Table of Contents

Preface xxi

Volume I

Section 1
Fundamental Concepts and Theories

Chapter 1
Social Innovation, Entrepreneurship, and Sustainability 1
João M. S. Carvalho, University of Minho, Portugal & University Institute of Maia, Portugal

Chapter 2
Social Innovation in the For-Profit Organization: The Case of Banca Prossima 35
Tindara Abbate, University of Messina, Italy
Angelo Presenza, University of Molise, Italy
Lorn Sheehan, Dalhousie University, Canada

Chapter 3
The Role of Social Entrepreneurship and Social Economy in Romanian Sustainable Business Development: Social Entrepreneurship and Social Economy 49
Rodica Gherghina, The Bucharest University of Economic Studies, Romania
Ioana Duca, Titu Maiorescu University, Romania

Chapter 4
Crowdsourcing Dispute Resolution: Survey and Challenges 66
Nuno Luz, Polytechnic of Porto, Portugal
Marta Poblet, RMIT University, Australia
Nuno Silva, Polytechnic of Porto, Portugal

Chapter 5
Crowdsourcing Social Innovation: Towards a Collaborative Social Capitalism 83
Emanuele Musa, Babele, Romania

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Chapter 6
Introduction of Social Media Platforms and Social Media Analytics for Social CRM 107
In Lee, Western Illinois University, USA

Section 2
Development and Design Methodologies

Chapter 7
Ethical Behavior and the Development Paradigm 125
Punam Gupta, Dev Samaj College for Women, India
Dinesh Kumar, Amity University, India

Chapter 8
Transforming Crises into Opportunities to Generate Sustainable Business in Brazil 135
Marcia Juliana d'Angelo, Fucape Business School, Brazil
Janette Brunstein, Universidade Presbiteriana Mackenzie, Brazil
Emerson Wagner Mainardes, Fucape Business School, Brazil

Chapter 9
Social Entrepreneurship and Entrepreneurial Ecosystems: An Empirical Examination 151
Susana Bernardino, The Polytechnic Institute of Porto, Portugal
J. Freitas Santos, The Polytechnic Institute of Porto, Portugal & University of Minho, Portugal
J. Cadima Ribeiro, University of Minho, Portugal

Chapter 10
On the Configuration of Crowdsourcing Projects 180
Mahmood Hosseini, Bournemouth University, UK
Keith Phalp, Bournemouth University, UK
Jacqui Taylor, Bournemouth University, UK
Raian Ali, Bournemouth University, UK

Chapter 11
Entrepreneurial Process and Financial Well-Being Generated by a Colombian Association of Vulnerable Individuals 200
Liyis Gomez-Nuñez, Universidad del Norte, Colombia
Luis Javier Sanchez-Barrios, Universidad del Norte, Colombia

Chapter 12
Nascent Social Entrepreneurship: Economic, Legal, and Financial Framework 218
Cristina López-Cózar-Navarro, Universidad Politécnica de Madrid, Spain
Tiziana Priede-Bergamini, Universidad Europea de Madrid, Spain

Chapter 13
Social Entrepreneurship Taxonomy: Extremadura Case (Spain) 239
Alicia Guerra Guerra, Universidad of Extremadura, Spain
Lyda Sánchez de Gómez, Universidad of Extremadura, Spain

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Chapter 14
Developing an Integration Framework for Crowdsourcing and Internet of Things With Applications for Disaster Response 274
Rameshwar Dubey, Symbiosis International University, India

Chapter 15
Industrial Guidelines for Stimulating Entrepreneurship With the Internet of Things 284
Mohammad Zarei, University of Tehran, Iran
Ahmad Jamalian, University of Mazandaran, Iran
Rohollah Ghasemi, University of Tehran, Iran

Chapter 16
Innovation, Sustainability, and Organizational Change in a Social Portuguese Organization: A Strategic Management Perspective 304
Fernando Barbosa, University of Minho, Portugal
Fernando Romero, University of Minho, Portugal
Jorge Cunha, University of Minho, Portugal

Chapter 17
A Social Enterprise Business Model and a Case Study of Pacific Community Ventures (PCV)..... 328
In Lee, Western Illinois University, USA

Chapter 18
Implementation of a Social Innovation Model for Economic Value Creation..... 351
Edgar Muñiz Avila, Tecnológico de Monterrey, Mexico
Lucia Rodríguez-Aceves, Tecnológico de Monterrey, Mexico
Mario Adrián Flores-Castro, Tecnológico de Monterrey, Mexico

Chapter 19
The Business Model of a Public Social Partnership: Contextual Determinants..... 373
Aldona Frączkiewicz-Wronka, University of Economics in Katowice, Poland
Monika Tkacz, Mondragon Innovation and Knowledge (MIK), Spain
Saioa Arando, Mondragon Innovation and Knowledge (MIK), Mondragon Unibertsitatea, Spain

Section 3
Tools and Technologies

Chapter 20
A Framework for Using Crowdsourcing in Government..... 405
Benjamin Y. Clark, University of Oregon, USA
Nicholas Zingale, Cleveland State University, USA
Joseph Logan, O-1 Leadership Development, USA
Jeffrey Brudney, University of North Carolina Wilmington, USA

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Chapter 21
Crowdsourcing the Disaster Management Cycle 426
Sara E Harrison, University of Waterloo, Canada
Peter A Johnson, University of Waterloo, Canada

Chapter 22
Incorporating Global Medical Knowledge to Solve Healthcare Problems: A Framework for a Crowdsourcing System 451
Kabir Sen, Lamar University, USA
Kaushik Ghosh, Lamar University, USA

Chapter 23
Creating Market Inclusion: Assessing the Role of Social Entrepreneurship in Working Institutional Voids in a Developed Market 467
Jose Godinez, University of Massachusetts Lowell, USA

Chapter 24
The Crowdsourcing Scheme as an Innovative Management Tool in University Spin-Offs 484
Katarzyna Kopeć, Tischner European University in Krakow, Poland
Anna Szopa, Jagiellonian University, Poland

Chapter 25
Crowdsourcing as a Tool for Improving Learning in Tertiary Institutions in Developing Countries 501
Indo Benna, Mohammed AlMana College of Health Sciences, Saudi Arabia

Chapter 26
Business-Oriented Analytics With Social Network of Things 524
Pawan Kumar, Government of India, India
Adwitiya Sinha, Jaypee Institute of Information Technology, India

Chapter 27
The Influence of Crowdsourcing Business Model Into Artificial Intelligence 546
Anna Szopa, Jagiellonian University, Poland

Chapter 28
Experiences in Social Innovation: A Platform for Ethics Through a School of Engineering Studies 557
Domingo Alfonso Martín Sánchez, Universidad Politécnica de Madrid, Spain
Ana García Laso, Universidad Politécnica de Madrid, Spain

Chapter 29
Improving Accessibility Through VGI and Crowdsourcing 571
Igor Gomes Cruz, Federal University of Campina Grande, Brazil
Claudio Campelo, Federal University of Campina Grande, Brazil

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Volume II

Chapter 30
Designing Effective Crowdsourcing Systems for the Healthcare Industry 590
Kabir Sen, Lamar University, USA
Kaushik Ghosh, Lamar University, USA

Chapter 31
Strengths and Limitations of Social Media Analytics Tools 595
Dražena Gašpar, University of Mostar, Bosnia and Herzegovina
Mirela Mabić, University of Mostar, Bosnia and Herzegovina

Chapter 32
Social Media as Persuasive Technology for Business in Malaysia 616
Shahizan Hassan, Universiti Utara Malaysia, Malaysia
Norshuhada Shiratuddin, Universiti Utara Malaysia, Malaysia
Sobihatun Nur Ab Salam, Universiti Utara Malaysia, Malaysia

Chapter 33
Conducting Survey Research Using MTurk 639
Silvana Chambers, The University of Texas at Tyler, USA
Kim Nimon, The University of Texas at Tyler, USA

Chapter 34
The Standardization of Down-Streamed Small Business Social Responsibility (SBSR): SMEs and Their Sustainability Reporting Practices 670
Laura Corazza, University of Turin, Italy

Chapter 35
A Framework for Interfacing Unstructured Data Into Business Process From Enterprise Social Networks 686
Amjed Al-Thuhli, Sultan Qaboos University, Oman
Mohammed Al-Badawi, Sultan Qaboos University, Oman
Youcef Baghdadi, Sultan Qaboos University, Oman
Abdullah Al-Hamdani, Sultan Qaboos University, Oman

Chapter 36
Software Process Paradigms and Crowdsourced Software Development: An Overview 703
Nitasha Hasteer, Amity University, India
Abhay Bansal, Amity University, India
B. K. Murthy, Centre for Development of Advanced Computing, India

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Section 4
Utilization and Applications

Chapter 37
Disruption and Deception in Crowdsourcing 722
Agnieszka Onuchowska, University of South Florida, USA
Gert-Jan de Vreede, University of South Florida, USA

Chapter 38
Social Entrepreneurship and Social Inclusion in Peru: A Case Study 743
Piedad Cristina Martinez, Corporación Universitaria del Caribe, Colombia
Erick Oswaldo Salazar, Universidad César Vallejo, Peru
Armando Miguel Buelvas, Corporación Universitaria del Caribe, Colombia

Chapter 39
Value Creation in Business-to-Business Crowd Sourcing 769
Nina Helander, Tampere University of Technology, Finland
Hannu Kärkkäinen, Tampere University of Technology, Finland
Jari Jussila, Tampere University of Technology, Finland

Chapter 40
Applying Business Solutions to Social Problems: Social Co-Operative and Its Business Model – Evidence From Poland 783
Martyna Wronka-Pośpiech, University of Economics in Katowice, Poland

Chapter 41
Knowledge Creation, Management, and Dissemination in Impact Communities 809
Ana Melro, University of Aveiro, Portugal
Lídia Oliveira, University of Aveiro, Portugal

Chapter 42
Professional and Business Applications of Social Media Platforms 824
Kijpokin Kasemsap, Suan Sunandha Rajabhat University, Thailand

Chapter 43
Integrative Learning Toward Social Responsibility in Teaching Engineering 848
Domingo A. Martín-Sánchez, Escuela Técnica Superior de Ingenieros de Minas y Energía, Spain
Ana García-Laso, Universidad Politécnica de Madrid, Spain
Ana Muñoz-van den Eynde, CIEMAT, Spain
Emilia H. Lopera-Pareja, CIEMAT, Spain
María Cornejo-Cañamares, CIEMAT, Spain
Emilio Muñoz-Ruiz, CIEMAT, Spain

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Chapter 44
How Do UK B2C High-Tech Start-Ups Utilise Innovation Through Social Media to Improve Business Performance and Outcomes? 873
Raja Yahya Alsharief, King Abdulaziz University, Saudi Arabia

Chapter 45
Understanding Crowdsourcing of Agricultural Market Information in a Pilot Study: Promises, Problems and Possibilities (3Ps) 895
Musa Fadhili Juma, Sokoine University of Agriculture, Tanzania
Kadeghe Goodluck Fue, Sokoine University of Agriculture, Tanzania
Alcardo Alex Barakabitze, Sokoine University of Agriculture, Tanzania
Neema Nicodemus, Sokoine University of Agriculture, Tanzania
Mawazo Mwita Magesa, Sokoine University of Agriculture, Tanzania
Fredy Timothy Mlyavidoga Kilima, Sokoine University of Agriculture, Tanzania
Camilius A. Sanga, Sokoine University of Agriculture, Tanzania

Chapter 46
The Impact of Social Networks on "Born Globals": A Case of De-Internationalisation 911
Qingan Huang, University of East London, UK
Ellis L. C. Osabutey, Middlesex University, UK
Junzhe Ji, Tongji University, China
Liying Meng, The University of Northampton, UK

Chapter 47
Re-Inventing the Social Business Model: New Opportunities for the Third Sector Organizations in Italy 931
Dario Cavenago, University Milano-Bicocca, Italy
Laura Mariani, University of Bologna – Alma Mater Studiorum, Italy

Preface

The constantly changing landscape of Social Entrepreneurship makes it challenging for experts and practitioners to stay informed of the field's most up-to-date research. That is why Business Science Reference is pleased to offer this three-volume reference collection that will empower students, researchers, and academicians with a strong understanding of critical issues within Social Entrepreneurship by providing both broad and detailed perspectives on cutting-edge theories and developments. This reference is designed to act as a single reference source on conceptual, methodological, technical, and managerial issues, as well as to provide insight into emerging trends and future opportunities within the discipline.

Social Entrepreneurship: Concepts, Methodologies, Tools, and Applications is organized into eight distinct sections that provide comprehensive coverage of important topics. The sections are:

1. Fundamental Concepts and Theories;
2. Development and Design Methodologies;
3. Tools and Technologies;
4. Utilization and Applications;
5. Organizational and Social Implications;
6. Managerial Impact;
7. Critical Issues and Challenges; and
8. Emerging Trends.

The following paragraphs provide a summary of what to expect from this invaluable reference tool.

Section 1, "Fundamental Concepts and Theories," serves as a foundation for this extensive reference tool by addressing crucial theories essential to the understanding of Social Entrepreneurship. Introducing the book is "Social Innovation, Entrepreneurship, and Sustainability" by João M. S. Carvalho: a great foundation laying the groundwork for the basic concepts and theories that will be discussed throughout the rest of the book. Section 1 concludes and leads into the following portion of the book with a nice segue chapter, "Introduction of Social Media Platforms and Social Media Analytics for Social CRM" by In Lee.

Section 2, "Development and Design Methodologies," presents in-depth coverage of the conceptual design and architecture of Social Entrepreneurship. Opening the section is "Ethical Behavior and the Development Paradigm" by Punam Gupta and Dinesh Kumar. Through case studies, this section lays excellent groundwork for later sections that will get into present and future applications for Social Entrepreneurship. The section concludes with an excellent work by Aldona Frączkiewicz-Wronka, Monika Tkacz, and Saioa Arando, "The Business Model of a Public Social Partnership: Contextual Determinants."

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Section 3, "Tools and Technologies," presents extensive coverage of the various tools and technologies used in the implementation of Social Entrepreneurship. The first chapter, "A Framework for Using Crowdsourcing in Government" by Benjamin Y. Clark, Nicholas Zingale, Joseph Logan, and Jeffrey Brudney, lays a basis for the types of works that can be found in this section. The section concludes with "Software Process Paradigms and Crowdsourced Software Development" by Nitasha Hasteer, Abhay Bansal, and B. K. Murthy. Where Section 3 described specific tools and technologies at the disposal of practitioners, Section 4 describes the use and applications of the tools and frameworks discussed in previous sections.

Section 4, "Utilization and Applications," describes how the broad range of Social Entrepreneurship efforts has been utilized and offers insight on and important lessons for their applications and impact. The first chapter in the section is "Disruption and Deception in Crowdsourcing" written by Agnieszka Onuchowska and Gert-Jan de Vreede. This section includes the widest range of topics because it describes case studies, research, methodologies, frameworks, architectures, theory, analysis, and guides for implementation. The breadth of topics covered in the section is also reflected in the diversity of its authors, from countries all over the globe. The section concludes with "Managing Small Business Social Responsibility (SBSR) in Formalized Network Using a Euclidean Perspective" by Laura Corazza and Maurizio Cisi, a great transition chapter into the next section.

Section 5, "Organizational and Social Implications," includes chapters discussing the organizational and social impact of Social Entrepreneurship. The section opens with "Technology and Innovation: The Connection of Social and Technological Networks in China" by Ron Berger. This section focuses exclusively on how these technologies affect human lives, either through the way they interact with each other or through how they affect behavioral/workplace situations. The section concludes with "How Social Commerce Emerged: The Role of Social Word of Mouth – Social Commerce" by Nick Hajli.

Section 6, "Managerial Impact," presents focused coverage of Social Entrepreneurship in a managerial perspective. The section begins with "Defining the Role of Social Media as a Contemporary Local Area Marketing Technique in Franchising" by Geoffrey Webster and Margee Hume. This section serves as a vital resource for developers who want to utilize the latest research to bolster the capabilities and functionalities of their processes. The chapters in this section offer unmistakable value to managers looking to implement new strategies that work at larger bureaucratic levels. The section concludes with "Business and Technology Trends in Social CRM" by Anteneh Ayanso.

Section 7, "Critical Issues and Challenges," presents coverage of academic and research perspectives on Social Entrepreneurship tools and applications. The section begins with "Beyond Micro-Tasks: Research Opportunities in Observational Crowdsourcing" by Roman Lukyanenko and Jeffrey Parsons. Chapters in this section will look into theoretical approaches and offer alternatives to crucial questions on the subject of Social Entrepreneurship. The section concludes with "Sustainability and Competitive Advantage: A Case of Patagonia's Sustainability-Driven Innovation and Shared Value" by Francesco Rattalino.

Section 8, "Emerging Trends," highlights areas for future research within the field of Social Entrepreneurship, opening with "Social Business: A Way to Promote Organizational Transformation" by Maria João Ferreira, Fernando Moreira, and Isabel Seruca. This section contains chapters that look at what might happen in the coming years that can extend the already staggering amount of applications for Social Entrepreneurship. The final chapter of the book looks at an emerging field within Social Entrepreneurship in the excellent contribution "Translation Learning Environments for the Future: Online Collaborative Practices" by Maria del Mar Sanchez Ramos.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Although the primary organization of the contents in this multi-volume work is based on its eight sections, offering a progression of coverage of the important concepts, methodologies, technologies, applications, social issues, and emerging trends, the reader can also identify specific contents by utilizing the extensive indexing system listed at the end of each volume. As a comprehensive collection of research on the latest findings related to using technology to providing various services, *Social Entrepreneurship: Concepts, Methodologies, Tools, and Applications* provides researchers, administrators, and all audiences with a complete understanding of the development of applications and concepts in Social Entrepreneurship. Given the vast number of issues concerning usage, failure, success, policies, strategies, and applications of Social Entrepreneurship in countries around the world, *Social Entrepreneurship: Concepts, Methodologies, Tools, and Applications* addresses the demand for a resource that encompasses the most pertinent research in technologies being employed to globally bolster the knowledge and applications of Social Entrepreneurship.

Chapter 1
Social Innovation, Entrepreneurship, and Sustainability

João M. S. Carvalho
University of Minho, Portugal & University Institute of Maia, Portugal

ABSTRACT

This chapter provides a summarized and objective review over the relationships among innovation, social innovation, entrepreneurship, social entrepreneurship, new business models (NBM), value proposition and sustainability (economic, social, ecological, and psychological). A study has been done in Porto region through interviews with 13 social innovators and entrepreneurs to evaluate those relationships. The conceptual base for the analysis presented in this chapter is tetrad-value theory. It has been concluded that market-oriented social innovation has a crucial role in the social entrepreneurship development. Moreover, these NBM should be adjusted to population needs towards societal well-being, by combining creation of shared value, co-creation of value, and multiple value creation. Thus, a transformational value proposition contributes to economic, social, ecological, and psychological sustainability, and consequently to human, social and territorial development.

INTRODUCTION

This chapter begins with the theoretical framework that underlies the concepts of entrepreneurship, social entrepreneurship, entrepreneurial partnerships, innovation, social innovation, sustainability, new business models (NBM), and the relations among them and their impact on regional development.

For the purpose of this chapter, the theory developed since the international presentation of Carvalho, Sousa, Ferreira, Silva, & Novo (2013), first published by Carvalho and Jonker (2015) and coined as tetrad-value theory (Carvalho & Sousa, 2015) was applied to the analysis of 13 cases of social innovation and entrepreneurship. The main characteristics of these NBM were assessed, as well as their link to a balanced value proposition (Carvalho & Jonker, 2015) that considers economic, ecological, social, and psychological factors, which contribute to a broader concept of sustainability (Carvalho, 2016).

These case studies illustrate what is happening in Porto region in terms of social innovation and social entrepreneurship. The methodology followed is qualitative, based on interviews with the leaders of the projects and institutions. The analysis allows to draw conclusions about the new trends of social innovation in the region and in Portugal, as well as the adjustment of the social sector to population needs and towards a societal well-being, helping to reduce social exclusion.

The impact on regional and national development is perceived indirectly by the positive impact of these organizations on economic, ecological, social, and psychological sustainability. The latter is a new broad concept developed in connection to the concepts of psychological value (Carvalho & Jonker, 2015) and mental well-being (European Union, 2011).

The NBM analyzed here show the importance of the concepts of creation of social and shared value (Austin & Seitanidi, 2012b; Porter & Kramer, 2011); co-creative networks (Chatterjee, 2013; Zott, Amit, & Massa, 2011); and multiple value creation (Carvalho, 2016; Elkington, 1997).

In the end of the chapter, a new model is presented, which considers psychological sustainability as the fourth pillar of human, social, and territorial development – societal sustainability.

BACKGROUND

Entrepreneurship

The identification of business opportunities and the use of enterprise skills to create a new organization or develop an existing one is at the core of the concept of entrepreneurship, which contributes to personal and professional self-realization, active citizenship and social inclusion of the individuals (Vázquez, Lanero, Gutiérrez, & García, 2011).

The entrepreneurial activity is influenced by a set of cognitive (self-efficacy, scripts, cognitive styles, analyzing problems, etc.) and non-cognitive (creativity, autonomy, self-confidence, etc.) competences, and is conditioned by factors like education, family experience in business, access to finance (e.g., Fairlie & Holleran, 2012), and other environmental variables from the entrepreneurial ecosystem: entrepreneurial finance; government policies (support and relevance; taxes and bureaucracy); government entrepreneurship programs; entrepreneurship education (at school age; at post school stage); R & D transfer; commercial and legal infrastructure; internal market (dynamics; burdens or entry regulation); physical infrastructure; and cultural and social norms. These variables were pointed out in the Global Entrepreneurship Monitor (Kelley, Singer, & Herrington, 2016) as the nine structural conditions that facilitate or constrain entrepreneurial activity.

The analysis of the conceptual definitions of entrepreneurship in the literature leads to the conclusion that all approaches are complementary. Entrepreneurship is seen as a process of identifying and valuing an opportunity, and creating value through a package of resources in order to exploit it (Engelen, Heinemann, & Brettel, 2009; Morris, Kuratko, & Covin, 2008; Sahlman, Stevenson, Roberts, & Bhide, 1999; Shane & Venkataraman, 2000; Stevenson & Jarillo-Mossi, 1986). Other authors defend that this process should be innovative and increase wealth, and that it is based on entrepreneurial skills like risk-taking, autonomy, and pro-activeness (Nasution, Mavondo, Matanda, & Ndubisi, 2011). In the same line of thought, there are sociological points of view like those of Shapero and Sokol (1982) who state that all organizations and individuals have the potential to be entrepreneurial, and that creating new organiza-

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

tions is a social and economic context-dependent process (Reynolds, 1991; Thornton, 1999). Thus, the entrepreneurial process is viewed as an outcome of a complex social process, shaped by the profile of the entrepreneur, as well as the context surrounding the new venture (Chell, 2008; Gartner, 1985; Steyaert & Katz, 2004). For Chell (2007) entrepreneurship includes both business and social enterprises, and it is seen as a process of recognizing and pursuing opportunities in relation to the available resources for the creation of value.

Linked to the concept of entrepreneurship is the notion of entrepreneur. He/she has been seen as an innovator (creative destruction) who disrupts the economic equilibrium (Schumpeter, 1934), and can manage the innovation transfer process from an idea into a market (Raab, Stedham, & Neuner, 2005); as an individual who undertakes risks and develops innovations, even within an existing organization (intrapreneur), showing creativity and being responsible for identifying new opportunities in the market (Rathna & Vijaya, 2009); as a person committed in terms of equity, time, and career to creating economic value (Hornaday, 1992), who designs, develops and conducts visions as the ability to set and achieve goals (Filion, 1999); as someone who has the capacity to build an entrepreneurial or venture team to complement his own skills and talents, and possesses the know-how to find, manage, and control resources (Timmons, 1994).

Venkataraman (1997) suggested that entrepreneurship can have economic, psychological, and social consequences, and Cohen and Winn (2007) added environmental consequences in their definition of sustainable entrepreneurship. Carvalho and Jonker (2015) develop these four perspectives in terms of a balanced value creation theory, which was developed as tetrad-value theory (Carvalho, 2016; Carvalho & Sousa, 2015). Dean and McMullen (2010) also talked about sustainable entrepreneurship as a process linked to economic opportunities that are present in market failures.

By integrating all these ideas, we define an entrepreneur as a person that can identify opportunities inside and outside an organization, and who has the skills to gather tangible (material, financial, and people) and intangible resources (teamwork, partnerships, knowledge, etc.) to plan and start a new project or activity while controlling risks, and increasing economic, social, ecological and psychological values. Consequently, entrepreneurship is the process conducted by entrepreneurs, and can be summarized by the creation of something, most of the times through an organization, to serve and satisfy human wants and needs (Carvalho & Jonker, 2015).

The study of Praag and Versloot (2008), based in the analysis of 57 other studies, shows that entrepreneurs have a great impact on employment, economic growth, and innovation. Thus, their contribution to regional development is a natural consequence, positively affecting all companies in the long run. More, there is a strong evidence suggesting that high-growth entrepreneurship has a significant impact on economic development across nations (Wong, Ho, & Autio, 2009), and that economic development depends on high rates of productive entrepreneurship (Bianchi, 2010). In underdeveloped regions (Base of the Pyramid – Prahalad & Hart, 2002), entrepreneurship can contribute for inclusive growth, but it may also lead to negative outcomes such as crime and social exclusion (Hall, Matos, Sheehan, & Silvestre, 2012). Entrepreneurship policies should be based on economic and social indicators to avoid this possible negative societal effect. There are studies (e.g., Fiorentini, 2006; Mutis & Ricart, 2008) that focus on social-oriented companies, which by developing NBM to address low-income markets effectively and profitably, increase their value based on co-creation and strategic networking. Therefore, it might be possible to teach and train entrepreneurial skills, and create or sponsor a better contextual environment to enhance entrepreneurial success contributing to the regional and national societal development.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Social Entrepreneurship

There is a significant demand for entrepreneurs with a new vision to cope with global, national and local problems that the market and the state have failed to solve (OECD, 2010). These opportunities emerge as new social enterprises, which can be defined as organizations driven by social or cultural values as opposed to financial gain or profit. Therefore, social entrepreneurs create value but they are not motivated by the appropriation of this value (European Commission, 2013; Santos, 2012). On the one hand, a social enterprise seeks to respond to the social needs of its target publics, and for that it needs to be financially sustainable. On the other hand, an enterprise aiming to be profitable needs to serve its stakeholders, namely the shareholders, in order to achieve that goal. Thus, while social entrepreneurship views stakeholders as the "ends" and the social enterprise as the "means" of entrepreneurship, economic entrepreneurship has the opposite perspective and treats the stakeholders as a mean to accumulate financial capital (Ridley-Duff & Bull, 2013). Hence, with different leading purposes, all the organizations must satisfy the economic, social, ecological and psychological demands of their stakeholders through a process of value creation as already mentioned in the last section. However, social value creation is considered the distinctive feature of social entrepreneurship (Sullivan-Mort, Weerawardena, & Carnegie, 2003).

Several authors have contributed to a definition of social enterprises adding complementary approaches: the concept of social innovation (e.g., Mulgan, Tucker, Ali, & Sanders (2007); the quest for business solutions to social problems (e.g., Chell, Nicolopoulou, & Karataş-Özkan, 2010); the community and voluntary work from private and public organizations that seek to solve social problems (e.g., Austin, Stevenson, & Wei-Skillern, 2006; Dees, 1998; Dees & Anderson, 2003) through hybrid structures with a mix of non-profit and for-profit activities (Dart, 2004); the enhancement of social wealth by creating new ventures and managing in an innovative manner (e.g., Chell, 2007; Zahra, Gedajlovic, Neubaum, & Shulman, 2009); and the creation of value congruent with the social cause and the social community aiming a transformative social change through innovative activities (Tapsell & Woods, 2010) in a historical and cultural context (Austin et al., 2006; Chell, 2007; Roberts & Woods, 2005).

In brief, social entrepreneurship seeks the common good, namely the sustainability for both people and planet (Carvalho & Costa, 2015; Muscat & Whitty, 2009), looking for "sustainable solutions to neglected problems" (Santos, 2012, p.335), through a new combination of resources that creates social value (Mair & Marti, 2006; Short, Moss, & Lumpkin, 2009; Smith & Woodworth, 2012), in particular combining business and innovative perspectives for social purposes (Chell, 2007; Mair & Marti, 2006; Peredo & Mclean, 2006).

