communicate the good will. Here, students could see the different consumption behaviors and how to approach the target market. For example, students mentioned that they could reach the baby boomers early in the morning at the park and it was critical to attract the opinion leader because they could easily persuade others in their peer group to contribute via their social media networks. In this case, products serve as a medium to open up and connect the social issues with the general public's attention and eventually this could lead to further donations which remain the major source of income for most social development organizations. To apply this to the case of Yaowawit, it was suggested that this approach could help tackle challenges of the school being too premium to attract donations, but support through the buying of merchandise would be possible.

Finally in the more business-oriented state, students were engaged in the social enterprise projects which provided them with direct opportunities to make use of business knowledge and skills in support of social development. At Yaowawit, there is Yaowawit Lodge created for students to gain professional training in the hospitality sector and for the school to generate additional revenue. The goal is for the school to eventually become sustainable and be less dependent on donations. Students learned from the real case that this hotel, situated far from the beach and tourism areas, could attract very little interest among tourists on vacation. Therefore, they suggested targeting different groups such as businesses and other school communities who might be interested in organizing activities (e.g. bonding trip, camping) at Yaowawit and, with its mission to support disadvantaged children, it could also be incorporated into their social responsibility projects. This idea has been realized and has successfully raised a continuous stream of income for the school up until today. Students also learned about focusing on subsegment of schools or academic-related groups because they have shared common interests in organizing activities that can be easily combined with the school's arrangements. It also promotes Yaowawit children's interactions with friends and teachers from other school communities. Interestingly, most partner schools are international schools in Thailand or from abroad, probably due to the common approach regarding

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

children's development. An example of continued relationship is the Hong Kong International School's summer camp organized every year as a part of their social conscience education program.

Besides Yaowawit Lodge, students were introduced to another social enterprise project, Pan Kan, a charity shop developed to sell donated items to raise funds for scholarships for needy children under the care of the Yuvabadhana foundation. Established in 1993, this organization has sponsored more than 5,000 children to finish high school, vocational school, or university. For this project, students had a chance to operate their own pop-up retail shops in designated venues during the specified period (with permission to use the space free of charge as part of the University's activity). Here, they had to work through the whole process from market identification and consumption analysis to sourcing (e.g. asking for donations of used items), arranging products, pricing, displays, logistics, promotions, and more. Here, students learned how to solve problems and adapt their strategies accordingly, which can help connect creativity with social responsibility as well as generate identification and commitment to the causes (Wildemeerschet al., 1998). One student group, assigned to work at a busy fresh market, saw that despite the high traffic most people were not paying attention to anything other than food and groceries. So they tried to walk around calling interest to their shop, but they learned that this would interrupt the other vendors' businesses. Later, they changed their approach to introduce this business to the other vendors and gained collaboration from them to help invite customers to visit the shop.

For students, it is crucial to highlight that the primary objective of these organized exercises is learning and engaging students in planning and conducting activities, rather than measuring the end results (e.g. amount of money raised). The group mentioned earlier could not achieve high sales performance at the end, but gained impressive involvement from the community which can also serve as a significant mechanism to promote social development projects.

Step 4: Evaluating Output and Outcome

After the exercises, students were asked to evaluate output according to their prior analyses and strategic plan. Each team needed to give a presentation on their selected target segment, how they analyzed this segment's behavior, planned and performed strategies leading to their outputs. Importantly, evaluation would be based on their own plan and performance rather than comparing the returns across different groups. In fact, students might collect a small amount of donations from the low-income group but achieve high success regarding their plan to promote participation with no boundary. In this stage, management teams from the social development organizations would be invited to share their views with students and collect new ideas for their future development. They could assist in the process of connecting the outputs with possible outcomes such as analyzing to what extent these efforts could become scholarships for disadvantaged students under support of the organization, or how the activities conducted could help broaden the organizations' collaborative networks. The management teams must be open and acknowledge that engaging volunteers, specifically the business school students, could lead to greater and longer lasting impact despite some imperfect results and the extra effort needed. As Wenger (1998) suggested, learning of social practices enhances how to participate rather than the end result. Such perspective must be emphasized as some NGOs might prefer to gain only resource support, especially from the business sector, instead of collaborating with students, as they might be concerned about the complex nature of the social issues or want to control management and operations internally. There might also be some doubts about the sincerity of business entities which need to be clarified.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

To summarize the learning process, all proceeds from students' activities were then combined into the class donation to the organizations, and for their future reference and engagement every student would be presented with a certificate from the organization to acknowledge their contribution. For example, the recent activity to sell commemorative coins for the Thai Red Cross raised 32,500 USD within ten days. This will contribute to the expansion of the King Chulalongkorn Hospital, a public tertiary hospital serving about 1.4 million patients a year. The other pop-up retailing for Pan Kan totaled 4,000 USD sales in one day, or scholarships for 20 underprivileged children.

Finally, each student would submit a short essay to reflect on individual experiences. This reflection process is important after any activity since it allows opportunities for students to review and integrate their learning. Moreover in promoting active citizenship, this process can help connect awareness of social conditions and developments with personal life themes and bring students to attain underlying meanings of experiences. Examples from the real practices are shown in students' feedback after class (and even after graduation). Many of them still recall and talk about such experiences while some have become supporters of these and/or other social projects. For instance, one Japanese alumnus has brought a group of people from his organization to visit Yaowawit every year. Other alumni said these activities (stated in their CVs) are normally discussed in job interviews and the experience could bring quite insightful conversations with the companies. Those who felt reluctant at the beginning even noted (in the evaluation) that the initiative had given them new perspectives in making a difference and they felt proud to have taken part. This is consistent with Jansen, Chioncel, and Dekkers (2006) who suggested that the sense of communality could arise from encountering experience of togetherness and sharing of symbolic meanings or emotional events.

CONCLUSION

Business and society are interdependently related as business is initiated from the ability to analyze and promote opportunities to fulfill the needs of people in the society. Such an approach yields better satisfaction for the people as well as producing higher returns for business. In our modern economy with its forces of capitalism and globalization, it is ever more evident that society is being driven by business progress. Thus, in today's more complex world with its serious and fragmented issues, further involvement of business in tackling and preventing problems is needed in order to promote shared happiness and sustainability. As CSR has become increasingly emphasized, the concept has become the common reference point for individuals and organizations who want to contribute to society.

The movement is quite apparent in the case of Thailand, an emerging country with a positive growth of economy which has, at the same time, faced serious sociopolitical problems due to mismanagement and the lack of contributing efforts from the people. Particularly, the business sector has benefited significantly from the country's resources and economic expansion but contributed further problems of inequality and separation. This has led to a call for the responsibility of business people to play a bigger role in social development. This concern is quite apparent and the best and most fundamental way to begin is to start from education. Many business schools around the world have responded accordingly, to the extent that some schools announce the vision to produce business leaders who can make a positive difference in society. Nevertheless, despite the desire to see change, it is not always easy to make the change especially among the business school students who will have to manage a balance of other expectations such as making returns on investments of shareholders.

This chapter features the summarized learning from examples of MBA classes conducted in Thailand. While the subject of Consumption and Marketing can connect with the goal because it enhances better understanding of the target group of people and devising of strategies to persuade them to take action in support of social development projects, the subject also requires care in the design of processes to facilitate the integrated learning. Here, the four main steps from understanding the problem to introducing the solution, engaging participation, and evaluating output and outcome are discussed together with the use of techniques such as problems, practices, and projects. In each class, students are introduced to problems from various sectors (business, social, etc.) at both domestic and international levels and they are encouraged to practice tackling the multiple challenges with focuses on analyses of target customer/donor behaviors and development of marketing strategies. Finally, students will be able to apply knowledge and experiences into their projects or activities. Through this process, students can learn about relevant theoretical concepts but in a more engaging and pragmatic manner. As a result, students will be able to further develop their analytical, creative, and theoretical skills. Analytical skill denotes the ability to collect, analyze, and present information in a logical and coherent manner. Creativity includes, for example, innovative and thought-provoking ideas, fresh and different viewpoints, and unique techniques or styles. Theoretical skill is the ability to employ or engage some concrete concepts/theories of consumption and marketing.

Besides learning the subject, Consumption and Marketing, this process can enhance students' understanding of the wider, deeper, and longer (sustainable) perspectives as it expands the boundary of marketing education from a business/economic focus to the social issues, and from class-based to experiential-based learning. Empirical evidence from the real practice demonstrates such effort being well received because unlike some businesses which may be limited to specific interest groups, social problems are close to the heart and lie in the hands of everyone. Not only can this benefit the students, but also the overall business sector and economy, to move in the direction of sustainability. The learning from the case of Thailand can bring insights into the 21st century marketing education and emphasize ongoing initiatives promoted by various business schools to integrate diversity, ethics, analytics, and sustainability into their programs. Ultimately, this learning can impact on society by turning marketing students into active citizens of the country and the world.

KEY TERMS AND DEFINITIONS

Active Citizen: A person who actively takes responsibility or participate in the area of public or social development.

Consumption: An act of consuming product, service, idea, or concept influenced by psychological factors (e.g. motivation, perception, learning, attitude, self-concepts and personality) and sociocultural factors (e.g. family, social class, culture, cross-culture, subculture).

Fundraising: An effort to gather money for social development projects.

Social Development: A process to benefit people and the society.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Social Enterprise: An organization that applies business strategies for the benefit of public or social development.

Social-Related Marketing: A strategic process of identifying demands and exchanging values in support of social development.

Sustainability: An ability to sustain itself and to continue in the future.

Chapter 51
Corporate Social Responsibility and Sustainable Business

Ioana Duca
Titu Maiorescu University, Romania

Rodica Gherghina
The Bucharest University of Economic Studies, Romania

ABSTRACT

In this article, the authors propose an analysis of the corporate social responsibility (CSR) concept together with an emphasis on the role it plays in the context of sustainable development. The article includes a synthesis of the various theoretical approaches to CSR, an overview of the development of CSR practices at a national and an international level, certain authors' for and against arguments are related to generalising these practices, trends regarding CSR practices at international level, as well as an analysis of the CSR practices in Romania. The research conclusions express the author's own points of view on the development of corporate social responsibility initiatives at company level and the related benefits thereof.

INTRODUCTION

The environment in which business is performed is more demanding and dynamic than ever before. At the same time with the permanent pressures from shareholders related to making profit, companies must live up to higher and higher expectations on behalf of stakeholders with regards to transparency and taking responsibility. The authors make a synthesis of the specialised literature, indicating that the idea of corporate social responsibility meant first of all changing the perspective on business, from a mainly financial performance-oriented model, to once with wider interest in life quality, preserving resources and meeting the general interests of society. Namely, a vision which is circumscribed to the sustainable development principles.

At present, a company's social responsibility implies more than donating money to social causes or doing charity, but it refers to that honest and upright attitude the company is self-governed by, performs

its mission, respects its values and stakeholders, as well as the way in which it communicates and assesses the impact its activity has. A socially responsible attitude means making sustainable investments in the community where the activity is performed. In this context, 21st century company managers must turn social responsibility into a business tool – corporate social opportunity.

Under the pressure of regulations, more and more companies (mainly, but not limited to, multinational ones) have started integrating the social responsibility activity into their management strategy and communicating completed projects in their social commitment annual reports, in addition to the financial-accounting ones. This trend is also embraced by companies in Romania, country where recent studies have shown that the general public is more and more interested in socially committed campaigns, and consumers are more and more informed and demanding. Romanian companies must understand that responsibility towards society can be a strong element of differentiation, as consumers are more open to messages from companies that aim at the sustainable development of society than to messages from those that are perceived to be focused on profit alone. Moreover, the Romanian market has become more and more competitive and companies must find relevant solutions in order to establish emotional bonds with the public. All these are factors that currently make CSR a powerful tool in building and expanding a brand.

THEORETICAL IDEAS REGARDING CORPORATE SOCIAL RESPONSIBILITY

The specialised literature has recorded in time various and eve contradictory definitions of and approaches to this concept.

A chronological presentation of the main authors who contributes to the CSR concept development was made by Carroll. In 1999, Carroll published a vast research whose topic was the evolution of the definitions given to the concept of corporate social responsibility. Although he identifies theoretical references dating back to the 1930s – 1940s, he decides to place emphasis on the intervals after 1950, namely what he considers to be the modern era of corporate social responsibility (Carroll, 1999). Thus, Carroll considers Howard Bowen to be the father of the theoretical CSR concept, with reference to the latter's paper written in 1953 and titled *Social Responsibilities of the Businessman.* Bowen defined corporate social responsibility as being "… the obligations of businessmen to implement those policies, to make those decisions, or to take those directions which are accepted by society in terms of values and objectives…" (quote in Carroll, 1999).

In 1973, other authors, Eilbert and Parket wrote "…that the best way to see social responsibility is that of a good neighbour. On the one hand, it means not doing things that cause damage to the neighbourhood. On the other hand, it can be seen as the voluntary acceptance of the obligation to help solve the neighbourhood's problems…" (Eilbert & Parket, 1973).

Carroll, in a paper published in 1979, considered that CSR "… implies managing the business in such a way that it is economically profitable and it observes the law, ethical principles and social matters." Carroll brought into discussion four aspects of the concept and called them *the corporate social responsibility pyramid*:

- **Economic:** The responsibility to make profit for the shareholders;
- **Legal (Judicial):** The responsibility to observe the laws;

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

- **Ethical:** The responsibility to adhere to the social, moral rules, etc., other than the legal ones;
- **Philanthropic:** "…the responsibility to play a role in the voluntary support provided to a part of society…" (Carroll, 1979).

Dahlsrud (2006) in his turn, identifies five aspects of the social responsibility concept:

- **Environmental Aspect:** It takes into account the companies' integration of certain environment protection interests into the performance of their economic activity;
- **Social Aspect:** In which social responsibility is presented as a relationship between the company and society, and the company's role is to contribute to the development of society;
- **Economic Aspect:** In which social responsibility is presented as financial aspects (responsibility to shareholders);
- **Stakeholders Aspect:** In which we analyse the stakeholders that the company must take into account (employees, suppliers, customers, community);
- **Voluntary Aspect:** In which social responsibility is seen as an activity performed by the company, whereby the company sets higher standards in its activity than those set by the legislation in force.

In the Green Paper elaborated by the European Commission in 2001 – *Promoting a European Framework for Corporate Social Responsibility,* CSR is defined "…as a concept whereby companies integrate social and environmental interests into their business operations and into their relationship with stakeholders on a voluntary basis, being aware that a responsible behaviour leads to the company's long-term success…" *(European Commission, 2001).*

OECD considers CSR as being "…the multitude of actions taken by companies in order to consolidate their relationships with the communities in which they operate (Gordon, 2001). Falck and Heblich (2007) consider that social responsibility is understood as a voluntary corporate commitment to go beyond the implicit and explicit obligations related to what conventional corporate behaviour implies…" (Falck & Heblich, 2007).

In the ISO 26000 Standard on Social Responsibility, social responsibility is defined as "…an organisation's responsibility for the impact of its decisions and activities on society and the environment, through ethical and transparent behaviour, which contributes to sustainable development, takes into account the stakeholders' expectations, complies with the legislation in place and is consistent with the international behavioural rules, is integrated throughout the organisation and implemented in the organisation's activities…" (ISO, 2010).

It is important to mention that not every author shares these opinions. The most famous critic of the CSR practices is M. Friedman, in whose opinion a company's only objective must be to maximise profitability for the shareholders. In his approach, only people have responsibilities, considering the company as an artificial person with artificial responsibilities. In his book, *Capitalism and Freedom*, he emphasises that "…there is only one social responsibility of the business – to use its resources and to be involved in activities oriented towards increasing profits, taking into account the rules of the game, namely free competition and avoidance of fraud and deceit…" (Friedman, 1962). In 1970 in *The New York Times Magazine,* Friedman stated that "…a company's only responsibility is to produce welfare for its shareholders…" (Friedman, 1970).

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Other arguments made against the CSR practices are synthesised by Bowie and Duska in their paper published in 1990 (Bowie & Duska, 1990):

- **The Corporations' Obligations to Do Good Cannot Be Extended Endlessly:** Higher and higher pressure on companies to contribute to solving certain social problems could lead to making it more difficult for them to obtain profits;
- **There Is No Moral Authority That Sets Hierarchies of Social Needs:** Company managers, accustomed to decisions based on economic and financial criteria, will be in a position to make decisions based on moral reasons. Thus, business will influence social priorities, which must remain within the decision scope of public authorities;
- **The Relationship Between Ethics and Business Must Be Realistic:** After all, the end goal of business is to make profit. Businesses do not have the moral responsibility to do good.

In terms of the companies' motivations, opinions are also varied. Armstrong and *al.* (2013) say that current pressure related to companies' taking CSR actions "…interferes negatively with their strategy, distorts the allocation of financial and human resources and increase the probability for irresponsible decisions." Other authors (Halpern & Snider, 2012) say that certain companies perform CSR programmes only to take the public's attention away from the ethical problems triggered by their core operations, to clear their image or because in fact their products and services are harmful to the consumers' health or the environment (companies producing weapons, tobacco, alcohol, etc.).

We may identify a few general ideas in these theoretical debates:

- The corporations' social responsibility is a phrase that defines a certain type of behaviour on the part of companies as social actors, behaviour which is meant to lead to an improvement in the quality of life for the community the respective company is part of;
- This activity is a voluntary one, in addition to the legislative duties imposed by each country;
- The concept is quite old, and there has been an increase in interest in it in the past two-three decades, but it still has no clearly defined "boundary", only actors with responsibilities undergoing change, government – private sector – civil society;
- Although the facts show that they are not a passing trend, but tend to become a legitimate part of the business environment, CSR practices continue to be quite controversial and open to debate at world level.

HOW IMPORTANT IS CSR FOR BUSINESS?

The first institutional effort to promote and implement corporate social responsibility at international level is related to the *Business in the Community* initiative, in Great Britain, in 1982, in the context of very high unemployment in this country. The initial purpose was to create the organisational framework for action in which companies (30, initially) to become involved in increasing the level of employment in the local communities, and it evolved towards social investments and, eventually, to what we consider CSR today.

As international institutions (United Nations (UN), European Union (EU), Organisation for Economic Co-operation and Development (OECD)) became aware of the fact that the companies' adopting the

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

CSR principles is subsumed to sustainable development objectives, there surfaced the need to create international standards in order to define the desirable corporate behaviour and the indicators whereby it may be assessed, namely a series of recommendations and principles that encourage CSR initiatives.

Thus, we must mention the UN Global Compact programme, operational since July 2000, namely a network made up of United Nations agencies, companies, unions, universities, civil society organisations, government institutions, etc. The programme has 10 important principles organised in 4 domains of interest: human rights, labour standards, environment and fight against corruption. UN Global Compact requests companies to embrace, support and adopt this set of fundamental values voluntarily.

The importance of CSR at world level is proven by the collaborative effort made to create the ISO 26000 Standard on Social Responsibility in 2010. This standard meant creating a unitary value framework in the field of social responsibility, so as to harmonise the multitude of codes, rules, certifications and standards in the social and environmental fields. This initiative supports all companies "…in achieving long-term economic benefits, incurring reduced social costs and generating minimum adverse effects on the environment…" (ISO, 2010). ISO 26000 is a document that provides guidance to all types of organizations, regardless of their size or location, on:

- Social responsibility concepts and definitions;
- Social responsibility tendencies and characteristics;
- Social responsibility principles and practices.

In 1999, the *Dow Jones Sustainability World Index (DJSW)* was launched, the first global index used in measuring the financial performances of companies that are leaders in the field of social responsibility at world level. Lately, more and more investors take into account this index when they decide to invest in a certain company, firstly because the "…introduction of social responsibility policies promises the creation of sustainable value and, consequently, ling-term benefits…" (Mandache, 2007). Secondly, because such companies are expected to have superior performances as compared to the others, due to better risk management. Currently, there is a wide range of indices which measure the companies' social performance and which are key reference to investors. Among them, we mention: FTSE4Good Index, Global Challenges Index, MSCI World ESG Index, STOXX Global ESG Leaders, STOXX Sustainability Indices, Dax Global Alternative Energy Index, Hang Seng Corporate Sustainability Index, etc. (Jankalova, 2015).

At present, voluntary involvement in the community life is a must for a company that wants to ensure not only financial success on the market, but also the respect of those among whom it operates. According to a survey performed in 2015 by Cone Communications and Ebiquity (Cone Communications & Ebiquity, 2015) nine out of tem consumers consider that companies must do more than just to make profit, namely they must approach social and environmental issues. The research includes responses of nearly 10,000 consumers from countries like the United States, the United Kingdom, France, Germany, Canada, Brazil, China, Japan, and India. Consumers perceive more and more clearly the messages conveyed by the companies' social actions and they are more and more inclined to buy "green" products. 81% of the consumers are willing to buy and consume fewer goods in order to preserve the planet's natural resources or they would buy the goods/services of a less known producer about whom they know that it has high CSR standards. 62% of the consumers would accept to work in a company that is thoroughly involved in social responsibility and environmental activities, for a lower salary than the one offered by a company which is not committed to social and community actions.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Reputation Institute published in 2016 The CSR RepTrak, a vast survey of the consumers' perception of the CSR performances of the top 100 companies worldwide, according to their reputation. The survey is based on over 100,000 interviews performed in 15 countries in Europe, Asia, North America and Latin America. Together, the GDPs of the countries in which the interviews were performed exceed 75% of the global GDP. The survey emphasises the connection between the companies' success and the stakeholders' attitude to them. Whether we are talking about consumers, authorities, sponsors or speakers, stakeholders pay attention to the companies' performance and reputation. 73% of the interviewed consumers would recommend the companies with high reputation score in terms of CSR. Whereas companies with low scores related to CSR perception would be recommended only by 17% of interviewees. The survey also shows the fact that the companies in the top 100 in terms of reputation invest on average $50m annually in CSR activities, yet only 35% of the interviewed consumers believe about the 100 companies that they act as good citizens, supporting society and the environment, and only 40% believe they behave ethically and transparently in business.

Beyond the survey results and the debates, more and more companies, which are aware of the obvious benefits of taking on social tasks, both in terms of creating a competitive advantage, and by promoting a positive image, and which are also animated by philanthropic sentiments, incorporated CSR into their long-term development strategies (Katsoulakos et al, 2004).

Therefore, a company's success depends crucially today not only on the economic and financial operations, but also on the way in which managers know how to tackle ethical and moral issues and the relationship with stakeholders. CSR programmes help companies set themselves apart from the competition and gain the customers' brand loyalty. As they meet emotional needs, "CSR programmes are also a good opportunity to communicate brand values in a memorable way…" (Oprea, 2011).

Other benefits of social responsibility actions for companies may be summarised as follows:

- Better risk forecast and management;
- Competitive advantage and supply differentiation – CSR increases the company's competitiveness, in an economy where consumers and customers make purchasing decisions according to how socially responsible are the companies they buy goods and services from;
- Improved operational efficiency;
- Increased ability to recruit, develop and keep valuable staff. For any company operating in a strongly competitive environment, the employees' brand attachment is essential (Oprea, 2011);
- Increased capacity to build efficient relationships in the supply chain. Companies have been put pressure on suppliers for many years to deliver better and cheaper products, now it also becomes important how thoroughly they respect the sustainability principles;
- Increased ability to manage changes in the business as well as in the political-social environment;
- Easier access to funding.

GLOBAL TRENDS IN THE CSR PRACTICES

Various authors emphasised in their research ways in which companies underwent the process to incorporating CSR policies in their permanent activity agenda. Becoming committed to social responsibility was dominated by multiple changes in the corporate values and by an alternative approach to creating business value.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Hohnen and Potts identified "…ten factors that have influenced the development of corporate social responsibility at international level, in the past decades…" (Hohnen & Potts, 2007):

1. **Sustainable Development:** CSR is seen as potential solution to problems such as the incorrect use of natural resources;
2. **Globalisation:** CSR may increase positively the impact the global level businesses have on local communities;
3. **Governance:** CSR provides internationally acknowledged tools regarding human rights, the environment and anti-corruption policies;
4. **The Impact of Multinational Companies:** The way in which big companies behave has become an issue of general interest because their influence on political social and environmental systems is greater and greater;
5. **Communication:** In the CSR context, modern communication technologies give the possibility to improve dialogue and partnerships;
6. **Financial Capital:** Investors are more and more interested in supporting socially responsible businesses;
7. **Ethics:** A responsible type of approach may lead to improving the relationship of the company with stakeholders, to increased transparency and to higher ethical standards;
8. **Consistency in The Approach to the Community:** Companies should have the same high standards in terms of caring for environment and the community regardless of country;
9. **Leadership:** Lately, we have become aware of the limits to governmental initiatives in terms of comprising all the problems in a community more efficiently. CSR provides possibilities for action in those areas in which regulations seem improbable;
10. **Business Tools:** Adopting more efficient CSR programmes may lead to boosting reputation, higher market shares, ensuring customer loyalty, etc.

Regarding the global trends in CSR practices, we may pinpoint the following directions:

- **Increase in Transparency and Reporting in Terms of CSR Practices:** Reporting and disclosing social responsibility practices will continue to intensify undoubtedly, given the public interest and the changes in regulations. In this sense, we reiterate the fact that the European Parliament and the European Union Council adopted, in 2014, Directive 2014/95/EU on the disclosure of non-financial information (social and environmental factors) by companies of public interest in the European Union, which have over 500 employees. This information includes *policies, risks and results related to social, environmental and human rights impact, diversity, anti-corruption aspects, etc.* According to the Directive, transparency in terms of such information contributes to measuring, monitoring and managing the companies' performances and their impact on society. The changes brought along by Directive 2014/95/EU were transposed into the member states' legislations until 6 December 2016. When information disclosure is requested, the member states foresee that the mother-company can rely on the national frameworks (currently non-existent in Romania), on the EU ones (e.g. Eco-Management and Audit Scheme) or the international ones (e.g. United Nations Global Compact) etc. The Directive entered into force in 2017 and will have an impact on approximately 6,000 European companies. It is estimated that approximately 2,500

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

of them are already involved in reporting sustainability, as they reached the conclusion that these reports may be a competitive element of differentiation on the market;

- **Stronger and Stronger Positioning of Responsible Companies:** The growing impact of the corporate community on society and common good means that citizens and consumers expect that the companies' power and influence should be exerted in a responsible manner. Nowadays, companies are not only considered public enemies, causes of environmental disasters, of financial scandals and crises, but, at the same time, they are perceived also as solution to global problems. Nowadays, companies are expected to do more in the areas which used to be the exclusive scope of the public sector - ranging from healthcare to education, to investments in the community and in environment management;
- **Supporting the Development of New Markets:** Companies nowadays have moved away from their role of "user of resources" to that of market "creator". Direct foreign investments aim more and more at creating and accessing new markets, and less at merely using cheap local resources. Overcoming obstacles to economic growth, such as civil violence, uneducated labour, poor infrastructure and the lack of sustainable sources of energy, water and soil, is now the focus of businesses and on the agenda of all multinational companies;
- **The Global Commitment to Social Responsibility:** There are numerous companies actively involved in and with substantial initiatives on all key markets. After 2000, social responsibility began to be seen as an integral part of the company's business strategy – the 21st century is the "responsibility century". The concept of sustainable business developed, having as drive *the triple bottom line* – the 3 Ps – People, Planet, Profit (term coined by Elkington in 1994). In this context, we must reiterate the fact that the UN General Assembly adopted, at the end of 2015, 17 Sustainable Development Goals (SDG) for the year 2030. The 17 SDGs are equally targeted to both underdeveloped states and regions, and the developed ones. Thus, until 2030, the world states have committed to eradicate poverty and famine, to fight inequality and injustice and to take active measures regarding the protection of the environment. A major role in achieving these goals will be played by the representatives of the business environment (United Nations, 2015).

AN OVERVIEW OF THE SOCIAL RESPONSIBILITY PRACTICES IN ROMANIA

At the beginning of the 2000s, Romanian companies resorted to responsible practices only to align with a European and international trend or because they understood them as a form of rather less expensive advertising. But in time, as the Romanian economy became more and more competitive, local companies began to realize the advantages of this social approach, as prerequisite for increasing their reputation and consolidating their market share (Oprea, 2011). Decision makers in Romanian companies began to understand that, far from being a simple exercise for image improvement, social responsibility programmes are an efficient business tool. The result is that corporate social responsibility begins to change from a marginal phenomenon into a mainstream one in Romania as well.

Yet, the obstacles to this process were not few. Among the main causes for the slow incorporation of the social responsibility principles into the local business culture we find:

- The depreciation of ethical values at the time of the centralized economy;
- Lack of private capital maturity and identity;

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

- Organisational culture at an early stage;
- The economic environment lacking transparency;
- The hostile and discouraging political environment;
- Lack of specialised information sources;
- Numerous legislative changes.

In the past years, Romania has undergone a process of harmonising the legislation on human rights, labour conditions, environment protection, energy, transparency in administration, equality of chances, corruption, etc., and there is a legislative framework for each of the domains associated with social responsibility. But the problem "…for all companies is that they are facing an entire legislative jungle and, most often, they do not have the material and human resources to do more than simply comply with the requirements of this complex legislative framework…" (Barbuta et al, 2014).

Other factors that discouraged the social responsibility practices in SMEs, both in Romania and in other European states, are summarised in a survey from 2006: lack of managerial culture on the part of shareholders and administrators, paternalistic and authoritarian management style, conservatism, lack of transparency, rejecting innovation in business practices (Murillo & Lozano, 2006).

In the National strategy for the promotion of social responsibility 2011-2016, there is an SWOT overview of the CSR practices in Romania until 2010. The following are emphasised as obstacles to the development of a more responsible business environment: little knowledge of the CSR concept at the level of decision makers in companies, as well as corruption and lack of public policies in the field. At the same time, an aspect that may be capitalised on in the future is the consumers' positive and open attitude to the companies' involvement in the community/society (see Table 1).

In the Strategy, three major domains are identified, in which action must be taken in order to promote CSR in Romania:

Table 1. SWOT analysis of the CSR practices in Romania

Strengths	**Weaknesses**
• The company's openness to the social responsibility concept • Involvement in CSR initiatives on the part of multinational companies and of some of the large Romanian companies • Continuous increase in the number of initiatives of CSR type and of good practices • Increasing level of the consumers' interest in the products/ services of socially responsible companies	• Insufficient knowledge of the social responsibility concept • Lack of fundamental surveys and research on the level of knowing and implementing CSR in Romania • Poor knowledge and involvement of small and medium-sized enterprises in CSR initiative • Corruption, with direct effects on the business environment and on its capacity to implement CSR practices • Insufficient development of a business culture based on moral values
• Generating competitive advantages for Romanian companies on the European and international market • The opportunity to learn, take over and adapt good practices and lessons learnt from the experience of other more developed countries • The customers' positive attitude to the companies' commitment to the community/society	• The lack of coherent public policies to promote CSR • Delays in adopting acceptable standards in CSR related fields (e.g. the environment) as compared with other EU member states • Insufficient involvement of public authorities in promoting and implementing CSR
Opportunities	**Threats**

Source: The authors' processing from Guvernul României. (2011). Strategia Naţională de promovare a Responsabilităţii Sociale 2011 – 2016.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

1. Creating a favourable framework for the development of CSR, both at central and at local level, by the public authorities;
2. Promoting the use of social responsibility at organisation level in Romania;
3. Actively involving the public sector in initiatives of CSR type.

Yet, since 2011, progress has been made in the CSR field, initiative increased both at implementation level within companies, and at the level of performing surveys and research or proposing public policies. We will list the most important surveys and analyses made in Romania in the past 5 years, whose objective were to: analyse the CSR activities performed in the local business environment, provide companies with a comparative analysis tool and increase in the level of awareness of the CSR domain in Romania.

A survey performed in the interval 2011-2012 in the project "Partnership for development" by the Bucharest Chamber of Commerce and Industry (CCIB), European Social Action Network (ESAN) and the Assistance Centre for Non-Governmental Organizations CENTRAS targeted the social responsibility of 500 companies in the regions where the project was performed, with emphasis on actions for the employment and social inclusion of underserved categories. The most important results of the survey were (CCIB & al, 2011):

- 76.19% of the interviewed companies had social actions mentioned in their development strategies;
- 27.50% of the companies included in the project had never performed any social responsibility project;
- In terms of domains of actions, the prevailing ones were environment protection (33.33%), education (30.56%), healthcare (12.5%) and culture (8.33%);
- Most implemented programmes targeted socially responsible business practices (30.14%), and philanthropic actions (20.55%). Fewer companies chose programmes that aimed at promoting a cause or at marketing related to a cause;
- Most programmes were performed at local level, and fewer at regional and national level. The environment in which it was intervened was mainly the urban one, with a ratio or 34.04%, followed by the rural one with only 9.75%;
- 61.19% of the interviewed companies had never published CSR reports and only 16.42% elaborated such documents in proof at the time the survey was performed.

In 2015, the company The Azores launched *Romania CSR Index 2015*, performed on the basis of an analysis of the commitment of the top 100 companies in Romania to the sustainable development of society. To assess the companies' performances, The Azores analysed the corporate websites as well as the CSR and financial reports for 2014. The communication documents published by the companies were assessed according to three European and international references: Directive 2014/95/UE, Global Reporting Initiative G4 Standard and Dow Jones Sustainability Index. The index includes 36 quantitative indicators, organised into 9 categories: Corporate governance and transparency; Diversity; Economic impact; Environment; Human rights and Anti-corruption policy; Employees; Consumers; Community and philanthropy and Supply chain. The analysis showed interesting aspects, such as (The Azores Sustainability & CSR Services, 2015):

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

- The most active companies in the CSR field in Romania are found in the following industries: non-alcoholic drinks, beer, building materials, oil & gas, banks and telecommunications, and the least active ones are the companies in the pharmaceutical, media, supply and tobacco domains;
- Responsible companies in Romania are generally concerned with aspects such as protecting water resources and energy efficiency, education, but also with the development of communities and the employees' job-related training;
- Of the 100 assessed companies, 30 companies had never published any information about CSR. Of the companies that publish reports/newsletters, many include only data about donations to local communities or about the employees' voluntary actions, which leads to the erroneous perception that CSR refers only to philanthropic activities. In addition, few companies use social and environmental performance indicators, which does not allow stakeholders to make a comparative analysis with other companies and assess the impact objectively.

The most important measure of social responsibility in Romania may be considered the survey performed annually beginning with 2013 by Ernst&Young Romania & CSR Media. The latest report is based on a questionnaire administered in the interval 25 April – 25 May 2016. The report analyses the responses of 150 executive managers in the local business sector and specialists in the field of social responsibility. The survey indicates that 88% of the companies who answered the 37 specific questions are already involved in social responsibility actions (Ernst&Young Romania&CSR Media, 2016), as compared to only 69% in 2014. This result indicates actual progress in the field of CSR practices in the Romanian business environment. The most important conclusions of the survey are:

- Romanian companies understand by social responsibility involvement in the community (26%), sustainable business strategy (21%), business ethics (16%), responsible management of the supply chain (11%) or significant interactions with stakeholders (10%);
- Although the two main reasons for which companies became involved in CSR projects in the past year remained the fact that it brings along acknowledgement and visibility (56%) and the fact that this activity is part of their public relations strategy (46%), these are decreasing as compared to the previous year. Instead, there are visible increases in motivations such as: our shareholders request this commitment (40%), the company's financial value increases (25%) and we are forced by the company's policy (21%). There is evolution that indicates a strategic approach to CSR activities and more openness to the stakeholders' requirements;
- Companies continue to be interested, to the largest extent, in intervening in the field of education (75%). Also, there is increased focus on the healthcare field (61%), as well as the environment (51%);
- 76% of the companies say they have a CSR strategy/policy. Of these, most (52% of the interviewees) have a local strategy they implement, whereas 24% state they implement the strategy received from the mother-company. Although they do not have a dedicated policy or strategy, 21% of the interviewees still implement individual CSR projects;
- There is significant decrease in the ratio of companies that provide financial aid (philanthropy), from 80% in 2014, to 69% in 2015, and we notice a diversification in types of initiatives;

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

- The main tools used in communicating CSR commitment remain the company's website for 66% of the interviewees, and news releases for 59%;
- In 2015, almost half of the interviewees had an average budget per project of up to EUR 5,000, and 45% of the companies benefitted from budgets ranging from EUR 5,000 to 50,000 per project. Only 2% of the companies, compared to 5% in the previous year, said they performed CSR projects with an average value ranging from EUR 100,000 to 500,000 or more.

SOLUTIONS AND RECOMMENDATIONS

By analysing the results of all these surveys, we may identify the following ideas about the CSR practices in Romania:

- Romanian companies mostly have knowledge and general ideas about what the social responsibility field implies;
- The local legislative framework includes reference to domains related to CSR and it is mostly harmonised with the European one;
- The tendency to intensify the companies' commitment to CSR actions is visible, and the projects are more and more numerous from one year to another;
- For a long time, there was this erroneous perception in the Romanian business environment that CSR is a marketing or public relations activity, and not a society impact management activity;
- The development strategies of many companies include social objectives, but their implementation is not always seen in reality;
- The most active companies in the CSR field are multinational ones, and they include CSR in the company's general strategy; Romanian companies, most of which operate according to a traditional organisational structure, tend to place social responsibility as a peripheral activity;
- The intervention scope is limited especially in sectors with the most publicised problems, such as education, healthcare, the environment etc.;
- Regarding the types of programmes, these focus mainly in philanthropic actions, socially responsible business practices or social marketing programmes, but the range of actions has undergone a visible diversification trend in the past 5 years;
- Companies in Romania do not involve stakeholders much in making decisions about investments in CSR initiatives and they usually do not organise meetings and consultations in order to determine their needs;
- There are very few projects targeting the development of the rural environment;
- Interest in publishing the data about sustainability is relatively low among large companies in Romania, and the lack of transparency issue is obvious;
- Companies use only to a small extent the performance indicators related to sustainability (CSR Key Performance Indicators), except for certain multinational companies that are harmonised with the policy of the group they are part of;
- The public authorities' involvement in stimulating the business environment to adopt sustainable policies is still insufficient, although progress has been made in terms of implementing a public-private partnership.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

The European tendency is that sustainability will become an integral part of a company's business strategy and, to an equal extent, CSR reporting will become a significant part of corporate communication. These tendencies, together with the ever stricter legislation on publishing information related to the economic, environmental and social impact, will put pressure on companies, including Romanian ones, to be more transparent and more interested in investments in sustainable development. In this respect, we mention that over 700 companies in Romania prepare to elaborate non-financial reports beginning with 2017, according to the provisions of Directive 2014/95/EU. The directive had as timeline for incorporation into the legislations of the member states the date of 6 December 2016 and it implied a notable legislative effort to modify the Fiscal Code, Corporate Law, Accountancy Law, Banking Law and the Romanian Government emergency Ordinance on the corporate governance of public enterprises.

Consequently, the Romanian companies that will develop CSR practices in the following years should consider the following recommendations:

- To develop the necessary expertise at the level of shareholders, management team and in the company's culture;
- To develop their own CSR standards and policies using good practices in their field of activity;
- To identify correctly the community's problems and to ensure that there is correspondence between the company's profile or industry in which it operates and the social area it approaches in order to maximise the effects of its actions;
- To set up sustainable partnerships with NGOs, governmental agencies or local public authorities;
- To be more transparent with regards to the economic, social and environmental consequences of the company's activities;
- To involve stakeholders in defining a coherent and sustainable CSR policy;
- To encourage their employees to be more and more involved in CSR projects;
- Not to overlook the subsequent monitoring of performed projects (social audit, impact assessment, etc.).

CONCLUSION

Until not long ago, being socially responsible in business meant observing the laws. Nowadays, social responsibility implies much more, it involves meeting numerous stakeholder expectations. The concept of corporate social responsibility nowadays extends beyond a social programme performed at a certain time, an individual charity campaign done by a company, sporadic philanthropic actions or an intense public relations activity.

Social responsibility is no longer optional for companies. Social responsibility, even if it is "voluntary", actually starts being an obligation, whether it is about the pressure from regulations, or about the pressure from stakeholders in large companies. The increased level of competitiveness in the business environment and the decrease in natural resources, the instability of the economic and political environment are factors that make it necessary to implement new business models – more responsible ones. In this context, companies that want to be identified in the environment in which they operate must strategically manage their dialogue with the stakeholders. Only this approach allows them to identify and rank the expectations of various social and business partners, to balance their interests, thus minimising on the long term the risks that might affect their reputation.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Regarding Romanian companies, they have made obvious progress in the past years in terms of developing and implementing social responsibility projects, in partnership with NGOs, but also with the public sector. Even if CSR commitment was a practice initiated by the branches of multinational companies, it is no longer an abstract concept for companies in Romania which gradually become harmonised with this global trend.

Stakeholders such as consumers, the media, the online environment, NGOs have put pressure so that Romanian companies become aware of the responsibility they have in solving social matters and promoted, through various channels and tools, the successful projects and responsible organisations.

From the surveys presented in this article, we may notice an obvious increase in the number of social responsibility initiatives and projects in the past 5 years, which indicates the Romanian business environment has become mature and responsible. Yet, what is debatable is the extent to which these activities are actually integrated voluntarily in the company's core business. Surveys indicate that, in most cases, these are individual initiatives, and not necessarily a coherent and clear strategy. The exception is represented by multinational companies that are already harmonised with global standards. Therefore, it is time for all Romanian companies to rethink their approach to commitment to society and take CSR to the next level, namely that of sustainability (Ernst & Young, 2016). This means starting to see social responsibility from a strategic approach and integrated into their business, rather than a peripheral activity.

Chapter 52
Business and Social Media:
Collaboration for the Sixth Discipline

Kate Andrews
University of Phoenix, USA

Bethany Mickahail
University of Phoenix, USA

ABSTRACT

*During the 21st century, businesses benefit from two key components of effective innovation: social media and collaboration. This chapter provides an in-depth analysis to study the interrelatedness of these components. Featured in this chapter are classroom exercises to deepen the learning of students. By providing multiple recent social media examples, the reality of the integral ways in which social media permeates our lives is delivered. Introduced in the chapter is a sixth discipline, an extension of Senge's five disciplines of collaboration. Through the presentation of a new leadership model based upon the six disciplines, the impact of social media is examined. The conclusion of the chapter contains definitions of the concepts introduced. The use of social media has been and still remains a strategically keen tool in business effectiveness.**

INTRODUCTION

Social Media and Business

During the 21st century, businesses have benefited from the use of two key interventions: social media and collaboration. What is included in the context of social media? We can only say what is included today because tomorrow will bring new innovations. Social media uses any form of electronic communication connectivity used to enhance collaboration and sharing of information through the internet. Technical support for social media are electronic tools such as, smartphones, tablets, laptops, and desktops. Technical tools that are digitally connected to social media venues are those such as Facebook, Twitter, LinkedIn, Instagram, Google +, Pinterest, Clouds, and Reddit feeds (Mickahail & Andrews, 2015). These are the well-known social media of today but for tomorrow, the trends reported are wearables,

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

drivables, flyables, and scannables. Present day examples are Google glasses and watches (the purchase and use of wearables has doubled every month since 2012), self-propelled cars (prototypes are running in California), personal drones, and bar code futures (Meeker & Wu, 2013).

There is no question that the use of social media is a strategic direction for business. As the latest innovations enter the market during each business cycle, the reasons for business utilization of social media proliferate. "Consider recent statistics, the number of mobile connected technological devices count more than the number of the entire population of the earth (Cisco, 2013). The average users of cell phones check their text, phone, and Internet contacts on their phones 150 times per day (Meeker & Wu, 2013). Fifty billion devices will be connected to the Internet by 2020 (Vestberg as cited in GIGAcom, 2013). The average North American uses a mobile device 141 minutes a day and 90% of all Internet traffic in 2017 will be video (Advertising Age Mobile Fact Pack, 2013). Globally, the US ranks 10 in the number of new Internet users from 2008-2012 while China, India, Indonesia, Iran, Russia, Nigeria, are all above the US (Meeker & Wu, 2013). From these predictions and facts, it is clear that social media as a corporate tool for profit, is growing exponentially every year" (Mickahail & Andrews, 2015).

Social Media for Business Innovation-Senge's Disciplines and Collaboration

Senge first brought the terminology of disciplines as they relate to *learning organizations* to the forefront as the preeminent guru in his 1990 work, *The Fifth Discipline.* Senge's five disciplines are needed for developing modern collaborations for innovation and fostering essential change in business delivery models through social media.

The five disciplines cultivate what Senge (1990) called learning organizations. The disciplines are personal mastery, mental models, shared vision building, team learning that together form systems thinking, which is needed for necessary change. "All five of Senge's core learning capabilities are actionable collaboration in culture, dialogue, and context revealing the potential of globalization in how we interact with social media (Mickahail & Andrews, 2015).

Because Senge's (2013) core learning capabilities are tied together with collaboration, a case can be made that collaboration is the *sixth discipline* for 21st century business innovation. Caldecott (2013) wrote that the success of Inventor Thomas Edison's "collaborative culture" nurtured 20th century innovation. Senge's ideas support Edison's in promoting a growing culture of team communication and collaboration and subsequent business innovation that meets consumer needs of the 21st century and beyond.

SECTION ONE: RECENT INNOVATION FOR COLLABORATION, CONNECTIVITY, AND PRODUCTIVITY

Social Media From Telephones to Media Convergence

The US has been a leader in Internet use internationally since 2008 with social media securely anchored as a profitable American business industry. From 2012 to the present, Internet use in the US was overshadowed by the rapid use of the Internet by citizens in China, India, Indonesia, Iran, Russia, and Nigeria on smartphones so that now the US ranks 10th in the world for Internet use (Meeker & Wu, 2013). Media convergence and collaboration brings information from rural third-world farmers to CEOs of Fortune

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

500 companies. As the price of the smartphone drops, more and more previously unconnected countries will open up vast new opportunities for business to profit from Internet users' access to commercial social media promotions, advertising, and products.

Rural Third World Communities: India and Smartphones

With over 900 million mobile devices, India has 350-400 million Internet connected devices and 150 million smartphones (IDC 2014). In a report from CyberMedia Research, during the first three-months of 2014, 14.5 million Samsung, Micromax, and Nokia brand smartphones were shipped into India. The three mega companies comprised 67% of India's smartphone market.

Naturally, a smartphone boom is anticipated for the rest of 2014 as entry-level smartphones are planned to go for a low 2,500 Indian rupees ($42 US), these early sales numbers may push the smartphone ownership to be available to all in India's market. Many third world citizens without laptops will benefit greatly from connected smartphones (Aulakh, 2014).

Rural Indians and others from developing countries have found the smartphone equipped with social media apps useful for a variety of business and social reasons. Because most people in developing countries lack access to laptop computers, smartphones now fill the gap. Many activities can be accomplished with smartphones where the activities use to demand access to computers. However, in rural communities of the developing world the lack of computers no longer has to limit collaboration and interaction. Smartphones can help farmers by providing weather information and updated market prices for farm related commodities. Indian farmers are able to use Skype to contact agriculture scientists and discuss crop issues. They may also buy and sell needed supplies, such as fertilizers and tools. Smartphones can also assist in promoting rural distance education, by facilitating the use of augmented reality applications to learn collaboration. Connected students can access Massive Open Online Courses (MOOC) classes and engage in online homework groups. They may also play educational games.

Mobile Banking in the Developing World

Several mobile cash options are available in the developing world, such as Airtel money, a common cash alternative service in India. Airtel money may be the future of money and commerce in Asia (Aulakh, 2014). Airtel money is becoming more widely accepted in India and other countries and there are more than 1 million users. Beyond the convenience of using Airtel to transfer money to friends and pay bills, the Airtel's technology app also enables migrant workers, of the many Indian states, to transfer money to their families while providing convenience for Indian workers. Without this service, migrant workers need to wait in bank lines at 6 am in order to transfer money before they start work. The money transferred with Airtel is instantly transferred at any time of day. Another cash option, M-Pesa is the prevailing tech currency in Africa (Aulakh, 2014).

Social Media Apps for Global E-Commerce

An example of the impact of social media benefits to grow and expand business ventures is the potential presented in Facebook's new accelerator, FbStart. Although Facebook has always offered special business benefits to companies featuring apps on Facebook pages, the new FbStart accelerator is designed to help startups create mobile apps at an affordable price. FbStart works by encouraging people to share

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

information from business apps on their Facebook walls. As the sharing network for the business apps expands, the businesses become more reliant on Facebook to grow more business leads, and Facebook becomes harder to replace. Facebook spokesperson Shankar, sees a Facebook partnership with profitable companies seeking to connect with startups, as all benefit from the tools of FbStart apps (Dormehl, 2014). FbStart is the first generation of apps that promote collaboration while breeding more online business ventures.

Technology Trends: Current and Emerging

"A new generation of usercentric, open, dynamic Web, with peer production, sharing, collaboration, collective intelligence, distributed content, and decentralized authority in the background" has become known as Web 2.0 (Sinha, 2012). Web 2.0 includes collaborative components of instant messaging, discussion forums, web conferencing, blogs, wikis, social networking, and social bookmarking.

For emerging trends above and beyond Web 2.0 there are the wearables: Google glasses and smart watches. They provide the impetus for buyers and users of wearables to join the wave that has doubled every month since 2012. The sensory apps are also here. They are specialized apps developed to revolutionize medicine to regulate the user's blood sugar, heartbeat, and measure his or her blood pressure. These specialty apps are incorporated into a smartwatch to assist your fitness goals. Another sensory app, Biorhythm for Sony 2 SmartWatch, monitors a person's health daily. By referring to the user's birth date, the biorhythm program attempts to predict various details of a person's life through simple calculated cycles. This app breaks the cycles into three categories: physical, emotional, and intellectual.

A user may monitor his or her alcohol blood content level. The Sober Up app for Pebble lets him or her count the number of drinks and estimate his or her alcohol blood level. Or perhaps the user would like to try a breakthrough app on Googleglass. With this app, for Photoglassic Memory for Google Glass, the user will never forget. It helps him or her remember and recall people, places, and things by adding them to his or her memory bank with a picture and geo-tag.

The scannables assist business by making a purchase easier to buy with a single swipe of a bar code. The new self-propelled car prototypes are in use providing tours to visitors in Southern and Northern California. Business and personal drones are raising issues about privacy and security rights across the land. In the future, a new era transcending technology convergence will be the ***contextual tech*** era defined by the integration of technology into daily life.

Media Convergence

All the above trending examples are manifestations of *media convergence*, (when different digital media meet and function on a mobile device). The definition of convergence as it applies to new media was defined by Jenkins (2006) in that

By convergence, I mean the flow of content across multiple media platforms, the cooperation between multiple media industries, and the migratory behavior of media audiences who will go almost anywhere in search of the kinds of entertainment experiences they want.

For businesses in the early 21st century, the most important digital media device is the growing international use of the smartphone. Current discussions revolve around the subject of laptops, which are

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

fading as fast as smartphone users are increasing. The factors that have contributed to this phenomenon are the increasing affordability of the smartphone and *cloud based Internet connectivity*. A shift is occurring in which the smartphone, a previously inaccessible technology is suddenly affordable and more connected, making them more accessible. This has served the developing economies by bridging a long existing *digital divide* between the developed and developing worlds. Presently, Singapore touts the highest level of connectivity per person despite the fact there are few laptops. Kenyans use their phones to transfer money to family across the continent.

Social Media Entrepreneurs in the Developing World

Recent statistics document the proliferation of mobile phone use with the Mobile phone use has reached 80% in the African continent. In 2005, 3% of Kenya's GDP was transferred with mobile money. The number rose to 31% by 2013. African entrepreneurs are benefitting from the promotion social media provides (Slaughter, 2014).

Developing countries' economies are bolstered by micro-business loans from organizations such as Ashoka where craftswomen are encouraged to form collectives around their indigenous craft culture, through weaver, silversmith, textile and mosaic collectives. Western franchises such as Avon, Amway, and Tupperware are creating micro entrepreneur inroads into Asia and Africa. Internet social networks benefit from tight marketing and customer service networks to promote their wares, Mixit of South Africa boasts six and a half million users, while over fifty million Africans access Facebook (Slaughter, 2014).

Section One Summary

Reduction of the digital divide can occur through collaborative social media innovative use. There has been a prevailing concern that those without technical literacy and access to tools would be left in the dust of technological progress. With the availability of smartphones in all corners of the earth, the sky is the limit on what can be achieved through social media collaboration.

Collaboration through social media becomes the new driver of strategic direction in design, production, service, marketing, delivery, and continuous improvement as shown with the MasterCard case. Social media with its exponential growth has become a forerunner in determining strategic direction in companies and personal live. Just as the middle class rose as a result of the Renaissance in Europe, today an emerging new middle class in the developing world is benefiting from an era of disruptive change with global connectivity and collaboration into tomorrow.

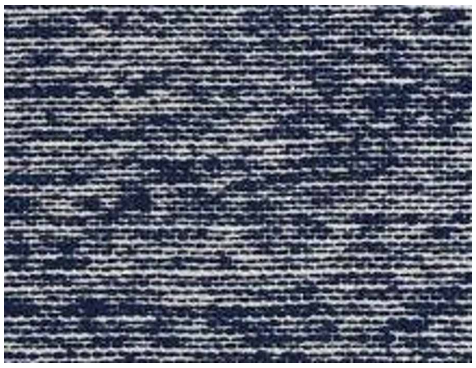
Section One: Discussion Review and Small Group Exercises

I. Bridging the International Digital and Economic Divide

- **Discuss the Scenario:** How to promote more business profits for a Weavers's Collective in Mumbai, India?
- What social media campaign would you use?
- How would the collective use the smartphone to manage finances and payments?
- How would the collective communicate with prospective buyers from the West?
- *Design* a page in Social Media (Facebook, Twitter..) to promote the Collectives weavings

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 1. A weaver's example.



- What is special about your product? What audience are you trying to reach?
- What are your financial goals?
- *Explain* how social media apps will help grow new business ventures. What dangers exist? Please include as many new concepts introduced in Section One as possible in your answers.

II. Business Orientation Today Requires Strategic Collaboration: The Case of Mastercard

Successful business ventures today require companies to plan using *strategic collaboration* to promote economic sustainability and growth. Many Internet based businesses depend on increasing smartphone use to promote and advertise their products through social media.

Just a few years ago many businesses feared the impact of social media and users who may post negative comments. Although the possibility of negative user comments on social media still exists, savvy businesses have also seized the social media as a chance to build the company brand.

MasterCard developed a social media staff training program to make their employees the company's social media representatives. Each employee is now a MasterCard brand ambassador. Those who are not *digital natives* at MasterCard are trained by *digitally literate* employees so all may participate and reduce the *digital divide*. These changes required new collaboration among the employees. MasterCard's social media training program was initiated with Conversation Suite, a social media listening program created to highlight the multitude of digital interactions about the MasterCard brand (Meister, 2014). Social media has further increased the company's employee collaboration as MasterCard's brand ambassadors, promote the company's success. Conversation Suites is a main piece of a four part strategy to educate, empower and encourage the 8,000 MasterCard employees in this endeavor.

SECTION TWO: COLLABORATION, SOCIAL MEDIA, AND CLOUDS

Six Disciplines Needed for Learning Organizations Ready for 2020 and Beyond

Senge (1990) has traditionally been "anointed" as the organizational leadership guru since publication of his book, *The Fifth Discipline*. The premise of Senge's (1990) work is a learning organization is vital

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

not only for business sustainability but for businesses to be organizations excelling in accomplishing organizational goals. Furthermore, to be a learning organization, five disciplines must be in existence (Senge, 1990). The four initial disciplines Senge (1990) identified were personal mastery, mental models, shared vision building, and team learning. These four are linked together with the advent of the fifth discipline: systems thinking-the ability to make connections clearer and to find the leverage points in a system (Senge, 1990). An effective system is a union of components linked together to accomplish a shared goal. Systems thinking brings together the other four disciplines to guarantee a thriving organization brought about by a fusing of theory into practice. However, without the preliminary four disciplines, systems thinking becomes hollow and devoid of the force required for excelling organizations. Without these five disciplines, organizations cannot continue to grow and to excel in accomplishing strategic goals (Senge, 1990).

A behavior necessary for the five disciplines to be congealed into one piece of art, collaboration, a participatory process, is required (Senge, 2013). Personal mastery cannot be accomplished in isolation but requires association with others for knowledge and wisdom to grow (requiring collaboration). Mental models are the schema by which the world is understood. To understand one's mental models, there is the necessity of holding a mirror pointed inwardly revealing the internal pictures that must be brought to the light and analyzed for goodness of fit in the equations of life. To analyze and determine if mental models are working effectively, they must be exposed and objectively critiqued from various viewpoints (requiring collaboration). By definition, vision building that is shared can only be accomplished through input and consensus with others. Building a shared vision is at the center of leadership and employee success (requiring collaboration). Learning with teams is a fundamental concept that emphasizes the need for an end goal of group cohesion. Team learning is initiated with dialogue in developing the expertise needed to bring the vision into fruition (requiring collaboration). System thinking is nearly impossible with only individuals trying to see whole patterns. Instead related forces are necessary to see the interconnectedness of the parts (Senge, Scharmer, & Winslow, 2013). Every part's action influences the actions of other parts just as when humans are part of the equation, everything and everyone is connected (requiring collaboration).

Therefore, as all five disciplines in order to function require collaboration, collaborative behavior could be perhaps considered a sixth discipline. This sixth discipline is a necessary component linking together all of the other disciplines in moving into the decade of the 2020s and beyond.

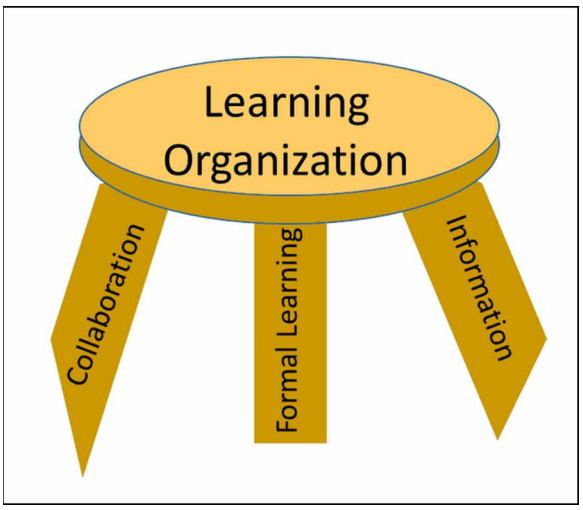
In recognizing how the five disciplines are related to social media, one sees the natural ability of social media in bringing people together. In achieving the sixth discipline, a learning organization sees the digital, virtual world of relationships being built effectively for use in developing social media. The potential of globalization is contained within the culture (way we interact), dialogue (technical abilities), and context (technical accessibility) of how we collaborate with social media.