There is also a large institutional and political interest in the local and regional developmental role of social enterprises (Chell, Karatas-Ozkan, & Nicolopoulou, 2007; Haugh, 2007). Escobar and Gutiérrez (2011, p.45) state that "social entrepreneurs are agents that respond to market failures with innovations that are transformational and financially sustainable". Kostetska and Berezyak (2014) defend that social entrepreneurship could be "a generator of socially oriented economic development" (p.569), depending on the support of the state. The spread of this kind of innovative approach is considered a major criterion for the success of social entrepreneurs (Kramer, 2005), and they have been recognized for their contribution to social, economic, cultural and environmental wealth (Shaw & Carter, 2007). All these approaches underline the close bonds between social entrepreneurship and economic and social development, as well as with innovation, entrepreneurial orientation, and social change (Kramer, 2005; OECD, 2010; Perrini, Vurro, & Costanzo, 2010). For Balta, Darlington, Smith, and Cornelius (2012), the adoption of entrepreneurial orientation with a market-oriented strategy and social innovation practices provides the

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

potential for sustainability and growth of social enterprises. Entrepreneurial orientation is associated with risk-taking, innovation and pro-activeness (Covin & Slevin, 1988), whereas market orientation is associated with gathering, disseminating and analyzing market intelligence, responsiveness to the market, and inter-functional coordination (Carvalho, 2005, 2009), i.e., to offer the best product (good, service or idea) to serve and satisfy customers' needs. Thus, entrepreneurial and market orientations are also innovative processes that will allow social organizations to intensify and fulfill their missions.

Social entrepreneurship can also be seen as a NBM that combines innovative ideas for a social change with a business mentality (Germak & Singh, 2009; Kramer, 2005), and thereby it will be a potentially radical innovation (Austin et al., 2006; Dees, 2009; Witkamp, Raven, & Royakkers, 2011) in programmatic and fiscal terms (Harding, 2004; Roberts & Woods, 2005) to solve broader social issues. However, it seems that improving the quality of life through social value creation that leads to social change can be achieved not always by radical innovation, but also by incremental paths (OECD, 2010).

The integration of values related to an old culture based on charity with a modern view of an entrepreneurial culture based on problem solving is a requisite to success of social entrepreneurship (Dees, 2012). Societal forces may shape the role of social entrepreneurs, but their motivation, cognitions and capital are essential for them to be the entrepreneurial agents in the process (Grimes, McMullen, Vogus, & Miller, 2013).

Social enterprises are part of the social economy, which also includes foundations, charities, mutual societies and cooperatives. Social enterprises are businesses trading for social purposes, within the (social) economy (European Commission, 2013). According to the EU Social Business Initiative, the social economy employs over 11 million people in the EU, accounting for 6% of total employment. It is recognized by European Commission (2013) that social economy and social entrepreneurship can clearly play a role in regional development and social inclusion. There are also examples of countries that assume by law this kind of goals. For instance, in Spain the Law 5/2011 regulates the concept of Social Economy and among its guiding principles is stated the "promotion of internal solidarity with society that favors commitment to local development, equality of opportunities between men and women, social cohesion, insertion of people in risk of social exclusion, the generation of stable quality employment, the reconciliation of private, family and work life and sustainability". In the same way, in Portugal, the Law 30/2013 states that the organizations of social economy should reconcile the interests of members, users or beneficiaries with the public interest, in respect for the values of solidarity, equality and non-discrimination, social cohesion, justice and fairness, transparency, shared individual and social responsibility, and principle of subsidiarity.

Innovation and Social Innovation

Schumpeter (1934) was one of the first authors to acknowledge the role of innovation in cultural, social, and political aspects of society besides the economic one. As such, innovation can be seen as the generation, acceptance, and capacity to change or adapt new ideas, processes, products or services by organizations (Thompson, 1965) in order to advance, compete and differentiate themselves successfully in the market (Baregheh, Rowley, & Sambrook, 2009), and to prepare the future of the business (Carvalho, 2013) through an interactive process involving both formal and informal relationships among various actors interacting through social networks (Doh & Acs (2010).

Lundström and Zhou (2011) differentiate technological, business and social innovation. The former focuses on knowledge production and ends with R&D results (new ideas) that can or cannot be used to

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

make products. The second focuses on economic benefits from business innovations like market share or profit rate. And the last focuses on social value like the solution for social problems with limited resources, seeking for political recognition, financial support, voluntary labor, and philanthropic commitment.

Hurley and Hult (1998) introduced the concept of innovativeness, as the capacity of an organization to be open to new ideas, and consider it as a measure of its orientation towards innovation. These authors also introduce the concept of ability to innovate, as the organization's capacity to adopt and implement new ideas, processes, or products successfully. Thus, innovativeness reflects a firm's propensity to engage in new idea generation, experimentation, and R&D activities resulting in new products and processes (Lumpkin & Dess, 1996). It is important to notice that there are new characteristics in the way companies are innovating: co-creation of value with customers; global knowledge sourcing and collaborative networks; and global challenges and public-sector problems as drivers of innovation (Prahalad, McCracken, & McCracken, 2009).

Taylor (1970) pointed out that social innovation involves activists and social entrepreneurs to meet social needs by doing things in a new way. Holt (1971) emphasized that technological innovation is concerned with application of new technology, whereas social innovation deals with the application of new social patterns of human interaction. Drucker (1987) considered social innovation as a complement of technological innovation, including educational methods, hospital administration, and marketing practices that impact on productivity. Mulgan (2006, p.146) defines social innovation as "innovative activities and services that are motivated by the goal of meeting a social need and that are predominantly developed and diffused through organizations whose primary purposes are social", which can be complemented by the definition of Phills et al. (2008, p.36) as "a novel solution to a social problem that is more effective, efficient, sustainable, or just than existing solutions, and for which the value created accrues primarily to society as a whole rather than to private individuals".

Social innovations are related with the use of social means (inventiveness of citizens, civil society organizations, local communities, businesses, and public agents) to achieve social ends (Caulier-Grice, Kahn, Mulgan, Pulford, & Vasconcelos, 2010), creating shared value, both economic and social (Porter & Kramer, 2011). Although business innovation is considered market- and consumer-driven (Mulgan et al., 2007), to be successful it should satisfy unmet human and societal needs and desires (Carvalho, 2013) as well as happens with social innovation. Both business and social innovation are needed to improve quality of life in Europe, and to promote sustainability of welfare state social systems (European Commission, 2013). In particular, social innovation seeks new answers to social problems, implying conceptual, process, product, and organizational changes, based on new relationships with stakeholders and territories (OECD, 2010).

As we have seen in regards to social entrepreneurship, there are two types of innovation: incremental and radical (Abernathy, 1978) or disruptive (Christensen, 1997). Also, some social innovations can be incremental (as they build on what already exists), while others are radical, disruptive and generative, transforming approaches and situations, like those targeting new customers and those addressing the low-income market with low-cost products (Christensen & Raynor, 2003). The ultimate goal of social innovation should be systemic change linked to disruptive innovation. Systemic change involves the interaction of social movements, business models, laws and regulations, data and infrastructures, and entirely new ways of thinking and doing things (Murray, Caulier-Grice, & Mulgan, 2010).

In what regional development is concerned, it is important to consider science and technology parks based on natural sciences and technologies, and social innovation parks based on social sciences and technologies, which support diversified innovative activities, such as organization development, knowl-

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

edge transfer, social technology progress, educational and training programs and entrepreneurship services (Lundström & Zhou, 2011). There is also the concept of territorial innovation models (industrial districts, milieux innovateurs, new industrial spaces, local production systems, etc.), which are models of regional innovation and local development (Moulaert & Sekia, 2003; Moulaert & Mehmood, 2010). These models represent what happens in several countries, like France, Italy and the USA, regarding the role of the endogenous potential of institutions in launching innovative dynamic firms (Aydalot, 1986), with a great focus on cooperation and partnership (Becattini, 1987), a regional learning economy (Edquist, 1997; Storper & Scott, 1988; Saxenian, 1994), and systems of innovation (Bartholomew, 1997; Cooke, Uranga, & Etxebarria, 1997; Freeman, 1995). All these types of innovation and R & D networks are seen as important mechanisms for regional economic development (Yokura, Matsubara, & Sternberg, 2013).

Other concept around social innovation is "Socio-Ecological Innovation" that concerns innovation resulting from the strategic integration of sustainable innovation that is part of the organizational culture, and innovation for sustainability that addresses ecological or societal issues (Edgeman & Eskildsen, 2013). Olsson and Galaz (2011) suggest that socio-ecological innovation should work more directly toward social justice, poverty alleviation, environmental sustainability, and democracy rather than toward profits. Thus, innovation can also be a key enabler of sustainability (Nidumolu, Prahalad, & Rangaswami, 2009).

Other important issue concerns the form of a social enterprise. It depends on which format will be most effective on mobilizing resources to address a social or environmental problem, and "can occur within or across the non-profit, business or government sector" (Austin et al., 2006, p. 2). Van Looy et al. (2011) show that the scientific productivity is positively associated with entrepreneurial effectiveness, through patent activity and contract research. Thus, the link between the universities, the industries and the state is very important to achieve a more effective innovative and entrepreneurial activity (e.g., Etzkowitz & Ranga, 2011).

Light (2006) describes a social entrepreneur as "an individual, group, network, organization, or alliance of organizations that seeks sustainable, large-scale change through pattern breaking ideas in what or how governments, nonprofits, and businesses do to address significant social problems" (p. 50). Therefore, nowadays, a preferable approach seems to be the idea of a partnership between sectors for the innovation in the development of solutions for social issues in a broad perspective. Presently, a 4th sector seems to be emerging, which is constituted by "integrated enterprises" or "hybrid enterprises" that are in the intersection of the public, private and social sectors (Escobar & Gutiérrez, 2011; Michelini, 2012), and that is related to new processes of social innovation. Recent studies (e.g., Manning & Roessler, 2014) point out the concept of "cross-sector development partnerships", which aggregate business, government, and civil society organizations as a basis for development at many dimensions such as sustainability, health education, and economic development. Other studies (e.g., Arnkil, Järvensivu, Koski, & Piirainen, 2010; Eriksson, Niitamo, & Kulkki, 2005) talk about a quadruple helix approach to innovation that includes civil society, defending a user-driven innovation. However, one can see this idea already developed in the context of market orientation literature (e.g., Carvalho, 2009).

Thus, it seems that cross-sector collaboration and the process of hybridization has advantages. They allow for more efficiency, by reducing costs through a more efficient sharing of resources and capabilities, and by improving product distribution and services. Also, they contribute to projects that are more innovative, creating new products and services, and more social sustainable in terms of business models, human capital, information, reputation, and credibility (Escobar & Gutiérrez, 2011). They also lead to social innovation and new ways of governance and management with more benefits for society (Austin et al., 2006; Crane & Matten, 2007; Grudinschi et al., 2013; Jupp, 2000; Le Ber & Branzei, 2010; Phills,

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Deiglmeier, & Miller, 2008). These kinds of collaborative partnerships between the private, public, and third sectors can also lead to participative processes and people's empowerment, which are considered essential aspects of social innovation with an impact on regional and local policies ((Edwards-Schachter et al., 2012; Klein, Fontan, Harrisson, & Lévesque, 2012; Prahalad & Krishnan, 2008; Thomke & von Hippel, 2002; von Hippel, 1985, 2005). However, the state has a crucial role in establishing legal and tax conditions and a favorable institutional environment for the creation of all kind of social enterprises (Kostetska & Berezyak, 2014).

In fact, social innovation can happen within any sector, but seems to appear more often in the space between the three sectors (Lundström & Zhou, 2011), supported by open innovation, as a sharing attitude and by the use of external ideas and technologies, collaboration, self-organization, decentralization, transparency of process, empowerment, and plurality of participants (Chesbrough, 2006). Moreover, social innovation can be the grounds for designing and implementing programs to improve local and regional economic development and people's quality of life (Edwards-Schachter, Matti, & Alcántara, 2012). In January 2009, EC President Barroso met social innovation experts and stakeholders in Brussels (BEPA, 2010) to discuss and explore ways to boost social innovation, leading to new European Commission policies in this domain like those published in 2010 (European Commission, 2010a, 2010b, 2010c) where social innovation and open innovation, next to technological innovation, are considered as key features of Europe's innovation policy.

Thus, stimulating innovation, entrepreneurship and the knowledge-based society is the core of the Europe 2020 Strategy (European Commission, 2013).

New Business Models

A business model can be defined as the organizational method to use resources and offer a better value to customers and make money with that (Afuah & Tucci, 2001), or "as the blueprint of how a company does business" (Osterwalder, Pigneur, & Tucci, 2005, p.4). Thus, creating and offering value is the common foundation of every business model.

The NBM appear with novel characteristics like the crucial role of stakeholders (Freeman, 1984); the creation of social and shared value (Austin & Seitanidi, 2012b; Porter & Kramer, 2011); co-creative networks (Chatterjee, 2013; Zott et al., 2011); and multiple value creation (Elkington, 1997). Multiple value creation refers to the idea that sustainability implies the organization of several types of value such as ecological, social, economic (or financial), and psychological value (Carvalho & Jonker, 2015). The concept of shared value means that values can benefit other entities beyond their creator. And collective value creation refers to the collaboration between partners in order to create value.

Thus, a business model is a conceptual and operational tool that describes the values (economic, social, ecological and psychological) offered to the main organizational stakeholders, through the creation of a product (good, service or idea), the organization and coordination of key activities of the team and the partners, and the design of a marketing plan, to deliver those values and achieve economic, social, ecological, and psychological sustainability (Carvalho & Jonker, 2015).

It is important to notice that among the proposed determinants of value creation (e.g. Austin & Seitanidi, 2012a; Pitelis, 2009; Zott et al., 2011), the most relevant appears to be innovation, leading to a value proposition that may include individual, organizational, and societal benefits as a foundation to economic, social, ecological and psychological values to customers and other stakeholders (Carvalho & Jonker, 2015).

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Value Proposition and Sustainability

The concept of "sustainable development" appeared at the United Nations Conference on the Human Environment in 1972 and later gained prominence by way of a report to the United Nations by the World Commission on Environment and Development (WCED, 1987), chaired by Dr. Gro Harlem Bruntland, former Director General of the World Health Organization and former Prime Minister of Norway. The Bruntland report defines sustainability in terms of the enterprise perspective as a composition of four characteristics: lean (conservation of non-environmental resources), green (conservation of non-renewable natural resources), ethical (commitment to and practice of social equity and justice, community involvement and contribution, and positive regard for treatment of the enterprise's human capital), and real (implies lean, green, and ethical practice and their financial, societal, and environmental results) (Edgeman & Eskildsen, 2013).

Now, it is common that large firms have explicit public sustainability policy statements and claim to apply financial, environmental, and social assessment (Hall, Daneke, & Lenox, 2010), the so called "triple bottom line" (Elkington, 1997). These three divisions are also called the three P's: people, planet and profit, or the "three pillars of sustainability", and are obviously linked to sustainable entrepreneurship (Kuckertz & Wagner, 2010). This means that a sustainable entrepreneur should seek for environmental sustainability – preservation of natural capital –, social sustainability – preservation of social cohesion in terms of well-being, nutrition, shelter, health, education, quality of life, etc. –, and economic sustainability – satisfying human needs with available resources as a condition to financial sustainability of the organizations. Therefore, sustainable innovations should account for the needs of local customers, people's wealth status, natural environment, and business ecosystems (Khavul & Bruton, 2013). All the concepts are linked: economic and environmental sustainability contribute to societal development, which leads to social sustainability (Assefa & Frostell, 2007). Thus, sustainable development should integrate social, environmental, and economic sustainability (Goodland, 1995), promoting a better access to education, income, health, and culture, and contributing to the creation of equal conditions for all Carvalho & Costa, 2015).

However, and according to the European Union (EU) Sustainable Development Strategy adopted in 2006, "health policies should aim at creating and implementing plans to help women and men achieve and maintain positive emotional states and thus improve their well-being, their subjective perception of the quality of their life and their physical and mental health" (European Commission, 2011, p.7). This EU strategy defends that it is necessary to protect and promote human capital and the mental well-being of citizens, in order to achieve economic, social and environmental objectives. Problems like those related with childhood and adulthood inequalities and mental health (e.g. school drop-outs, poverty and social exclusion) request a new vision, mainly in what concerns social responses. Hence, the concept of psychological sustainability extends the concept of mental well-being to all aspects that contribute to individual human being satisfaction (e.g. new knowledge and skills to cope with health or working life).

The bonds among (social) entrepreneurship, (social) innovation, and (social) sustainability can be seen in NBM, in particular on the third and fourth sectors.

CASES OF SOCIAL INNOVATION IN PORTO REGION

Porto region is a Portuguese multi-municipal metropolis in the north of the country with eleven counties. The region occupies a total area of 1,024 km^2 and has 1,287,276 inhabitants (2011 census).

The author has collaborated in this research studying 13 Portuguese cases in nonprofit sector, through in-depth interviews with their managers. This chapter presents these cases to illustrate how social entrepreneurship emerges with social innovation through a NBM, contributing to economic, ecological, psychological, and social sustainability at regional level.

It was used a qualitative strategy with a cross-section design. The method to collect data is based on the international interview protocol (Jonker, 2012). For the purpose of this chapter, we consider the following questions of that protocol:

1. What is the nature of the firm's activity generated for its business model? Why/what is new about it?
2. What is the role of sustainability (economic, social, and ecological) in the new model? If exists, what is its nature in the model?
3. Why did you start to develop this model? What led to this?
4. Does the business model generate value(s) other than profit (or beyond the value for users in the case of nonprofit)? If so, what kind of value(s)?
5. Did you start new collaborations or strengthen previous collaborations for the new model? (If so, with which actors and what does that collaboration look like?)
6. Up till now, what are the results of the new sustainable business model?

The sample of 13 organizations selected have a significant social media impact and present some sort of innovation in the processes, or in the activity, or in the way they approach the market. This research took place between January and May 2013. All the chosen cases in nonprofit sector are in Porto region, north of Portugal that is the second more important region in the country. The interviews were made with the owners or the top managers, and took one to two hours long.

Case 1: Socialis

Socialis - http://socialis.no.sapo.pt/index.html

Socialis is developing an innovative activity since 2006 with a fringe of the population that has been socially "forgotten" – teenage mothers. They were supported by a State program to start this new venture. The president is a social worker of the municipality that faced this kind of social needs, and realize that there was no social response adjusted to these cases.

As she said: we are developing an activity that is already innovative, because we work with adolescents (…), which is strategically different from what other institutions are doing. The innovation is working with teenagers and young pregnant teenage mothers (not necessarily single) and supporting also the integration of immigrants in our society.

Socialis has a social response called ATL (Free Time Activities) that is directed toward children and youngsters, encompassing ages up to 30 years. This is in fact an innovation because, prior to the estab-

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

lishment of Socialis, the extant institutions were solely working with children up to 4 years of schooling. This activity helps fighting against school failure and absenteeism.

Socialis created a Life Support Center where female teenagers have a personalized intervention in order to in the one hand improve their household and maternal skills to cope with life, and in the other hand receive professional orientation aiming their social inclusion in labor market. At the same time, Socialis work with teenagers' families as an important piece in their life's project, monitoring and assessing the results obtained with all players in the process.

The president stated that the innovation in this social response is at the level of competencies... and the support to life is made by a personalized intervention with each one of the young people, training and developing their competencies. […] Therefore, it is they who carry out their tasks, who take care of themselves and the babies, always under the technical guidance of the trainers, becoming aware that one thing is pregnancy, another is motherhood.

Socialis is supported by State Social Security (SSS), fundraising, product donations, and organization of charity events with the participation of all users of social services. They have partnerships with the City Hall and other local authorities. Its services produce economic, social and psychological value, contributing to regional development. These values are related to the activity with users – "*we have changed their lives…*" –, to the creation of new jobs (21 permanent workers) and several job shadowing promoting employability. However, because of the economic crisis, Socialis has to deal with financial problems since it serves 136 teenagers and only has financial support for 86 from SSS, which makes it more dependent on fundraising and volunteers.

Case 2: CrescerSer [BeGrowing]

CrescerSer – http://www.crescerser.org/

The CrescerSer Association is nationwide and headquartered in Lisbon. The association is comprised of 7 temporary shelters. There are two in Porto: since 1996 the "Casa do Vale" that welcomes boys from 12 to 18 years; and since 2004 the "Casa de Cedofeita" that welcomes children of both sexes from birth to 10 years old.

The innovation of these shelters is stressed by their technical director: "*what I consider innovative in this project is that care intervention is done within small units, as if they were homes*".

CrescerSer houses have between 10 and 14 children simultaneously. This is a different approach from the traditional method that comprehends hosting children in larger institutions for many years. These shelters give time to families to reorganize themselves to allow the return of the child. Moreover, innovative work with families, the direct relationship with the community, and the very emotional and personal hosting are also appreciable distinctions.

Recently, there is a new class of users, institutionalized youngsters that want to leave the institution at 18 years old, and live on their own. Thus, 'Casa de Cedofeita' promoted a support network, allowing them, in an informal basis, volunteering in homes in return for meals, clothing, medical and psychological support, and counseling. In many cases, these young people haven´t had a normal childhood phase, and thus the 'Casa de Cedofeita', having on their staff only women, fulfills the need of "maternal support" even though those youngsters are not aware of it. This female proximity has given good results in young people's development.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

There is a great concern about the economic sustainability based on SSS and community support, because there is a strong risk of being reduced or terminated. All the food gathered by the shelters is provided freely by a chain of suppliers through an innovative method. For instance, the bread is provided by the baker but he only contributes with his part of the costs, the cereal producer supports his own part, and other part comes from the grinding.

CrescerSer contributes to ecological sustainability by separating garbage for recycling, involving children in this activity for educational purposes, and carrying out energy saving programs. In terms of social and psychological sustainability, the organization tries to prevent institutionalization of children, avoiding an emotional cost to them and their families. It also contributes to the education of the community, aiming that children are not maltreated and removed from their families:

We seek to make children and young people aware of the expenses and the financial management that we have. The social dimension is a goal, trying to act at the level of prevention and preventing children from reaching an institutional host situation that represents a great emotional cost for them and their families. We also try to contribute to the training of the people of the community to prevent children being abused and removed from their families of origin.

Thus, its psychological value proposition is linked to the influence on new life projects for children and youth. However, it is noted that the greater the age the greater the difficulty of social inclusion, since they suffered more traumatic damages, and have high levels of consumption (alcohol and drugs) and delinquency paths. Hence, CrescerSer must also play a role as therapeutic host. All these activities have a positive impact in society, as social value, by promoting social inclusion, as well as influencing both families and community behaviors by giving parental training, organizing technical meetings with families, workshops, seminars, conferences, where the rights of children, young people, and good practices are addressed.

The NBM has been achieving good results in children's care and support, because most of the 180 children, who were helped in these years, are again with their families or with an adoptive family.

Case 3: Nomeiodonada [Inthemiddleofnothing]

Nomeiodonada – http://www.nomeiodonada.pt/

Beginning in 2012, this association was established to address deficiencies in supporting children, who are in intensive care, and their parents. The support can be comprised of money, clothing, food, and technical aids, which currently are not subsidized by the State. This is a pioneering activity in terms of client targets and personal support. Most founders had worked in intensive care and had noticed daily the problems of parents who require psychological support to cope with the situation, as well as those who do not have the economic means to remain near their children during their stay in intensive care: "*some even slept inside their own cars because they had no place and no financial support to do it elsewhere, because only one person could stay with the patient*".

Therefore, to be able to provide them with some assistance, partnerships were established with the Porto City Hall, Hospital Centre of Porto, Abbot, and Pingo Doce, which help these parents with food, facilities, housing, financial and counselling support.

This organization wants to start another innovative project, which consists in opening a Continuing and Palliative Care Unit for children aged 0 to 18 years, who need special care, allowing the permanence

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

of the family 24 hours a day, and contributing to avoid the breakdown of the nuclear family. This kind of social response only exists in National Health System for adults.

The organization's economic sustainability depends on partnerships with private companies for fund-raising, organization of events (fairs, workshops, walks, etc.), and other activities, like editing, publishing and selling books with stories related to parents and children's experiences in Intensive Care Units.

The president of Nomeiodonada considers that its activities "…meet the needs that somehow the state cannot fulfill…" The solidarity with the families who have psychological and financial needs so that they can rehabilitate the family unit, the implementation of several financial supporting activities, and sharing information with other entities to list the cases that wouldn't otherwise came to their attention, are the main characteristics of their business model.

She thinks that the association generates psychological, social, and economic value, since it provides children and their parents with a more humane health care environment and psychological care, promoting their reintegration into society; it offers equipment, like wheel chairs; and it helps with medication payment and transportation costs, allowing families to visit their children. Consequently, its activities contribute for a better living of vulnerable people and to social sustainability in a time of great economic crisis.

Case 4: SAOM [Mary Organizations Assistance Service]

SAOM - http://www.saom.pt/

SAOM was initially founded in 1976 and focused on two major aspects: support for seniors (a Day Center and Home Care Service) and support to children and young people. Since 2005, the latter social response ceased to exist when it was discovered that it no longer made sense given the reduction in the population in these age groups in the historical center of the town and the existence of many other institutions with those types of services. A new and innovative social response was then created in 2006: the social reintegration of adults in situations of extreme vulnerability, including the homeless – the "Give Way to Life" project.

The leader of the project was aware that: in social reintegration, especially in a project such as training in the hotel sector, it is asked me for some things for which I had no answer. For example, the image and social presentation of each trainee for the activity is very important and then we are debating with questions such as the need to treat their teeth and National Health Service does not give an adequate answer, or the need for a hairdresser and a manicure to for the ladies. And a certain degree of financial autonomy was required to take care of those matters. So if we are always instilling in our trainees that it was not possible and permissible to live eternally with the state minimum income, and so there is a need to be proactive, we should pass immediately this example of pro-activity. As we have always been apologists for a higher level and more sophisticated insertion in the hotel industry, by complying with the highest standards of food hygiene and safety at work and always using top quality products, we think that we could have available certain services that could be profitable.

Thus, this project consists in providing training in hospitality domains, and was initially supported by a state program during 4 years. In the last 2 years, the users of this service started working in paid catering services, which allows paying their personal care treatments. Then, to be financial sustainable, SAOM decided to open a social enterprise: a restaurant near the old wall of Porto. This social economy

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

project is in a developmental stage, and aims to invest all the profit in enabling people to be part of "normal" society.

The coordinator of the training courses defends that the autonomous financial sustainability is the most important characteristic in this type of business model:

We have a great client that is the EDP (power company) Foundation. We do not want the money, we want the Foundation to hire us because it gives us profit, visibility, a sense of work to the trainees, training time to the team, publicizing the service and promoting the raising of new clients. For the Foundation this payment is a donation, enjoyable from the fiscal point of view; socially it is well seen because they know that this money is well used and contribute to the achievement of the social response; in return we provide the catering service. We trade also with local council, providing our hall to their activities in return of our food services.

SAOM generates ecological value through recycling all the materials, and sensitizing the trainees for this subject; psychological value through the great change they promote in the image and lifestyle of the trainees, helping social inclusion of homeless, prostitutes, addicts, and people living with minimum income from the state; social value because they may contribute to solving in the long run the social problems already mentioned; and economic value by producing and selling services, satisfying clients' needs. All these values are strategically thought by a team that shares all the situations in weekly meetings, to be aware of what happens with each one of the trainees, with the help of psychologists and social workers. There is a need for a strong leadership and an empowered and skilled team, to work and gather trust among all, including the trainees, whose commitment and responsibility must be formal, accepting all rules of the institution by signing a contract. Obviously, providing these values to society has a positive impact in all types of sustainability.

Case 5: C.V.P. Matosinhos

C.V.P. Matosinhos – http://matosinhos.cruzvermelha.pt/

It was created in December, 31st 2012, a new and innovative response to the need of an emergency foster home for victims of domestic violence. This service consists of providing temporary shelter and support to the victims (10 days maximum). During this period, the victim receives psychological, legal, and social support. After this period and upon determining a diagnosis, the victim is then directed to his/her home or is placed in a different home or shelter. The absence of a social response of this kind in Portugal was considered a serious gap that was urgent to fill, and it is in the beginning of its development.

The service is supported by a European Fund framed on POPH (Human Potential Operational Program), which assures it financial sustainability. C.V.P. Matosinhos collaborates with other internal social responses and with SSS.

There are psychological and social values inherent to the type of service and support given to the victims, contributing for psychological and social sustainability.

The coordinator defends that: "*this NBM takes advantage of existing synergies to a better sharing of resources, which are the main characteristics of this new service*."

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Case 6: Santa Casa da Misericórdia do Porto [Holy House of Mercy of Porto]

Santa Casa da Misericórdia do Porto – http://www.scmp.pt/

Just as with any organization of social economy, the "Santa Casa" (SCMP), now, is concerned about and strives to provide a different solution to the situations of the economic and social crises, and the need to establish a new paradigm in the relationship between institutions of Social Economy and the state. This entails that, in the name of sustainability, there is better and more efficient management. This organization is accomplishing this by introducing management rules that allow the centralization of services, called Back-Office, which were spread over several areas within the organization. These areas of social intervention are linked to the SSS, through the work with at-risk children, female victims of domestic violence, elderly in the most varied situations, and social entrepreneurship projects. Thus, it is implementing a new governance process since 2011 that allows it to be more financial sustainable and, at the same time, to contribute more to social sustainability through the improvement of the services. In terms of ecological sustainability, it must take care of the medical waste of its three private hospitals.

The president argues: what concerns us the most is economic and social sustainability. Economic because this is a nonprofit organization, being profit a means and not the end, can only survive by obtaining resources. So we have to add value to the value chain of our products, which are the work with people and their involvement. The more effective we are the better the answers we will get in the area of sustainability.