Collaboration has been known to be a key characteristic of innovation since the time of Thomas Edison, who consistently collaborated even into his 8th decade with others in generating ideas for consideration as components of innovation. Edison saw collaboration as a vital component required for continued innovation of a learning organization. A learning organization cannot stand without the three legs of information (job aids, webinars, podcasts, knowledge portals), formal training (self-paced e-learning, virtual classroom learning), and collaboration (blogs, wikis, networking, chat, surveys; see Figure 2).

How can collaboration be achieved in the global, digital world existing today? The answer is in front of us all, through effective use of social media. Social media, therefore, becomes a necessary component in learning organizations, brought to the forefront of importance in acknowledgement of the potential

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 2. Three legs of a learning organization: Information, Formal Learning, and Collaboration are all needed for the stool to stand supporting a learning organization.



for both synchronous and asynchronous collaboration. The lack of geographic boundaries presents the opportunities for a collaboration infrastructure that is conducive to learning organizations in the generation of knowledge work.

Google, Amazon, Microsoft, and Apple exemplify a corporate culture in a creative collaboration model that stagnate businesses seek to emulate. This paradigm shift promotes and stimulates employee creative collaboration resulting in innovations and greater profitability in a thriving 21st century corporate culture.

Social media, instead of prescribing actions, brings suggestions of actions to users wherein communication is not just direct but collaborative and where consideration of the utility of tangential directions of communication are recognized as necessary for creativity occurring through these interactions that are unpredicted. The resulting tension from wondering off a path of defined dialogue can be loosened by drawing reality toward the vision and snapping the vision back to reality.

What Is Up in the Clouds? Any Information Needed, Wanted, or Desired

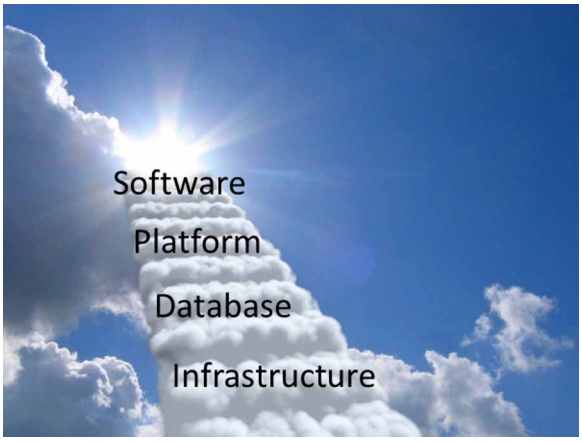
Where is all of the information going from business and social media (see Figure 3)? The trend is up and into the clouds, clouds of computing solutions. Information technology accessed via the Internet can be called *Cloud*. A cloud has four primary categories: Infrastructure, Database, Platform, and Software. Each of the categories can be differentiated by a) which users interface with the category, b) having technologies that are transparent, and c) no technology can be accessed from the level above (see Figure 4).

For the user, data is accessible from anywhere and the hardware used to access the data is interchangeable, meaning the user is not limited by the specific machine being used to access the database. To the user, data access appears free of downtime and errors because of the technology's infrastructure of elasticity and scalability. Specialized apps will connect tomorrow's media to the data of today due to the broad platform compatibility of the apps.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 3. Where is all the information going?

Figure 4. Four categories make up the cloud computing system.



The Future Is Contextual Technology-How Will Business Change to Meet the Consumer?

Georgia Tech researchers Anind Dey and Gregory Abowd defined *contextual tech* in 2001. They described ubiquitous all-present computers, with abilities to sense the objective and subjective features of a stated scenario. Contextual computers will promote the ability to understand and act in the moment based on where we are, who we're with, and past experiences. These advanced artificial intelligence devices would serve as our sixth, seventh, and eighth senses.

Data graphs make it work. Jump, a business strategy firm, has identified four data graphs essential to the rise of contextual computing: social (connections), interest (likes, curiosities), behavior (what's done), and personal (all beliefs; Mortensen, 2014). These four data graphs are tracked by companies to market products that match the user's profile online. The personal and behavior graphs are not as well developed but social media is finding a way to harness this information for global business development. In a decade, it's predicted *wearable intelligence* will be available.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Section Two Summary

As Senge (2013) reported, collaboration is central to learning organizations and a requisite factor and catalyst of organizational change. Therefore, it is proposed that collaboration be the sixth discipline of a learning organization. The inherent collaborative mechanism of social media makes its use intrinsic to a learning organization. In accessing today's data, cloud computing is becoming more and more the trend. Cloud computing allows for the access of data through machine interchangeability. The future holds limitless possibilities with technological advances today and tomorrow.

Section Two: Discussion Review and Small Group Exercises

I. A New Business Venture: Utilize Social Media for Collaborative Learning

- *Discuss*
- Even though Social Media presents many benefits, what disadvantages exist for Businesses? How can product ratings and reviews impact business ventures?
- *Design* your group venture complete with Social media apps.
- *Explain* how the apps will help grow your new business. What dangers exist?

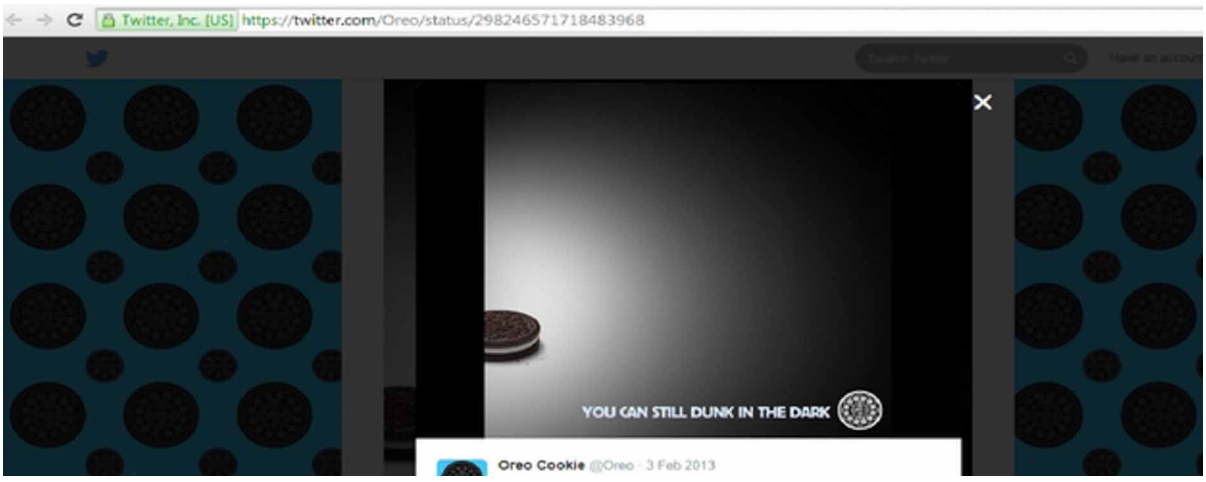
II. Oreo at the Super Bowl: A Sweet Tweet

Ad Age (2013) recognized the digital Oreo ad campaign with an A lister Award for its popular Super Bowl strategy. When the lights went out at the 2013 Super Bowl, Oreo earned the spotlight with the words: "You can still dunk in the dark." It was a "sweet tweet" that grabbed national attention and multiple awards.

Discussion questions after viewing link: https://twitter.com/Oreo/status/298246571718483968

1. Did you see this tweet? Or did someone you know see this tweet around the 2013 Super Bowl?
2. What made this tweet so powerful?

Figure 5. You can still dunk in the dark



EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

3. How is this ad an example of business use of *media convergence*?
4. Is the ad effective? Why?
5. Would this campaign work in Japan or China or Nigeria? Why, or why not?

Follow up Exercise: Small Group Huddle! Develop a Twitter Campaign!

In small groups discuss how you would develop a Tweet campaign for your favorite food brand, (Cheetos, Doritos, Kashi, etc.).

What would you emphasize in seven to nine words? How would you launch your campaign to ensure success? Share your ideas with your group and then with the class through Twitter.

KEY TERMS AND DEFINITIONS

Cloud Based Internet Connectivity: Or connectivity-cloud is another word for internet and cloud connectivity that holds the connotation of enterprise networking without businesses having to purchase server hardware and software. It does not have delivery of a product but of a service.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Collaborative Culture: Involves a commitment to and action for the needs of the organization and individual without competitive actions.

Contextual Tech: Involves ubiquitous computers, utilizing situational computerized cookie type technology. Tech that is able to sense the objective and subjective aspects of a given situation. A way computers will extend human ability to perceive and act in the place where they are, who they're with, and their past experiences. It is specialized machine intelligence that will serve as humanity's sixth, seventh, and eighth senses.

Digital Divide: Is a gap of economic and social inequality based on human access to, use of, or knowledge of information and communication technologies. The divide within countries, such as the digital divide in the United States, refers to inequalities between individuals, households, businesses, or geographic areas, usually at different socioeconomic levels or other parts of the country.

Digital Native: Is a concept authored by American writer Marc Prensky in 2001 to describe the global' dominant generation of post millennial. Prensky defines digital natives as those born into an innate "new culture."

Digitally Literate: Describes those with the skills to use information and communication technologies to find, evaluate, create, and communicate information, requiring both critical thinking and technical skills

Learning Organization: Is an entity composed of individuals adept at generating, gathering, and conveying knowledge in order to create what they want to create.

Media Convergence (MC): Is the merging of computing and information technology companies, telecommunications networks, and content providers from the publishing worlds of newspapers, magazines, music, radio, television films, and entertainment software. MC brings together the "three Cs"-computing, communications, and content.

Tech Convergence: Is the process by which existing technologies merge into new forms that bring together different types of media and applications.

Sixth Discipline: Is collaboration as the next discipline necessary for a learning organization to exist to its fullest capacity.

Wearable Intelligence: Is machine intelligence that can be worn. It is the next step in the evolution of computing platforms (from desktop to mobile to wearable).

Chapter 53
Managing Small Business Social Responsibility (SBSR) in Formalized Network Using a Euclidean Perspective

Laura Corazza
University of Turin, Italy

Maurizio Cisi
University of Turin, Italy

ABSTRACT

This chapter deepens the knowledge of inter-firm collaborations to address sustainability issues between SMEs in adopting small business social responsibility (SBSR) approaches. The study investigates the role of formal network contracts (FNCs), where aspects of SBSR are formalized into legal agreements between the networkers. For this purpose, the authors identify three management implications declined as sub-variables: control, consensus, and consistency. Institutional theory and, specifically, isomorphism and normative theory of CSR are used as lenses through which to analyze the results. The methodology applied is a deductive qualitative content analysis, while results are shown using an Euclidean perspective. The study discovers the use of FNCs to clearly govern consistency and consensus, more than to control and audit sustainability herein the network. In addition, it demonstrates a relation between network size and use of the tool.

INTRODUCTION

The anthropocentric view of sustainable development considers the presence of the humans with their activities as an inseparable part and a menace of the future of our Planet (Griggs et al., 2013; Reid et al., 2010). Consequently, the sustainable development of our society cannot be reached without the sustainable development of corporations, as they are outputs of humans' activities (Wigginton, 2016). Despite the evident disparities between large corporations and small businesses in adopting socially and

environmentally responsible management practices, both are called to take a firm commitment towards the society and the environment without exception (Tilley, 2000). However, small and medium-sized enterprises (SMEs), micro-businesses and individual entrepreneurs can respond to such commitment with their limited resources, struggling with external forces, precarity, uncertainty, complexity and ambiguity (i.e. post 2008 crisis). Nonetheless, small businesses have considerable social and environmental impacts if considered in their totality (Perrini, 2006). In recent years, the academic interest towards the so-called Small Business Social Responsibility (SBSR) increased and scholars have just begun to analyse a fragmented phenomenon. The variety of the acronym SMEs includes: medium-sized companies that account for 1% of all European companies; micro businesses (92.8%) and small businesses (6%) that cover 98.8% of the entire European economy (according to the European definition of SME, in Eurobarometer, 2016) (European Commission, 2016). For this study we address sustainability, CSR and stakeholder management as related concepts, according to the Euclidean demonstration of closeness given by the study of Fassin et al. (2015) regarding the European as well as the Italian context.

Unfortunately, scholars continue to stress the lack or inconsistency of the existent tools to address sustainability issues at company level (Horisch, Johnson, & Schaltegger, 2015; Johnson, 2013, 2015; Johnson & Schaltegger, 2016). The lack of knowledge, resources (time, financial and human) and practical suitability of the such tools are limiting the development of theories on SBSR. Mainstream CSR theories are often developed having in mind large companies (Spence, 2014; Vázquez-Carrasco & López-Pérez, 2012). A solution to overcoming traditional limits of SBSR may rely on business model changes (Lai, Lionzo, Stacchezzini, & Rossignoli, 2015). Emerging studies are combining effective ways to overcome SBSR barriers through the adoption of collaboration strategies and strategic network alliances (Freeman, Edwards, & Schroder, 2006; Håkansson & Snehota, 2006; Kirkels & Duysters, 2010; Lee, Kelley, Lee, & Lee, 2012; Swoboda, Meierer, Foscht, & Morschett, 2011). The paper specific aim is to deepen the relation between network alliances and sustainability.

BACKGROUND

Despite the fact that the literature on inter-firm collaborations boasts many contributions, few studies directly address how and to what extent SMEs may use formal and informal collaboration to achieve social and environmental outcomes. Existing studies are mostly related to network performances, to interpersonal and organisational features and the distribution of power between network members (Keast, Brown, & Mandell, 2007; Keast, Mandell, Brown, & Woolcock, 2004; MacGregor, 2004; M. Mandell, Keast, & Chamberlain, 2016; M. P. Mandell & Keast, 2008; O'Donnell, 2004; Storey, 1994). The purpose of our study is to deepen the knowledge of inter-firm collaborations to address sustainability issues between SMEs. We locate our study in a national context of Italian SMEs that exploit the introduction of a juridical tool called Formalised Network Contract (FNC) to start-up network agreements (Baldo, 2011; Cantele, Vernizzi, & Ricciardi, 2016; Cardoni & Tiacci, 2013). In general, FNCs are devoted to boosting entrepreneurial internationalization (Haddoud, Jones, & Newbery, 2017; Kenny & Fahy, 2011; Lee et al., 2012) or to exchanging knowledge, research and development on new product and services (de Jesus Pacheco et al., 2016; Kirkels & Duysters, 2010; Konsti-Laakso, Pihkala, & Kraus, 2012; Mazzola & Perrone, 2013; Mazzola, Perrone, & Kamuriwo, 2016; van de Vrande, de Jong, Vanhaverbeke, & de Rochemont, 2009). FNCs are formed through interconnected bilateral or multilateral contracts, and they

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

differ from other traditional forms of collaborations (such temporal agreement, consortia, joint ventures, etc.), as the contract itself manages outcomes related to specific business programs, compositions of the network and content. Turning back to our research question, our paper explores the management of sustainability inherent the network of SMEs through the use of two different theoretical lenses. The first is the contribution given by institutional theory to explain why SMEs must conform to the rules and belief systems prevailing in the environment (Di Maggio & Powell, 1991); in particular, we use isomorphism to explain the link between structural and procedural changes that lend the organisation legitimacy (Dowling & Pfeffer, 1975; Lindblom, 1994; Suchman, 1995). Secondly, we derive insights from reflexive regulation, the attempt to norm-making SBSR through the use of the networks. Crane (2010) called it governance, as the way that organizations go about managing partnerships through formal rules and procedures. In his research, he claimed the need of more studies on how cross sector partnerships should be organised and managed, how authority and decision-making powers should be allocated and how performance should be evaluated and reported.

The paper proceeds as follow: section 2 presents the literature review on the main barriers of SBSR and the opportunities given by formalised business networks in the institutional context; section 3 discusses the hypotheses development considering the theoretical lens above mentioned; section 4 is dedicated to the methodological discussion; section 5 presents the findings, while, at the end, section 6 provides discussions on the results of our analysis. Conclusions alongside managerial and social implications end the paper.

MAIN FOCUS OF THE CHAPTER

Issues, Controversies, Problems

A Discussion Over the Main Barriers of SBSR and the Potential Role of SMEs Networks

SMEs and their business networks can be considered relevant economic actors supporting the economic growth of territories (von Høivik & Shankar, 2011). Studies on SBSR confirms that SMEs face several issues in implementing a sustainable behaviour creating a situation of general unsustainability (Ahmad & Krishnan, 2017). The first issue regarding SBSR is due to the lack of resources to adopt social and environmental management practices or to comply environmental regulations (Avram & Kühne, 2008; Battaglia, Bianchi, Frey, & Iraldo, 2010; Williamson, Lynch-Wood, & Ramsay, 2006). The lack of time, finance, staff and expertise can limit the positive intention of entrepreneurs representing an insurmountable constraint to the adoption of SBSR business practices (Lepoutre & Heene, 2006; Russo & Perrini, 2010; Spence & Rutherfoord, 2001, 2003). The second issue is related to external pressure coming from suppliers and customers, especially when these customers are large corporations (Spence & Rinaldi, 2014; Vurro, Russo, & Perrini, 2009). As a consequence, SBSR should be consistent and strategically oriented to the business to become effective and produce factual results (Castka & Balzarova, 2008; Jenkins, 2006). Third, because most of the sustainability tools are developed having in mind large corporations, SBSR is perceived as distant from the core business, a business cost, or neglected (Horisch et al., 2015; Johnson, 2013, 2015; Johnson & Schaltegger, 2016). Definitely, size matters (Baumann-Pauly, Wickert,

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Spence, & Scherer, 2013; Fernandez & Camacho, 2016; Tomšič, Bojnec, & Simčič, 2015; Vázquez-Carrasco & López-Pérez, 2012). One way to overcome the size problem can and should be represented by the so-called business networks.

A business network can represent a secure ecosystem to address sustainability issues safeguarding managerial organisation and governance and the internal value creation dynamics (Taurino, 2015). Sharing common social and environmental problems is typical of corporations operating in the same area or in the same business sector or supply chain (Battaglia *et al.*, 2010). As such, adopting collaborative networks give coordination and synergy among business partners in the process of addressing sustainability issues (D'Alessio, 2008; Noran, 2010). The network approach is suitable to coordinate the actions of networkers governing their synchronicity (time), localisation (space) and type of interactions (Floridi, 2009; Murillo & Lozano, 2009). The adoption of CSR in the network represents a managerial innovation denoted by its effect under structural, interactive and cognitive dimensions (Abdirahman, Sauvée, & Shiri, 2014; Santana, Vaccaro, & Wood, 2009). Network model becomes a mean to address the limitations faced by the SMEs when they try to implement CSR individually. Instead of maintaining CSR as a reactive-defensive strategy and as a pure support function to reduce risks and costs for shareholders, CSR must be taken to the next level as a fundamental value creation driver (von Høivik & Shankar, 2011). According to von Hoivik and Shankar (2011), the network is the pivot of a new value creation process that unlock organizations in achieving an increased ethical awareness. As part of a cluster of individual companies, those that are faced with resource challenges can improve their organisational capabilities, such as specialised staff, leadership, and management capabilities (suppliers-buyers' relations) (Vurro, Russo & Perrini, 2009). A feature of our study is the focus on formal network. Formal network can be defined as organizations that bring entrepreneurs together in order to share business information and experience for mutual advantage (Parker, 2008). While chambers of commerce, corporate roundtables and associations may play a key role for the advancement of CSR knowledge between small entrepreneurs, our study focuses only on networks that promote information sharing between SMEs entrepreneurs and where only SMEs entrepreneurs are involved. Small business owners appear to esteem formal business networks by and for small entrepreneurs more than any other form of formal network such joint agreements, business groups etc. (Chell & Baines, 2000). From a business ethic perspective, corporations are moved to adhere to a network considering four criteria (1) intention, shared goals and participative activities in the practice of networking; (2) exchange of resources and transmission of information and knowledge or/and learning these from other network actors; (3) the exercise of power of each actor toward other actors; and (4) the behavioural and ideological influence within a network (Melé, 2009).

Institutional Context of Formalized Business Networks

Introduced in Italy in early 2009, FNC is a juridical tool allowing two or more enterprises, on a purely contractual basis, to pursue the goal of individually and collectively increasing their capacity for innovation and their competitiveness in the market. The Italian formal network is as a specific contractual agreement aimed at bringing together firms to co-produce, co-market, co-purchase or co-operate in product or market development (Ferrari, 2010). Italian law defines the main guidelines for SMEs wishing to adopt a networked model, while companies are free to define the purpose, the management of the network, goals and sub-objectives within the network programme (Cerrato, 2016). According to Ricciardi et al. (2014), 75% of the total business entities within these network contracts are individual

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

businesses, partnership and limited companies, i.e., the typical organisational structure of entrepreneurial and small-medium enterprises (SMEs) (Ricciardi, Cardoni & Tiacci, 2014).

The pool of FNCs are becoming popular between business and management scholars as they pose several organisational challenges to research and managerial implications (Aureli & Forlani, 2015; Baldo, 2011; Baldo & Aureli, 2012; Cardoni, Rossi, & Tiacci, 2011; Cardoni, Saetta, & Tiacci, 2010; Cardoni & Tiacci, 2013). Nowadays, the universe of FNCs available at September 2017 on the website of the Union of the Italian Chambers of Commerce account 3,985 contracts signed between 20,154 companies involved. The trend of FNC is of 10% every semester according to the in-time official data published by Unioncamere on their website[1] (18.079 companies involved and 3,588 FNCs signed accessed in April 2017). FNCs are private documents, while a summary of the content of each FNC is freely available on Unioncamere Excel database.

FNC, as a tool useful to the purpose of bringing SMEs on the right track of sustainability, is an under-explored topic, full of managerial implications. Only the study of Del Baldo (2016) considers FNC within the tourism sector as a vehicle of CSR and sustainable development.

Regarding formalisation, Guercini and Tunisini (2017) commented on the consequences of it in terms of internal [inside the network] and external. According to scholars, formalisation can act internally as an element to reduce ambiguity and building elements of "fragile trust," in the absence of basic elements of "resilient trust" and in the presence of changes in the competitive environment. Externally, FNC allows the policy maker to identify more clearly companies' aggregations in order to let them be destination of specific public investment initiatives. Our study will deepen the knowledge of the role of formalisation applied to sustainability issues in FNCs.

In this section, we have depicted the main limitations regarding the application of sustainability inherent in SMEs and we have presented the opportunities offered by the adoption of a networking business approach. In particular, we locate our study in the Italian context of formalised network contracts. We know there is no need for a contract to determine whether an entrepreneur is more or less ethical. For this purpose, we consider institutional theory, in its sub-declination of isomorphism, and reflexive regulation as a norm-making approach of a normative CSR.

THEORETICAL FRAMEWORK

The Contribution of Institutional Theory and Isomorphism to Frame FNC Between SMEs

Institutional theory suggests that companies must conform to the rules and belief systems prevailing in the environment (Di Maggio & Powell, 1991) particularly to obtain external legitimacy on their license to operate. Moreover, isomorphism explains the link between structural and procedural changes over this legitimacy (Dowling & Pfeffer, 1975; Lindblom, 1994; Suchman, 1995). Isomorphism describes a process whereby one organisation becomes similar to another organisation by adopting the same or similar characteristics of the other organisation (Rodrigues & Craig, 2007). In that sense, we can use the term isomorphism as substitute of homogeneity, convergence, conformity as companies tend to change their morphology towards structures and management practices which are considered legitimate and socially acceptable by other organizations in their field, according to predominant norms and social influences (Di Maggio and Powell, 1991).

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Isomorphism assumes several declinations according to its nature of being: institutional, because other organizations are the major factors that organizations must take into account; mimetic when organizations emulate the actions of similar organizations; coercive when organizations are subject to external pressure, either from organizations they depend upon; and normative, when similar individuals promote a cognitive base, diffuse shared orientations and organisational practices, and legitimise their activities (Aldrich, 1979; Carruthers, 1995; Di Maggio & Powell, 1983).

Due to that different declination of isomorphism, and because the external business environment is pressing SMEs to conform their business behaviour towards the adoption of sustainable business practice, we assume that isomorphism can clarify the role of FNC in governing sustainability. We highlight a commonality between normative isomorphism and the use of reflexive regulation as FNCs.

FNCs as Reflexive Regulation in the Field of Normative CSR

Reflexive regulation is taking place in the field of CSR (Buhmann, 2009, 2011). In our study, the normative view of CSR is not in conflict with the understanding of CSR being 'voluntary', because FNCs are attempts to go beyond direct legal obligations (Buhmann, 2011). This patter to going beyond legal obligation generates the changes that companies prescribe and they would like to see about desirable/undesirable behaviour between their organizations (Mitnick, 1995). Applying this discourse to FNC, we can state that FNCs may play an important role in starting a dialogic role over the norm desirability and applicability, as the case of environmental compliance and SMEs (Ahmad & Krishnan, 2017; Fasterling, 2012). For instance, SMEs are not confident about the plethora of the existent CSR standards and often adopt those standards imposed by their market (Moratis, 2017). According to the study of Baden et al. (2011), when CSR is down-streamed along the supply chain between a large company and its SMEs suppliers, it is translated into a burden of imposed standards, with related increases in bureaucracy and costs, and it can create frustrations for such firms, resulting in a potential 'ceiling effect' and lower overall engagement with CSR (Baden, Harwood and Woodward, 2011).

FNCs can than stimulate a multi-company' decision about CSR standards to adopt. This is reflected by the translation of intents into formalisation of interests. Formalisation of SBSR aspects can reduce ambiguity and business costs about inefficient managerial choice, supporting the network awareness over a shared sustainability pattern to follow. For instance, each network might agree upon specific certifications, specific sustainability strategies, technologies, processes and actions. As such, the integration of sustainability aspect herein legal contract remembers instrumental and normative CSR. The work of del los Reyes et al. (2017) presents the norm-making approach as a suitable option for managers and entrepreneurs, when the compliance to mainstream legal options can produce business failures (de los Reyes, Scholz, & Smith, 2017). This is the case of sustainability tools, often criticised for their ineffectiveness in SMEs. On the opposite side, Spence (2014) imputes SBSR as an output of an entrepreneurial logic derived from the ethic of care and from the entrepreneurial proactive approach towards societal issues. In our study, the FNCs are di per se a voluntary norm-making approach to manage collaboration and to enhance business performance. In that sense, we support the work of Spence, formulating the hypothesis that FNCs are a factual translation of that entrepreneurial logic into a tool.

The Development of Our Research Question

As the purpose of our study is to deepen the knowledge of inter-firm collaborations to address sustainability issues between SMEs, we will focus on the deployment of FNC to serve the purpose of overcoming the barriers of SBSR (RQ). FNCs can be described as legal documents and guidelines for the management of the network. In order to overcome SBSR barriers, FNCs should mention three groups of sustainability multiple-variables ranging from intangible to more practical aspects. We define the management of sustainability in SMEs as functions of: control, consistency and consensus. Control is intended as practical instruments and procedures to exert the control of sustainability within the network for instance, ethical code, certifications, sustainability audit. This dimension has been supported by the evidence of the existent interplay among SMEs between morality, management systems and certification (Bürgi, 2010). Consistency means that sustainability issues must be connected to business initiatives to increase economic profitability, to increase profitability in dealing with large customers in the supply chain and to exploit business opportunities derived by public grants and/or tax exemption. This dimension has been already described in literature using the relation between customer power and customer interests (Lynch-Wood, Williamson, & Jenkins, 2009; Williamson et al., 2006). Third, consensus means the intricate bonds between behavioural and ethical commitment, shared goals and exchange of resources and transmission of information and knowledge or/and learning these from other network actors (Melé, 2009). Table 1 reports the sustainability managerial variables and the link with the relevant literature over SBSR.

Methodology

To answer our research question, we performed a qualitative deductive content analysis on the FNCs legal document. Content analysis is a research method widely applied in management sciences and it has

Table 1. Sustainability managerial variables in FNCs

Variable	Sub-Declination	Relevant Literature
CONTROL (CONT)	Ethical code	(Fernandez and Camacho, 2016)
	Sustainability management system (certification)	(Bürgi, 2010)
	External sustainability audit	(Albelda, 2013; Johnson and Schaltegger, 2016)
CONSISTENCY (CONST)	Increase profitability	(Tilley, 2000)
	Supply chain	(Avram and Kühne, 2008; Castka and Balzarova, 2008; Baden, Harwood and Woodward, 2011)
	Compliance with law and opportunities	(Ahmad and Krishnan, 2017)
CONSENSUS (CONSU)	Statement of ethical values or moral principles	(Melé, 2009)
	Knowledge exchange	
	Activism and shared commitment towards specific sustainability topics

been used in documentary analysis of sustainable public procurement by Testa et al. (2016). Alternative to direct interviews already applied in the field of SBSR (Battaglia, Testa, Bianchi, Iraldo, & Frey, 2014), the researcher examines the communication that a person/a company/ companies has produced to determine such behaviour/s (Kerlinger, 1964). Successively, the researchers replicate the study to enhance the validity and generalisability of the conclusions (Krippendorff, 1980). In particular, we performed a deductive content analysis. This deductive qualitative content analysis has been performed to enforce credibility, dependability, conformability, transferability, and authenticity to our methodology (Elo et al., 2014; Elo & Kyngäs, 2008). For the preparation phase, we collected the material starting from the original database of the Union of the Italian Chambers of Commerce that in April 2017 accounted 18.079 companies involved and 3.588 signed FNCs. We decided to sample a reasonable amount of FNCs in order to provide generalisable results safeguarding the amount of information to be analysed, as they are private legal documents, we had to have an authorised access and to pay the registration fees for each of these contracts[2]. We decided to collect at least 100 FNCs. We selected our sample basically on the presence of keywords in two relevant part of the FNC: the title and the network programme/objective of the contract. The research keys were: *sostenib *green *eco *social *responsab *verd *stakeholder *solid **CSR*. Researchers have doubly checked the sample selected in order to avoid any misunderstanding in the use of the word sustainability (abbreviated in Italian to *sostenib) as it can be used in several semantic contexts. Our sample includes only FNCs designed to reach sustainability purposes and aims; in that sense, we excluded all the FNCs that simply used the keywords as buzzwords or in an inconsistent way.

The unit of analysis is the single FNC composed by all its parts ranging in length from 2 to 48 pages. The interpretation and the categorisation occurred according to the model presented above. The variables used are dichotomous. In that sense, the maximum score of CONT, CONSU, CONST is 3 for each one. The number of organizations per FNC is 5.91, a result in line with the analysis of Unioncamere 2014 that shows as the majority of FNCs are signed between a range from 4 to 9 organizations.

In order to avoid misinterpretation of the meaning of "sustainability" and its practical translation into a business context, we used two different studies to support our categorisation of sustainability with reference to green economies and social innovation. The first is the Report of Green Italy (Symbola, 2010, 2016), while the second is the Third Report on social innovation edited by the research center CERIIS, International Research Center on Social Innovation, in 2017 (Caroli, 2017). QCAmap software has been used to code the parts of the FNCs collected under examination.

RESULTS

The management of sustainability (*MANSUS*) herein the FNCs has been expressed as a combination of control (*CONT*), consistency (*CONST*) and consensus (*CONSU*).

Where *MANSUS* (1) is obtained as:

$$MANSUS = \sum_{i=0}^{n} CONT + \sum_{i=0}^{n} CONST + \sum_{i=0}^{n} CONSU \tag{1}$$

According to (1), we produced Table 2 in order to show the results of those three variables, grouped by number of companies in each FNC. The Appendix shows the 3D scatterplot of the FNCs by CONT, CONST and CONSU.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Table 2. The management of sustainability within FNC expressed as variables and grouped by number of organisations in the FNC

Network Size	CONT	CONST	CONSU
From 2 to 5	1,15	1,35	2,17
From 6 to 9	1,03	1,38	2,72
From 10 to 19	1,8	1,6	2,8
20+	0,75	2	3

Source: authors' elaboration

Table 2 shows that there is a linear relation between the number of organisations in the FNC and the use of FNC to give consistency to sustainability efforts and the use of FNC as a tool to build consensus over sustainability and social responsibility issues. In fact, the number of organisation per FNC is positively correlated to CONST and CONSU (Table 3). This means that the larger the network is, the more attention networkers pay to link sustainability to business results (CONST) and, to creating external awareness of and activism (CONSU) around the topic or the sustainability problem faced by the network.

Looking at a graphical representation of sustainability management (Figure 1), it appears clear how SMEs can exploit FNCs to overcome SBSR barriers. In particular, larger FNCs rely on the formalisation to commit SMEs providing a statement of ethical values or moral principles, to foster the knowledge exchange and to create practical activism in order to explain and engage external stakeholders towards the specific sustainability topic faced by the FNC. The use of FNC to bring together business objectives and sustainability appears fundamental also in relation to network size, while the use of FNC to control sustainability issues with the use of certification and audit is not correlated to the dimension of the network. Of course, the higher number of SMEs are involved in the network the more complex is the management of sustainability. According to these results, the dimension of the network and the control of sustainability are not positively correlated because larger FNCs are composed of SMEs and single entrepreneurs that often belong to completely different business sectors, and the content of FNCs is related to the sustainability of their territory and their regional competitiveness. In that sense, the economic convenience of adopting sustainability management systems is not essential nor strategic to achieve the network objectives.

From this analysis, we can observe how the network dimension may influence the use of FNCs to govern sustainability in the network. Another perspective of analysis is that one of the simultaneous use of the FNCs to reach CONT, CONST and CONSU objectives. From the Euclidean geometry perspective, we can measure the area of the triangles and derive results on the proper exploitation of FNCs to manage sustainability. The areas of sub-triangles represent the Euclidean dimension of the use of the FNC to achieve pairs of variables. The area of each sub-triangles has been calculated as:

Table 3. Correlation between the number of organisation in a FNC and the management variables

	CONT	CONST	CONSU
Number of organisation in FNC	-0,34216	0,98677	0,852653

Source: authors' elaboration

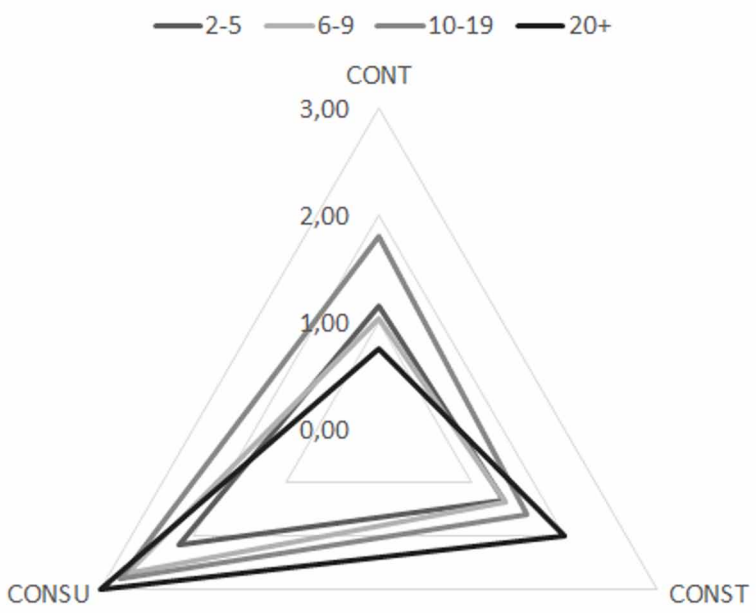
Figure 1. The graphical representation of the variables and network size



$$\text{AREA } MANSUS = A_1 + A_2 + A_3 = \frac{CONST * CONT \sin\alpha}{2} + \frac{CONST * CONSU \sin\beta}{2} + \frac{CONSU * CONT \sin\gamma}{2}$$

Where $\alpha = \beta = \gamma = 120^\circ$ (see Figure 2 applied to a case of our sample)

As reported in Table 4, network size influences the use of FNC to govern control, consensus and consistency simultaneously. This finding suggests that FNCs are better exploited by larger networks than by smaller ones. Again, our results suggest that FNCs are driven by the aim to govern consistency and consensus, more than to control and audit sustainability.

Table 4. The management of the three dimensions simultaneously by Euclidean area

Network size	A_1 *CONST-CONT-0*	A_2 *CONST-CONSU-0*	A_3 *CONSU-CONT-0*	*MANSUS*
From 2 to 5	0,73	1,30	1,09	3,12
From 6 to 9	0,65	1,68	1,27	3,60
From 10 to 19	1,39	1,99	**2,34**	**5,72**

SOLUTIONS AND RECOMMENDATIONS

FNCs are effective juridical and managerial tools to implement sustainability strategies in SMEs overcoming the traditional barriers. They might be useful to provide small entrepreneurs tangible benefits of SBSR, overcoming the perception of CSR as a business cost. Our study applies a model to explain the management of sustainability using three different variables. These are explained by the adoption of a range of actions, from more tangible tools to intangible ones. In our model, each variable is explained by a subset of three conditions that represents the managerial translation of SBSR in SMEs. All the variables have the same importance and significance. This means that when an FNC states that an ethical code will be mandatory for the networkers, for our study it counts the same as having explicitly prescribed that all the networkers are committed to sustainable development or the importance to achieve measurable increases in economic profitability ratios of the networkers.

To give the reader a complete overview of our analysis, we would like to report an extract of citations taken from these contracts included in our model (Table 5).

Our model is not influenced by the business turnover or by the business sector risks. Because most of the companies in our study are micro-businesses or single-entrepreneurs this has implied difficulties in systematically retrieving business results (which could be the focus for further studies).

From the sustainability perspective, we are aware that FNCs stipulated between companies of the same sector might be influenced by business sector sustainability issues, especially in terms of norms, codes and certifications. Conversely, FNCs are not strictly classifiable by business sector codes since they are composed of different companies operating in completely different sectors. For instance, the FNC#1013 for the defence of biodiversity in a local area puts together fishermen, sport shops, food

Table 5. Extracts from FNCs and the corresponding variable

Variable	Sub-Variables	Extracts From FNCs [Number of the FNC in the Brackets]
CONTROL	Ethical code	"The contract provides for the preparation of specific protocols and regulations for the production, processing and transport of products in accordance with the rules laid down in the Code of Ethics for Traceability" [#2195]
	Sustainability management system (certification)	"No later than three months from the end of each calendar year, each company must comply with the ISO14001 certification provided for in the network program" [#71]
	External sustainability audit	"For the purpose of designing, producing and disseminating the use of Sustainable Packaging, as defined by the principles of the Sustainable Packaging Coalition (SPC), the participants feel that they have to structure their own organizations, to provide them with a service that can be used to preserve the environment, social and economic sustainability audit" [#1682]
CONSISTENCY	Increase profitability	"Unify administrative and logistically the production process by improving vinification, especially with regard to environmental sustainability" [#2243]
	Supply chain	"[The aim of the FNC is to…] Improve the cultivation and distribution of cereals, harvest and other agricultural products used for the production of malt and successively agricultural and original beer of the Company XX produced with 100% Italian products, exclusively obtained on the Italian territory. With this network contract, the participant companies, thanks to a stabile fiduciary and synergic collaboration and to high professionalism in the various components of the production background, decided to start a project with the aim of increasing the level of our competitiveness, attending a sustainable agriculture and give value at the vocational products of the territory". [#2278]
	Compliance with law and opportunities	"The Affiliates intend to enter into a Network Agreement in compliance with the Call for Proposals issued by the Region 2007-2013 to lower environmental impacts in the production processes" [#797]
CONSENSUS	Statement of ethical values or moral principles	"To this end, companies undertake to implement common products / projects in accordance with the principles of environmental sustainability and CSR" [#200] "The parties agree and declare to pursue, through the present contract, the objective of increasing the penetration capacity of the participating companies on the national and international markets by a strong focus in terms of respect for ethical principles and intrinsic and organoleptic quality of products" [#1493]
	Knowledge exchange	"The added value of the network is that each company enjoys specific know-how, with its strong specialisation that if combined in synergy with that of other companies, it can create a very important degree of competitiveness in the market [of kenaf applications in the thermocouple insulation] compared to that reached individually" [#1045]
	Activism and shared commitment towards specific sustainability topics	"In order to stimulate the cultural, social and economic development of the Mediterranean and other regions of southern Italy, by increasing the competitive economy of the firms on international markets, networkers believe: […] to engage in joint activities of affirmation and dissemination of territorial cohesion in order to promote a sustainable, responsible, aware and balanced system, of which the territory and its traditions appear to be the most authentic and authoritative vehicle" [#1391]

Source: authors' elaboration

producers and restaurants. We have not used the business sector as a driver in order to be neutral by specific sustainability problems. Precedents studies indeed, focus solely on FNCs in the tourism sector and its sustainability issues (Aureli & Forlani, 2015; Del Baldo, 2016).

Applying Existent Theories to Our Results

According to normative isomorphism, similar individuals tend to promote a cognitive base, diffuse shared orientations and organisational practices to legitimise their activities (DiMaggio & Powell,

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

1983). SMEs in the sample are using the FNCs to promote a shared base of values, orientations and practices towards sustainability. In particular, using FNCs they legitimise themselves towards the sustainable choices they make in order to give credibility to their sustainability actions. For instance, they are favouring a particular sustainability strategy giving juridical importance to have chosen a particular certification instead of another. They also "contractualise" SBSR in the sense that they are normatively defining their own sustainable strategy among existent standards and rules. This formalisation happens to reduce ambiguity and business costs concerning inefficient management choice, as SBSR is often perceived as a business cost, more than a success factor (Tilley, 2000). According to del los Reyes et al. (2017), this norm-making approach is seen as suitable for small entrepreneurs (de los Reyes, Scholz & Smith, 2017) as they implement the vision of sustainability of their large customers, normally large multinational companies.

In addition, our study shed light on the management of SBSR using the FNC. In particular, our study has deepened the implications in terms of control, consistency and consensus. We demonstrated that consistency and consensus influence the management of sustainability especially in large networks of SMEs. The importance of consistency is in line with the literature and the implication of a managerial view of CSR linked to the business and source of competitive advantage (Porter & Kramer, 2011). The importance of consensus is in line with the conception of SBSR as a substantially proactive behaviour among small entrepreneurs explained by ethical motivation and not only by business objectives. In our sample, business motivations and ethical principles coexist as there are no written rules about the legal content of the FNC. Regarding control, our results demonstrate a negative correlation between the size of the network and the use of ethical code, certifications and sustainability audit. Since FNCs are developed having with a view to exploiting the network to increase the wellbeing of the networkers more than to control and evaluate their performance, control remains residual. As in our model, two main components of control are represented by certifications and audit. Our results are in line with the relevant studies of Johnson and Schaltegger (2016). Unfortunately, the mimetic isomorphism of the network doesn't seem to overcome the full cost of being certified and audited, and the "network effect" is translated into consistent actions and consensus claim. In fact, such certifications are applied at firm level and sometimes at site level, not at network level. Costs of audits and asseverations could not be divided by participants.

CONCLUSION

Several managerial impacts and practical output arise from our study. First, FNCs face directly some weakness of the SBSR providing practical solutions, as in the case of supply chain adaptation and knowledge sharing. The latter has been constantly reported in the related literature as one of the main barriers of SBSR. With FNCs public regulators can induce small companies and single entrepreneurs to become more aware of CSR and sustainability. Second, our study contributes to the growing literature on FNCs, providing a new perspective as invoked by several scholars (Tiacci & Cardoni, 2011; Cardoni & Tiacci, 2013; Aureli & Forlani, 2015; Del Baldo, 2016). Third, our study sheds light on the sustainable behaviour of SMEs and single entrepreneurs using a qualitative methodology and reporting results grounded in the territory.

Future development of our research regards/could include the implication of the network shape and structure for sustainability management. In addition, future development will consider the opportunity

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

of interviewing directly a sample of networkers to compare the achievement of sustainability targets with the distribution of power in the network, and, moreover the implications arising from the diversity of business sectors involved in the achievement of such targets. Using the viewpoint of SBSR, further study will investigate more in depth the motivations that explained the decision of networkers to formalise ethical values and sustainability concepts with these contracts.

Chapter 54
Technology and Innovation:
The Connection of Social and Technological Networks in China

Ron Berger
College of Law and Business, Israel

ABSTRACT

This chapter deals with the speed to market as one of the most important competitive advantages in nowadays' markets. Responsiveness requires information sharing among all members across the supply chain and thus how to facilitate channel coordination is a major problem to address. Enterprise resource planning (ERP) systems have been employed to deal with this issue by re-engineering the supply chain. This Chapter addresses the issue of guanxi creation that is inherently based on an individual's knowledge and social networks to the technological implementation in the Chinese firm. An ERP system, that is based on access to technological networks based on Western business culture leading to potential conflict if implemented without cultural sensitivity as China is based on social business networks. There is a need to balance these two networks if harmony and business success is to be achieved.

INTRODUCTION

In 2012, China continues to be the world's largest recipient of direct foreign investment - which totaled around US$105 billion (Berger et al., 2013). Once a staunchly Communist state, China now advocates a social market economy based on State Capitalism as its business system. One of the utmost changes in the global economy of the 21st century is the emergence of China's as one of the world's major economies (Song and Schein, 2011). President Hu Jintao in his visits to foreign countries has declared that China will continue its twenty years of phenomenal economic growth and transition from a Communist to a "social market economy". To achieve this it will implement the newest technologies in – order – to transform itself from made in China to designed in China. To appreciate the present Chinese business system and managerial performance necessitates an approval and appreciating of Chinese cultural orientations. As China becomes more and more important to the international economy, it becomes gradually more prudent to comprehend the mindset of the Chinese business culture compared to other established and

more mature business cultures. Global business environments today, with China having a major role in them, are acting as catalysts for economic changes and the blurring of national boundaries. The impact of these changes combined with the ramifications for firm activities and performance have led to an urgent need to reassess the traditional purely neoclassical, competition-driven frameworks such as that of Porter (1990) used in international management research. Other social science systems of exchange including sociology, anthropology, cultural studies must be incorporated into the research paradigm (Bird-David and Darr, 2009; Chu, 2009) to be relevant for China. The unique perspective offered by other social science disciplines can better analyze the characteristics of China's "social market economy" (Honig and Christie, 2003; Perraton, 2009; Schrank, 2009) than traditional models.

The global balance of economic power is shifting away from the US and Europe towards Asia. Attention today is being directed toward emerging countries especially China as one of the major countries to bail out Europe from the present financial - institutional economic crisis (Berger and Herstein, 2012). Economists forecast that Chinese consumers will mitigate the effects of the present slow down in the Western developed economies. China is seen as the catalyst for economic global growth as the West is gradually entering a period of economic stagnation and institutional turmoil. As China becomes more integrated and active as a global policy setter managerial relationships between Western and Asian countries are receiving heightened interest (Barnes et al., 2011; Song and Schein, 2011) but technological and cultural integration in a Chinese context is generally neglected (Hu, 2014; Li-Ying et al., 2014). What constitutes good managerial practices are not universally shared around the world. As China is emerging as a leading economic power, appreciting the direction in which its management theory is developing is of high significance for policy makers, academics and business leaders alike.

Ever since China joined the World Trade Organization in 2001, it has embraced a strategy that requests Chinese companies to be more internationally competitive. China is resolute to be an 'innovation-oriented' country by 2020 and a 'leading science power' by 2050. To guarantee a successful evolution toward an innovation-oriented market, the Chinese national science and technology policy is tuned accordingly to support 'indigenous innovation', which embraces of two major assumptions. First, Chinese firms must strengthen their internal R & D in order to build adequate absorptive competence for innovation. Second, Chinese firms require to actively obtain external technologies from both international and domestic foundations and thrive through an open scheme of innovation. Marketing competence has been established to be a source of competitive benefit. It refers to the integrative processes used to recognize, collect and apply the knowledge and skill to deal with internal resources, adapting to the external environment. However, most of the studies undertaken in the Western business world provide marginal implications for emerging nations in terms of how to configure organizational capabilities and their critical drivers under challenging economic and governmental reforms.

Theoreticians must move away from neoclassical, economics - driven frameworks in the study of the role of business in society and models of corporate social performance, social control of business and stakeholders that predominated throughout the 1980s and 1990s (Donaldson and Preston, 1995; Shamir, 2009). Indeed, only following or as result of the global financial crises of 2008 and 2009, and the corporate scandals of Enron, WorldCom, Adelphi, and Global Crossing and others in the early 21st century, have social science researchers begun to think in a more pluralistic way in terms of ethics as well as the diversity of comparative business systems (Glynn et al., 2000; Gonzalez, 2003; Kilduff and Dougherty, 2000; Reed, 2002). Nevertheless, there has been relatively less research on China's national

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

business system or its social market economy and the factors that are influencing the integration of Western technology with Chinese culture in mind.

As it appears today, despite President Hu Jintao's declarations that his country will have a social market economy, China's business system is evolving into a hybrid of these two major business systems. Given China's focus on a social market economy, its system can be said to be evolving into one that is much closer to the Communitarian business system prevalent in Continental Europe and many Asian countries such as Japan and Korea (Berger et al., 2013). Communitarian business system argue that the group can have rights that are autonomous of and even conflicting to the rights of the individual and contends that the person develops and can prosper only within the context of a community. It recognizes (1) that mutually individual human self-respect and the social elements of human existence is essential; (2) that the protection of personal liberty depends on the dynamic preservation of the institutions of civil society; and (3) that the communities and polities have responsibility to be approachable to their members and to foster participation and consideration in social and political existence. Under communitarianism there can be no query of eliminating all government authority from business relationships because the state is accountable for the welfare of its citizens whose economic lives must be taken into consideration. It leaves the way open for confidential proposals but is ready to come to its aid when private initiatives are unsuccessful. It not only protects but completely promotes all ventures undertaken for the widespread good. Hence, any implementation of Information Technology must take these factors in mind.

The fact that China's $105 billion of foreign direct investment (Economist, 2011) originates from companies from both systems is an interesting phenomena that will further accelerate a mixed system and the need to understand how best to implement information technology. China's phenomenal economic growth and rapid development in various industries including electronics, telecom, and semiconductors has placed it in a league of its own (Zhu and Sun, 2011). The traditional terms, developing county or transition economy, neither describe China accurately nor reflect its unique character. Most likely a new name will emerge for China's advancing business system. Market liberalization in China has required firms to follow the revelation regulations of the foremost global financial centers in the Anglo-Saxon business systems in the U.S. and the UK. Nevertheless, its weak legal infrastructure and weak Information Technology infrastructure has not enabled it to comply with the regulations. There have been many cases of Chinese fraudulent accounting and violations of disclosure rules. The major areas of low or missing disclosure are asset evaluation, disclosure of off-balance sheet objects and transactions with the partners related to controlling shareholders. Strategic transparency, therefore, requires bringing about structural change in the Chinese corporate governance business system and the successful implementation of information technology can assist in this transition. The economic integration already underway in the country will gradually liberalize the Chinese market further, requiring even more disclosure to outside stakeholders. At this stage of its economic transition, China requires low-cost long-term financing (Sun and Wang, 2010), which cannot be guaranteed unless financiers are sure about the near and far future of Chinese firms. In this regard, China is considered to be in a good position to reach reduced transaction costs because it can leverage its technological information advantage and become more transparent to the existing and potential investors and stakeholders. Evidence in the field supports the positive relationship between firm transparency, reducing the cost of equity and the cost of debt, and improving product market performance. Since China is still a giant, emerging economy, it is still too early to know the precise characteristics that will dominate its future business system and the full impact China will have on the global economy and what effect information technology will have on it.

CONCEPTUAL FRAMEWORK

An organization's ability to formalise a co-operative relationship establishing a secure context for innovation and organizational change requires more than just choice and negotiations. It also requires organizations to have a socio-institutional context conducive to the emergence of such co-operation between existing actors and new actors that are championing the information technology and organizational change (Keohane, 1998; Milner, 1997). This paper addresses the nature of such "inter-cultural" relations and conflicts, especially the issues of trust, collective action and technological implementation (Olson, 1965; Jervis, 1985), with an application to technological innovation and organizational change. In this paper, inter-cultural relations in an global organization context refers to the inter - cultural relations between existing actors of an organization who are knowledgeable about the organization's political and business processes and new actors who are advocating a new technological innovation and organizational change to facilitate the implementation of such technology.

Past research in the social sciences and management and organisation theory suggests that abstract forms founded on the rational self interest of actors, treated as unitary actors functioning in a perfectly informed environment with frictionless exchange do not assist in predicting behaviour. Reality is an imperfectly competitive environment. In such a world, a high amount of inter-cultural co-operation survives involving ordinary communication and mutually innovative expansion of socio-institutional norms (Ostrom, 1998). In such a world, collective action can be achieved by other methods than Nash equilibrium of neo-classical economic theories (Axelrod, 1984; Lenway and Murtha, 1994; Murtha and Lenway, 1994; Ring, et al., 1990; Stopford and Strange, 1991; Ostrom, 1998). This is so because actors are embedded in national culture and social structures, institutions and webs of political power. These in turn are rooted within a framework of global relationships (Schelling, 1960; Olson, 1965; Keohane, 1988; North, 1990; Elster, 1989; Putnam, 1988; North and Weingast, 1989; Ostrom, 1992; Burt, 1992; Granovetter, 1985; Coleman, 1990). Research in international relations and political economy has shown the importance of national, organizational and social beliefs, values and norms in determining the course of constructed inter-cultural co-operation in organizations (Jervis, 1988; Schelling, 1960; Cowhey, 1993; Axelrod, 1984; Snidal, 1991). For this to be achievable requires effective transmission of information on what and how good collective results are achieved. This paper is about the analysis of inter-cultural relations in organizations, between existing actors who dominant the political processes and new actors who want to deploy technological innovations and organizational change. I provide a conceptual model based on a "dual" framework of integrating both the existing actors' political power and control over political processes and the new actors' ambitions to deploy technological innovations and organizational change.

This paper aims to provide a general conceptual framework useful for the analysis of inter - cultural relations and co-operation required for technological innovation and organizational change to take place. Economic and business criteria and reasons are of course fundamental to the drivers of innovations, technologies and organizational change. This is factor number one within organizations and provides the communication necessary to stabilise collective action towards such technological innovation and change. However, other more social, or institutional, factors embedded in the culture of each organization (North, 1990; Granovetter, 1985; Snidal, 1991; Keohane, 1988; Lipson, 1999; Grieco, 1990; Inman and Rubinfeld, 1997; Weingast, 1997; Williamson, 1985; Cowhey, 1993; Ostrom, 1992) are significant in determining the viability or not of a particular technological innovation and change. Factor number two can be seen as a dual level game and provides the innovation in relating existing and new actors in an organization to stabilise collective action. A new technological or organization change is required

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

to meet unexpressed socio - psychological criteria, as judged by existing actors in an organization, in addition to well - defined specific business and economic ones. This is because existing actors tend to control the political and financial processes of the firm especially in China. Any organization relies on implicit tacitly expressed socio-institutional factors as well as the more explicit, business and economic ones to ensure valuable collective stability is achievable on reasonable time scales. My approach in this conceptual paper is not dissimilar to the way in which researchers in international relations, and international political economy, have studied the impact of path dependent historical experience on the success or not of international collective action (Haas, 1992; Krasner, 1991; Ostrom, et al., 1992; Grieco, 1990; Keohane, 1988; Putnam, 1988; Martin, 1992; Mayer, 1992). In this strand of research, factors such as a history of shared values and social norms play an important role in supporting and stabilising collective action to group advantage. In other words international political-economic behaviour becomes socially embedded just as it does within a national culture. This paper intends to contribute to the continuing research on political processes, technology and organization change by suggesting that new actors advocating technological innovation and organizational change have to recognise that they are in a "dual game" of multiple criteria in terms of overcoming inter-cultural differences and not only need to submit their explicit economic, business or technological qualification for organizational change but also tacit (Polyani, 1966) uncodifiable information on their commitment to the values and mores of the existing actors in the organization. The economic, business, technology and innovation performance criteria required are easy to determine but provide only a necessary basis for change to be accepted. Sufficiency requires recognition of the socio-institutional compatibility of prospective with existing actors who control the political processes of the organization. The latter is based on far less tangible criteria such as evident willingness to accept the beliefs, values, and norms of the existing actors in the organization, some of the fundamental factors in successful international collective action (Olson, 1982; Jervis, 1985, 1988; Lipson, 1991; Ostrom et al., 1992).

In terms of related research in international political economy, Putnam (1988) has developed the earlier works of Gourevtich (1978) and Rosenau (1969) in that, that he has analysed the importance of games played at two levels. However his typology is ponting to the requirements of political science and local versus global politics, not the multi-disciplinary potential we need to expand to address the troubles of technological and organizational change. Putnam sets out the political contextual issues appropriate to understanding the interaction between domestic and international politics. His analysis does show that the issues are neither purely domestic nor purely international, and as such must take account of dual causality and the constraints each puts on the other. I similarly believe that the acceptance of new actors advocating technological and organizational change requires inter-cultural relations and co-operation and requires such a multiple, two level analysis. Reality is such that the explicit criteria used in looking at the pay-offs to the existing actors of a technological and organizational change may be very different from past change in the organization and in many cases culturally biased. All the existing actors of an organization have an existing identity and social position in the political processes of the organization and their own internally well established collective socio - economic institutions supportive of co-operation and collaboration within the organization. Research in social psychology has shown the extreme significance of the communal social context for the effectiveness of inter-cultural co-operation. A collective social distinctiveness and worldview are it appears essential to the cohesion of any social group (Burt, 1992, Coleman, 1990). Success in a complex organization to a unitary identity needs to be rooted in shared and tacit social beliefs as well as formally expressed explicit economic, business and technology criteria.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Such a two level analysis requires a balance to be struck between the fast explicit dynamic of expressed economic, business and technology based criteria and the powerful slower dynamic generating an embedded social and institutional identity. One needs to be clear about the linkage that exists between these. Any analysis must recognise not only the links between the rational interest of the outsiders acting collectively in an international setting as unitary political-economic actors but also the linkages Etzioni (1988) has expressed as essential between the economic and moral dimensions of choice made by the insiders acting collectively within the bounds of their own organization or community. This dual political-economic and socio-institutional conceptual framework has to be seen in contrast to the conventional two level analyses of international negotiations used by Putnam (1988). I shift gear here away from a political - economic context defining national interest traded of against international collective interest to the need to develop a mutual understanding of each other's cultural uniqueness necessary to construct a common socio-institutional basis sufficient to generate consensual support for accepting a new technological and organizational change.

There are similarities here to recent research in organisation theory. This has begun to combine the reasoning derived from a consideration of rational political-economic man with the intuition derivable from an appreciation of the nature of socio-economic man (Murnighan and Brass, 1991). These works combine the rational choice of the realists with social psychological analysis. Coalition research, which has similarities to the collective action research of Olson (1982) in political science and international relations by Keohane and Ostrom (1992) demonstrates that once a coalition exists, social interactions amplify cognitive recognition of characteristics conducive to establishing an identity for the new formed group. Such characteristics emerge at the social boundaries between the old and new members and act as focal points, of the type made famous by Schelling (1960), enabling the members of the new group to orientate themselves better to serve or support each other's interests. By these means they can demonstrate the utility of shared values as enables of value adding co-operation and co-ordination within the bounds of the newly created social identity.

The two point game approach seeks to enclose within the one echelon analysis based on communicated economic criterion widely understood by affiliates, potential applicants, and the rest of the humankind. However it also look for a way to encompass a second echelon of socially driven perceptions of strategic standards supportive of growing harmony where the criteria utilised are institutionally embedded in the understanding of working together of the existing members. Given the demonstrable success such norms clearly support it is essential that potential associates can commune their compatibility with these and that existing associates have a mechanism for expressing them as a compatibility requirement for aspirants to associates. These criteria and the focal points they are indicative of (Schelling, 1978) are tacitly understood by all existing actors in the organization and will become evident to all new actors who are advocating technological and organizational change.

UNCERTAINTY, TRUST, AND CHANGE

The existence of homogeneous beliefs within an organization has been attributed variously to naïve unchallenged shared myopia, the creation of norms as a result of chronological experience or the dynamic creation of conventions by the members within a community of interest. Such means for establishing a basis for shared identity are important. They overlap with understandings emerging from the works by Frank (1988); Burt (1992); and Choi and Lee (1997). These works centre on the implication of the

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

standing that can be attributed to overt partisanship of such groups for relative position and attributable morale values. Members can then use cluster membership to prevail over uncertainty. If a probable exchange partner is an associate of such a faction and the faction is exclusive in selecting associates of superior standing and sets high principles of morality in exchange then much dealing vagueness is dispelled (Berger et al., 2011).

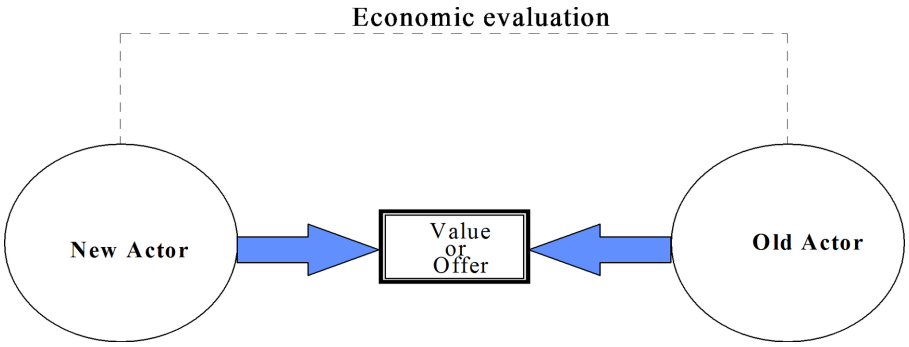
Global organizations in the 21st century are complex. Uncertainty is augmented both by members intent on attaining an advantage in negotiation and the discrete socio-institutional milieu each member eminates from (Larson, 1988; Levinger and Rubin, 1994). New actors advocating technological and organizational change, must expect significant uncertainty to surround their ideas and innovations concerning change, especially when emanating from different cultures. The different socio-institutional base and possible motives of the new actors advocating technological and organization change (Schelling, 1978) will interact with those of the existing actors in the organization, significantly increasing uncertainty. To counteract this independent evidence is likely to be sought to counter doubts about their capacity to participate usefully in future collective value adding actions. The collectively could speedily become uncontrollable unless a procedure is established for communicating and sustaining the superiority of community norms founded on active institutionally embedded philosophy generated as a consequence of its past account of transactions. Existing actors of organizations rely on their own traditional criteria to diminish uncertainty. They also will anticipate new members advocating technological and organizational alterations to present themselves as being only a very small psychic, social and cultural, distance from these existing norms. They will also be expected to display objectively their obligation to these norms. Given the two echelon nature of the alternative of new members this will be in accumulation to their capacity to display compatibility with the additional physical, economic and other factors mandatory for membership. The thought of psychic distance overlaps, but must be seen as distinct from, the importance of values, united norms, and beliefs, emphasised as important in research in global relations and global political economy. The researchers in these fields examine collective action in a related but nevertheless diverse way from that positioned out here (Keohane, 1988; Putnam, 1988; Martin, 1992; Jervis, 1988; Larson, 1988).

Figure 1 characterises the elements of rational choice under anonymous exchange as used in political economy to analyse exchange transactions in a co-operative environment. Realists in international relations and neo-classical economic analysis in general, use this type of model. They treat each nation as a unitary actor pursuing a well - defined measurable common goal. Each contributing country is assumed to have absolute sight of the information accessible to all others in the process and is apathetic to the character attributable to their partners in dealing only in the worth to themselves of the goal sought. The assumption in my case would be that the content, or value, to be brought to the existing actors who control the political processes in an organization, first can be easily evaluated and measured and second will serve as the only criteria used in assessing their suitability for membership. There are thus no uncertainties as to what is on offer and so no measurement costs. The weakness of the formality possible using such an approach is that it focuses totally on a final well-specified measurable final result to be achieved. Such a comparative static equilibrium is the normal state in a world of perfect information, foresight and frictionless exchange – the institutional structure for this is suggested in Figure 1 below.

In the real world one finds actors in organizations are as concerned as much with the long process of getting from one such solution to another as they are with agreeing on what it should be (Knight, 1992). Generally actors operate in a world of uncertainty where they cannot clearly specify the end to be achieved only what it might look like (Schelling, 1960; Axelrod, 1984). For example, failure of Informa-

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

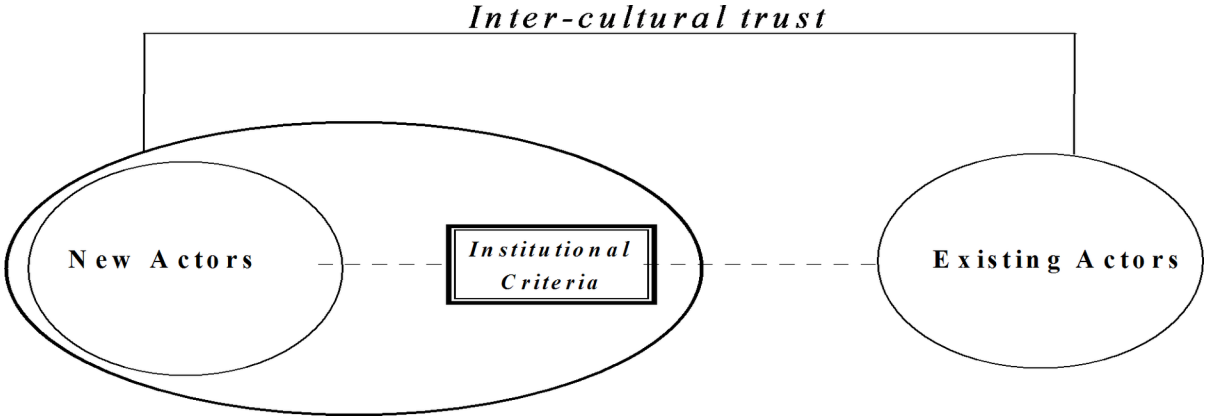
Figure 1. Single level criteria: innovation, economic, business co-operation



tion Technology can have long term reputational and financial consequences on the Chinese firm. In such circumstances the trust one has in the partner chosen for the search is pretty crucial to ones faith in the likely value of what can be achieved (Berger et al., 2013). The means to achieve a result, the socio-institutional position and so trust one has in one's partner is as important as the, as yet ill-defined, end itself. It is mutual success in this process of co-operating in the face of external uncertainty that dispels internal uncertainty, distrust, of one partner (Elster, 1989; Ellickson, 1991). If such internal uncertainty cannot be dispelled it will never be possible to sustain the external equilibrium sought; what is required is, "inter-cultural trust" between existing actors who control political processes and new actors advocating technological and organizational change. From the perspective of one of the actors a successful basis for exchange has the structure indicated by Figure 2 below.

The increasing uncertainty of an external world in such flux makes the stability, of a co-operative partnership within a complex organization, desirable. In such circumstances the fog that surrounds the intangible aspects of a prospective partner's behaviour inside the boundary will create less of a concern about the uncertainty outside it. The reliability and value of a new partner inside the organization will be tested and clearly become known as they face the uncertain outside world together. Until that time there is a need to have a provisional assessment of a potential actor's objective compatibility within

Figure 2. Innovation, inter-cultural "trust" between new and existing actors



EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

the existing institutional basis within the existing political processes of the organization (Garrett, 1993; Moravcsik, 1991).

However, while economic and business compatibility is necessary for co-operation within organizations, it is not sufficient. One has to turn away from the concrete and observable at the economic and business level and focus instead on the socio-institutional level. The issues that require to be articulated here are those apprehensive with the values, social norms, and social norms of a potential partner and thereby the likely trust one can place in their robustness as a partner in an uncertain world. Knowing the socio-institutional position of a potential partner relative to one's own establishes the compatibility of new actors advocating technological and organizational change, with the socio-economic position of existing actors. In solving this problem, organizations often rely on third party intermediaries, of appropriate but independent status in the global environment; for example, consulting firms and guanxi networks in China (Berger and Herstein, 2012). Such a third party can play an important part in bringing forward the credibility or otherwise of new actors advocating technological and organizational change (Barnes et al., 2011). In an uncertain and complex world the current or even forecast value of objective economic metrics of performance apart from the problematic of their measurement are not so important for decision as signals (Schelling, 1960) having a social dimension indicative of the existence of institutional drivers towards a sustainable affinity based on well embedded but unobservable values (Keohane and Ostrom, 1995; Granovetter, 1985; Burt, 1992).

INTER-CULTURAL PARTNERS

Signals of nationwide policies and intentions can be influenced by the nations emitting them for strategic ends calculated to strengthen their own and weaken the negotiating situation of others. In an increasingly media dependent humanity with communication expenditure decreasing fast, it is predictable that there will be a overabundance of signals that will be either fuzzy or tricky to evaluate or both (Keohane, 1988; Jervis, 1988; Boulding, 1962; Snyder and Diesing, 1977; Putnam, 1988; Polyani, 1966; Ikenberry and Kupchan, 1990). As discussed by Burt (1992), reality is forever hardened by imperfect information while in the perfectly competitive ground trust based on good information is significant. The question is not whether to trust or not, but the continuation of those whom one feels capable to trust. The capacity to sense the existence of an actor with whom one might be able to co-operate within organizations, and so eventually trust is a vital first step on entering the process leading to the next comparative static equilibrium. Although trust may appear irrelevant in the analytical context of anonymous market exchange it is crucial to the generation of the affinity networks that are sufficient to support optimal search in real exchange (Cao and Xiang, 2013). To this end the socio-institutional position of those whom one wishes to connect into a network of actors controlling the political processes in an organization, is as important to it as is the economic, business and technology benefits. Any global organization in the 21st century represents a set of values on which other have based existing highly useful socio-institutional relationships. It thus provides a good starting point for search strategies in the dual game. If a new member threatens to disturb such affinities then not only will the existing actors in the organization suffer but so also will those with whom they have existing relationships. Socio-institutional position is thus essential to "inter-cultural trust" as it provides the fuel to start them sustain and enforce the co-operation that creates the value generating boundaries that are the foundation of constructive international negotia-

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

tion. Existing behavioural research such as Schelling (1978); Axelrod (1984); Landa (1994); Choi and Lee (1997); have shown the importance of such socio-economic positioning as it leads to value adding co-operative exchange.

Research by anthropologists and legal researchers on societies functioning on a non-market basis has exposed how the selection of inter-cultural co-operative partners is carried out with great care (Landa, 1994). Under the circumstances of uncertainty that prevail in such societies for them especially their trade and exchange, spreads beyond their own territories of direct interest one finds that their members have a tendency to use fixed positioning characteristics to determine optimal co-operative exchange partners as cheaply as possible; their initial efforts are then restricted to sensing the position of those with whom they are dealing rather than with the political-economic basis for any eventual trade. This approach makes the presumption that it is the socio-institutional position of the other actor that is the vital issue not the product, service or goods to be traded. This behaviour is entirely rational if occasionally naïve when one deals with a totally alien culture. Homogeneous social groups such as the overseas Chinese in Asia; the Syrians in West Africa; the East Indians in East Africa; the the Jews in medieval Europe; Lebanese in North Africa; the Medici merchant-bankers in 15th century Florence all promoted deliberate social descriptions that first identify them. They are then used to implement meaning to signals the insiders of the group finds useful in conveying information to the world outside (Landa, 1994). This is similar to the evidence collected on the means modern public corporations use when initially internationalising their operations. They tend to do so to countries having a low psychic distance from their own, in terms of cultural and social values. This Ibelieve is exactly analogous to my emphasis here on the importance of socio-institutional position as a means to evaluate the psychic distance of new actors advocating technological and organizational change from existing actors in an organization.

This type of perceptual positioning is common throughout the globe and can undoubtedly be used to establish a foundation from which inter-cultural trustworthiness can expand and is based on an evaluation of the calculus of relationships. It is designed to diminish uncertainty and risk in co-operative exchange in and between societies. Research in anthropology and law shows that in such societies, the criteria for selection of co-operative associates develops and changes as more official impersonal social institutions materialize (Landa, 1994) such as those providing dependably enforceable legal contracts in unidentified markets operating on the basis of economic not social criteria. The objective evaluation of products and businesses rather that the trading parties social affiliations arguably facilitates economic exchange and this can then displace business based on trust and kinship or other social characteristics that are difficult and expensive to ascertain. However such displacement is not inevitable as is indicated by the resilience of modern societies where trust based co-operation continues to be the norm, e.g. Japan, as analysed in the works of authors such as Ouchi (1980); Boisot and Child (1988).

The Importance of Social Networks in China

Understanding Guanxi, the Chinese social network of reciprocal business relations common in Confucian cultures, has long been acknowledged as one of the foremost success factors when undertaking business in China (Barnes et al., 2011; Berger et al., 2013). Recognizing the important impact of guanxi and its influence on everyday business interactions in China is thus crucial for Western firms. Whereas considerable research has dealt with the growth of Chinese industries in recent years, the key relationship between changes in its economy and shifts in Chinese business information technology integration

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

has been neglected although it impacts the ways Westerners in particular both clinch deals and judge Chinese firms (Fuller, 2009). Chinese history suggests a spiral development model of guanxi constantly interacting with its environment. As Psychic distance, psychological barriers, and cultural differences have been shown to have dramatic impacts on the economic and managerial decisions by multinational corporations understanding the other's culture can be very beneficial for business success. As a result of market uncertainty resulting from the constant evolution of rules and regulations coupled by weak implementation was reduced through a mechanism named "guanxi" based on social networks (Tam, 2002). It is labeled as the actions directed towards founding, developing and sustaining mutually successful business activities (Shi et al., 2011). These social networks, widespread in Confucian cultures, have long been documented as playing a key role in conducting business in China. It is also seen as a regulator of business ethics especially in uncertain business environments where the implementation of the law is lax (Barnes et al., 2011). Guanxi may serve the purposes of both satisfying the need of affiliation and obtaining instrumental value (Hwang et al., 2009). There is a wealth of research on Guanxi, but few studies have illustrated its evolution in conjunction with the changes in the business environment in China. Most researchers have argued for its linear progression starting from a traditional culture toward a more Westernized consumer society throughout the country's three-decade experimentation with the free market. Recent developments have highlighted that Chinese people have increasingly demanded that the traditional components of their culture should be part of business ethics and technology integration (Hu, 2014). In China, the relationship of the firms to the state determines the firms' sources of finance and these sources of finance in turn impact their ability to upgrade. The unsuccessful domestic upgraders lack finance (neglected domestic firms) or financial discipline (the favoured domestic firms) due to their particular relationships to the state. The dissimilar patterns of technological upgrading in China have numerous important implications.

International firms trying to do business in China are faced with the unavoidable question of how to benefit from its enormous economic potential and navigate China's institutions and markets successfully (Berger and Herstein, 2013). Ethical dilemmas are certain to arise when diverse stakeholders have conflicting interest attached to business transactions. A complex challenge for international firms arises when differences in local and home country business ethics lead to tension about which business ethical standards should be applied in a particular situation, especially when implementing information technology which has a complex effect on firm management. Psychic distance and psychological barriers have been shown to have dramatic impacts on the economic and business decisions of Chinese firms. "Psychic distance" is the socio-cultural distance that companies and countries feel towards countries they consider to be dissimilar from their own business systems. To appreciate the contemporary Chinese business and managerial models one needs to understand Chinese cultural foundations and its evolutionary cycles.

Regarding the overall topography of China's technology sector, this paper illustrates that there are four different types of firms in China's technology region with three distinct patterns of technological upgrading. Driving these diverse patterns of technological upgrading are two aspects: the political financial system in China and the corporate strategies informed by the presence or lack of ethnic ties to the Chinese market. This paper identifies four types of firms operating in China's high-technology sector: neglected domestic companies, favoured domestic companies, hybrids, and regular foreign invested firms. There are three disconnected patterns of technology upgrading found in China's firms: high, moderate, and low levels of technological upgrading. What accounts for these dissimilar patterns are the politics of finance and the operational strategy of the firms. The financial systems under which the various

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

companies operate strongly character their capabilities and incentives to chase technological development. The financing of provides the appropriate incentives to chase technological upgrading whereas the financing of local firms undermines capabilities and forms disincentives for technological growth.

The Integration of Technological Networks With Chinese Culture

In the precedent decade, the progress in business globalization, the need for information technology, and deregulation in China have overwhelmingly changed the competitive business landscape (Wei et al., 2014). Innovators regularly toil together with lead technology users, suppliers, and other relevant stakeholders in business. They work in an integrated course of action to exploit and explore novel technologies and so the importance of understanding cultural differences in – order to enhance implementation success rates. The most up-to-date advances in the technological innovation business research area argue that firms ought to simultaneously invest in exploitative innovation to exploit active technologies and in exploratory innovation to capture novel technological opportunity. It is claimed that technological innovation must fit with business model design. Business model design interrelates with technological innovation to encourage firm growth and profitability. Business model design redefines the value proposition for new and existing technologies and the ways to capture its value from its successful implementation. Efficiency focused business model design is appreciated mainly by reducing information asymmetry, transaction uncertainty, and transaction complexity among business partners as well as better co-ordinating the internal value creation. It further strengthens mutual trust between the value chain members (be it internal or external). Reducing information asymmetry decreases opportunistic behaviour and, in turn, increases mutual trust between firms and promotes joint problem solving.

It is normally accepted that worth creation is the centre of the business model (Teece, 2010; Zott and Amit, 2007). Based on value creation mechanisms, existing business model definitions can be divided into two types. The first category is constructed from the perspective of an inner value chain, which considers the offer of services or products, the arrangement of internal value activities, and the allowance of internal assets to be the major mechanisms of value formation (Morris et al., 2005). The second type is constructed from the perspective of an external value network. This category highlights the arrangement of a value network, the integration of boundary - spanning operations, and cooperation between companies as the chief mechanisms of value creation (Amit and Zott, 2001; Hienerth et al., 2011). This requires creative management of technical resource and activity links, connecting a firm's technology to other firms in the network. As a result, cooperative and competitive market. China moves from a centrally controlled to a market-based economy, making appropriate realignment decisions to better reflect structural transitional changes, and its impact on network resource and activities reallocation are becoming increasingly difficult and complex. What would companies have to do to maintain their network legitimacy in transforming old to new industrial production, procurement and consumption? While some companies have, and will continue to make a virtue of their time and investments in the network, many face the prospect of "network legitimacy redundancy" unless they can build on their legitimacy in the presence of constant structural changes (Low et al., 2007).

ERP has been regarded as a main part of a company's information technology infrastructure for modern businesses. In recent years, it becomes a world-wide impression for companies to invest in ERP development. To meet the increasingly unstable and diverse market expectations and to constantly advance productivity, many Chinese firms have been moving rapidly to reengineer business processes

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

by utilizing up to date information technology. Managerial structures heavily influenced by traditional Chinese social value system. ERP projects have notoriously high failure rate. Research found that more than two-third of these projects resulted in complete failure (Li et al., 2014). Other authors observed that 90 percent of ERP adoption ran behind schedule and/or over budget. Simplified such list by categorized the factors into three general dimensions: organizational environments, people characteristics, and technical problems. They added a supplementary vendor support facet to emphasize the role of ERP software suppliers and a culture impact factor to recognize the exclusive challenges of adopting ERP in the Chinese context. Confucianism is a set of religion-like pragmatic rules and beliefs that have guided the Chinese social behaviours since 500 BC. One of the key principles is that the stability of the society is based on unequal relationships. It is believed that the society could function only when each member took its proper role. How people interact with others is based on the relative level of social status: ones with lower social status are expected to always respect and obey (unquestionably) the orders and principles of the ones with higher status. Where the bosses act as paternal figures to make all business decisions based on "personal knowledge and intuition", rather than "objective criteria or formal quantitative methods" (Hu, 2014).

I find that in emerging economy such as China, exploitative innovation may promote disinterest and makes a firm drop behind other mature industries to capture new growth opportunities in face of noteworthy structural change. It is claimed that the centre of value creation has transformed from a focal firm's technological innovation to the whole business environment and hence the need for an integrated information – technology system or network. As technological innovation is progressively more entrenched in the firm's business environment, managers should adopt a more systemic view to create and capture value from technologies ERP systems. This systems are aimed at improving communication within internal and among external business networks, and share information along the supply chain from the suppliers to the customers, as well as enhance the decision-making process. ERP systems can also provide information for companies to identify the causes of uncertainty that accounts for delivery delay so that the companies can tackle to the right areas for business improvement, which up to date was conducted through informal networks such as guanxi (Choi et al., 2013). ERP systems should be put into operation in a cautiously planned, progressive approach with substantive communication and training across the organization and in line with its business culture.

Firms' external technology hunt can be carried out on three idiosyncratic dimensions: cognitive (technical), spatial, and temporal dimensions (Li et al., 2014). Besides the cognitive (technical) dimension, the spatial (geographic) dimension refers to the knowledge search crossing physical space, which is somehow associated with local resource endowment, culture, and institutions the temporal dimension examines the role of time. Chinese firms for example, from a resource-based view, due to controlled resources and short-term oriented strategy, many Chinese companies are more imitative than innovative. They may not have sturdy absorptive capacity to investigate distant technologies to recombine the latest with the old. From an institutional standpoint, 'indigenous innovation' policies in China encourage domestic technology exchange and try to decrease the reliance on foreign technologies. Among many developing countries, China is of meticulous interest due to its speedy economic growth and vast market potential. China is determined to upgrade the driving force of its economic growth from labour-intensive manufacturing industries to more knowledge-intensive ones lead by innovation oriented companies. Chinese companies have made vigorous and intensified external knowledge exploration that played a significant role to compensate their lacking technological competences.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Many researchers propose that appropriate organizational culture and managerial leadership strongly expedite ERP adoption and hence its success and failure. For companies in China, organizational (as well as social) culture, languages, and ‘‘relationship amongst acquaintances’’ (guanxi) play very important roles in implementing ERP systems. Chinese people tend to be integrated into groups and have a high degree of uncertainty avoidance. They conceptualize the ERP system as a part embedded in a complex social system. Researchers in the area claim that the implementation failure of ERP integration in Chinese firms is generally high and many firms in China simply cannot achieve their intended implementation results. It is claimed that one of the impediating factors is guanxi. ERP implementation in China maybe particularly perplexing because this ERP concept comes from the Western world with Western cultural attributes which are totally different than that common in Chinese culture and mindsets. All kinds of supply chain relationships are driven by guanxi. As a result, the use of system mindset to ensure every procedure is well-defined and crystal clear (black or white) is inherently different from the business culture and ‘‘rule’’ in the Chinese world which has many colours of grey. It unswervingly leads to all kinds of operational and implementation problems. It even directly leads to the failure of many ERP system implementation projects. As a result, more flexibility in Chinese ERP systems is needed with ‘‘human decisions’’ in thought is seen as critical to ensure success in using technological solutions for companies operating in China. It is claimed that implementing ERP systems in China can be even more successful than implementing similar systems in mature industries because once the most critical elements in Chinese business culture and norm are respected in the ERP system, the well - cultivated cooperative merits of Chinese business person will assist smoothen the transition and hence the chance of success of implementation is much enhanced.

Abundant number of studies have steadily credited ERP for its ability to improve business decision - making competences and organizational performance (Li, 2011). The largely prominent benefits of ERP consist of improved cost structure, elevated information visibility, faster customer response rate, and improved procedure flow. They had the trepidation that ERP would deprive them of the privilege connected with information ownership and direct to status equalization with the inferior status employees. Support from senior management has been stressed as an indispensable ingredient for ERP adoption, predominantly when the outcomes are dynamic and tentative. Coercive pressure from senior management can offer leadership role in sending out understandable signals to any doubts and settling potential disputes, while the institutional pressure helps to lock necessary organizational resources to the project. Considering ERP is designed for rule-based and mature operations. In Chinese culture undoubtedly requires vigilant strategic analysis and meticulous project planning. China’s economy is increasing in the value curve, transitioning from the low-cost manufacturing of fundamental products to the assemblage of high-tech products, and more lately to innovation-led expansion.

CONCLUSION

The purpose of this paper was to develop a “dual” approach to how existing actors who control the political processes in an organization can collaborate or co-operate with new actors advocating technological innovation and organizational change. My approach thus combines several of the social sciences, including the economic, political and socio - institutional perspective that Ibelieve determine whether

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

existing actors who control the political processes in an organization will accept new actors advocating technological innovation and organizational change. This approach has political, economic, business and a moral dimension to the nature of technological and organizational change. Because the value and content of economic and business knowledge in organizations can be intangible in its cause and effect the numbers produced, they need to be supplemented by inter-cultural trust; such inter-cultural trust criteria tend to have a socio-institutional dimension. These provide a robust and objective mechanism for verifying the credentials of a new actor advocating technological innovation and organizational change, and if well constructed can also be indicative of a new actor's capacity for sustaining actions appropriate to fitting in with the existing actors that control have the power to control the political processes within the organization.

Over the past few decades, China has recognized the crucial role to be played by private enterprise in building the country's economy. This paper illustrated that the transition between Western and Eastern managerial systems is and will continue to be slow and incremental; its final destination is illusive. In general Chinese companies are still weak at technological learning and implementation, even though they diverge as to the causes of this problem. It is suggested that the social business networks that underpin business doings in China are dominated by rent-seeking collusion with state officials. Even though China's economy is already the fastest growing in the world and China is well on its way to becoming the leading economic power, China's managers are still searching for ways to become better managers. Modeling the Chinese miracle of transition and development poses considerable difficulties for economists (Fan, 2002). This is because China integrated a steady managerial transition advance, and because it continues to manifest many remnants of the old business system, reflecting the permanence and perseverance of its political and business system. The early twenty-first century has experienced two major economic, social and business events of global magnitude. The first was the global financial crisis of 2008/2009, which was preceded by the global corporate scandals of Enron and WorldCom, etc. The second was the emergence of China as a major global economy, the world's second largest economy after the U.S. China annually receives $105 billion of direct foreign investment, the largest amount for any country in the world (Economist, 2011). The implications for the global economy of these changes are still being felt. As part of these changes, China along with many other countries in the world has begun to adopt a wide range of corporate governance reforms. The rate of adoption is being determined by the pace of the country's globalization, which in turn is based on factors in both the shareholder and stakeholder business systems. These changes and the convergence of many business institutions are shaping China's new social market economy. This emerging economy will take into account the foundations of its complex institutions, which have many similarities to the Communitarian business system practiced in the countries of Continental Europe and in Asia in Japan and Korea, among others.

Further research is warranted in two areas. Firstly, there is a need to analyse in more depth the way a new actor's socio-institutional position can be measured and recorded and the relationships between such positions and its subsequent performance within the political processes and innovations, created by existing actors within an organization. Such trade-offs between political-economic or market valuation and socio-institutional assessment and eventual communicated identity and legitimacy are clearly especially important areas for research in integrating the social sciences. Secondly, there is a call for to empirically research further the dynamics of the relationship between nations and the drivers leading to the materialization of a confirmed institutional uniqueness for the existing members who control political processes in the international and complex nature of innovation in organizations in the 21st century.

Chapter 55
Women as Social Entrepreneurs in Turkey

Berat Cicek
Mus Alparslan University, Turkey

Mehmet Ali Türkmenoğlu
Mus Alparslan University, Turkey

ABSTRACT

Entrepreneurship has been an attractive topic for scholars over several decades. However, social entrepreneurship has remained relatively understudied in scale and scope. More specifically, the aspect of women in entrepreneurship is mostly untouched. Therefore, this chapter aims to examine the role of women in social entrepreneurship in an emerging economy such as Turkey. This research provides literature on definitions of social entrepreneurship and the differences between social entrepreneurship and business entrepreneurship by taking the historical development of entrepreneurship into account. Secondary data of four difference-maker women entrepreneurs are demonstrated through analyzing videos, newspapers, websites, and interviews of the entrepreneurs. Four different life stories of social entrepreneurs suggest that Turkish women social entrepreneurs face many challenges from their environment. The life stories indicate that they touched women's lives by improving their social status as well as economic conditions.

INTRODUCTION

Entrepreneurship has been an attractive topic for scholars over the several decades (Shane & Venkataraman, 2000; Low & MacMillan 1988). Scholars from diverse backgrounds e.g. management, economics, sociology and psychology have attempted to define and examine this concept within distinct contexts. These scholars (Yunus, 1999, 2010; Dees, 1998; Mair and Marti, 2004; Zahra, Gedajlovic, Neubaum & Shulman, 2009 among others) have looked at entrepreneurship from various angles, one aspect is business entrepreneurship which is defined as "the activity of setting up a business or businesses, taking on financial risks in the hope of profit" (Oxford dictionaries, n.d.).

According to prominent figures in this field (e.g. Yunus, 2010; Dees, 1998), social entrepreneurship is a burgeoning area within the entrepreneurship literature. Thus, there is no consensus about the

boundaries and definitions of social entrepreneurship due to the concentration on different aspects of social entrepreneurship. Therefore, there are several meaningful gaps in literature in regards to the role of social entrepreneurship to be filled (Seelos & Mair, 2005).

First and foremost, over the last a few decades the concept of entrepreneurship has been captured attention of scholars and practitioners (Bornstein, 2004; Chell, 2007; Dees, 1996); however, social entrepreneurship literature remained relatively untouched comparing to general entrepreneurship literature (Miller, Grimes, McMullen & Vogus, 2012; Harding, 2004). Second, having reviewed the research on social entrepreneurship suggests that this is a growing literature (Short, Moss & Lumpkin, 2009), yet the aspect of women social entrepreneurs have been mostly ignored. Third, while there is a substantial literature concerned with social entrepreneurship in developed countries (Mair & Marti, 2009; Bhawe, Jain & Gupta, 2006), research from emerging economies especially from a developing context such as Turkey, which has cultural influences from both Western and Eastern cultures, still requires more studies to delineate this phenomenon as social entrepreneurship emerges with unique local roots and dynamics in Turkey (Yetim, 2008). Thus, there has been a relatively limited amount of research completed within the Turkish context that concentrates on the role of social women entrepreneurs.

This chapter aims to provide a systematic literature on growing concept of social entrepreneurship with a special emphasis on women social entrepreneurs to fill the identified gaps. In this regard, we will focus on the differences between social entrepreneurs and entrepreneurs and examples of social entrepreneurship as well as the contribution of four women entrepreneurs in Turkey to highlight the impact of women on social entrepreneurship.

We first start with the definitions and historical development of social entrepreneurship, and its characteristics before talking about the traits of social entrepreneurs. We then highlight the differences between social entrepreneurship and business entrepreneurship. After that, we demonstrate four life stories of Turkish social entrepreneurs after describing our methodology

SOCIAL ENTREPRENEURSHIP

Covering a wide-ranging area, social entrepreneurship is a concept focused on social purposes (Peredo & McLean, 2006: 59; Dees, 1996; Chell, 2007). Although there has been significant progress in social entrepreneurship education and research, there is no absolute agreement about the definition of the concept in the literature. Some academics have attempted to explain social entrepreneurship within the scope of non-profit organizations, e.g. social organizations and associations (Weeawadena, 2006: 22). The researchers, e.g. Dees, (1998; 2006); Yunus, (2010); Zahra et al., (2009), on the one hand have drawn attention to the inclusion of social entrepreneurship in commercial activities, through entrepreneurial practices of the non-profit sector. On the other hand, another group of researchers have addressed social entrepreneurship within the world of entrepreneurship (Peredo and McLean, 2006: 57), and indicated that it was specific to only non-profit organizations, but that social entrepreneurship was also a part of the sector where for-profit enterprises exist (Austin et al., 2006; Naumes et al., 2002; Thompson, 2002). These researchers' attempt to attribute a social identity to entrepreneurship or to approach the matter as a type of entrepreneurship has led to the increase of the entrepreneurship content in theories and definitions made in relation to this matter (Sullivan Mort et al., 2003: 79). However, both approaches agree on the fact that social entrepreneurship, at its core, is about providing benefit to society.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Austin et al. (2006) drew attention to the main components of the matter while defining social entrepreneurship. They defined social entrepreneurship as an "innovative, social value creating activity that can occur within or across non-profit, private and public sectors". The three components underlined in this definition are as follows (Austin, 2006: 22):

- **Innovation:** As the activity carried out is entrepreneurship, a creative process is essential in producing something new.
- **Creation of Social Value:** As the characteristic that distinguishes social entrepreneurship from private sector entrepreneurship, social value creation is an essential motive.
- **Area/Sector:** Social entrepreneurship is a phenomenon that can be seen in any sector or intersectorial cooperation activities.

Social entrepreneurs define problems and help with their resolution. They fight against injustice, feed the homeless, teach illiterate people how to read and write, raise money to seek treatment methods for illnesses and protect the natural environment. Social entrepreneurs also lead social innovations and change in various fields such as education, health, environment and enterprise development. Like financial entrepreneurs, social entrepreneurs establish strong and sustainable organizations. Their only difference is that they do not seek profit. In societies, social entrepreneurship might occur when people take action to support social welfare (London & Morfopoulos, 2009). To Leadbeater (1997: 11), social entrepreneurship is supposed to be an action which is sensitive to social problems and which prioritizes social aims, focuses on social outcomes and aims to achieve social development through social capital.

Some approaches that define social entrepreneurs would include as follows:

- Adopting a specific aim in creating and sustaining a social value rather than profit or a private value;
- Finding out new opportunities that serve this purpose and never giving them up;
- Being continuously in an innovation, adaptation (to change) and learning process;
- Acting boldly without being limited by resources currently at hand;
- Achieving significant successes in finding and using resources;
- Exhibiting a high responsibility to people to whom they provide service and with regard to the results that emerge (Alvord et al, 2004: 262).

Bygrave, the Head of Entrepreneurial Studies at Babson College, names 10 traits that characterize social entrepreneurs. According to Dees et al (2002), Bygrave considers social entrepreneurs to be:

- **Dreamers:** Social entrepreneurs have visions about their organization and society. More importantly, they have the ability to make these dreams real.
- **Determined:** They do not waste time but take decisions, fast which is the key to their success.
- **Hard-Worker:** They first decide on the type of action and put it into practice as fast as possible. They make the necessary adjustments to reach their targets.
- **Decisive:** They undertake their tasks fully. They give up only when they encounter insurmountable obstacles.
- **Self-Sacrificer:** They adapt to work. They rarely have relationships with family or friends. They work seven days of the week (12 hours a day) without getting tired.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

- **Devoted:** Social entrepreneurs, especially those with a difficult mission, like their work.
- **Elaborative:** They care about the details of work. They launch a new initiative in the best way, make it grow and focus on critical details.
- **Believers:** Social entrepreneurs do not believe in faith. They believe in being committed to their employers.
- **Profit-Makers:** Profit is not a motivation factor for social entrepreneurs but it is necessary for sustaining the activities of their enterprise. They understand the role of economy in their organization and work at maintaining it.
- **Distributors:** They distribute responsibilities among shareholders and everybody exhibits a sense of ownership in the activities carried out.

There is more than one potential motive that can encourage social entrepreneurs. Some of these motives might be primary while others might be secondary. Besides, some of these motives might be implicit while others might be explicit. The most fundamental motive that social entrepreneurs may have is altruism. Also, there might be secondary motives that motivate social entrepreneurs such as gaining a particular status, being in the public eye and having power (London & Morfopoulos, 2009).

As can be seen, several attempts have been made to define the concept of social entrepreneurship. When the available definitions are examined, it is possible to distinguish the traits that are most frequently associated with social entrepreneurship. These traits are mainly as follows: non-profit, social value creation, awareness of social problems, innovation, leadership, elimination of social problems etc. Accordingly, we define social entrepreneurs as *individuals who have a social mission and who listen to the society, determine the needs of the society and act as a bridge between social needs and existing resources*.

HISTORICAL DEVELOPMENT OF SOCIAL ENTREPRENEURSHIP

When the historical development of social entrepreneurship is examined, a considerable difference between theory and practice catches the attention. It is seen that several charity organizations, especially those taking their roots from long-established religions, carry out many economic activities focused on a social mission at their core. Though they are associated with social entrepreneurship, these examples demonstrate that the attribution of a social mission to economic activities dates back to older times (Singer, 2002; Mengu, 2016; Besler, 2010).

Contrary to the deep historicity in the practice of social entrepreneurship, it is seen in the literature that social entrepreneurship is still developing and the shift from practice to the academy is undergoing certain stages. Below, the chronological order (as in the literature) of the concepts of social entrepreneur and social entrepreneurship is given:

Looking back at the historical development of social entrepreneurship in practice, we first encounter William Lloyd Garrison, who founded "The American Anti-Slavery Society'" in 1833. Founding also "The Liberator", which is the first anti-slavery newspaper, Garrison passionately fought against slavery throughout his life and defended the rights of black Americans (Barendsen & Gardner, 2004).

In 1889, social services expert and reformist Jane Addams founded "*Hull House*" in order to help destitute people in Chicago. This settlement house served as a welfare centre for disadvantaged neighbourhoods. Later, it became a role model that was taken as an example at national level and attempts

Table 1. Definitions of social entrepreneur and social entrepreneurship

Author/Year	Definitions
Theobald (1987)	Social entrepreneurs are "change agents" who have a desire to take the risk of presenting new ideas and approaches to individuals, groups, and institutions.
Leadbeater (1997)	Social entrepreneurship focuses on using entrepreneurship behaviour instead of profit-oriented behaviour while achieving social aims for the benefit of a disadvantaged social group.
Dees (1998)	Social entrepreneurs play the role of change agents in the social sector, by adopting a mission to create and sustain social value (not just private value); recognizing and relentlessly pursuing new opportunities to serve that mission; engaging in a process of continuous innovation, adaptation and learning; acting boldly without being limited by resources currently at hand; and exhibiting heightened accountability to the constituencies served and for the outcomes created.
Thompson, Alvy, & Lees (2000)	Social entrepreneurs are people who realize where there is an opportunity to satisfy some unmet need that the state welfare system will not or cannot meet, and who gather together the necessary resources (generally people, often volunteers, money and premises) and use these to 'make a difference'.
Fowler (2000)	Social entrepreneurship is the creation of viable (socio-) economic structures, relations, institutions, organizations and practices that yield and sustain social benefits.
Frumkin (2002)	Social entrepreneurs have a combination of the supply-side orientation and the instrumental rationale, providing a vehicle for entrepreneurship that creates enterprises that combine commercial and charitable goals.
Thompson (2002)	Social entrepreneurs are people with the qualities and behaviours we associate with the business entrepreneur but who operate in the community and are more concerned with caring and helping than "making money".
Sullivan Mort et al. (2003)	Social entrepreneurship is a multidimensional structure that involves all the dimensions given in the "fundamental components" section.
Mair & Marti (2006)	Social entrepreneurship is the process of evaluating new opportunities by combining different sources in order to satisfy social needs, create social value and speed up social change, either benefiting from opportunities or by using these sources innovatively.
Peredo & McLean (2006)	Social entrepreneurship aims either exclusively or in some prominent way to create social value.
Robinson (2006)	Social entrepreneurship is a process that includes the identification of a specific social problem and a specific solution (or set of solutions) to address it; the evaluation of the social impact, the business model and the sustainability of the venture and the creation of a social mission-oriented for-profit or a business-oriented non-profit entity that pursues the double (or triple) line.
Martin and Osberg (2007)	Martin and Osberg (2007) explained social entrepreneurship with three components: 1) Determining the marginalized group who do not have a financial or political power due to the unjust order, who cannot benefit from transformative benefits and who are excluded and thus suffer. 2) Having the determination, creativity and courage to create a social value and confront the circumstances by taking action. 3) Bringing out the potential of the group and creating a permanent, balanced ecosystem.
Nicholls et al. (2008)	Nicholls et al. carried out a study aiming to bring new models to social entrepreneurship: *"Social enterprise model, its missions and relationship with money. Social enterprises working for international welfare and development. Social entrepreneurship partnerships - university incubation model aimed at increasing social entrepreneurship."*
Yunus (2010)	Social entrepreneurship is a business model that aims to meet the most fundamental needs of humanity rather than maximizing profits.
Franz et al. (2012), Nicholls & Murdock (2012)	Franz et al. (2012) and Nicholls & Murdock (2012) emphasize the concept of social innovation. They address the differences in the theory and practice of social innovation besides social innovation and social entrepreneurship relations.
Definitions of Social Entrepreneurship by Some Institutions	
Harvard University, Harvard Business School, Social Enterprise Initiative	Social entrepreneurship is an innovative, value-creating activity that can be seen in non-profit, public or private sectors.
Oxford University, Said Business School, The Skoll Centre for Social Entrepreneurship	Social entrepreneurship involves dynamic administration strategies in order to create the best social and environmental effect. Social entrepreneurs are the change agents of society, who can see the opportunities that others overlook, develop systems for the benefit of the society, find new approaches and produce creative and sustainable solutions.
Duke University, The Fuqua School of Business, Centre for the Advancement of Social Entrepreneurship	Social entrepreneurship is a process that involves seeing the opportunities for creating a social value and using them productively.
Ashoka	Social entrepreneurs are individuals with innovative solutions to society's most pressing social problems. They are ambitious and persistent, tackling major social issues and offering new ideas for wide-scale change.
Schwab Foundation for Social Entrepreneurship	Social entrepreneurship is an innovative, practical, sustainable, market-based approach that achieves transformative social and/or environmental change, with an emphasis on underserved populations.
Skoll Foundation	Social entrepreneurs are society's change agents: a pioneer of innovation that benefits humanity.
Global Entrepreneurship Monitor	Social entrepreneurship is an activity aimed at starting a new enterprise or extending a social enterprise existing individually or as a group. In social entrepreneurship, the focus is on social purposes and the profit obtained is not returned to investors but it is re-invested for future activities or for the enterprise itself.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

were made to open more centres like Hull House. Jane Addams spent the rest of her life working for Hull House and was awarded the Nobel Peace Prize in 1931 (Barendsen & Gardner).

The awareness about, and the need for, social entrepreneurship in society came about due to some factors such as the work pace of charity organizations and dissatisfaction about the administration. One of the first examples of this awareness is William Draydon. Draydon is the first person to describe the concept of social entrepreneurship. He believed that social entrepreneurs offered the best potential for the resolution of social problems and thus established "Ashoka". Ashoka is the first enterprise established to support social entrepreneurs financially. Its aim is to provide financial support to social entrepreneurs and create a professional network of communication where they can discuss and exchange ideas and recommendations for solutions (Barendsen & Gardner, 2004; Denizalp, 2009).

The Nobel Prize success of Muhammad Yunus in 2006 with his microcredit system (small loans to entrepreneurs) against poverty in Bangladesh played a role in making social entrepreneurship the focus of the increasing interest in university, media and social sector organizations (Martin & Osberg, 2007). Muhammad Yunus, Head of the Department of Economics of Chittagong University, created a revolution that determined the fate of millions and won the favor of economic and political actors across the world. *Grameen Bank* (Bank for the Poor) established by Yunus gave loans to many poor people who could not give a refund guarantee and those absolutely rejected by traditional organizations. These poor people started various businesses, from hair salons to grocery stores. Thus, millions of people were saved from poverty. The Grameen Bank Model is a very successful example of social entrepreneurship that enabled the dissemination of microcredit across the world (Denizalp, 2009: 15).

As for the history of social entrepreneurship in Turkey, the plan conceived by Zeynep Kamil, the daughter of Muhammad Ali Pasha (Kavalalı Mehmet Ali Paşa), to establish a hospital where gynecological diseases and the reasons for child deaths would be investigated was one of the first examples. Within the scope of this plan, she established *Zeynep Kamil Hospital* in 1862. In 1872, Yusuf Ziya Bey pioneered the foundation of Darüşşafaka Association (Denizalp, 2009). Yet, from the aspect of Turkish authority social entrepreneurs are not considered as different from business enterprises in Turkey. In other words, these social enterprises are seen as business enterprises which have obligations similar to business enterprises such as paying corporate taxes. They do not benefit from some privileges which could lead them to grow easier due to bureaucratic obstacles in Turkey. In developing countries, social enterprises receive some incentives which are provided by their governments. In some European countries, for instance, Croatia and Czechia they adopt several programmes to boost this area with funds (OECD, 2016). Such supports are not provided by policy makers in Turkey yet.

DIFFERENCES BETWEEN SOCIAL ENTREPRENEURSHIP AND BUSINESS ENTREPRENEURSHIP

The main difference between social entrepreneurship and business entrepreneurship is the purpose. In other words, it is about what an enterprise aims to maximize. For social entrepreneurs, the aim is to maximize some social situations. These are generally urgent needs that other organizations overlook or fail to meet. As for business entrepreneurs, what is important is to maximize the profit that has been made or the assets of shareholders (Bornstein & Davis, 2010). In other words, profit, which is the main factor that business entrepreneurs focus on is not a target for social entrepreneurs. Rather, it is an explicit and central target for social entrepreneurs to work for social purposes and make a difference (Harding,

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

2004: 43). However, what matters is to make a difference based on a purpose, not to build wealth as a measure of value-creation like business entrepreneurs (Dees, 1998: 3). This is because the mission, value, and ideologies in social entrepreneurship are based on social purposes and all the actions of social enterprises are determined taking these purposes into account.

Whereas success is measured qualitatively in social enterprises, it is measured quantitatively in for-profit enterprises. That is, social entrepreneurship involves a qualitative evaluation of success regarding the service provided while the evaluation of success in business enterprises is based on quantity (Dees et al, 2002: 2). When private sector entrepreneurs create value for their customers, they are rewarded by getting a feedback in the form of profit in the short or long term. However, social entrepreneurs are seldom rewarded for the social value they create, and no data can be obtained about the organizational performance of social entrepreneurs since profit is not the criterion (Dees et al, 2002: 4). Another significant difference between social entrepreneurs and business entrepreneurs results from being internally or externally focused. While administration, ownership, and financing might be carried out externally in social enterprises, only financing might be external, though partially, in for-profit enterprises, but administration and ownership must be carried out internally (Prabhu, 1999: 142). Besides, the enterprising tendency of social entrepreneurs is lower in comparison with that of business entrepreneurs (Cools & Vermeulen, 2008: 18). The main differences between social entrepreneurship and business entrepreneurship are given in Table 2.

In today's world, both types of entrepreneurship are needed. Compared to business entrepreneurship, social entrepreneurship is more difficult because it opposes political decisions and looks for potential solutions. Despite this situation, it might not be right to consider one of them superior to the other (Bornstein & Davis, 2010).

METHOD

Bertaux and Kohli (1984) suggest that life story approaches are helpful to uncover people's experiences as well as life trajectories. This approach has been used for many disciplines, including sociology, psychology, and sociology. It must be noted that there are two ways of collecting data: either a researcher collects directly from the informant or someone, who has collected data before, collects data from the informant. It is called primary data if a researcher himself/herself collects data, while if a researcher uses collected data, it is considered secondary data (Saunders, Lewis & Thornhill, 2016). Therefore, this chapter draws on secondary data from documentaries, videos, blogs, newspapers, and interviews from available media resources. Reviewing these resources influenced us in our reporting four difference-

Table 2. Differences between social entrepreneurship and business entrepreneurship

Social Entrepreneurship	Business Entrepreneurship
Based on collective consciousness and experience	Based on individual skills and knowledge
Focused on long-term productivity	Focused on short-term financial gain
Ideas are limited with the mission	There is no limit to the scope of ideas
Profit is a tool	Profit is an aim to be reached
Profit is used for providing service to humanity	Profit is kept or re-used for making more money

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

makers from distinct sectors. Each of them is Turkish and a woman which fits our purposive sample. Therefore, we begin with the first life story, that of Hilal Gerçek then continue to Bedriye Hülya. Tülin Akın is the third entrepreneur, followed by Pınar Kaftancıoğlu.

Hilal Gerçek

Hilal Gerçek's story starts in her university years where she felt the need to contribute in one way or another. However, there was a lack of research and practice in relation to social entrepreneurship. Some social entrepreneurship websites barely worked. Then she sought advice how she could be beneficial to the society through entrepreneurship training. She was advised that she could attend student communities and do volunteering. Initially, she did not know what she was doing in the projects of social entrepreneurship (Gerçek, 2017). After joining and becoming active in projects, she had experiences which made her feel the need to be socially responsible to society. She devoted herself so much that she had to extend her bachelor degree from four years to seven years. Her family started to be concerned about her education and life. However, she was aware of what she did or did not want, because whatever she did, she looked to see if there was a social impact involved. Having experiences in the spirit of good impact on society gave her pleasure to find social entrepreneurship.

Although she has not established an enterprise yet, she does represent TurkishWIN on campus and in social media – a social initiative in Turkey to empower women. Also, she volunteers for AFS Turkey. AFS bridges new cultures by providing several opportunities for training and learning. She works for *SOGLA* (Sosyal Girişimci Genç Liderler Akademisi, Translation: The academy of young leaders of social entrepreneurship). She volunteered in *BinYaprak* as Operations Director. She has done several beneficial things in *BinYaprak*; because she always had a dream to be involved in helping people. She is greatly inspired which empowers her to leave her comfort zone. In other words, she has faced many hardships, especially arguments with her family about marriage. Although her family has backtracked on that, she spends her time on the activities that make her happy as she asks herself; 'Where am I the happiest?' Other challenges include her feeling alone in the journey of social entrepreneurship, feeling that the things that she does might be wrong, feeling being judged. However, she has jumped into dark and deep waters which later appeared not to be so dark and deep after all.

Bedriye Hülya

Bedriye Hülya was given the award of Social Entrepreneur of the Year 2013 by The Schwab Foundation for Social Entrepreneurship. She founded B-fit Sport and Health Living Centres for Women in Turkey in 2006. She has always been very enthusiastic about working; interestingly, when she was very young, she applied for a chief assistant position at the US embassy. She had an unfortunate traffic accident and was very bored both in a hospital and at home with two crutches over two years, which led her to start working at the age of 18. She firstly started working in transportation sector then in banking after that in tourism sector finally in education sector before in textile sector. There is no work that she cannot do, from the easiest to the most complex (Hülya, 2017).

After saving enough money to study for a master's degree in the USA, she went to America. While she was studying in the USA, she came across a new type of gym in which there was a certain session that lasted only 30 minutes. Normally she hates gyms as she cannot stay for a long time; however, she could stay for 30 minutes, as the system was highly effective and quick. Then she put this idea in her

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

projects file to work on it later on. After she returned to Turkey in 2004, she wanted to put this idea into practice with her six girlfriends.

It is a fact that everyone has to exercise; however, she knew why Turks, especially Turkish women, do not exercise. She wanted to remove the barriers by offering men-free gyms for all ages and all income groups. These gyms are widely available; for instance, she encouraged women to open a centre in less developed cities in the eastern part of Turkey when there were not shopping malls in these cities. Therefore, Bedriye provided support for over 250 women entrepreneurs to operate their fitness centres for only women to socialise by surpassing social oppression as well as making exercise a habit. Due to the cultural and societal barriers, B-fits are designed for those women who cannot go to the gyms that are unisex to meet others and socialise. These places are venues not only for exercise but also for sharing many aspects of life (B-Fit, 2017).

In B-Fits, women make new friends, read and learn new things and share their problems, recipes, and experiences. In attending sessions at B-Fits, women feel better, healthy, and self-confident which leads to a better communication with their family and they are more productive in their work. As they make time for themselves they feel happier, especially if they lose weight and they see themselves more beautiful and well cared for. Having a social life with their friends suggests that attending these centres reminds women that they co-exist with their husbands as well as in society as a valuable individual.

Bedriye employed more than 1000 women and helped more than 250 women to establish this business. Over 350,000 women have used one of the 200 centres of B-Fit gyms in Turkey's 50 different cities. She is an entrepreneur who has given her support and opportunities just for women. The employees, franchisees, and customers comprise only women. If the aim was to make more money, Bedriye could have given franchises to men, yet the aim was to empower women. The social impact that she was looking for was more important than money.

Tülin Akin

She is another difference-maker woman who has received a number of awards from distinguished organisations, including the Social Entrepreneurship Network Award from ASHOKA in 2013, and the Most Successful Entrepreneur Award from Junior Chamber International in 2012 among others. She founded a website of www.tarimsalpazarlama.com in 2004 while studying for her bachelor's degree. The main aim was to ease farmers' lives by informing them for free about market prices, weather conditions, and new technologies about farming and animal breeding to improve their efficiency as well as overall productivity.

The main concern arose from the difficulties that farmers face, e.g. difficulty in accessing instant reliable weather conditions information, lack of access to markets and low efficiency in agricultural products. Since small farmers cannot make enough profit due to higher costs, they finally give up and migrate from their villages to big cities. When she observed all these hardships she could not sleep. She thought that she could solve this by a website. Since some farmers were uneducated, they did not have access to websites and they did not have computers. Therefore, she travelled around 6000 villages over six years to tell them about the impacts of technology, computers and the internet on agriculture and animal breeding. Furthermore, she was advising farmers about how to get bank loans if they needed them (Tarimsalpazarlama, 2017).

Tülin then established a Farmers Club text messages service to inform farmers about all the details they need for farming, which was free. 1.4 million farmers receive texts informing them about weather

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

conditions and advise them about what to do, relating to market prices, sales, stock exchange states etc. Text messages were not enough; she started training farmers about how technology affects their lives, using a convertible lorry to educate farmers about technology. In 2012, she felt that farmers were ready to have individual computers. Then she went to Intel to get them to produce computers to enter their data into software in return to get accurate information. However, it did not work well because; most farmers make their decisions by consulting their children. Since the computer hardware were not capable of playing video games, the children convinced their parents not to buy the computers. Then she noticed fast-growing smartphones, tablets and similar devices for use in the application of Farmer Guide in iOS and Android (Akın, 2017).

All these were not enough; she had to do more to disseminate crucial information to farmers as there was no agriculture agency in Turkey. Producing devices and applications became insufficient and waiting for farmers to use their applications might have constrained them. In order to overcome this issue, she prepared a TV programme to inform farmers over three months. This project was so successful that several TV shows from six different countries imitated the project in their countries.

Finally, she realised what she was doing wrong. She was solving problems that occurred, yet she needed to prevent them from occurring in the first place. Tülin moved to a village in *Aydın* to transform it into a smart village, *Kasaplar* Village. It is easy for visitors to access. 424 people live as typical villagers. In this village, she aimed to bring together family farming and technology to increase small farmers' efficiency and profitability to a standard of living. Also, she intends to prevent migration from villages to cities for economic and social reasons. Called a 'new rural life model', she is building this now. This model is a uniquely innovative model in Turkey and in the world. All devices used in agriculture and stock farming are made smart. It has become quite straightforward to monitor land by using sensors to transfer data via smartphones as well as using drones to measure solid surfaces. Automation systems, measurements, and all data are monitored and controlled by tablets or smartphones (Akın, 2017).

This place is also for women, youngsters and children to socialise, to be trained and educated, along with smart greenhouse products, meteorological stations, early warning systems under net house production, smart pasture farming, collective milking, animal monitoring systems, beekeeping and tracking systems, an agricultural data monitoring centre, a laboratory, and a digital library. There are many software programs for all these activities. Every year, all data emerging from this village, e.g. social status, income, environmental state, are measured and shared with NGOs, universities and the private sector.

Farming leaders from other villages come together to visit this village to see how it works because farmers do not obey what veterinarians or agricultural engineers suggest. Rather, they pay attention when other farmers talk about how technology plays a role in the production.

Pinar Kaftancioğlu

Pınar Kaftancıoğlu is a 48-year-old mother of two who used to live in Istanbul until she established '*İpek Hanım Çiftliği*' (Lady İpek Farm). She was working in a business tower in one of the busiest places in Istanbul, where she grew fed up with the chaos and disorder of Istanbul and its dense population and traffic. In particular, working in a professional role made her too involved with her job in which she could not spare enough time for her family. Her baby started to call her nanny 'Mommy'. This became a milestone for Pınar to realise the importance of spending more time with her children. The chaotic and complex life in Istanbul so exhausted her that she decided to enjoy the rest of her life in the countryside. She then quit her job and escaped from Istanbul's metropolitan life to an Aegean village. She first lived

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

in *Kuşadası,* a small tourist town. Then she moved to *Nazilli's,* a small village named *Ocaklı* where she established her current organic farm before running a natural spring water factory for several years there (Kaftancıoğlu, 2017).