The new governance and management model is near the stabilization phase, and allows us to spare many resources and use them in a more efficient and effective way. Of course, in its base is the goodwill of all collaborators that understand the new management ideas.

This NBM must pay attention to financial sustainability and to self-regulation of the collaborators to achieve a quality certification. The effectiveness and efficiency in management leads SCMP to increasingly become a state partner in administrating new spaces, new equipment and new social responses.

SCMP creates mainly economic and social value, as it helps people to go out of the difficult situation they are in, and it has a great impact in regional economy, as SCMP employs thousands of workers in their social services and provides, daily, support to more than 1,000 people.

The president of the board also talks about a generation of affective value among the people that works in SCMP, and people that benefit from its activity. Hence, it is possible to see here the psychological kind of value provided by this institution.

Case 7: Mundos de Vida [Living Worlds]

Mundos de Vida – http://www.mundosdevida.pt/

Mundos de Vida is organized around three major services: childhood, older persons, and family. All services are performed through a type of intervention based on quality models (the institution is certified by ISO 9001-2008). Within family service, foster care for children was created in 2006, and is based on a model of intervention with new processes: building awareness and raising families (a new generation of quality foster families) that requires a very high level of strong partnerships with the civil

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

society (through the tools of social marketing) and changes in the mentality both of protection system and ordinary citizens (employing innovative and extensive awareness campaigns).

In Portugal, only 5% of children that need an alternative way to grow up in a healthy environment has an opportunity with a foster family. Thus, there is a great gap between demand and supply, mainly due to, on the one hand, the financial limitations of SSS and, on the other hand, the preference of the authorities in this matter, anachronistically, for institutionalization in state homes. The NBM allows users (children at risk and their families) to fulfill their care and education needs through an activity almost nonexistent but with superior results in comparison with institutional care. It also allows finding quality foster families in the community, with higher humanitarian motivation.

As its technical director explains: this NBM requires sustainability in three dimensions: at the micro level, through the adjustment of care relations and education of a child who moves into a new family, called foster family, maintaining relations with the biological family, hoping for their transformation in terms of social stability and positive parenting, that allows the return of the child through support and mediation of the technical team; economic, once the biological family doesn't pay for care service or education, SSS support is required, which is limited and, therefore, has to be supplemented by resources that the institution has to identify and capture within civil society; and social, as Mundos de Vida needs to create a pool of foster families with different profiles, in order to identify the right family for each child that needs to be protected, after a decision by the Protection Commission or the Court. These families must have a clear humanitarian motivation with a family and social network that accept to collaborate in this project, since caring for and educating a child goes beyond the border of a nuclear family.

Mundos de Vida generates social value using potential foster families, developing a sharing and responsible mentality; promotes a better economic sustainability because the cost of foster care is half of the cost in a residential care system; and provides psychological value because contributes to the transformation of children' lives and families' behaviors.

They claim excellent results with this business model in terms of recruiting new families, reducing institutional care rates, extending their offer to other municipalities, and promoting social and psychological sustainability.

Case 8: Percurso das Memórias [Route of Memories]

Percurso das Memórias – http://www.facebook.com/percursodasmemorias

This is a community tourism project which aims to promote the economic and social development of local communities through the promotion of tourist activities that are streamlined by the communities themselves in order to defend and respect their identities by disclosing their customs. The project promotes not only interaction with the community but also its socio-economic development. As the entrepreneur said: "*this is a product that is not offered in the programs of other travel agencies*".

This NBM allows a positive impact on psychological, economic and social sustainability. For example:

When we take tourists to a craftsman or to a traditional shop, we are contributing to an increase in the owners' self-esteem, enhancing their personal development, and helping them to get more business. We are creating an active and sustained community around these routes of memories.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

His major motivation was the lack of this kind of tourist projects involving the communities in the city of Porto, with special relevance to the historical center, and the will to help combating its desertification, promoting the stories, culture, customs and traditions of the old city. Now, the project is being developed by consolidating the routes. Thus, they generate economic, socio-cultural, and psychological value to all local communities and to all stakeholders (directly or indirectly), helping preserving their identity and fighting urban desertification. The nature of the project involves a whole set of associations, institutions, craftsmen, municipality, schools, and the general population.

Case 9: Santa Casa da Misericórdia da Maia [Holy House of Mercy of Maia]

Bué de Escolhas – http://www.misericordiadamaia.com/Default.aspx?tabid=955

The project called "Bué de Escolhas" is designed to work with children and youth at risk from 6 to 24 years. It is the first time that this municipality, near Porto, has this kind of social intervention in the scope of a larger public program. The promotor established a consortium for this program, comprising 14 companies and institutions, to ensure the continuity of the project. These organizations also have an interest in maintaining this cooperation by the visibility that is provided by the project, representing one profitable marketing operation that fits perfectly in the concept of social economy.

The coordinator of the project considers that it generates essentially a very large social value:

We work daily for young people's emancipation, their employability, their training. We want to prevent dropout from school, promote entrepreneurship, self-employment, and other support for artistic creativity and so on. I can also mention that the project could finance any innovative business up to 5,000 euros.

They create new services, including pedagogical monitoring work, to prevent school failure, and social activities like sports practice, dancing, and theatrical acting.

The coordinator considers that is important to use the consortium resources because he does not have funds to cover most of the costs. Some of these costs, not being financial, are particularly important in terms of management, like lending of spaces, vehicles, technical know-how, transport, etc. The greater the involvement of partners, the better and more rational will be the management of all resources (including human) and so the better the odds to continue with the project.

Thus, they produce economic value to all stakeholders, as well as psychological value to children and youngsters, and social value to society in general. They have already notice changes in behavior and improved ability and responsibility.

Case 10: Coração da Cidade [Heart of the City]

Coração da Cidade – http://ccidade.no.sapo.pt/

This is a rare institution wherein all work is done on a volunteer basis. Its activities extend to several areas of the Great Porto. There is a new project since 2012 called "TAKE", which is intended to supply food to pensioners, unemployed, and people who still have economic difficulties even while working (ashamed poor). The coordinator pointed out the NBM:

The organizational process begins with a diagnostic evaluation, inscription proceedings and data confirmation after which the user is provided with an access card to the take-away store. The user is

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

required to inform the take-away store, the day before, of the desired number of meals to avoid waste and it is mandated to bring properly cleaned containers for transporting the food. He/she pays only 50 cents, and the meal consists of a main course (meat or fish), soup and dessert (sweet, fruit or yogurt). One of the concerns of the institution is the personalized service, we only serve one person at a time to assure privacy to the user.

This institution has financial problems because it doesn't have support from the state and has to manage an annual budget of 700,000 euros, which is fully supported by civil society through private and enterprise donations, and sales from the social shops they own. It only used to help homeless, but with the economic crisis and increasing unemployment and taxes, it has noticed that many people had started to have difficulties to survive.

Their partners offer them the food, and volunteers do all the work in this project. It has good results generating economic value, providing meals and promoting the partners (Continente, Pingo Doce, Intermarché, Lidl, etc.), and social value by lessening family crisis and increasing corporate social responsibility. In terms of psychological value, it changes the way that ashamed poor act, because it provides food discreetly.

Case 11: Projeto Rios [Project Rivers]

Projeto Rios – https://www.facebook.com/pages/Projecto-Rios/133403460063312

Projeto Rios has a business model that acts at the level of environmental intervention, and intend to implement business and social entrepreneurship. The coordinator of this project said: "*the great novelty is to use the rivers as factors of mentality and behavior change and as a backdrop for the transformation of society through the acquisition of added value and improvement of the quality of life*".

At business level, it promotes activities that create economic value through efficiency (efficient water use, monitoring of rivers), safety (reduction of losses in the floods), and added value (rehabilitation of rivers, new uses, soil valorization); social value through changes in behaviors (relationships, interpersonal communication, collective activities); psychological value through education (attitudes and actions, the river as a multidisciplinary natural laboratory, respect and appreciation for environmental heritage), and health (with walks and advice on food, the river as a school and a source of healthy behaviors); and environmental value through ecology (ecological integrity), freedom (clear margins) and conservation (biodiversity).

The existence of many heavily degraded water lines and the lack, at national level, of a public participation tool for the rehabilitation of rivers where the local community could be actively involved, was the motivation to create this project. There was a need for technical and professional solutions with a multidisciplinary approach that led to engagement and involvement of users in the selected solutions. As the coordinator pointed out:

The project encourages personal communication and has the slogan: "The Rios Project unites people and unites the rivers". People are a key link in resolving conflicts and local problems. At an ecological level, it creates more value in the riverside eco-system, allowing more freedom for rivers in their multi-functions, where I highlight hydrological, ecological and use potential. Thus, the habitats of the riverine species gain space and time for their biotic functions. For example, it allows the "Guarda-rios" bird to make its nest and promote local biodiversity.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

The coordinator defends that the institutionalization of a solution is needed to seek for economic, social, and ecological sustainability, and the accomplishment of the proposed objectives. They share resources, services and knowledge with partners, like municipalities, schools, other ONG's, companies, associations, groups of fishermen and hunters, owners of the land in the river banks, researchers, etc. The project is already recognized by the Portuguese Environment Agency and has the Honorable Mention awarded by the Green Project Award. The Entrepreneurship Institute ranked Projeto Rios as a project of high potential for Social Entrepreneurship, thus contributing to ecological, economic and social sustainability.

Case 12: ColorAdd

ColorAdd – http://www.coloradd.net

ColorAdd created a new product to help colorblind people to "see" colors. This social innovation (inclusive design) meant to enhance quality of life of 350M people, contributing to economic and social sustainability. It consists of five simple symbols, representing the primary colors (blue-cyan; yellow, and red-magenta, plus black and white). The combination of these symbols allows new composed symbols that represent the secondary colors (green, orange, and purple). Adding a primary and a secondary symbol enables once more new composed symbols performing tertiary colors, and so on.

The creator and president of ColorAdd stated:

A social project like this has to be self-sustaining. It is the only way we can survive without running the risk of being subsidy-dependent. So, if there are a lot of people making money doing evil, it is also possible for people to earn money by doing good. To this end, we have created a company that works with two types of usage licensing (for a certain renewable or definite time frame) that guarantee revenue from property rights. This transfer involves some nuances to reinforce the social component: the value of the use licenses is indexed to the size and reality of the company, organization, municipality, etc.; we did not use any bank financing or venture capital companies; we are not held hostage by any government subsidies or similar; to be cheap; there is no exclusivity; it can be used without any financial contribution; to provide assistance in the implementation of the project to the partners; with an objective: universality that will ensure sustainability at all levels.

Thus, this social business model aims at this main objective: to be sustainable, independent, and available to all, allowing its utilization without conditions, avoiding the stigma of segregation and, at the same time, without any payment. They are also thinking to adapt this project to the blind and autistic people.

So, beyond economic value, this business generates psychological and social value to millions of colorblind that have problems of social inclusion.

He established collaboration with the Portuguese Education Ministry, so that students' exams can use the ColorAdd when the color is relevant to the correct interpretation of statements. Other collaborations are with EIDD (Design for All), Ageuk (England), Conade (Brazil) and, in Portugal, with AICEP (Foreigner Commerce), various State Departments, Portuguese Olympic Committee, Porto City Council, Equal Rights Commission, Institute for Social Entrepreneurship, St. John's Hospital (Manchester Triage), Hospital dos Capuchinhos, etc. and more than 200 companies and organizations.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Case 13: Ajudaris

Ajudaris – http://www.ajudaris.org

Ajudaris is a project of educational and citizenship nature. It wants to promote reading, writing, creativity, social sensitivity, and solidarity among children. The president said:

The innovative aspect is to provide every child with the possibility to be a co-author of a collective work, namely a perennial document that can mark the development of the child.

Each year Ajudaris indicates a theme of social context for schools (primary and pre-school) with which they establish cooperative protocols. This topic will be the subject of work in the classroom for all students, and the best texts will be selected by Ajudaris. Teachers from The Faculty of Arts and Humanities of Porto University do the revision of texts. Artists and illustrators (volunteers) also contribute to the making of the book. The company Bichinho da Conta, partner in the program, makes the graphical arrangements. The presentation of the book is done during a ceremony involving hundreds of people (teachers, students, families), where children are recognized as Authors.

The books are sold in the school community, having the students as their ambassadors. The result of this sale allows the economic sustainability of Ajudaris. They offer an economic value with the production and sale of the book, which has a positive psychological impact on children, in terms of learning and behavior, with positive social consequences in the community of families and in school.

DISCUSSION AND CONCLUSIONS

All the organizations present a strategic market orientation as a necessary condition to be successful serving the customers/users (Carvalho, 2005, 2009). After identifying a social need, each entrepreneur creates a solution to each problem through the launch of a startup or a new project. Therefore, they become social entrepreneurs because they aim, first, to respond to a social need or problem without distribution of profit. Their products or solutions (good, service, process or idea) become social innovations because they had success in the market or in the organization (Table 1).

In this context and aligned with the literature (e.g., Carvalho, 2016; Carvalho & Jonker, 2015; Carvalho & Sousa, 2015; Elkington, 1997), a new product value proposition must have four intentions: economic, to enable the offer and the transaction; social, related to the impact on the community; environmental, related to ecological issues; and psychological, related to a new state of mind and new behaviors that contributes to an individual transformation in relation to life and society.

Therefore, the success of these social entrepreneurs is related with the promotion of NBM based on new solutions, sharing resources among partners, and producing multiple value.

In terms of the types of value created by these organizations, all of them produce economic value (new products, services, ideas or processes with economic impact), psychological value (transformation in individual's mindset and behaviors, new knowledge, skills, experiences, empowerment), and social value (impact on society, relationships, quality of life, social inclusion). Ecological value only concerns four institutions (CrescerSer, SAOM, SCMP, and Projeto Rios), because they have activities of recycling and education for ecology and, in case of SCMP, because they have health care activities, managing hospitals.

Table 1. Social needs and social innovations

Organizations	Social Needs	Social Innovations
Socialis	Support to teenage mothers.	Life Support Center: improving household and maternal skills, professional orientation, and working with teenagers' families.
CrescerSer	Shelter to children and youngsters with family problems.	Temporary shelters with small population, avoiding traditional institutionalization.
Nomeiodonada	Support to children, who are in intensive care, and their parents.	Providing facilities, housing, food, and financial and counselling support.
SAOM	Social reintegration of adults in situations of extreme vulnerability, in particular homeless.	Promoting social reintegration through providing training in hospitality domains.
CVP Matosinhos	Emergency foster home for victims of domestic violence.	Providing temporary support to the victim in terms of shelter, psychological, legal, and social support.
SCMPorto	Better and more efficient management of social responses.	New management rules that allow the centralization of services, called Back-Office, which are spread over several areas within the organization.
Mundos de Vida	Better and more foster families to increase foster care in social intervention with vulnerable children and youngsters.	New private family recruitment model.
Percurso das Memórias	Lack of tourist projects involving the communities in the city of Porto, and the need to combat desertification of city center.	Promoting tourist activities with communities' collaboration.
SCMMaia	Children and youth at risk from 6 to 24 years in Maia.	Improving employability through training; preventing dropout and school failure; promoting entrepreneurship and self-employment; supporting artistic creativity and social activities like sports practice, dancing, and theatrical acting.
Coração da Cidade	Food support to pensioners, unemployed, and people who still have economic difficulties even while working (poor ashamed).	Supplying food with personalized attendance to take away.
Projeto Rios	Degradation of water lines and the lack of a public participation tool for the rehabilitation of rivers where the local community could be actively involved.	Promoting activities that allows efficient water use, monitoring of rivers, reduction of losses in the floods, rehabilitation of rivers, new uses, soil valorization, relationships, interpersonal communication, collective activities, education, respect and appreciation for environmental heritage, walks and advice on food, ecological integrity, clear margins, and biodiversity.
ColorAdd	How to make colorblind people "sees" colors?	Creation of 5 simple symbols that in themselves and by their combinations represent all the colors.
Ajudaris	Promotion of reading, writing, creativity, social sensitivity, and solidarity among children.	Providing a process that allows children to be coauthors of a book.

It is possible to verify a difference between for-profit sector and nonprofit sector, because NBM in the former appears to have less incidence of psychological value and more of ecological value (Carvalho et al., 2013). The products in the for-profit sector serve human needs and, to be successful, must satisfy the customers, however not always present a mindset or psychological value. In the other hand, current societies are more eager about environment, thus it is more frequent to see for-profit organizations proposing products with ecological value.

This new approach to a complex value proposition is conceptually related to a wider concept of sustainability. All the leaders of the organizations and projects interviewed mentioned, in one way or another, the importance to be economic (financial) sustainable, and to have a positive impact on what

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 1. Societal sustainability model

we call psychological sustainability. Some of them have ecological sustainability in mind, but all believe in their contribution to social sustainability.

Thus, it is possible to construct a model that represents the links among complementary aspects of sustainability (Graphic 1). In all situations, we defend that is preferable to have a value proposition with the all package of values – economic viability, ecological stewardship, social equity, and psychological balance – in order to achieve societal sustainability. This means that new products and NBM may contribute to a new and better state of mind, considering social and ecological aspects, in order to obtain economic gains in the for-profit sector; and, otherwise, in nonprofit sectors, to obtain social gains through a new mindset and new behaviors, considering ecological and economic issues. An innovative product or a social innovation happens when through an entrepreneurial action, the novelty has success in the market. If this occurs, then the new product or social innovation contributes to economic and/or social sustainability and, in many cases, also to ecological and/or psychological sustainability. And, all together, these are complementary pillars of societal sustainability.

There is also a significant and positive impact on regional and national development caused by entrepreneurship (e.g., Bianchi, 2010; Praag & Versloot, 2008; Wong, Ho, & Autio, 2009), social innovation and social entrepreneurship (e.g. Chell, Karatas-Ozkan, & Nicolopoulou 2007; Edwards-Schachter, Matti, & Alcántara, 2012; European Commission, 2013; Haugh 2007). The thirteen cases in Porto region presented in this chapter, demonstrate and reinforce the idea that social innovation and entrepreneurship are crucial to human and social development, as well as to societal sustainability, and so, their promotion can be a key factor to regional and national development policies.

FUTURE RESEARCH DIRECTIONS

It is needed a deeper research in the organizational domain, improving methodological approaches and experimental designs, in order to conceptualize and theorize what is happening in society, and what could be the better policies to enhance societal sustainability and development.

We need more research about what are the trigger factors to the success of social innovation (educational system, cultural values, political economy, economic development, support from the state and civil society, partnerships between sectors), besides the obvious ones like the presence of unmet needs, social

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

problems, and entrepreneurial people. Also, more longitudinal and experimental research is needed to validate causal-effect processes, and their relations with the increase of quality of life.

Social innovation is needed to fight all kind of discriminations in the domains of gender, age, religion, disability, sexual orientation, and ethnics. Social and individual problems related with ageing, urban life, education accessibility, multi-ethnical societies, chronic diseases, addictive behaviors, non-healthy alimentation, adulthood transition, criminal behaviors, rehabilitation of prisoners, compatibility between work and personal lives, quality of life, happiness, climate influence, etc. are still on today's agenda.

In Europe 2020 agenda there is a strategy that aims at a smart, sustainable and inclusive economy. Thus, there will be a long strand of research to access all the means used to achieve those goals, and to evaluate the outcomes of Europe's policies and programs, in particular those related with social innovation against poverty. European Commission (2013) propose some areas where it is important to support social innovation at regional level: preparation of a plan linked to the region's smart specialization strategy; supporting new organizations and adapting existing organizations; strengthening the market for social innovations and encouraging cross sectorial collaborations; supporting the innovators to get started and to grow and encouraging workplace innovation; investing in new financing models based in results; setting up better structures for measuring the results of social innovation; and promoting exchange and learning on approaches to social innovation across Europe.

In the United States, social problems remain the same, despite the programs designed to address each one, which are never enough and have a high rate of failure, reducing economic growth (Liebman, 2013). This shows that we can solve many individual problems with social products because they have psychological value, but in many cases, we fail solving them at social level. Liebman (2013) proposes a direct funding to increase social innovation made by government or philanthropic grant competitions and innovation funds. Governments should offer prizes for the development of social innovations, measure their effectiveness, and guarantee their acquisition. It is also important to measure the efficiency of the innovation process at regional and national level (Matei & Spircu, 2012). Thus, it is needed more research on effectiveness and efficiency of all social innovations to invest public and private funds wisely.

KEY TERMS AND DEFINITIONS

Business Model: Conceptual and operational tool that describes the value proposition (economic, social, ecological and psychological value) offered to the stakeholders through a product (good, service or idea), the organization and coordination of key activities (team and partners), and the design of a marketing plan, to deliver those values and achieve economic, social, ecological, and psychological sustainability.

Ecological Sustainability: Conservation of natural resources, environment and biodiversity.

Economic Sustainability: Financial equilibrium through an efficient use of resources, producing the products (goods, services, ideas) that satisfy the customers/clients/users and other stakeholders.

Entrepreneurial Partnerships: Collaboration between sectors (non-profit, business, government, academia, civil society) in order to promote innovation and new ventures.

Entrepreneurship: Creation of something (company, product, project), most of the times through an organization, in order to serve and satisfy human wants and needs.

Innovation: Generation of new ideas, processes, products or services that are successful in the market.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Psychological Sustainability: Mental well-being manifested by healthy behaviors and feelings of fulfilment and happiness.

Social Entrepreneurship: Creation of something (company, product, project), most of the times through an organization, to serve and satisfy human needs (social and psychological), where the promoter has the main purpose to contribute to the resolution of a social problem.

Social Innovation: Generation of new ideas, processes, products or services that are successful in the resolution of social issues.

Social Sustainability: Preservation of social cohesion in terms of social well-being, nutrition, shelter, health, education, justice, social equity, quality of life, etc.

Societal Sustainability: The outcome of the contributions of all complementary aspects of sustainability: economic viability, ecological stewardship, social equity, and psychological balance.

Value Proposition: The set of economic (economic value to the firm, to the customer and other stakeholders, and to society), social (economic externalities, health, security, quality of life, etc.), ecological (environmental concerns), and psychological (mental transformation, increased awareness of the subject, attitudinal change, knowledge creation, learning new skills) values that are provided by the product (good, service, idea) to the customer/client/user and other stakeholders.

Chapter 2
Social Innovation in the For-Profit Organization: The Case of Banca Prossima

Tindara Abbate
University of Messina, Italy

Angelo Presenza
University of Molise, Italy

Lorn Sheehan
Dalhousie University, Canada

ABSTRACT

Social entrepreneurship and social innovation are attracting increasing attention from policy makers, practitioners, as well as academics. They represent different ways of thinking and addressing social issues often overlooked by public/private organizations and also provide a viable means of responding to multiple social, economic and environmental crises. With this in mind, this chapter leads to a better understanding of social entrepreneurship and social innovation in the non-profit sector, using one specific case followed by a more generalized discussion. The case of "Banca Prossima" illustrates engagement in social problems and trying to find and apply new solutions that simultaneously meet a social need while also leading to new or improved capabilities and relationships and a better use of assets and resources.

INTRODUCTION

Social entrepreneurship has fast become a global phenomenon (Zietlow, 2002; Robinson et al., 2009), receiving increased attention from researchers (Doherty et al., 2014; Dees, 2012; Defourny and Nyssens, 2008; Haugh, 2007; Hockerts, 2006; Mair and Martí, 2006; Short et al., 2009), including identifying its relevant societal effects (Austin, 2006; Martin and Osberg, 2007) and moving towards the definition of innovative approaches and activities to solve certain social problems (Robinson et al., 2009).

Globalization of the social entrepreneurship phenomenon is strictly associated with the following key factors: wealth disparity at the global level; market, institutional and state failures; spread of the corporate social responsibility movement; technological developments and recognition of shared responsibilities (Zahra et al., 2008). Two additional reasons may further explain why social entrepreneurship has emerged so strongly in society. First, social entrepreneurship can help non-profit organizations define and work in innovative ways, improving efficiency in products/services and serving their communities better (Reis and Clohesy, 1999). Second, certain conditions are best served by alliances between corporate and non-profit organizations where cooperation can clearly produce a better quality of life (Jiao, 2011).

Intrinsically linked with social entrepreneurship is the concept of social innovation which refers to exploring and finding new products/services, new ways to meet social needs which are not satisfactorily met by the market or the public sector, or tackling societal challenges, empowering people and creating new social relationships and models of collaboration (European Union and The Young Foundation, 2010). These are contemplated as a major issue for the European Commission, and also considered an important opportunity to connect with citizens and to stimulate a better quality of life (Altuna et al., 2015). Consequently, the European Commission has committed to keep, define and develop the European Union social model (under a sustainable and inclusive growth agenda) to address major societal challenges through social innovation with the involvement and the collaboration of all social actors, including the public sector, large enterprises, small-medium enterprises, social economies, etc. (European Commission, 2010), utilizing the open innovation approach highlighted recently by Chesbrough (2003).

Beyond the role played by the European Union in social innovation and the emblematic cases of non-profit organizations and foundations created on an ad hoc basis, there is limited contribution from other actors, such as private sector firms. Additionally, in recent years the concept of social innovation is increasingly of interest to academics seeking to structure and to develop the field of social innovation in an appropriate way (i.e., Rüede and Lurtz, 2012; Howaldt and Schwarz, 2010; Zahra et al., 2009; Phills et al., 2008; Pol and Ville, 2009; Alvord, et al., 2004). But, the resultant empirical studies have mainly referred to cases dealing with not-for-profit organizations (Altuna et al., 2015). Relatively unexplored are other sectors and other actors involved in social innovation activities, which, better understood through empirical investigation, might lead to a better understanding of how they create, develop and launch social innovations.

To address this gap, the chapter presents and discusses a case study of Banca Prossima, a firm that is mainly involved in social innovation projects and initiatives. Banca Prossima is a for-profit independent bank within the Intesa Sanpaolo group which provides products and services to non-profit customer segments (such as social businesses, associations, foundations and religious organizations). The continuous commitment to, and focus on, social innovation activities makes this for-profit organization an ideal case for the exploratory purpose of this research. Additionally, this case represents an interesting example of a bank that has evolved its activities to ever more advanced financial services (Formisano et al., 2016), in response to the profound changes that have taken place in the last few years, such as globalization, technological innovation and increasingly demanding customers. In particular, banks are putting strategies in place to respond to increased competition and more sophisticated customer's needs (Formisano and Russo, 2011) and in doing so have begun to transition from a product orientation to a customer orientation, with the aim of better understanding and satisfying heterogeneous client needs.

In light of these trends, the chapter is structured into three sections. First, a brief review of the literature on social entrepreneurship and social innovation. Second, an analysis of the "Banca Prossima" case study, emphasizing the application of new solutions to social problems that simultaneously meet

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

a social need while also leading to new or improved organizational capabilities and relationships and better use of assets and resources. Finally, conclusions with managerial implications and suggestions for future research.

BACKGROUND

The Concept of Social Entrepreneurship

Although social entrepreneurship appears an inevitable response to complex societal needs and problems, a decade ago Roberts and Woods (2005, p. 45) observed that social entrepreneurship was at an "exciting stage of infancy, short on theory and definition but high on motivation and passion. The challenge for academia is to turn an inherently practitioner-led pursuit into a more rigorous and objective discipline". In this regard, various definitions of social entrepreneurship have been developed (Christie and Honig, 2006; Nicholls, 2006; Certo and Miller, 2008; Thompson, 2008), with some focusing mainly on its mission (Dees, 2001), its multiple dimensions (Mort et al., 2003) and its processes or mechanisms (Chell, 2007; Robert and Woods, 2005). However, a number of "conflicting tensions" regarding the definitional boundaries still remain (see table 1), such as the content and the dimensions of social enterprises (Dacin et al., 2011; Santos, 2012; Zahra et al., 2009), which fuel a relevant debate involving both academics and policy makers (Leadbeater, 2007).

Accordingly to Zahra et al. (2009, p. 522), social entrepreneurship "encompasses the activities and processes undertaken to discover, define, and exploit opportunities in order to enhance social wealth by creating new ventures or managing existing organizations in an innovative manner". Another useful conceptualization is offered by Peredo and McLean (2006, p. 64) who, after an examination of social entrepreneurship in its common use, suggest the following comprehensive definition: social entrepreneurship is exercised where some person (or group) (1) aims at creating social value, either exclusively or at least in some prominent way; (2) shows a capacity to recognize and take advantage of opportunities to create that value ('envision'); (3) employs innovation, ranging from outright invention to adapting someone else's novelty, in creating and/or distributing social value; (4) is willing to accept an above-

Table 1. The main tensions regarding the notion of Social Entrepreneurship

Is social entrepreneurship an individual or a collective phenomenon?	It appears that social entrepreneurship can be both an individual and a collective phenomenon.
Is social entrepreneurship shaped by social value rather than economic value?	The creation of social value is the essential feature of the initiatives, for the social entrepreneur's principal aim is to produce social change.
Is social entrepreneurship located only in the non-profit sector, or can it also be found in the for-profit and public sectors?	While many social entrepreneurship initiatives can be found in the non-profit sector, some social entrepreneurship "attitudes" also concern other sectors.
Does social entrepreneurship aim to achieve incremental social impacts, or is it meant to produce radical social transformations only?	It seems that if social entrepreneurship is a way to improve the quality of life of individuals and communities through social value creation and innovative paths, it is not essential to establish whether its impact has to be incremental or radical.
Is social entrepreneurship a local phenomenon or a global one?	While many initiatives happen at the local level, the impact and the repercussions that flow from that impact cannot be isolated, as there are ultimately global links.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

average degree of risk in creating and disseminating social value; and, (5) is unusually resourceful in being relatively undaunted by scarce assets in pursuing their social venture. From this perspective, social entrepreneurship seems to be one of the most deliberate, and potentially most effective, ways for social innovation to offer solutions to pressing social problems. This means that social enterprises seek to serve the community's interest (social, societal, and environmental objectives) rather than profit maximization.

This point is reinforced by Phills et al. (2008) who suggest that social entrepreneurs see new patterns and possibilities for innovation and are willing to bring these new ways of doing things to fruition even when established organizations are unwilling to try them. And enterprises are important because they deliver innovation. But ultimately, innovation is what creates social value. Innovation can emerge in places and from people outside of the scope of social entrepreneurship and social enterprise. In particular, large, established nonprofits, businesses, and even governments are producing social innovations.

As Phills et al. (2008) noted, the underlying objective of social entrepreneurs and social enterprises is mainly to create social value which entails the creation of benefits or reductions of costs for society – through efforts that address social needs and problems – in ways that go beyond the widely-held convictions of private gains and general benefits from market activity. In this respect, the European Commission perceives social enterprises as often having an innovative nature, through the goods or services they provide, and also through the operational or organizational methods they utilize, often employing society's most fragile (socially excluded) individuals (Pisano et al., 2015). In addition, Dees (2006) emphasizes that social entrepreneurs discover or create novel opportunities through processes of exploration, innovation, experimentation and resource mobilization, revealing an active, confused and highly decentralized learning process that is necessary if social innovations are to be practically discovered and implemented to solve social problems.

Social Innovation

The novelty of the concept and the heterogeneity of disciplines involved have led to the proliferation of various definitions of social innovation (Zapf, 1991; Alvord et al., 2004; Moulaert et al., 2005; Pol and Ville; 2009; Rüede and Lurtz, 2012), in an attempt to explain its different forms and practices (Howaldt and Schwarz, 2010). Phills et al. (2008) state that social innovation can be considered as follows: "a novel solution to a social problem that is more effective, efficient, sustainable or just than existing solutions, and for which the value created accrues primarily to society as a whole rather than private individuals. Alvord et al. (2004, p. 262) underline that social innovation can be defined as "innovative solutions to immediate social problems that mobilize ideas, capacities, resources, and social arrangements required for sustainable social transformations". Additionally, the Innovation Union Flagship describes social innovation as finding new ways of meeting social needs which are not adequately met by the market or the public sector or to tackle societal challenges, empowering people and creating new social relationships and models of collaboration (European Commission, 2010). Although, the project and initiatives of social innovation are generally encouraged by non-profit organizations and foundations, the European Commission (2012) states that social innovation can and must take place in all four sectors or as combination of them: (1) the non-profit sector; (2) the public sector (both in terms of policies and service models); (3) the private sector; and, (4) the informal sector.

As outlined by the European Commission, all actors and all regions should be involved in social innovation and there is actually an interesting sign that social innovations can increasingly be defined and developed by firms (European Commission, 2012, p. 29). In fact, the for-profit sector is increasingly

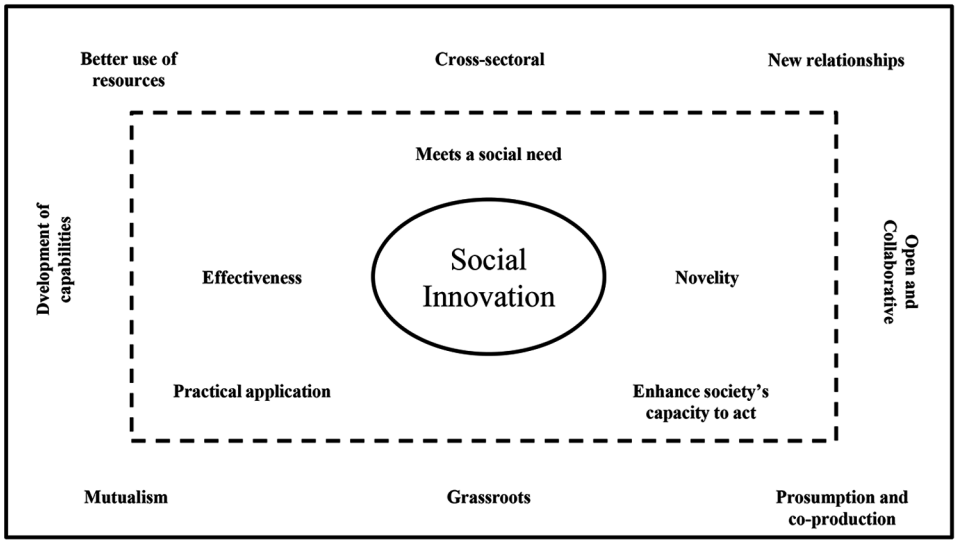
EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

showing concrete levels of social responsibility, a high level of social value creation and certain social entrepreneurship "attitudes" (OECD, 2010, p. 190) to develop and manage social innovation projects. Emblematic cases in this direction are the big companies like Apple, Siemens, Dell and others that may have created an environment of entrepreneurship or ancillary industries or processes to satisfy some social needs/problems of China (Salim Saji and Ellingstad, 2015).

Following a review of the literature, Caurlier-Grice et al. (2012) propose several common features and core elements of social innovation (see Figure 1). The core elements appear mainly necessary to define a social innovation, speaking to: novelty, where social innovation needs to be new in some way or applied in a new way; practical application, where social innovation has to address the practical application or implementation of a new idea financially sustainable in the medium- to long-term; meets a social need, explicitly considered as something that can cause serious harm or socially suffering when not met; effectiveness, implying that social innovation should be more effective by creating a measurable improvement in terms of outcomes from existing solutions; enhancement of society's capacity to act, determining new roles and relationships, developing assets and capabilities and/or better use of assets and resources. The main common features of social innovation are: cross-sectoral; grassroots and bottom-up; pro-sumption and co-production; mutualism; creation of new roles and relationships; better use of resources and assets; and development of assets and capabilities; and open and collaborative.

Regarding this last feature, it is interesting to note that social innovation seems to naturally reflect the open innovation principles (Chesbrough, 2003) because the development of successful social innovation projects/activities inevitably requires the involvement of different external actors, strongly committed to the social mission and social goals. In addition, social innovation activities need generally to create new social relationships or social collaborations (Murray et al., 2010). Similarly, open innovation is strongly focused on collaboration (Chesbrough et al., 2008), stressing opportunities to attract innovative ideas, exchange knowledge among different actors, and work together through open and collaborative networks in order to develop products/services (Chesbrough, 2003) or to solve problems. In fact, according to the principles of open innovation, an organization does not innovate in isolation, but rather by engag-

Figure 1. Common features and core elements of social innovation



EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

ing with different types of partners and acquiring ideas and resources from the external environment (Chesbrough, 2003).

With these definitional elements in mind, the chapter presents a case study that provides exploratory insights into the main characteristics and activities through which a for-profit organization can successfully define and develop social innovation involving particular segments of society (usually disadvantaged, marginalized or poor) and allowing all or part of the benefits derived by the innovation activity to accrue to that same segments of the society (Tan et al., 2005).

CASE STUDY

Banca Prossima: Overview

In 2007 Intesa SanPaolo emerged from the merger of Banca Intesa and Sanpaolo IMI. It has Italian leadership with context and a significant international presence focused on Central-Eastern European, Middle Eastern and North African Countries with approximately 1,200 branches and 8.1 million customers belonging to the Group's subsidiaries working in commercial banking in 12 countries (Intesa Sanpaolo, 2017). The bank is characterized by the Head Office Departments that consist of both the Corporate Social Responsibility (CSR) Department and the Bank and Society Laboratory (defined easily as "Laboratory"), which reflects the organizational structure oriented mainly to the definition and the development of social innovation projects and activities. Additionally, Banca dei Territori (the domestic commercial banking unit) is dedicated to retail customers, private customers and small-medium enterprises (SMEs). Within this division, there are different branches: Mediocredito (the bank oriented to SMEs activities), Banca Prossima (the independent bank dedicated completely to non-profit organizations) and other banks committed to specific client segments.

This chapter intends to focus on the case of Banca Prossima, which represents an emblematic experience of social entrepreneurship, operating in the not-for-profit sector, and of strong commitment and effort to generate new ideas and initiatives capable of transforming the economic, social and political context of marginalized groups and affect social change.

The mission of Banca Prossima is to meet and satisfy the needs and requirements of non-profit organizations (i.e., foundations, social businesses, associations and the religious world), by offering excellent products targeted to improving the quality of banking services and participating in the creation of social value. In this regard, it intends effectively "to support the best not-for-profit initiatives to spread culture diffusion and education, enjoyment and protection of the environment and art and to facilitate access to credit and to work" (Banca Prossima, 2017). In fact, as underlined by the CEO of Banca Prossima: "the decision to create a specialized bank to better serve the third sector is the result of the experience gained by the Laboratory in four years of collaboration with the non-profit. This is a project that affects the way we do business with a clientele usually neglected by banks, but that could soon take charge of many services no more supplied directly by the system of public welfare" (Altuna et al., 2015, p. 266).

Therefore, since its foundation, Banca Prossima has sought to ensure the highest level of service and ability to support the growth of the best initiatives, which are often limited and penalized by the conventional criteria of banking evaluation. To further this goal, it has revised the process of risk analysis by defining and adopting an innovative social enterprise rating model that integrates the traditional

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

methods of banking with specific metrics to evaluate the sustainability of clients that present peculiarities different from those of "privates" or "companies". In fact, this new ad hoc rating is not in contrast with the bank's traditional analytical methods, but it also contemplates some qualitative elements, such as fund raising abilities, critical success factors related to projects funded by the Public Administration and Foundations, and the percentage of orders derived from individual benefactors. Specifically, this model enables Banca Prossima to take the peculiarities of the non-profit organizations into account when evaluating its clients on matters of debt sustainability and social projects. Additionally, Banca Prossima has developed a special risk fund (Fund for the Development of the Social Enterprise) from the company's profits. As specified in the statute, 50 per cent of these profits (100 per cent for the first ten years since its foundation in 2007) have to be devoted to this fund, which intends to intervene in particularly risky areas, considered highly relevant in terms of the social value generated. This fund is not considered as part of the bank equity and it would be given to charity in the event of dissolution of the company.

For these reasons, Banca Prossima has been placed among the organizations and institutions which primarily serve the specific needs of social enterprises and businesses with social and environmental objectives within "The Open Book of Social Innovation".

Banca Prossima: Initiatives and Projects

As noted above, Banca Prossima works partially on its own and partially in collaboration with Intesa Sanpaolo on numerous projects (Table 2), fostering socially innovative activities through the involvement and participation of external partners making innovative use of their capabilities and competences. It stimulates the creation of inter-organizational relationships and strategic alliances, explores new opportunities to better use existing resources (i.e., knowledge and capital), and also aims to improve or to solve social problems (i.e., health-related problems).

In fact, the definition and the development of these innovative initiatives demonstrate the profound belief and the relevant work of Banca Prossima in support of social projects that are pursued for their social impact, independent of the profits they can generate, and in support of disadvantaged social groups in terms of resolutions of their problems Such projects and the groups they serve are usually excluded from receiving credit. In contrast to commercial entrepreneurs, these groups have several difficulties in accessing or finding financial resources for innovation, as well as in attracting potential investors, such

Table 2. Examples of social innovation projects

A scheme for advancing payments from the Campania Region to a consortium of non-profits that won a regional auction for provision of healthcare services to old and disadvantaged people. This can be considered one of the first such schemes in the South of Italy.
A nursery centre project run jointly with a consortium of "social co-operatives" that would train the childcare workers, guaranteeing quality standards. Banca Prossima grants loans with no personal guarantee required. The resulting network is currently one of the country's largest, servicing over 8 000 3-year-olds and employing over 2000 women
A project for setting up residences to host mentally disabled people who have outlived their parents.
A project to finance volunteer organizations, whereby Banca Prossima provides loans guaranteed up to 20% by means of a fund set up by local centres servicing volunteer organizations in Lombardy and a Foundation.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

as venture capitalists, to support social innovation because they are legally restricted from distributing profits and, consequently, are unable to offer financial returns (Austin et al., 2006).

In this regard, a significant initiative developed by Banca Prossima is "Terzo Valore", a free web-based platform which provides new resources to the Third Sector and, at the same time, permits any private citizen to select and fund a non-profit project, amongst those pre-screened by Banca Prossima, either through specific donations or loans without intermediation. This crowdfunding initiative is particularly innovative in Italy because citizens' loans between peers (as is the case for non-profit institutions) were previously problematic to implement from a legal viewpoint. In fact, P2P platforms emerged, but most shut down, so "Terzo Valore" created a viable way to serve the market. The "Terzo Valore" loans are capital-guaranteed by Banca Prossima (this was not standard in previous cases) and Banca Prossima supplies at least a third, and up to 100%, of the financing. Through "Terzo Valore", 23 projects have been financed in education, religion, social welfare and cultural areas, for a total of 4.21 million euros, at an average interest rate of less than 3% (Banca Prossima, 2017).

Another important initiative of Banca Prossima is the "Foundation for Innovation in the Third Sector" (Fondazione Fits2014, 2017). It is proposed as "an enterprise venture established by Banca Prossima in 2011 with the aim of creating social value, starting with the voluntary sector and with our sights set on the entire community" (Fondazione Fits2014, 2017). This foundation does not intend to offer subsidies but exists to "monitor new social needs, develop flexible service models to meet rapidly evolving social demands, disseminate best practice across the region to generate efficiency and economies of scale, and attract interest from new social investors for public and private entities" (Fondazione Fits2014, 2017). This is because the social system intensely supports defining and developing different innovative models able to support the sustainability of organisations by improving efficiency and using diverse financial tools to facilitate and strengthen links with private, public and social enterprise supporters. Therefore, the roles of researching, monitoring and "its accompanying social planning, promotion and development of network systems among third-sector players, synergy with commercial entities and government agencies, and innovative welfare models are the modus operandi for FITS!" (Fondazione Fits2014, 2017). From this perspective, it is clear that the foundation assumes a critical role of an "aggregator" in terms of suitable experience and a "catalyst" for skills and competencies. The main achievements of the Foundation are principally developed around the following important areas: energy, Europe, social project financing, skills workshops and corporate social responsibility (see Table 3). These activities are the result of intense and qualified research that identifies social needs by digging into different information sources. This preliminary and relevant phase is followed by the so-called design activities (Altuna et al., 2015, p. 266), during which the intervention model is concretely defined because, once the main objective is defined, it is necessary to determine where and how to change and innovate the process of credit provision. Finally, the process concludes with the identification of the project partners that should be engaged. In effect, all the activities are developed in collaboration with on average two or three partners with specific competences important to the social project; with the majority (around 80 per cent of them) coming from the third sector.

Similar to these innovative social initiatives, it is useful to consider other two different areas of activities. Firstly, Banca Prossima has developed a stakeholder communication strategy for the Third Sector, identifying and defining appropriate mechanisms, such as collaboration with a national non-profit association named Vobis (Volunteer Bank for Social Initiatives), to put its expertise service through mentoring at the disposal of citizen and non-profit applicants. Secondly, within its organization Banca Prossima has introduced the so-called "Head of Relationship" program in recognition of managers who

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Table 3. The principal activities of FITS!

Areas	Needs Analysis	Model of Intervention	Partners
Energy	Revising energy installations to reduce the waste associated with these activities and the cost savings; to support the development of renewable energy and to reduce the effects of pollution from fossil fuels. The need for access to qualified professionals to examine production systems and energy usage with low investment.	Analysis of energy efficiency needs for estates (i.e., offices, schools, sports facilities, etc.); Planning for installations required; Creation of Social Energy Service Companies; Use of financial mechanisms of the FITS! and Banca Prossima energy-efficiency programme.	FITS! Banca Prossima E.ON Connecting Energies (ECT)
Europe	There are 14.5 million people employed in the social economy in Europe (6.5% of the European Union population), but in relation to the major European economies, Italy has the highest number of employees as a percentage of the total economy (9.7%). The "Made in Italy" motto and the quality of life are rooted in the infrastructure of relationships and ties with the community. It is the share capital of the Italian territory that supplies production chains today, and without this it would be impossible to generate value. The presence and the widespread dissemination of non-profit organisations and social enterprises, even outside the national borders, therefore, becomes a major indicator of competition.	Participation in European tenders; Establishment of social enterprise networks, exploring market opportunities for social enterprises and/or members of these networks; Fostering synergies between companies and enterprises to generate economies of scale.	FITS! Banca Prossima
Social Project Financing	The current state of public finance in Italy, the demands from Europe and, in the case of municipalities, the obligations imposed by the Stability Pact, have induced legislators to introduce tools and mechanisms to engage private capital more effectively in the development of public works and public utilities.	Public-initiative financing and private-initiative financing. The public-initiative model of project financing requires a private institution (the promoter) to propose construction of a public utility work to the authorising government agency, where it is already included in its three-year schedule of work. Where it is not already included, but the authorising agency acknowledges the public utility of the scheme proposed by the private institution (the applicant), project financing is by private initiative.	FITS! provides access to its planning facilities and performs an advisory function. Banca Prossima: financial partner Companies and public institutions Private companies Joint stock companies with majority public holding Joint stock companies with majority private holding
Skills Workshop	Non-profit organisations have invested in training to strengthen the skills of their workforce and management. Priority training objectives: development of vocational skills for workers and managerial skills of corporate heads	Focus groups to identify training needs to inform training programmes that will be made available to organisations and institutions in the voluntary sector.	FITS! Intesa Sanpaolo Formazione
Corporate Social Responsibility	Company focus on corporate social responsibility has increased significantly in Italy. Social responsibility plays an important role in internal and external business communications and in positioning the company image, especially in the context of the territory and the sector in which it operates. The need arises to devise models of intervention that are oriented towards a new way of promoting company policies and increasing their social impact on the territory and on the community.	Implementation of initiatives in support of community welfare to selected corporate clients, to enhance their CSR policies.	FITS! Companies: Vodafone Foundation, Peppino Vismara Foundation, L'Oreal, E.ON Connecting Energies Srl Intesa SanPaolo Banca Prossima

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

distinguish themselves through their professional skills in managing relationships, not only with Third Sector clients but in their private life through their engagement in volunteer-related activities. These managers receive refresher courses and training to help them identify core decision making needed to understand both the process and areas of inter-organizational conflicts, and ultimately to pinpoint the most suitable solution for even the most complex problems.

SOLUTIONS AND RECOMMENDATIONS

As highlighted by the literature review and the case study 'Banca Prossima', the term "social entrepreneurship" is used to refer to the rapidly growing number of organizations that have created models for efficiently catering to basic human needs that existing markets and institutions have failed to satisfy. Social entrepreneurs solve several societal issues because they combine the resourcefulness of traditional entrepreneurship with a mission to change society. A few recommendations are key to support the growing number of social innovation initiatives across the globe. The most important concerns improving the capacity of social entrepreneurs to effectively apply open innovation principles (Chesbrough, 2003). Additionally, social innovation projects or activities inevitably require the involvement of different external actors, strongly committed to the social mission and social goals being pursued. This means that social entrepreneurs must be also comfortable and adept with concepts such as informal organization, trust, culture, social support, social exchange, social resources, embeddedness, relational contracts, social networks, and interfirm networks. All of these fall under the "umbrella concept" of social capital (Hirsch and Levin, 1999). This means that social entrepreneurs should take care to develop interpersonal trust and meet social expectations. The ultimate goal is to create value in their social innovation network by bonding similar people and bridging diverse perspectives.

FUTURE RESEARCH DIRECTIONS

Future research could include gathering additional empirical evidence, beyond this case study, on social innovation in for-profit organizations. Other sectors, beyond banking and financial services, with their own set of specific dynamics might also be investigated. It would be useful to understand the main motivations that stimulate these organizations to develop social innovation projects and the existence of any contextual factors that can affect the success of this kind of innovation.

CONCLUSION

This chapter contributes a focus on how for-profit organizations can develop, organize and deliver successful social innovation projects and initiatives. At the broadest level, it adds new insights to scholarly research focused on a relevant, although underdeveloped topic, namely the definition and implementation of social innovation in for-profit organizations. More specifically, the case study emphasizes that these organizations need to develop a set of resources and specific competencies to facilitate social innovation projects, such as the knowledge of societal needs of particular disadvantaged groups as well as the competences needed to define an appropriate model of intervention. For-profit organizations can help

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

to solve social problems using their business competencies and resources, and through partnerships with government, create and maintain suitable relationships and collaborations with them in order to effectively solve community problems and social issues. Intrinsically linked with this, is the opportunity and necessity for these organizations to develop and implement an open business model (Chesbrough, 2003) that clearly fosters the involvement and participation of external stakeholders in their internal activities and processes.

The case study presented here provides some interesting suggestions to managers working in firms that are willing to develop products or services motivated by the goal of meeting a social need. They are shown to be able to solve social problems with innovative solutions that contribute to the creation of social value while also creating firm level profits. With the notion of a social mission, they have to select and adopt an appropriate approach to explore social value-opportunities and to administer their social innovation projects, in a way that overcomes organizational rigidities while acquiring the critical competencies for social innovation that for-profit organizations typically lack. These implications are highly relevant to achieving positive societal effects. Although social innovation is usually considered the principal domain of non-profit organizations, encouraging a superior engagement of for-profit organizations in this type of innovation activity represents a key opportunity for the generation of several benefits for society.

KEY TERMS AND DEFINITIONS

Banca Prossima: It represents a relevant example of social entrepreneurship, whereby a for-profit organization (in this case a bank) also operates in the not-for-profit sector. It has a strong commitment to generating ideas and initiatives capable of improving the economic, social and political situation of marginalized groups and affect social change.

Open Innovation: Is a paradigm that assumes that firms can access and absorb external ideas as well as internal ideas, and internal and external paths to market, as they seek to advance their technology. More recently it has been described as distributed innovation process based on purposively managed knowledge flows across organizational boundaries.

Social Capital: Broadly refers to the resources accumulated through the relationships among people.

Social Entrepreneurship: Encompasses the activities and processes undertaken to discover, define, develop, and exploit opportunities in order to improve social wealth by creating new ventures or managing existing organizations in an innovative manner.

Social Innovation: New ways of meeting social needs which are not adequately met by the market or the public sector or to tackle societal challenges, empowering people and creating new social relationships and models of collaboration.

Chapter 3
The Role of Social Entrepreneurship and Social Economy in Romanian Sustainable Business Development:
Social Entrepreneurship and Social Economy

Rodica Gherghina
The Bucharest University of Economic Studies, Romania

Ioana Duca
Titu Maiorescu University, Romania

ABSTRACT

In their scientific endeavour, the authors aim at analysing the concepts of social entrepreneurship and social economy, as well as emphasising the role these concepts play in sustainable business development and in the economic development of society as a whole. At the same time, several aspects of social enterprises are presented and their importance in the Romanian economic environment is emphasised. As these are two relatively new concepts in the social economy in Romania, the authors refer to the specialised literature throughout their research. The authors present several of the opportunities and challenges raised by social economy. The importance of financing is emphasised by means of presenting the organisations' financing sources which are specific to social economy. The conclusions to this research include some of the authors' own viewpoints, with reference to the aspects of social entrepreneurship – social enterprises – social economy and their role in overall economic development.

INTRODUCTION

In the modern society, where the market cannot solve economic problems entirely, and the available measures and means are not always efficient, especially in terms of solving the social problems that all world countries are facing, it is necessary to involve the main "actors" in setting up some forms of organisation so as to attract resources and also to establish an interaction among people in order to build sustainable business with the aim of developing the communities they belong to and the overall economy. In this context, setting up and developing a business of the social enterprise type may become a challenge to any entrepreneur, in response to a social or economic need of those setting it up, needs which the public sector and the market economy sector do not succeed in meeting.

All the more so as, in any economy, the central role is played by entrepreneurs and the authors state that social economy cannot exist without social entrepreneurs, but at the same time, neither can there be social entrepreneurs that do not participate in the process of creating the social economy. Thus, a change in paradigm is underway at macroeconomic level through the emergence of a new type of economy, called social economy, which is based on people, and simultaneously of a new type of entrepreneurship, namely social entrepreneurship.

In this context, social entrepreneurship may contribute to increasing social inclusion, creating employment, involving persons that belong to underserved groups into economic activities and facilitating their access to social resources and services.

Throughout the research, the authors emphasise the major role played by social entrepreneurship and social economy in sustainable business development at emerging economies level.

For this reason, the structure of the research paper includes a synthesis of the specialised literature related to defining the concepts and, at the same time, to the importance of approaching these concepts in the economic development process. Along the research paper, the authors present a series of differences between the social enterprise and the private enterprise, the types of indicators measuring the impact of the activity performed by social enterprises and, at the same time, their effects on the local development process triggered by the characteristics of such entities. Then, the authors present the concept of social economy in Romania, which is relatively new in the Romanian economy, being enacted by Law 219/2015. Then, some of the social economy opportunities and challenges in the Romanian socio-economic environment are presented. Also, the types of social economy entities acknowledged at regulatory documents level are presented. The financing sources are also presented in the scientific endeavour, as they are of major importance in the activity performed by the organisations that constitute the social economy.

It is mentioned that, in the future, new means of financing must be identified to replace the traditional ones, and performance-based employment policies must be pursued. Also, the authors must consider stimulating performance by means of material rewards, benefits that change the attitude to the organisation entirely and the operative commitment to achieving social objectives.

The authors' scientific endeavour conclusions are presented at the end of the research paper.

DEFINITION OF THE SOCIAL ENTREPRENEURSHIP CONCEPT AND ITS IMPORTANCE

In time, economy specialists defined various concepts of social entrepreneurship and the tools it works with, of social enterprises type.

The aim of social entrepreneurship is to solve certain social problems and to increase the employment level of persons belonging to underserved groups.

Among the objectives of social entrepreneurship, there are: producing goods and/or providing services that contribute to the welfare of the community or of its members; mainly promoting certain activities that can jobs so as to employ persons belonging to underserved groups; developing efficient training programmes dedicated to persons in underserved groups; developing social services in order to increase the capacity to enter the labour market in the case of persons belonging to underserved groups; involving individual persons in the sustainable development of local communities; developing an inclusive society as well as social responsibility; taking the focus away from social security and promoting social inclusion practices, thus turning underserved persons from consumers of resource into generators of value.

Next, the authors will detail the three concepts which begin to settle in and develop more and more in the Romanian society as well, triggering benefits and contributing on the long term to a decrease in poverty, an alarming phenomenon taking an upward trend recently in Romania.

In order to make a logical presentation of the three concepts, the authors start by emphasising the concept of social entrepreneurship analysed in time by a series of specialists in the field of economics.

The concept of social entrepreneurship is quite famous in the USA and Western European countries, but lately it has become more and more widespread in Eastern Europe, as it is the case in Romania.

The approach to social entrepreneurship, which is widespread in the Romanian environment as well lately, is that social entrepreneurship uses business principles, entrepreneurial and managerial skills in order to solve social problems. In this context, social entrepreneurship targets a social goal by using commercial, entrepreneurial and managerial means. Besides, social entrepreneurship is the means by which it is attempted to bridge the gaps between the business and the social sector.

Mainly in the past few years, social entrepreneurship has become important both to NGOs and to the entrepreneurial environment, due to causes generated by the economic recessions which led to an increase in the population's level of poverty and to a rise in unemployment.

As compared to traditional entrepreneurship, the social entrepreneurs' approach is different, they take into account generating "social value", rather than profits, so that their efforts aim at decreasing poverty on the long term.

Besides, most social enterprise definitions in popular discourse, as well as in the specialized literature, focus mainly on social entrepreneurship within the non-profit and business sectors.

In the authors' approach (Kostetska & Berezyak, 2014), "social entrepreneurship generates the prerequisites for obtaining resources by providing a better future not only to socially vulnerable groups, but also to society as a whole."

Other authors emphasise the fact that social entrepreneurship "provides the means that facilitate social inclusion and the creation of human, economic and political capital among the beneficiaries" (K'nIfe & Haughton, 2013).

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

The argument that "social entrepreneurship creates economic and social capital," is supported by Jain (2012) in one of his papers.

In the authors' opinion (Dees & Anderson, 2003), "social entrepreneurship is an innovation also because the term profit had a negative connotation in the NGO environment." It is otherwise well-known that "non-profit organisations are taking over more and more strategies, concepts and practices from the business world."

Noruzi, Westover and Rahimi (2010) focus on the social problem, which, in their opinion, "is the main reason for social entrepreneurship." In another approach (Kickul & Lyons, 2012), the main difference between commercial and social entrepreneurship is that "social entrepreneurship focuses on achieving the social mission, while commercial entrepreneurship focuses on profits for the enterprise owners. Thus, the former type benefits the stakeholders, while the latter benefits the shareholders."