In *Ocaklı,* Pınar firstly purchased a field, using her previous savings from Istanbul, which she began to plow and then to fertilize it, using cow manure. After a while, she started to grow her own vegetables and fruit as. She felt immensely happy when she tasted her first vegetables. She no longer bought any food from supermarkets. She also had chickens and cows which she named them individually. Every morning she collected eggs from the shoe rack which some chickens used for incubation purposes. She also made cheese and yogurt from the raw milk as well as her own bread and olive oil. So she became a totally self-sufficient woman. In her diet, she had fresh eggs, tomatoes, carrots, and lettuces which she never found in big cities. This was the feeling that she had been dreaming of. Her dream came true, but a problem arose when she exaggerated this self-sufficiency.

She loved her animals so much that she could not slaughter them; as a result, she was collecting around a hundred eggs daily. Moreover, she had six tonnes of olive oil which she would have taken her a long time to use up. Since she used no chemical products, all vegetables and fruit decayed in a few days. Wholesale dealers or buyers were offering humiliating prices to buy her products, even though she did not have any financial concerns, as she already made enough savings in Istanbul for her remaining life. She came up with the idea of sending these extra products for free to friends in Istanbul. She found a way to avoid food waste but after sending parcels to her friends, they were impressed with the taste of vegetables and requested more, which delighted Pınar. Then her friends' friends and their friends' friends were sending emails full of praise to Pınar. Day by day, the demand increased and diversified. They asked for a wide range of products from the village from sour orange jam to *Tarhana* (soup with dried yoghurt). Her products increased consumers' appetite for less well-known delicious products too, which pleased Pınar very much (Berköz-Ünay, 2010).

Pınar extended her field and planted several more separate vegetables and fruit. She hires mostly women from *Ocaklı* village; there are around 120 people working in her farm, which goes up to 300 people during summer. There are around 100 cows and oxen and also a large number of sheep and goats. She has a shelter which includes around 80 dogs and 100 cats. She describes herself a vegetarian and an animal lover, therefore she never slaughters animals or sells meat. This is how she started this social enterprise in which she had several aims to achieve. The main and maybe primary motivation came from the anxiety about how she would feed her children as there is unhealthy and cheap food in abundance in big cities. She wanted to keep her children and herself away from the tasteless, hormone-fed food as well as from genetically modified food.

İpek Hanım Çiftliği created a social impact upon the villagers, especially upon women. Talented women in the village were revealed and discovered by Pınar. She did not let them underestimate themselves, e.g. a woman was very good at village bread-making but did not realise just how good the bread she was making was. Therefore, Pınar created a self-awareness among women, especially those who were not working anywhere before. Women in the village feel empowered by being financially independent. She became a role model and idol for younger women to avoid early marriage. There was an education campaign in Turkey called '*Haydi Kızlar Okula*' (Girls, Let's Go to School) to provide girls mostly from rural areas with a primary school education. Pınar uses a similar slogan '*Haydı Kızlar İşe'* (Girls, Let's Go to Work) to increase the village people's wealth and prosperity. It is a fact that it is difficult to be accepted by villagers in Turkey if you are not from the specific area, yet she established trust among village members as Pınar never founded her farm for financial concerns, which was noticed later on.

Concepts of richness and wealth have changed for her; these are not measured based on a house and make of a car, it is measured by what is contributed to people and how you value people as well as how they value you. There are many people doing good things like Pınar in Anatolia 'despite villagers' but she does it 'with villagers' due to the trust between Pınar and her friends (Kaftancıoğlu, 2017).

Another aim of Pınar was to preserve seed and healthy food by using authentic local seeds instead of imported ones. Using local seed is a hot topic in Turkey which needs to be addressed as imported seeds are infertile and mostly genetically modified. Therefore, Pınar is contributing to the national seed reservoir by using and keeping original seeds. She sees it as a social responsibility towards society.

Pınar's farm has changed the destiny of a village and became a pioneering example for social entrepreneurs. It is a revolution in a small village rather than only a rural development project the love they have for each other makes for a happy Aegean village.

CONCLUSION

This chapter has attempted to cover definitions of entrepreneurship and social entrepreneurship as well as highlighting the differences between social entrepreneurs and entrepreneurs. By pointing out the historical development of social entrepreneurship, we focus on prominent figures in the field among several examples of social entrepreneurship. The contribution of pioneering women social entrepreneurs in Turkey was highlighted to demonstrate the impact of women on social entrepreneurship in Turkey. After talking about methodology, we found three prevalent women social entrepreneurs in Turkey who were difference-makers in their areas.

Although there is no consensus on the definition of social entrepreneurship, we first described general definitions of business and social entrepreneurship from prestigious institutions as well as featured scholars who brought social entrepreneurship forward or contributed to social entrepreneurship scholarship. It is suggested that social entrepreneurs have several traits, including being a dreamer, being determined, being hard-working, being decisive, being self-sacrificing, being devoted, being elaborative, being a believer, being a profit-maker, and being a distributor.

Examining the historical development of social entrepreneurship in the literature demonstrated that social entrepreneurship goes back to the 1800s. The first known example is William Lloyd Garrison, who founded "The American Anti-Slavery Society" in 1833 then reformist Jane Addams founded "*Hull House*" in order to help destitute people in Chicago in 1889. In 2006, the Nobel Prize success of Muhammad Yunus captured attention with his microcredit system against poverty in Bangladesh. His system gave a rise to making social entrepreneurship in society including universities, media and social sector organizations (Martin & Osberg, 2007). One of the first examples of women social entrepreneurship was Zeynep Kamil's gynecological and children's hospital in 1862 (Denizalp, 2009).

We distinguished the differences between social entrepreneurship and business entrepreneurship. Based on the literature, social entrepreneurship is mostly based on collective consciousness and experience whereas business entrepreneurship is based on mostly individual skills and knowledge. While social entrepreneurship considers profit as a tool to serve humanity, business entrepreneurship uses the profit to make more money. Social entrepreneurship focuses on long-term productivity whereas business entrepreneurship concentrates on the short-term economic gain.

We chose four difference-makers in social entrepreneurship field in Turkey. First is Hilal Gerçek who extended by three more years her self-sacrifice with the aim of being socially impactful to soci-

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

ety. Although she encountered many challenges from her family and acquaintances, she never stopped and she dedicated a considerable time to social activities. The second woman was Bedriye Hülya who founded B-Fit gyms in Turkey. She is quite enterprising as she has worked in several different businesses. She finally founded men-free gyms in which women can exercise and socialise. Bedriye's new ideas, including only 30 minutes exercise and socialisation, became popular. Therefore, thousands of women from different ages and income groups have attended her sessions. Those who wanted to open a franchise were supported and granted this if they were women. Bedriye was aware of the conditions of most Turkish women. Members went to her gyms to learn new things about life and opportunities, to share their sadness and happiness as well as food recipes. By attending her gyms, women have felt empowered and valuable.

The third difference maker is Tülin Akın, who established a website to inform farmers during her bachelor degree. She then travelled to over 6,000 villages to explain how technology increases their efficiency and productivity. While doing that, she created a free FarmersClub text message service about daily crucial information of weather conditions and market prices. She then made an agreement with technology firms to produce computers and software to provide accurate information to farmers. She has never stopped advancing the way she works. Tülin started to build a techno-village to automate every machine to work hassle-free. This village is also a home to women and children for them to learn and socialise. The last difference-maker is Pınar Kaftancıoğlu who worked in Istanbul's chaotic environment for a long time before she moved to a small town in the Aegean. She first grew her own vegetable and fruit alongside rearing domestic animals such as cows, sheep, goats, and hens. Then she began to harvest so much produce that she could not consume it by herself. After that, she started to send it to her friends as gifts. Later on, all her friends asked for more fruit, vegetables, olive oil, and different ranges of jams due to their chemical-free and organic growing methods. She bought a field to produce different vegetables while women from the village were invited to work there. So far, up to 300 women work in her farm.

To sum up, four different life stories of social entrepreneurs suggest that Turkish women social entrepreneurs face many challenges from their environment. However, they never give up on their dreams. While doing that, they offer quite bold resistance against critics. Also, each of them looks for a social impact on society, mostly on disadvantaged groups such as women in their business. The last three stories indicate that they touched women's lives by improving their social status as well as economic conditions. As a result of their initiatives, women have felt empowered and financially independent. Similar examples of these stories will contribute to the social welfare of not only women but also all society members in Turkey.

Chapter 56
Crowdsourcing in Local Public Administration:
Importance of Online Platforms

Kalsoom BeBe Sumra
Huahong University of Science & Technology, China & COMSATS Institute of Information Technology, Pakistan

Wang Bing
Huazhong University of Science and Technology, China

ABSTRACT

Social networks have become very popular online sources of participation in crowdsourcing. This article examines the antecedents of user participation in crowdsourcing and importance of online community involvement in local public administration. Based on data collected from local public administrators and local public through survey, the results produce evidence that importance of online platforms in crowdsourcing can have a consistent impact on services delivery system in local public administration and importance of online open sources have significantly higher level in crowdsourcing on the whole, while importance of social media have significantly lower level overall. The paper contributes with potential implications and recommendations for local public management to achieve effective services delivery in developing countries through crowdsourced work. The present study is the first study that not only shows the effect of online platforms in local public administration, but also analyses the antecedents of crowdsourcing for participation (knowledge sharing, consultation, innovative ideation and reporting).

INTRODUCTION

Scholars and practitioners have long regaled the possibility that 'engage the crowd' may have potential to revitalize public administration in improving the quality of public services delivery in local public administration. The term 'crowdsourcing' first emerged in print in Howe's June 2006 article in Weired magazine and in complex societal issues, local public administration can play important role through

crowdsourcing to improve public policies and services (Benkler, 2006; Bertot, Jaeger & Hansen, 2012; Johnston & Hansen, 2012;UN, 2008;Howe, 2006; Peters, 2010). Today, scholars seem to agree that crowdsourcing is used to create innovative and modernized ideas into practices of business and management (Borins, 2008; Pollitt & Bouckaert, 2004; von Hippel, 2005; Brabham, 2008). Crowdsourcing is an online engagement of crowd as public participation tool through social networking sites, mobile apps, blogs, mapping soft wares and so on (Brabham, 2013a; Duval, 2010; World Public Sector Report, 2003; Benkler, 2006). New public management reforms in the last two decades have considered citizens as one of the key elements in transforming local public administration into public service providers with a strong emphasis on participation of citizens (Svara, 2001; Hood, 1991; Moore & Moore, 2005; Bowler & Donovan, 2000). Contemporary scholarly research in crowdsourcing has been done for profit companies and business production models but crowdsourcing has been gradually gaining traction in government functions as tool for bold ideas and innovative practices.

Although crowdsourcing is often considered to be a general concept with open sources, open innovation, an individual ability to contribute but important distinction of crowdsourcing is that it entails a mix of open process in involving online communities to solve problems for public management (Chesbrough, 2006; Brabham, 2013b; Messina, 2012; Takemoto, 2010). It can be argued that collective creativity and innovation are very influential because they produce constructive feedback on services for improving the quality of outcomes (Libert, 2010; Creighton, 2005; Burby, 2003). This suggests that citizens directly contribute collective technical and managerial suggestions through social platforms. In addition, crowdsourcing may play an important role in interaction between public managers and the public communities in which citizens contribute more resources in the form of time, expertise and efforts (Horne & Shirley, 2009; Bertot et al. 2010a; Nam, 2011). Clearly scholars need to identify the impact of online communities' initiatives for modern, innovative ideas for best practices and appropriate applications (Donahue, 2004).

Crowdsourcing is not only applied in developed countries but it also have strong impact in developing countries in various contexts such as in natural disastrous management in Pakistan, in Mali and in Uganda in market price information sharing, and in tracking human rights in Kenya (World Bank, 2014). This study is based on assumption that crowdsourcing may have effective role in local public administration for public services delivery system in perceptions of local officials and citizens in context of innovative, modernized management practices. Authors examine this proposition by studying two samples of local officials and citizens in Pakistan. Thus objective of this study is to know the importance of online platforms for crowdsourcing in local public administration, which include antecedents of crowdsourcing (knowledge sharing, consultation, innovative ideation and reporting) for online community user participation.

The structure of the article is as follows. First review the literature on crowdsourcing creativities. Second, innovative communication platforms are explored. Third, theoretical framework perspectives are identified to know the importance of crowdsourcing (knowledge sharing, consultation, innovative ideation and reporting) on public services delivery system in local public administration. Fourth the data and methods for the study are described. Then statistical analysis and results are presented. Finally authors discuss the implications of our findings and some recommendations for developing countries.

LITERATURE REVIEW

Several scholars have pointed out the potential influence of crowdsourcing in industrial and business sector through online communities activities, but only few have investigated crowdsourcing in public administration (Brito, 2008; Brabham, 2013a, 2013b, 2013c; Hilgers & Christoph, 2010; Giordano et al. 2011). Literature reviews on open sources, crowd innovative ideas and social media platforms in crowdsourcing show that there is a distinction among online communities (Alexandra & Schedler, 2012; Sørensen and Torfing, 2011; Brabham, 2008; Chesbrough, 2003; Dunleavy et al. 2005). Our review of the literature finds that most empirical studies investigate either participation of crowd in social networks from social influence perspective or online co-creation in public industrial firms (Lakhani & von Hippel, 2003; Nambisan & Baron, 2009; von Hippel, 2005; Brabham, 2008; Lakhani et al, 2007; Prahalad and Ramaswamy, 2004; Auh et al. 2007; Sia, 2009). Past research on incorporation of ICTs into the public sector e-governance (S. Jones et al. 2007; Bertot et al. 2010b; Bannister & Connolly, 2012; Dada, 2006) and public sector collaborative innovation during the last few years emphasized the digitalization of administrative processes to improve quality and showed the path towards online public crowdsourcing inclusion in government and management practices (Linders &Wilson, 2011; Linders, 2012; Giordano et al. 2011; Orange et al, 2007; Kuzma, 2010; Brabham, 2013a; Sørensen and Torfing, 2011; Alexandra & Schedler, 2012; Hartley, 2005). There is, however, a general lack of research on crowdsourcing in public services delivery. Studies that look at perceptions of local level on innovative ideas in public services delivery is missing. Some studies put concentration on public participation through e-government, contracting and present some empirical evidence for contribution of communities like volunteering, union members, political party affiliation and religion affiliations (Brabham, 2013c; Toral et al., 2009; Hilgers & Christoph, 2010). Nevertheless, the samples investigated in these studies drawn on perceptions of crowdsourcing. There are no comparative studies as far as authors can determine. This study presents crowdsourcing as a consequence of four antecedents of online user participation (knowledge sharing, consultation, innovative ideation and reporting).

THEORY AND PROPOSITIONS

Online Platforms in Crowdsourcing (Knowledge Sharing, Consultation, Innovative Ideation and Reporting)

Online platforms consisting of social media and online sources has been emerged in interaction with communities and in innovation processes using open source software (Kozinets et al., 2008) and this advancement has led to increase interest and the importance of knowledge exchange. With the advent of web 2.0 technologies has triggered the rapid development of online community and several social platforms like Facebook, twitter, blogs and so on having global online communities on the largest scale. The advancement of technologies can be leveraged to convert the way governments provide online information and services and argues that via internet more participation of citizens can help government in policy-making (Freeman & Loo, 2009; Romsdahl 2005). Social groups and networks through open source government use these social platforms to educate others about political issues in their communities and local governments can use social media sites to procure resources and local knowledge (Danis et al. 2009; Cole, 2009).

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Authors ground our assumption of online platforms importance in crowdsourcing through citizen involvement. The concept of "network" has become an important theoretical framework based on multiple schools of thought or "families of theories" (Monge & Contractor, 2003). These complex networks are not only relatively common but are very important for supporting of government services providing network approaches to management. The historical background of the roots of network theory in public administration is traced as far back as the 1930s from anthropology and sociology (Berry et al. 2004).

Network theory provides further insights into theories of self-interest, theories of social exchange or dependency, theories of mutual or collective interest and cognitive theories. Such network exchanges allow individuals to engage in a variety of support to governments through videos or other media and informational works on social sites. Networks coordination for public services delivery are to provide services at a desired level of the satisfaction of common public and local governments can use social sites and online communication networks to efficiently manage public service delivery (Savas 2000; Kuzma, 2010). Several studies showed the online communities influential impact on public organizations and government agencies can use online communities to bring new information to better decisions and resource allocation (Mergel et al. 2009; Sutton et al. 2007; Cole, 2009; Cope & Elwood, 2009).

Based on the above reviewed discussion, the following proposition is formulated.

Proposition 1: Online platforms (open sources and social media) are highly important in crowdsourcing for local public administration.

The Importance of Online Open Sources in Crowdsourcing

Public crowdsourcing (knowledge sharing, consultation, innovative ideation and reporting) can be seen as a logical extension of the online public participation in problem solving in government projects and planning (Creighton, 2005; Fiskaa 2005). Through open call for citizen crowdsourcing can result higher quality of input from a community to solve a given problem in public administration and open call for participation enables the organization to overcome the local search bias (Hilgers & Christoph, 2010). The increasing challenges for public administration have increased the need to implement more creativity and there is need to enhance the ability of public administrations to generate, introduce and implement innovative ideas more creatively (Alexandra & Schedler, 2012). Several examples of innovate ideas and practical work proved the success of crowdsourcing in public administration such as future Melbourne program, FixMyStreet.com a British website. Many developing countries assisted by international donors has taken initiative in public crowdsourcing as in India, Brazil, Argentina, Philippines, Pakistan and in many African countries through mobile apps and other online social platforms (World Bank, 2014).

Innovative ideas play a key role in terms of renewing and shaping the resources available to organizations and promising reforms in public administration (Brabham, 2013a). The institutional adoption of government-to-citizen the online interactivity of local public administration opens up a powerful new problem-solving mechanism that invites everyday citizens to use their skills and expertise to solve local challenges with local indigenous knowledge (Linders, 2012). In this way, local public offices can get innovative solutions and these online platforms create more frequent collaboration between government and citizens. The professionals from academia and industry can identify operational deficiencies in local public services delivery and the way outs for improvement (Brabham, 2013a).

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Based on the above discussion, another proposition is formulated, which frames our main question.

Proposition 2: Online open sources are a potential proxy for crowdsourcing in local public administration.

THE STUDY SETTING

Pakistan is a South Asian developing country that became an independent state in 1947 after liberation from British in the Sub-continent. It is a densely fifth populated country with more than 180 million people whose significant proportion of population either lives in extreme poverty or is vulnerable to falling into poverty due to any adverse natural or idiosyncratic shock. Internet technology has been available since the early 1990s and information and communication technology (ICT) is one of the fastest growing industries in the country. In 2012, internet users' figures had grown to 10.0% population and currently 27th in terms of global internet usage. The rapid increase of smartphones has increased mobile Internet users to increase and according to statistics there are now 30 million internet users in Pakistan, 15 million browse the web using their mobile phone roughly. Social networking and chatting is found to be the number one activity and social media penetration is 4%.

Since its independence, Pakistan cycled through a number of politicians who mostly were tarnished by corruption and inefficiency and still corruption remains a substantial obstacle where it is still perceived to be widespread and systemic. Public administration is also suffering in lack of governance and the ranges of corrupt behaviors are the challenges to reform public policies through accountable and transparent mechanism. A large proportion of the population is not satisfied with services provided by local governments and there is need of new innovative ideas to face resources constraint challenges. Online community participation will be significant and public ideas can shape the attitudes and behaviors of the majority of the population. Thus, governments can use these social sites to reach these key influential individuals and experts to solve problems. So this study in context of Pakistan is suitable where there is need of involving a variety of ideas and perspectives to increase the likelihood that local needs and priorities are successfully met. This study shows the importance of innovative ideas from public through crowdsourcing in improving services delivery in local public administration in Pakistan.

HYPOTHESES

Recognizing the benefits of public participation in backdrop of the peculiarities outlined above, authors hypothesize that local public officials may have higher perceptions on importance of crowd ideas in public administration in services delivery system. Several studies explored that all expert stakeholders appreciate public participation however public officials who seem disagree on role of citizens considering them under less capacities (Besley & Nisbet, 2013; Brossard et al., 2009). Mediated information through online platforms is the most likely important in which services providers get information about public attitudes. On the one hand, open source platforms can provide users with extensive opportunities to infer productive discussions and conflicting partisan stances on services delivery situations (Freeman & Loo, 2009; Romsdahl 2005; Alexandra & Schedler, 2012). Online platforms can provide an excellent forum for debates and discussions of government policies and public can express their opinions through blog posts.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

A second explanation as to why crowdsourcing is hypothesized to be higher in public officials is based on the basis of potential capacity in experts among citizens who can better suggest to government. Local public administration is not well equipped with indigenous knowledge and resources constraints are main blockage. Some experiences in disastrous management, sms complain system for corrupted acts and other smaller scale crowdsourcing initiatives proved potential of public expertise in innovative solutions of problems (Sania et al., 2010; Pak Report, 2010; Michelle, 2015).

Based on the above mentioned arguments, the following hypotheses are formulated:

H1: Perceptions of local officials on importance of online platforms (open sources and social media) in crowdsourcing will have higher levels than citizens.

H2: Perceptions of respondents on importance of online open sources in crowdsourcing will have higher levels than social media.

RESEARCH METHODOLOGY

Data

The data for this study comes from two surveys. First literate citizens of six urban municipalities were surveyed in August/September, 2014 in two provinces of Pakistan. The survey utilized purposive sampling technique to enable the researchers to select participants based on their ability to contribute (Corbin & Strauss, 2008). A total of 2000 citizens were contacted in six municipalities. These unit samples were then examined to ensure that they were representative in terms of socio-demographic characteristics (gender, age, education and salary class). Thus, the survey tried to reduce the possibility of under- or over representation of population from each municipality. The online and paper-and-pencil survey yielded 1200 responses (overall response rate of 60%).

Second, data was collected at the municipal level of public organizations through online and paper-and-pencil survey in August/September, 2014. This survey also included the same six municipalities from two provinces of Pakistan as for first sample. A total of 180 local officials were contacted and 150 returned useable responses in paper and pencil survey for a response rate of 83%. The survey questionnaire was given to local public administrators working in services organizations (water, sanitation, health, fire, police, revenues, education and so forth). To provide anonymity, the purpose of the study was explained by researchers and participants were not identified by name or designations to maintain confidentiality. The survey questionnaire items were explained by researchers to guide respondents apart from main constructs The socio-demographic characteristics of the sample were on the same pattern as for first sample and purposive sample was used to have better input.

Over all, approximately 40% of citizens range within 36 to 45 years of age and 30% range within 46 to 60 years. Among local public administrators, 45% range within 36 to 45 and 35% range within 25 to 35 years of age. The citizens' sample contains 61% graduate or higher education respondents and local officials sample contains 50% undergraduate and 48% graduate participants. Data from 1200 citizens shows that 36% of population earn 100-200 USD per month, 25% earn 200-300 USD per month and 20% earn 300-400 USD per month while 32% of local officials are having salary within 200-300 USD and 54% are having 300-400 USD per month which over all indicates in both samples lower middle class in majority.

Undergraduate	300	25	75	50
Graduate or Higher Education	735	61.25	72	48
Income Level				
< 60 USD per month	15	1.25	0	0
60 to 100 USD per month	201	16.75	0	0
100 to 200 USD per month	435	36.25	20	13.3
200 to 300 USD per month	300	25	49	32.7
300 to 400 USD per month	249	20.75	81	54
Note. “Literate citizens here stand for those who at least have secondary school certificate and know internet usage.				

These data sets can be compared to good effect. Both data sets contain same measures. Table 1 reports on the distribution of demographic variables in respective data sets. Comparatively, local officials sample has more men; a slightly younger and higher mean salary.

Measures and Methods

The survey questionnaire was containing of three parts; demographic variables, importance of online open sources in crowdsourcing (knowledge sharing, consultation, innovative ideation and reporting) and importance of social media in crowdsourcing (knowledge sharing, consultation, innovative ideation and reporting). Our dependent variable, crowdsourcing (CrwS), is measured including four antecedents in framework: knowledge sharing (Lüthje et al, 2005), consultation (Howe, 2008), innovative ideation (von Hippel, 2005), and reporting (Brabham, 2013a). A factor analysis did not detect the same four antecedents in our sample so measurement items were prepared by researchers under each dimension. The authors included three items to measure knowledge sharing (KnS), three items for consultation (CON),

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

three items for innovative ideation (INI), and two items for reporting (REP). Respondents scored the items on a five-point Likert scale ranging from strongly disagree to strongly agree. Reliability of scales is initially assessed via Cronbach alpha coefficient and according to social scientists Cronbach alpha should be over 0.7 for a scale to be considered reliable ($CrwS_{Citz}$= 0.83; $CrwS_{Loff}$ = 0.76). For citizen sample, reliability coefficients for all constructs were above the threshold (KnS = 0.77, CON = 0.86, INI = 0.87, REP = 0.70) and for the local officials sample reliability coefficients are within accepted range (KnS = 0.88, CON = 0.76, INI = 0.83, REP = 0.67).

Importance of online platforms is measured via online open sources and social media and a two-sample *t* test was used to analyze the mean differences in crowdsourcing and its antecedents in the online open sources/social media. Ten regression models were then estimated five for each data sets. In each model, a dependent variable (aggregated measure of CrwS or one of its four antecedents) was regressed on a very similar set of independent variables. Variables values and errors are within the parameters of normality in these models in regression analysis.

The control variables gender, age and income group were used in analysis of both samples. Education is also used as control variable in both samples, se authors expect that this variable will be positively correlated with CrwS, or at least with the consultation dimension.

RESULTS

Univariate Analysis

First, authors compare the means of crowdsourcing and its four antecedents across the two proportions online open sources and social media and in both data sets. In Table 2, it shows two main effects. First in the citizens sample, respondents in importance of online open sources score higher in crowdsourcing construct as a whole and in all four antecedents and respondents in importance of social media score lower overall. At the local official's level, the means for respondents in importance of online open sources is higher overall and in all four antecedents of crowdsourcing. Second, all differences are significant at the level of .001 in both samples.

Overall, this comparison in both data sets in online open sources and social media provides initial evidence for the hypothesized level of crowdsourcing through open online sources and lower level of crowdsourcing through social media.

Multivariate Analysis

To assess the importance of online platforms in crowdsourcing for public administration in public services delivery system, the regression analysis in ten models is run. The regression statistics show (Table 3, Table 4) that adjusted R^2 is between 4% and 17%. The relationship between most control variables and crowdsourcing are consistent in way as men have significantly higher levels of crowdsourcing, significantly higher levels of education and consultation, significantly lower levels of innovative ideation and significantly higher levels of reporting only at local official level than women. Age is significantly correlated with crowdsourcing and its four dimensions, except for education at local official level and

age is having a non-significant relationship with reporting in the local official sample. Income level is significantly correlated with higher levels of crowdsourcing, knowledge source, and innovative ideation in citizens' sample. It is notable that education is positively related to knowledge source and innovative ideation, but negatively correlated with reporting in the citizen data set. In the local official data set, the effects are stronger with the aggregate measure of crowdsourcing, knowledge source and innovative ideation.

Overall authors find that age has a strong positive effect on crowdsourcing in both samples. This relationship contains on three-fourths of the regression on crowdsourcing's dimensions. The variable of greatest interest in this study is the dummy variable for online open sources and social media, which represent online platforms importance. The online sources variable was coded 0 and 1 for social media. The online sources variable shows a significant positive correlation with crowdsourcing and all of its dimensions at citizen level. In other words, citizens in online sources report significantly higher levels of crowdsourcing. Results of local official data analysis generally support these findings. There is only one exception; authors found a significantly negative correlation between the online open sources and innovative ideation. However, crowdsourcing at the aggregate level and its other three dimensions are positively related to online open sources.

The results show high consistency for both samples and for online open sources which supports our second proposition. Authors note that this proxy variable for online platforms shows a stronger effect than control variables. Overall, reporting also presents results on different patterns which indicate that reporting may be considerably different type of dimension when compared with other dimensions of crowdsourcing in results.

Overall, results indicate that online open sources are positively related to crowdsourcing and most of its antecedents and local public officials perceptions are higher on importance of online open platforms

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

(online sources and social media), which provide strong support for our both hypotheses. At some points, the results are not uniform as with the dimension of reporting which works differently and seem not fit to the part of crowdsourcing. However these findings will be discussed further.

Discussion, Practical Implications

The results show that both online open sources and social media have significant importance in crowdsourcing in local public administration. In addition, online open sources strongly impact on participation intention and predict online communities' importance in local public administration (Kozinets et al., 2008). As noted earlier the results of this study are consistent with most other studies in terms of online sources importance in productive contribution (Hilgers & Christoph, 2010; Alexandra & Schedler, 2012; Chesbrough, 2003; Lakhani & von Hippel, 2003; von Hippel, 2005; Brabham, 2008). To explain first proposition of this study, online communities and platforms are highly important antecedents of crowdsourcing for local public services organizations, the results highlights the importance of online platforms in crowdsourcing. From the perspective of online communities, the results support that communities can increase the magnitude of the input and it also shows indication to improve their involvement in local issues and challenges.

To enlighten second proposition of this study, online open sources are a potential proxy for crowdsourcing in local public services delivery system. The implementation of crowdsourcing practices through online open sources provides the opportunities to public managers to increase the involvement of citizens. Effective implementation of crowdsourcing practices suggests that citizens with high degree of involvement in services delivery are the prime partners for solutions.

This study adds confidence to our findings that online platforms are important for crowdsourcing through community participation. More importantly, this study has produced convincing empirical evidence showing that crowdsourcing for both local officials and citizens are of high importance. Furthermore this study supports the increasing trend of citizen sourcing in other countries. The social media is little negatively correlated with both samples which show that online social media can increase knowledge and can be source of information but it cannot be solely taken for productive and innovative solutions. Online specific open sources for local public problems can have more productive and innovative ideas for solution of problems. Our results also raise questions about the impact of education as a possible predicator in crowdsourcing.

These findings have several implications for citizen involvement in the context of services delivery in local public administration. It appears that citizens are the best source of selecting ideas that score high in terms of importance of crowdsourcing and that they are willing to engage in this process on the platform for crowdsourced work. However, in terms of reporting, crowdsourcing antecedent does not seem to be the way to identify monitoring tool. For this purpose, special online software for reporting of citizens seems to be more appropriate, a more selective form of idea generation through crowdsourcing. In the case of developing countries, this will be possible in the future as citizens more potential contributor starting from the user base that participated in the crowdsourcing local projects. The ideas generated by experts' citizens can be selected by means of an open call for selective crowdsourcing.

Beyond only getting ideas or comments from citizens, crowdsourcing can also serve as a tool for monitoring and evaluation in local public services delivery to implement a direct feedback from citizens. Crowdsourcing has the advantage of being open to all citizens with access to a mobile phone through local government apps. Social media's empowerment may well force a reinterpretation of the role of public

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

management and with its responsibilities of the citizen (O'Reilly, 2010). This source of citizen ideation to public administration paradigm in way of New Public Management (NPM) seeks to adopt citizens as responsive tool and technological advancement changed the role of public administration into more responsive. (Nam, 2011; Vigoda, 2002). The newly empowered citizen sourcing strategists have begun to propose a number of benefits to public managers that seek to take greater advantage of online sources.

From a managerial perspective, our results suggest that public managers need to concern with online platforms including social media and open sources in order to collect ideas from online communities to make public administration more efficient. They cannot just focus on general feedback of public such as perceived availability of services and neglect the role crowdsourcing because as a member of community, individual user may also contribute better with expertise. Knowledge sharing, ideation and consultation are the best representation of crowdsourcing. Crowdsourcing is a multiple-dimensional concept, which includes online problem solving, designing and knowledge intensive networks. Public administrators can enhance system and information quality, organize offline activities and build public trust to improve services delivery. The effect of online platforms through crowdsourcing and participation of online communities are emerging important component of public organizations. Public managers need to launch online programs, thus enabling users to internalize their expertise into public services.

Limitations and Future Research

There are some limitations within this research. First, authors conducted this research in Pakistan, which features a different setup but mostly similar to other developing countries. Second, authors selected literate citizens as our sample and only six municipalities may not represent the whole population of local public administrators. Thus, with such small sample the findings are guiding points of officials. Experts only can also be taken as main group of professional contribution because all citizens may give exact input for benefits of crowdsourcing. Last, authors mainly conducted a cross-sectional study. Thus a longitudinal research may provide more insights on effect of online platforms in crowdsourcing.

Beyond our study further research is needed to understand the productivity of crowdsourcing and, indeed, social media in general for public relationship management. Research might study also the effect of observed behavior of respondents on online platforms and also the impact of new technological possibilities like mobile application (Kleijnen et al., 2009) as well as the limitations of online experiences (Picard, 2010). Additionally, further study is needed for the effects of negative effects of social media platforms. It might also be interesting and important to look for best practices for managing negative use of social media platforms.

CONCLUSION

This study has investigated the importance of online platforms in crowdsourcing. Authors began by arguing that crowdsourcing can play an important role between public managers and citizens. Moreover, the internet, communications and social networking in public sector services organizations influence innovation processes in management, which are important elements in the formation of crowdsourcing. In the empirical analysis, authors examined the importance of online platforms for crowdsourcing in public administration, which shows the empowerment movement of external contribution by citizens. Our findings produce evidence that importance of online platforms in crowdsourcing can have a consistent

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

impact on services delivery system in local public administration and importance of online open sources have significantly higher level in crowdsourcing on the whole, while importance of social media have significantly lower level overall. In this article, authors discussed the importance of crowdsourcing in the public administration, with its special setting of citizen participation.

The evidence of crowdsourcing importance analysis has also helped to identify some of the important outcomes of crowdsourcing and crowdsourcing requires significant contributions by citizens through online sources. In the transition from citizens as potential partners in productive contribution, the public has to play a far more active role in the functioning of their government. In this new era, government has to provide the platforms and access to citizens and communities to contribute more.

Chapter 57
The Electronic Obsolescence as an Opportunity for Social Entrepreneurship:
The Case of EEE in Manizales, Colombia

Diego Lopez Cardona
Universidad de Manizales, Colombia

Rocío del S. Tabares Hoyos
Universidad de Manizales, Colombia

ABSTRACT

The chapter contains the concepts of Social Entrepreneurship, Planned and Perceived Obsolescence, Corporate Social Responsibility, the legal framework for Electrical and Electronic Equipment (EEE) waste, and Reverse Logistics, as theoretical support from different authors. Applied to Manizales, Colombia, the study was conducted with a quantitative and qualitative approach. The information was collected through surveys and interviews with 26 entrepreneurs and 331 households' consumers to know the type of appliances, how they buy, change and use them, and the chain of intermediaries. With planned and perceived obsolescence, products lose their life in a short time, are dumped as Waste of Electrical and Electronic Equipment (WEEE), and collected by people of low educational and economic level that survive in precarious conditions. Due to these results and conclusions, we offer in the chapter the opportunity to generate proposals for their inclusion and social development.

1. INTRODUCTION

In Colombia, due to the few public policies related to environmental management, and specifically the control of manufacturing, distribution and sales of electrical and electronic equipment (EEE), there have been implementing market strategies concerning to Planned and Perceived Obsolescence[1] (Valquíria and Bonifacio, 2013) that reduce the time of use by consumers and therefore the acceleration occurs in its abandonment as an useful object. Having completed its life cycle, the Waste of Electrical and Electronic Equipment (WEEE), the vast majority are thrown in the trash at the mercy of the collector car

where they are mixed with other organic, building, metalworking wastes, polluting the air, water and soil, imposing great challenges for society and the authorities that manage and regulate, given the large volume of waste of EEE, which mostly get tossed.

This chapter is intended to address from several authors the concepts of social entrepreneurship as an opportunity for social inclusion of those who collect, recycle and reuse products. The problem lies in the few opportunities offered by the agents involved in the collection process, and belonging to a parasitic intermediation chain, using people with low educational level, with few job opportunities and many social problems, being most individuals who are not associated or included in a program of social inclusion. Similarly the concepts of planned and perceived obsolescence as trading strategies that result in businesses and industries engaged in selling products in different versions to force change, so that the user feels an unconsciously need to have analyzed this product that every day gets older in relation to new products launched on the market.

Selective harvesting strategies and environmental management of waste computers and-or peripherals, as well as EEE just beginning to be regulated, in order to prevent and control environmental degradation. These efforts simply suggest to the producers and trading companies, to establish collection programs that produce few results, at least in the city of Manizales, as are programs that are barely in their implementation and dissemination. In the city it has a collection logistics based on routes established by the company that has a monopoly of management of waste. Each tour does not only the vehicle with company employees, but also people of low educational level, seeking, as the carriage advances, select different types of waste, such as plastics, cardboard, heavy metals and some high-volume WEEE and then classify its parts. These informal workers take them to a collection center, according to their specialty. There are intermediaries who buy according to the law of supply and demand. This intermediary is responsible to sell the volume of raw material to companies.

Therefore, based on the potential of social entrepreneurship as an opportunity to form working groups with people who collect WEEE and training them in the extraction of precious metals which are manufactured, we can establish a project of social innovation grouping this community with low level of education, low income, health conditions and deplorable housing, and we can step in improving their quality of life. WEEE recycling becomes an opportunity for social entrepreneurship.

The case study presented responds to an inventory of consumption of electrical and electronic equipment (EEE) in the city of Manizales. It was made from conducting surveys to recycling companies (26) and consumers (331), which allowed knowing the type of EEE used in homes, the life, the way of acquisition, the frequency with which they change the reasons for that change and the final repository once it has completed its life cycle.

With the results we hope to contribute with alternative solutions to the problem of the current economic system of production that does not conform at all to harmony and balance that nature requires. Therefore, to counter planned obsolescence, the key will be the commitment and responsibility with which the laws of manufacture of each product are met, of course, without neglecting corporate growth by implementing new business models to rectify this phenomenon.

2. CONCEPTS OF SOCIAL ENTREPRENEURSHIP

One of the major purposes of social entrepreneurship is the social inclusion of vulnerable groups into the economic dynamics that through the creation of value are able to generate opportunities for social

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

change. It draws attention to the importance of social entrepreneurship as a solution to many global crises that occur daily. For Yunus (2010), Nobel Peace Prize in 2006, "the financial crisis is just one of the many crises that threaten mankind. We also have global food crisis, energy crisis, environmental crisis, health care and continued economic and social crisis of massive poverty." According to Yunus, social business is an initiative that contributes to the development not only of opportunities for citizen participation, but also processes of economic social inclusion, employment and contributes to overcome welfarism and poverty.

Social entrepreneurship to Roberts and Woods (2005, p. 49), is the construction, evaluation and pursuit of opportunities for transformative social change conducted by visionary individuals, passionately dedicated. Emphasize that social entrepreneurship is key aspects such as social opportunities that are not discovered, but constructed due to the generation of ideas. Taking into account the characteristics of entrepreneurs, Austin, Stevenson and Wei-Skillern define it as an innovative activity, creating social value, which occurs within and across sectors, non-profit, business and government (Austin, Stevenson & Wei-Skillern, 2006), which implied that social entrepreneurship and business entrepreneurship coexist, go hand in hand.

All entrepreneurial process involves a balance of social behavior and economic behavior, which in turn, allows the generation of social and economic value "(Chell, 2007, p. 17) (Guzman and Trujillo, 2008).

In an environment characterized by the values of "paradigm of competition" individuals who have the capacity of initiative, creativity and be proactive to overcome the usual risk aversion project involves all business need. Thus, to meet the challenges and the economic model of globalization required high entrepreneurial capacity in any region (Guzman and Santos 2008; Santos, 2004), (Santos, Barroso and Guzman, 2013).

Yunus (2006) classifies social entrepreneurs into two types: social entrepreneurs based on market and social entrepreneurs not based on the market, the difference lies in their pursuit of profit, i.e., that social enterprises not based on the market are those that pursue social purposes (associations, foundations), and based on the market are those that pursue social purposes but also business profits (cooperatives, labor companies). There is evidence to recognize the difference between the social entrepreneur and the rest of the business.

The Red Senk[2] defines social entrepreneurship as actions performed with the explicit purpose of creating social value. Performing actions from purely philanthropic, to business projects aimed at improving the quality of life of the people, and at the same time, the economic performance of companies. These actions can be carried out by an organized community or by a company, ie the need to create value ignores the subject to do so. In other words, the need for economic performance goes hand in hand with the aim of improving the quality of life of its members, two elements which must stay together in theory and in practice (De Pablo, 2005).

Social enterprise is also defined as one whose purpose is to facilitate the development of the community looking for community development, as one who is in charge of creating not-for-profit, driven by social mission, exploring and recognizing opportunities to create social value, while the primary objective of economic value is taken into account as a product that guarantees sustainability (Seelosa, 2005). Different authors agree three fundamental characteristics: for the development of social enterprises community service, focus on the solution of a problem, and a generator of change. At the base of the pyramid it is where social enterprise is its scope, with the central point all stakeholders, including several (Prahalad, 2010), with the creation of cooperative enterprises, looking for traits that have led to

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

undertake the so-called collective entrepreneurs, you can define the cooperative entrepreneurship as a collective entrepreneurship in which converge most of the attributes of the entrepreneur (Mozas, 2013).

There is another feature that is the development of goods and services. This feature allows the social enterprise to become: an enterprise that is service-oriented to the community that seeks to solve territorial problems and allows the generation of change in the company impacting territory, taking into account its focus on sustainability, which will allow an impact for a longer period of time. Social enterprises are effective to the extent that there is a fundamental pillar of leadership and an adequate strategy to the fair distribution of resources. The market of social entrepreneurship is the world's population with its various challenges and needs, taking on standard concepts such as basic education, gender equality, reducing child mortality, combating diseases, environmental sustainability, and improving the quality of life, among others (Alemán y Coronado, 2014, p. 6).

Leadership in Social Entrepreneurship is defined as "the ability to make changes and achieve outstanding results." It is necessary to establish mechanisms for quality control of the production as well as pride in the work product, the value of creativity, and honest relationship with the user, seeking fair terms of trade and the value of cooperation. They need to develop information systems that allow making proper decisions on economic activity, as well as the inclusion of entrepreneurship in the community and incorporating them into various networks (Céspedes, 2009, p. 6).

The evolution of the world economy and the existence of an overwhelming inequality and poverty leave important lessons in regard to the generation of wealth, where perhaps the most important has to do with the challenge of generating greater social mobility within societies. And it is here where the project becomes a powerful tool for this purpose, since the undertaking is, by far, the most social and economic mobility creates. Andres Pumarino (2011) (Wompner, 2012, p. 4). The venture can be transformed into a platform for social mobility.

Therefore it is necessary to give it the prominence it deserves to entrepreneurial activity, as the best tools for economic and social development of the countries, promoting their initiative, educating for entrepreneurship and supporting management with key actors of social mobility and the fight against poverty.

2.1 Training in Social Entrepreneurship

Training in social entrepreneurship is keys to implement values, social models and techniques to enable the creation of wealth; avoid and ignore the political opportunism. Among the results expected with education in social entrepreneurship is the increase in jobs that allow developing a local economy, and even regional, producing a virtuous circle between an educational system based on social entrepreneurship and students with vocational entrepreneurship. In fact, these virtuous circles allow you to create human capacities to produce and use knowledge in a changing, challenging and competitive environment, to meet the economic, industrial, organizational, and social needs of people, also encouraging future generations (Silakalne-Araja and Arajs, 2012).

Social entrepreneurship based on education and taking practical experience and theoretical models, improves the culture of innovation (Zain et al, 2013), the responsibility of persons involved and the development of skills and knowledge (Dejaeghere, 2013); including the creation and use of courses and seminars, it has become an examiner factor for business performance (Daghbashyan and Harsman, 2014), ensuring good coverage of the jobs, sustainability and development of the local and regional

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

economy (Li and Zuo, 2013), improving academic performance (Johansen, 2014), and self-employment self-esteem (Yin and Li, 2013).

Are key factors in creating a virtuous cycle of creativity and innovation (Sudharson, Ali and Sermakani, 2012), entrepreneurship, incentives (Egbe-Okpenge and Igbo, 2012), economic growth, productivity, creating labor (Ndou and Del Vecchio, 2013), tacit and explicit knowledge, technology transfer (Spulber, 2012), are key to promoting social entrepreneurship. This is taken into account and experience is gained.

In summary and according to several authors it is necessary and important to encourage and promote the implementation of all the conditions conducive to social entrepreneurship, because they are a viable solution to overcome difficult situations in social, economic and environmental alternative.

If companies want to succeed, they must adapt to difficult cultural environments (Alam et al, 2010), manage a good public-private partnership based on solidarity, social networks, joint ventures, innovation and marketing (Racic and Viduka, 2013), and accelerate economic growth (Grundey et al, 2008; Kayasan, 2011). Increase competitiveness with the participation of other innovative companies (Grundey et al, 2008). All these activities are more profitable when those companies that encourage social entrepreneurship and which also pursue a social purpose, a business method, inclusive ownership, governance stakeholders, fair compensation and reasonable return on investments also benefit, social and environmental responsibility, transparency and protection of assets.

3. CONCEPTS OF PERCEIVED AND PROGRAMMED OBSOLESCENCE

The problem of the consumer society of CSR yet practiced in full is that "under the principle of profitability is still no technology to maintain a viable rate of profit for the owners of the means of production" (Mahecha, F. and Zambrano, C. 2013), thus ending excessive and devoid of ethical business practices is becoming increasingly difficult, because companies have the basic idea that what matters is not that their products last, but that they can be sold.

Since the early twentieth century products that have a limited life, for example manufactured bulbs (Guerrero, 2012) formed a Phoebus, who was called officially but never existed, but through documents it was showed how that industry agreed to limit the lifetime of the products.

This model was then applied to the Second World War for all industries, regardless of ecological and environmental damage, only to dominate the consumer market, driving customers to throw the products away.

While these processes are maintained to sustain an economy of inequitable consumption, it will continue to produce unlimited amounts of low-quality products to be damaged in time, which will end up being sold in the third world countries, multinational landfills with considerable social and ecological impact, no matter how green we are when we recycle.

Using three basic instruments such as advertising, planned obsolescence and credit companies come to the perceived obsolescence where new followers of fashion products, become obsolete to those who have not used, almost forcing them to dump products still they serve for the sake of change model, or use products that others have. Most times these goods become social consumption, since they depend on the acceptance of the person in human groups, affecting social inclusion in the study, work and institutions.

These two types of obsolescence create a consumer society, social problems connecting to environmental consumption, emphasizing the need for a more sustainable and just world. These trends affirm what Victor Lebow, ideologist of this way of life, in 1955 said: "Our enormously productive economy

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

... ask that we make consumption our way of life, that we convert the buying and use of goods in a ritual to seek our spiritual satisfaction, our ego satisfaction, in consumption ... We need things consumed, burned up, replaced and discarded at an accelerated pace".

Contrary to the virtuous circle of nature, which does not produce waste, but waste that serve as nutrients for other organisms, product obsolescence designed to fail, seeking the benefit only manufacturers, which means that users are constantly buying given the change constant models that only have a different piece to the above but providing the same service, it is added to the effect of advertising that everything gets old in a short time, in addition to the current generation knows very little repair, reuse, replace. This acceleration of consumption depletes natural resources, wastes energy and produces a large volume of waste. In the company's waste products only generate short-lived waste.

The current economic model is more ideological than technical components; buying, selling and credit are facilitators that make obsolescence operate without major problems, that encourage mass production and the consumer society, forcing the buyer to keep pace posed the interests of producers.

Despite the great efforts made by environmental organizations to process or reuse of the waste generated by excess consumption, have created other organizations seeking to reuse of "electronic waste" materials recovery and replenishment parts, seeking to social responsibility is extended to the producer, trying to create an infrastructure for the disposal, storage, transportation and recycling of WEEE.

Social entrepreneurship arises as an opportunity to implement new business models where obsolescence should be seen as an opportunity to seek solutions to extend the life of products, creating new ventures.

In the city of Manizales, located in the center of Colombia, it was conducted the study on "planned and perceived obsolescence in Manizales appliances sector" (Lopez y Tabares, 2013) with the purpose of conducting technological inventory As for appliances, use, frequency of change are in the homes of the city and the deposit give industrial waste.

Although there are theories that help fight these obsolescence, as rethinking the engineering and production work and trying to make industry imitating nature, looking for raw materials to be organic so that when discarded become an energy source for other processes (Thackara, 2006, 89); from cradle to cradle ("cradle to cradle", McDonough and Braungart, 2005); and the theory of decline which seeks to break with the paradigm of infinite growth that does not fit in a world with exhaustible sources of raw materials, changing the logic of excess by reducing the footprint of waste, overproduction and overconsumption and have more time to produce other inexhaustible sources such as friendship or knowledge(Kumar research y Putnam,2008)(Krikke, Van Harten, y Schuur,1999).

If happiness depended on the level of consumption because of the high esteem that generates, today people should be supremely happy because they consume 26 times more than 70 years. Sharing the vision of Gandhi: "the world is big enough to meet everyone's needs but will always be too small for the greed of some" (Latouche and Harpages, 2010, p. 78). The effort is wasted because when it comes to protecting the environment always think about cutting, resign, be reduced (Genchev, 2009).

It is known that is increasingly shortens the life of the products consumed, a situation that is the kind analyzed as planned obsolescence, great marketing strategy that is generating serious consequences. Function (a product by technological innovation plays a better role than is currently on the market: three types of obsolescence are considered. From quality (in a premeditated manner, the (short) time a product is projected wear desirability (the product becomes obsolete in the consumer's mind because a small change of style leads to less desirable and have a good performance. In reality, according to Slade (2006), the product is "spent" in people's mind, and consumers are induced to associate the new with the best and the old with the worst. The design and appearance of things become very important and is what is

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

known as perceived obsolescence which makes the consumer uncomfortable when using a product that has become obsolete because the new style of the new models. (Valquíria y Bonifacio, 2013).

As Ruiz and Romero (2011) expressed, some decades ago the products were produced to be used for a long time and it was normal to think that the mechanical visited households to repair or maintain any item purchased, so that it would kept the same operability. Today things have changed; the useful life of each product purchased is becoming shorter. The reality reveals how society is wrapped by consumerism, a phenomenon that increasingly appropriates most of the present generation, which is stimulated by new inventions, innovations, modernization and different changes in production, which has led to generate a large collection of waste and garbage that destroy, in most cases, the natural resources essential for sustainability and human development (Contreras, Fraile and Silva, 2013, p. 29).

It seems contradictory to speak of environment and corporate social responsibility to a consumer society which has as its paradigm satisfy all needs and create new ones using various means to achieve this, such as advertising, credit facilities and of course, planned obsolescence. The planet has become a world full of products that every day are encouraged to be obtained through advertising, innovation and new and striking features in each device, so each individual is tempted to consume no matter the damage to the environment and the community. The commercials are the best tool that companies use to fan (and sometimes through false information), the irrational desire of people for the purchase, and the result is that people every day are buying only to improve their self-esteem or simply for the attention of other individuals. And the lack of awareness and responsibility make those purchase products without considering the consequences that it will have on the present and the future, because they are involved in a consumer world where items that are not needed are bought.

4. CONCEPTS OF CORPORATE SOCIAL RESPONSIBILITY

Following the devastating rise of consumerism, every day becomes more important the concept of Corporate Social Responsibility (CSR), and even more in Latin America, which became pantry raw material for large multinationals, with the complacency of governments in turn, required minimum in relation to CSR; They are wiping out the wild looking for supply sources, then flood the underdeveloped countries with appliances very short shelf life.

There are many definitions of CSR, but in the context of the issue of production of EEE, it is important to know the aspects that take into account companies in their manufacture, where what matters is: a) the parts of the apparatus, once they have served their useful life can be reused; b) that parts can be reassembled; c) which parts are biodegradable, d) what is the collection program those devices that are environmentally and socially dangerous, among others.

Keep in mind that the policies implemented in relation to CSR, culturally dependent of each country, particularly dependent on public policy and institutional development to be promoted in accordance with the interests of the nation; that is, the policy is different because it changes from country to country and from culture to culture (Vives and Peinado, 2011, p. 29). Thus, CSR practices must adapt to the environment in which it operates.

In developed countries there are strict practices for certain activities which require the companies to other countries that do not yet have the need to move, that is, how important is the development of the company and its tangible growth, ignoring the philosophy of CSR aims because that responsible practices are sustainable and contribute to the development of the company and society.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

4.1 Approaches to the Concept of CSR

To clarify the concept of CSR we must take into account the processes that led sustainable development in relation to the different understandings that have been taken from the theory. Initially the development was economic and was given in stages, with the idea of being easily assimilated by the other countries where the problem lay in the way of how to accelerate such assimilation. To make such development is required that the country produced capital goods (machinery and equipment) that would allow it to produce goods and services not only for subsistence but also for people to have entertainment and education, i.e., improve their quality of life . This forced the country to foreign investment considered necessary, given the lack of capital that stimulates the production of consumer goods, thereby establishing mandatory planning policy development, tax incentives, tariff, type of Instead, the credit with specific conditions, among others.

Then the concern shown by the nature of economic development associated to wonder if it was driven by a democracy or a dictatorship in order to run, leaving it clear that development was purely economic.

Given this, people and societies not only became traders but also in historical subjects who needed other elements, in addition to income, to survive and live in harmony with the environment; conditions such as health, education, cultural identity they did change the concept of CSR.

The vision of sustainable development including environment appears where development concepts to preserve for future generations at least the same conditions as these are included. Also it includes intergenerational equity, the definition of sustainability appearing as joint processes of environmental, economic and social dimension.

Governments, businesses and institutions working with prospects for sustainable development used as reference the triple bottom line (economic, social and environmental), to account for the way they operate.

4.2 Different Concepts of CSR

There have been different emphases to the concept of CSR according to the associated processes: - economic (ROI) - Legal (required obligations) - ethics (what society expects and there is no legal requirement) and - philanthropy (donations) (Carroll, 2006). Given this classification can be made such distinctions company according to CSR, where not only enough to make donations, but look at their ethical responsibility.

Other authors have had a perspective using the concept of corporate citizenship (Crane y Matten, 2006) classifying companies that assume the responsibilities according to the consequences of their actions, assuming functions which were the responsibility of governments, also becoming actors, not only economic and social, but also political.

This classification is done from: a) the limited perspective, giving the company something for perceived economic benefits; b) equivalent perspective, in the interests of interested parties, stakeholders, and; c) extended perspective, linked to good community governance, recognizing a political role.

According to these conceptions, different definitions have emerged from other angles as well:

1. **Global:** Different emphases that have been modified are found as well as other variables, for example, for the entity that brings together the world's largest companies: the World Business Council for Sustainable Development (WBCSD), it is " the commitment of business to contribute to sustainable economic development, working with employees, their families, the local community and society at

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

large to improve their quality of life "(WBCSD, 2000), similar to the notion of freedom and equality It will always be redefined according to changing needs and circumstances. CSR with its dynamics becomes a guide, a prospect for companies can target to assume their responsibilities (Caravalo, 2011, 35). The Global Compact or Global Pact (United Nations, 2007) defines principles under increasing globalization due to the impact of transnational corporations in the nineties, involving them in social and environmental challenges, given the disaster that to date had been given.

2. **For the United States:** One of the countries that has promoted entrepreneurship and individual entrepreneurship. Despite the interventions made by the state in different times, it is the one who most clearly expressed respect for the free market and free competition. The companies have played an important social role, despite the changes in methods. It has captured the philanthropic culture of companies and citizens, not only in works of charity but also in the promotion of art, scientific research and education, leading to a more comprehensive understanding which made possible the redefinition of traditional philanthropy. This redefinition has allowed some facts that in form are assimilated to the concept of social responsibility as:
    a. Employees work best when they understand the meaning of their tasks in the company, in favorable environments with reasonable wages. Enjoy a healthy stability between work and family life.
    b. Constantly employer encourages workers to work constantly looking for personal and professional growth.
    c. Set aside autocratic, authoritarian and abusive methods in the workplace, in which employers rule by tyranny and intimidation.
    d. In the long term, companies work best when they are located in healthy communities.
    e. The companies dealing with the natural environment with respect usually reduce their production of waste, obtaining products and services of higher quality and efficiently maximize their resources, including capital investments.
    f. The vision of the companies must make long-term with a broad perspective of time and affected communities.
    g. With the methods of CSR, the reputation of companies is notorious, for recognition and credibility that can lead to implementation.
3. **For Europeans:** In Europe the state has had a greater role in social and economic affairs. European societies have been more attentive to environmental issues and are very sensitive to these problems. From the perspective of CSR, companies have changed their way of doing business, incorporating the concept of sustainable development and achieving savings opportunities where previously only perceived costs and difficulties. They have achieved cleaner technologies, extending the vision of CSR to all parts of the company transforming the concept of reliability by openness and transparency.

For the European Commission, CSR is "the voluntary integration, by enterprises, of social and environmental considerations into their commercial activities and their relations with stakeholders concerns" (Renaut, 2005).

Efforts have been made to promote the voluntary nature of CSR, however, different trade unions have pointed out that one should not confuse CSR as an alternative to the responsibilities of governments, assuming that the starting point should be a voluntary focus, not excluding the regulatory approach reviews.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

4. **For Latin Americans:** The relationships and links between different social classes, has been characterized by paternalism, as one of the most influential factors in the formation of governments, the business community and in general, of societies, which it has contributed to the marked inequality in income distribution in the concentration of political, economic and social power and the extent of poverty.

Social differences have been maintained thanks to religion and love of family businesses, and philanthropic gesture of medium and large enterprises.

Some business and social leaders have been given the task of dismantling this paternal culture dependent and other philanthropic and social responsibility build.

Transnational corporations, who have come from countries where social responsibility is a voluntary activity and have the technology and socially responsible processes imposed by the global market, drag and complement local initiatives to act responsibly, this being a task of cultural and social transformation of great difficulty. For this reason, the practice of CSR remains a charitable and modification task difficult.

CSR in the company as "the commitment that it has to contribute to the development, welfare and improving the quality of life for employees, their families and the community at large" (Martínez, H. 2005), the same has been raised as a fashion since its inception, however, now it is practiced as an essential requirement in the world of organizations, because it is no longer considered temporary but necessary for the evolution of it.

5. LEGAL FRAMEWORK OF WEEE

The Ministry of Environment, Housing and Territorial Development, by Resolution No. 1512 of August 5, 2010, established separate collection systems and environmental management of waste computers and / or peripherals.

Colombia also signed the Basel Convention on the Control of Trans boundary Movements of Hazardous Wastes and their Disposal[3], to prohibit the passage of these wastes between OECD and non-OECD. This agreement was signed by Law 253 of 1996, which became effective on March 31, 1997, (Sánchez, 2012, p. 1) acquiring a series of obligations to trade, processing, reduction and elimination of all types of hazardous waste,

The Ministry of Environment and Sustainable Development of Colombia, by law No. 1672 of July 19, 2013 (MINAMBIENTE, 2013 the guidelines for the adoption of a policy of integrated management of electrical and electronic equipment waste, which defines the concepts were established who they are producers, marketers, product life cycle, integrated management, classification and other guidelines of EEE and WEEE.

It also defines the responsibilities and obligations of producers, traders, users or consumers and managers.

The programs of "post-consumer" are being established WEEE collection programs through various institutions such as chain stores, foundations, educational institutions and agencies. These processes are just getting established as collection programs to provide not only industry but also other WEEE products such as paper, plastics, glass, among others.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

5.1 Electrical and Electronic Equipment

According to Royal Decree 208/2005 of February 25 (MINETUR, 2005) in Spain, defines the electrical and electronic equipment, such as those that require electricity to run or electromagnetic fields; while the Waste Electrical and Electronic Equipment (WEEE) are specified as those materials, components, consumables and subassemblies that comprise, from households or other commercial, industrial or other sources, from the time passing be waste.

It also defines the waste treatment like that after the delivery of WEEE to a facility for decontamination process, dismantling, shredding, recovery or preparation for disposal.

The term WEEE, which in English equivalent to the term E-WASTE (Waste Electrical and Electronic Equipment WEEE) refers to damaged, discarded or obsolete devices that consume electricity. It includes extensive reference devices like appliances, computers, cell phones, electronic devices, ie, devices that contain electronic circuits that sooner or later, either by planned obsolescence or perceived obsolescence, waste end up being.

The WEEE symbol is used as a general term for all types of waste containing electricity consumption problematic, dangerous, rare, and valuable or by use or treatment, interesting materials.

EEE manufacturers shall: not use lead, mercury, cadmium, hexavalent chromium, polybrominated biphenyls or polybrominated diphenyl ethers in the manufacture of its products; design appliances so that dismantling, repair, reuse and recycling is available; provide the necessary information to managers of waste electrical and electronic equipment of various components and materials suitable for reuse and recycling, as well as the location of dangerous substances and preparations; and provide users with the criteria for proper environmental management of waste.

The categories were defined by the decree adopted by WEEE Colombia and displayed in Table 1. According to this classification, the study took into account the categories 1, 2, 3 and 4, which cover more than 50% of waste (RAEE Colombia, 2014).

Table 1. Classification of EEE

No.	Category	Items
1	Major appliances	Refrigerators,, freezers, washers, dryers, dishwashers, stoves, electric stoves, microwave ovens, heaters, fans, air conditioners
2	Small appliances	Vacuum cleaners, sewing machines, knitting, irons, toasters, deep fryers, coffee makers, grinders, electric knives, devices for cutting and drying hair, shaving, massage, clocks, scales
3	IT and telecommunications equipment	Computers, laptops, printers, copiers, electric typewriters, calculators, fax, telephones, answering machines
4	Consumer electronics appliances	Radios, televisions, camcorders, sound amplifiers, musical instruments
5	Lighting appliances	Lighting equipment used to spread or controlling light with the exception of filament bulbs.
6	Electrical and electronic tools	Sewing machines, drills, saws, lawn mowers, among others
7	Toys or sports and leisure equipment	Electric trains, video games, slot machines
8	Medical devices	Radiotherapy, cardiology, dialysis appliances, nuclear medicine, analyzers …
9	Monitoring and control instruments	Smoke detectors, heating regulators, thermostats, surveillance cameras, sensors
10	Vending machines	Hot drinks, hot or cold bottles or cans of solid products, money

RAEE Colombia, 2014.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Environmental subpoena, consisting on a sanction for the persons involved in throwing garbage in inappropriate places, was established on December 2, 2014.

Nationally, the WEEE chapter Colombia consulted that Colombians linked to a program of collection of such devices, used the following options to return them: 32% return the devices in stores and distribution warehouses, 29% called service collection by phone, 21% take them to the collector garbage truck and 18% to municipal collection sites.

5.2 Estimate of WEEE to Colombia

According to information provided by the associations that manage the production, distribution, marketing and final inspection of the EEE, in Colombia, for the year 2008 there was an installed base of over 133,000 tons of production of appliances, regardless smuggling for not having estimated figure. In that figure it is presumed that 40,500 tons are waste equipment.

For 2008 it was estimated that the amount of WEEE in Switzerland was 14 kilos per inhabitant, while in Colombia was 0.7 kg. It is estimated for 2018 a volume of 2 kg per capita. This estimate may grow if the quality of life of Colombian inhabitant also grows.

6. REVERSE LOGISTICS

In order to create a more sustainable environment and due to the shortage of some raw materials and rapidly increasing waste, some time ago, within the framework of integrated logistics, it has been heard the concept of Reverse Logistics, It aimed at ensuring, through recovery techniques, reuse of all waste materials and any product in the final stage of use, so that they come back to their original producer giving a total or partial reuse of these wastes, adding renovation and reprocessing methodologies to finally turn them into raw material for the industry itself or other organizations that can benefit by reducing the environmental impact it generates.

This process involves moving products from their final destination uphill in the supply chain to achieve give added value or ensure their proper disposal. As more clearly indicated Blumberg (2004): “A supply chain that is redesigned to manage the flow of products for reprocessing, reuse, recycling or destruction, correctly using all its resources efficiently”.

According to Martí Frias (2014) the relationship between conventional logistics and reverse logistics is broadly the same activities, given that the primary action of conventional logistics is to get the raw materials from reaching the organization at the right time, and as the products are in the hands of consumers in the planned time and at less cost. For reverse logistics the environmental concept is present, which is not only to take into account economic factors, but the fact of wanting to recall those products which at first are considered as waste.

Reverse logistics has allowed a historic breakthrough in companies since its inception in the 70s has made today have a deeper feeling for social responsibility and environmental impact. More and more organizations are looking to base their strategies on policies for common and ethical good in their way of doing business, in order to give them the same weight that is given to economic benefit.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

6.1 Reverse Logistics Management

Within the management of reverse logistics, there are several aspects that define this macro process to plan, manage and control the flow of products and materials that have been deemed defective, excess inventory, customer returns, inventory or seasonal products obsolete, to be taken from the place of consumption to the point of origin of the manufacturer or supplier including information associated to assess the causes of the return and bring the products in the right place Atún (2004).

Among the general aspects of reverse logistics (RL), some essential factors such as strategic cost, quality, customer service, environmental concerns and legal concerns that are keys to the successful implementation of RL programs are covered, as suggested Dowlatshahi (2000) in his research, which also identifies operational factors such as cost-benefit analysis, transport, storage, supply management, remanufacturing, recycling and packaging. These factors together make the knowledge of the state of the art on the keys to successful design and management of RL systems.

6.1.1 Processes Involved in Reverse Logistics

The reverse logistics processes focus on five key objectives, which can be defined within each business logistics sorted by Mora G (2008) as:

1. **Procurement and Shopping:** It involves the production, supplier development and procurement of raw materials, components, packaging materials, packaging, packing and handling units that are "environmentally friendly".
2. **Reduction of Virgin Inputs:** Involves activities of product engineering and re-training of human resources in order to evaluate activities of surplus materials reuse, preference for recycling materials, choose containers, packaging, handling units, reusable and recyclable, promote the culture of "return."
3. **Recycling:** We need to develop recycling policies respecting performance or product standards: Use recycled source materials; explore technological innovations that allow the use of recyclable materials; finance studies to reduce the use of virgin raw materials.
4. **Replacing:** The increase in the rate of innovation in recycling processes should promote the substitution of materials, i.e. heavier particles by lighter ones with equal or superior performance (as is the case in the automotive industry where plastic parts are replacing massively metal and glass in automobiles, as well as aluminum or composite materials in new truck chassis decreasing the tare and facilitating an increasing the charging unit for equal axle weight).
5. **Waste Management:** The material procurement policies should evaluate the rate of utilization of waste materials; waste management is a considerable cost; it is also necessary to have policies for acceptance of samples, if the requirements of waste management of these, or just available by rejection, is costly. Reverse logistics is certainly a philosophy that any company should add to its environment, because of all the above factors and to globalization that is taking place, it is important to have a strategic planning of reverse logistics.

After having a clear strategy and discuss how to carry out the reverse logistics within the organization and taking into account the objectives of the logistics business, we have considered the following

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

fundamental processes involved in reverse logistics, as it exposes Fernandez *et al*. (2004) in their book "Reverse Logistics and Environment" (Contreras, Tordecilla and Silva, 2013): Repair, Renewal, Reprocessing, Recycling, Cannibalization, and Direct Reuse.

6.2 Rules for Implementing Reverse Logistics

In Colombia there is no law specifying the terms of reverse or inverse logistics but some decrees have been made in order to protect the environment and that have been imposed by the government to regulate the handling of certain waste.

The Ministry of Environment puts special emphasis on the definition of "residue" and "waste" because this depends on knowing what is the salvage potential to be held depending on the scope and rules applying their value.

We can notice that in the decrees, the Government chooses to meet the obligations and responsibilities that must have both the producer and the consumer, however, makes no mention of the possibilities for reuse or use of these resources.

Finally in 1713 Decree 2002 appoints definitions of the cleaning commissions and plans to do to waste management, such as creating landfills or dumps, and have set depending on the business - plan management of solid waste management, seen from an environmental point for the disposal of products.

Among the regulations that certify the implementation of green logistics processes we find ISO quality standards that are evolving: ISO 9000 Process Management, ISO 14000 Cleaner Production, ISO 18000 Industrial Safety and other ISO standards on occupational health issues and clean distribution.

7. CASE STUDY

Technical and general information of the population surveyed: Of those surveyed 79% are aged between 18 and 33 years and mostly belong to strata 3, 4.5 and 6, with households made particularly between 3 and 4 people.

In compliance with the specific objective of knowing the type of appliances (Sánchez Pérez, 2003, p. 75) and technology (EEE)[4], belonging to the white line, brown line, food preparation appliances, devices for home care, and personal grooming appliances that have the Manizales homes, are consulted about the equipment used, the number of them, how to purchase, how many times has been changed, the reasons why it has been changed and reasons for changing. Similarly through the notion of the life of electrical and electronic equipment there is inference on the concept of obsolescence that may have participants in the study; while it is consulted on recycling programs for these articles.

7.1 Analysis and Interpretation of Results

Analysis and interpretation of information collected as a result of the application of the survey techniques, interview and observation is presented.

7.1.1 Type of Appliances and Technology of Surveyed Households

The list of the EEE presented, all claim to possess at least one of the elements of white and brown in their homes and the most common mode of acquisition is the purchase as a new article

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

The most owned appliances are: TV, computer, phone, video player, audio player, keeping it from two to four devices per household, which implies that they are items of high consumption and fashion by different members of the households, services and benefits for entertainment, work and communication and accounting; other high consumption devices are the refrigerator, stove, blender, washing machine, rice cooker, justified by the roles of conservation and food preparation, hygiene and beauty.

The products that go out of style are televisions and mobile phone, the style change; respondents see the need for change to keep up with new technology. Is the influence of perceived obsolescence, these items assimilate as old and obsolete and are good.

A large percentage of respondents they consider the useful life of products, because they are concerned about not losing the invested money, the quality, the utility of the product, the need for what they are buying.

Products that have the majority of the population in their homes are: fridge, stove, washer, blender, rice cooker, cellular, blender, iron, hair dryer, hair iron, because they are everyday devices for: storing food, produce, generate heat, streamline tasks, work, communicate, entertain; essential for good living

7.1.2 Reasons for Buying of Appliances Knowing Their Useful Lifetime

The responses are classified into the following variables:

- **Variable Necessity:** Indicator of great importance because of the relevance, since it is needed at that time to be better.

Consumers prefer products of better quality, better performance and / or innovative features, people make them wishes and needs no matter how long they would last, what matters is the satisfaction it generates.

- **Variable Quality:** People are willing to buy an expensive product when their brands are good because they provide good service and are characterized by being considered more durable, thin, have good quality and better performance. For most people, the life of a product has to do, not only with the durability and price, but also with the quality of the materials that make them.

Quality becomes a decisive condition for the consumption of certain products. It is definitive to develop superior products with better performance, because over time, buyers will value and appreciate a product specifically for its quality.

- **Variable Functionality:** When buying any EEE, people expect to fulfill a number of functions during the time of use, and to take full advantage of the investment made, and enjoy it 100% during its lifetime, because if an appliance fails, it should be counted as an expense. Buyers seek comfort and take into account the value and service it provides.

7.1.3 Reasons for Not Buying the Appliances

- **Economic Variable:** there are many consumers who say they would not buy an expensive product if that lasts only for a short time, because they consider spending their money in a product with

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

those characteristics is unnecessary and would be a waste of money. People take into account their economy, i.e., they recognize the implications of the disbursements to remember that today due to the market economy and the extent of the supply of all products they can get a product with the same price and even longer lifetime, so they buy something cheaper, avoiding waste of resources and achieving some savings.

- **Environmental Variable:** The appreciation is that it is not consistent to what they want to achieve is expensive and gets damaged very fast, it would make sense to look for something cheaper or the same price, but better quality, people would not buy the appliances because it does not justify investing money in a product or brand that results damaged soon because it generates more expenses, greater pollution and environmental damage. This suggests that although environmental awareness is lacking to some extent, it is manifesting a certain environmental responsibility, even though, people seldom realize the consequences that will bring the discard of EEE. It is perceived that some have certain Environmental awareness and responsibility for the accumulation of waste in the discard of any device that stops working and at short time becomes junk, due to an inadequate return and can become harmful to society and the environment elements.

7.1.4 Recycling Programs

81% of respondents said they did not know recycling programs, which allows us to infer that there is ignorance and/or there are not many recycling programs that can be found in the city. 19% of the sample said they do know. With that percentage, we can deduce that the level of ignorance about recycling in is high the city, perhaps because it is not being given an appropriate and adequate information about what to do with waste and the importance of awareness about the damage generated by all these electric and electronic waste.

Of those who responded affirmatively is that many are unaware of such programs through phone companies, Claro and Movistar, have been campaigning for mobile users take them to their institutions when they will stop using or changing to do not let them in the house, since its components are pollutants

; others are aware of recycling programs, for example scrapping, a common practice undertaken by many people and that is a way to make a living. It consists of collecting all sorts of junk, rubbish or waste which then are sold; there are campaigns from shopping centers; from hospital programs, companies like CONFA, Universities, schools, EMAS, the Mayor, GAIA Vitare, MABE, ANDI; post-consumer programs; Corpoinfantil. But there is necessary to work and make collective efforts to achieve a recycling awareness of all kinds of EEE so that they could be reused.

7.1.5 Results From Recycling Companies

The most disposed appliances in the city of Manizales are washing machines, refrigerators and microwaves, mostly discarded in very bad conditions, very few in perfect condition. These discarded appliances are purchased as follows: 72% buy them, 16% give them away, and 12% otherwise acquire them in ways liker collecting them or by request.

Of waste collected, 60% disarms and pulls pieces, 20% sells them for parts, sells 16% and 4% repairs them.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

As for the benefits of these wastes, is that 48% are economical 24% serve as raw material, 24% say they are a business opportunity and represents 4% were other types of benefits. Of what does not work 54% throws away 33% leads to the landfill, 8% reuses 4% as a gift.

Waste materials that do not operate are led to collecting entity companies which prevent pollution at all levels. As for the environmental impact of this waste it is that 60% believe that they cause damage to the environment, while 40% do not think so. It is clear that the entrepreneur recyclers have notions of the basics of social responsibility, of which one is to ensure the protection of the environment, for example not disposing the waste to water or land, not cutting trees, recycling and reuse parts of products. However, its application is not visible by the lack of government agencies to enforce the standards.

The way recycling intermediaries get the products that destroy and recover usable parts that can be used as raw material for the big industry, due to recommendations made between them, i.e., there are individuals whose job it is to look for industrial waste materials for manipulation and selection. Traditionally people walk behind a garbage collection vehicle for specific products such as plastics, cardboard, glass, plus get EEE are thrown away by the owners of the homes.

These collectors take EEE to places where they are bought according to weight, regardless if they carry engines, cables, or other materials mostly valued in the market.

In the chain of intermediaries are involved: collectors walking behind the collecting vehicle, who sell to an intermediary its small profit, zonal intermediaries who will buy cardboard, glass, iron, among others, the wanderers buys to regional middlemen who buy from and sell their zonal products to the factories.

These recycling efforts are made by hiring people with a low socio-economical level, looking ways to mitigate their basic needs, people with low education levels that are "exploited" under precarious security and allowing them to achieve the selection of materials to provide them to big industries. Thanks to this, there is the opportunity to implement programs of "social innovation business" to organize these people who are not included in any program of social development.

8. CONCLUSION

The household sector is no stranger to the guidelines of evolution, there is a growing number of new products (EEE), which are continuously put on the market; the supply of goods is greater than the demand, so the obsolescence becomes a sales strategy that encourages the purchase.

Today's consumer is increasingly informed and demanding person; seeking higher quality and not only want to buy essential goods for their daily activities; also buy products that give value to life.

Given the easy terms and EEE oversupply, most people want to the first purchase of an item, being this new or not.

According to the findings, when people change appliances of consumption, they have little awareness of how to dispose the product, given that most times these are thrown or given away, not recycled properly.

When people buy EEE, they are seeking for innovation requirements and conditions, warranty, safety, welfare and care of these devices to allow a more convenient and comfortable life

Social innovation, social entrepreneurship and reverse logistics are related in that they are strategies to promote processes that generate return and contribution to the environment, given the declining and damage that has resulted from all production processes and consumption; It is the opportunity to develop friendly and responsible practices.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Companies must develop an effective policy for the management of recycled and recovered items, using the theories of reverse logistics, the cradle to the cradle, and the theory of decline, trying not to affect the cost structure and that most of the parts of the product, once discarded, become raw material for upgrade, or for other products.

We could reflect on the role of science, marketing, advertising and universities in the world and especially the engineers who are those involved in the design and development of products, which often have become collaborators of capitalist commercialism and businesses, where the major goal is to promote the consumerism economy.

There are laws that protect consumers' rights against possible abuses of market makers. The consumers have the final decision to reject or choose what really suits them in the middle of a society that is attacked daily by planned obsolescence, hence the need to educate them to have a responsible consumption, a condition when all social actors must be involved.

In the world and in Colombia, to forge a responsible consumer attitude towards respect for the environment, there have been consolidating agencies and bodies responsible for setting parameters necessary technical, economic and of legal level for the integrated management of technological resources They are used in homes, but there is more production speed of WEEE that form big volumes of waste, than the application rules generated.

To overcome the problem of perceived obsolescence, the education for a more responsible consumption is basic as well as the support social entrepreneurship and alternative ideas to counter the effects of the large amount of WEEE.

The communities involved in the chain of intermediaries, are classified as intermediaries and gatherers; the first are only interested in participating in market supply and demand sides, while the latter, are communities which have no social security and are excluded from conversion programs.

In Manizales there are few recycling programs, and they are aimed at garbage collection. Therefore WEEE collection programs present an opportunity to make proposals for social entrepreneurship aimed at the inclusion of this collecting community.

KEY TERMS AND DEFINITIONS

Chain of Intermediaries: Composed of parasitic agents that do not add value, just cost, consisting of gathering people walking behind a collection vehicle; zonal middlemen who buy from collectors materials such as plastic, paper, glass, among others; regional middlemen who buy from the above; and people or companies that specialize in buying "lots" of waste products, whether institutional or industrial, who sold the products to the zonal intermediaries and/or regional EEE (electrical and electronic equipment): those that require electricity to run or electromagnetic fields.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Corporate Social Responsibility (CSR): The commitment that a company has in order to help the development, welfare and improving the of employees life quality, including families and the general community.

Manizales: Capital of the Department of Caldas, Republic of Colombia, located in the center of the country, coffee region, with over 400,000 inhabitants.

Perceived Obsolescence: Due to the progress of technology a product meets a function better than before, or become obsolete in the minds of consumers due to the effects of advertising, the new followers of fashion products become obsolete to whom have not used them, almost forcing them to dump products that still work for the sake of model change, or use products that others have.

Planned Obsolescence: To reduce product quality life programming, it makes people throw what is even useful to buy a new one.

Reverse Logistics: Ensure, through recovery techniques, the reuse of all waste materials and any product in the final stage of use, so that they reach their original producer again giving a total or partial reuse of these wastes, adding renovation and reprocessing methodologies to finally turn them into raw material for the industry itself or other organizations that can benefit by reducing the environmental impact it generates.

Social Enterprise: One that seeks a social impact rather than make a profit for their owners or interested parties providing goods and / or services for the market of entrepreneurial and innovative way, using its revenues especially for social benefits.

Social Entrepreneurship: Actions performed with the explicit purpose of creating social value. Performing actions from purely philanthropic, to business projects aimed at improving the quality of life of the people, and at the same time, the economic performance of companies.

WEEE (Waste Electrical and Electronic Equipment): Specified as those materials, components, consumables and subassemblies that comprise, from households or other commercial, industrial or other sources, from the time when they became waste.

ENDNOTES

1 Understood as the programming of the end of the useful life of a product, so that, after a period of calculated or determined by the manufacturer during the design phase, it becomes obsolete, useless or unusable.

2 Social Networks of Knowledge in Entrepreneurship (-SEKN Social Entrepreneurship Knowledge Network) is a network of collaboration among ten of the most renowned business schools in Latin America, also having as strategic partnership with Harvard Business School and the Foundation Avina.

3 This convention was adopted by the Diplomatic Conference in Basel (Switzerland) in 1989 and entered into force in May 1992. Since November 1997, a total of 114 states and the European Community are part of the agreement, adopting an instrument governing the transboundary movement of hazardous wastes.

4 Under the generic category of electrical appliances, traditionally several lines that are usually classified into three major groups are distinguished: brown goods, white goods and small appliances

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

and household applications such as mixers, coffee makers, fryers, etc. The brown goods refer to the set of video and audio appliances (televisions, videos, stereos), while the white goods refer to major appliances connected to the kitchen and household cleaning (dishwashers, refrigerators, washing machines).

This research was previously published in the Handbook of Research on Social Entrepreneurship and Solidarity Economics edited by José Manuel Saiz-Álvarez, pages 475-498, copyright year 2016 by Business Science Reference (an imprint of IGI Global).

Chapter 58
Digital Inclusion, Crowdfunding, and Crowdsourcing in Brazil: A Brief Review

Beatrice Bonami
University of São Paulo, Brazil

Maria Lujan Tubio
University of São Paulo, Brazil

ABSTRACT

In the present chapter, we map and characterize crowdsourcing and crowdfunding platforms that promote social entrepreneurship in the online universe. We first analyze relevant theoretical concepts and the existing literature on entrepreneurship, digital inclusion, information and open culture, digital culture, and social technologies to better understand the genesis and development of initiatives that promote social entrepreneurship in the online universe. Then, we map and describe the platforms that tried to encourage this type of entrepreneurship around the world, especially in Brazil. Finally, we examine some important aspects of the panorama of crowdfunding in Brazil. By exploring the current development of crowdfunding and crowdsourcing platforms at international level, we expect to contribute to the creation of new projects and policies that respond to the current demands of the network society.

INTRODUCTION

The use of information communication technologies (ICTs) around the world has increased dramatically over the past 20 years. ICTs affect all aspects of everyday life. They allow users to access, store, transmit, manipulate, produce, and publish information, thus providing a wide array of opportunities for education, professional development, and lifelong learning.

According to Cardoso (in Passarelli & Azevedo, 2010), the world is not only going through financial, political, and environmental crises but also through a communication crisis. This phenomenon, as Cardoso (2010) explains, can be seen in a series of events and habit changes. It can be seen at the sharp fall in newspaper sales; the proliferation of P2P audiovisual content distribution; the increase in Internet

advertising; the role of social networks in the daily coverage of events; the Open Access, Open Source, and Open Science models; or the case of media production destined to online sharing. The communication crisis transforms, or at least questions, all dimensions of information production, distribution, and consumption. It also affects the way we approach entertainment and knowledge. As Cardoso points out, we moved from a system of schemes and matrices of mass-communication based media to a model based on networked communication.

This new model coincides with the emergence of a new set of skills, attitudes, and behaviors that are necessary to participate in today's network society. Passarelli (2007) explains in *Interfaces digitais na educação: @lucinações consentidas* (Digital interfaces in education: consensual hallucination), the globalized world is typified by intense capital, product and information flows and has started to require new competencies from its citizens. These competencies are what we call today "emerging digital literacies" (2007, pp. 40).

Digital literacies are a new set of habits, attitudes, and behaviors that are necessary for full participation in today's media-saturated society. They affect the way people learn, work, socialize, and use their free time. They also increase their access to education, employment, entertainment, and health. Their development constitutes a necessary step to adapt to the fast-changing world of information and communications technology.

In 1997, Gilster (1997) coined the term "digital literacy." According to Gilster, digital literacy is a "logical extension of literacy itself, just as hypertext is an extension of the traditional reading experience" (pp. 230). The author defines digital literacy as "the ability to understand and use information in multiple formats from a wide range of sources when it is presented via computers" (pp. 1), and he sheds new light on the concept by stating that "digital literacy is equally about context" (pp.35). Warschauer (2003) later developed a concept of literacy to address the various social, economic, human and digital resources that affect the "effective use of ICTs to access, adapt, and create knowledge" (pp. 47). Jones-Kavalier and Flanningan (2008) argued that literacy is characterized by the ability to use information effectively and creatively. Finally, Jenkins (2008) discussed the emergence of a media convergence culture, characterized by nonlinearity and interactivity.

In recent years, the development of ICTs and the emergence of new digital literacies have opened up opportunities that used to be restricted to a very privileged sector of society. In fact, ICTs have favored the genesis of an online social entrepreneurship phenomenon that has led to the creation of online platforms that attempt to develop a taste for entrepreneurship in its users. These platforms help people to identify opportunities that can be transformed into projects to promote community development. The objective of this type of platforms is simple but challenging: to make entrepreneurship accessible to everyone. The initiative "Social Good Brasil" is a notable example of this recent trend.

The present chapter examines the development of crowdfunding and crowdsourcing platforms and explores their key role as catalysts for social inclusion. In order to contextualize the development of crowdfunding and crowdsourcing platforms, the chapter first provides important background information on digital inclusion and its link to social inclusion. Then, it looks at three key concepts: collective intelligence, Hacker ethics, and social entrepreneurship. Finally, it examines the current state of development of crowdfunding and crowdsourcing platforms in Brazil and around the world.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

BACKGROUND

1. Digital Inclusion

To better understand the role of crowdfunding and crowdsourcing platforms as catalysts for social inclusion, it is necessary to comprehend first what digital inclusion is and how it has contributed to promote social inclusion.

Gaps in access to ICTs or digital illiteracy continue to deepen the digital divide. The term digital divide is used to describe disparities in access to ICTs, which are often associated with race, gender, age, income, education, physical and mental ability, and spatial location as the authors Hoffman and Novak (2000), Norris (2001), Ragnedda and Muschert (2013), Servon (2002), pointed out. According to Ragnedda (2014), the digital divide is, inevitably tied with the concept of social inequalities. That is, each society exhibits inequalities among individuals and groups, and as these are the sedimentation of social history, this give rise to social strata in the practice of social relations, notably regarding access to social rewards such as money, prestige and power.

People who have access to ICTs and the necessary skills to use the Internet have many advantages over those who do not. They are more successful financially and educationally, and more likely to show political and civic engagement. In addition, DiMaggio et al. (2004), Mossberger et al (2003), Oden (2004) argue that Internet use increases access to education, employment, and health, and it provides new spaces for political discussion and direct access to the government. As such, the Internet plays a very important role in reducing inequality, which DiMaggio et al. (2004) examine in the following manner:

We call attention to five broad forms of inequality. The first is variation in the technical means (hardware, software, and connections) by which people access the Internet. The second is variation in the extent to which people exercise autonomy in using the Web---for example, whether they access it from work or from home, whether their use is monitored or unmonitored, whether they must compete with other users for time online. The third is inequality in the skill that people bring to their use of the medium. The fourth is inequality in the social support on which Internet users can draw. The fifth is variation in the purposes for which people use technology. We view each type of inequality as likely to shape significantly the experience that users have online, the uses to which they can put the Internet and the satisfactions they draw from it, and their returns to Internet use in the form of such outcomes as earnings or political efficacy. (pp. 376)

Some authors as Al-Jaghoub et al. (2009), Cuevas-Cerveró and Simeão (2011), Notley (2009), Passarelli (2010) (2011) Selwyn and Facer (2007) (2012), Straubhaar (2011), and Warschauer (2003), has shown a high degree of correlation between digital inclusion and social inclusion. Digital inclusion "is broadly understood as a phenomenon whereby marginalized people are able to access and meaningfully participate in the same learning, employment, social and citizenship activities as others, through access to and use of digital technologies such as computers" Seale (2010, pp. 445). Digital inclusion programs are public or private (or both) initiatives that seek to provide access to ICTs and/or build the necessary skills to use them so that disadvantaged individuals and groups can enjoy the benefits of information society.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

In 2006, the United Nations World Summit on the Information Society (WSIS) stated the need to promote universal, ubiquitous, equitable and affordable access to ICTs. The goal was to ensure that the "benefits are more evenly distributed between and within societies, and to bridge the digital divide in order to create digital opportunities for all and benefit from the potential offered by ICTs for development" (2006). With this goal in mind, many countries have developed and implemented digital inclusion programs that target the elderly population, people with low incomes and/or low levels of education, and those who live in geographically remote areas where ICTs access is limited or nonexistent.

According to Passarelli (2010), digital inclusion programs in the last two decades of network society can be divided into two waves. The first wave focuses on policies, digital inclusion programs, and related concerns; the second one, on the different forms of ownership and knowledge production on the web.

In Brazil and around the world, many digital inclusion programs have been implemented in an attempt to both reduce the digital divide in terms of technology access and map and understand emerging digital literacies. Canadian and American programs have targeted minority groups and people from rural areas. In Latin America, where the level of socioeconomic inequalities has improved but remains high, most programs have focused on many disadvantaged sectors of the population, such as the unemployed, low-income families, public school teachers and students, indigenous groups, and the elderly. In fact, developing countries have the greatest need for digital inclusion programs since digital literacy constitutes a key step in the race for social inclusion.

In Brazil, numerous public and private initiatives have targeted the development of emerging digital literacies and the reduction of the digital divide. Programs such as "*Digitando o Futuro*" (Typing the Future), "*Pirai Digital*"(Go Crazy in Digital), "*Ideias*" (Ideas) and "*AcessaSP*" (Access São Paulo) have made significant contributions to promote the development of digital literacy and social inclusion in the country. In fact, the AcessaSP program, which was developed by our research team at the School of the Future (University of São Paulo), recently received the prestigious "2013 Bill & Melinda Gates Foundation Award" for Best Digital Inclusion Program, after competing with 300 programs from 56 countries.

Research on digital inclusion has mostly focused on people's increasing access to technologies and the practical skills that are necessary to use them, as Selwyn and Facer (2007) points out. Selwyn, Gorard and Williams (2001) studies have focused on broader issues, such as connectivity, the types of hardware and software that people can use. As also detected by Abbott (2007), the content and information that is delivered through technology are as important as digital literacies or general literacy in a broader sense, as sharped by Passarelli (2012) and Wessels (2008).

Aiming to map and understand contemporary emerging literacies, our team at the School of the Future – USP Collective has sought to explore the cross media context of WEB 2.0 non-linear narratives and the emerging protagonism of digital collectives over individual authoring, among other topics. For instance, Passarelli and Junqueira (2012) most recent book, *Gerações Interativas – Crianças e adolescentes diante das telas* (Interactive Generations - Children and adolescents in front of the screens) examines the set of skills that children and teenagers need in order to interact and select content when confronted with different types of screens, such as TVs, video games, computers, and cell phones. Conversely, Passarelli and Azevedo (2009) edited volume *Atores em rede: Olhares luso-brasileiros* (Network Stakeholders: Luso-Brazilian Perspectives), discusses methodological approaches to analyze virtual communities and the digitization of cultural flows and hierarchical restructuring of knowledge production, while looking at successful programs from Brazil and Portugal (such as AcessaSP and Second Life).

It is also important to mention Pinheiro and Márquez (2013) recent study, "*A cúpula mundial sobre a sociedade da informação: foco nas políticas de informação*" (The world summit on the information

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

society: focus on information policies), which evaluates the level of achievement of the objectives set by WSIS in 2006. Their work is based on the information published on the WSIS database, which provides a record of activities carried out by the governments, international organizations, the private sector, civil society, and other entities. In this article, Pinheiro and Márquez conclude that "indicators/statistical data of digital inclusion help in the measurement and investigation processes of the WSIS outcomes, as well as help in the process of establishing information policies that meet the demands of the Information Society" (pp. 128). Also, although the WSIS "has counted with the participation of more than 170 countries and has undertaken great effort and financial investment [it] has not yet reached its goals" (pp.129).

Pinheiro & Márquez's study constitutes a significant first step in mapping the progress each country has made towards achieving the proposed objectives. However, many major and significant programs are not included in the WSIS database, which calls for the need for a more comprehensive and in-depth examination.

1.2 Collective Intelligence, Hacker Ethics, and Social Entrepreneurship

To comprehend the contemporary society's arrangement is necessary to understand the concept of cyberculture developed in the last 20 years. To define cyberculture, we need to consider its conception in a contemporary space and has neither center nor guidelines. A multiple content accepts all individuals and subjects at the same time because anyone in the network can become a producer or a new information transmitter.

According to Manovich (2003), cyberculture involves,

The study of various social phenomena associated with Internet and other new forms of network communication. Examples of what falls under cyberculture studies are online communities, online multi-player gaming, the issue of online identity, the sociology and the ethnography of email usage, cell phone usage in various communities; the issues of gender and ethnicity in Internet usage; and so on. [...] To summarize: cyberculture is focused on the social and on networking; new media is focused on the cultural and computing (pp 16).

Cyberculture arises from the disconnection of social workers (abstract machines): universality and "totalization". These two concepts have been engaged in the invention of writing, as writing does not only determines the universal, but also the context where people are immersed. Virtually all posts conveyed on the web are dipped into a boiling communicational bath of life (including people themselves) from which the cyberspace gradually emerges. The cyberspace is thus the result of a genuine social movement where three guiding principles predominate: interconnection, virtual communities, and collective intelligence.

Virtual communities' configuration is primarily as learning communities on the Web using Distance Learning (DL). The need to know and learn at the lowest possible cost has led institutions and companies to reorganize themselves to provide online learning. As for social networks, they are increasingly used on a regular basis because the necessity to communicate and learn has led millions of people to explore multiple communication interfaces. Communications platforms have evolved in such a way that they have gone from simple textual communication to communication with real-time images and sound.

Cyberculture is as a central element in collective intelligence, a concept that was examined at length not only by Lévy (2007) but also by Jenkins (2008) and De Kerckhove (2009). Collective intelligence describes a type of shared intelligence that emerges from the collaboration of many diverse individu-

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

als. It is a "distributed intelligence", as Lévy (1997) describes it, "constantly enhanced, coordinated in real time, and resulting in the effective mobilization of skills" (pp.13), in which all knowledge comes from humanity, since no one knows everything but every person knows something. The term appears in socio-biology, political science, and in specific contexts such as peer review and dynamic crowdsourcing applications. This broader definition involves processes such as building intellectual and human capital. Different actions, from a political party to an entry in Wikipedia, can be described as a form of collective intelligence.

Collective intelligence can also be seen as an emergent characteristic in people and ways of processing information. According to Lévy (2007) and De Kerckhove (2009), the term refers to the possibility of Information and Communication Technologies (ICTs) to improve the collective pool of social knowledge while expanding the range of human interactions. This concept contributes strongly to shifting knowledge and power from the individual to the collective.

In a similar way, media theorist Jenkins (2008) examines collective intelligence as a site in which each viewer builds his/her own mythology from scattered fragments available in the media. From the grouping of these fragments, collective intelligence emerges, arising as an alternative power. According to Jenkins, this alternative is currently being used for recreational purposes (virtual communities on Facebook, for example), but in the future it might be employed in more important contexts such as religion, education, law, politics, advertising, and perhaps even the military. Collective intelligence, thus, arises from knowledge communities that form around common intellectual interests.

The concept of collective intelligence according to Jenkins is a source of interactive media power that is closely related to the culture of convergence. Both Jenkins and Lévy support the claim that collective intelligence is important for the process of democratization as it is intertwined with culture based on knowledge. It is also sustained by the collective sharing of ideas, thus contributing to a better understanding of our diverse society and its different actors.

Thus, we can say that the convergence of various media leads to a cultural change. With the collision between new and old media, the interaction between the power of media and consumers often produces unpredictable results. The current situation implies a more active and direct participation of consumers, forcing large industries to shift their strategies in a direction that converges to the current needs of individuals.

The convergence process is complex and constantly changing as it depends on the relationship between technology and culture. Technology plays a secondary role, and cultural change is what will dictate content. Behind the decisions of content is individual knowledge. Today, people holding such knowledge appear as micro-hits that supply in massive way the new formulations of the content available on the Web 2.0.

The cyberculture, associated with collective intelligence, with anonymous people and production tools that are available at no cost on the Internet, has changed the parameter of contemporary market relations as a new reigning logic of thinking about the relations established by the connected environment. One example is the note released by the Cluetrain Manifesto in 2000 in which it is claimed that, a powerful global conversation has begun. Through the Internet, people are discovering and inventing new ways to share relevant knowledge with blinding speed. As a direct result, markets are getting smarter and faster than most companies are.

According to the official website of the Manifesto, through the Internet, people are "discovering and inventing new ways to share relevant knowledge with blinded speed." As a direct consequence, "markets are getting smarter--and getting smarter faster than most companies." The term market is a "set of conversations." Their members casually communicate with informal and natural language. How-

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

ever, once their members are in a business context, they adopt a one-sided and monotonous language. Consequently, people served by these companies refuse to talk or communicate with these entities with "boring" language, which hinders the economic processes that depend on communication between individuals and companies.

According to Anderson (2006), the set of mass-talks has undergone a transformation and began to market a few hits for numerous market niches and micro-hits. The market is dealing with a huge community of fans and followers governed by personal and independent blogs, and this interferes with the market's logic, since until recently, followers and fans were financial contributors who were buying records and CDs.

According to Anderson, "When the tools of production are available to everyone, everyone becomes a producer" (pp. 73). This is so due to the democratization of the acquisition of production tools that does not annul the sale and purchase of other tools. For example, Smartphone and multi-functional devices democratized sharing and access to social networks. However, the proliferation of these devices does not completely nullify the buying and selling of CDs of musicians for more than the sales rate of those items approximates to zero (examples as Wikipedia and Netflix illustrate this reality). Today the goal of producers exceeded the extrinsic motivation of financial and material gain and part of an intrinsic motivation to do something big and recognized.

Plenty of deals on the internet offer thousands of options for products in bulk. The huge mass markets are turning millions of small niche markets that accompany virtual communities of relationship such as social networks and blogs. Blogs are a consequence of the democratization of production tools: software and the advent of simple and inexpensive services that facilitate online publishing to such an extent that they become accessible to everyone.

With lower costs of production and distribution, Anderson (2006) argues that the era of "one size" is ending and in its place appears the market of varieties. This suggests that, according to websites, amateurs and professionals are competing on equal terms because the Internet makes it cheaper to reach people. This is evident when considered the increased use of Web 2.0 social networks.

In the wireless era, social networks had the highest growth in the history of media and followed the development of youth culture and public policies that encourage individual expression. In *Mobile Communication and Society: A Global Perspective*, Castells (2009) discusses an unprecedented expansion of mobile communication and the adoption of technology in the background of different economies, policies, and new logics of thinking about the social impacts and cultural. When examining the differences among continents, the rate of inclusion appears more significant in Asia Pacific (41%), Europe (32%), the Americas (21%), Africa (4%) and Oceania (1%). In Brazil, the penetration of new technology reached 36% being considered an exception in Latin America, next to Chile's rate (approximately 50% of access).

Through data analysis, was also observed that mobile communication is a means of pervasive communication, mediating social practice in all spheres of human life. Mobile communication extends technologies and shapes the logic of social practices in all places and contexts, as "the technology of wireless communication has powerful social effects to generalize and extend the logic network, which defines the human experience today" Castells (2009, pp. 334).

The study is far from completed, and its development in many different societies and contexts does not exclude the underdeveloped and developing societies. In the future, everything individuals need will be available in technology platforms and connected in a networked society. We can make this prediction because in a society of overconsumption, the need for mobility and visibility is increasing, triggering a

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

constant reshaping of identities as ways of ensuring the principles of inclusion / exclusion drawn up by the market. New ways of thinking about both consumer goods and means of production are also triggered.

Twenty-first century entrepreneurship requires a new logic of behavior and treatment for members of the communicational dive. An example is the Hacker's Ethic, which rocked the pragmatic structure of production and suggests a new way of working.

The Hacker's Worldview shows how to neutralize some of the inhuman consequences of the networked society. According to Himanen (2001), the hacker ethic is,

… a new work ethic that challenges the attitude toward work that has held us in its thrall for so long, the Protestant work ethic, as explicated in Max Weber's classic The Protestant Ethic and the spirit of Capitalism (...) But first and foremost the hacker ethic is a challenge to our society and to each of our lives. Besides the work ethic, the second important level of this challenge is the hacker money ethic - a level that Weber defined as the other main component of the Protestant ethic. Clearly, the 'information sharing' mentioned in the hacker-ethic definition cited above is not the dominant way of making money in our time; on the contrary, money is mostly made by 'information owning. (pp. 09)

The Hacker Ethics argues that flexible hours, creativity, and good sense are essential both for the employer and for the employee. The philosophy embraces a multimedia line of thought, based on the values of play, excitement, sharing and creativity. Those values have the potential to improve production and competitiveness both in individual and corporate contexts.

The notion of vertical communication was replaced by equality between the actors. The current media are horizontal, which eliminates the hierarchy of existing discourses. That is why the Hacker's World View encourages flexibility of labor policies in order to promote the creation of new solutions to issues raised by network society. This incentive is part of mechanisms that support collective intelligence, which triggers a new way of thinking activism and activities in a connected world; it means that at all times we deal with contributors and developers of content, anywhere on the planet.

This new logic of thinking about social practices is reflected on the market (or set of conversations) that constitute new skills through democratic means of production and network activities. Understanding this setting is essential because a new way of thinking about the world and its interrelationships arises when looking at such practices in a global context. This is the first step toward the construction of connected digital platforms and toward democratic access to the media.

In Brazil and in the world, entrepreneurship is of paramount importance not only for the growth of individuals, but also for the development of society. The origin of the term entrepreneurship is to "do or perform". The enterprising individual has a new look on the world as he/she witnesses the evolution of his/her time and context, valuing experiences and making decisions. He/she opens up new trails and explores new knowledge.

There are several definitions and applications of the term entrepreneurship, but in the context of the present chapter, we are interested in examining it from a behavioral perspective. One of the first authors to show interest in the term was Weber (1972). Weber identified entrepreneurship as a system, which is the key element for the explanation of entrepreneurial behavior. As innovators, entrepreneurs are independent people, intelligent and emotionally potential creators who are in changing the present.

However, the more accepted definition of entrepreneurship is, according to the economist Schumpeter (1950), a central element of his theory of creative destruction. According to Schumpeter, the versatile

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

entrepreneur is someone who has the technical skills to produce knowledge. Schumpeter defines entrepreneurship as a study focused on the development of skills and abilities related to creation. He is constantly looking for new ways and new solutions that respect the concept of literacy. The enterprising individual has a new look on the world as he/she witnesses the evolution of his/her time and context, valuing experiences and making decisions.

As such, entrepreneurship opens new trails and explores new knowledge. When looking at it from a behavioral perspective, it is necessary to bring attention to the concept of "intellectual capital," which is nothing more than knowledge, experience, and expertise. The focus is on people and their knowledge and ability to generate new ideas. In this book chapter, the focus is taking on new skills that are necessary in the network society.

Social entrepreneurship is a means to develop a community, city, or region. Drayton (2010) to address the existence of individuals that can make profound changes, to solve social and environmental problems, coined the term "social entrepreneur". Through its activities, social entrepreneurs accelerate the process of change in society and inspire others to engage around a common cause.

According to Byers et al. (2014), entrepreneurship links with social good: "Entrepreneurs strive to make a difference in our world and to contribute to its betterment. They identify opportunities, mobilize resources, and relentlessly execute on their visions" (pp.3). Furthermore, entrepreneurship "is more than the creation of a business and the wealth associated with it. It is focused on the creation of a new enterprise that serves society and makes a positive change" (pp. 4).

In the world of social entrepreneurship, social innovation plays a very important role. According to Godin (2012) social innovation occurs when presenting a new idea, or when interest in an idea is presented as new or relatively new (pp. 5). As a concept, it "would necessarily have appeared after that of technological innovation" (pp. 6). At the beginning of the 20th century, social innovation meant socialism or social reform (economic and political context in Europe and North America in the 20th century). As Godin explains, it "owes its origin to socialism, and its resurrection (in the twenty-first Century) to technological innovation" (pp. 43.) At present, there is no consensus regarding the meaning of social innovation; its meaning changes depending on the context in which it is discussed.

According to Mulgan *apud* Godin (2012), social innovation is about "new ideas that work in meeting social needs or, more specifically, innovative activities and services that are motivated by the goal of meeting a social need and that are predominantly developed and diffused through organisations whose primary purposes are social" (pp. 37). At the same time, "social innovation is concerned with anything 'social', whatever it may be." (pp. 39). Also, according to Murray *et al. apud* Godin (2012)

Social innovation may be defined as [...] a goal and/or its form/type. To many present day researchers, the source is necessarily the community, the goal is anything and social innovation is "alternatives" to current ways of doing things. By contrast, to early writers the 'social' of social innovation refers simply to (diverse) changes introduced into society by individuals, groups and organizations (pp. 40).

In a context of social entrepreneurship, the crowdfunding and crowdsourcing platforms are becoming an interesting alternative to the achievement of projects and to the pursuing of money without intermediaries. We describe how these platforms work and discuss its potential to democratize access to capital and resources.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

2. Crowdsourcing and Crowdfunding

What Is Being Done and How It Arranges the Now Economy (Means of Production) and Digital Inclusion Actions

According to González-Ladrón-de-Guevara (2012) crowdsourcing is a relatively recent concept that encompasses many practices. This diversity leads to the "blurring of the limits of crowdsourcing that may be identified virtually with any type of internet-based collaborative activity, such as co-creation or user innovation" (pp. 3)

Howe (2009) was the first author to examine the world of crowdsourcing. He defined crowdsourcing as the practice of obtaining services, ideas, or content through contributions from a large group of people online instead of traditional employees or suppliers. As such, crowdsourcing combines the efforts of many participants who decide independently to take the initiative to contribute to an existing project.

According to Howe (2009), the community or crowd has a power and intelligence to create innovative and high quality things or activities. There are numerous successful projects and Open Source initiatives such as Wikipedia. Other examples abound. Communities have the autonomy and capacity to analyze up patents such as the Project Peer-to-Patent. Of course, not everything in the online universe contributes to knowledge or even content, but there are certainly high quality examples for one simple reason: a small percentage of a high number is still a high number. Such is the case of Youtube, which hosts about 100 million videos. If we consider that 1% of them offer high quality content, then Youtube has 1 million outstanding videos. No television or radio broadcaster has the potential to offer as much high quality content.

Much as the different types of media are already saturated with so much material that is produced minute by minute by online users, the process of collecting this material only accelerates because producing and distributing content is becoming easier and cheaper. Costs are decreasing due to the democratization of the means of production and the access to the internet, which is available in many primary schools and used by children at a very early age. Regarding digital natives, Ragnedda (2013) points that in the U.S. show that 93% of Americans between 12 and 17 years old are regular users of the Internet and of these, 64% create content.

In a context of democratization of access to digital technologies, crowdsourcing and crowdfunding are changing not only the logic of connected behavior, but also the market structure and labor. Companies will not stop existing. Neither will professional expertise. Capital and a production line will always be necessary to generate a physical product like a plane, a refrigerator or a car. However, businesses built on top of intangible capital (intellectual capital) will be organized in different companies in the industrial world order.

In light of these changes, it is interesting to explore the power of communities such as the ones created by the company TopCoder. It builds communities using software generated in programming competitions and codes that produces high quality programs, with a mean of 0,98/1.000 bugs LOC. Another interesting example is uTest, which uses the power of the community to test software. This is the result of the Theorem of Diversity Overcoming Capacity, which suggests that innovation comes from diversity and not homogeneity. Communities are heterogeneous by nature, even when centered on common interests.

As the etymology of the term crowdsourcing suggests, crowdsourcing combines the words "crowd" and "outsourcing". It is different from regular outsourcing as an undefined public as opposed to perform work requested from a specific group of individuals. Successful examples of crowdsourcing show how

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

the power of the many can be used to accomplish various goals for the common good. It also shows the emergence of amateurism as a transformative force in the online world.

At present, there are different types of crowdsourcing models around the world. The main platforms allow to: 1) hire specific services through different a pool of applicants, or, 2) conduct projects with the participation of volunteers. In the first case, the crowdsourcing platform functions as a kind of administrator that offers job opportunities aimed at specific groups of professionals (designers, copywriters, etc). Individuals offer their services but only one of them can be chosen to do the proposed job. For example, Design Crowd, allows crowd source designers to create different types of objects (web, logo, business cards, etc).

The second type of crowdsourcing initiative is closer to the concept of social entrepreneurship as it seeks to get people to contribute to the development of a social project for the common good (e.g projects related to the environment, the protection of animals or the creation of a music school). Internationally, one of the most famous crowdsourcing platforms is Catchafire. This website, which acts as a mediator between NGOs and social enterprises and qualified volunteers, however, charges a fee for its mediation. Other platforms, conversely, allow organizers and volunteers to contact each other directly, without charging a fee.

DoSomething.org, platform whose slogan is "to make the world suck less" is a great example of a non-profit crowdsourcing platform. The largest NGO for young people and social change, with 2.5 million members, tackles campaigns that affect every cause (from poverty to violence, to the environment, to literally everything else). 1% Club, Goteo and Fandyu are also very interesting initiatives, as they offer both crowdfunding and crowdsourcing services to find financial aid and volunteers at the same time.

The term crowdfunding refers to online fundraising through multiple funding sources, which are generally individuals and entities that are interested in the proposed projects. The term talks about donations or "kitties/goodies" made online. In the current global economic crisis, small businesses are struggling more than ever to survive, and entrepreneurs are finding very few opportunities to get investors and other sources of funding. Crowdfunding offers these people a possibility to share their ideas and projects with the entire world and get the funding that they need.

There are numerous crowdfunding platforms where individuals can ask for or donate money. Kickstarter, Indiegogo, RocketHub, or Catarse in Brazil are among the most popular ones. While each site offers a unique spin of its own, the general concept is more or less the same. Project creators can create a profile typically containing a short video, an introduction to their project, a list of rewards per donation, and some images to draw attention. The idea is to create a compelling message that readers will access.

Projects that use crowdfunding generally have a monetary goal for the project to be feasible. If the raised amount does not meet the goal, the money is given back to the donors. This operation is called "all or nothing." According to Inc.com, potential investors are more inclined to support "all-or-nothing" (AON strategy) initiatives, which typically provide more detailed information on the campaigns.

Other crowdfunding initiatives allow people to keep the money they raised even if they did not reach the proposed goal. In such cases, platforms tend to charge a higher administrative fee. It is interesting to point out that even if virtually all crowdfunding platforms charge an administrative fee and deduct it, there are a few sites that do not charge any administration or transactions fees to the donor.

Some crowdfunding are focus on charity fundraising (e.g. buying food after natural disasters, shipping medical supplies, etc.) Other platforms also help to achieve personal goals of all types (eg, affording a trip across Europe, university costs, the purchase of a cell phone). One example is the platform Go Get

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Funding, an English-based fundraising site to raise money for anything: from paying for a pet's medical bills, to creating a short film.

There is yet a different type of crowdfunding initiatives, which seek to help entrepreneurs find investors for their projects or start-ups. They are the "investment/equity crowdfunding" platforms. Equity-based crowdfunding is the collective effort of individuals to support efforts initiated by other people or organizations through the provision of finance in the form of equity. These initiatives allow investors to support entrepreneurial projects and gain equity. At present, Crowdfunder is one of the most successful equity crowdfunding platforms in the world. This platform blends donation-based and investment crowdfunding models, and encourages online and offline crowdfunding and collaboration.

2.1 Crowdfunding in Brazil

A Panorama of National Resources

Crowdfunding is a global phenomenon that has brought about much success in many parts of the world. In Brazil, it could not be any different. One of the most famous Brazilian platforms is Catarse.me, an Open-Source crowdfunding site that seeks to help finance creative projects. Individuals who back Catarse.me projects wins tangible rewards and special experiences in exchange for their pledges. At present, Catarse.me is one of the most famous (if not the most famous) crowdfunding platform in Brazil.

In 2013, Catarse.me conducted a survey to get to know the profile of people who make collective funding happen in Brazil. Also to understand the behaviors, motivations and reasons why people support a project, and analyze the current scenario of collective funding in the country. Finally, the survey shares the perspective of project developers who have used the Catarse platform" (catarse.me). 3336 people answered a survey between July and August 2013. Below, we present a few graphs that will help us understand the current panorama of crowdfunding in Brazil.

As we can see, according to the survey conducted by Catarse.me, the general trend in most Brazilian regions shows a correlation between the Brazilian population and participation in collective financing. In the North and Northeast of the country, where Internet access is more limited, there is less participation (9% in the northeast, 7% in Midwest and 1% in the North).

In the Southeast and South, where access to the Internet is significantly higher, participation is also higher (20% in the South and 63% in the Southeast). This percentage reflects the fact that most users have access to the Internet in their own homes. In addition, State governments provide a large number of public Internet access points. For example, the AcessaSP, Digital Inclusion Program, run by the state of São Paulo (South East Brazil), offers at present more than 760 infocenters in the state of São Paulo and is in the process of opening 190 more.

In the world of crowdfunding in Brazil, the age of the surveyed participants corresponds to the national working-age population. As we can see, 97% of them are between 18-60 years of age, and the most representative age group is that of 25-30 years (31%). This age group corresponds to the digital immigrants group, that is, people who have been born in the analog era and transitioned to the world of digital technologies. According to Passarelli (2007), this group still needs to develop media, digital, and information literacies.

Figure 2 also shows that 74% of the people who participated in crowdfunding campaigns have completed university studies (undergraduate or graduate). Interestingly, 35% of them have completed a postgraduate program, which highlights the importance of higher education for the development of

digital literacies. Finally, there is a significant difference in terms of gender, 59% of participants are male, while 41% are female.

Before commenting Figure 3, it is important to clarify that the minimum wage in Brazil is 724 reais (which is approximately 320 USD). It is very unlikely that individuals with this monthly income participate in crowdfunding projects for various reasons, the main one being their limited access to information and technologies. Table 3 shows that the majority (54%) of the surveyed participants has a monthly income of up to 6000 reais (3000 USD, based on the current exchange rate). About 29% earn between 3000 and 6000 reais (1300 to 2600 USD), when 24% earn between 1500 and 3000 reais (650 to 1300 USD), and 21% have a very low income of up to 1500 reais (about 650 USD). The low participation of individuals with higher income might be related to an easier access to bank loans.

It is also important to consider that crowdfunding initiatives play a key role in configuring a new way to create employment and foster financial inclusion. Crowdfunding, then, may signal a change in patterns of economic behavior. Bauman (2008) sees a relationship between the state versus the individual and autonomous production. He says that these initiatives are interrelated and are a consequence of each other: if an individual does not succeed by means of government or public initiatives, he/she looks for private and / or autonomous initiatives, and vice versa. However, in this context, the market remains at the center, even when crowdfunding and crowdsourcing are involved as economic initiatives.

Figure 4 shows areas of interest for project development and also the areas where participants perceive that there is a lack of relevant projects. According to the surveyed participants, the category where there is greater opportunity to get funding, considering people's interests and the lack of relevant projects, is mobility and transportation. In general, projects that intend to contribute to improve the community and society are well funded all over the world. In countries such as Brazil, where government funding to support social and creative projects is very limited, crowdfunding emerges as an increasingly popular means to finance projects.

The two areas that incite least interest are fashion and carnival. The lack of interest could be explained by the fact that Brazilians tend to perceive fashion and carnival as leisure activities despite the cultural component that both possess. Education, environment, community, science and technology, social businesses, and architecture and urbanism are also sectors that raise interest and have a significant lack of relevant projects. Music, cinema and video, cartoons, literature, photography, design, theater, games

Source: Catarse.me (Own translation)

and fine arts raise interest but already constitute popular categories for project development. Very often, projects that contemplate a huge social change are difficult to be completed. However, practical good causes that have a direct impact on society are more likely to get support and receive funding.

2.2 Crowdfunding and Crowdsourcing Around the World

As a part of a research project sponsored by the AcessaSP program - Scientific Connections (2014), we mapped and described crowdsourcing and crowdfunding platforms that seek to promote social entrepreneurship around the world.

We used the following criteria to select the platforms:

1. The main goal of the crowdsourcing platforms should not be hiring specific services but supporting social entrepreneurship projects that require working as a team;
2. Crowdfunding platforms should not be aimed solely at developing charity projects or achieving personal goals (e.g. go on a trip, go to college, pay a medical bills etc.); and
3. The platforms should not be investment / equity crowdfunding websites.

At present, crowdsourcing websites are the most innovative crowd solving tools. They provide updated information about what is taking place in every region of the planet, and connect potential change makers with people who need help in order to crowd solve very important issues. In addition, crowdsourcing websites provide access to very creative tools, useful information, and contacts to reach organizations that are already contributing to alleviating important social issues. As such, they allow associations and project developers to scale or duplicate their past efforts in new areas and inspire new users to create projects or adapt existing projects to address the needs of their respective communities.