In a different interpretation, social entrepreneurship is the basis for a social entrepreneur's activity, which generates profit and whose purpose is to support social issues. But, in addition to non-profit organisations, social entrepreneurship includes "activities whose purpose is to yield profit, such as banks acting for the development of the community and organisations that combine items specific to the business and non-profit sectors" (Orhei, 2007).

Other authors (Hibbert, Hogg & Quinn, 2002), point out that "social entrepreneurship is to employ social entrepreneurial behaviour in order to use the profits that are generated to the benefit of an underserved group."

The authors place great value on the opinions and approaches of the cited authors, but among the most thorough and explanatory definitions of social entrepreneurship is provided by Dees (1998b), who refers to "a combination emphasising discipline and responsibility, with the concepts of generating value taken from Say, those of innovation and vectors of change taken from Schumpeter, those of taking the opportunity from Drucker, and those of inventiveness from Stevenson."

Based on these statements, it may be emphasised that social entrepreneurs play the role of change agents in the social sector by means of: taking on the mission to create and support a social value, acknowledging and pursuing new opportunities to support that mission, committing to a process of continuous innovation, adjustment and learning, taking action bravely and with increased responsibility for the outcome.

In a different approach, (Kostetska & Berezyak, 2014), "social entrepreneurship may be considered a response to social issues: unemployment, poverty, community fragmentation," etc. Its aim is to solve or alleviate the problems of the underserved populations by increasing their financial autonomy, innovation and independence. In this approach, social entrepreneurship may be seen as a combination between the social and commercial mission, so that, in order to solve a specific social problem, social entrepreneurs draw in resources so as to achieve their mission, to obtain revenues from these activities. Moreover, "social entrepreneurship may be a mix of charity and business aimed at solving social problems, therefore it takes it social purpose from charity and the entrepreneurial approach from business." The ones called social entrepreneurs take innovative, unusual approaches to the standard solutions to complex social problems, such as: decrease in poverty, energy conservations, environment protection, education, healthcare, etc.

In the specialised literature, a comprehensive definition is given by Peredo and McLean (2006). In their opinion, social entrepreneurship is in place if

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

one or more persons aim at creating social values of a certain type, and pursue this objective by means of acknowledging and taking the opportunities to create this value, using innovation in order to achieve this social value, tolerating above-average risk in creating and disseminating social value and, at the same time, refusing to accept boundaries to available resources.

Certo and Miller (2008), argue that

social entrepreneurship is nothing more than a sub-type within the field of entrepreneurship, and social value is of key importance, followed by the shareholders' personal wealth.

In the authors' opinion (Kostetska & Berezyak, 2014) introducing social entrepreneurship

becomes one of the ways to solve critical social problems, and developing it aims at harmonising social and commercial concerns, the mechanism to include representatives of the economically active population in productive work.

In another approach, social entrepreneurship includes a wide range of personal initiatives, organisational social trends and structures (Roper & Cheney, 2005).

Fowler (2000), emphasised social entrepreneurship as being

a complex product with three categories of entrepreneurial social activities: integrated social entrepreneurship, reinterpretation and complementary social entrepreneurial spirit.

Sud, VanSandt and Baugous (2009), reckon that

social entrepreneurship cannot be reasonably expected to solve wide-ranging social problems for a variety of reasons. They labelled the reasons as follows: legitimacy-related organisational pressures, isomorph pressures, political pressures, structural pressures and moral pressures.

Other authors (Durieux & Stebbins, 2001) define social entrepreneurship as

the activity whereby it is meant to solve a social problem.

Certain specialists (Urbano, Toledano & Soriano, 2010) investigated social entrepreneurship from an institutional perspective. They examined the institutional factors and "emphasised that these influence the emergence and implementation of social entrepreneurship."

Yet, other approaches indicate that social entrepreneurship is a type of entrepreneurship in which the established "social enterprise" aims at solving certain social problems and considers profit reinvestment as being foremost. The core of social entrepreneurship is attempting to improve living conditions and providing opportunities to underserved persons or to those who are among vulnerable categories.

Social entrepreneurship may also be defined as the art of setting up businesses in order to obtain benefits for the underserved population, in order to solve social, cultural or environment protection issues.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Starting from the experience of developed countries in this field, the authors define the concept as the entrepreneurs' capacity to build, to develop social businesses in order to integrate underserved persons and decrease unemployment, with positive effects on developing the community they are part of.

Yet, more and more authors approach social entrepreneurship in terms of social entrepreneurs.

In the authors' opinion (Thompson, Alvy & Lees 2000), social entrepreneurs are people who know how to adjust their opportunities so as to meet a need and who gather the necessary resources and use them in order to be differentiated from the public system.

Other authors (Tan, Williams & Tan, 2005) list a few characteristics of a social entrepreneur, "a social entrepreneur is a person who takes innovative risks and earns profit for the society."

Social entrepreneurs want to draw in resources for the sake of the social good rather than for financial return (Dal Forno & Merlone, 2009).

Brinckerhoff (2000), specifies that

social entrepreneurs are persons who take risks in the name of their people and serve the organisations.

A social entrepreneur is "a pioneer, with a new and strong idea, who combines in a visionary manner the real world with resolving creativity problems, who has a strong ethical structure and a vision for change" (Bornstein, 1998).

Drucker (1985), reckons that social entrepreneurs "change the society's capacity for performance," while Schuyler (1998) calls them "persons who have a vision for change." Both definitions communicate the following: social entrepreneurs are a society's vectors of change, but their change is mainly in compliance with social needs, not necessarily with market requirements.

Leadbeater (1997), argues that "social entrepreneurs are considered small amounts of resources which meet social needs. He indicates the types of social entrepreneurship sources in the economic activity (public, private and voluntary)."

The social entrepreneur is a member of the civil society who uses the business he develops so that it will have a social impact. Sometimes, the concept of social entrepreneur is also used with the meaning of social innovator–the person who solves an important social problem in a highly efficient or innovative manner.

DEFINING THE CONCEPT OF SOCIAL ENTERPRISE AND ITS IMPORTANCE AT COMMUNITY LEVEL

The importance of social enterprises at community level is higher and higher due to the fact that they participate in creating sustainable businesses and also in economic development. As a matter of fact, social enterprises may be considered the result of implementing social entrepreneurship.

At the same time, social enterprises support the accumulation of social and human capital at local level and create the favourable context which allows the use of these capitals as resources in the economic development process.

In the authors' opinion (Borzaga & Defourny, 2001), the social enterprise is defined as being and "organisation in which the main objective is to ensure/provide community welfare, created upon the initiative of a group of persons and where the material interests of those who invested capital are limited." The social enterprise operates as an independent organisation which takes "economic risks derived from

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

the economic activity it performs," and it involves various persons that are interested in the community and in managing it.

In a different approach, social enterprises are "new types of businesses which are based on an entrepreneurial approach to the activities, associated with a clear social mission" (European Union & Organisation for Economic Co-operation and Development [OECD], 2015).

Social enterprises are relevant actors in the social innovation process by means of the goods and services they produce and especially through the effects these trigger on the entire local development process (Borzaga & Tortia, 2009).

Social enterprises are part of the "economic structure both of the nation and of the local communities" (Anheier, 2005).

The social enterprise is also represented by a new entrepreneurial type in which the social objective is combined with economic efficiency, based on the current socio-economic status quo in which the transition from "the classic economic value to a new concept called distributed value" is performed (Barna, 2014).

The social enterprise in Romania is defined "as any privately-owned legal entity which performs activities in the field of social economy, which holds a social enterprise certificate and observes the principles stipulated" in the law (Law 219/2015).

For the Romania economy, this is a new type and, at the same time, an old type of business which, mostly recently, has been encouraged to develop through the use of local (human and material) resources in order to develop the overall community.

Yet, the authors must consider the fact that the social purpose of such businesses is to decrease the negative effects of the development process at community level and, also, to provide support to persons in marginalised groups by means of providing services or integrating them in the labour market and in various activities being performed. In this context, social entrepreneurship may be an important step in local development, as it reduces the marginal costs of the process and allows the social integration of such persons by using the resources they have.

As a matter of fact, social entrepreneurship is the type in which the established social enterprise is oriented towards solving a social problem and not towards gaining profit. In this context, the obtained revenues are a way to ensure the social enterprise's financial autonomy.

Social enterprises participate in developing community businesses and yield benefits acknowledged by the community members. The development of sustainable businesses at community level aims at stimulating the local economy development by means of having local employers use the resources available in the area, by decreasing poverty through the creation of jobs and diminishing unemployment at local level, by achieving social inclusion as far as the vulnerable groups are concerned, by participating in the development of socio-cultural capital at community level, and last but not least by protecting the environment.

But, at the same time, social enterprises have effects on the local development process due to the characteristics of these entities, with advantages as compared to other actors: the social purpose, the limited allocation of profits, democratic governance, autonomy.

Among these advantages, two may be presented as key ones: achieving the social, cultural, environment protection objectives and gaining revenues in order to achieve the objectives.

If we take into account that a social enterprise plays the role of an economic agent, then it produces goods and services which it puts on the market, and, at the same time, it redirects its surplus to the achievement of social, cultural or environment protection goals.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Table 1. Differences between the social enterprise and the private entity

	Social Enterprise	Private Entity
Main objective	• Participating in the process of producing goods and services in order to meet the community's collective needs and to achieve its members' welfare.	• Gaining profit for shareholders.
Management	• Consulting all those involved in making decisions takes time.	• Reducing the time for decision-making, as decisions are made by the manager.
Right to vote	• Control is exerted equally regardless of the number of shareholders, based on the *one person and one vote* principle.	• It depends on the number of shareholders and on the number of shares, so that the shareholder with the largest number of shares is the one that controls the decisions.
Investment pay-back	• Those who invest, the shareholders, do not focus on investment pay-back because they are the ones benefiting from the goods or services being produced. • By leaving the social enterprise, they are provided only with the amount they invested.	• The shareholder will be paid the initial investment according to its commercial value at the time the shareholder withdraws from the economic entity. • Initial investment pay-back by means of incorporating dividends is foremost.
Profit allocation	• Profit allocation is done according to the activity being performed in the social enterprise, not according to the equity owned by shareholders	• Profit allocation is done by distributing dividends to shareholders according to the equity each of them has.
Beneficiaries	• The community's or the citizens' needs are envisaged.	• Clients are envisaged.
Enforcing the legislation specific to the field	• The legislation in the field is enforced and observed by the social enterprise.	• The legislation in the field is enforced and observed by the private entity.

Background and Common Denominators, *Unit of Economics Working Papers 2002*/4, http://uwcc.wisc.edu/info/intl/chloupkova.pdf

In Table 1, the authors present the main differences between the social enterprise and an economic agent, so as to support the previously-listed arguments.

On the other hand, social enterprises contribute to the consistent and sustainable development in consumption, provide access to quality social services to underserved groups, and, at the same time, contribute to the reorganisation of the most important sectors in the social field.

The result of social enterprises is a social one. Social enterprises promote aspects such as healthcare, welfare, etc. The main resources are "social capital forms based on relationships, networks, confidence and cooperation, providing at the same time access to financial and physical capital" (Leadbeater, 1997).

As the economic activity of a private entity is measured by means of economic indicators, similarly, in social enterprises a series of indicators are identified, which can measure the impact of their activity (Table 2).

The welfare of the employees in social enterprises and at the same time of the communities they are part of is one of the concerns each social entrepreneur should have in mind. Based on what has been presented so far, the authors can state that the success of social enterprises depends firstly on the companies' desire to contribute to developing this direction and, at the same time, social enterprises should prove social responsibility and, what is more important, invest in this segment. Also, the state, in its turn, should pay special attention to developing social entrepreneurship, create the legal and fiscal premises for its development, implement the most favourable forms of interaction with the civil soci-

Table 2. Types of indicators measuring the impact of the social enterprise's activity

Types of Indicators	Impact at Social Enterprise Level
• The number of those earning this type of salary (minimum salary inflation / standard of living cost).	• The amount of revenue earned by the staff with low income at a decent standard of living.
• X,Y,Y skills developed by the employee on the job and which apply to P, Q, R jobs.	• Technical skills which can be transferable and operational ones which can be learnt.
• Increase in efficiency at work.	• Acquired computer skills.
• Amount of accumulated goods (bank deposits, shares, real estate etc.).	• Accumulating wealth.
• Total number of tax payers and amount of collected taxes.	• Increase in taxes as a result of employment
• The individuals' purchasing power.	• Increase in prosperity at community level as a result of economic development.
• Number of buildings purchased or built.	• Increase in economic security by means of owning the real estate.
• Net income per capita.	• Increase in income per capita.
• The total number of products manufactured by means of streamlining the activity.	• Increase in product quality and increase in competitiveness by comparison with the products of other social enterprises of the same type.
• The number of products delivered according to the increase in demand.	• Increase in the social enterprise's performance as a result of the increase in demand.

Source: processing from Orhei, E., L. (2007).

ety's organisations and create an institutional environment that facilitates setting up social enterprises (Kostetska & Berezyak, 2014).

In this context, a change in paradigm is anticipated at macroeconomic level and may speak now of a "new type of economy – social economy, an economy based on people" (Stanescu, 2013).

SOCIAL ECONOMY: OPPORTUNITIES AND CHALLENGES FOR THE ROMANIAN SOCIO-ECONOMIC ENVIRONMENT

Lately, social economy has been one of the solutions for economic development in many countries, due to the fact that it has created an increasing number of jobs. It has consolidated its position as alternative form in economic development which is based on values and principles that are different from those of the market economy. Social economy approaches "a new way to develop sustainable businesses which are based on social equity principles, social responsibility and transparency, thus encouraging a democratic participation when decisions are made" (Barna, Institute for Social Economy & Foundation for the Development of Civil Society, 2014). As a matter of fact, the changes caused by the economic crisis have also led to identifying other forms of organisation and to increasing interest in social economy. The way to perceive the opportunities that appeared in the field of social economy was capitalised on by ever more entrepreneurs. In this context, interest in social economy increased due "both to acknowledging the limits of the traditional public and private sectors in terms of meeting the current challenges on the labour market, and to the quality and amount of services of collective interest" (European Parliament, 2009). At the same time, social economy demonstrated adjustment to the new economic changes, by means of

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

creating new types of intervention aimed at meeting economy requirements and thus at increasing the process of active inclusion of the beneficiaries. Among these new types of intervention, the authors mention the public-private partnership, which targets the implementation of new social economy initiatives by NGOs, based on support from the state, but to a larger extent via local authorities.

In time, social economy was defined as "including non-profit organisations, cooperatives and other private types of associated enterprises, or it was used as synonymous with social enterprises" (Defourny & Nyssens, 2001). Social Economy includes "cooperatives, mutual societies and associations (more and more non-profit organisations) emphasising the characteristics of these organisations' mission, especially in order to be rather beneficial to their members, or the community, than to generate profit for investors" (United Nations Development Programme & European Research Network, 2008).

In Romania, the concept of social economy is relatively new, that is why opportunities and challenges for the Romanian social economy are the focus for the authors of this research.

In this context, the debates in the past few years on the national social policy have aimed at finding innovative solutions, yet adapted to the needs of vulnerable groups, in order to decrease multiple social exclusion. Thus, to Romania, it has become a strategic priority to develop the social economy which will ensure the employment level of underserved persons. In 2010, promotional actions such as "European year for the fight against poverty" aimed at taking several actions in order to raise public awareness and promote active social inclusion. (European Commission, 2008).

Subsequently, in the Romanian legislation, the concept of Social Economy is first mentioned in the GD 829/2002 regarding the approval of the National anti-poverty and social inclusion promotion plan. Thus, in the law, as subsequently amended and supplemented, strategic objectives on the medium and long term (2002-2012) and on the short term (2002-2004) are defined. Social economy is mentioned among the medium and long-term objectives as "one of the principles targeting the creation of an inclusive society" (GD 829/2002). In the following interval, up to the year 2008, there is no further reference in the documents with an important role in promoting social economy.

Then, in September 2008, once the Romanian state made clear commitments to developing this sector in Romania, social economy was brought back to the fore. At this time, Romania's Government approved and sent to the European Commission the Strategic National Report on Social Protection and Social Inclusions (RNS PSIS), whereby it is stated that "the development of the sector regarding Social Economy may be the first step for an efficient and dynamic economy to interact with one based on social justice" (Ministry of Labour, Family and Social Protection [MMFPS],2008).

After 2008, the concept of social economy receives a new definition due to its being included as eligible domain for projects with European funding.

Thus, it was mandatory to supplement the legal provisions in force, so that the definition of social economy should be extended to other types as well, in addition to those that contribute directly to social inclusion.

In this context, in 2015, Romania's Parliament passed Law no. 219 regarding Social Economy, whose purpose was to stimulate the development of an alternative model for the social inclusion of vulnerable groups.

According to the Law – Social Economy represents

all the activities organised independently from the public sector, whose aim is to serve the general interest, the interests of a group and/or non-patrimonial personal interests, by means of increasing the level

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

of employment for persons belonging to the vulnerable group and/or producing and supplying goods, providing services and/or performing work.

At the same time, social economy is based on "private, voluntary and solidary initiative, with a high degree of autonomy and responsibility, as well as limited profit distribution to shareholders" (Law 219/2015).

Moreover, social economy plays a key role in the European economy, making a sustainable connection between profitability and solidarity, it creates jobs, contributes to social, economic and regional cohesion, generates social capital, promotes active citizenship, gives priority to individuals and takes into account the development of sustainable businesses which lead to economic development and it also creates the premises for social, technological and environment innovation.

Social economy provides an alternative model for the social inclusion of vulnerable groups, it represents a different way of performing social inclusion and reintegration through economic development (Barna, Institute for Social Economy & Foundation for the Development of Civil Society, 2014). At the same time, social economy is an alternative business model, based on the principles of equity, responsibility and transparency, whereby the participation of all relevant actors in the decision-making process is encouraged (vulnerable groups, employable persons who benefit from social security services, unemployed persons, local authorities, non-governmental organisations, etc.).

In Romania, beginning with 2015, as soon as the Social Economy law entered into force, the following entities are acknowledged by law (Law 219/2015):

- Cooperative companies of degree I, which perform their activity in compliance with Law no. 1/2005 regarding the organisation and operation of cooperatives, as it was republished;
- Credit cooperatives, which perform their activity in compliance with the Government Emergency Ordinance no. 99/2006 regarding credit institutions and capital adequacy, approved with amendments and supplements by Law no. 227/2007, with subsequent amendments and supplements;
- Associations and funds, which perform their activity in compliance with the Government Ordinance no. 26/2000 regarding associations and funds, approved with amendments and supplements by Law no. 246/2005, with subsequent amendments and supplements;
- Employees' mutual aid funds, which perform their activity in compliance with Law no. 122/1996 regarding the legal status of employees' mutual aid funds and of the employees' unions, as it was republished;
- Pensioners' mutual aid funds, which are established and operated in compliance with La no. 540/2002 regarding pensioners' mutual aid funds, with subsequent amendments and supplements;
- Agricultural companies, which perform their activity in compliance with Law no. 36/1991 regarding agricultural companies and other types of association in agriculture, with subsequent amendments;
- Other categories of legal entities which observe, according to their articles of incorporation and organisation, cumulatively, the definition and principles of social economy provided for in the aforementioned law.

The authors present in Table 3 a few of the differences between the organisations belonging to social economy and those making up traditional economy.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Table 3. Differences between the organisations belonging to social economy and those making up traditional economy

	Social Economy	Traditional Economy
Purpose	• Solving social problems	• Maximising the enterprise's value, namely the profit
Role of social benefits	• Core	• Secondary
How financial resources are obtained	• Economic activities, donations, sponsorship	• Capitalising on the provided goods/services
Financial role	• Financial instrument	• Financial means are an end in themselves
Organisation type	• According to the pursued goal (cooperative, limited liability company)	• Economic entity (limited liability company, joint stock company)

Source: processing from *Ghid pentru constituirea unei întreprinderi sociale în regiuni rurale având ca obiect produsele agricole şi de artizanat* (2012). Proiect cofinanţat din Fondul Social European prin Programul Operaţional Sectorial Dezvoltarea Resurselor Umane 2007 – 2013, Axa prioritară 6 „Promovarea incluziunii sociale", Domeniul major de intervenţie 6.1 „Dezvoltarea economiei sociale".

In Romania, in terms of the organisations' legal forms, social economy includes:

- Associations and foundations;
- Cooperatives;
- Mutual aid funds;
- Trading companies owned by social economy organisations.

Yet, all these social economy "actors" must be supported by means of efficiently attracting and using financial resources, through own revenues or through social activities support mechanisms.

The authors emphasise the fact that certain initiatives were identified which contributed to the development of funding of social economy activities and whose purpose was: to identify solutions in order to fund the implementation of projects that support the development of poor local communities, as a way of promoting social inclusion, and, at the same time, to involve underserved groups in local activities with economic or non-economic structure, which will allow medium and long-term increase in employment.

Funding sources come mainly from:

Market economy (from profit), non-commercial activities (production of goods and services for own consumption), voluntary activities; direct public funding, through the state budget and the social security budget; funding from special funds and sources (of the types: European Social Fund, structural funds, Structural Operational Programme Human Resources Development, Regional Operational Programme, etc., other national / EU/ international funds: National Research, Development and Innovation Plan, PHARE, World Bank funding, United Nations Development Programme, private donations (natural and legal entities) and taxes related to individual revenues (2% of the taxes on work-related revenues may be redirected to the direct funding of non-profit organisations). (MMFPS, 2010)

In Table 4, the authors present the sources of funding and the types of funding for the organisations that make up social economy.

The authors of this research consider that, in future, in terms of social economy in Romania, new funding types must be identified to replace traditional ones, by promoting employment policies based on performance and also stimulating performance by means of material incentives, benefits that change

Table 4. Sources and types of funding for Social Economy organisations

Sources of Funding, Instruments, Policies	Key Actors Involved in the Social Economy Activity
• from own revenues of the entity whereby it performs its activity; • from external funds attracted via funding programmes; • from donations or other types of funds.	• organisations which, based on voluntary actions, provide services to vulnerable social groups or to those at risk.
• from performing voluntary activities; • by using local resources efficiently; • certain donations from local community members.	• certain groups made up of community citizens providing support to citizens.
• the profit of trading companies that can be used for social purposes; • attracting external sources by means of doing projects; • donations made by cooperative members or by external donors. • own funds obtained from all members according to their level of participation to the creation of such funds, by democratic vote.	• companies of cooperative type. • mutual aid funds and mutual organisations.
• funds of the types: sponsorship, donations, partnership agreements.	• foundations and associations.
• from the achieved profit.	• associations and foundations that perform economic activities through trading entities and use the resulting revenues or profit to the benefit of the community.
• the members' participation quotas to the establishment of dedicated assets; • revenues from economic activities aimed at supporting social actions; • from activities that are completed by promoting social inclusion; • by selling products and services obtained through economic activities as a result of the participation of disabled persons.	• individual enterprises and certain family enterprises.
• identifying viable and available sources in case of economic crisis situations.	• individuals or individual companies, international organisations for funding via grants with or without co-participation of the beneficiary or of the states.
• sustainable funding flows which are less dependent on fluctuations in the economy.	• developing business models that are based on strategic procurement and partnership for funding.

Source: processing from the Ministry of Labour, Family and Social Protection, 2010, *Raport de cercetare privind economia socială în România din perspectivă europeană comparată*, Bucureşti, 2010, in cadrul Proiectului „Economia socială - model inovator pentru promovarea incluziunii active a persoanelor defavorizate" finantat prin Fondul Social European prin Programul Operaţional Sectorial Dezvoltarea Resurselor Umane 2007-2013

entirely one's behaviour towards the organisation by means of an operative commitment to achieving social objectives. Yet, the use of innovative funding sources and mechanisms must be supported by a series of market-specific regulations and by legislation with clear enforcement norms that do not leave any room for interpretation.

CONCLUSION

In their scientific endeavour, the authors consider that they emphasised a series of approaches to the concepts of social entrepreneurship, social enterprise, social economy and that they presented the major role these play in establishing and developing sustainable businesses which contribute to developing a country's economy. During this research, they emphasise the importance of social entrepreneurship which leads to increasing social inclusion by means of creating jobs, finding the best ways to involve persons belonging to underserved groups in economic activities and, at the same time, by facilitating these persons' access to financial and other resources and to social services.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

We may state that social enterprises are the result of implementing social entrepreneurship. It was emphasised that social enterprises are those which participate in developing community businesses and which bring along benefits at the level of community members and of the community as well. The development of sustainable businesses at community level aims at stimulating local economy development by means of having local employers use the resources available in the area, by decreasing poverty through the creation of jobs and diminishing unemployment at local level, by achieving social inclusion as far as the vulnerable groups are concerned. At the same time, it leads to developing the socio-cultural capital at community level, and last but not least to solving issues related to environment protection. Yet, it is worth mentioning the risk taken by those who set up social businesses and the existence and proper performance of the activity depends on the necessary resources provided by their initiators. Moreover, the diversification of funding types and the identification of new options, such as the public-private partnership, must be taken into account. Also, financial and fiscal measures must be promoted to support social economy directly or indirectly. The authors must extend the way in which to make the direct correlation between fiscal benefits and the social enterprise status and must also specify clearly the types of benefits they may enjoy, and last but not least the legislation associated with this domain must be observed by all those who participate in developing these types of businesses.

The authors mention that social enterprises prove their capacity to stimulate positive increase in inclusion, they take into account the society's needs in order to build social inclusion, thus responding to the economic crisis and to the implemented austerity measures whose results did not match the expectations.

In the same context, social economy is presented as an alternative model for the social inclusion of vulnerable groups, which represents a different way of performing social inclusion and reintegration through economic development. Social economy envisages an alternative business model, based on principles and responsibility, whereby the participation of all relevant actors in the decision-making process is encouraged.

In the authors' opinion, social economy as part of the Romanian economic environment, is undergoing a development process and sustained effort must continue to be made by all actors involved in developing this field, not only in terms of start-up, organising or funding, but even up to changing mentalities related to the underserved population working in social enterprises.

Yet, in order for social economy to become sustainable for the vulnerable groups' options, it must be based on the analysis and research in the field, on financial support and also on raising the awareness of the wider audience. All these depend on financial, legal, institutional promotional mechanisms and on an adequate social environment.

Chapter 4
Crowdsourcing Dispute Resolution:
Survey and Challenges

Nuno Luz
Polytechnic of Porto, Portugal

Marta Poblet
RMIT University, Australia

Nuno Silva
Polytechnic of Porto, Portugal

ABSTRACT

After almost one decade of active research into human computation and crowdsourcing, several approaches and business models based on crowdsourcing have emerged, managing and distributing work to the crowd. Dispute resolution approaches may incorporate crowdsourcing as a step to retrieve relevant data. The reverse relationship has also become a tendency, where crowdsourcing approaches are close to incorporate dispute resolution techniques to perform quality control and data aggregation or filtering. This chapter provides an introduction to crowdsourcing and its relationship with dispute resolution. A discussion regarding the apparent symbiotic relationship between these two research domains is also presented, along with an overview of several approaches and use cases of particular interest.

INTRODUCTION

As suggested by Levine and Kurzban (2006), humans have developed sophisticated mechanisms to extract benefits from the social world, which are expected to be the product of several adaptations designed to generate mutual benefits to the actors involved.

The Web has opened unprecedented venues for studies on human cooperation and behavior, since much of the information that flows through the Internet contains or represents, either explicitly or implicitly, social interactions. These interactions manifest themselves through technologies like e-mail, mailing list

archives, hyperlink structure of homepages, co-authorship of documents, chat sessions and many others (Erétéo, Gandon, Corby, & Buffa, 2009). Also, the Web 2.0 came to introduce social features in most web applications and tools, giving birth to multiple explicit social networks for functional or entertainment purposes (Yun & Kim, 2009).

Online social networks seem to be triggering yet another adaptation to the way humans cooperate, bringing forth new tools for interaction that help to either maintain existent social relationships or establish new ones. They also leverage the emergence of collective intelligence (Segaran, 2007) from the combined behavior, ideas and preferences of thousands or even millions of people (Porter, 2008), attracting even more participants on a world-wide scale.

Over the last decades, researchers have been trying to build machines that emulate the creative and cognitive capabilities of humans. This has led to the development of multiple branches of artificial intelligence, such as multi-agent systems, reasoning and negotiation. Back in the 1960s, however, Licklider (1960) believed that machines and computers were just part of a scale which weights humans on one side, and computers on the other. His vision was that computers and humans should work together performing complementary roles (Licklider, 1960; Quinn & Bederson, 2011).

It was only recently that relevant research emerged and brought humans into computer affairs. The early factors contributing to this retake on Lickliders' vision are the social Web and the harnessing of collective intelligence (Gruber, 2008). These new developments have proved that humans can successfully complement computers with their abilities, and that they can act as guided computational units. Some examples include the use of CAPTCHAs to digitize texts and micro-task crowdsourcing (e.g. Mechanical Turk).