We found only 6 platforms that offer the service of crowdsourcing based on the criteria mentioned above: Project Free World, Catchafire, Do something, 1% Club, Goteo, Fandyu. The Project Free World believes that "collectively, humanity has no limits on time, money, or resources. People have created

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

these problems together. So there's no reason they can't be solved together." Another great example is Catchafire, a "community of individuals striving to push the social good sector forward by focusing on efficient and effective ways to give back." One way Catchafire does this is by "matching professionals with nonprofits based on their skills, cause interest and time availability." They are committed to providing transformational volunteer experiences, to do so, they make sure that all of that nonprofits that are included in their platform have demonstrable impact, strong leadership and are aligned to the platform's proposed mission. The platform's goal is to "provide a significant return on investment for the partners and save them time, money and resources in finding talented and passionate individuals who have the potential to become long term advocates."

We found 61 platforms that offer crowdfunding services in Brazil and around the world, based on the chosen criteria. Some of them are: 1% Club; 100 days; *Benfeitoria* (Well Done Factory); Biayda; *Bicharia* (Animaly); Catarse; *Causa Coletiva* (Common Caude); Change Heroes; *Clube do Financiamento Coletivo* (Collective Financing Club); *ComeçAki* (Starts Here); Crowdonomatic; Crowdrise; Doare; Embolacha; Eppela; *Eu Patrocino* (I Fund); *Eu Socio* (Me Partner); Fandyu; Fundit; Fundrazr; *Garupa* (On the Road); GoFundMe; GoGetFunding; Goteo; Guigoo; Ideame; Ignite Intent; *Impulso* (Impulse); Indiegogo; JumpStarter; *Juntos* (Together); KickStarter; Kickante; Kiva; Kolmea; Mimoona; Mobilize; Moola Hoop; *Muito Nós* (Lots of Nodes); Music Raiser; Opote; Pantreon; Partio; Peerbackers; Pifworld; Pledgeme; PPL CrowdFunding Portugal; *Quero Incentivar* (I Wanna Fund); Rocket Club; *Salve Sport* (Save Sport); Sibite; *Startando* (Getting Started); Starteed; StartSomeGood; Ulule; Vakinha ; Variavel 5; Verkami; We Make It; When You Wish Brasil; and Zarpante.

All the selected platforms seek to offer online funding possibilities to support impactful and creative initiatives around the world. The names of some of the platform already suggest their goals, as in, for example: Jump Starter, *ComeçAki* - that in English means "Starts here", and KickStarter. Other platform names show the area they focus on, as in: Music Raiser - which supports projects related to music; *Salve Sport* (Save Sport) - which supports projects related to sports and health; and Bicharia - which supports projects to help animals and pets. Another good example of creative names associated with the goal of the platform is the crowdfunding initiative "Juntos", which would be equivalent to the term "Together". This kind of platform name conveys in a very simple but effective way the idea of getting both supporters and entrepreneurs to collaborate in a common project.

In addition, there are various categories that are included in all the listed platforms (crowdfunding and crowdsourcing). The categories are based on the key-words provided in the selected websites. They are as follows: General (it allows projects from all areas to participate to be funded or recruit volunteers). Arts and Culture (it contemplates projects about music, fine arts, festival, book production, etc.). Social and Education (it addresses projects that seek to improve the lives of individuals from a specific community or promote education). Entrepreneurship (for business, entrepreneurship, and social entrepreneurship initiatives). Creativity, Technology and Innovation (very similar to the Art and Culture category, but it focuses on projects that are centered on technologies and innovation). Environment and Sustainability (for projects that seek to find sustainable solutions for environmental problems). Animals and Nature (for projects that seek to save or help animals in risk areas, improve the lives of animals, etc.). Sports and Tourism (for initiatives that intend to develop sports programs, disseminate knowledge about a touristic destination, etc.)

Internationally, two of the most famous and popular reward-based crowdfunding platforms are KickStarter and Indiegogo. According to Forbes contributor Schroter (2014), the most successful business crowdfunding campaigns can be found on Kickstarter, Fundable, and IndieGoGo. Schroter

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

elaborate a list of "top 10 business crowdfunding campaigns of all time", which includes the following three crowdfunding campaigns: the Pebble E-Paper Watch, which raised $10,266,845 in 37 days and seemed to create the first affordable smartwatch in the market. The Ouya open-source game console, which raised over $8.5 million in 29 days. And Pono, which raised over $6 million raised in 30 days and promises to deliver a music listening experience that allows users to hear music as the artist intended. These are just some examples of successful crowdfunding campaigns that have had a high impact in an entrepreneurial context.

Next, we examine important data based on the crowdfunding platforms that were selected and included in the mapping, elaborated for the Scientific Connections (2014) research project.

2.2.1 Social Media Followers: Facebook and Twitter

The most important social network where crowdfunding platforms find followers is Facebook. 32.5% of the crowdfunding platforms have a very low number of followers on Twitter (up to 1000). The "Not applicable" category (18.2%) corresponds to platforms that have no Twitter account or have an almost nonexistent number of followers. This means that 50.7% of the platforms do not use Twitter to get followers. In contrast, 58.5% of the platforms have Facebook pages with more than 5000 followers.

2.2.2 Rewards

On most platforms, reward are an incentive (55.7%). Platforms included in the "Does Not Apply" category (36.7%) usually do not give the possibility to offer rewards or do not have clear policies regarding the rewards. Based on the instructions and tips that are on the platforms, it seems that rewards are key factors for project success.

It is noteworthy that the rewards/goodies of the platforms surveyed are of varied types and values. The platforms do not encourage project developers to offer cash as rewards. Some even determine "everything but money" (like the platforms Moola Hoop and Impulso). The key is to make a commitment

Figure 5. Number of Followers on Facebook

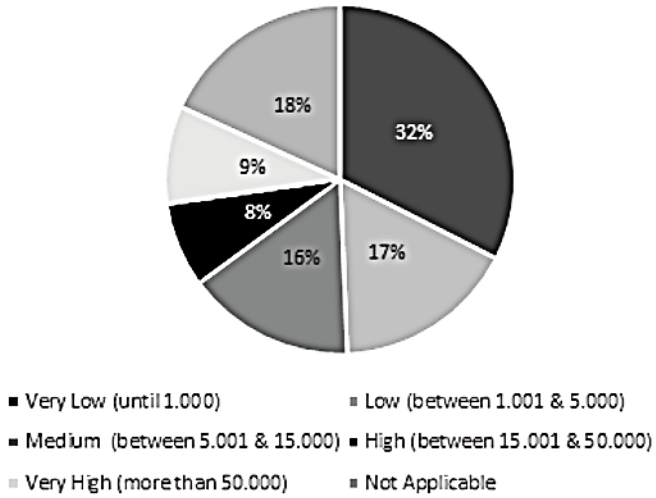
Figure 6. Number of Followers on Twitter
Source: Scientific Connections 2014

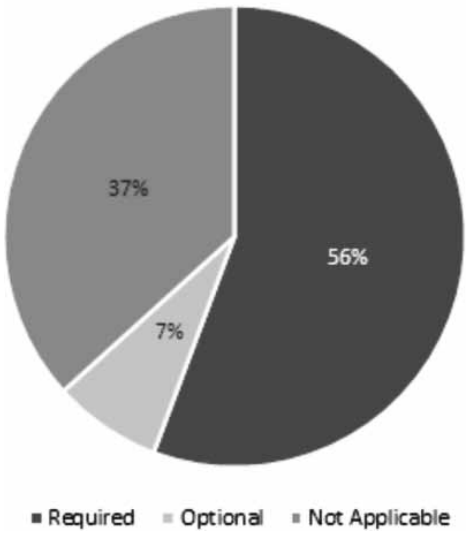


that can be fulfilled, so perks can be objects, acknowledgements, thank-you notes, services, events, or "anything that does not violate our Terms of Service" (as specified in Indiegogo). It can also be a copy of what is being produced (CD, DVD, book), a discount in stores (Bicharia offers 50% off).

3.3.3 All or Nothing System vs. Partial Earnings

Most platforms only use the "all or nothing" system (47.4%). Many of them explain in their terms of service that they only use this system because only projects that achieve their monetary goals are able to

Figure 7. Rewards
Source: Scientific Connections 2014



EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

complete projects and deliver the promised rewards. Other platforms accept to transfer the money that raises even if the monetary goal is not met, but they charge a higher administrative fee in such cases.

3.3.4 Citizenship Restrictions

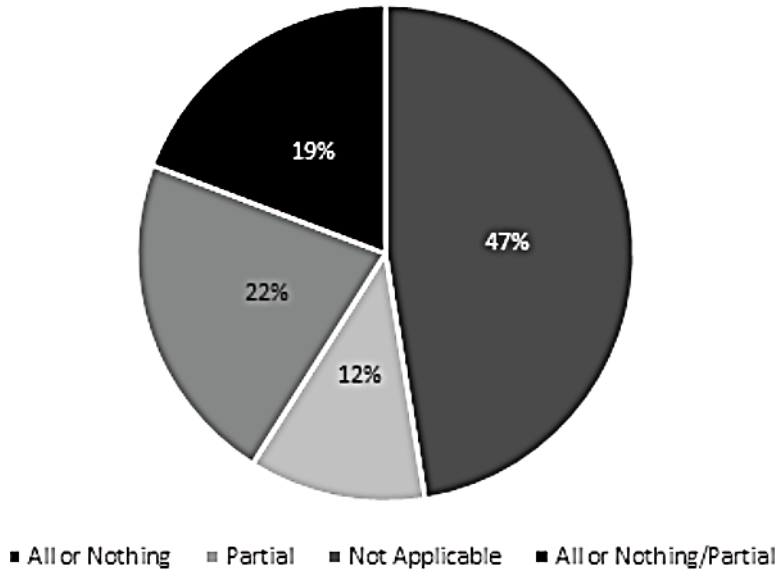
72.5% of the platforms have no citizenship-based restrictions. The global trend is to allow the participation of all people who can open a PayPal or MoIP account. However, the linguistic factor probably affects how people choose a platform. Even when platforms translate into English and other languages and have no citizenship-based restriction, most of them show projects in only one language.

3.4 Social Entrepreneurship / Social Technology Prizes

As a complement to the Conexões Cientificas 2014 research project, we also looked at the important elements when awarding prizes to social entrepreneurship/social technology projects. Prize criteria are a good means of understanding what makes a project successful and impactful in a crowdfunding context. We selected the following social entrepreneurship / social project awards to elaborate a list of with the most common criteria:

1. Google Global Impact;
2. Pasha Fund - P@SHA Social Innovation Fund;
3. Gründer-Garage (Google sponsored);
4. Youth Citizen Entrepreneurship Competition;
5. Prize Kopf schlägt Kapital, Stiftung Entrepreneurship;
6. Do Something;
7. Unreasonable Institute;

Figure 8. All or Nothing System / Partial
Source: Scientific Connections 2014



EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

8. Echoing Green;
9. The Social Entrepreneur of the Year Competition (Schwab Foundation for Social Entrepreneurship);

Below, we present a summary with the description of the most common criteria:

1. **Technology:** Projects must use technology to add value to a specific community or solve a problem that is affecting society in general.
2. **Innovation:** Projects must propose a creative and innovative solution to a clearly identified problem (or a major contribution to society).
3. **Feasibility:** Projects should identify a concrete problem and propose a realistic and feasible solution. They should anticipate possible difficulties and explain how these difficulties would be addressed, or explain which challenges might stand in the way and how they will be overcome. Team members must be clearly identified and be capable of performing the proposed actions (it is important to demonstrate that they have prior experience in their proposed roles). Projects must explain how the prize money will be used and how the plan will be executed.
4. **User Centered:** Proposed solutions must be user focused.
5. **Sustainability:** The solution must be sustainable once the prize money has been invested.
6. **Scalability:** The project should be able to be replicated / multiplied elsewhere or by others.
7. **Representation:** Prize recipients should be willing and able to become ambassadors that represent and contribute to the growth of the organizing association.

Many crowdfunding platforms also take these criteria into consideration when choosing or curating projects. They also offer assistance and helpful information to make sure projects are sustainable. Sustainability is a key aspect in a crowdfunding context because campaigns are not ongoing; they are a one-time experience that means to help people kick-start a project. That is why projects should be able to continue after the raised money is used up. According to The Social Entrepreneur of the Year Competition (Schwab Foundation for Social Entrepreneurship), the potential for social change is also key. They seek projects that achieve transformative social and/or environmental change through the application of innovative and practical approaches to benefit society in general, with an emphasis on underserved populations. The innovation can take the any form in everywhere.

Scalability and the possibility to replicate a project are also important as crowdfunding platforms are building a project database that works as a source of inspiration for new, experienced and inexperienced project creators. In the article "The dynamics of crowdfunding: An exploratory study," Mollick (2014) also examines key aspects that lead to project success in a context of crowdfunding. His research seeks "to develop initial evidence about the nature of crowdfunding and its role in entrepreneurship research" (pp. 4) and "examine the key issues around crowdfunding from the perspective of entrepreneurship: its links to existing theory, the effects of a new form of fundraising, and the success or failure of the process" (pp. 4). According to Mollick,

Projects generally succeed by small margins, or fail by large ones. Social capital and preparedness are associated with an increased chance of project success, suggesting that quality signals play a role in project outcomes. Geography also appears to be linked to the nature and success rates of projects. Finally, the vast majority of founders attempt to deliver products promised to funders, but relatively few do so in a timely manner, a problem exacerbated in large or overfunded projects (pp.13).

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

As we can see once again, social capital and preparedness, which are directly related to project feasibility, also emerge as key elements. Interestingly, the ability to deliver the promised rewards also constitutes a key factor, which is why many crowdfunding platforms offer extensive information on how to create low-cost and quality incentives.

4. Final Considerations

This chapter aimed to analyze the development of crowdfunding and crowdsourcing platforms in Brazil and around the world, exploring its key role as a catalyst for social inclusion. We presented relevant information about digital inclusion and its connection with social inclusion. Three essential key concepts were collective intelligence, hacker ethics, and social entrepreneurship. Finally, we examined the current state of development of crowdfunding and crowdsourcing platforms in Brazil and around the world through an extensive mapping of the various platforms. Through the graphs from Catarse.me and the Scientific Connections 2014 Research Project (sponsored by Digital Inclusion Program Access São Paulo), it was possible to produce a socio-economic overview of crowdfunding and crowdsourcing activities, as well as an analysis of important data based on the guidelines and rules that platforms employ to increase the projects' success rate.

Through this analysis, it is possible to envision that crowdfunding is opening new possibilities to provide democratic access to funding and to create new opportunities to promote online social entrepreneurship, both in Brazil and around the world. According to Mollick (2014), "Increasingly, [...] crowdfunding appears to be a viable source for entrepreneurial seed capital, allowing entrepreneurs to raise the initial money required to start their new venture. For example, of the fifty highest funded projects through 2012 on Kickstarter, the premier crowdfunding site, 45 have turned into ongoing entrepreneurial firms" (pp. 3). As such, crowdfunding is proving that it has the potential to take the place of bank loans in a context of start-up creation / accelerator. Investment / equity crowdfunding, in a similar way, could become an interesting alternative to the stock market, eliminating commissions and intermediaries and allowing people with no prior experience in investment to support and become involved in a start-up of their choice.

In Brazil, crowdfunding is not yet widely known by the population, but it is growing at a very fast pace. The number of crowdfunding platforms that exists in Brazil and in the world increases every day. For example, according to Catarse.me data (available on the blog.catarse.me) in 2011, the best project of the year on the platform had 285 supporters, raising over 25.000 R$ (approximately 11.000 USD based on the current exchange rate). This year's (2014) best project had 3200 supporters and raised over 206.000 R$ (about 91.200 USD based on the current exchange rate). Unfortunately, many project still are unsuccessful and end up closing down. Some of them keep appearing in search engines, even if they are not updated, which can create confusion among users and potential supporters.

Crowdsourcing as a tool to promote social entrepreneurship is less developed than crowdfunding, both in nationally and internationally. In fact, in Brazil, there is no platform to promote collaborative work in a context of social entrepreneurship. However, many crowdsourcing websites offer job opportunities, which means that crowdsourcing is becoming an interesting job alternative and is changing the way companies and individuals hire people.

This means that a completely new scenario is being created based on crowdsourcing initiatives. A new economic perspective is arising, leading to new hiring and funding processes. Crowdsourcing platforms are also offering new possibilities to develop ideas and projects (mainly in social, cultural and environmental issues) that before were not feasible. Finally, both crowdfunding and crowdsourcing,

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

are becoming key factors to encourage people to develop their entrepreneurial projects in a context of digital and social inclusion.

Also enables the awareness that we are not alone and that a collective effort can be successful. Social entrepreneurship preaches it, and adds the collective as an alternative to "make, prepare and think". The collective sense denotes not only the fact that people help each other, but also the fact that anyone can be a protagonist and can also be able to create your own initiative in the Web Universe. As we have seen, not only are they are democratizing access to capital and resources, but also they are also bringing the world of entrepreneurship into everyone's homes. Provide discussion of the overall coverage of the chapter and concluding remarks.

KEY TERMS AND DEFINITIONS

Crowdfunding: Crowdfunding is the practice of funding a project or venture by raising monetary contributions from a large number of people, typically via the Internet. One early-stage equity expert described it as the practice of raising funds from two or more people over the internet towards a common Service, Project, Product, Investment, Cause, and Experience. Three types of actors fuel the crowdfund-

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

ing model: the project initiator who proposes the idea and/or project to be funded; individuals or groups who support the idea; and a moderating organization (the "platform") that brings the parties together to launch the idea.

Crowdsourcing: Crowdsourcing is the process of obtaining needed services, ideas, or content by soliciting contributions from a large group of people, and especially from an online community, rather than from traditional employees or suppliers. This process is often used to subdivide tedious work or to fund-raise startup companies and charities. It combines the efforts of numerous self-identified volunteers or part-time workers, where each contributor of their own initiative adds a small portion to the greater result. The term "crowdsourcing" is a portmanteau of "crowd" and "outsourcing"; it is distinguished from outsourcing in that the work comes from an undefined public rather than being commissioned from a specific, named group.

Digital Inclusion: Digital inclusion is commonly defined as the incorporation of information technologies into the community in order to promote education and improve the quality of life.

Means of Production: In economics and sociology, the means of production refers to physical, non-human inputs used in production; that is, the "means of production" includes capital assets used to produce wealth, such as machinery, tools and factories, including both infrastructural capital and natural capital. This includes the "factors of production" described in classical economics minus financial capital and minus human capital. They include two broad categories of objects: instruments of labor (tools, factories, infrastructure, etc.) and subjects of labor (natural resources and raw materials). If creating a good, people operate on the subjects of labor, using the instruments of labor, to create a product; or, stated another way; labor acting on the means of production creates a good.

Social Entrepreneurship: Social entrepreneurship is the process of pursuing innovative solutions to social problems. More specifically, social entrepreneurs adopt a mission to create and sustain social value. They draw upon appropriate thinking in both the business and nonprofit worlds and operate in a variety of organizations: large and small; new and old; religious and secular; nonprofit, for-profit, and hybrid. Business entrepreneurs typically measure performance in profit and return, but social entrepreneurs also take into account a positive return to society. Social entrepreneurship typically furthers broad social, cultural, and environmental goals and is commonly associated with the voluntary and not-for-profit sectors. Profit can at times also be a consideration for certain companies or other social enterprises. Social entrepreneurship practiced in a world or international context is called international social entrepreneurship.

Social Inclusion: Social inclusion aims to empower poor and marginalized people to take advantage of burgeoning global opportunities. It ensures that people have a voice in decisions which affect their lives and that they enjoy equal access to markets, services and political, social and physical spaces.

Social Technology: "Social technology" is defined as applying the use of social science theories and methods implementing related technologies for specific purposes especially social ones: to ease social procedures via social software and social hardware, which might include the use of computers and information technology for governmental procedures. It has historically referred to two meanings: as a term related to social engineering, a meaning that began in the 19th century, and as a description of social software, a meaning that began in the early 21st century.

ABSTRACT

This chapter looks at the adoption of general social media applications on usefulness for business, comparing the factors that influence adoption at work between Japan and the United States. In Japan, ease of use and usefulness for collective knowledge in general social media are predictors of usefulness for business social media, and in the United States, only usefulness for collective knowledge is a strong predictor of usefulness for business. The authors did not find behavioral intention to use social media in the workplace to be an important factor in predicting the usefulness of social media for business. The value of this research is its ability to understand the use of social media in the workplace to include how the experience of social media impacts on the expectation of usefulness for business and how the impact of ease of use differs from Japanese to the United States because of cultural, technological, and market reasons.

INTRODUCTION

This research paper addresses the impact from general social media perception or experience to perception of social media usefulness at work in both Japan and the United States. Is there a difference? It appears that culture may have an impact on the use of social media. Social media is defined as "a group of Internet-based applications that build on the ideological and technological foundations of Web 2.0, and

that allow the creation and exchange of User Generated Content" (Kaplan & Haenlein, 2010). Kalamas, Mitchell, and Lester (2009) defined social media as, "a communication medium that is devoted to or characterized by interaction between participants or consumers of the medium".

The worldwide rapid diffusion and growing popularity, potential risks, negative impacts or controversial issues of social media exists. Das and Sahoo (2011) describe the impact of social networking on individuals: "The growing popularity of social networking sites (SNS) among the Internet users demands an introspection of personal and social behavior of human beings. Today 1.5 billion people across the world have their profiles in social networking sites. Everything looks nice when you create a profile on social networking site, but how you feel when someone starts blackmailing using your personal data. Your boss threatens to fire you for posting comments on SNS. You feel compulsive to check your profile during work hours. SNS becomes a reason for anxiety and addiction. It starts affecting personal relationship with spouse and family members. Such sites make private life and public life of an individual a digital document." However, it might be true that still many practitioners and researchers anticipate massive opportunities, positive impacts and abundant harvest from usage of social media in the workplace, even though the way to success is still ambiguous. Many people, especially the younger generation, have already had some experiences with social media at least in private settings. Before discussing effective and/or efficient usage of social media in the work place, it might be useful for us to clarify ordinary people's needs or expectation to social media in workplace.

Internal corporate use of social media has reported in articles, especially in big global companies such as IBM (2010) and Ernst & Young (Williamson, 2009). Social networking has increased collaboration at IBM. The article explained effects to increase collaboration in IBM by using internal social networking. The article showed preferable effects of implementing social networking to increase internal collaboration in a company (Greenberg, 2009). According to Williamson (2009), a partner at Ernst & Young and the company's Americans Inclusiveness Officer, communication with team members is the most important task for virtual team managers. For efficient and effective communication, managers inevitably use both traditional media and the latest innovative technologies. They should use not only e-mail and a company intranet but also 'a community home space', which seemed to be an equivalent word to 'social networking site', to help virtual team members connect with each other and engage in the team. Moreover Williamson (2009) pointed that telephone call, face-to-face meeting and an annual onsite company-wide event are also important to manage a global company. It means social media should be used as one of communication technologies in global work place and we should understand the country and cultural difference of social media.

One of the benefits of social media is the ability to reach a large group of people by tapping into the network. Each person has their own network and each node in the network taps into a completely different group of people. This creates a very large audience to reach people in general. Many of these social media services are familiar to the younger generation. Annetta (2008) explained that younger social media users spend an average of 6.5 hours a day using variety of media. Managers believe that younger workers are more likely to create high level of emotional engagement when using social media in the workplace. Robinson (2006) also discussed that the increased participation in the use of social media potentially leads to greater attendance by workers and potentially a higher recollection of while at work. Divol, Edelman, and Sarrazin (2012) found that companies invest millions of dollars in social media, with little understanding of how it influences consumers to favor their brands or buy their products. Without knowing how social media affects consumer behavior, companies run the risk of aiming

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

it at the wrong targets, wasting time and money on ineffective efforts, and generally failing to harness its potential. Bennett, Owers, Pitt, and Tucker (2010) found that the business advantages and benefits of social networking in the workplace are still very much underappreciated and undervalued. Some organizations across the world have started to implement some of the facets of social networking technology and reap the business benefits (Hathi, 2010; Williamson, 2009).

As mentioned above, the use of social media has expanded and many people use different types of social media in their private life. Past studies showed that technology experience enhanced users' perception of ease of use of the technology (Venkatesh, 2000; Venkatesh & Davis, 1996). It is possible that the use of private general social media experience might have impact on the expectation of social media at the work place. Therefore, it is the purpose of this research to clarify the impacts from general social media perceptions or experiences to perception of social media usefulness at work in both Japan and United States. We came up with two broad research questions:

- What are the predictors for expectation to social media at workplace?
- What are the experience levels of general social media perception and country difference?

LITERATURE REVIEW

Social Media and the TAM Model

Davis (1989) proposed Technology Acceptance Model (TAM) and he showed that perceived usefulness and perceived ease of use were antecedents of user acceptance were user attitude and behavioral intention. From that time, tremendous researchers applied TAM. Since technology adoption is not only influenced by a user's own preferences, but also by the norms and beliefs of the cultural environment, technology adoption and consumer behavior is culturally specific and articulated within or in relation to specific cultures (Yang & Jolly, 2009).

Lee, Xiongb, and Hu (2012) analyzed users' attitudes and intentions in Facebook and clarified that ease of use had indirect impacts on the attitudes. They found that valence, the continuum of positive and negative emotions, has a direct strong relationship with perceived ease of use which, in turn, impacts perceived enjoyment of using social media, and then affecting attitude toward using Facebook. Perceived usefulness and perceived ease of use were not directly related to attitude toward using social media. This indicates the need to consider other factors in explaining intention to use social media.

Lin and Lu (2011) studied why people continue to join SNS and found that usefulness is one of the influential factors in people's continued use of SNS. Like Lee et al. (2012), perceived enjoyment had a strong impact on continued intention to use social media

Leng, Lada, and Muhammad (2011) analyzed SNS adoption in Malaysia using TAM. They showed that ease of use has an impact on usefulness and that usefulness has impacts on attitude and behavioral intention. Perceived ease of use was found to affect perceived usefulness which, in turn, was found to affect attitude toward social media, similar to Lee et al. (2012). Unlike Lee et al. (2012), Leng et al. (2011) found that perceived usefulness had a strong impact on behavioral intention to use social medial

Lin, Liu, and Kuo (2013) found that perceived usefulness has a moderating effect between attitudes toward using mobile technologies in Taiwan. They also found that perceived usefulness was affected in

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

part by users' perceived ease of use. This indicates that the attitude of users to use general social media may be moderated in part by perceived usefulness and affected by perceived ease of use of that social media application.

The research by Venkatesh and Davis (1996) focused on understanding the determinants of perceived ease of use and usefulness and found a direct relationship between experience and ease of use. Those studies imply that TAM can be applied to social media studies and the social media acceptance may be affected by another information technology or communication media experience.

Social Media and Employees

The importance of embracing social networking as an effective business tool is summarized in Williamson (2009) and Amoroso and Orita (2010). Bennett et al. (2010) found that the main business benefits that social networking tools can have are:

- In the workplace, social networking tools promise to revitalize organizations by harnessing collective intelligence.
- Social networks, blogs, wikis, mashups and RSS feeds can facilitate networked conversations, information sharing and problem solving.
- Rigid hierarchies, corporate silos and walled-off R&D departments can be ripped down and replaced by transparent, open-ended "crowdsourcing" strategies that even bring customers into the collaborative dialogue.
- Power is shifting from executive C-suites to employee cubicles, from companies to customers, from monopolists to markets.
- The potential upside: improved morale, enhanced collective knowledge, increased productivity, sharpened strategic focus, greater innovation. And on the bottom line, higher profits.

Edosomwan, Prakasan, Kouame, Watson, and Seymour (2012) discussed the benefits of social media in business, as listed here, but mostly to promote communication. Social media helps to share project ideas, communicate with customers, receives feedback, and provides a good venue for discussions. Social media will also create brand awareness, but they found that the key factor for success is enabling conversation.

Kane, Robinson-Combre, and Berge (2010) explored how knowledge management and e-learning within an organization are tied together through social networking, thereby causing a strong impact on how people communicate, learn and share knowledge. They found that knowledge management, e-learning, and social networking met the needs of adult learners. Further, they showed why an organization should tap into social networking tools and activities while incorporating them into their knowledge management system to enhance their e-learning and other training activities. Hsu and Lin (2008) found that ease of use and enjoyment and knowledge sharing were positively related to attitude toward using blogging. Also, attitude toward using blogging and community identification (social factors) significantly influenced a blog users' intention to continue to use blogs, explaining 83% of the variance of intention to blog.

The use of social networking websites such as Facebook, MySpace, LinkedIn, and Twitter for recruiting, hiring, or terminating individuals is relatively new. Many questions about using these sites for HR practice have yet to be addressed, including questions about the validity and usefulness of information obtained on these sites, applicant perceptions of employers' use of these sites, and the legality of using these sites, among others. The study by Davison et al. (2011) describes issues associated with using

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

social networking websites for recruiting, staffing/selection, and discipline/termination, and provides recommendations for future research studies in this area. Clark and Roberts (2010) found that employers were making decisions not to hire people based on the information posted on social networking sites. Few employers have policies in place to govern when and how these online character checks should be used and how to ensure that the information viewed is accurate. They explored how these inexpensive, informal online character checks are harmful to society.

Based on those studies, one of the important outcomes of social media is sharing information and knowledge based on social networking. If people use general social media and learn the usefulness for knowledge sharing before using social media at work place, they may expect strong value of using social media in the workplace.

Social Media and Consumers

Social media is used so much in the area of marketing to consumers. Schmidt and Ralph (2012) found that companies need to be able to determine which of the different social media the company should or should not use in marketing their products, services, and/or company. One of the most important uses of social media sites is data collection. It not only provides companies with the ability to obtain massive amounts of information from a wide range of places about their products, services, and company, it also gives them valuable information about their competitors. Divol et al. (2012) proposed a model where social media can be used to develop a customer-oriented process for marketing and sales. The important aspect of this research is the involvement of both consumers and employees at each level and that customers will provide feedback to employees in order to make changes in brand and product. Social media is also used in customer relationship management to connect with consumers and to get feedback.

Social customer relationship management (SCRM) is also a remarkable concept in marketing area. Kotadia (2009) defined social CRM as "the business strategy of engaging customers through social media with a goal of building trust and brand loyalty." Loyalty is an attitude towards a brand that inclines a customer to repurchase it and/or recommend it to others. Social CRM and social media are more about building trust and managing loyalty with customers than about managing relationships or transactions. Greenberg (2009) also found that customer relationship management is not a technology, but a philosophy and business strategy with business rules, processes and social characteristics to support a collaborative environment with the customer. Woodcock, Green, and Starkey (2011) discussed three hurdles of SCRM which pioneers in large companies faced; (1) organizational readiness, (2) over-hype and over-expectation and (3) project management failings. Research by Baird and Parasnis (2011) clarified perception gaps between consumer and business executives showing that companies have some misperceptions regarding why consumers interact with them via social media. However Woodcock et al. (2011) found that the benefits are centered on 'customer engagement' and are not peripheral but fundamental to driving business performance. In addition, SCRM can deliver insight that will help drive real customer centric innovation.

Corporate Social Responsibility

Kaupins and Park (2010) found that corporate social networking sites provide employees and employers with considerable opportunity to share information and become friends. Unfortunately, American and international laws do not directly address social networking site usage. The National Labor Relations

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Act, civil rights laws, and various common law doctrines such as employment at-will and defamation provides the pattern for future social networking laws. Ethical considerations such as productivity, security, goodwill, privacy, accuracy, and discipline fairness also affect future laws. Corporate policies on corporate social networking should balance the employer and employee's interests. Existing laws and ethical issues associated with social networking should impact social networking policies related to configuration, communication, discipline, and evaluation of policies. Chen (2009) examined the growing importance of networks for businesses and found that there are few theoretical studies on the social responsibilities of businesses in such networks, and how these responsibilities are affected by different types of networks.

Cross Country Aspects of Social Media at Workplace

Large global companies introduce social media for business in order to understand and help employees work with country difference of social media. We believe, as other researchers have found, that country differences might have an influence the development of consumers' personalities, which can, in turn, impact the formulation of innate differences, such as innovativeness. Kim, Benedetto and Lancioni (2011) found that consumer innovativeness, defined as the predisposition to buy new things, can differ from one country or culture to another. They found that the generic socio-psychological trait dimension of consumer innovativeness was influenced by the country; whereas the product difference dimension did not have an impact. Further, they found that United States consumers had a higher level of innovativeness than both Korean and Chinese consumers.

The value of more cross-national research in technology acceptance is increasing in the inevitable trend of globalization of markets. Many studies have found that cultural factors influence technology development adoption, system usage, task outcomes, mobile application development and technology management (Baker, Al-Gahtani & Hubona, 2010; Hung, Kang, Yen, Huang & Chen, 2012; Sherer, Kohli, Yao & Cederlund, 2011). Hofstede, Hofstede, and Minkov's work (2010) focused on the cultural dimensions of individualism, power distance, masculinity, uncertainty avoidance and long-term orientation. Individualism is defined as the degree to which a society emphasizes the role of the individual. Uncertainty avoidance is the extent to which people feel threatened by unstructured and ambiguity. Uncertainty avoidance might be a similar construct to risk avoidance and may influence the degree of consumer innovativeness. Pookulangare and Koesler (2011) found culture as a moderating variable on perceived ease of use to intention to use social networks. In an earlier study, Amoroso and Ogawa (2013) also found that perceived ease of use was statistically significant with consumers in the United States, whereas Japanese consumers did not feel the influence of complexity of mobile applications, instead rather enjoyed solving problems related to learning how to use such applications.

We found a number of similar studies analyzing the constructs in our model, examining technology adoption across multiple cultures in two or more countries. For example, Baker et al (2010) found a relationship between social influence factors and cognitive instrumental factors affecting technology adoption in Saudi Arabia. Hung et al. (2012) studied the use of email and instant messaging within Taiwan and United States and found that culture and communication tools jointly affect communication outcome variables individually. Huy et al. (2012) investigated e-commerce adoption by small and medium size enterprises (SMEs) in transition economies, such as Vietnam, finding a positive relationship

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

between attitudes of managers towards innovation and adoption. Shin (2010) conducted a cross-cultural validation of technology adoption between Korea and the United States and found that differences were identified in terms of intrinsic and extrinsic dimensions and can be inferred that user's motivation in different contexts are an important explanatory variable when determining cross-national SNS site usage. Pooukulangara and Koesler (2011) used individualism, uncertainty avoidance and long-term orientation as tree culture dimensions to design their cross-cultural research model. Hung et al (2012) focused on especially individualism/collectivism to analyze culture dimension of communication between U.S. and Taiwan. Shin and Choo (2012) conducted a survey in the United States and Korea to clarify country-specific differences in product value perceptions based on TRA and Hofstede et al.'s dimensions.

RESEARCH QUESTIONS AND HYPOTHESES

Based on existing studies, we sought to clarify the experience of general social media users, the expectation for workplace social media, and the country difference of the social media acceptance. This study focuses on experience levels of general social media perceptions and country difference. After review of previous models and their supported hypotheses on social media use and benefits in the workplace, we have developed the following research questions below and research model (see Figure 1). It was found that experience is important predictor of ease of use and usefulness (Venkatesh, 2000). They focused on understanding the determinants of perceived ease of use and usefulness and found a direct relationship between experience and ease of use. However they did not find that experience levels had any impact on the user's perception on usefulness.

We feel that experience may have a positive impact on not only ease of use but on usefulness with respect to social media adoption because social media users can learn not only how to use social media, but also how useful social media can be when users experience the communication and collection useful knowledge using social media. Therefore we hypothesize that the experience for social media utilization may have a direct effect on the expectation of usefulness for social media at the workplace.

RQ1: How does the experience of general social media impact on the expectation of usefulness for business?

People who use general social media can learn how to use social media in the workplace when they start to perceive that general social media is easy to use. Additionally, when they start to perceive that social media is useful and intend to use social media more, they will move over the application of social media to the workplace. It is possible that people who perceived ease of use for general social media expect usefulness for not only general social media but also for workplace social media.

H1: Ease of use for general social media will impact on the expectation of usefulness for business.

It is possible that people who perceived usefulness for general social media expect usefulness for social media at the workplace, especially the perception of usefulness for knowledge sharing may have strong impacts on expectation for usefulness for business.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

H2: Usefulness for knowledge sharing in general social media will impact on the expectation of usefulness for business.

Based on the TAM model, ease of use and usefulness tend to have an impact on behavioral intention. Therefore, it is possible that people who intend to use social media expect usefulness for social media at workplace are based on their high perception of ease of use and usefulness. But the relationship between the behavioral intention and usefulness for business could be a spurious correlation because of the ease of use and the usefulness constructs.

H3: Behavioral intention for general social media will not impact on the expectation of usefulness for business.

According to the research about self-esteem, the level of self-esteem in North American is higher than Japan (Heine, et al. 2010). The self-esteem construct is a closely related concept to self-efficacy (Judge, Erez, Bono & Thoresen, 2002), and the self-efficacy concept is closely related to the concept of the ease of use (Clark & Roberts, 2010). Pookulangare and Koesler (2011) focused on a social networking environment and proposed the cultural difference had effect on self-efficacy, and the positive relationship between the self-efficacy and perceived ease of use based on some previous research studies (Das & Sahoo, 1989, Schmidt and Ralph, 2011).

We think that it is possible that level of the ease of use in the United States is higher than Japan, and the difference may have impact on the difference of causal models. The result is that it matters more in the Japanese culture because the consumers like complex applications. Hofstede, et al. (2010) found that countries that had a lower power-distance index, such as the United States rather than Japan, showed more of a need for self-expression and independence. They also found that countries that had more of an individualistic orientation (like the United States) rather than a more collectivistic culture would have a higher self-efficacy need and potentially a higher need for ease of use. Furthermore, the popular social media platform in the United States is different from Japan.

RQ2: How does the impact of ease of use differ from Japanese to United States because of cultural, technological and market reasons?

The research model in this study is a composition of variables and relationships in order to understand the theoretical underpinnings of the research model. Users' attitudes toward usefulness of knowledge was employed as an antecedent determinant that generated differences in behavioral intention and usefulness for business between American and Japanese social media users in this study. Ease of use in general social media and usefulness for collective knowledge in general social media was employed as an antecedent determinant that generate differences in behavioral intention in general social media and usefulness in business between American and Japanese social media users in this study (see Figure 1). We used the measure of usefulness for collective knowledge instead of the popular usefulness measure (Clark & Roberts, 2010); because collective intelligence is one of the business benefits, found by Amoroso and Orita (2010) and the experience of collecting useful knowledge in general social media may have an effect on expectation of social media for business.

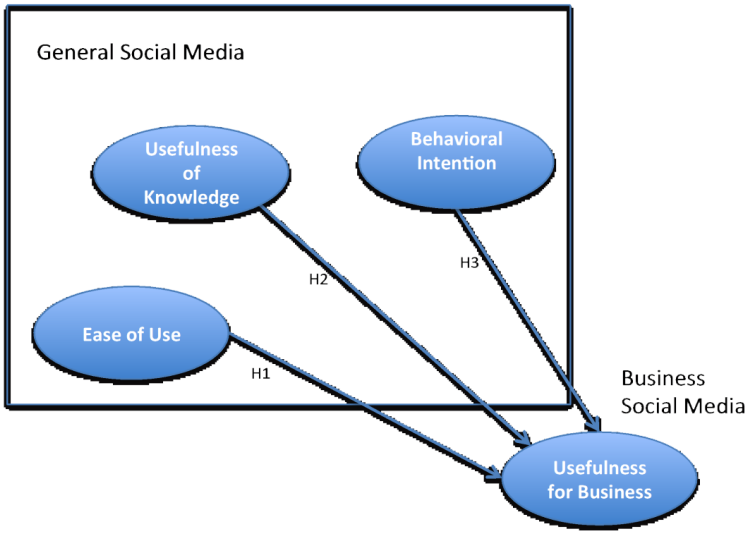
EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

METHODOLOGY

A survey to investigate the impact of social media in the workplace was developed using SurveyMonkey with twelve specific questions as derived from Amoroso et al. (2011), Amoroso and Orita (2010), and Ogawa, Amoroso, Mukahi, Tanabu, & Sato (2012). We adapted technology acceptance measures and developed new measures which are ease of use for general social media, usefulness for collective knowledge in general, behavioral intention in general social media, and usefulness for business social media. Reliability was checked by Cronbach Alpha and the construct validity by factor analysis. The survey was conducted at multiple universities with working students in the United States and Japan with 440 respondents completing the online survey. After considering response bias, 406 responses were utilized, yielding a 92.4% completion or usability rate with responses in Japan (n=210) and the United States (n=196). Although working university students comprised the primary sample, we observed the relationship between general social media experience and expectation of social media at work place. If we apply non-student office workers to the sample, we believe it is difficult to distinguish the effect of general social media experience from the effect of work place social media experience.

We looked at the types of reasons organizations why workers use social media, types of social media, and the purpose of social media use for respondents located in the United States and Japan (see Tables 1-4). We found that the most utilized social media was externally-focused toward the consumer, and the least utilized was the internally-focused employee social media. In both the United States and Japan, there was a high expected of social media for advertising products and/or services (78.6% in total). Consumer research (54.9%) was the second heaviest usage of social media in organizations followed by acquiring potential customers, which was significantly higher in the United States (63.3%). In general, marketing uses of social media were very strong.

Figure 1. Research model



EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Table 1. Comparison of social media means: Uses of social media

	Japan *n = 210*	US *n = 196*	Total *n = 406*	t-Test
Advertising	85.2	71.4	78.6	**
Research on users	52.9	57.1	54.9	*
Potential customers	30.0	63.3	46.1	**
Meetings online	17.6	28.1	22.7	**
Recruiting and hiring	36.7	39.8	38.2	*
Advertising	37.1	38.3	37.7	
Communities	29.0	34.2	31.5	*
Service provider	34.3	31.1	32.8	*

** t-test < 0.05, ** < 0.01*

Table 2. Comparison of social media means: Types of social media

	Japan *n = 210*	US *n = 196*	Total *n = 406*	t-Test
Social networking site	58.6	90.8	74.1	**
Blog	38.6	20.9	30.0	**
Chat	11.0	37.2	23.6	**

** t-test < 0.05, ** < 0.01*

Table 3. Comparison of social media means: Purposes of social media

	Japan *n = 210*	US *n = 196*	Total *n = 406*	t-Test
Pesonal use	80.1	69.4	74.9	**
Business use	19.4	28.0	23.5	**
Both	0.5	2.7	1.6	

** t-test < 0.05, ** < 0.01*

The area of social media expectation that we are most interested in for this study is the internal corporate use of social media, the building of communities (31.5%) and meetings online (22.7%). Compared with the Japanese sample, the United States sample tended to use social networking sites and chat functions in order to communicate with friends outside of their own country (57.1% versus 17.6%). In both countries, business use of social media (23.5%) was far lower than personal use (74.9%). It is this area of social media use that we want to explore further in this research.

ANALYSIS

Measurement Model Evaluation

We found strong support for construct validity and reliability by examining Cronbach alpha reliability coefficients and by confirmatory factor analysis. The measurement scales for this instrument showed strong psychometric properties. All measurement scales showed relatively high Cronbach alpha coefficients (see Table 5) at α>=0.70 for all the measures with the exception of ease of use and usefulness for collecting knowledge in Japanese which is slightly below the lower bounds set for this study, near the α>=0.70. This pattern of high scale reliability is consistent with much of the prior research dealing with the technology acceptance model.

Average variance extracted (AVE), for assessing convergent and discriminant validity (Fornell and Larcker, 1981) is the sum of squared standardized loadings divided by the sum of squared standardized

Table 5. Measurement model statistics

	Japan Sample			United States Sample

loadings plus the sum of indicator measurement error. Discriminant validity analysis refers to testing statistically whether two constructs differ; convergent validity tests through measuring the internal consistency within one construct, as Cronbach's alpha does, indicators for different constructs should not be so highly correlated as to lead one to conclude that they measure the same thing. This would happen if there were definitional overlaps between constructs. The average variance extracted (AVE) estimate (which measures the amount of variance captured by a construct in relation to the variance due to random measurement error, ranged from 0.312 to 0.898 for United States and Japanese participants. Convergent validity requires that AVE should be greater than 0.5. However, AVE score of Japanese usefulness for collective knowledge is low and the convergent validity of the measure is low. Discriminant validity requires that AVE should be greater than their squared correlation between two constructs. We calculated the squared correlation between each factors (see Table 6). For the Japanese sample, the squared correlation between ease of use and usefulness for business is lower than AVE. We also found that the discriminant validity between ease of use and usefulness for business in Japan is low.

Measurement Equivalence Across Groups

The multiple group invariance tests have been suggested as a reliable method for determining measurement equivalent in a cross-cultural study (Myers, Calantone, Page & Taylor, 2000). This study undertook an application of multiple group invariance tests to determine the measurement equivalence between Japanese and United States samples. The chi-square difference tests and overall model fit indices were used to evaluate overall measurement structure consistency in this study.

We conducted the multiple group invariance tests for social media use samples across the countries of Japan and the United States, using a confirmatory factor analysis for Japan and United States individually. Second, the configural model was constructed and then we constrained all factor loadings between the two countries shown as invariance. Third, we calculated the difference between the configural and invariance models showing the difference (p-value). By examining the results of the chi-square difference test of factor invariance model against a configural model and model fit indices' changes, this

*Scores on diagonal are AVE

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

study revealed the factor invariance model had a slight change in the model fit indices compared to the configural model for social media use. The results do not show significance at $p < 0.05$ and indicates that the factor correlations are invariant across the two countries. The data demonstrated that the measurements were invariant across the two country subjects, thus enabling the researchers to proceed to the structural model evaluation. We built the measures based on the results of confirmatory factor analysis and use the measures as variables for the structural model.

Hypotheses Testing

We generated two regression models for usefulness in business, one for Japan and the other for the United States sample. Table 7 provides the regression coefficients for each country's regression model. Both regression models showed strong F-statistics at 15.919 and 27.924 respectively. The adjusted R^2 for the Japanese model is 17.6% and for the United States model 29.3%, showing the amount of variance explained. For the Japanese model, ease of use was found to be statistically significant in explaining usefulness in business ($p<0.000$). However, we did not find ease of use to be significant in the United States to explaining the usefulness of social media in business. Usefulness for knowledge of social media was found to be extremely significant ($P<0.000$) in the United States sample, but only mildly significant in the Japan sample ($p<0.017$). Behavioral intention to use social media was not found to be significant for either the Japanese or United States model.

Japan

We found that ease of use has significant impacts on usefulness in business; therefore H1 is supported. Since usefulness for knowledge sharing has significant positive impacts on usefulness in business, H2 is also supported. Since behavioral intention does not have significant impact on usefulness in business, H3 is supported.

United States

We found that ease of use does not have significant impact on usefulness in business; therefore H1 is not supported. Since usefulness for knowledge sharing has significant positive impacts on usefulness

in business, H2 is supported. Since behavioral intention does not have significant impact on usefulness in business, H3 is supported.

Differences Between Japan and the United States

Ease of use is a construct that has often been found to have a difference between the two countries (Amoroso & Ogawa, 2013). Because ease of use is a significant factor with Japanese consumers, we posit that the culture of Japan is much more technical than the United States, and as such Japanese consumers tend to view more complex applications as desirable and useful for working. We might even say that the more complex the social media application, the more useful for business. Social media usefulness for knowledge was found to be important to both the United States and Japan in terms of its impact on usefulness for business.

DISCUSSION

Significant Findings

In Japan, ease of use and usefulness for collective knowledge in general social media are predictors of usefulness for business social media. On the other hand, in the United States sample, only the usefulness for collective knowledge is a strong predictor of usefulness for business. These results mean, if the United States sample experienced that they could collect useful information in Facebook or another social media, they expect that social media is also useful in the business situation. In contrast, for Japanese respondents, not only collecting information but also perceived ease of use for Mixi, which is a popular social media in Japan, or another social media, are important for expectation for business social media. If Japanese companies apply social media at the work place, employees' perception of ease of use for general social media may be important. The difference of the two countries may be related to the difference of the score of ease of use. Our findings showed that usefulness for knowledge and ease of use scores are higher than Japan. Most usefulness for knowledge respondents perceive high ease of use for social media, therefore the ease of use may not important predictor of usefulness for business.

The results show that ease of use and usefulness for knowledge sharing using general social media has an impact on usefulness for business in Japan. In the United States, ease of use has an impact on usefulness for business. These results mean that the experience levels of general social media use enhances the expectation of social media for business. If an organization considers introducing social media for business, the organization should encourage employees to use social media effectively in their personal lives before introducing social media in the business units.

The results show that the impacts of ease of use differ from Japanese and the United States. In Japan, ease of use and usefulness for collective knowledge in general social media are predictors of usefulness for business social media. On the other hand, in the United States, only the usefulness for collective knowledge is a strong predictor of usefulness for business. These results mean, if the United States respondents could collect useful information in Facebook or another social media, they expect that social media is also useful in the business situation. In contrast, for Japanese, not only collecting information

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

but also perceived ease of use for Mixi, which is a popular social media in Japan, or another social media are important for expectation for business social media. If Japanese companies apply social media at the work place, employees' perception of ease of use for general social media may be important.

Usefulness of the Findings

In the results of the factor analysis, the discriminant validity between ease of use and usefulness in the Japanese simple is lower than expected. For the Japanese employee, ease of use and usefulness for business might be almost one construct. However, our study shows that the causal structure is different between Japan and the United States, maybe due to cultural issues. In the results of factor analysis for the Japanese employee, the convergent validity for usefulness of collective knowledge is low. It is possible that, for Japanese respondents, meaning or role of collecting knowledge is different for United States respondents. In the summary of the reason for using social media, United States employees tended to use social media for communication with other persons who live overseas. The United States respondents have weaker but more diversified networks than the Japanese respondents. Granovetter (1973) argued that weak ties build wider relationships and are more effective for gathering diversified information. They may use the weak but diversified network for gathering diversified information and knowledge, and they perceived that social media was useful for collecting knowledge.

The question as to why the difference of ease of use exists between Japan and United States might be the effect on the difference of ease of use as a strong predictor for usefulness and self-esteem. In general, self-esteem of the United States respondents is higher than Japanese respondents and the difference may be reflected in ease of use. We found that in previous research (Amoroso and Ogawa, 2013) that self-efficacy, perception of external control, computer anxiety, perceived enjoyment and objective usability have strong effects on ease of use. The cultural, technological and market difference of social media between Japan and the United States for usefulness for knowledge may influence those predictor variables, and the predictor variables may also influence ease of use. These differences might have an impact on those predictors of ease of use. This study showed that general social media experience has an effect on perception of usefulness of social media for business. The relationship between experience and usefulness in social media is different from normal application software. This study also showed if companies introduce social media for business and their employees have a lot of experience with using social media, they might not be requested to provide much training for their employees.

Limitations

One of limitations of this study is related to the sample as we could not assess how the respondent was working. Because the sample contained some student respondents, we feel that those participants may not have had full-time employment, which might yield different results. We plan to conduct an additional study that will survey business employees directly in the organization. One reason for the lower convergent validity of the Japanese sample for usefulness for collective knowledge could be because this study did not use the normal usefulness measure but a measure of usefulness for collective knowledge. Collective knowledge is one of salient effects of social media. In future research, we will use another measure of usefulness and confirm these results. Also the discriminant validity between ease of use and usefulness

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

in Japanese is low. Even though we found a significant path from ease of use to usefulness, we believe that both variables might be contained within one construct. The types of use of social media are different between Japan and United States samples. Even though cultural differences might be related to the selection of social media, we plan to select one type of social media and conduct an additional survey.

FUTURE RESEARCH

In this study, we conducted analysis using regression analysis. However, previous research showed that ease of use has an impact on behavioral intention through usefulness. We plan to confirm the relationship between those three constructs and usefulness in business using Structural Equation Modeling. Future research efforts will include examining social networking systems in specific organizations to ascertain how they are developed and how their configuration affects utilization. We would like to develop a specific employee adoption model for corporate-sponsored social networking systems to better understand why certain employees would use these systems and why others hesitate or find them not useful. In future studies, we plan to integrate the trust construct into further data collection efforts in order to analyze the impact of trust on social network system adoption within the workplace. As discussed above, the difference of ease of use is a key issue. The difference of how to use, purpose of use, kinds of social media and so on may effect on ease of use. We plan to analyze the causal model with these variables.

ACKNOWLEDGMENT

This study was partially supported by Japan Society of Promotion of Science KAKENHI (2530409) and with the help of the International Center for Innovation in Technologies (ICIT) at Kennesaw State University. We would like to thank all the above in writing.

KEY TERMS AND DEFINITIONS

Behavioral Intention to Use Social Media: The perceptual measure of intention of workplace employees to use social media.

Business Use of Social Media: Use of social media based systems to achieve business goals and objectives, such as for marketing tools.

Collective Knowledge: Knowledge gained by adding two or more people's knowledge together.

Corporate Social Networking: The use of social media to support and enhance an organization's commitment to corporate social responsibility.

Corporate-Sponsored Social Media: Organizational approved and developed internal social media systems for employees.

Cross Country Aspects of Social Media: The differences between countries in the use of social media.

Cultural Aspects of Social Media: The infusion of cultural factors, such as individualism or long-term planning, on the use of social media.

Ease of Use: The lack of difficulty using social media programs and systems.

Expectation of Social Media Use: The predication of social media in the workplace to enhance job performance.

General Social Media: Social media that is used in the private sector by most consumers.

Social Media Systems: Internally developed social media-based information systems that are corporately maintained.

Team Enhancement: Ability to improve a team's overall performance using social media tools.

Usefulness for Knowledge: The ability of social media in the workplace to enhanced knowledge of one or more employees by sharing ideas.

Workplace Social Media: Social media used solely in the workplace by employees.

This research was previously published in Integrating Social Media into Business Practice, Applications, Management, and Models edited by In Lee, pages 14-32, copyright year 2014 by Business Science Reference (an imprint of IGI Global).

Chapter 60
Quality and Acceptance of Crowdsourced Translation of Web Content

Ajax Persaud
University of Ottawa, Canada

Steven O'Brien
University of Ottawa, Canada

ABSTRACT

Organizations make extensive use of websites to communicate with people. Often, visitors to their sites speak many different languages and expect that they will be served in their native language. Translation of web content is a major challenge for many organizations because of high costs and frequent changes in the content. Currently, organizations rely on professional translators or machines to translate their content. The challenge is that professional translations is costly and too slow while machine translations do not produce high quality or accurate translations even though they may be faster and less expensive. Crowdsourcing has emerged as a technique with many applications. The purpose of this research is to test whether crowdsourcing can produce equivalent or better quality translations than professional or machine translators. A crowdsourcing study was undertaken and the results indicate that the quality of crowdsourced translations was equivalent to professional translations and far better than machine translations. The research and managerial implications are discussed.

INTRODUCTION

Crowdsourcing takes a job normally performed by a designated person and having it done by a large, undefined, and dispersed number of participants (Howe, 2008). Participants are recruited online to perform defined, sub-autonomous tasks (Behrend, Sharek, Meade, & Wiebe, 2011). Crowdsourcing leverages Web 2.0 tools (O'Reilly, 2007) to foster intellectual cooperation among human collectives in order to create, innovate and invent (Grasso & Convertino, 2012).

Crowdsourcing has been used in a variety of contexts including ideation generation (Schweitzer, Buchinger, Gassmann, & Obrist, 2012), citizen journalism (Tilley & Cokley, 2008), disaster and emergency management (Dailey & Starbird, 2014), scientific collaboration (Jirotka, Lee, & Olson, 2013), health care management (Adams, 2014), and linguistics (Munro et al., 2010). The study by Eagle (2009) is an early attempt to use crowdsourcing to translate single words and terminologies that have specific meanings among particular groups (e.g., engineers, accountants). Ledlie, Odero, Minkov, Kiss, and Polifroni (2010) used crowdsourcing for speech recognition translation i.e. converting speech to text. The use of crowdsourcing to translate website content that is longer, more descriptive, open to many interpretations and targeted to the general public rather than specific groups is a qualitatively more complex and difficult undertaking that has not yet been done but needed (Snow, O'Connor, Jurafsky, & Ng, 2008).

Translation of website content is important for several reasons. Today, users turn to the web as their first source to find information on virtually any topic, product or service. Therefore, it is important for organizations, businesses, and governments to make their content accessible to users in their native languages. Hutchins (2001) contends that people prefer to read content in their first language, even with some errors, than struggle to understand a website in a foreign language. DePalma, Sargent, and Beninatto (2006) found that language quality is a major factor influencing consumers' online purchase decisions or online interactions with organizations. Consequently, it seems that organizations serving people that speak different languages should offer web content into multiple languages.

There is also an important social challenge pertaining to the digital divide associated with language barriers. Although the digital divide is often used to describe whether or not people have access to the Internet or information and communication technologies (ICTs), Selwyn (2004) posits that it can also be seen as a practical embodiment of the wider theme of social inclusion or digital exclusion. Selwyn (2004) argues that access to the Internet does not guarantee that users can effectively access every available website and online resource. Similarly, Van Dijk and Hacker (2003) argue that access to a technology is useless without the necessary skills, knowledge and support to use it effectively. According to Selwyn (2004), 'meaningful' use of the web requires that users are able to engage with the content. Moreover, content is only useful if it is relevant to the user and those who are isolated or marginalized face a digital divide (Selwyn, 2004). Thus, not serving users in their first language is a form of digital divide that needs bridging.

Translating website content is a formidable challenge because of the enormous amount of content on websites, which tend to change often. Translating web content using professional translators is slow and costly. On the other hand, machine translation, while faster and less expensive, produces inferior quality translations (Bowker, 2008). These challenges combined with the growing use of crowdsourcing motivate the question posed in this study: Can crowdsourcing produce equivalent or higher quality translations compared to those produced by professional or machine translators?

At a practical level, if crowdsourcing produces high-quality translations quickly, reliably, and cost-effectively, then organizations would have yet another option to perform this important task. At a theoretical level, this study provides evidence on the validity of the principles of crowdsourcing and illustrates how this new technology may effectively alter the processes and human interactions involved in language translation.

The remainder of this article presents a review of the relevant literature, the research questions, hypotheses, and framework, the methodology, the analysis and results, and the discussion and conclusion.