As a part of collective intelligence, human computation re-emerged as a relevant research field. Shortly after, the term crowdsourcing was coined by Jeff Howe, leading to yet another field of business and research highly connected to human computation (Howe, 2006; Poblet, García-Cuesta, & Casanovas, 2014; Quinn & Bederson, 2011; Von Ahn, 2009). One decade after, several approaches and business models based on crowdsourcing have emerged, managing and distributing work to the crowd (Doan, Ramakrishnan, & Halevy, 2011; Quinn & Bederson, 2011; Yuen, King, & Leung, 2011).

Dispute resolution approaches may incorporate crowdsourcing as a step to retrieve relevant data. The reverse relationship has also become a tendency, where crowdsourcing approaches are close to incorporate dispute resolution techniques to perform quality control and data aggregation or filtering.

Constitution-making (Landemore, 2014; Luz, Poblet, Silva, & Novais, 2015) is an application scenario where crowdsourcing is an important step in retrieving relevant data, but also a scenario where dispute resolution techniques can be incorporated into the crowdsourcing process in order to (semi-)automatically reach an adequate constitution document.

This chapter provides an introduction to crowdsourcing and its relationship with dispute resolution. A discussion regarding the apparent symbiotic relationship between these two research domains is also presented, along with an overview of both crowdsourcing and dispute resolution approaches and use cases that are of particular interest. Finally, a systematization of the discussed approaches that captures the main challenges and directions for mixed dispute resolution and crowdsourcing approaches is given.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

APPLICATIONS OF CROWDSOURCING

Humans are innately social and the intrinsic aspects of human cooperation have been the subject of great research efforts (Porter, 2008). We, humans, not only tend to form a clustered structure of relationships (social circle), but also extract individual benefits from them (Levine & Kurzban, 2006). Social circles have a great impact on our lives, influencing our ideas and behaviour (Konstas, Stathopoulos, & Jose, 2009). Not so long ago, the information that a person had access to was mostly the information flowing inside each ones' social circle. Nowadays, this social circle also acts as a filter for all the vast amounts of information and choices delivered every day (Ma, Zhou, Liu, Lyu, & King, 2011) by multiple means (e.g. social media, internet).

The emergence of the social Web has brought new powerful Web applications that connect people on a global scale, and allow them to reap the benefits of social life from online virtual environments in a global scale. Along with their huge popularity, online social networks allow the retrieval of significant amounts of important social data, which can be used to promote social benefits (Levine & Kurzban, 2006).

One of the most straightforward benefits we extract from society comes from asking our friends for an opinion or advice (Ma et al., 2011). It is possible to apply a similar mechanism to online social networks by automatically filtering data, and providing the user with relevant and personalized results according to the opinions coming from her/his online social circle. The difference is that, unlike humans alone, the introduction of machines allows that procedure to be performed for millions of items, covering a wide social circle.

Online social networks blur geographical barriers, thus promoting the combination of behaviours and ideas on a global scale (Porter, 2008). This combination is often referred to as collective intelligence (Luo, Xia, Yoshida, & Wang, 2009).

An interesting example of the importance of collective intelligence is what Porter (2008) regards as the Amazon Effect. To explain the Amazon Effect, he describes a usability study where people were asked to buy a product at a certain online store. A lot of people wanted to go to Amazon first, and when they were asked why, they just answered that they would like to do some research on the product, even if they were not buying it on Amazon.

(Brabham, 2008a) follows Surowieckis' (2004) view on the wisdom of crowds (often referred in the context of the Web as collective intelligence), as emerging from aggregating individual solutions instead of averaging them. This view is particularly relevant in the context of problem solving, where aggregating individual solutions often leads to a better solution than any of the best originally proposed individual solutions. The average, however, is mediocrity, and will never be better than the best proposed solution. Following this view, Brabham argues that crowdsourcing is a distributed model achieved through the Web that is "capable of aggregating talent, leveraging ingenuity while reducing costs and time formerly needed to solve problems".

Crowdsourcing, and in particular micro-task crowdsourcing, can be considered to be a form of human computation that harnesses collective intelligence.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Definitions

The term crowdsourcing was coined by Howe in the context of a paradigm shift in business models (Howe 2006, 2008). The shift originated from companies that started to provide outsourcing services relying on anonymous communities or crowds throughout the Web (e.g. iStockPhoto, InnoCentive and Amazon's Mechanical Turk). By 2006, these communities were growing into incredible valuable work forces capable of performing several specific tasks in exchange for small monetary rewards.

Since then, several different definitions have been given to the term crowdsourcing. According to Howe (2008), "crowdsourcing is the act of taking a task traditionally performed by a designated agent (such as an employee or a contractor) and outsourcing it by making an open call to an undefined but large group of people". Doan *et al*. (2011) define crowdsourcing as a system that "enlists a crowd of humans to help solve a problem defined by the system owners, and if in doing so, it addresses" the challenges of recruiting and retaining users, defining which contributions can be made by users, combining these contributions and evaluating user performance.

Quinn and Bederson (2011) not only provide a definition for crowdsourcing, but also compare it to terms such as human computation, social computing and collective intelligence. They aggregate several definitions found in the literature and state that crowdsourcing is a form of collective intelligence that overlaps human computation.

The term human computation dates back to the early years of artificial intelligence, in the 1960s, where it was envisioned that computers and humans should work together performing complementary roles (Licklider, 1960; Quinn & Bederson, 2011). Still, the vision of human-computer collaboration only started to be properly explored after 2005, the year Von Ahn published his doctoral thesis entitled Human Computation (Von Ahn, 2009). Von Ahn proposes the use of human algorithm games to harness the distributed processing power of humans to perform specific tasks. In accordance, human computation can be defined as a computational process that involves humans and their cooperation in order to solve problems that computers cannot yet solve (Quinn & Bederson, 2011). This definition is complemented by stating that "human computation does not encompass online discussions or creative projects where the initiative and flow of activity are directed primarily by the participants' inspiration, as opposed to a predetermined plan designed to solve a computational problem".

Quinn and Bederson (2011) argue that while human computation requires humans to act as managed units that merely perform a computation, crowdsourcing requires several humans to cooperate in a process by performing a computation or a creative task that is not always managed by computers (e.g. Wikipedia).

Crowds have an important role in human computation. Besides providing good amounts of computational power, applicable in tasks that machines can barely solve with efficiency and efficacy, they can also be used for redundancy.

Typical Domains of Application

Several experiments in different domains have shown that crowdsourcing and human computation have great potential for solving large scale problems that are often difficult for computers to solve automatically, on their own (Von Ahn, 2009). These problems usually require a degree of creativity or just common sense plus some background knowledge (Chklovski, 2003; Singh et al., 2002). The interpretation and recognition of images and natural language are two examples of such problems.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

One of the applications of crowdsourcing lies in harnessing geographical information. Recently, the production of geo-referenced data, maps, and atlases has moved from mapping agencies and corporations to non-expert users (Goodchild & Glennon, 2010). Some of the services that allow this include Flickr, Google's MyMaps, OpenStreetMap, and Wikimapia. Following this trend, Goodchild and Glennon (2010) discuss the applications of crowdsourcing to harnessing geographical information for disaster response. They argue about the importance of quality in harnessing geographical information and present an analysis of non-expert user generated geographical information from occurrences of wildfires in Santa Barbara, California. Further research on volunteered geographic information (VGI) has proved that there is great potential for quickly generating and spreading disaster-related information through a crowdsourcing system (Elwood, Goodchild, & Sui, 2013; Sui & Goodchild, 2011; Sui, Goodchild, & Elwood, 2013).

The potential and importance of crowdsourcing in harnessing geographical information has also been successfully noted and put into practice by Safecast, a project that emerged one week after the earthquake that led to the Fukushima Japanese nuclear accident. Safecast is a "global sensor network for collecting and sharing radiation measurements to empower people with data about their environments". In order to collect data, different types of radiation sensors are distributed through volunteers that later use them to collect geo-referenced radiation measurements during their travels. The results are collected and published by Safecast, which provides free access to the data.

Several crowdsourcing-based businesses have emerged since the advent of crowdsourcing platforms. While some maintain their own community of workers (e.g. MicroWorkers, ShortTask), others interact with one or more crowdsourcing platforms (e.g. CrowdFlower) offering their services in designing and managing projects and tasks, for obtaining reliable results. Brabham (2008a) discusses several successful applications of crowdsourcing as business models, including Threadless, InnoCentive and iStockPhoto. Threadless crowdsources the design process of t-shirts by promoting online competition. InnoCentive crowdsources the research and development of scientific problems as challenges. The last, iStockPhoto sells photographs, animation and video clips produced by its crowd of artists. Interestingly, surveys of the iStockPhoto crowd show that the main motivations behind their time and effort are not only monetary but also enjoyment and the development of individual skills (Brabham, 2008b).

In 2010, Dawson published a diagram distinguishing up to 13 categories of crowdsourcing operating in different domains (business ideas, 3D and graphic design, data analysis, research, tagging, translation, writing and editing, reviewing and software development) (Dawson & Bynghall, 2015). Categories included: crowdsourcing aggregators (e.g. CrowdFlower), content markets (e.g. iStockPhoto), prediction markets (e.g. Crowdcast), question answering (e.g. Yahoo! Answers), innovation prizes (e.g. XPrize), service marketplaces (e.g. Freelancer), distributed innovation (e.g. InnoCentive), crowdfunding (e.g. KickStarter), competition platforms (e.g. 99 Designs), content-rating (e.g. Delicious), idea platforms (e.g. IdeaScale), data sharing (e.g. Dead Cellzones), reference content (e.g. Wikipedia), cycle sharing (e.g. SETI@Home) and micro-tasks (e.g. Mechanical Turk and ShortTask.

From all the crowdsourcing systems and common types of crowdsourced tasks enumerated by Dawson, just a few qualify as human computation systems. This is the case of crowdsourcing systems under the micro-tasks category. However, even if crowdsourcing systems such as Mechanical Turk and ShortTask provide a platform for building any type of tasks, some types of tasks have become widely popular for being particularly appropriate to micro-task representation, and for being easily accepted by workers.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

These specific types of tasks are often (as presented in CloudCrowd) writing, editing, categorization, searching, data entry and translation tasks.

In this sense, most crowdsourcing micro-task systems feature the creation of task templates that can be used to request multiple similar tasks. These systems often provide a predefined set of templates for commonly requested types of tasks. Some of the predefined templates provided by Mechanical Turk and ShortTask include:

- Categorization, classification;
- Data verification (e.g. provide correct spelling);
- Data extraction (e.g. finding a website address);
- Moderation and tagging of multimedia content (e.g. tagging images or videos with adult content);
- Transcription from multimedia content (e.g. audio, video and images);
- Sentiment analysis and surveys;
- Search relevance (e.g. evaluate relevance of search results).

Around these crowdsourcing systems that manage their own community of workers, crowdsourcing-oriented businesses have started to emerge. For instance, MobileWorks, a crowdsourcing-oriented company, groups its services into categories such as digitalization of documents, categorization and classification, researching, and harnessing feedback (e.g. through surveys).

Some of these application domains can be easily modelled and managed with single and independent crowdsourced micro-tasks. Recently, however, a special interest in employing crowdsourcing towards solving more complex tasks has emerged (Ahmad, Battle, Malkani, & Kamvar, 2011; Kittur, Smus, Khamkar, & Kraut, 2011; Kulkarni, Can, & Hartmann, 2011; Little, Chilton, Goldman, & Miller, 2010; Luz, Silva, Maio, & Novais, 2012; Sarasua, Simperl, & Noy, 2012). This interest has led to several approaches being built upon workflows of micro-tasks. The modelling of such workflows allows the crowdsourcing of a new kind of more complex processes, such as dispute resolution processes.

MICRO-TASK CROWDSOURCING AND DISPUTE RESOLUTION

Over the last years, online dispute resolution (ODR) has been applied in a variety of situations and domains such as law, conflict resolution and knowledge management. The process involves the use of Web technologies to facilitate the resolution of disputes between parties. Generally, the resolution occurs through an additional "fourth party" that assists in the assessment and identification of common interests and in establishing a consensual solution (Poblet, 2011; Poblet & Casanovas, 2007).

As stated by Rule and Nagarajan (2011), "the field of Online Dispute Resolution has always been driven by technology". It has continually evolved to exploit and absorb new emergent technologies and approaches that improve its efficacy (e.g. Web conferencing, shared whiteboards, mind mapping platforms, social networking). More recently, these approaches include mobile devices and crowdsourcing (Van Den Herik & Dimov, 2012).

In the particular case of micro-task crowdsourcing, there is a close relationship to dispute resolution due, not only to its data collection capabilities, but also to the existence of multiple results for the same

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

micro-task (redundancy). This is often necessary to increase the quality of the micro-task results. Nevertheless, a process that tends to resemble a dispute resolution process is required to aggregate these data.

In this sense, a two way relationship between crowdsourcing and dispute resolution can be identified (where one exploits the other), which manifests in:

- The use of dispute resolution approaches to aggregate micro-task output data;
- The use of crowdsourcing to retrieve relevant information for the dispute resolution process;
- The use of crowdsourcing to model a dispute resolution process through workflows of micro-tasks.

While the first is a manifestation of crowdsourcing exploiting dispute resolution, the other two are manifestations of dispute resolution approaches exploiting crowdsourcing.

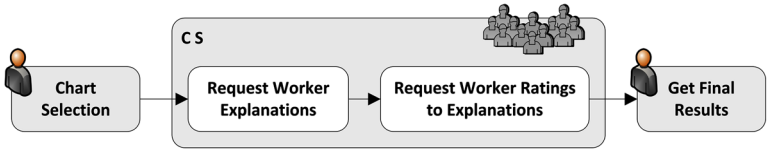
Data Aggregation and Quality Control as Dispute Resolution

Over the years, several researchers have dedicated their efforts to evaluating the quality of the results obtained through crowdsourcing micro-tasks (Brabham, 2008b; Goodchild & Glennon, 2010; Kittur, Chi, & Suh, 2008; Paolacci, Chandler, & Ipeirotis, 2010; Willett, Heer, & Agrawala, 2012).

Kittur et al. (2008) present an analysis of crowdsourcing user evaluations and surveys using Mechanical Turk. These user evaluations include "surveys, usability tests, rapid prototyping, cognitive walkthroughs, quantitative ratings, and performance measures". By performing two different experiments they concluded that although promising, special care is required when formulating user evaluation micro-tasks. In the first experiment, workers were asked to rate the quality of a Wikipedia article according to questions formulated from the Wikipedia article guidelines. Results showed that nearly 48.6% of the answers were invalid and 30.5% were given in less than one minute. In the second experiment, questions that guided the worker through the article evaluation process (e.g. how many references and images does the article have?) were added to the micro-task. This resulted in a significant reduction of invalid responses (now around 2.5%) and in an increase of the micro-task execution time.

Willett et al. (2012) discuss the quality of results in social data analysis tasks. This kind of task focuses on harnessing explanations and interpretations of data, thus requiring diverse justified analytical answers. The crowdsourcing process (Figure 1) starts after the selection of a set of charts by an analyst. An analysis micro-task is then created for crowdsourcing workers to provide explanations for each chart. The analysis is followed by a micro-task where workers assess the quality of the submitted explanations according to relevance, clarity and plausibility. The results of this task aid the analyst in filtering low quality explanations.

Figure 1. The crowdsourcing process of data analysis proposed by Willet et al. (2012)



EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Implementing this workflow of micro-tasks, Willett et al. (2012) describe seven strategies to improve the quality of explanations, tackling issues like irrelevant, unclear and speculative explanations, inattention to chart details and lack of diversity. These strategies are: i) to use feature-oriented prompts, ii) to provide good examples, iii) to include reference gathering subtasks, iv) to add chart reading subtasks, v) to include annotation subtasks, vi) to use pre-annotated charts, and vii) to elicit explanations iteratively.

Experiments by Willett et al. show that around 63% of the given explanations are good, and that the described strategies significantly improve the quality of explanations.

Although quality evaluation and control is often a highly domain-specific process, Ipeirotis *et al*. propose an algorithm that evaluates the quality of workers for general tasks in Mechanical Turk and attributes a score to each worker (Ipeirotis, Provost, & Wang, 2010). Following the assumption that biased workers can still provide relevant (although often considered wrong) answers, the algorithm tries to distinguish between error and bias in worker answers.

These processes are similar to common dispute resolution processes. Furthermore, the involved data is highly relevant for situations of conflict and for assessing and establishing a consensual solution.

Dispute Resolution through Micro-Task Crowdsourcing

So far, crowdsourcing has been introduced into dispute resolution processes where "the crowd is a (generally large) group of people who participates in the dispute resolution process through an open call" (Van Den Herik & Dimov, 2012). This kind of crowdsourcing is referred to as Crowdsourced Online Dispute Resolution (CODR).

Van den Herik and Dimov (2012) provide an overview of the currently existing approaches to CODR, which include (i) online opinion polls, (ii) online mock trials and (iii) CODR procedures rendering decisions enforced by private authorities.

The concerns regarding CODR are mostly inherited from general crowdsourcing approaches. However, there is a special concern in the screening of users/workers and in the harnessing of unbiased results. Nevertheless, crowd incentives and quality control, in general, are still issues that must be tackled in every CODR approach.

More recently, workflow approaches to micro-task crowdsourcing have emerged (cf. bellow). These approaches are a typical manifestation of human-machine computation, where humans are guided to act as computational units and their efforts are integrated with the effort of machine algorithms and routines.

The WfMC (Workflow Management Coalition) defines a workflow as "the automation of a business process, in whole or part, during which documents, information or tasks are passed from one participant to another for action, according to a set of procedural rules" (Lawrence, 1997; Van Der Aalst, Ter Hofstede, & Weske, 2003). Similar definitions describe a workflow as "a collection of tasks organized to accomplish some business process" (Mentzas, Halaris, & Kavadias, 2001) and even as a process that "supports the coordination and collaboration of people that implement a process" (Georgakopoulos, Hornick, & Sheth, 1995). Dispute resolution processes can be modeled and represented as crowdsourced micro-task workflows.

So far, several approaches to the crowdsourcing of micro-task workflows have been proposed. These include Turkit, Turkomatic, CrowdForge, CrowdWeaver, Jabberwocky and CompFlow.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Turkit

TurKit is an API, built on top of Mechanical Turk, for running iterative tasks, which provides an environment for the creation of workflows that connect multiple dependent tasks (Little et al., 2010).

Using the crash and rerun model, it provides an abstraction over the specificities and synchronization issues of Mechanical Turk, allowing the developer to focus on imperative ordinary function calls.

The crash and rerun model follows the premise that it is cheap to rerun an entire program up to the point where it crashed, as long as it runs locally. For remote and costly operations (e.g. Human Intelligence Task requests) the results must be stored in a database so that they will be accessible in future reruns.

Turkomatic

Turkomatic follows a divide-and-conquer approach to plan work featuring micro-task workflows partially designed by workers. It works over Mechanical Turk and is defined as "a crowdsourcing interface that consults the crowd to design and execute workflows based on user requests" (Kulkarni et al., 2011).

Workers start by dividing the requested task into subtasks that will be solved by other workers. This process can be iterative, generating a tree of subtasks. The final results are later combined by workers into an adequate solution.

CrowdForge

CrowdForge is a general purpose framework for distributed processing that provides scaffolding for complex human computation tasks (Kittur et al., 2011). The approach features a set of task coordination strategies that allow multi-level and dynamic partitioning of tasks, the specification of task workflows, quality control tasks and aggregation of results.

Finding inspiration in Googles' Map Reduce framework, CrowdForge defines three types of subtasks: (i) partition tasks, (ii) map tasks and (iii) reduce tasks. Partition tasks divide a larger task into smaller subtasks. In map tasks, one or more workers process a task. Finally, in reduce tasks the processing results of multiple workers are merged into a single output.

The CrowdForge prototype presented in (Kittur et al., 2011) consists in a Web application allowing the design of complex tasks, along with a back-end server that interacts with Mechanical Turk. The system manages a workflow of Mechanical Turk HIT (Human Intelligence Task) templates, which can represent partition map or reduce tasks.

CrowdWeaver

TurKit, CrowdForge and Jabberwocky provide an environment for the design and execution of complex tasks through structured languages and non-visual representations. With the current trend on micro-task workflows, work on their management and visualization has started to emerge. Kittur et al. (2012) state that one of the major issues faced by employers working with crowds lies in the complexity of linking tasks and forming workflows. In this sense, they identify several challenges in visually managing crowdsourced workflows and present a system for visualization and management of complex tasks, entitled CrowdWeaver.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

CrowdWeaver works on top of CrowdFlower and features the creation and monitoring of task workflows, the management and reuse of templates with human and machine tasks, the tracking and notification of crowd factors such as price and quality, and support for real-time experimentation. The interface provides a mental representation of the task workflow, which can be saved and re-used in further instantiations of the workflow.

Several machine tasks, which mainly manipulate input and output, are supported. These include divide, concatenate, pair, and permute. Additionally, custom machine tasks are allowed.

Jabberwocky

Similarly, Jabberwocky (Ahmad et al., 2011) also employs the MapReduce approach in a framework featuring a high-level abstraction task modelling language. It allows the modelling of complex tasks and workflows in which the advantages of multiple worker communities can be harnessed. These communities can be local or found in social networks and other crowdsourcing systems. In the case of local communities, workers can be identified during the crowdsourcing process. For social network communities, expertise data may be extracted from the social network API.

Jabberwocky is formed by three layers: the (i) base layer is called Dormouse, followed by the (ii) ManReduce layer, with the (iii) Dog layer on top. The Dormouse layer provides an abstraction over human (crowd workers) and machine computational units. Unlike other crowdsourcing frameworks such as Mechanical Turk and CrowdFlower, each computational unit registered under Dormouse can be uniquely identified during workflow executions. Besides featuring its own worker community, Dormouse can crowdsource tasks to external crowdsourcing platforms.

The ManReduce layer is a programming framework, written in Ruby, responsible for facilitating complex data processing tasks in Dormouse. It features map and reduce steps which can be computed by either humans or machines.

The top layer, called Dog, represents an abstraction scripting language for modelling tasks. Dog works over the low-level ManReduce framework and focuses on reusability, maintainability and ease-of-use.

CompFlow

CompFlow (Luz, 2015) is a method for the representation, construction, instantiation and execution of human-machine computation task workflows through ontologies. The representation captures the structure and semantics of the tasks and their domain, while remaining close to the human conceptual level. Workflows are built according to two dimensions: the domain dimension and the operational (task) dimension. This allows the input and the output of workflows to be described according to a domain ontology, completely independent from the workflow representation. The instantiation and execution of the represented workflow can be performed through the implemented workflow engine.

To aid the requester in the creation of new workflow representations (or workflow-definitions), a semi-automatic construction process based on domain ontologies is also proposed. The process has been implemented into a construction framework that allows the aided, iterative and visual construction of workflow-definitions.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Applications to Dispute Resolution

The approach proposed by Willett et al. (2012) is a typical example of CODR through micro-task workflows.

Van der Herik and Dimov (2012) identify four types of CODR, classified according to the dispute resolution approach, i.e. through litigation, arbitration, meditation and negotiation.

Forms of CODR that solve disputes through litigation (Marder, 2005) demand a workflow analysis and representation of the roles of traditional juries and civil procedures. Such approaches are yet to be fully exploited and require a broader community of participants than the one found in traditional litigation procedures.

The process of solving disputes through arbitration (Schmitz, 2010) can be easily adapted to crowdsourcing if the group of workers or micro-task participants performs an impartial judgement of the case presented by the involved parties. In this case, the focus is given to appropriate selection of the group of workers.

Similarly to litigation processes, heuristic-based mediation processes (Sycara, 1989) can be modelled and represented as micro-task workflows. Nevertheless, mediation can be a typically unstructured and creative process that may not adapt and scale well in the strict structure of a micro-task workflow representation.

Multi-agent negotiation approaches (Maio & Silva, 2011) are well known and often resemble workflows of actions. Such workflows can also be modelled as micro-task workflows for crowdsourcing that exploit and harness collective intelligence.

Although several ideas and approaches have been suggested over the last decade, "the process of solving disputes by collective intelligence is in its infancy" (Van Den Herik & Dimov, 2012). With the emergence of micro-task workflow approaches, new applications of CODR are also possible.

CHALLENGES

Since the appearance of the first crowdsourcing systems for micro-tasks, many more have emerged. Their continuous use has led to several experiments and studies that often focus on user motivation and quality control (Yuen et al., 2011).

User motivation has been addressed in several ways, from providing enjoyment and relying on altruism, to giving monetary rewards (Faridani, Hartmann, & Ipeirotis, 2011). The latter has been the subject of some criticism due to the creation of cheap labor marketplaces (Harris, 2011). In the specific case of task crowdsourcing systems, the current monetary rewards are not sufficient to be a primary source of income, and often they are not enough to serve as a motivator (Mason & Watts, 2010; Paolacci et al., 2010). In these cases, workers actually participate out of altruism, curiosity or simply to keep themselves busy. Still, motivating and retaining workers over time remains a challenge for any crowdsourcing system.

Quality control has been studied in different application domains and addressed differently by a variety of crowdsourcing systems. In general, assessment methods are employed either before (during the worker selection step) or after (during the worker assessment step) the participation of the worker. Among the current assessment strategies are expertise tests in certain domains, asking questions for which the answer is known and analyzing performance in previous tasks.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Although several quality control strategies already exist, the advent of crowdsourcing of complex tasks has brought new challenges to different dimensions of the crowdsourcing process, including specification, flow control, quality control and visualization.

In the specific case of quality control, and due to the presence of a micro-task workflow structure, a deviation or error in one task can accumulate with those of the following tasks.

Besides quality control, the flow control assumes special relevance. In fact, the crowdsourcing of complex tasks establishes requirements regarding worker selection that are often discarded in simple micro-task crowdsourcing systems. One of these requirements is worker identity. The fact that most crowdsourcing systems regard the micro-task as the top-level unit of work, leads to loss of identity information from one micro-task to the other. This can easily become a challenge when the worker, as an identifiable individual, is required to participate in different steps of the task workflow.

Another challenge when dealing with complex tasks is the aggregation and visualization of results. At some point, since multiple micro-tasks are involved in a workflow, tracing a specific result and asserting the causes and facts that led to it becomes a necessity. Enforcing structured machine-readable data also facilitates the implementation of strategies for tracing workflow results. Still, special care is needed so that such a structure does not increase the complexity and cumbersome nature of solving tasks from the worker's perspective.

Overall, the following main challenges were identified:

- Specification of complex tasks, namely:
  - Iterative, interactive and incremental tasks;
  - Support for complex flow control conditions, both internal and external;
  - Structuring the task specification, including its domain knowledge, in a way understandable and interpretable by both workers and machines;
- Specification of the human-machine interaction, namely:
  - Specifying worker selection restrictions for different phases of the workflow;
  - Identifying workers across the workflow in order to permit iterative workflows;
  - Tracing results and obtaining and providing justifications;
- Control quality in complex task workflows:
  - Assessing and reducing the impact of low quality answers across the workflow;
  - Using (social) profile information to assess worker's expertise and relevance, and to enhance context;
- Visualization and reporting.

FUTURE RESEARCH DIRECTIONS

There are several aspects of CODR that are particularly relevant since they affect the dispute resolution process and its results:

- Participant selection, which requires an enriched model of the participant, including the participant's background, expertise and social network;
- Contextual micro-task information, i.e. establishing the context of the dispute along with the facts;

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

- Tracing results and obtaining justifications, i.e. reaching a justifiable solution based on the output of previous micro-tasks;
- Formal structure and semantics for further automatic processing of data (e.g. the participation of machine agents in the dispute resolution process).

The selection of participants based on social network properties such as homophily (the tendency to bond with similar others) and centrality (Wasserman & Faust, 1994) is particularly interesting and may reveal social patterns and tendencies.

Micro-task crowdsourcing is a research field with a wide variety of application domains. Also, given the complexity of the dimensions involved in the crowdsourcing process, there is room for many different approaches. In this sense, the proposed ideas and possible directions are but a fraction of the future research and development possibilities.

CONCLUSION

Over the last decade, human computation and crowdsourcing approaches have been employed in the creation of multiple systems for problem solving on a wide scale. These systems are starting to facilitate the man-computer symbiosis envisioned by Licklider (1960) in the 1960s.

The increasing popularity of crowdsourcing has led to a variety of commercial and non-commercial applications in different domains. Among these applications, a small set of crowdsourcing platforms oriented towards problem (task) solving has emerged. These platforms regard the problem as micro-tasks that can be solved redundantly in one step by multiple users. In more complex processes (such as dispute resolution) where a workflow of micro-tasks is often required, new challenges emerge. This new trend in crowdsourcing has led to some interesting workflow oriented systems such as CrowdForge and Jabberwocky.

Nevertheless, several challenges regarding CODR still need to be tackled through further research and implementation in different areas such as knowledge representation, visualization and user interaction.

KEY TERMS AND DEFINITIONS

Collective Intelligence: The result of the combined behaviour, effort and ideas of different people on a global scale.

Crowdsourcing: A problem-solving approach that consists in enlisting a crowd of human workers to solve a particular problem defined by an owner.

Dispute Resolution: The process of solving a dispute between entities.