RELATED WORK

Crowdsourcing belongs to a new class of collective intelligence tools that facilitate computer supported cooperative work (Grasso & Convertino, 2012). These new generation of collective intelligence tools, often described as Web 2.0 technologies (O'Reilly, 2007), have the ability to change the way people work and how work is organized (Grasso & Convertino, 2012). Essentially, the Internet and these Web 2.0 tools enable crowds of users from anywhere in the world to work collectively by leveraging their social and professional networks to create and share knowledge and undertake complex tasks (Grasso & Convertino, 2012). Crowdsourcing takes a task that is normally done by designated professionals or experts and having it performed by a large, undefined group of individuals (Howe, 2008). The tasks are usually broken down in numerous sub-tasks and each individual within the crowd performs various sub-tasks (Brabham, 2008). Payments for work performed vary from no monetary reward or very small amounts to large amounts, which are paid by large corporations (Hossain & Kauranen, 2015).

In a recent review of the literature, Hossain and Kauranen (2015) reported that scholarly research on crowdsourcing is in the early stages but growing despite its widespread use among practitioners. Hossain and Kauranen (2015) show that most of what we know so far is rooted in conceptual articles based on case illustrations of crowdsourcing applications. Currently, the bulk of the scholarly research is empirical and focuses on the applications of crowdsourcing in a variety of contexts. Other themes covered in the literature include the principles and practices of crowdsourcing (Guyon, 2010; Hong & Page, 2004; Surowiecki, 2004), the tools, technologies, and processes that facilitate crowdsourcing (Kern, Zirpins, & Agarwal, 2008; Kittur, Smus, Khamkar, & Kraut, 2011; Liu & Maddux, 2008; Schenk & Guittard, 2011; Vuković, 2009; Welinder & Perona, 2010), the quality of work produced (Behrend et al., 2011; Brabham, 2008; Hoßfeld, Hirth, & Tran-Gia, 2011; Poetz & Schreier, 2012), and the motivations of workers (Horton & Chilton, 2010; Jeppesen & Lakhani, 2010; Skopik, Schall, & Dustdar, 2010; Terwiesch & Xu, 2008).

Generally, crowdsourcing emphasizes user-generated content, sharing, and interactivity (Kaplan & Haenlein, 2010). A central tenet of crowdsourcing is that crowds, under certain conditions, are capable of producing solutions that are equivalent to or better than any single individual, even an expert, once four conditions are present (Surowiecki, 2004). These four conditions are diversity of opinion, independence, decentralization, and aggregation. Diversity of opinion is the cognitive diversity of the crowd. Independence is the ability of group members to express their individual judgments without influence of other members. Decentralization involves the entire group in decision-making. Aggregation involves aggregating the answers of the crowd to form the crowd's collective judgement since individual workers may have varying level of expertise (Surowiecki, 2004).

Further, Hong and Page (2004) advance the idea that diversity trumps ability by proposing that a functionally diverse group whose members have less ability may outperform a group of people with high ability under four conditions. First, workers must be intelligent — that is, given any starting point, a worker finds a weakly better solution. Second, the problem must be difficult so that no worker can always find the optimal solution. Third, workers must be diverse, that is, for any potential solution that is not the optimum, at least one worker can find an improvement. Fourth, the best worker must be unique.

Von Ahn (2006) argues that in situations where participants have less experience and ability than professionals, the mechanism of task repetition can increase the probability of achieving a better outcome for a given task. Task repetition refers to a situation where several independent workers perform a task. Von Ahn (2006) and Eagle (2009) demonstrate that task repetition increases the quality of output.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Vuković (2009) examine the development and effectiveness of crowdsourcing platforms and microtasking - executing a big task through small contributions from a very large crowd. Vuković (2009) identify several crowdsourcing platforms that facilitate collective work by crowds. Amazon Mechanical Turk is one of the most widely used crowdsourcing platforms (Hossain & Kauranen, 2015). Kittur et al. (2011) and Olsen and Carmel (2013) propose frameworks to perform microtasking. Kern et al. (2008) examine the efficacy of crowdsourcing platforms.

In language studies, crowdsourcing was first used by linguists for annotation (Munro et al., 2010). According to these authors, crowdsourcing makes it possible for researchers to undertake large-scale, systematic, judgment studies more affordably and conveniently than expensive, time-consuming lab-based studies. They demonstrated that studies that would have taken several years to complete could be done easily, reliably and for a fraction of the costs in a matter of a few days. Munro et al. (2010) argued that the greatest contribution of crowdsourcing to language studies might be the ability to generate new kinds of data, especially within experimental paradigms. In their study of computational linguistics, they found that the quality of crowdsourced results is often indistinguishable from controlled laboratory experiments. Eagle (2009) is another language study that used crowdsourcing to translate single words and terminologies. Ledlie et al. (2010) used crowdsourcing for speech recognition translation.

RESEARCH QUESTIONS, FRAMEWORK AND HYPOTHESES

This study addresses the following four research questions:

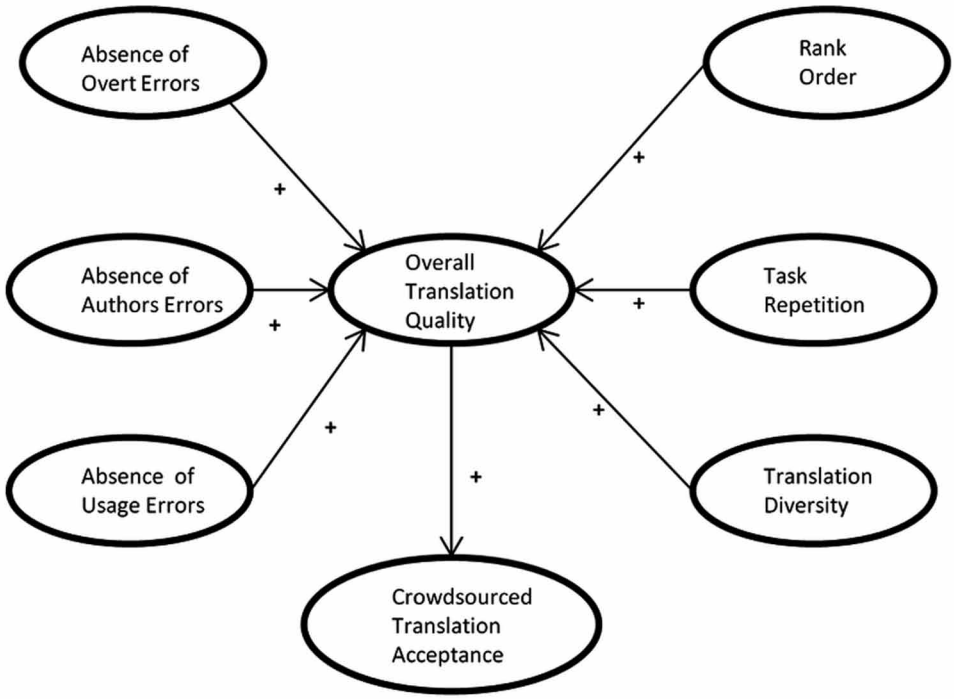
1. How does the quality of crowdsourced translation compare to those of professional and machine translations?
2. What level of task repetition affects crowdsourced translation quality?
3. What level of diversity affects crowdsourced translation quality?
4. Is crowdsourced translation an acceptable means of language translation?

Figure 1 presents the research framework used in this study. The figure shows that translation quality is influenced by the absence of three types of errors, namely, author, usage, and overt (or user) errors. Further, task repetition and crowd diversity enhance crowdsourced translation quality, which leads to greater acceptance of crowdsourced translations. Moreover, the variable rank order captures the notion that when crowdsourced translations are ranked against machine and professional translations, crowdsourced translations will rank highly and this will lead to greater acceptance of crowdsourced translations. The relationships shown in Figure 1 are described in detail below.

In this study, participants translated an English text (source text) into French (target text). Translation quality is judged not only by the absence of lexical or grammatical errors or by poorly translated semantics but also by whether or not the target text has the same impact as the source text (House, 1997). For instance, if the goal of the source text is to get a person to contact the organization or to make a purchase and the target text is of acceptable quality, then after reading the text, consumers should feel comfortable contacting the organization in their native language or make purchases from the company. If the translation is weak, the same individual may avoid the company and its products or services (DePalma et al., 2006).

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 1. Research model



House (1997) also argues that three types of language mechanics errors are important when judging translation quality, namely, author, usage, and overt (or user) errors. Author error refers to whether or not the target text appears to be written by someone who is fluent in the target language, has a university education, and uses language that is appropriate today. Usage error refers to whether or not the target text is written in a style of a professional blogger for an educated middle-class audience that calls readers to action. Overt errors are errors in grammar, spelling, punctuation, semantics, and other language mechanics. It is operationalized as the extent to which the text has an understandable meaning and uses correct terminology and grammar. Generally, the quality of a translation is higher when author, usage, and overt translation errors are absent (House, 1997). In order to assess the quality of crowdsourced translations, the following hypotheses are proposed:

H_1: The absence of author errors in the target text positively affects the quality of crowdsourced translation.
H_2: The absence of usage errors in the target text positively affects the quality of crowdsourced translation.
H_3: The absence of overt errors in the target text positively affects the quality of crowdsourced translation.

Traditionally, professional translators translate web content in order to ensure high quality translations. However, this is a slow and costly process that is affordable to primarily big players (Garcia, 2009). The availability of online machine translation websites such as Google Translate, Bing Translator, and Yahoo! Babel Fish represent quick and inexpensive alternatives to professional translation. According to Garcia (2009) the consensus is that machine translations are not yet up to the standard required by organizations. Translation by crowdsourcing is a new area of practice and research; therefore, it is not

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

clear how the quality of crowdsourced translations will compare to professional and machine translations, and whether users will accept crowdsourced translations.

Generally, in a crowdsourced environment, the workers may not necessarily be professionals or experts in their field but a large number of knowledgeable workers can produce results equivalent to those of experts (Hong & Page, 2004; Surowiecki, 2004). In the context of crowdsourced translation, it is reasonable to assume that many of the workers would be non-professional bilinguals with less experience and ability than their professional counterparts. This raises the question of whether or not these workers can produce translations that are comparable to professional translators. Proponents of crowdsourcing argue that task repetition is a mechanism that could increase the probability of obtaining higher quality translations when non-professionals are used (Eagle, 2009; Guyon, 2010; Von Ahn, 2006). Indeed, Eagle (2009) and Von Ahn (2006) provide limited insights into this efficacy of task repetition in the context of single words and terminologies with specific meanings. Based on these arguments, the following hypothesis is proposed.

H_4: An increase in task repetition will lead to an increase in the quality of crowdsourced translation.

Diversity is another important dimension of crowdsourcing that could affect the quality of crowdsourced translation (Hong & Page, 2004). Applying the arguments advanced by Hong and Page (2004) to the language translation context, it is expected that the more diverse the crowd of translators, the more likely it will produce equivalent or better quality translations than professional translators. In this study, the conditions governing diversity advanced by Hong and Page (2004) are met since non-professional bilingual individuals are intelligent regarding the languages to be translated, translation itself is a difficult problem (Bowker, 2008), and no individual translator can be said to always find the optimal translation (Williams, 2004). Thus, the following hypothesis is proposed.

H_5: An increase in diversity of the crowd will lead to an increase in the quality of crowdsourced translation.

Professional translations are widely accepted because of their perceived high quality. Since there are three methods to translate web content – professional translators, machine translators, and crowdsourcing – it is important to rank the resulting translations from these three methods in terms of their quality. The variable rank order in this study captures the ranking of the translations obtained through the three methods. The process used to determine the rankings is described in the methodology section. It is posited here that if the quality of translation emerging from crowdsourcing is sufficiently high, then bilingual individuals are more like to accept crowdsourcing as an acceptable means of translation. Thus, the following is proposed:

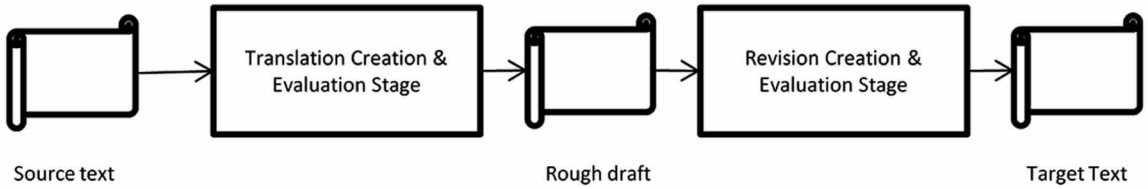
H_6: When crowdsourced translations are ranked against machine and professional translations, bilingual individuals will likely select crowdsourced translations.

Language Translation Process

Figure 2 shows the generic two-phase translation process for translating a source text into a target text (Garcia, 2009; Guyon, 2010). The two broad phases are (1) translation creation and evaluation and (2) revision creation and evaluation. Traditionally, this process is performed by professional translators (Gar-

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 2. High-level translation process model



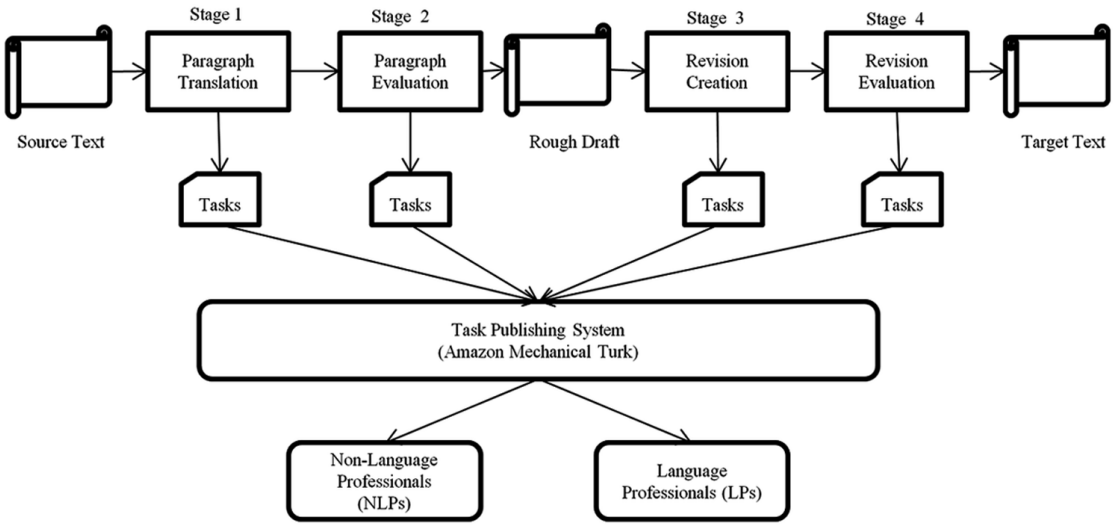
cia, 2009; Guyon, 2010). However, with the advent of machine translation, the initial translation is often done by machine and the revision done by professional translators or bilingual individuals (Garcia, 2009).

In the crowdsourcing environment, the two broad stages shown above are subdivided into four stages each with a series of sub-tasks as shown in Figure 3. This is because crowdsourcing involve a large number of participants working independently in a decentralized manner performing various small tasks whose work are ultimately aggregated to arrive at the best translation (Garcia, 2009; Guyon, 2010). Amazon's Mechanical Turk, a micro-tasking platform, was used to deliver the tasks in a structured and systematic manner and for aggregating completed work (Olsen & Carmel, 2013; Vuković, 2009). This is necessary because the source text chosen for the study is relatively long. At each stage, multiple workers perform the translation tasks and then select the best quality translation, which serves as input for each successive stage of the process. This detailed process is designed to involve as many workers as possible, each doing small tasks, in order to obtain diversity.

METHODOLOGY

The source text used in the study consisted of 360 words divided into three paragraphs. It is a restaurant review for a café. To assess the appropriateness of the source text, it was pretested on a group of 15

Figure 3. Crowdsourcing translation process with Amazon Mechanical Turk



EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

bilingual (English/French) professors and staff at a bilingual university. Pretest participants were asked to indicate on a seven-point Likert scale how easy or how difficult it would be for a bilingual person to translate the source text into French (1 = extremely easy and 7 = extremely difficult). The goal was to select a source text that was fairly challenging since a source text that was too difficult or too easy could compromise the value of the study. The average difficulty ranking was 4.9/7, which is fairly challenging.

The workers were language professionals (LPs) and non-language professionals (NLPs). LPs are fluent in both English and French and have translation education, training, and work experience. NLPs are fluent in both English and French but do not have formal translation education, training, and work experience. Participants were recruited by e-mail and through postings on LinkedIn, Kijiji, and sites of translators' groups. A prequalification questionnaire was used to ensure participants met the criteria of the study. Fifty-four percent of the LPs have a bachelor's degree, 31 percent have a master's degree, and 54 percent have more than one year of professional translation work experience. Regarding the NLPs, 32 percent have bachelor's degrees and 32 percent have master's degrees.

They could have participated in any of the four stages and could have chosen the number of tasks they wanted to work on except for paragraph translation (stage 1) and revision creation (stage 3) where they were restricted to a limit of one in order to ensure some level of diversity. Participants had a maximum of two hours to complete each task. The study is based on four crowdsourced experiments (described in detail below) involving thirty-two unique participants, which produced 128 data points (4 experiments * 32 participants).

The Data: Four Translation Experiments

Four experiments were conducted in order generate data to test the hypotheses of task repetition and diversity. The four experiments enabled the researchers to engage as many workers as possible and to have some level of task repetition. Details of the four experiments are presented in Table 1. The first experiment used a task repetition value of two, which produces two unique translations of each paragraph and two unique revisions of the rough draft. The second experiment used a task repetition value of four, which produces four unique translations of each paragraph and four unique revisions of the rough draft. The translations from stage 1 were used in stage 2, translation evaluation, which produced a rough draft translation of the entire source text that was used in stage 3, revision creation. In stage 3, there were two revision tasks when the task repetition was two and four when the task repetition was four. Once all revision creation tasks were completed, they were aggregated and used as input for the final stage, revision evaluation.

Table 1. Crowdsourced task distribution

Experiment 1	Experiment 2	Experiment 3	Experiment 4
LP – Task repetition 2	LP - Task repetition 4	NLP - Task repetition 2	NLP - Task repetition 4
9 unique participants	7 unique participants	6 unique participants	6 unique participants
PT = 2 participants, 6 tasks	PT = 5 participants, 12 tasks	PT = 3 participants, 6 tasks	PT = 4 participants, 12 tasks
PE = 9 participants, 27 tasks	PE = 3 participants, 27 tasks	PE = 5 participants, 27 tasks	PE = 6 participants, 27 tasks
RC = 2 participants, 2 tasks	RC = 4 participants, 4 tasks	RC = 2 participants, 2 tasks	RC = 4 participants, 4 tasks
RE = 2 participants, 9 tasks	RE = 2 participants, 10 tasks	RE = 4 participants, 9 tasks	RE = 4 participants, 10 tasks

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

PT, PE, RC and RE corresponds to the 4 stages shown in Figure 3 -paragraph translation, paragraph evaluation, revision creation, and revision evaluation

To generate data to test the rank order hypothesis, which seeks to compare the quality of crowdsourced translation (CST) to professional translation (PT) and machine translation (MT), three professional translation companies were hired to translate the source text into French and three online translation websites were used to translate the source text into French. Altogether, this process produced 10 translations of the source text: four CSTs from the four experiments, three PTs, and three MTs. These ten translations were given to a Ph.D. student in translation to rank them in order of quality. The Ph.D. student was not told how the translations were created. Table 2 shows the rankings of the 10 translations. Crowdsourced participants were then given the highest ranked PT and MT along with the four CSTs and instructed to rank them from 1 to 6 (1= highest rank and 6 = lowest rank) in terms of translation quality. The reason for selecting these six translations is to compare the crowdsourced translations with the best machine and professional translations.

Finally, to ascertain if knowledge of how the translations were done influenced the rankings, the 32 crowdsourced participants were asked to complete two separate surveys for each of the six target texts. In the first survey, participants were not told how the target text was obtained. After completing the first survey, participants were provided with information on how the translations were generated and were asked to fill the same survey again. They were told about the duration of the translation process, the number of people involved in creating the CST, the participant group (LPs or NLPs), the name of the machine translation website, and the translation certifications of the professional translation company.

Participants had to indicate the extent to which they agreed or disagreed with a series of five-point Likert scale questions (1 = strongly disagree and 5 = strongly agree) pertaining to the quality of all the translations. They also rated the CSTs against the best PT and the best MT.

CST acceptance was measured on a 5-point Likert scale (strongly-agree to strongly-disagree) to the following statements: I prefer crowdsourced translation over machine translation; I prefer crowdsourced translation over professional translation; Crowdsourced translation should be performed by non-language professionals; Crowdsourced translation should be performed by language professionals; Crowdsourced translation should be used to translate website content.

ANALYSIS AND RESULTS

The impact of diversity on the quality of crowdsourced translations was evaluated with the reciprocal of Simpson's Diversity Index, shown below. In the formula, **R** is the reciprocal of Simpson's Diversity Index, **n** is the total number of tasks completed by a particular participant, and **N** equals the total number of tasks completed by all participants. This measure is computed for each of the four experiments (CSTLP2, CSTLP4, CSTNLP2, and CSTNLP4).

Table 2. Rankings of translation quality

Rank 1 – PT	Rank 6 – PT
Rank 2 – CSTLP2	Rank 7 – CSTNLP4
Rank 3 – PT	Rank 8 – MT
Rank 4 – CSTLP4	Rank 9 – MT
Rank 5 – CSTNLP2	Rank 10 - MT

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

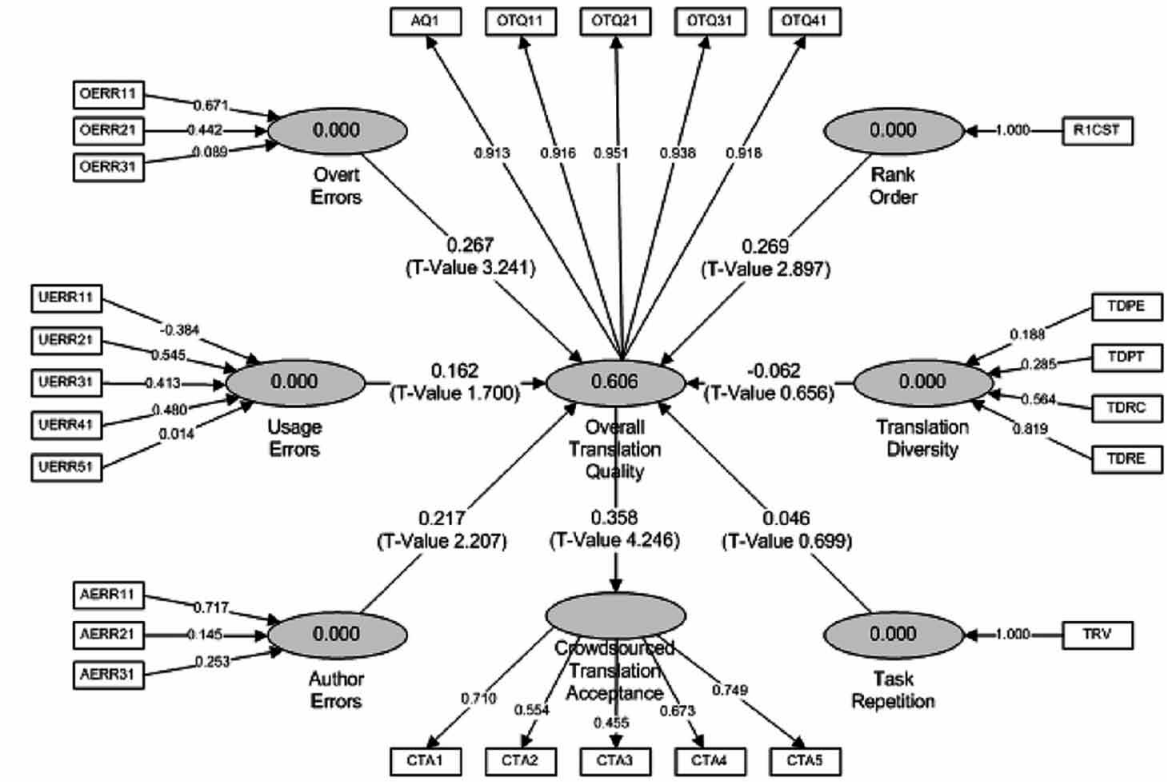
$R = 1/[\Sigma n(n-1)/N(N-1)]$

The reciprocal of Simpson's Diversity Index is used to control for the number of unique participants and tasks of each experiment. This means that if a participant did the lion's share of the work, R will be a lower number than if the tasks were completed equally among all the participants.

The data was analyzed using Partial Least Squares (PLS), which allows for the simultaneous analysis of the relationship among multiple independent and dependent variables (Ringle, Wende, & Will, 2005). It consists of an outer model (measurement model) and an inner model (latent model). The measurement model consists of observed variables, which determines the latent variables. In PLS, the measurement model must exhibit reliability and validity before inferences can be made about the latent model (Fornell & Larcker, 1981).

Figure 4 shows the results of the model. The results beneath Figure 4 show that the composite reliability (0.97), average variance extracted (0.96), and Cronbach's alpha (0.96) are above the commonly

Figure 4. Crowdsourcing translation acceptance



First Multivariate Model (PLS Statistics)

Overall Translation Quality	Cronbach's Alpha (0.959184), Composite Reliability (0.968410), Average Variance Extracted (0.859801), R^2 (0.605673)
Crowdsourced Translation Acceptance	Cronbach's Alpha (0.644663), Composite Reliability (0.768756), Average Variance Extracted (0.406432), R^2 (0.128375)

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

used threshold of 0.70, which establishes the model's reliability and validity (Fornell & Larcker, 1981; Nunnally & Bernstein, 1994). In terms of the relationship between translation quality and crowdsourced translation acceptance, the Cronbach's alpha (0.65) is slightly below the 0.70 threshold, but the composite reliability (0.77) is above the threshold. Hulland (1999) shows that it is common to obtain values that are somewhat lower than thresholds when new variables or measurement scales are used, as is the case in this study. Overall, the statistical results indicate that the model is acceptable. Further, the model explains a very high proportion of the variation in translation quality ($R^2 = 0.6056$).

Crowdsourcing Translation Acceptance (PLS Statistics)

Overall Translation Quality Cronbach's Alpha (0.959184), Composite Reliability (0.968410), Average Variance Extracted (0.859801), R^2 (0.605673)

Crowdsourced Translation Acceptance Cronbach's Alpha (0.644663), Composite Reliability (0.768756), Average Variance Extracted (0.406432), R^2 (0.128375)

Table 3 summarizes the results pertaining to the hypotheses. The absence of author errors (H_1) and overt translation errors (H_3) are statistically significant with a positive effect on overall translation quality. The absence of usage errors (H_2) was not statistically significant. Taken together, this suggests that crowdsourced translations will be acceptable if they are free of language errors and seem to be written by someone who is fluent in the target text language. Interestingly, the style in which the target text is written is not a concern because both LPs and non-LPs appear capable of producing similar writing styles. Thus, high-quality crowdsourced translations could encourage users to interact online with organizations in their own language (DePalma et al., 2006).

Increases in both task repetition (H_4) and translation diversity (H_5) did not seem to increase translation quality since these relationships were not statistically significant. The lack of significance of diversity on translation quality was perplexing and prompted additional data analysis. The results shown in Figure 5 indicate an acceptable model with a high level of explanation of the variation in translation quality ($R^2 = 60\%$). The statistical significance of diversity to overt and author errors suggests that diversity indirectly influences translation quality. This implies that diversity may not necessarily contribute directly to better quality. Further, the negative signs for the paths seem to suggest that too much diversity may actually result in lower quality. Indeed, analysis of the raw data shows positive associations at lower levels of diversity.

Table 3. Summary of results of multivariate analysis

Hypotheses	Results
H_1: The absence of author errors in the target text positively affects the quality of crowdsourced translation.	Supported
H_2: The absence of usage errors in the target text positively affects the quality of crowdsourced translation.	Not Supported
H_3: The absence of overt errors in the target text positively affects the quality of crowdsourced translation.	Supported
H_4: An increase in task repetition will lead to an increase in the quality of crowdsourced translation.	Not Supported
H_5: An increase in diversity will lead to an increase in the quality of crowdsourced translation.	Not Supported

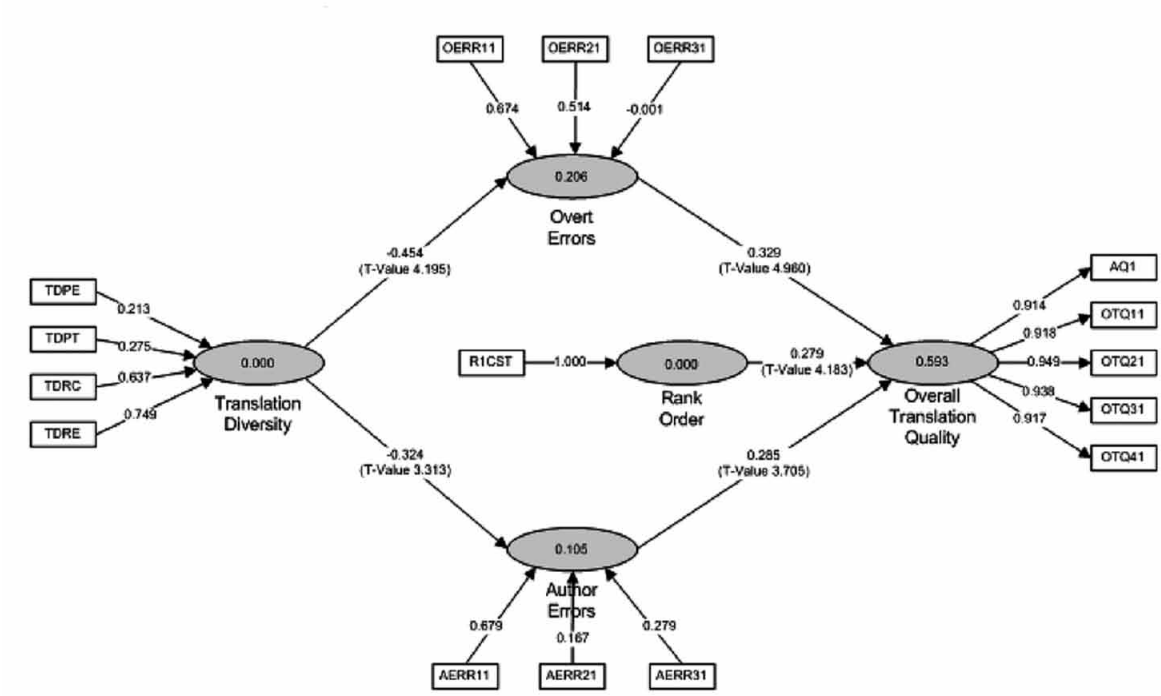
This observation is important for at least two reasons, one theoretical and one practical. First, it suggests that the diversity is a more nuanced concept than currently articulated in the literature. The data indicate that diversity and translation quality may actually have an inverse-U relationship, where diversity has a positive impact up to a certain point but beyond that, it negatively affects translation quality. This raises several important questions for which there are no clear answers yet. For instance, what is the optimal level of diversity that will produce high-quality work? Is the optimal level fixed or will it vary according to the task (i.e., task-dependent) or the skills and experience of the crowd (i.e., crowd-dependent)? From a practical perspective, it seems that managers may not need large crowds to get high-quality translations, which could save them time and money.

Participants evaluated the translations before and after knowing the methods used to generate the translations. The strongest positive changes towards acceptance were observed in the crowdsourced translations that used a Task Repetition Value of 4. Moreover, once the methods of translation were known, the crowdsourced translation experiments performed by non-language professionals did better than those of language professionals. These results indicate that crowdsourced translations, which are enhanced by Task Repetition are regarded as high quality translation. The results reported by Bowker (2008) concerning professionally edited machine translation do not appear in the evaluation of crowdsourced translations.

Figure 5. Crowdsourced translation quality



EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

In terms of ranking of translation quality (H_6), the results show that crowdsourced translations were ranked higher than machine and professional translations. This implies that crowdsourced translation is at least equivalent to or better than professional translations and superior to machine translations. This finding is consistent with the ranking of the translation Ph.D. student who ranked CSTLP2 as the second best of 10 translations and CSTNLP2 as higher than all the machine translations. The fact that crowdsourced translations are faster and cheaper than professional translations means that organizations have another option to bridge the linguistic divide. The Appendix shows that the costs of the crowdsourced translations is about 20 to 34 percent less expensive than professional translations.

DISCUSSION AND CONCLUSION

This study demonstrates that crowdsourcing is an effective method for translating web content. Users will accept crowdsourced translations regardless if they are aware or unaware of how the content was translated once the content appears to be translated professionally. Crowdsourced translations were substantially superior to machine translations and equivalent to or better than some professional translations. This finding is consistent with Behrend et al. (2011) who reported that the reliability of the data from unspecified crowd was equivalent to or better than the reliability of the data from university students. Similarly, Poetz and Schreier (2012) show that crowds can outperform professionals in many levels of new product ideation.

From a managerial perspective, the findings demonstrate that crowdsourcing is not only a feasible and viable method for translating web content but also quick and cost-effective. This could help them manage the high costs of quality translations and the scarcity of professional translators. Small businesses and non-governmental organizations with limited financial resources could use crowdsourcing to reach global audiences in their native languages. Crowdsourcing could also be an effective way to bridge the linguistic divide existing in places where people speak multiple languages.

From a theoretical perspective, this study provides empirical evidence of the validity of two key principles of crowdsourcing, namely, task repetition and diversity of crowds. It seems that diversity is a more subtle concept than currently proposed in the literature (Hong & Page, 2004; Surowiecki, 2004). That is, some level of diversity leads to better solutions but too much diversity may have the opposite effect. An interesting but unresolved issue is whether there is such a thing as an optimally diverse crowd or whether diversity depends on the nature of the tasks or the characteristics of the crowd. The issue is under-researched and the limited findings appear equivocal.

The results indicate that task repetition is an important mechanism for eliminating errors when the workers are non-language professionals but less so when they are language professionals because they have greater ability and experience. From a managerial perspective, this suggests that managers can reduce the amount of task repetitions by making greater use of language professionals. Theoretically, this implies that task repetition may be a more relevant when non-experts are used.

Finally, the study has some limitations, which require caution when applying the results. One limitation is that this study only looked at only two popular languages. Future studies should examine other languages using longer source texts and as Zaidan and Callison-Burch (2011) suggests other languages that are not covered by machine translations. Another limitation pertains to the small sample size of

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

participants and the use of one Ph.D student to rank the translations. Studies with larger crowds combined with much longer source texts could add invaluable insights to those reported here. Moreover, having the target text evaluated by a large number of people in the general population alongside a larger pool of professional translators could allow for comparative insights concerning the acceptance of crowdsourced translations.

APPENDIX: TRANSLATION COSTS

The costs of the translations are as follows: CSTLP2 and CSTNLP2 cost US$72.60 each and CSTLP4 and CSTNLP4 cost US$87.45 each. The professional translation that was used in Phase II costs US$110.00. Machine translation was free. On average, the costs of obtaining crowdsourced translations were approximately 20% (CSTNLP4) to 34% (CSTNLP2) cheaper than professional translations.

Chapter 61
Business Strategies Creating Value for Social Entrepreneurs

Andrisha Beharry-Ramraj
University of KwaZulu-Natal, South Africa

ABSTRACT

Social entrepreneurs seek to make a difference in their societies. It starts with the identification of a specific social problem and devising a specific solution to address the problem. A historical overview of social entrepreneurs shows how individuals considered the greater good of society over self interest as well as the trickle down impact in order to achieve that difference. This chapter explores the various strategies available to social entrepreneurs and begins by defining strategy then presenting a broad spectrum of different competitive, social skills, growth, marketing and communications well as resource strategies that social entrepreneurs can adopt. The chapter concludes by presenting possible solutions and recommendations for social entrepreneurs.

INTRODUCTION

Over the years, attempts to alleviate the high rates of unemployment and its detrimental effects worldwide have seen the substantial amount of attention being directed to the promotion of novel start-up businesses in most parts of the world. Apart from the Real Gross Domestic Product (GDP) and Balance of Trade, the formation of new businesses is not only a direct source of employment creation but also a significant indicator of economic growth (Mahadea, Youngleson, Botha, Dhliwayo, Fregidou-Malama, Musengi-Ajulu, Myres, Pillay & Reyneke, 2013).

As the rapidly changing socio-economic global environment presents new challenges to the business environment, it has been observed that the changes also affect the nature of social entrepreneurship at the level of business practice and in its quality as a discipline. It is therefore important to comprehend that business environment and entrepreneurship are interrelated and influences each other simultaneously. It is also significant to understand the evolving interrelationships between the two when pioneering a small business in order to address stability, growth and ensure the survival of the business. In order to see a small business from the introduction stage through to maturity, sound ethical practices and busi-

ness relations should be applied within a secure and well researched framework which considers both the internal and external business environment and paying particular attention to the current competitors strategies, legislation governing small businesses as well as theories articulated by Mahadea and Youngleson *et al,* (2013).

The chapter explores some of the many business strategies available to social entrepreneurs. These strategies include the social skills strategy, the growth strategy, the marketing and communication strategies and lastly the resource strategies in particular. Relevant business strategies are provided for the readers to gain a better understanding of the importance of social entrepreneurs in the creation of value.

Mahadea and Youngleson *et al,* (2013) point out that entrepreneurs go against the flow in an attempt to be successful and by so doing they believe that what they do is right when everyone else is wrong. The modern social entrepreneur is thus someone who effectively controls resources and takes strategic decisions to produce goods and services for the given market.

BACKGROUND TO SOCIAL ENTREPRENUERS

Entrepreneurship is typically concerned with the measuring of performance in terms of profit or return. Social entrepreneurs are interested, in bringing about positive return to society. Social entrepreneurship typically goes beyond social, cultural, and environmental goals and is frequently associated with the voluntary and non-profit sectors. Just as business entrepreneurship is indispensable to the advancement of economies and business, social entrepreneurship is vital to the progress of societies.

Social entrepreneurs always consider the trickle-down effect of their business on society. They are those individuals who create special ventures with a view to solving the problems in society. Such problems include unemployment, housing, poverty, hunger and pollution. Social entrepreneurship attracts considerable resources and attention (Mahadea & Youngleson *et al*, 2013). Barendsen and Gardner (2004) articulate that social entrepreneurs are unusual in a number of ways. They have deeply rooted norms and beliefs, these norms beliefs are formed early. Social entrepreneurs are exceptional in what they believe and in how these beliefs originate.Social entrepreneurs can also be described as people who have to tackle major social problems. They provide the necessary leadership, energy, resources activism and innovation to address these social issues. Examples of social entrepreneurs include such people as politicians and public figures like former South African President, the late Nelson Mandela, Archbishop Desmond Tutu and Mahatma Gandhi as well as business persons and philanthropists, such as Bill Gates and Warren Buffet; celebrities, such as the late musician Michael Jackson and Bob Geldof as well as actress and talk show host Oprah Winfrey. The above mentioned all had visions of improving people's lives and bringing about changes that impact positively on the living conditions of people in their own countries and across the globe. Social entrepreneurs have existed for many years, although social entrepreneurship has been identified as being vital for progress in societies, there is no single universally accepted definition of the phenomenon. According to Dees (1998) the concept of social entrepreneurship means different things to different people. Drayton (2002) contends that social entrepreneurship is a result of unique personality traits that are found in a rather small number of the population, that however goes beyond selfless motivation and reveal fortitude to bring change to the society.

Mahadea and Youngelson *et al,* (2013) affirm that social entrepreneurship plays a necessary role in the development of social and economic regions. As highlighted earlier, social entrepreneurship creates value and opportunities for growth. Light (2006) concurs with Mahadea and Youngelson *et al*, (2013)

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

and adds that although social entrepreneurship is a very popular terms in the non-profit sector, it is also often misunderstood. Sullivan Mort, Weerawardena and Carnegie (2006) contend that social entrepreneurship leads to the development of new social organisations and increasing innovation in the existing organisations. Sullivan Mort, Weerawardena and Carnegie (2006) emphasises that while this phenomenon is much discussed it is seldom understood. Empirical research on social entrepreneurs recommends that given the increasing importance of such social entrepreneurial organisations, the misunderstandings should be addressed.

Social entrepreneurs identify social challenges and problems and solve them by altering the existing system, instead of leaving the social problems and needs to the government. It is therefore very important that social entrepreneurs identify the right framework and relevant business strategies which will ensure that the purpose and aim of the business are achieved.

Lechler (2001) highlights that entrepreneurs founding and developing new businesses are confronted with variety of challenges. These challenges are mainly derived from uncertainty in technology and business. This will require social entrepreneurs to proactively adapt to the challenges and solve the technological as well as the managerial challenges. Adapting to a changing business environment will enable social entrepreneurs to better understand the needs of customers and thus ensure that value is achieved. This is all centred on adopting the right strategy which will complement the start-up venture. Strategy is discussed in detail hereunder.

STRATEGY

Bateman and Snell (1999) define strategy as a pattern of action and resource allocation to achieve the goals of the organisation. A strategy is usually achieved after a well-rounded strategic planning session. For Bateman and Snell (1999) strategic planning entails making important decisions about the organisation's long-term goals and plans. According to Oosthuizen (2002) the strategic planning process normally involves the following steps:

1. Developing the organisation's vision and mission that is the reason for its existence.
2. Analyze the business environment at macro, market and micro levels.
3. Set long-term objectives.
4. Develop corporate, business and functional strategies.
5. Develop action plans for the attainment of each strategy, with a resource plan and time allocation for each.
6. Implement and control the most appropriate strategies selected.

The decisions made by entrepreneurs should be in accordance with the mission, vision and objectives of the business. Venter, Urban & Rwigema (2008) highlight that strategies are often outlined to reflect the direction a company intends to take within a given context, its resources, purpose and objectives (Lynch 1997). This section of the chapter relies on this definition, notably the aspects of context, resources, purpose and objectives. The parts of the definition are elaborated as follows:

1. **Context:** Context represents the external atmosphere at intervals that associate the operation of entrepreneurial venture. This includes the political, economic, legal, technological, social, envi-

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

ronmental, demographic and international problems that impact on the business. Comprehension of the context also will embrace exanimation of associate organisation's competitors, customers and suppliers.

2. **Resources:** Resources represent the inner assets that a corporation owns; not simply monetary assets such investments or cash, however conjointly mounted assets like instrumentation, machinery and buildings non-tangible assets like folks, material possession and copyrights and emblems.
3. **Purpose:** Purpose refers to a sense of determination that drives a company onward. it's typically characterised by a vision and mission that binds the corporation along and guarantees that the required resources are available to achieve the purpose of the plans so as to trigger actions.
4. **Objectives:** Each business entity has a set of distinctive objectives. The determination of what these are is essential within the strategic planning process. Whereas sustainable growth is commonly the fundamental goal, several corporations select a broader vision like the delivery of world class service or zero product defect. Regardless of the vision, the agreed objectives are going to be the means that realise a strategic amendment.

A strategy should entail a comprehensive plan for accomplishing organisational goals and objectives (Griffin 2014). Organisations engage in strategic plans in order to gain a competitive advantage and maintain value.

This section describes the five basic competitive strategy options. The choice of competitive strategy is a business decision meant to craft an overall strategy and represents a quest for competitive advantage (Hough, Thompson, Strickland, Gamble Human, Makin & Braxton, 2008). The competitive strategy deals exclusively with specifics of management's game plan for competing successfully. Social entrepreneurs, aim to do a significantly better job than their rivals by providing what buyers are looking for and thereby secure an upper hand in the market place.

A business achieves competitive advantage whenever is has some form of edge over its rivals in attracting patrons and addressing competitive forces. This section portrays the five basic competitive strategy choices which, assists organisations to identify the best option for crafting an overall strategy and to start to look for competitive advantage (Hough & Thompson *et al*, 2008). The ultimate aim for social entrepreneurs ought to be quite straight forward which suggests that they execute their work better than their competitors of meeting or exceeding customer expectations and thereby capturing a larger market share.

Hough & Thompson *et al*, (2008) present five competitive strategies which are outlined below:

1. **A low-cost provider strategy:** This strategy entails striving to realize lower overall costs than competitors and appealing to a broad spectrum of shoppers, sometimes by under-pricing competitors.
2. **A broad differentiation strategy:** This strategy is concerned with seeking to differentiate the company's product offerings from rivals' in ways in which can appeal to a broad spectrum of patrons.
3. **A best-cost provider strategy:** This strategy provides customers with a lot of value for the money they spend. It involves incorporating smart to wonderful product attributes at lower prices than competitors, the target is to possess all-time low prices and costs compared to competitors giving merchandise with comparable attributes.
4. **Market niche strategy based on low costs:** The focused low cost strategy involves concentrating on a slim purchaser section and outcompeting rivals by having lower prices than rivals and therefore having the ability to serve niche members at the lowest price.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

5. **Market niche strategy based on differentiation:** The focused differentiation strategy is centred on concentrating on a slim purchaser section and outcompeting rivals by giving niche tailored attributes that meet their tastes and needs higher than rivals' merchandise.

The five strategies mentioned earlier are competitive approaches that stake out a distinct market position, as shown in Fig. 1. Each approach involves distinctively completely different approaches to pursue a competitive advantage. The five strategies that business ventures can choose from are illustrated in Fig 1 hereunder.

Business Strategies Available to Social Entrepreneurs

This section targets the business strategies on the market which are available to social entrepreneurs. For several business ventures adopting the "correct" strategy is crucial because it determines the long run or short term success or failure. It is not only the businessperson or the atmosphere that matters, rather it is the strategic actions of the businessperson or the firm which can, outweigh competition. Therefore it is vital to make sure that the social entrepreneur has the power to change the atmosphere to their advantage instead of being reactive in the business environment. Social entrepreneurs work towards the uplifting of the community and as a result they have to be strategic to be able to select the best business strategy.

Social entrepreneurs seek success. After all, most of them are driven by passion for the cause and should not lose sight of the end game in order to build their business. The question that arises is how can business ventures keep their mission and remain relevant?

Figure 1. The Five Generic Competitive Strategies: Each stakes out a different market position.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

The following four lessons are important for social entrepreneurs:

1. **Your Mission Gives Direction to Teamwork:** The philosophy underpinning any start-up business particularly social entrepreneurs, is building a team with quality taking precedence over quantity. Additionally it is about finding folks with the correct ability sets to grow the business. Social entrepreneurs ought to identify those who not solely perceive the company's mission, however are willing to measure the company mission. At Green House Eco cleaning, they solely hire workers and executives who possess values that align with the company's standards and mission – people who want to do more than just a job, they want to create a positive and healthy change in the world. As such, the business is interested in people who are not simply employees, but people who make positive contributions to the business and in the world.
2. **Ethical Relationships:** Social entrepreneurs often advocate for others to align to their cause. After entering into any form of collaboration with a colleague, should contemplate what one is able to do to assist them accomplish their goals. Social entrepreneurs invest in those relationships that are mutually beneficial, true win-win partnerships, to make sure that employees are in it for the common good. Social entrepreneurs do not entertain self-interest as they are more concerned with public good.
3. **Be a Risk Taker:** While social entrepreneurs are risk takers naturally, they aim to develop a culture of risk taking in the organisation. Risk taking is not only concerned with being daring and gutsy, it is about leadership, experimenting, innovating, creating as well as taking calculated risks. Social entrepreneurs should empower and have interactions with their employees to encourage innovation.
4. **Continuous Learning:** The world changes rapidly and continued learning is important in day-to-day business activities. Continuous learning will assist social entrepreneurs adapt to changes in the business environment as well as maintain their competitive advantage. Investing in employee education and spending time with different groups of stakeholders will help social entrepreneurs learn from past mistakes and avoid repeating them.

Social entrepreneurs are change-makers. They are also role models who demonstrate how ideas can be made realities and those realities can make the world a better place for all. It is all about doing good and maintaining ethical business practices.

Further more Barendsen and Gardner (2004) mention three strategies social entrepreneurs use namely:

1. **Reframing Challenges:** Some social entrepreneurs have the power to envision positivity, like a commitment to a cause or to operating with underserved populations, which often emerges from a painful or tragic state of affairs. People who have experienced tough trauma demonstrate a capability to reframe these challenges into opportunities for growth.
2. **Sense of Obligation:** Social entrepreneurs feel accountable to the communities or causes they serve; business entrepreneurs discuss responsibilities with investors and workers. Social entrepreneurs feel all these obligations, and in some cases this results in the sensation that they know they have no alternative however they continue their work. It is vital to acknowledge, however, that though people could say they have "no choice" but to continue in their work, they after all choose to do so. As a result of their deep convictions, these people are willing to resort to and act on their obligations.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

3. **Measuring Success:** Social entrepreneurs often valuate their work. Several describe standards by which they quantify success. In assessing the worth of their work, social entrepreneurs feel the challenges of the opposite caring professions and face these challenges with business like organisation and strategies. Measuring the impact on a specific population or on behalf of a specific cause is not invariably simple, and also the social entrepreneurs share this challenge with the communities. For-profit social entrepreneurs face this challenge in an extremely business-like manner, by observing their monetary profits. Other, non-profit social entrepreneurs produce clear programmatic strategies of assessment that are substantially like business plans.

Therefore it's vital that full recognition is offered to social entrepreneurship as is the case with business entrepreneurship. Only then will all others be absolutely ready to guide social entrepreneurs.

Social Skills Strategy

Baron and Markman (2000) posed the question, "why are some social entrepreneurs so much more successful than others in starting new ventures?" Empirical research shows that building an inventory of social assets is vital. In their classic chapter on angle structuring, Walton and McKersie (1969) documented ways for building social assets. Instead of reiterating their comprehensive work, a summary of the key approaches is provided.

According to Walton and McKersie (1969) there are at least four major types of strategies to build social assets.

1. **Sharing Information:** By sharing knowledge the venture manager could also be ready to build up a list of social obligations or social affinities which might be spent at a future date.
2. **Solving and Receiving Help With Problems:** Solving issues for somebody is an understandable approach of developing social assets like feeling, gratitude or obligation.
3. **Giving and Receiving Favours:** This strategy operates very closely to that of solving and getting help with problems.
4. **Creating Opportunities for People to Demonstrate Their Skills and COMPETENCE:** By making or seeking opportunities that alter people to show their talents and to look competent ahead of others will engender extended social goodwill.

By investing time and focusing on the above mentioned strategies, it is possible to create a social quality base that becomes the inspiration for developing social assets, namely resource cooptation strategies which will be discussed later. The social enterprise's strategy is different for every business, however the following characteristics require consideration.

1. **Internal and External:** Connectivity between workers, departments, regions and divisions, is key. Improved communication within each company, in spite of the scale, should be effective from the corporate executive all the way right down to entry-level workers. Connectivity also aids in tactical communications associated with business processes, bringing on-boarding new workers, and building a culture of cooperation.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Participation in external, public social networks is an addition demand on a social enterprise. By establishing a persona on public social networks like Facebook, Twitter, LinkedIn and YouTube, an enterprise will manage its complete customer base from wherever shoppers are present.

2. **Personal:** In the age of the social enterprise, each client gets a voice, and it behaves upon firms to address client problems proactively instead of reactively. Public social networks are crammed with client comments, questions, problems and opinions concerning the merchandise they use. As corporations' entre into these networks, they will get a clearer understanding of their clients and then prepare social profiles of their customers. By being attentive to their customers, social entrepreneurs will be able to determine the problems affecting their clients and take this opportunity to win over unhappy customers and convert them into advocates.

However, awareness of your consumer's opinions, expectations and problems is not enough. Incorporation of this data into operations is important. For example, Gatorade an established Mission Control to monitor social networks. As a result, Gatorade has been tracking media performance. It monitors the sport landscape; tracks sports trends and buzz; monitors on-line discussions; and performs proactive social media reaching.

3. **Contextual:** The personalization of the social enterprise, internally and outwardly, needs shoppers, partners and workers to converse on the topical issues about what they do. Customers looking for information to make an informed purchase or to solve a problem need time and related information. If they do not obtain it, they will go to a rival. Good businesses build client social networks.

Contextual social interaction creates a way of connectedness for both workers and customers. Customers feel valued once their voices are listened to. This interaction facilitates loyalty.

4. **Mobile:** It is important to discuss social entrepreneurship mobility. Social interactions cannot realistically be restricted only to captive audiences. The prevalence of smartphones associated with PCs has reached great and previously unimaginable heights. The trend is expected to continue. Social enterprises are establishing communication channels through mobile devices. Consumers have high expectations of what they need in form of merchandise. It is not enough for systems and applications to be functional; they have to be even fun to use.

The next section outlines varied growth paths which are employed by entrepreneurial businesses which are universally accepted and can be adopted by social entrepreneurs.

Growth Strategies

This section illustrates many aspects of business growth strategies. Growing businesses is of utmost importance for South Africa's economy and address the triple challenges of poverty, inequality and unemployment. Growing social business companies is crucial for both the business and individual entrepreneur (Mahadea & Youngelson *et al*, 2013).

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Ellis (2010) states that social entrepreneurs apply completely different growth paths depending on their company's development stage and whether or not they have quantitative or qualitative value-adding ambitions. It is important to find the optimum size and also the right method to grow in terms of development, instead of following growth for the sake of growth. In the field of social entrepreneurship one of the following Seven Growth Strategies are generally applied.

Accordingly the Seven Growth Strategies are as follows:

1. Stay small in structure size and target different growth parameters, for example; worker happiness, environmental enhancements or building native economies.
2. Grow quantitatively in size, for instance; turnover and variety of workers by attracting investors, increasing into new markets and/or increasing the client base.
3. Replicate the business idea to different national or world regions, for example through systematic franchising or 'amoebic' multiplication of little freelance units.
4. Build a movement, for example; by spreading the core plan and principles so governments, thought businesses, native communities or different entrepreneurs arrange to add support of an equivalent purpose.
5. Collaborate or merge with different social ventures within the same cluster to develop processes, merchandise and services or interact in 'network production; therefore micro-entrepreneurs will get together to produce massive corporations.
6. Enter into partnerships with actors within the non-public, public or civil sectors, for example; to realize access to data, skills, infrastructure and/or capital.
7. Sell components of or the whole social venture to a mainstream business, for instance; to extend the information and impact of the idea so it goes mainstream. (Ellis 2010)

However it is important to note that the choice of growth strategy is closely linked to financing the social venture.

Intensive Growth Strategy

Figure 2 below illustrates an intensive growth strategy as articulated by the Ansoff Matrix:

1. **Market Penetration:** Corporations penetrate deeply into the market so as to extend sales of this product in existing markets. This can be done by aggressive distribution and promotion of product and complete. The company will increase market shares and makes its product on the market to customers on an oversized scale to develop its market. The main challenge of using this strategy is that an oversized quantity of capital needs to be spent on promotional advertisements.
2. **Market Development:** This strategy aims to extend the amount of sales of the present merchandise in new markets. This can be achieved in numerous ways. For example, the business will change the name of its product so that it is compatible with the culture of the new market or change the merchandise's packaging so that it arouses curiosity in the public concerning the product.
3. **Product Development:** This strategy suggests that the business can grow if an associated improved product of an equivalent sort is developed for the present market. The business will either replace the present product or sell it additionally alongside the new one.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 2. The Ansoff Matrix
Source: Riley, J. Ansoff matrix. [Online]. Available: http://tutor2u.net/business/strategy/ansoff_matrix.htm [24 April 2013].

4. **Differentiation:** Differentiation is applied wherever the firm launches new merchandise and services. This can be a risky strategy since the business moves into markets in which it has very little or no expertise. The main challenge of this strategy is creating the choice to either replace or continue with the product.

Diversification Growth Strategy

These strategies are often adopted once it has been confirmed that the business cannot grow to any extent further within the market through its present product range. There are three choices for diversification: homocentric, horizontal and conglomerate.

1. **Concentric Diversification:** The foundation of this strategy is analysis and education to the market. Concentric diversification also known as homocentric diversification takes advantage of latest opportunities, using this platform of the business to provide machinery and technology to manufacture new products within the context of a familiar market. The business therefore begins manufacturing new products however existing production continues to be considered the core business.
2. **Horizontal Diversification:** This entails analysis of new opportunities for growing the business in an exceedingly familiar market. However, it differs from homocentric diversification in that the diversification needs new technology which is completely different from existing technology employed by the business. While the production of the merchandise uses new technology, the corporate will use its existing technology distribution and provide network to supply the merchandise to the market. This strategy works well when new products are created and are made to work with the main product that the firm produces.
3. **Conglomerate Diversification:** This entails development of a brand new product that is not technologically connected with the company's existing technology. As a result, the corporation

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

needs to invest in new technology to develop this product. This product could target a brand new market. It should be noted that this method is complicated. It is affected by several factors, like the provision of essential resources, market seasonality and also the ability of personnel. This kind of diversification is commonly seen within the case of mergers between two completely different corporations.

Integrative Growth Strategy

This strategy is employed in instances where a corporation has strong base in business but being unable to use the strategy of growth. At an equivalent time, integration growth doesn't conflict with its long-term objectives. The corporation practices integrated growth both by acquisition of the opposite property and by internal extension.

1. **Backward Integration:** This type of integration involves merging with an organisation in the preceding stage of production. A company will integrate parts of different businesses that provide the raw materials it must manufacture. Using this approach, the corporate will secure continuous provision of raw materials. For example an acquisition of a textile works by a ready-made clothes producing company.
2. **Forward Integration:** This type of integration concerns merging with an organisation in the succeeding stage of production. A company that uses this strategy could integrate its channel as a part of the company. This provides the company with full management over distribution of its product. For example, a ready-made garment manufacturer might take over retail outlets so as to make sure its clothes are reaching a larger market.
3. **Horizontal Integration:** The final type of integration involves units of various corporations producing similar merchandise are united. This implies competitive companies are brought along to possess one management and ownership with a standard name. For example the merger of the two giant food retail outlets Shoprite Checkers in South Africa represents horizontal integration.

Once social entrepreneurs have used one of the growth strategies that have been outlined, new marketing and communication efforts that are in line with the growth strategies should be revised.

Marketing and Communication Strategies

The social businessperson needs to decide how best to serve its customers and the way to boost competiveness. A technique to consider in achieving this is marketing; often referred to as the four Ps, specifically product, pricing, promotion and distribution (place). Businesses build competitive benefits supported the marketing Ps. Smart promoting ways guarantee client satisfaction and thus business success (Mahadea & Youngleson *et al,* 2013). This section can verify the significance for social entrepreneurs in terms of identifying the right marketing strategy.

Marketing can be defined as providing information about a product and selling a product or service within the new sense of satisfying client desires (Kotler & Armstrong, 2010). Although small businesses do not typically follow the marketing processes of a large firm, understanding of these processes is useful in gaining a deeper insight into marketing.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

1. Corporate level strategy entails choices created on the size and scope, for instance the level of diversification, geographical scope and vertical integration of the organisation (Venter & Van Rensburg 2009). This can be the process nature of what the business is concerned with. Promoting connected choices at this level have an instantaneous impact on the business's core activities. The choices taken here are sometimes created by higher level management. It is at this level that the firm is monitored from an overall perspective. As argued by He (2008), company level strategy is supported by company level promoting, that focuses on problems like company identity, stigmatisation and communication strategy (he cited in Mahadea & Youngelson *et al,* 2013).
2. Business level strategies are based on how the best the firm competes (Griffin, 2014). The internal and external environments in which a firm competes are of paramount importance. The vital purpose to note is that the company's strategy should be in line with the strategic selections of the firm (Mahadea & Youngelson *et al*, 2013).

Consistency in Communication

Consistent communication at all levels of the organisation is vital. For example, wherever senior management regards the relationship as successful, disputes and disagreements may arise and this could lead to the relationship deteriorating. Hence paramount importance is given to consistent communication.

Communication as a Driver of Culture

Good communication is an enabler of a culture of openness, trust and mutual edges between the client and also the social entrepreneurs. Communication paves the way for openness between parties. Additionally the approach employees have and also the attitudes they hold concerning their companies and their relations is very important. Attitudes and behaviours, are as important in ensuring the foundation for good communication. Behaviours are the manifestations of the attitudes of these concerned in an exceedingly written agreement relationship. The correct attitudes can cause the correct behaviour (Office of Government Commerce 2002).

In general, it is useful for social entrepreneurs to develop the subsequent attitudes and behaviours:

1. Respect the contributions of others.
2. Do not over emphasise the ability of formal authority.
3. Take an extended term to read and understand short term edges.
4. Look for benefits for all parties and target gains for the cluster.
5. Recognise the independence of the connection which the beneficiary could directly influence the provider's ability to satisfy its objectives.
6. Be cooperative and comprehensive instead of adversarial.
7. Be involved with the success of the relationship, instead of achieving your side's objectives in isolation.
8. Be open with your employees and customers concerning your ways, plans, considerations and opportunities.
9. Empowering others to undertake certain business related activities, instead of demanding on hands-on supervising.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

10. Proactively look to anticipate change and build enhancements, instead of passively meeting existing desires and observation performance.
11. Create a persuasive relationship that operates on several levels within and outside the firm, instead of operating through one interface.

Everyone concerned within the relationship ought to be able to learn from the mistakes and experiences of others. The stress in providing and receiving feedback on performance ought to on using such information as a basis for improvement, instead of penalty. (Mahadea & Youngelson*et al,* 2013). Therefore it's crucial for the social entrepreneurs to totally recognize that marketing is concerned about ensuring full benefits are value for customers. So as to achieve success, companies have to be compelled to be each economical and effective in their varied promoting activities.

Segmentation/Target Market Strategies

Segmentation involves a firm's deliberate option to service a particular market section. This is supported by the promoting the segmentation strategy chosen by the firm. In selecting the market strategy, it is vital to appear as enticing to the market section. Factors like growth, competition, new entrants to the market, substitute merchandise within the market and also the role of the suppliers and shoppers should be assessed. Additionally the social entrepreneurial firm needs to have the aptitude and capability to be ready to target specific markets (Mahadea & Youngelson *et al,* 2013).

The following strategies are often applied in the segmentation of markets (Lamb, Hair, McDaniel, Boshoff & Terblance, 2008):

1. **An Undifferentiated Strategy:** This strategy means all segments within the market are going to be targeted using the same approach. However, this is not always a helpful approach of addressing customer needs.
2. **A Focused Strategy:** This involves segmenting shoppers into specific groups and making a separate strategy and promotional mix for every group.
3. **Multi-Segment Targeting:** This occurs once two or more of market sections are outlined and a definite promotional mix is developed for every segment.

Social entrepreneurs should in the slightest degree times valuate the target promoting strategy because the small and macro environments. As a social businessperson being incessantly conversant and created conscious of the atmosphere is imperative to make sure a competitive advantage. Below are ways employed by entrepreneurs to realize a competitive edge against rivals in competitive markets.

Resource Strategies

Human recourse invariably plays an important role within the success of any business. Social entrepreneurs need to rigorously choose the personnel which will run the business. This section involves associate assessment of the entrepreneur's own management capabilities. Any gaps that arise have to be filled with a decent management team and different key workers. The human resources issue considers the number and quality of management and workers (Mahadea and Youngleson *et al*, 2013).

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Bloom and Chatterji (2009) state that achieving excellence at staffing can clearly need the organisation to pay attention to its personnel and human resource functions, so recruiting, training, appraising, and compensating the paid employees should be done in a professional manner. Still, several social entrepreneurial organisations can have to be compelled to pay greater attention to recruiting, training, and managing unpaid volunteers in order to develop a strategy guaranteeing the acquisition of well trained employees.

From analysing the works of Kanter (1983, 1988), Burgelman and Sayles (1986) and many case examples, there appear to be four major classes of co-optation strategies for taking advantage of underutilized resources. Cooptation as a resource acquisition strategy is regarded as one of the easiest means for gaining access to acquired resources. These strategies are outlined hereunder:

1. **Borrowing Strategies:** Borrowing strategies serve the purpose to secure, quickly or sporadically, the employment of assets or different resources, below the premise that they are going to eventually come back.
2. **Begging Strategies:** Begging ways secure resources appealing to the charity, honour, or goodwill of the owner of the resources. During this approach venture managers gain access to the resources without having to return them, despite the actual fact that the owner acknowledges the assets have a price.
3. **Scavenging Strategies:** Scavenging strategies are a means whereby the social entrepreneur may extract usage from merchandise that others shun or do not use. This is as a means to save and use precious funds elsewhere in the business.
4. **Amplifying:** Amplification is that the capacity to lever much more value out of asset than the original owner of that asset. It is a development that is notably vital in societies that are urgently poor, or companies that are in dire circumstances, and therefore deserves considerable more study.

These four strategies of resource co-optation could permit the social entrepreneur to secure resources that might otherwise have to be compelled to be secured by economic exchange at a lot of larger value and in doing so will cost the social entrepreneur.

Therefore, there are crucial recommendations hereunder:

Recommendations for Social Entrepreneurs

1. Social entrepreneurs should conduct market research in order to identify the right marketing mix and the appropriate strategy for their start-up venture.
2. It is important to charge a price that gives the customers the best value for their money while covering the start-up production costs. Value and customer satisfaction are two vital aspects of social entrepreneurs.
3. Ethical considerations should be at the core of all social entrepreneurial ventures as they are centred on public-interest as opposed to self-interest and profit making.
4. Once the business has reached maturity, it is time to consider implementing growth strategies. Innovation, risk taking and continuous learning are some of the strategies social entrepreneurs need to consider. The social entrepreneur is encouraged to adopt a proactive approach to better respond to changes in the internal and external environment.

CONCLUSION

The success of social entrepreneurship relies extensively on the social skills strategy, the growth strategy, the marketing and communication strategies as well as the resource strategies.

Social skills influence the ability of social entrepreneurs to excel in their business by creating social assets and using them to the organisation's advantage. An entrepreneurs' social skills and specific competencies facilitate social entrepreneurs to act effectively with the people they relate with and also play a major role in their success.

Choosing an effective growth strategy has a significant bearing in the long-run of a start-up venture. Social entrepreneurs should have an in-depth understanding of the market in which they are operating and also the targets they wish to achieve. The right growth strategy will not only contribute to the success of the business, but will also guarantee the attainment of a larger market share.

Marketing and communication influence consumer perceptions and will give a social entrepreneur a favorable product positioning. Effective communication and marketing efforts will make the consumers aware of the products value.

Efficient management of resources works to the advantage of any business. Particularly in social entrepreneurship, human resources play a significant role in the success of the organisation. Training and development of employees and providing chances for growth are some of the strategies social entrepreneurs can use.

This chapter has explored the evolving traits of social entrepreneurs while providing the strategies they use to sustain their organisations.

KEY TERMS AND DEFINITIONS

Business Growth: Growth may be measured in several ways, including growth in sales volume, number of employees, territorial expansion, venturing into different business/ market sectors or new product/service lunches.

Business-Level Strategy: The set of strategic alternatives from which an organization chooses as it conducts business in a particular industry or market.

Corporate-Level Strategy: The set of strategic alternatives from which an organization chooses as it manages its operations simultaneously across several industries and several markets.

Differentiation Strategy: A strategy in which an organisation seeks to distinguish itself from competitors through the quality of its products and services.

Entrepreneurship Marketing: A social, personal activity where an entrepreneur uses innovation to create value-added competitive advantage.

Product Mix Consistency: How well all the different products of a firm relate or link to each other.

Social Entrepreneurship: Social entrepreneurship is a type of entrepreneurship that combines the resourcefulness of traditional entrepreneurship with a mission to change society through new organisations and ideas. The aim is to provide a solution to social problems and adding value to society. Social entrepreneurship is driven by social entrepreneurs and embraces various forms of organisations, from non-profit to cooperative to philanthropic.

Social Marketing: Firms with a societal orientation that utilise marketing tools in order to inform or advocate a change in behaviour/attitude regarding a social issue.

Strategic Management: A comprehensive and ongoing management process aimed at formulating and implementing effective strategies; a way of approaching business opportunities and challenges.

Strategy: A comprehensive plan for accomplishing an organization's goals.

This research was previously published in Incorporating Business Models and Strategies into Social Entrepreneurship edited by Ziska Fields, pages 80-96, copyright year 2016 by Business Science Reference (an imprint of IGI Global).

Chapter 62
The Potential of Crowdsourcing in the Health Care Industry

Kaushik Ghosh
Lamar University, USA

Kabir Sen
Lamar University, USA

ABSTRACT

Crowdsourcing has immense potential in the health care industry as it can tap into a vast global pool of knowledge to solve a wide variety of health care problems. This chapter first categorizes the different problems in the health care industry. It then describes some existing health care services and also discusses the future challenges that a typical crowdsourcing service could face. The chapter emphasizes the potential of crowdsourcing to disrupt old ideas and introduce new ones as well as a make a significant improvement in the social quality for different population groups.

INTRODUCTION

The twenty first century has seen the advent of technical advances in storage, transmission and analysis of information. This has had a profound impact on the field of medicine. However, notwithstanding these advances, various obstacles remain in the world regarding the improvement of human lives through the provision of better health care. The obstacles emanate from the demand (i.e., the problem) as well as the supply (i.e., the solution) side. In some cases, the nature of the problems might not have been correctly identified. In others, a solution to a problem could be known only to a small niche of the global population. Thus, from the demand perspective, the variety of health care issues can range from the quest for a cure for a rare illness to the inability to successfully implement verifiable preventive measures for a disease that affects particular pockets of the global population. Alternatively, from the supply perspective, the approach to a host of health issues might vary because of fundamental differences in both medical philosophies and organizational policies.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

In many instances, effective solutions to health care problems are lacking because of inadequate global knowledge about the particular disease. Alternatively, in other cases, a solution might exist but the relevant knowledge about it might only be available to selected pockets of the global medical community. Sometimes, the barriers to the transfer of knowledge might have their root causes in ignorance or prejudice about the initiator of the cure or solution. However, the advent of information technology has now provided an opportunity for individuals located at different geographical locations to collaborate on solutions to various problems. These crowdsourcing projects now have the potential to extract the "wisdom of crowds" for tackling problems which previously could not be solved by a group of experts (Surowiecki 2014). Anecdotal evidence suggests that crowdsourcing has achieved some success in providing solutions for a rare medical disease (Arnold 2014). This chapter discusses crowdsourcing's potential to solve medical problems by designing a framework to evaluate its promises and also suggest recommended future paths of actions.

The chapter consists of five sections. The first section builds on a phrase used by former US Defense Secretary, Mr. Donald Rumsfeld, in the context of Iraq, to devise a classification scheme for all possible medical issues likely to be faced by health care professionals. This categorization provides a convenient way to evaluate the myriad health care problems affecting the global population. The next section summarizes the relevant dimensions that differentiate the various medical approaches to health care problems. These are rooted in either different medical philosophies, governmental approaches, ingredients used, etc. The third section compares some existing popular medical crowdsourcing sites. The fourth section discusses the various challenges facing the dissemination of knowledge in the health care industry. The section suggests solutions for overcoming these problems related to these knowledge-based deficiencies. The recommendations include expanding the crowd and building appropriate algorithms that effectively identify the most efficient medical solutions. The final section concludes the chapter with a discussion of crowdsourcing's potential to evolve beyond the initial stages and be a force for positive changes for the quality of life around the world as well as an engine for disruptive innovation.

A CLASSIFICATION OF HEALTH CARE INDUSTRY CHALLENGES

In February 2002, the then US Defense Secretary, Donald Rumsfeld (2002) used the terms the "known knowns," the "known unknowns" and the "unknown unknowns" when discussing the situation in Iraq. Later, philosopher Slavoj Zizek (2004) added another term, the "unknown knowns" as a fourth classification. While, both Rumsfeld and Zizek used the terms to discuss the US involvement in Iraq, this classification scheme is used as a springboard in our chapter to classify the myriad problems facing the global health care industry. These four classes allow us to evaluate the different types of challenges facing the health care industry and help evaluate how modern methods of knowledge sharing in crowdsourcing can provide solutions to these problems.

1. **The "Known Knowns":** "Known knowns" describe situations in which the solutions to a common health problem or issue might already be known. However, the applications of the solution to different situations might come up against myriad obstacles. Examples include the presence of malaria in geographic areas, which are adjacent to places from which the disease has been eradicated. Similarly, while one government can provide better health care to its citizens, another with

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

more investments might be lagging behind on most measures. In some instances, an effective solution is available (hence the term "known knowns"), but unfortunately the results cannot be easily duplicated for different regions or populations. Sometimes, the answers might lie in adjusting the incentive/disincentive programs through specific government policies. In other cases, the programs might have to be fine-tuned in order to combat pockets of ignorance based on either tradition or misinformation. While the solutions to these problems might not involve breakthroughs in the basic field of medicine, health care professionals cannot be left out of this dialogue as their own discipline is inextricably linked with the process of solving the "known knowns" generalization problem.

2. **The "Known Unknowns":** In the field of medicine, there are some instances when failures occur because the disease was not detected earlier. This is illustrated with the problems of early detection of pancreatic cancer (American Cancer Society 2014). It is currently a "known unknown". Once a test is validated under stringent laboratory conditions, this problem will then transform to a "known". However, till such a test gains broad acceptance via the medical community, the problem will remain a "known unknown," still waiting to be solved.
3. **The "Unknown Unknowns":** While future predictions for any industry are always difficult to make, it is likely that a company can introduce a future drug whose potential harmful side effects can only be discovered years later. As of today, both the drug and its side effects are "unknowns". When both the drug and side effects are "unknown," it is tempting to relegate this problem to the realms of science fiction. However, the history of sulfonamide drugs provides an interesting insight into what the future might hold for the medical community. Sulfonamide based drugs were a popular antibiotic in the 1930's. However, the introduction of the drug in a liquid form, called 'elixir sulfanilamide' caused the deaths of more than a hundred consumers (Akst 2013). Later, the side effects of sulfa drugs, particularly taken in large doses were discovered (More 2014). Although, current rules of drug testing are more stringent than during the 1930's, competitive pressures to bring 'new elixirs' to the market could cause future unknown problems.
4. **The "Unknown Knowns":** Zizek (2004) contends that there are some facts that a culture might intentionally refuse to acknowledge. These psychological barriers are likely to be present in the health care industry. While traditional Western medicine has dominated the delivery of medical solutions, in many instances other alternative methods acquired through generations by specific population groups or based on alternative treatment philosophies might also exist. These alternative medical approaches include but are not restricted to Acupuncture, Ayurveda, Unani, Homeopathy systems, etc. This list is incomplete as various groups of indigenous people such as the Aborigines, American Indians, Tibetans, etc. also have their own medical traditions. While such alternative medical practices have long historical traditions, they might not be known to a large audience because of various factors. One of these could be the lack of medical solutions validated under controlled laboratory conditions, expected in traditional Western medicine. Another could be prejudices rooted in attitudes towards the indigenous people who originated the cure. Here the history of the fight against malaria provides an interesting insight. In 1898, Ronald Ross discovered the link between the mosquito and malaria. However, in the seventeenth century, a Jesuit missionary in South America had already discovered the remedial use of the bark of the cinchona tree in treating malaria. Reportedly, he in turn, had learnt about this from the indigenous population in Peru, who knew of the cure for many years (Parker 2013). Like the cinchona bark, "known" solutions to

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

medical problems which are "unknown" to a wider population might still exist. Another example of an "unknown known" is the confidential results of a test for a new drug. The wider audience might be ignorant of these results, particularly if they revealed undesirable side effects. Thus, various barriers, psychological or profit-driven, might effectively change the "known" problem to an "unknown" one for a wider population.

SALIENT DIFFERENCES IN MEDICAL TRADITIONS

To provide solutions to the problems facing the health care industry, an effective crowdsourcing service must be able to identify and then effectively tap different pools of medical knowledge in the world. Subbarayappa (2001) in his survey of ancient remedies identifies the Ayurveda, Chinese and Greek medical systems as the three early ones that existed in the first millennia. This is in contrast to the twenty first century, where multi-billion-dollar pharmaceutical companies promote drugs which have been ostensibly tested under stringent laboratory conditions. However, the history of recalls in the drug and pharmaceutical sector suggests that information about some of these drugs might be incomplete or inaccurate in certain cases. These incidents underscore the importance of sharing knowledge about all available solutions to health care problems and emphasize the need for a crowdsourcing service. However, for a crowdsourcing service to be successful, a proper understanding of the nature of the information to be shared is essential. This is only possible if the underlying dimensions that differentiate the various approaches to medicine are identified.

1. **Empiricism vs. Rationalism:** Coulter (1995) identifies the empirical and rationalist philosophies as a conflict between traditional Western medicine, usually termed as "allopathy," with other approaches to medicine such as Homeopathy, Acupuncture, etc. Many of the alternatives to traditional Western medicine adopt an empirical approach. This is based on a long experience of studying both the symptoms of the disease and a range of possible treatments. Traditional Western medicine on the other hand usually bases its diagnosis on theoretical insights backed up by tests conducted under stringent laboratory conditions. The difference in the two approaches is related to other differences in medical traditions as well.
2. **Holistic vs. Atomistic:** Numerous medical traditions are based on a unified approach. This is the underlying construct used in combating health issues. An example is the principle of *Qi* in Acupuncture (Finando and Finando, 2012). These holistic philosophies are markedly different from an atomistic approach. Here, each health care problem is tackled in disconnected bits and portions. In case of solutions derived from holistic medical traditions, the actual application can be appreciated better by understanding the fundamental philosophy it originated from.
3. **Structured vs. Unstructured:** A large component of Western traditional medicine is based on knowledge recorded in encyclopedias, medical journals and books. Exceptions exist in the case of more modern treatments whose actual impact has only been accepted in a few countries (Schrotenboer 2015). In contrast, many indigenous treatments, which are often based on the skill and individual knowledge of the medical practitioner, follow an unstructured path. In several cases, a corollary to this dimension is that the more structured medical solutions are sometimes also more transparent and easier to access. Accessibility and transferability are often more difficult in the case of medical traditions where the knowledge base is unstructured.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

4. **Natural vs. Synthetic:** The drugs prescribed or bought over the counter as part of traditional Western medicine are in most cases mass produced in high volumes. Each drug is expected to be identical to another. This mode of delivery is in contrast to that followed in some medical traditions where the dosage is designed with a specific patient in mind. In some cases, the dosage is composed of naturally occurring ingredients extracted from herbs and plants. In the continuum on the natural to the synthetic approaches, treatments are easier to be fine-tuned for individual patients when the medical traditions are closer to the "natural" end of this dimension.
5. **Regulated vs. Unregulated:** In addition to variances in philosophical approaches, the different medical traditions can also be distinguished by the diverse rules and regulations of the environment in which they operate. For example, a naturally occurring substance can be regulated by rules covering medicine in some countries while being regarded as a food product in others. Here, it is important to be cognizant of the variances in the global regulation of particular medical remedies, as well as appreciate the rationale behind the underlying reasons for the differences.

In order to efficiently tackle the four types of problems described in the second section, it is important for a crowdsourcing medical service to recognize the above dimensions that differentiate various medical approaches to treating health care problems.

CROWDSOURCING'S ROLE AS A SOLUTION PROVIDER

Existing Crowdsourcing Services

Crowdsourcing is often considered as a virtual production and collaboration platform for enabling collective idea generation and problem solving. It resembles an open call for intellectual contributions pitched to an undefined group. It is also a means by which experts can receive a call to brainstorm, assess, evaluate and consult on specific projects (Jain 2010). In the health care industry, crowdsourcing enabled by the Internet and 'backed' by the collective knowledge of large groups of individuals, is supporting health-related research collaboration, enabling prediction of disease outbreaks, and allowing diagnosis of rare medical conditions. With the advent of crowdsourcing and human computation, new and innovative approaches to health care are emerging to tackle open problems via crowd-based Internet services (Cheng et al. 2015). For example, community question answering and specialized medical sites offer new ways of solving medical cases. There are several examples of crowdsourcing initiatives currently underway in the health care domain. The salient features of some of the popular services are described below.

1. **CrowdMed:** Physicians are trained to identify common causes behind symptoms and then develop treatment plans. However, there are cases that challenge common causes. At that point, specialists are called in to provide their expertise. Even so, there are some cases so rare that both the health care providers and patients end up spending extraordinary amounts of time and money trying to provide a precise diagnosis and effective treatment strategy—with 7,000 currently known rare and/or difficult-to-diagnose diseases. On CrowdMed, patients with rare (or difficult-to-diagnose) diseases list their case to seek consultation for possible diagnosis from contributors; a broad pool of individuals (including physicians). These "Medical Detectives" review patients' symptoms, medical histories, and other pertinent data before recommending their diagnoses and expert opinions.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Prediction market algorithms aggregate medical solutions provided by the crowd and filter them to a probable list of diagnostic suggestions for each patient. It then sends patients the top diagnostic recommendations, stating the estimated probability of accuracy for each one. Patients can then discuss those findings with their personal physicians and/or health care teams. To date, CrowdMed reports an accuracy rate of more than ninety percent (Kamajian 2015).

2. **PatientsLikeMe:** PatientsLikeMe, is an online community enabling health information exchange between patients. The site provides visualization tools to allow patients to understand and share information about their health condition and uncover new knowledge. Patients can connect conveniently with other patients that have the same conditions, experiencing the same symptoms or using similar treatments (Cheng et al. 2015). Most join the site based on the recommendation of their health providers, other patients, or patient blogs, or after finding the site through online searches. Patients that join the website can choose to share their detailed health and treatment data. These data sets are presented as "health profiles" and aggregated as reports, accessible to other individuals on the site. Members can then discuss these data sets either within a group forum or individually through private messages. The resources on the site are designed to help members answer the questions such as: "Given my status, what is the best outcome I can hope to achieve, and how do I get there?" PatientsLikeMe is gaining recognition for its clinical research in areas such as patient-reported outcomes, identification of symptoms in neurological diseases, patient education and decision-making, and patient-lead clinical trials.
3. **CureCrowd:** Founded by doctors, CureCrowd is a "medically" guided search engine. It invites visitors to complete a survey of their experiences with various medical conditions and treatments. Collective wisdom of users is aggregated to offer ratings of the effectiveness of various medical-treatment alternatives. The "medical team" of CureCrowd reviews all user treatment suggestions before adding them to its database. Users can search the database and find the most dependable evaluations and answers regarding their medical conditions and/or treatment questions. An individual can type a medical condition or treatment into CureCrowd's search bar which will return results provided by users and reviewed by medical professionals. CureCrowd will not make recommendations by itself. Instead, it provides user-based statistics in graphs, allowing individuals to make their own interpretations of the data. The CureCrowd privacy policy states that the site doesn't share personally identifiable information with third parties. Unlike many health-information exchange websites, one can access the treatment survey results without having to provide any personal information.
4. **SERMO:** SERMO is a social networking platform exclusively meant for certified physicians. Doctors across the world can share information online anonymously on patient cases with the intention of obtaining recommendation from their peers. The contributing physician(s) can ask follow-up questions, post advice, and vote on the best treatment options for patients. The networking site also allows doctors to discuss topics unrelated to patient care without having to reveal their identity. This crowdsourcing platform is unique since it brings together physicians from eighty countries spread across five continents. These doctors have several millions of years of combined medical education and experience. Sharing of cumulative medical expertise improves the 'odds' of solving difficult medical cases and enhances quality of patient care at significantly lower cost to the health care system.

Table 1 compares the salient features of these crowdsourcing services.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Table 1. A comparison of some crowdsourcing services in the health care industry

	CrowdMed	Patients Like Me	CureCrowd	SERMO
Concept	Patients with rare diseases list their case to seek consultation for possible diagnosis from contributors who provide medical advice.	Health information sharing website for patients. Patients share personal stories and health data about conditions to uncover great ideas and new knowledge.	Founded by doctors. Medically guided search engine that allows users to find the most authentic answers regarding their medical conditions and/or treatment questions.	A private social network that allows doctors to share their medical wisdom and insights with peers, anonymously across geographical borders. Sometimes referred to as 'virtual lounge' for doctors.
Contributor Community:	Contributors are not necessarily medical experts. They are 54% males and 46% females, 56% work in or study medicine, across 23 different job titles or specialties. The average age is 35 years representing 22 countries of which 68% are in the US.	Patients	Participants and Medical Doctors	About 500,000 verified and licensed physicians that form a global community of doctors from eighty countries spread across five continents.
Revenue Model	In addition to a free case submission option, three paid packages are offered: Lite ($99/mo), Standard ($149/mo), and Premium ($249/mo). Some of these packages also include monetary incentives to attract the best case-solvers.	Takes information that patients share and sell it to companies that are developing or selling products to patients.	Non-profit	Physicians do not charge fees.
Problem Solving Mechanism	Prediction market algorithms are used to filter solutions provided by the crowd to a probable list of diagnostic suggestions for each patient.	By sharing information online, patients connect easily with other patients that have similar conditions, experiencing the same symptoms or using similar treatments.	User simply types medical condition or treatment into CureCrowd's search bar and will receive results provided by other users and vetted by medical professionals. CureCrowd does not make its own recommendations. Instead, visitors are provided user-based statistics in graphs, allowing them to have their own interpretations of the data.	Physicians can post patient cases online from anywhere. Posted patient information including images, test results, etc., can be anonymous. The submitting doctor usually requests for recommendations. Contributing physicians can ask additional questions, provide advice, and recommend treatment. Most patient cases receive a response within 1.5 hours and are solved within 24 hours.

DESIGNING THE IDEAL HEALTH CARE CROWDSOURCING SERVICE

The Knowledge Based Challenges

The promise of crowdsourcing hinges on accumulating knowledge from a global population and arriving at an effective solution to an existing health care problem. In most cases, there could be many possible answers. The challenge for a crowdsourcing service is to select the correct solution from myriad provided answers. This is a particularly important issue since a wrong selection could result in fatalities in

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

extreme cases. Given the impetus to have a zero defect process, it is important to understand the underlying reasons why mistakes occur. In almost all cases, the root cause is lack of perfect knowledge about the appropriate solution. This lack of perfect knowledge can be termed as nescience about the problem at hand. Three different types of failures can lead to nescience.

1. **Failure to Identify the Median:** Surowiecki (2004) summarizes the inherent advantages of the "wisdom of crowds" when he describes scientist Francis Galton's analysis of a crowd's guesstimate of the final weight of a slaughtered ox. Galton found that the average guess of the crowd, who were essentially fair-goers, was on the mark. The challenge for a crowdsourcing service dealing with health care problems is to hone in on the median solution. In most cases, particularly for "known" problems, the correct remedy might be known to a significant number of people. However, in some cases, vested interests can lead portions of a crowd to resort to "block" voting. In these instances, the crowd's wisdom is limited as the individual members of the crowd are not independent of one another (Surowiecki 2004). Here, a possible solution is to expand the width of the crowd in order to combat the problems of lack of individual independence.
2. **Failure to Recognize an Uneven Distribution of Knowledge:** In case of the guestimates of the weight of a slaughtered ox (Surowiecki 2004), every participant, even if they were not experts, had an opportunity to actually see the ox. In contrast, there might be cases, where vast pools of the available population are completely unaware of a cure or the potential side effects of a drug. However, a few small segments of the crowd could still have detailed knowledge about the product in question. For example, a few individuals who were treated with it might only know the benefits of an herbal remedy. These are therefore examples of "unknown known" problems. In these cases, the challenge for crowdsourcing is to avoid large swaths of ignorance but instead identify and utilize small isolated pools of knowledge. Here, preliminary questions can be designed to ascertain the responder's extent of knowledge about the particular herb in question. Budescu and Chen (2015) have shown that it is possible to derive a method that identifies a smaller crowd of premium contributors that outperforms the aggregate crowd. Thus, instead of expanding the crowd's width, the crowdsourcing service should concentrate on utilizing the depth of knowledge of particular sections of the crowd. Here, the crowdsourcing service provider should be careful to avoid any bias, conscious or sub-conscious, to affect their judgment about the differential weightage of crowd opinion. Thus, the utilization of the depth of crowd strategy should only be adopted in cases where there is a definite call for the application of rare, specialized knowledge about a new drug or hitherto unknown remedy.
3. **Failure to Recognize Idiosyncratic Knowledge:** Hayek (1945) describes the existence of a kind of knowledge which cannot be easily condensed into statistics. This type of knowledge is only available to the individual at the scene, i.e., as Hayek states to the "man on the spot." Knowledge which is difficult to transfer across different persons has been called "tacit" (Polanyi 1958). Jensen and Meckling (1990) describe the knowledge of specific skills, peculiarities of specific machines, etc., as idiosyncratic. Transfer costs for idiosyncratic knowledge are often high as it is impossible to know in advance what particular piece of knowledge is the critical portion (Jensen and Meckling 1990). In the field of health care, medical traditions that have an unstructured knowledge

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

base have a wealth of information that can be termed as idiosyncratic. In these cases, sharing it with others through a crowdsourcing service becomes difficult. However, one way to recognize the salient aspects of this knowledge is to use an ethnographic approach for developing a better understanding of its intricacies. Thus, a crowdsourcing service can use an algorithm which gives more weightage to the opinions of individuals who have an underlying appreciation of the social and cultural background of the particular medical tradition from which knowledge is being tapped. As idiosyncratic knowledge might be available in unexpected quarters, the crowdsourcing service should attempt to attract members from many disciplines and backgrounds in order to assimilate it. While transferring idiosyncratic knowledge is likely to remain expensive, the world-wide access to internet technology provides a chance of selectively utilizing the depth of knowledge of certain sections of the crowd. However, a crowdsourcing service must be cognizant of the various nuances that inhibit the transfer of medical practices that contain idiosyncratic knowledge. It should therefore strive to patiently build a heuristic model that improves with experience over time.

The three different types of failures call for the design of a crowd sourcing service which has the appropriate algorithms in place. For the failure to identify the median, the algorithm should give equal weightage to individual opinions. This must be linked to a process which attempts to solicit responses from the broadest swath of the population possible. However, when the relevant knowledge about a cure or a drug is limited, the algorithm should be based on a vetting process that first identifies the particular pockets of the population which have the knowledge relevant to the medical problem at hand. The next step should attempt to find the popular consensus from these small pools of knowledge within the respondents. However, when the knowledge is idiosyncratic, the crowd sourcing service should make an effort to first identify all the dimensions that come into play when discussing a possible remedy or cure. It should then solicit responses on these relevant dimensions to arrive at the correct answer. Here, the process is likely to take more time as the relevant knowledge might be tacit and difficult to share across the internet. The success of the crowd sourcing service might hinge not only on the design of its algorithms, but also on its ability to distinguish between the three different types of failures.

CROWDSOURCING IN THE HEALTH CARE INDUSTRY

In the information age, business entities as well as individuals can benefit from innumerable talents via open-ended networks, which provide access to accumulated individual experience. This aggregate knowledge, termed as collective intelligence, has immense potential in the health care industry. In this context, crowdsourcing can enable medical providers and other stakeholders for using their collective intelligence to deliver higher quality health care. In addition to efficiently selecting the correct medical solution, crowdsourcing can also break down the barriers that exist between different medical disciplines and traditions. Thus, it has the potential to disrupt old ideas and herald in new ones (Peisl et. al. 2014). In addition, if crowdsourcing in the health care industry brings to light effective medical remedies that were originally based on the wisdom of indigenous people, it will empower these groups through world-

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

wide social recognition and the provision of both intrinsic and extrinsic rewards. Thus, the efficient use of information and communications technology, in addition to providing effective medical solutions, has the potential to highlight the contributions of hitherto neglected pockets of the global population (Wallace 2012).

Chapter 63
Shared Value Creation for Sustainability in Not-for-Profit Organisations

Tony Kandaiya
Partners in Micro-Development (PIMD), Australia

Meena Chavan
Macquarie University, Australia

ABSTRACT

The objective of this chapter is to delineate the sustainability problems encountered by not-for-profit organisations and to explore how these challenges can be can be managed through shared value creation by the stakeholders. Case study-abductive research methodology was adopted to explore stakeholder shared values and sustainability. This method of study is especially useful for trying to test theoretical models by using them in real world situations. Findings revealed that the sustainability strategy in not for profit organizations must be a holistic approach. Such an approach needs to build upon value-creation that is integrated to develop social entrepreneurship and create social capital along the three dimensions which includes innovative, proactive, and risk management behavior. This chapter contributes to the shared value with stakeholders to provide a social enterprise pathway for a not for profit organization to achieve long-term financial sustainability while maintaining the core social mission and objectives.

INTRODUCTION

Partners in Micro-Development (PIMD) adopted a social enterprise model and introduced a commercial training arm which would provide training at subsidized rates to staff from donor corporations and the sales proceeds. This division would support the diminishing donations which will enable PIMD to continue with the social mission and provide sustainability. The contention in this discussion is that nonprofit organizations would benefit from the development of an entrepreneurial sustainability strategy to survive. The findings suggest that an innovative business model for the creation of shared value with the stakeholders provide a pathway to achieve long-term financial sustainability while maintaining the core mission objectives.

The objective of this chapter is to understand the survival strategies for not for profit organizations and to identify approaches to meet the challenges faced by them for long-term sustainability. The intention here is to advance the theory of corporate social responsibility in the context of social enterprise sustainability. To this end, financial sustainability challenges faced by a not for profit organisation (NPO), PIMD is explore and two main challenges are examined:

1. Over reliance of the trustworthiness theory on the non-distribution constraint.
2. Failure to explain why this constraint does not destroy the motivation of undertaking social entrepreneurial activities.

In this discussion, the challenges of financial sustainability faced by not for profit organisations but particularly the case of PIMD highlights those challenges. Drawing from the academic literature and the intellectual and human capital experiences of PIMD, an explorative case study investigates the challenges of financial sustainability faced by NPOs Data was collected through a structured interview. This chapter advances the theory of corporate social responsibility in the context of social enterprise entrepreneurship to expand the understanding of survival of not for profit organizations. To achieve this outcome, corporate social responsibility and social enterprise entrepreneurship theories are explored to illustrate the complexities of a not for profit organization as it transitions and shifts to a new business model where the production of multiple goods with social value attracts funding for sustainability.

A conceptual framework influences the theoretical framework of sustainability which contributes to the development of a new business model for PIMD. Such an approach capitalized upon value-creation that is integrated to develop social entrepreneurship and which creates social capital along the three dimensions of:

1. Innovative.
2. Proactive.
3. Risk Management.

This chapter contributes to the understanding of long-term financial sustainability, entrepreneurial social enterprise business model development. Commencing with an introduction and literature overview, this chapter then provides real-life case study observations which in turn guides the research methods. Second, the theoretical framework of social enterprise entrepreneurship business and not for profit sustainability are analysed. Third, understanding financial sustainability influences the on the development of a business strategy and the application of the development of a business model. Fourth, shared values with stakeholders and a social enterprise pathway for not for profit organisations to achieve long-term sustainability while maintaining the core social mission and organisational objectives are highlighted. Fifth, multiple challenges are identified, solutions are suggested and future research directions concludes this chapter.

LITERATURE REVIEW

Salamon & Sokolowski's (2003:13-27) study on NPOs in India illustrates the wide variations in definitions of NPOs along the dimensions of economics, services, financing, legal structure as well as regional

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

patterns. These views are supported by Salamon and Anheier (1997:11-51), Boris and Steuerle (2003: 66-110) and PRIA (2002). The NPO industry has also grown exponentially in the developing countries of Asia, Africa and Latin-America due in part to the increasing reliance of governments and international agencies on the third sector to deliver services, innovations in information and communication technology and the media (Te'eni & Young 2003), and growing demand for change in socio-economic conditions, politics, human rights, environment, rise of advocacy, volunteerism, and community groups.

Partnerships and channeling of funds between NPOs in the developed world and those in the developing world have also been a contributing factor (Salamon & Anheier 1997: 321-467; Salamon & Sokolwski, 2003: 1-13; UN NGO/Civil Society Forum 2004). More governments are turning to the not for profit sector to deliver goods and services to communities that are underserved. As a consequence, there is extensive research on not for profit organizations Dees and Economy (2001).More recently this research has branched out in the areas of social enterprises and social entrepreneurship (Kourula and Laasonen, 2010). Literature on these topics is a progression from not for profit research in the 1970-1980.

However, diminishing trend of the traditional donor-based funding model precipitated by the global financial crisis is threatening the survival of many not for profit organizations. To overcome this challenge, not for profit organizations need to explore new financial sustainability strategies that will provide financial independence to continue the core mission of service delivery to the community as well as building social capital. Dees and Economy (2001) have argued the case for NPO leaders to be particularly enterprising to meet the challenges and demands for greater accountability from donors, as well as new forms of competition from the business sector. The commercialisation of not for profit organisations has also gained wider acceptance due to the global economic downturn Weisbrod (1998).

PARTNERS IN MICRO DEVELOPMENT

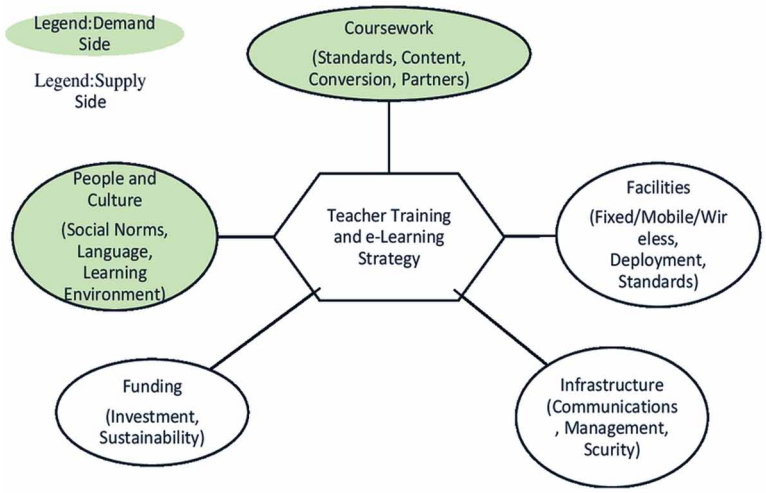
Partners in Micro Development (PIMD) an Australian-based volunteer supported not for profit organisation delivers primary education in underserved communities in the northern and eastern provinces of Sri Lanka. For the past eight years, PIMD's programs have focused on English as a second language (ESL) and computer literacy (CL) for primary grades in remote rural village schools. The organisation has developed curriculum and lesson plans, designed and delivered teacher training programs and provided computers, educational software, printers and other accessories for the sixty participating schools. This work constitutes the early stages of the teacher training e-learning and m-learning strategies as illustrated in Figure 1.

The aftermath of the conflict in Sri Lanka and the 2004 tsunami have devastated the economic, social, physical and human capital of the North and East provinces. Sri Lanka is now confronted with challenges on many fronts (social, political, economic, psycho-social, residual ethnic tension and divisions, gender and other issues) in its post-conflict recovery, reconstruction, and reconciliation programs. PIMD investments in social, human, intellectual capital, and infrastructure and other resources have also been lost. This has left the organisation with no choice but to make a fresh start on its education programs in a very challenging post-conflict environment.

Post-war reconstruction in the north and east of the country commenced in the latter half of 2009 with the help of international donors to rebuild the basic infrastructure in the war ravaged areas to sustain and rehabilitate the communities returning from the IDP camps UN (2010). In the final years of the war, the relationship between the government of Sri Lanka and western donor aid agencies was strained

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 1. PIMD e-Learning and m-learning strategy: Five Pillars
Source Adapted from Ministry of Defense (2000)



(Samath, 2010) and has since continued to be an impediment to the reconstruction effort in the early stages (Goodhand et al. 2002; Ofstad 2000; Senanayake 2009).

As a part of the reconstruction effort in the northern and eastern provinces and as recognition of the success of PIMD programs in the past the Ministry of Education, Sri Lanka has approved the restart of the ESL and CL programs in the northern and eastern provinces. The current donative (Hansmann, 1987) PIMD business model which is dependent exclusively on revenue from donations is unsustainable. New entrepreneurial strategies and business models for sustainability are explored if PIMD is to survive and grow upon the trust and confidence that the communities and government have in the organisation to deliver outcomes.

THEORETICAL FRAMEWORK

Numerous case studies on social enterprises and social entrepreneurship (Kernot & Mcneill 2011) are a testament to the phenomenon of social and economic business model development. However some scholars have argued that the demand-side and supply-side theories are incomplete as they do not consider the interactions between supply and demand. They advocate the need for an integrated approach and holistic understanding of NPOs where various elements are inter-related to each other and the roles of each sector (Ortman 1996; Steinberg 2006: 129-134; Valentinov 2008b).

A number of interesting academic contributions on the complete or integrative theories on not for profit organizations (Ortman, 1999, Steinberg, 2006, Valentionov, 2008b) but for different reasons are not relevant in this discussion. For example, Ortman (1996) have proposed theories based on the division of labour and game theory. Steinberg (2006: 29-134) proposed a framework to clarify thinking on developing complete and integrated theories. Valentionov (2008b), like Ortman (1999) have proposed theories based on the division of labor and game theory.

To further enhance the understanding of the adoption and implementation of a social enterprise business model for PIMD, two ground-breaking contributions Weisbrod (1975) and Hansmann (1980) are of particular relevance in this case study analysis. Weisbrod (1975) in public goods theory and Hansmann (1980) in trustworthiness and non-distribution constraint theory provide insights into the challenges and successes of not for profit organizations. Furthermore, theories categorized as demand-side economic theories takes into account the role and need of NPOs and supply-side theories considers the objectives and motivation of entrepreneurs. The contributions of Weisbrod's (1975) public goods theory and Hansmann (1980) trustworthiness and non-distribution constraint theory have both argued that NPOs exist due to market and state failure to satisfy the demand of the citizens.

Public Goods Theory

Weisbrod (1975), argued that not for profit organisations fulfilled the demand for public goods which remain unsatisfied by government agencies. For example, while satisfying the demand for the median voters, the government overlooks the needs of some citizens which are then provided by not for profit organizations that receive donations from citizens. Although some not for profit organization would like to increase their financial sustainability and subsequently the availability of public goods based on the definition of the NPF, policies are restricted in terms of profit distribution, financial management and accountability. Furthermore, managers of not for profit organizations continue to lack the incentive of profit maximization that could possibly misrepresent the provision and delivery of goods and services (Weisbrod 1998: vii).

According to Weisbrod (1975), the public goods theory also be offered as semi-public or private goods. For instance, playing music in the open area is a public good but if the same music is played in a concert and fees applied, it will be considered as a private good (Heitzmann, 2000). These theories and subsequent theoretical and empirical studies are categorized as demand-side economic theories which conceptualize the role and need for NPOs, and supply-side theories which conceptualize the objectives and motivation of entrepreneurs (Krashinsky 1997; Valentinov 2006). What is noteworthy is the subsequent extension of these two theories to explain the complexities of the not for profit sector as it developed new business models and moved to the production of multiple goods with social value in order to attract funds.

Non-Distribution Constrain Theory

According to the non-distribution constrain theory of Hansmann (1980) NPOs are legally prohibited to distribute their net earnings to their controlling members such as directors, managers, trustees and so on. In spite of the limitation imposed upon them, nonprofits may succeed in distributing some of their net earnings through inflated salaries, various perquisites granted to employees and other forms of excess payments (Hansmann 1980: 844)

This non-distribution constraint therefore renders not for profit organizations attractive to donors in terms of trustworthiness on efficient utilization of their funds. Hanmann's (1980) trustworthiness theory (or contract failure approach) explains that NPOs exist due to asymmetric information in the marketplace. In most cases, the producer or supplier of goods and services have much more information than those who demand it. Commercial organizations have their own incentives in exploiting this information to

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

increase their profit margin. However, since NPOs are not profit-oriented and legally obliged to refrain from using net earnings for personal use, they are assumed to be more trustworthy by the donors.

Both Hansmann and Weisbrod theories are based on the assumption that NPOs and other profit-making enterprises are competitors. For instance, that not for profit organizations satisfy the service delivery demands which government fail to meet. However, Salamon (1997) argues that in many countries, NPOs and the state operate jointly rather than separately. Empirical study performed in Austria revealed that NPOs which operate jointly with the state-owned organizations received funding from the public institutions although amounts varied significantly (Heitzmann, 2000).

Kingma (1997) and Valetinov (2008a) have criticized the over reliance of the trustworthiness theory on the non-distribution constraint and the failure to explain why this constraint does not destroy the motivation to undertake social entrepreneurial activities. Valentinov (2008a) and DiMaggio & Anheir (1990) contend there are other motivational factors such as sympathy, altruism, reciprocity and prestige that enhance the utility function of stakeholders in being engaging, participating and enjoying the process, akin to the diverse motivations of the members of PIMD for participating in social capital building programs.

The crucial issue confronting not for profit organisations is how to achieve financial sustainability to manage and sustain projects for extended periods in a complex, competitive and unpredictable environment (Hugget 2009; Landsberg 2004). Furthermore, commercialisation in the NPO sector is not a new phenomenon (Hansmann 1990) but one that has gained wider acceptance due to the global economic downturn and competition for diminishing funding pools (Bradley 2004: xiii-xvi; Tuckman 1998; Weisbrod 1998: 1-22).

The paradox of a not for profit mission and the for-profit commercialisation, mission creep and motivational dilemmas facing volunteers and stake holders can erode the trust and social capital built by the not for profit mission. Tuckman and Chang (2006) have enunciated the necessary conditions for successful commercialisation of the NPOs including establishing the need for financial resources to sustain social programs such as through the sale of goods and services, the existence of opportunities for commercial activity, and to ensure that there is no or minimal mission conflict between the not for profit and for-profit objectives.

Not for profit commercialisation requires the adoption and implementation of for-profit business models, governance regimes and market orientation without compromising the core not for profit mission. This contradiction has spurred the entrepreneurial social activists to create a new form of hybrid organisation, the social enterprise. The social enterprise draws from business, charity and social models (Alter 2007: 13-22; Mair & Noboa 2006:121-135; Nicholls 2006: 1-23). The drivers behind the growth of the social enterprise business model in the NPO sector can be attributed to the adoption of hybrid business models for sustainability by the corporate sector through corporate social responsibility programs. Figure 2 illustrates a sustainability strategy to achieve sustainability equilibrium through dual value creation strategies.

Current studies have focused on the not for profit and public policy domains are social entrepreneurship phenomenon-driven and lack a cross-disciplinary theoretical framework (Dees 2001; Mair & Marti 2006; Short et al. 2009). However, existing studies focused on the social enterprise and social entrepreneurship fields are nascent areas of scholarly research (Dees, 2001, Mair and Marti, 2006, Short et al, 2009).

The conceptual framework in Figure 3 encapsulates key elements of a sustainable business model. It draws from, and integrates key dimensions of financial sustainability and frames the questions raised by an NPO such as PIMD by addressing the key sustainability challenges.

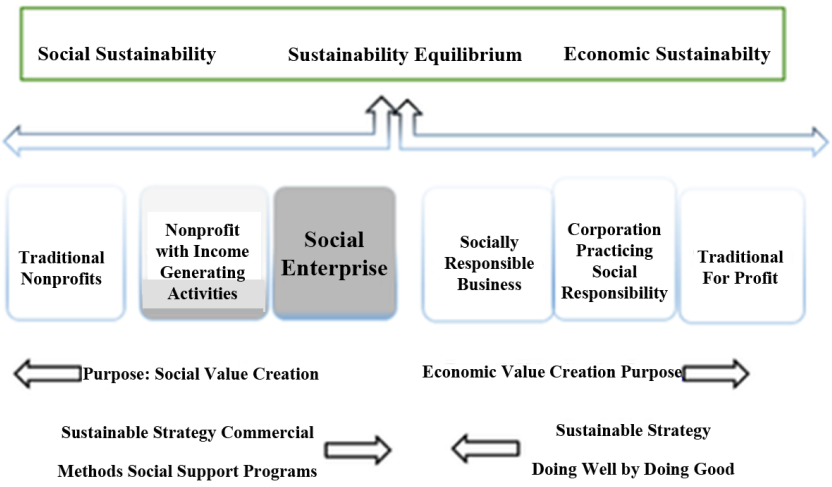

Figure 3. Conceptual sustainability framework

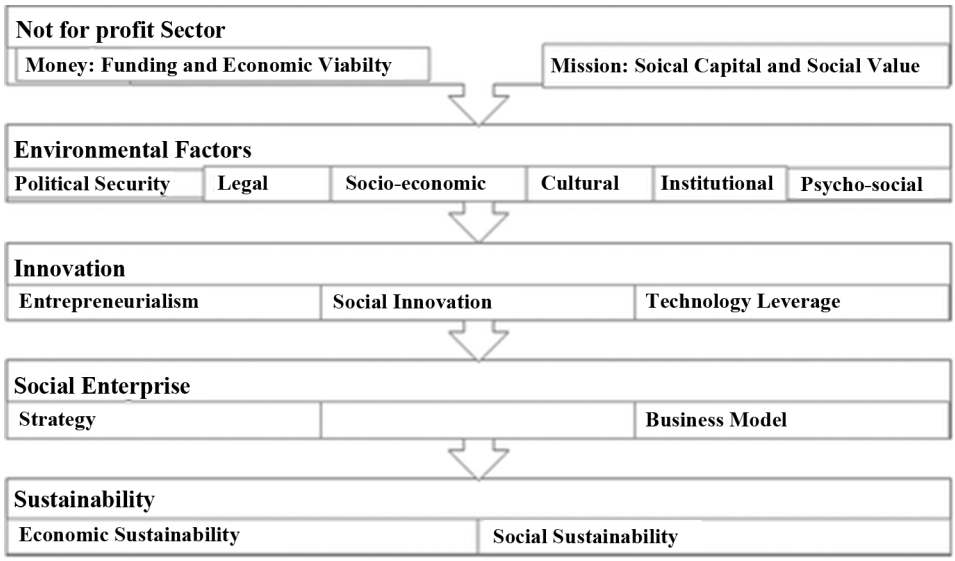

The ultimate goal is to achieve a balance between a sustainability economic equilibrium and social value creation as referred to by Alter (2005). Given that some NPO sectors have embraced and implemented social enterprise business models, hence the adoption of this model has been considered a practical proposition for PIMD to achieve financial sustainability. Based on the above-mentioned observations, adapting a social enterprise business model as a sustainability strategy for NPOs is an economically viable response to the challenge of financial sustainability.

CASE STUDY

According to the grounded theory of sustainability (Seel, 2006) NPOs can no longer follow the traditional pattern of small incremental changes, but instead require multiple and organizational-wide transformation and adaptation of organizational culture. A specific approach for PIMD is therefore to develop a transformative business strategy and model for the long-term financial sustainability for the organisation. This can be achieved by asking two questions:

1. Drawing on theory and literature relating to the not for profit and particularly social enterprise and financial sustainability, what is the sustainability strategy that can ensure long-term economic and financial sustainability for an organisation such as PIMD?
2. What is the conceptual business model that will ensure the feasibility of the identified sustainability strategy?

A case study methodology was thought to be appropriate for this research project. This method of study is especially useful for trying to test theoretical models by using them in real world situations. A case study provides more realistic responses than a purely statistical survey. Furthermore, qualitative case study methodology provides tools for researchers to study complex phenomena within their contexts.

As outlined by Blumberg, Cooper and Schindler (2008), the case study method is appropriate for explanatory, descriptive and exploratory research and most appropriate to accomplish the research objectives. This view was supported by Yin (1989:23) who defined case study research as an empirical inquiry that investigates a contemporary phenomenon within its real-life context when the boundaries between phenomenon and context were not clearly evident and in which multiple sources of evidence are used. In the real world case study examined in this chapter, an abductive research methodology is best suited to gain insights into the complexities experienced by not for profit organizations.

Kovacs and Spens (2005) argue that the inductive and deductive research approaches look for relations between existing constructs and are not conducive to the creative process which leads to an intuitive leap to creating knowledge. The abductive research process is viewed as systematic creativity or intuition to discover/develop new knowledge (Saraniemi 2009: 23). Chamberlain (2006) observes that the literature on formulation of business strategies leans more towards the traditional normative and descriptive outputs (Haugstad 1999; Ortner 2007).

These approaches however do not consider research methodology as a critical research task and can lead to methodological problems. Chamberlain (2006) for example contends that business strategy formulation is a subjective social construct as is the case of PIMD. Chamberlain (2006) advocates instead the adoption of an interpretive approach as suggested by Blaikie (2004). The interpretive version of abductive research focuses on the subjective social constructs such as business strategy formulation. In particular where the researcher is engaged or immersed in the interpretivist reality of the situation to perceive remarkable or noteworthy and then insightfully speculate on likely associations or causations thereof (Chamberlain, 2006: 295). It is also argued that the abductive research approach is commonly used in both action research and case studies (Saraniemi 2009: 22-24) due to the parallelism of data collection, theory development and theory building element common to both methods (Dubois & Gadde 2002; Kovacs & Spens 2005)

In the case of PIMD, the prior theoretical knowledge (step 0) discussed in this chapter, the real-life observations (step 1) drawn from its work to date are used to match relevant theories (step 2). The de-

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

velopment or extension of an integrated theory of financial sustainability (step 3 in Figure 4) form the basis for the development of a business strategy and the application of conclusions (step 4 in Figure 4) leads to the development of a business model for PIMD.

TRANSFORMING PIMD INTO A SOCIAL ENTERPRISE

While the discussion so far suggests that adapting a social enterprise business model as a sustainability strategy for NPOs is an appropriate and economically viable response to the challenge of financial sustainability, the decision to embark on a new business strategy and model demands disciplined and meticulous analysis of the business opportunity underscored by entrepreneurial creativity and innovation, pro-activeness and risk management. It also involves a learning process in which theoretical and empirical studies are used to add clarity to defining objectives, managing stakeholder expectations and setting realistic performance targets (Dees 2004: 3-18; Caesar & Baker 2004:207-223). The cost of failure is much more devastating to NPOs compared to the government or corporate sectors who are better positioned to withstand the loss and move on.

The findings of Weerawardene et al (2010) empirical research on sustainability of not for profit organisations emphasize that NPO sustainability should be a strategic issue and not an operational one. Adoption of multiple strategies that consider competition, opportunity recognition, governance, operational efficiency, revenue enhancement and cost reduction should be part of the overall business strategy which underpins the social enterprise business strategy and model.

Chesbrough and Rosenbloom identify the functions of a business model as follows: articulate value proposition, identify market segment, define the structure of the value chain, estimate cost structure and profit potential, describe the position of the firm within the value network and formulate competitive strategy (Chesbrough & Rosenbloom 2002: 536).

It was decided that PIMD's social enterprise can therefore be designed using the above functional framework as a basis. It is an entrepreneurial response (Steinberg, 2003) to ensure the long-term sustainability of PIMD's social projects in Sri Lanka. The question relating to strategy should draw on

Figure 4. The Abductive Research Process

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Weerawardene and Mort's, 'Bounded multidimensional model of social entrepreneurship' as the foundation of PIMD's sustainability strategy. The strategy in turn will be based on a holistic perspective of a social enterprise and built around themes which are integrated to develop an approach in which social entrepreneurship creates social capital along three dimensions: innovative, proactive, and risk management behavior. These behaviors are constrained by the need to fulfill the social mission and ensure sustainability of the organization within the environmental dynamics in which it operates. Thus, the sustainability dimension of the social enterprise strategy will underscore PIMD's conceptual business model for financial sustainability.

A similar but pragmatic approach as above can be adapted for the second question relating to the social enterprise business model itself, due to the real life application to PIMD. Literature on financial sustainability issues in social enterprises, entrepreneur business models, adoption of commercial practices in NPOs, functions of business models and business models will serve as a guide in developing PIMD's e-business model based on Chesbrough and Rosenbloom business model framework. It was determined that PIMD would adopt a social enterprise model and introduce a commercial training arm which would provide training at subsidized rates to staff from donor corporations and the sales proceeds from this division would support the diminishing donations which will enable PIMD to continue with the social mission and provide sustainability. Besides, a PIMD fund would be created which would be supported by the Government, donations from donor corporations and small voluntary donations from benefit recipient families and candidates. This would enable the creation of shared value by all the stake holders and sustain PIMD.

CONCLUSION

The demand side and the supply side of nonprofit organization should be viewed as complementary to each other, rather than mutually exclusive. In this paper we focused on the demand approaches to nonprofits through the public good approach based on Weisbrod's path-breaking paper from 1975 and the trust approach, which stems from Hansmann's influential paper from 1980.

Weisbrod's theory delineates that public good provision dilemmas are solved by collective action of the affected individual. He stresses more donative financing necessarily leads to more provision of public good. Extensions of Weisbrod's approach identifies altruistic behavior, possible integration with Hansmann's trust approach which rationales for nonprofit entrepreneurship and a variety of stakeholders with partly conflicting interests. Many of these models maintain donations as a key feature (Kingma 2003)