Human Computation: An approach where humans perform computational tasks often performed by machines.

Human-Machine Computation: An approach where both humans and machines collaborate to perform both creative and computational tasks.

Micro-Task Crowdsourcing: A crowdsourcing approach that divides the problem into small computational tasks that are then distributed through a crowd of human workers.

Ontology: A formal, explicit specification of a shared conceptualization.

Workflow: The automation of a business process through the organized execution of tasks.

This research was previously published in Interdisciplinary Perspectives on Contemporary Conflict Resolution edited by Paulo Novais and Davide Carneiro, pages 279-295, copyright year 2016 by Information Science Reference (an imprint of IGI Global).

Chapter 5
Crowdsourcing Social Innovation:
Towards a Collaborative Social Capitalism

Emanuele Musa
Babele, Romania

ABSTRACT

The growing awareness of humanity's finite resources and recognition of the limitations of one-off projects are prompting step changes in development planning. Sustainable development addresses the limitations of current practices; its aim is to achieve the triple bottom line of economic prosperity, environmental quality and social equity, meeting the needs of present society without compromising resources for future generations. Collective intelligence is considered by both Charles Leadbeater (former advisor to Tony Blair) and MIT as one of the most powerful ways to tackle complex problems, like climate change. This chapter explores the principles of crowdsourcing, its applications and the main trends. It presents theories, practices and examples of the use of crowdsourcing to innovate in the area of sustainable development for the common good. It announces the rise of collective brain-power to the challenge of creating better and more effective forms of civic and social engagement to solve problems on a world scale.

INTRODUCTION

The growing awareness of humanity's finite resources and recognition of the limitations of one-off projects are prompting step changes in development planning. Sustainable development addresses the limitations of current practices and features at the centre of almost every political, environmental, scientific and economic discussion held today. Its aim is to achieve the triple bottom line of economic prosperity, environmental quality and social equity, meeting the needs of present society without compromising resources for future generations.

The 1992 Rio Earth Summit was the moment when sustainable development captured worldwide attention. It established why sustainable development is necessary; the project now is how to execute it. The 21st century is the era of mass innovation - more ideas, knowledge and information being shared by

more people than ever before. Can we harness collective brainpower to innovate in the area of sustainable development for the common good? Google, Wikipedia and Linux are already using collective intelligence to develop new solutions through online communities. Could a collaborative online community do the same for sustainable development?

THE LIMITS OF CAPITALISM

At the beginning of the twenty-first century, the world seems more divided than ever.

The world GDP keeps growing year after year, so in theory, we are all getting wealthier. However, the gap between the richest and the poorest is increasing and the richest 1% of the population will soon possess half of the global wealth. We keep extracting, exploiting and consuming at a rate that was never so high before. We are increasingly polluting, despite the evidence of global warming, the alarming loss of biodiversity, and the uncountable number of lives that are wasted throughout the process to consumerism.

A "revolution" toward a large scale improvement of well-being and sustainable development is approaching.

The growing awareness of humanity's finite resources and the impossibility to achieve an infinite economic growth in a finite planet, are demonstrating the capabilities of the capitalistic model to reduce inequalities and address the most urgent challenges of our time.

While market forces demonstrated to be a non-sufficient mean to lead to the most efficient allocation of resources, governments and institutions have failed to meet the needs of the Common Good and bring society together to solve global issues:

- Every year nearly 12 million children die of mainly preventable causes, including diseases for which vaccines are routinely administered in many countries;
- Although access to safe drinking water increased from 61 per cent in 1990 to 71 per cent by mid-decade, 1.4 billion people in developing countries still lack such access. Furthermore, 2.7 billion people still do not have adequate access to sanitation;
- In the developing world, about 130 million children still remain out of primary school, nearly 60 per cent of them girls. Adult illiteracy remains high, affecting roughly 855 million people, nearly two thirds of them women;
- According to the World Bank, in 2011, 17 percent of people in the developing world lived at or below $1.25 a day.

Through intense pressure from commercial marketing, consumption became the desire for status and social distinction at the personal and group level. Considering the finite natural resources available, it would be impossible for the estimated 2.2 billion people currently living on less than 2$ a day, to ever match the consumption level of the richest group. If every person on earth would consume at the same rate of a US citizen, we would need 5 planets in order to accommodate the need for resources.

We are still using a linear system applied to a finite planet.

Increases in poverty and inequality and the decline in opportunities have had a serious adverse effect on the well-being of individuals, communities and even countries. Several critics have argued that the development orchestrated by the industrialized countries tended to replicate the forces of colonialism continuing the pattern of resource expropriation and economic control by the industrialized countries.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

The paradox of a global economy increasingly unified, and a global society increasingly divided is the most dangerous threat that weighs on the planet, because it makes difficult, if not impossible, the cooperation necessary to solve the most urgent problems of our time.

WHAT IS THE ROLE OF BUSINESS IN SOCIETY?

To understand the role of business in society, we should go back a few centuries.

Until the 17th century, people owned businesses or worked for businesses, but they were just people, as the businesses did not exist independently of the people who owned them – thus their individual ethics were directly reflected on these businesses.

When the first corporations came into existence, they were granted charters for specific short-term projects, like building a bridge or a railroad. Once they fulfilled their purpose, they were disbanded.

But over time, the law changed and corporations no longer had to be turned off once their project was complete. They began to live on indefinitely, with a much more general purpose, profit (Korten, 2001).

Unlike people, who are driven by all kinds of motivations – doing the right thing, love for family, peers, the planet – publicly traded corporations are now required, by law and the markets, to maximize value for their shareholders – making as much profit as possible (Leonard, 2007).

The idea that a corporation's purpose is to maximize financial gain for its shareholders was first articulated in Dodge v. Ford Motor Company in 1919: Dodge v. Ford Motor Co. – 170 N.W. 668 (Mich. 1919). Over time, through both law and custom, the concept of "shareholder primacy" has come to be widely accepted. With such definition, there will always be a trade-off to be made between profits and the general interest of society.

Thus, there are many reasons why the traditional business sector cannot become the drive behind substantial change. If we have a look at the current situation throughout the world, we see a business environment which is shaped by a history of unhealthy competition, manifold cases of adulteration for the sake of profit or the ongoing issues of child labor for the sake of reducing labor costs (Bakan, 2004).

Reports about the horrible working conditions in the factories producing our iPads (Duhigg & Baraboza, 2012) or the toxic chemicals contained in our everyday products are easily available. These examples show quite well how the drive for higher dividends is heavily corrupting the social sense of entrepreneurs.

We, the consumers, we didn't choose to put toxic products on the shelves, or to allow slave labour in factories around the world. We didn't choose to fill stores with electronics that can't be repaired and have to be thrown away. We did not choose a world in which some people can afford to live green, leaving the rest of us to be irresponsible planet wreckers. (Leonard, 2007)

Another false myth of liberal thinkers is the capability of the market to automatically adjust itself according to a continuously changing environment. E.g. *when the issue of Global warming will become an absolute priority, then the market will invest in greener technology that will take our CO2 emissions down*. The counter argument is that the planet does not respond to such linear thinking. Transgressing one or more planetary boundaries may be deleterious or even catastrophic due to the risk of crossing thresholds that will trigger non-linear, abrupt environmental change within continental- to planetary-scale systems.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Thus, even if we would drastically reduce our environmental impact, this would not bring us back to the same environmental conditions of the 17th century.

The short term logic of the capital market is undermining our capability as a society to foster common good initiatives. The urgent environmental problems, and the incapability of this type of democracy and of the market alone to handle them, request a totally fresh approach.

THE NEW WAY

Common good, is broadly understood as the overall social condition that enables individuals or groups to attain their fulfillment more easily. Unlike the utilitarian approach, which focuses on the greatest good for the greatest number, the principle of the common good is geared toward the benefit of all (John Paul II, 1991). As a reaction of the public institutions failures to answer to the global need of common good, citizens are getting "smarter", more capable of interpreting issues and discerning between options on their own than simply accepting the views of media and political elites. In the global environment, several companies have come under pressure from civil society and non-governmental organizations (NGOs) to be more responsive to the range of social needs in developing countries, including addressing concerns about the working conditions in factories or service centers, and attending to the environmental impacts of their activities.

Companies are an essential element of our society as they are deeply involved in the creation (or destruction) of common good, by providing workplaces adherent to law, ethical standards, and international norms. Their importance has increased over the last century to a point in which 52 of the 100 biggest economies on earth are now corporations (Anderson & Cavanagh, 2005).

Thus, for society to thrive, it is fundamental that companies embrace responsibility for the impact of their activities on the environment, consumers, employees, communities, stakeholders and all other members of the public sphere.

Today's corporate literature envisage a new economy that puts safe products, happy people and a healthy planet first; where businesses proactively promote the public interest by encouraging community growth and development, and voluntarily eliminating practices that harm the public sphere, regardless of legality.

Can we review the way we create companies, and measure success beyond profit? The key enabler for this new economy is sustainable development, which addresses the limitations of current business practices and promotes the deliberate inclusion of public interest into corporate decision-making. Its aim is to achieve the triple bottom line of economic prosperity, environmental quality and social equity, meeting the needs of present society without compromising resources for future generations.

The 1992 Rio Earth Summit was the moment when sustainable development captured worldwide attention. It established why sustainable development is necessary; the project now is how to embed its principles in the market.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

A NEW BUSINESS SECTOR

Typically, when we think about "sustainable business," we concentrate on corporate social responsibility (CSR): energy efficiency, reduced carbon footprint, recycling and reuse, fair treatment of employees, and charitable giving, among other considerations.

However, there is a growing market of mission-driven companies that are dedicated to being socially responsible from their inception, unlike most (though not all) corporations that pursue CSR for marketing purposes or to cut costs and increase profits.

The realm in which these mission-driven enterprises operate has come to be known as "social entrepreneurship," a term widely credited to Bill Drayton, founder of the social venture philanthropy, Ashoka.

While the term 'social entrepreneurship' is relatively new, initiatives to promote positive social change are not new. – earliest writings extend back to the late 1990s (Emerson & Twersky, 1996). For example, the Greystone Bakery was founded in 1982 by Roshi Bernie Glassman, with the explicit mission to train and hire unemployed local residents, who otherwise would have struggled to obtain employment elsewhere. The Grameen Bank was founded in 1983 to provide rural illiterate women with access to micro-credit facilities to launch new businesses.

"Every time I see a problem, I create a business to solve it", says Professor Mohammed Yunus, the founder of the Grameen Bank, in his books. He describes Social enterprises as businesses designed to meet a social goal not to create profit for its owners.

The strength of being a social enterprise lies partly on its predisposition to bring lessons from business and apply them to answering social need. They bring the self-sufficiency of for-profit businesses and the incentives of market forces to bear on global social problems in a way that neither pure capitalism nor pure charity has been able to match.

Gregory Dees, one of the "fathers" of the field of social entrepreneurship (Dees, 1998) that social entrepreneurs play the role of change agents in the social sector by:

1. Adopting a mission to create and sustain social value (not just private value);
2. Recognizing and relentlessly pursuing new opportunities to serve that mission;
3. Engaging in the process of continuous innovation, adaptation, and learning;
4. Acting boldly without being limited by resources currently in hand;
5. Exhibiting a heightened sense of accountability to the constituencies served and for the outcomes created.

Entrepreneur and social entrepreneur have in common the strong motivation to pursue their vision relentlessly and realize their ideas. However, what makes social entrepreneurship distinct from traditional business entrepreneurship is its focus on the social/environmental mission. This is true, no matter what legal structure the social entrepreneur chooses.

For-profit social enterprises put mission before profits, typically using their excess revenues as a means of scaling the reach of their mission. Nonprofits are increasingly finding that they cannot rely on philanthropy to sustain themselves, much less grow. Thus, they are pursuing earned income strategies that leverage the organization's excess capacity and capability. By law, the earned income they generate must be reinvested in the enterprise and its mission. Hybrid social enterprises, which combine features

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

of both for-profits and nonprofits, use this legal structure to expand potential revenue streams, all aimed at increasing and sustaining the organization's ability to pursue its mission (Lyons, 2012).

Measuring the performance of a social enterprise is much more complex than it is for a commercial business, which can simply measure financial success. Measuring and monetizing lives saved, quality of life increased, and environmental damage mitigated (among other impacts), while possible, and are exceedingly difficult to do. However, there are great examples that showcase the potential of this sector to benefit large numbers of people.

A FEW GREAT EXAMPLES

WaterHealth International (http://www.waterhealth.com) is solving the problem of clean drinking water: 3.6 million people die each year from water-related disease. The social enterprise uses a franchising system providing village entrepreneurs with UV filtration technology that allows processing and selling clean drinking water to remote villages at a low cost. Through its network of franchises, WaterHealth provides access to pure and safe drinking water to half a million people in 4 different countries.

There are many charitable water projects, but they have difficulties in pursuing their mission, as they do not have money for maintenance, for example for fixing the pumps when they break down. On the other hand, WaterHealth through the franchising system, have a network of entrepreneurs that pay for maintenance to troubleshoot equipment. Thus the franchising system allows these initiatives to be sustainable, the model is not applied only by WaterHealth International, but also by other social enterprises that handle the problem of clean water delivery, for example 1001 fontaines (http://www.1001fontaines.com/en).

Another great example of social enterprise is the one of Sulabh International (http://www.sulabhinternational.org/): an India-based organization that works to promote human rights, environmental sanitation, non-conventional sources of energy, waste management and social reforms through education. Sulabh International counts 50.000 volunteers and is the largest nonprofit organization in India.

Sulabh was founded by Bindeshwar Pathak in 1970, with the mission to rescue the untouchables (or scavengers: the poorest cast in India) from the sub-human occupation to remove raw (fresh and untreated) human excreta from buckets or other containers that are used as toilets or from the pits of pit latrines. The employment of manual scavengers is officially prohibited in India since 1993 but is still taking place to this day.

Bindeshwar first developed a scavenging-free two-pit pour flush toilet (Sulabh Shauchalaya) as well as a safe and hygienic on-site human waste disposal technology: which enabled the users to throw the excreta themselves in a clean way, without having to make use of the Untouchables. Sulabh created several solutions that were positioned to serve both the poor and the rich families, so that the high-end products could compensate the very low price proposed to the poorest families.

The social business was further developed through a new concept of pay-&-use public toilets, popularly known as Sulabh Complexes with bath, laundry and urinal facilities being used by about ten million people every day.

The innovation is an open-sourced technology which treats excreta and generates:

- Bio-gas, which is converted into electricity to power the building);
- Bio-fertilizer, which is then sold at market price;

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

- Treated Water, which is used for agricultural use.

The exceptional environmental impact of Sulabh is further complemented by the set-up of English-medium public school in New Delhi and also a network of centres all over the country to train boys and girls from poor families, especially untouchables, so that they can compete in open job market – and finally become *touchables*.

Sulabh is one of the best example of social enterprise that is economically sustainable, it maximizes environmental quality and social equity, using a business approach to solve a complex problem that governments and institutions have failed to address.

But the greatest innovation of all is that Sulabh's toilet block blueprints are open source, thus other organizations and people that are affected by the same problem, can now use the solution and improve it. Innovation is not anymore limited to the organization and its activities, but it can be further developed by other stakeholders, who can participate in the development process.

THE IMPORTANCE OF STAKEHOLDERS PARTICIPATION

There is another feature that distinguishes social entrepreneurship from business entrepreneurship: social entrepreneurs are held to a higher standard of accountability. Business entrepreneurs are accountable only to their customers and shareholders, while social entrepreneurs are accountable to a much larger group – their stakeholders, "any group or individual who can affect or is affected by the achievement of the firm's objectives." according to Freeman's (Freeman et al, 2010) widely accepted definition. This group includes a part investors, employees (including volunteers in nonprofits), direct beneficiaries, also the local community and the society.

Stakeholders have the chance to influence the decision-making process, providing opportunities to further align business practices with societal needs and expectations, helping to drive long-term sustainability. They also must be taken into account by the organization when facing complex conditions in the operating environment.

Companies like Vodafone (2014) engage their stakeholders in dialogue to find out what social and environmental issues matter most to them about their performance in order to improve decision-making and accountability. Such practices are key to mitigate risks, helping the practitioners to compete in an increasingly complex and ever-changing business environment, while at the same time bringing about systemic change towards sustainable development (Jeffrey, 2009)

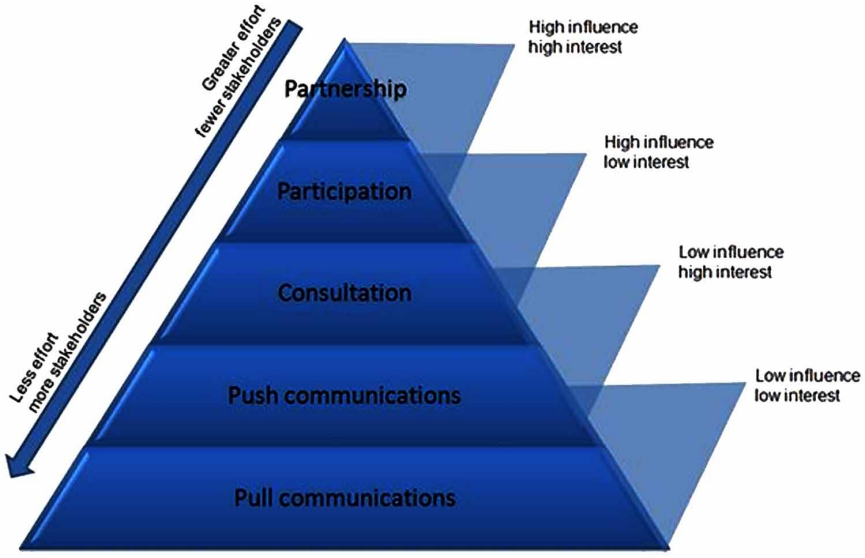
There are different stakeholder engagement approaches:

- From pull communication (*one-way engagement*: Information is made available, stakeholder choose whether to engage with it).
- To consultation (involved, but not responsible and not necessarily able to influence outside of consultation boundaries. *Limited two-way engagement*: organization asks questions, stakeholders answer).
- To real partnerships (shared accountability and responsibility. *Two-way engagement* joint learning, decision making and actions).

These engagement approaches are very well illustrated in the diagram realized by Stakeholdermap (see Figure 1).

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 1. The relationship between stakeholder influence/power and stakeholder engagement approaches
Stakeholdermap, 2015. Source: http://stakeholdermap.com/stakeholder-engagement.html.



Through stakeholder engagement, processes organizations have positive economic results and creating win-win situations. Through the better understanding of the stakeholder needs and desires in consultation processes and through participation and partnerships, organizations can identify and create win-win situations with those stakeholders. The underlying idea is that partnerships between businesses and other sectors can drive sustainable development.

Anticipating the potential in stakeholder dialogues at an early stage and following a step-by-step guide can lead to successful shared value creation. A great example of shared value creation is Gram Vikas (http://www.gramvikas.org), a social enterprise and rural development organization headquartered in Orissa, India which assures access to basic education and adequate health services. The entire value creation process of Gram Vikas' involves "participatory decision making, shared responsibility taking and equal opportunities" with various stakeholders, and particularly disadvantaged groups. The results are that each of these groups are assuming ownership of the solution and its delivery, and thus the success rate is very high.

The trend towards cross-sector collaboration and stakeholder engagement is clear. The question is whether we are moving towards a convergence of values and whether shared value creation (expanding the total pool of social and economic value) will become the norm? Could the gap between social entrepreneurship and entrepreneurship be closed by actually making so that every enterprise is responsible, transparent and engages its stakeholders in the decision making process?

THE AGE OF OPEN INNOVATION

Individually we are a drop, together we are an Ocean.

The 21st century is the era of mass innovation - more ideas, knowledge and information being shared by more people than ever before.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Knowledge has become the key resource in the post-industrial society (Bell) (Bell, 1974), thus reliance solely on internal innovation processes has become insufficient. Open innovation represents the logical result of dramatic, social, technological and environmental change and it describes how organizations work with large groups to achieve greater results than any team of experts working alone.

For Henry Chesbrough, one of its pioneers, open innovation is:

… the use of purposive inflows and outflows of knowledge to accelerate innovation. With knowledge now widely distributed, companies cannot rely entirely on their own research, but should acquire inventions or intellectual property from other companies when it advances the business model. (Chesbrough, 2006)

The process has become increasingly essential, if not inevitable.

"Wisdom of the Crowd" processes have taken place in various forms and in many areas for decades. But it is now, in the information or digital age, that they are being exploited at such a fast pace.

Innovation challenges, hackathons, external product development are all new phenomena that can best be summarized under the concept of open innovation.

The phenomenon that paved the road for a completely new approach to working together was the Open-source culture. The term open-source refers to a software development strategy in which the source-code is made available to a community. In this way everyone can make changes and improvement to the software. An example of the success of this strategy is the globally established computer operating system Linux, which benefitted from the ongoing analysis, review, testing and contributions of a large and diverse group of people from all over the world.

Wikipedia is another famous example of open source culture. It has over 80.000 contributors who have written more than 15 million articles in over 250 languages.

Traditional encyclopedias such as Microsoft Encarta or Britannica, did not see the crowdsourcing phenomenon coming, and continued to source their articles from few experts.

After some resistance, Microsoft decided to abandon its encyclopedia, acknowledging what everyone else realized long ago: it just couldn't compete with a free, collaborative project, where volunteer editors quickly update popular entries. Encarta could not simply keep-up to the pace and was embarrassingly outdated.

The open source approach to collaboration enables people from all-over the planet to engage and create together (Rayner, 2001). Open Innovation is also changing the way organizations work. A few corporations immediately realized the potential. LEGO, in its darkest days, tapped into abundant external talent to help them succeed in the face of some of their greater challenges. Back in 2003, the company was on the verge of Bankruptcy. Under the lead of a new CEO, Jørgen Vig Knudstorp, the company successfully reached a passionate group of smart and enthusiastic people, who were very familiar with their products and were just waiting to contribute: their customers.

They had hoped to get support from 100 of these fans; they were inundated with responses from 10,000.

The community shared creative ideas, and helped the company prioritizing which one were the best and had the greatest potential to become profitable. LEGO overcome its crisis and today it still develops this process of creative collaboration, by involving passionate people outside of their internal structure.

We are shifting from a world in which everyone seems a competitor, towards a world in which the upside of opening-up and engaging with people and ideas from elsewhere outweighs the risk of sharing confidential information. Innovation can come from any source, and the organizations that are succeeding

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

in inspiring external talent to engage in their crowd-storming process, are gaining a strong competitive advantage compared to those who still uniquely rely on internal resources.

Companies like Apple and Google also depend on the effort of outside talent in the form of apps and open source software.

After the launch of Iphone in 2007, Apple switched the focus from the phone functionalities towards applications (or apps) that can be run on the iphone to give it new capabilities. Apps demonstrated in a countless number of ways that the iphone can become much more than a phone: through apps you can read a Restaurant customer review, find a cab, buy a book, split a restaurant bill, find a hotel or translate speech into a foreign language. Only in 2012, Apple paid $4 billion to Apps developers and created 210.000 jobs related to the app economy in the United States.

In the same way, Google and Apple depend on open source software that has been developed, used, tested and improved on an open-cooperative environment. While Android derived from the Linux operating system; Apple used a package of open-source products called Darwin.

According to former P&G CEO A.G. Lafley: "Innovation is a social process. And [it] can only happen when people do that simple, profound thing – connect to share problems, opportunities and learning. To put it another way, anyone can innovate, but practically no one can innovate alone".

The paradox of open innovation lies in the conflict between the potential benefits of collaboration and the prospects of knowledge leakage and misappropriation of the results of the process. The process is based on 2-way interaction that may cause the organization to lose control of specific information. This knowledge, in the hands of a competitor, could compromise the competitive advantage potentially gained from the open innovation process. However, recent research focused on the significance of value creation through stakeholder engagement (Svendsen, 1998) offers a model that addresses this inherent conflict in open innovation processes.

Stakeholder participation removes the structural tension of open innovation according to Gould, R.W, (2012). Consideration of the social, organizational, and ethical benefits of engagement with relevant stakeholders enhances the concept of open innovation, helping to move beyond its solely practice-based origins.

THE LOVE STORY BETWEEN OPEN AND SOCIAL INNOVATION

The concept of open-innovation is very much associated with the business sector only; and in such a way Chesbrough defines open innovation as a process taking place mainly in commercial research and development, reducing it to product development.

However, seeking ideas and solving problems is just one of the many facets of open innovation and there are several reasons for expanding this paradigm shift to social innovation.

In fact, open innovation and stakeholder engagement towards collective social responsibility describe similar organizational processes: organizations reach outside their boundaries to access and share essential information with their stakeholders and with the crowd. Yet the two concepts, and their associated languages and discussions, have remained isolated from each other.

There is a vast potential to co-create social value through open and transparent networks that involve a diverse range of stakeholders, thanks to the ease of online collaboration tools and social media.

A few relevant initiatives started to emerge in the social sphere, creating a completely new field called open social innovation.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

As previously mentioned, stakeholders' participation brings even more value when it goes beyond just listening to the people who can affect the organization, and a process of co-creation is put in place. Modern information technology is a key enabler for empowering stakeholders and facilitates their participation in the development process: people can share their knowledge, exchange ideas; each one comes with incremental improvements, and together can benefit from the collective wisdom of a crowd.

A fantastic example of the power of open-social innovation is the R&D-I-Y, *research and develops it yourself*: a process that has been applied to the Windowfarms network (Pearl, 2011).

Britta Riley is the cofounder of Windowfarms.org, a New York based company that makes hydroponic platforms for growing food in city windows, designed with the help of more than 1,800 enthusiastic collaborators from all over the world.

Britta took her inspiration from NASA, which uses hydroponics to explore how to grow food in space. She reasoned that many apartment windows have less than stellar conditions for growing plants, especially in a Northern winter. Conditions in any particular window would limit what could grow there—but perhaps hydroponics could contribute to food security on earth.

Britta decided to open source the project. She published the design on the web and invited anyone from anywhere in the world to improve the system. With no intellectual property issues, it was open to co-developers. Collaboratively, they have developed a system that grows a salad a week in an apartment window and allows an individual to cut their carbon footprint nearly in half.

On a global scale, the project has taken on a life of its own. Enthusiasts in Finland are working to customize the system with LED grow lights--also developed collaboratively--so that they can continue their gardens during the long, dark winter. Other contributions include air pumps to replace water pumps and optimum nutrients for strawberries that result in fruit throughout a New York winter. Britta says that the real reward from working with this company is the joy of collaboration.

Many other examples of stakeholder's participation through open-innovation deserve the right attention.

People co-create concepts through open content systems such as Wikis – these web applications have led to fascinating examples of collective intelligence. Wikipedia has inspired many organizations to create their own versions or copycats. This is the case of Energypedia, a project of German development agency GIZ that combines local and global knowledge to collect experiences and best practices in water and sanitation issues.

In the wake of the Fukushima nuclear disaster, Japanese citizens' set-up a network of volunteers publishing radiation levels they measured themselves after that trust in official data had collapsed.

Volunteers and political activists also take advantage of the Internet and tech devices such as mobile phones, tablets, etc. to monitor events and issues taking place around the world. Ipaidabribe.com, an anti-corruption project, allows ordinary citizens to send messages denouncing cases of corruption.

However, the best example of open-social innovation is the one of Fold it, in which an effective online tool which combines advanced gamification techniques with crowd collaboration, to contribute to Cancer and HIV/AIDS research.

THE FOLDIT EXAMPLE

Foldit is an online puzzle video game about protein folding that was developed by Adrian Treuille. It is part of an experimental research project developed with the University of Washington's Center for Game Science in collaboration with the UW Department of Biochemistry.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

The public beta version was released in May 2008 and has 240,000 registered players.

The objective of Fold it is to fold the structures of selected proteins as well as possible: one of the hardest and most expensive problems in biology today.

The protein biosynthesis is reasonably well understood, as is the means by which proteins are encoded as DNA. Determining how the primary structure of a protein turns into a functioning three-dimensional structure – how the molecule "folds" – is more difficult; the general process is known, but predicting protein structures is computationally demanding.

Foldit is an attempt to apply the human brain's natural three-dimensional pattern matching abilities to this problem. By analyzing the ways in which humans intuitively approach these puzzles in the game, researchers improve the algorithms employed by existing protein-folding software. As more players complete more puzzles, the researchers can create a better understanding of these protein structures and craft new medicines to promote better health and cure disease.

While at the beginning, gamers were playing on folding proteins to which the solution was already known, now Fold it is being used for real-world scientific problems.

A report by an international team of researchers from the U.S., Poland, and Czech Republic in Nature Structural & Molecular Biology unraveled that Fold-it players have solved the crystal structure of Mason-Pfizer monkey virus (M-PMV) retroviral protease (Khatib et al, 2011).

Retroviral proteases have critical roles in viral maturation and proliferation and they are very important for antiretroviral drug development for diseases such as AIDS. Researchers have for over a decade been unable to solve the structure despite using many different methods. Even recently, the protein-folding distributed computer program Rosetta that uses thousands of home computers' idle time to compute protein structures, was not able to give an answer. The Foldit players using human intuition and three-dimensional pattern-matching skills, however, were able to solve the problem within days.

COLLECTIVE SOCIAL ENTREPRENEURSHIP

Social entrepreneurship has been considerably growing in the past 30 years, but it still remains a small part, only 6.5% of the entire economy in Europe (Seforis Consortium, 2013).

On the other hand, the explosion of global challenges in areas such as "climate change and environmental degradation; inequality and poverty; lack of access to basic healthcare, clean water and energy; mass-migration and international terrorism" requires modern sustainable enterprises to apply a more radical involvement of all their stakeholders.

Thus, to achieve true impact, social enterprises need to find a way to go beyond making progress on their own; they need to lead collaborations with others (Milway, 2014). Creating a sustainable ecosystem would require individual social enterprises to collaborate not just within their sector but also across sectors. Montgomery, Dacin, and Dacin (2012) term such collaboration "collective social entrepreneurship."

According to Robert Wayne Gould (2012) this can be realized through a combination of open innovation and stakeholder participation.

In the previous paragraphs, we have seen how Collective intelligence can be extremely effective at tackling complex problems. On the other hand, we have analyzed the importance of stakeholders' engagement to support social entrepreneurial organizations to produce long-lasting impact for the common good.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Thus, to initiate a new societal paradigm based on open-source collaboration, all stakeholders need to be empowered to voice their concerns and participate more actively in the decision making process.

The participation, investment and inclusion of all members of society in the development process is the key to help people fulfilling their human potential, but also to ensure that full advantage is taken from a country's human resources, as well as to promote peace and stability.

One of the main organizations that are democratizing the participation of stakeholders in the development process is IDEO.

ABOUT OPEN IDEO

OpenIDEO is an open innovation platform on which global communities can take part in solving any of the various challenges presented on the platform. It is an online international community enabling people to collaborate in developing innovative solutions to pressing social and environmental challenges. Everyone can participate: veteran designers, critics, academics, and curious lurker.

Similar to a formal innovation process, ideas are presented as "challenges". One such challenge initiated by Jamie Oliver to raise children's awareness of the benefits of fresh food so they can make better choices. Challenges make progress through various creative phases: inspiration, concepting, evaluation, refinement and implementation.

The first step is called inspiration, the process starts with research to develop empathy and understanding on the topic: capturing people's needs and experiences before diving into solutions. Contributors are encouraged to submit inspirations in the form of images, stories, and visuals. During the next phase of the project, concepting, contributors are asked to post a solution - in other words, how they would make the concept a reality. People are invited to comment, ideas owners to incorporate the feedback received, and then refining their ideas again. This iterative approach is based on the philosophy of learning through building – trying out ideas with real people as quickly as possible.

Next, members are asked to rate and comment on concepts in the evaluation phase because each concept will gain merit depending on the community response. Only the best concepts carry forward.

In the next step of the design thinking process, called refinement: IDEO facilitators tweak the evaluated ideas, adding a highly focused design approach to it. This phase is to be understood through Tim Brown, writing on his blog:

The idea of crowdsourcing innovation is, in my view, still a big experiment. Conventionally the question has been whether the crowd can outperform the internal team. Our view is that small teams are good for some things and the broader community is good for others. The goal of OpenIDEO is to find out whether it is possible to orchestrate collaboration between the two to achieve better results. (Brown, 2010)

The results of Open Ideo are impressive: within 5 years they managed to post 29 challenges, and over 80.000 people participated submitting over 6000 ideas. Out of them, 300 projects are in the development stage.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

OPEN LEAN INNOVATION

Another interesting trend that is converging with the crowdsourcing universe is the Lean startup methodology, which was coined by Eric Ries from his study of Lean Manufacturing techniques created by Taiichi Ohno and Shigeo Shingo of Toyota.

The lean thinking became particularly relevant after the Dot-Com bubble of the late 90's, in which companies like Pets.com and Webvan could raise huge amounts of capital, spending it as fast as they could raise it, only to collapse when common sense re-asserted itself and the bubble burst.

After the bubble, venture investors spent the next three years doing triage, sorting through the rubble to find companies that weren't bleeding cash and could actually be turned into real businesses. Startups began to recognize that they weren't merely a smaller version of a large company. Rather they understood that a startup is a temporary organization designed to search for a repeatable and scalable business model. This meant that startups needed their own tools, techniques and methodologies distinct from those used in large companies.

The "lean startup," favors experimentation overelaborate planning, customer feedback over intuition, and iterative design over traditional "big design up front" development. Although the methodology is just a few years old, its concepts—such as "minimum viable product" and "pivoting"—have quickly taken root in the startup world, and business schools have already begun adapting their curricula to teach them.

The unit of progress for Lean Startups is validated learning - a rigorous method for demonstrating progress when one is embedded in the soil of extreme uncertainty. Validation comes in the form of data that demonstrates that the key risks in the business have been addressed by the current product. The lean startup asks people to figure out the right thing to build – the thing customers want and will pay for – as quickly as possible.

Modern entrepreneurs need feedback on their solution. They want to know when it's going to fail. They have to know who will use it, and who won't. They need to know how much they're willing to "pay" for it. That information won't be found "pitching" a solution.

Thus, the startups that ultimately succeed go quickly from failure to failure, all the while adapting, iterating on, and improving their initial ideas as they continually learn from customers.

Each stage of a startup development is highly iterative, customer feedback is essential to learn everything: from the problem that the product should solve, to the best communication or distribution channel, as well as the revenue model and the pricing. This continuous collaboration with the customers is key to reduce the inner uncertainty within the innovation process.

As in the case of open innovation: there is a paradox between the benefit of opening a project to the feedback of the customers, and the fear that several entrepreneurs have that their idea will be stolen, thus they often prefer to develop their project in secrecy.

However, several economists and successful entrepreneurs support the concept of sharing business ideas. For example, Nilofer Merchant in her article Harvard Business review "Let your ideas go" (Merchant, 2012), or Patrick Hull in Forbes Magazine "Talk about your idea, it won't get stolen" (Hull, 2013). They strongly believe that ideas cannot be stolen, because the hardest task in creating a startup is not having the idea, but implementing it. Timing and Execution are the essential elements to succeed.

If we apply the concept of Lean startup to social innovation initiatives, then it becomes fundamental for social entrepreneurs to involve their stakeholders in the process of validating the organization strategy - promoting full transparency from the financial performance to the resulting social impact. At the end of the day, young social enterprises face the same challenges of traditional startups: they often lack

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

the resources to succeed (knowledge, network, and skills) and they operate in conditions of extreme uncertainty - which according to Forbes causes 8 startups out of 10 to fail in the first 2 years of activity. Thus, by opening up and enabling the mentors, peer entrepreneurs and stakeholders to contribute with their knowledge in the business modeling process of social businesses, we can considerably increase the chances of success of these organizations and scale their impact (Potter, 2014).

Furthermore, this open approach to social innovation will be the key to enable NGOs, to shift their revenue model (based on traditional philanthropic donations) towards the one of sustainable social enterprises. A recent OECD report showcases the decline in official development assistance, reinforcing the need for NGOs to decrease their dependence from external financial support. The opportunity for social projects to crowd-source consulting from their stakeholders in order to evolve their strategy is probably the greatest hope that we have to revitalize the third sector.

A great example of stakeholders' participation to validate the strategy of social entrepreneurs through crowdsourcing is the open innovation platform Babele.

BABELE: CROWDSOURCING BUSINESS MODELS FOR SOCIAL ENTREPRENEURS

Babele (https://www.babele.co) is a social enterprise launched in the fall of 2013, with the objective to harness collective intelligence to help social enterprise validate their key assumption and validate a sustainable strategy.

Babele has a unique open source approach for supporting social entrepreneurship and creating social impact. It has been inspired by the emerging paradigm of more open, collaborative and adaptive organizations. Instead of creating social business strategies in secrecy and thus reinventing the wheel without learning from others, it offers an advanced system to share ideas, get inspiration from others, co-create business strategies for social good and replicate them in other parts of the world. The platform provides a business modeling framework, enabling entrepreneurs to create, debate, learn and experiment with projects in a collaborative way. Peer-entrepreneurs, citizens and mentors can participate by submitting ideas and giving feedback on each precise element of the business strategy of the social entrepreneur.

The ecosystem hosts a community over 850 social business model and collaborators from 103 countries. The platform combines the principles of social entrepreneurship, crowdsourcing and lean startup, engaging crowds of stakeholders in problem-solving - supporting the business development process of social enterprises from all-over the world.

Also the business model of the social enterprise is highly influenced by the open-source culture, making the platform available for free to all the social enterprises that fully open their business model to everyone, and offering a premium service for organizations that wish to customize the privacy access to the strategy to different groups of constituencies.

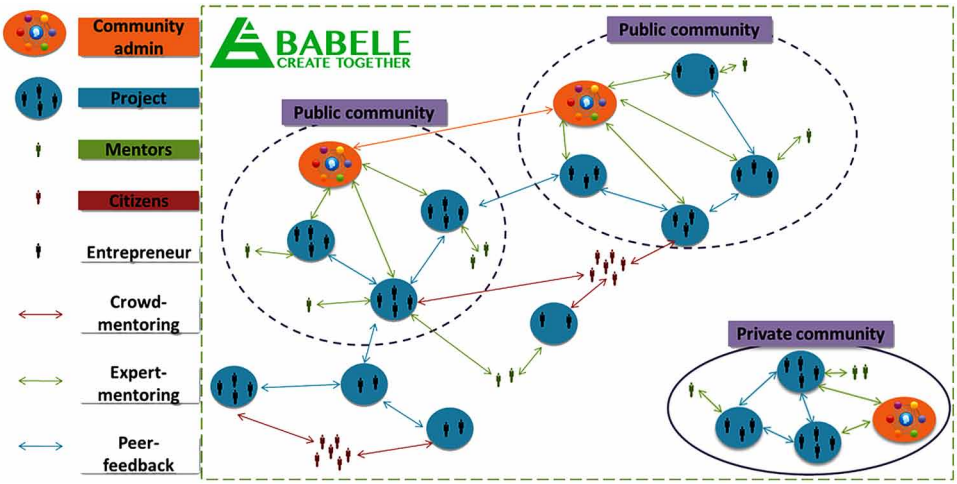
Furthermore, Babele embraces the philosophy of creating the network of networks for social innovation.

The key risk for the social innovation sector is to suffer from scarce effectiveness in addressing local and global problems due to the high market fragmentation.

While individual initiatives and organizations (Universities with social entrepreneurship classes, social incubators, foundations and support networks) are flourishing throughout the world at an incredible rate (e.g. Ashoka, Echoing Green, Schwab foundation, Skoll foundation, NeSst, etc.) on the other hand, they are failing at joining forces and sharing best practices.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 2. Interactions within the Babele platform between independent projects, projects within public and private communities, mentors, citizens and peer-entrepreneurs
Babele, 2015.



Babele is actively working to connect the dots between these networks and organizations, offering crowd-mentoring communities to manage their support programs for local social enterprises.

The organizations can stimulate peer-learning among their own projects, engage with their mentors, but also exchange with other organizations. The final result is a network of communities that can interact with each other: social innovation actors, entrepreneurs, incubators, universities, municipalities, citizens, or CSR driven companies.

This approach is fundamental to consolidate the social innovation market, incentivize openness and transparency and support the replication of the best initiatives that have the potential to address the most urgent challenges of our time (see Figure 2).

BEYOND R&D THROUGH THE POWER OF NETWORKS

Robert Fabricant discusses if Social enterprises can be seen as R& D labs in an insightful article in the Harvard Business Review *Meet Your New R&D Team: Social Entrepreneurs (*Fabricant, 2013). According to him, social entrepreneurs can have a "R&D function" for learning how to serve underdeveloped markets; they are innovative and find solutions to dedicated social issues. Once their solution has a proven impact, they should scale-up. In order to do this, they need more resources. Therefore, partnering with corporate CSR initiatives may offer them the necessary means to grow. There are many examples; Robert Fabricant describes four of these partnerships in his article.

This point of view is not new. What Robert Fabricant mentions are in fact "hybrid strategies", which means creating partnerships between social entrepreneurs and multinational companies. Oliver Kayser, after 18 years with McKinsey and 5 with Ashoka, has created Hystra consulting, a company specialized in these hybrid strategies.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Across the world, social entrepreneurs have been experimenting with a mix of social and business strategies, gaining new insights into market needs and coming up with innovative solutions to intractable global problems. It is now time for concerned and conscientious corporate leaders to do what they do best in order to help social solutions achieve the scale needed to change the world. (Kayser, 2009)

Both Robert and Oliver recognize that social entrepreneurs bring innovative solutions to social issues, and therefore are doing "R&D". However, they also acknowledge that social enterprises need to partner with multinational companies in order to grow their scale and scope.

If we continue with the metaphor where social enterprises are the "R&D Lab" for Europe social challenges, then corporations are the "production" department, which deploys the prototype conceived upstream.

Their point of view remains in the current paradigm, where only the corporations have the force to scale-up from the prototype model to consistent production. They are the only ones capable of doing this because social enterprises are too small and do not have enough resources.

Now imagine a new paradigm, where social enterprises would not only be the "R&D lab" but also the "production" department. They would be interconnected within an efficient network, where they collaborate, experiment and exchange in a transparent way.

This statement might sound absurd but it will become less hard to believe through the following comparison. In the 80's we had super-computers ("corporations") that were extremely powerful in comparison with any standard computer in the market ("social enterprise"). Now with the power of the internet ("our efficient network"), many interconnected PCs have become more powerful than a supercomputer.

A new ecosystem can be created to gather the competencies and resources to make it happen where social enterprises will not only be the "R&D lab" of Europe's social issues, but they will be the engine solving these social issues and promoting a new kind of growth.

OPEN GOVERNANCE

Open social innovation is contaminating several other sectors beyond social entrepreneurship.

Civic engagement is another key trend that combines the collective wisdom of the crowd (citizens) with the collaborative creation of sustainable initiatives that have the potential to improve the quality of life of local communities.

Governments are increasingly realizing that they can (and need) to communicate with citizens in a different way. Citizens can help provide better solutions for cities, but for that, they need to be included in decision-making processes. For example, in the German city of Nuremberg, citizens were asked to locate the noisiest areas of their neighborhood. By jointly identifying these spots, the city administration did not only get a different picture of the problems but could also work on much better solutions.

Multi-stakeholder governance appears to be the future way of developing public policy, bringing together governments, the private sector and civil society in partnership. The movement towards this new governance paradigm has been most marked in areas involving global networks of stakeholders: too intricate to be represented by governments alone. Nowhere is this better illustrated than on the Internet, where it is an inherent characteristic of the network that, laws, and the conduct to which those laws are directed, will cross national borders. This momentum has developed to bring multi-stakeholder governance to the Internet.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

The United Nations e-Government Survey 2008 indicates that governments are moving forward in e-government; the UN e-participation index indicated a constant upward movement with 189 countries online in 2008.

More than 200 municipalities and public institutions are estimated to have initiated participatory budgeting in the world.

MEU RIO

A magnificent example of this phenomenon is the online platform MEU RIO that allows the citizens of Rio de Janeiro to have a say in what's happening in the city.

Alessandra Orofino, founder of the initiative, explains in an interview that their main work is the one to translate public policy issues into a language that is understandable to broader society and young people. The site gives people an opportunity to act on things they think are important, and allows both organizers and users to identify areas for change and action. Meu Rio has a team dedicated to researching public policy so they can mobilize people effectively.

As an example, in 2013, an eight-year-old student wrote to Meu Rio about her school, the Escola Municipal Friedenreich. It has around 300 students, and is one of the best public schools in the country along with specialized staff and facilities for the disabled.

The city had decided to demolish a school to build a parking lot for the nearby Maracanã Stadium. There was no plan to rebuild the school or transfer the students, and the parents only found out through the local news.

So the organization set up a campaign to save the school and got 20,000 signatures on a petition. The campaign started attracting media attention, but even the secretary of education didn't know what to do. So Meu Rio decided to try a new tactic. They set up a webcam at an apartment across the street from the school, and monitored the school 24/7 through a website with a live feed from the camera. People could sign up to be a "guardian" of the school and watch the feed, and if bulldozers showed up, those watching could press a red button to contact Meu Rio, which would send out text messages to followers in order to physically protect the school. Around 3,000 people signed up to watch the school, and using analytics, Meu Rio discovered that for the two months of the campaign, not a minute passed that someone wasn't watching the school. Public officials realized it would be a PR disaster to demolish the school, and gave up.

TOWARDS PURE PARTICIPATORY DEMOCRACY

People participation can go beyond idea brainstorming and problem solving. The next step of stakeholders' engagement is the co-ownership of the common good solutions that are collaboratively conceived and implemented in the local communities.

A very small village in the middle of Lapland (Sweden), is living on the next edge of sustainable development and crowdsourcing - practicing as no-one else co-creation for the common good.

The majority of Vuollerims inhabitants have understood that, while in a period of abundance, competition might be the best strategy; in a period of scarcity, collaboration is certainly the approach that offers the best possible outcome.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Being in such a peripheral part of the world, can present several challenges, for example the migration of young minds towards the bigger and more attractive cities in the south of Sweden.

To address these challenges, the people of Vuollerim have come together and worked on a new welfare system that involves citizens in first person and embraces entrepreneurship as well as taking initiative, this initiative is based on collaborating for the common good, rather than focusing on individual benefits.

The district of Vuollerim has about 800 inhabitants, 60 companies and 40 non-profit associations. All of these businesses and organizations have jointly agreed (by writing it in their statutes) to aim for local development and the best for the village.

All started in 1999: when the first village-owned company was born in order to save the hardware store that had closed down and was about to be demolished. The Vuollerim's economic association is composed by more than 100 members, who recognised how essential the hardware store was for Vuollerim and its surroundings. Together they bought the property, which is now running as a multifunction store called 'The Greenhouse', in the middle of the village.

Another great example is VIVA, which manages the Inn: a year-round open hotel. VIVA is co-owned by 150 citizens: that have built and decorated the Hotel in collaboration with several other villagers.

This democratic collaboration among citizens has been extended also to the Educational field.

Vuollerims Charter School, "A good small school", is a village-owned company, which was founded in 2009 and has over 100 co-owners. The reason to start a charter school in the district of Vuollerim was to ensure there was a complete primary school education available in the village, now and in the future. This had become a concern after the municipality's decision to close down the elementary school in Vuollerim for the ages 6 to 9.

Another incredible collectively owned company is The Village Team, which provides innovators in all ages with the skills, the experience and the expertise necessary to take their idea off the ground and develop unique, locally anchored, sustainable enterprises. These days The Village Team business is in the start of implementing a crowdsourcing experiment in the open innovation platform Babele: a tool for crowdsourcing ideas and co-developing smarter solutions in a collaborative way.

The Village Team contributes as a "mentor" and sounding board for the development of new business ideas. They choose the projects depending on the individual competences and interests of the members, as well as on the local needs that are anticipated for the village. Currently, the company engages in producing local music, renting out conference halls and vehicle storage, as well as offering copying and tire services.

Another village company is Lapland Vuollerim Welcomes You AB. It is a community based tourism company, providing genuine 'everyday life' experiences. Lapland Vuollerim has been nominated for Best Outdoor Product of the Year, World Responsible Tourism Award and Tourism for Tomorrow Innovation Award and it is a socially responsible business owned by villagers, reinvesting 100% of their profits into further growth of the company and into the local economy.

What is absolutely fascinating of this model is that all the above mentioned companies strive to enhance both economic as well as social well-being and growth for the district. All profits for each village owned company are reinvested in the district in one way or another

This collaborative welfare model enabled Vuollerim citizens to work together towards a common goal: be better off as a community rather than having a village with Winners and Losers.

The village is on its way to a brighter future by retaining jobs, youth and investing in education. This model is a true HOPE for all the peripheral areas in the world that are suffering from similar challenges. It can be done everywhere! The secret is to work together.

HOW CROWDSOURCING AND SOCIAL INNOVATION CAN FAVOR PARTICIPATORY DEMOCRACY

Crowdsourcing and design thinking can be smartly combined to funnel the participation of societal stakeholders, who can take an active role in the development of civic projects for the common good. The ideal open innovation platform to achieve for participative local democracy should incorporate elements of design thinking - as a way to funnel the creativity of the crowd toward the development of the most effective and feasible solution - and a sustainable planning framework in order to use collective intelligence to define all the key elements of the project (from financial variables until its expected impact).

Below are the key phases that the ideal participatory democracy platform should contain:

Phase One: Research Phase

In this stage, stakeholders work together to create a clear picture of the status quo:

- Identify the key local problems that negatively affect the livelihood of the municipality and gather all the relevant data (quantitative and qualitative) to describe the problem and how it occurs;
- Collectively assess the root-cause of the problems and analyse the resulting negative impact through an 8-dimentional framework, which key variables are: Political, Economical, Social, Technological, Environmental, Demographical, Cultural and Legal;
- Gather success stories, solutions and best practices coming from other municipalities and contexts.

Phase Two: Ideation Phase

In this stage, stakeholders co-propose the solutions with the potential to address the problem.

The ideation framework has to be basic, in order to enable creativity in the crowd-storming process.

This will be composed by a short description of the solution, a presentation of why and how the solution has the potential to address the problem, necessary resources and implementation complexity.

Phase Three: Feedback and Screening Phase

In this stage, stakeholders dig deeper into the ideas with insights that will encourage idea development.

Stakeholders will also be able to vote their favorite ideas while justifying their choice;

By the end of this phase, the 10 most voted ideas will proceed to the following phase.

Phase Four: Planning Phase

In this stage, the selected projects will be developed extensively through a collaborative project planning methodology.

Stakeholders will develop each idea into a complete implementation plan, which will include key activities, needed resources, key partners involved in the implementation, realization timeline, as well as a complete section with financials budgeting and expected social/environmental impact.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Phase Five: Refinement Phase

In this stage, stakeholders will examine each idea and give feedback to each aspect, in order to further refine the proposed plans.

- Mentors and advisors are allocated to each project-topic based on their key interests and competences;
- Project proposers can incentivise proactivity and collaboration by rating the work done by their peers;
- The companies, organizations and institutions that could be involved in the implementation will help validate timeline and budgets for the realization of the projects;
- The municipality's will participate by sharing valuable data to assess each project feasibility;
- By the end of the phase, the community votes the best projects that will be implemented.

Phase Six: Implementation Phase

In this stage, the winning ideas are announced and an agreement is established among the organization that will participate in the project implementation.

- A transparent and easy-to-digest reporting will display the project progress and performance against established Key Performance Indicators;
- A blog with problems and challenges will be shared with the community, in order to benefit from the collective intelligence process also in this final stage.

If it is true that Democracy is a process that must constantly be reinforced at all stages by the internal participation and action by the institutions of the state as well as the international community, then it is fundamental to create new platforms to enhance the discussion amongst principal societal stakeholders, in order to spread awareness of the things which are known, discuss a strategy and get societies together to solve the global issues. Through this process, the crowd can engage and create meaningful solutions for the common good of the municipality, bringing a new fresh perspective to the current model of democracy.

CONCLUSION

The paradox of a global economy increasingly unified, and a global society increasingly divided is the most dangerous threat that weighs on the planet, because it makes difficult if not impossible, the cooperation necessary to solve the other problems.

While market forces demonstrated to be a non-sufficient mean to lead to the most efficient allocation of resources, these governments and institutions have failed to meet the needs of the Common Good and bring society together to solve global issues:

Our society has promoted homo economicus, selfish person, maximizing its interests, focusing solely on profits. This has led to a critical unsustainable situation. More and more people realize that we need to create a new type of system. People are not the rationally self-interested actor lurking at the core of

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

mainstream economic theory (the homo economicus: a mercenary ready to crush their neighbors in order to maximize its own interest).

We can also be homo reciprocans, if society promotes a development model based on sustainability, then people will act accordingly (Berlingen et al, 2015). We can see these values reflected in the new organizational models that pioneers are creating through social entrepreneurship and impact enterprises, Sulabh, Windowfarms, FoldIt are just some examples.

The demand for common good is influenced by the increasing level of awareness of the citizens that understand the importance of common good initiatives aimed at leveling inequalities and fight poverty. The world's short-sightedness about policy-making, together with the ageing of the population have led to a crisis of the welfare state, which has questioned the current pension, healthcare and education systems within the most developed countries. As a reaction of the public institutions failures to answer to the global need of common good, citizens are getting "smarter", more capable of interpreting issues and discerning between options on their own than simply accepting the views of media and political elites.

To solve the biggest challenges of our time we need a bottom up, collaborative and open sourced approach: where good ideas working in one place are easily replicated, the impact of a solution is easily reported and transparency is highly encouraged.

Stakeholder engagement combined with open innovation for social good projects allow achieving greater results than any organization working alone.

Chapter 6
Introduction of Social Media Platforms and Social Media Analytics for Social CRM

In Lee
Western Illinois University, USA

ABSTRACT

This chapter reviews customer relationship management, social media platforms, and social media analytics, and discusses how social media platforms and social media analytics are used to support social CRM. Social CRM emerged by integrating social media with customer relationship management. Social media offers companies an array of innovative ways to interact with their employees, customers, partners, and other stakeholders. As the user base of social media is growing rapidly, it is crucial for companies to understand their social media platforms, develop a plan to continually integrate social media with CRM, analyze social media data with social media analytics, and quickly respond to the needs of customers. To help CRM managers utilize social media analytics systematically, this chapter discusses various analytics methods and presents analytics processes for social media data.

INTRODUCTION

Ove the past several decades marketing discipline shifted its focus from transaction orientation to relationship orientation driven by the loyalty building and value creation paradigm (Yoon & Sims, 2014). Driven by this paradigm shift, customer relationship management (CRM) emerged as an invaluable marketing approach to strengthening customer relationships and creating co-value for both the company and the customer. The core of any CRM practice is to encourage voluntary engagement of target customers, with a special attention to those who are opinion leaders, into the value creation process (Boulding, Staelin, Ehret, & Johnston, 2005; Payne & Frow, 2005). CRM has been successfully used by large and small companies and touted as a robust marketing program for retention of existing customers and acquisition of new customers.

CRM evolved from traditional face-to-face CRM, to e-CRM, and more recently to social CRM. This evolution reflects technological developments and customers' changing expectations surrounding CRM. With the rise of e-commerce in the 1990s, electronic CRM (e-CRM) was conceptualized to leverage various web technologies in furthering CRM efforts (Llamas-Alonso & Jiménez-Zarco, 2010). While e-CRM is a subset of the broad CRM domain, it expanded traditional CRM with the use of real-time data and interactive web channels and could achieve a closer relationship between customers and business organizations (Chandra & Strickland, 2004). Fjermestad and Romano (2003) proposed two types of e-CRM: analytical and operational. Analytical eCRM focuses on the collection and analysis of customer data, while operational eCRM focuses on the management of day-to-day customer touch-points throughout a transaction.

Since the mid-2010s, social media have paved new ways of attracting new customers, retaining existing customers, and improving various types of the firm's performance indicators. While most people have been using social media for personal networking purpose, companies have utilized social media to promote their businesses and products to potential customers (Mangold & Fauld, 2009) and provide better services to their customers (Baird & Parsnis, 2011). Social media enhances the company's ability to offer better valued products/services by engaging customers in the value creation process as well as in the value feedback process. Customers are using online social networking applications to learn about products and services. Furthermore, customers are having higher expectations for products and services due to increased competition among sellers and more and better information about the products and services.

Social media is often used by customers to protest irregular business practices and customers' complaints posted on in social media are disseminated at high velocity. Companies need to analyze and respond to any postings on social media sites involving publicly disseminated complaints, allegations or other negative comments about the company, as these customer generated contents are having a great impact on corporate value (Katz & McIntosh, 2013). To strengthen their CRM efforts, major companies are keeping track of social media sites to monitor consumers' views on their socially responsible business practices.

Social media allows a company to reach a large group of people by tapping into the social network (Amoroso, Mukahi, & Ogawa, 2014). Each social network consists of members connected to a group of people and multiple-layer social networks can easily turn into a large-size network of networks of people. Leveraging the vast social networks, social media have great potential to accelerate the diffusion process of a company's innovations, to encourage opinion leaders to influence behaviors of opinion seekers, and to transform various customer engagements into the co-value creation. Despite social media's popularity, however, some companies are still hesitant to invest heavily in social media, because the value of social media investment remains to be proved.

According to Yoon and Sims (2014), social customer relationship management (social CRM) is defined as the business practice of promoting voluntary customer engagement activities with a mix of social media into the value creation process to build long-term co-beneficial relationships with target customers under the umbrella of customer relationship management (Yoon & Sims, 2014). In essence, social CRM embeds customer-business interactions into social media platforms. In an attempt to deliver customized messages and promote the voluntary engagement of opinion leaders into the value creation process, marketing practitioners have included social media as an additional new promotional element (Yoon & Sim, 2014) and have developed social media metrics to measure the effectiveness of social CRM efforts (Hoffman & Fodor, 2010).

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Yoon and Sims (2014) suggest that marketing practitioners consider how to cultivate reciprocal relationships with customers and appropriate interactions with customers within the social networks in order to build long-term relationships from the perspective of social CRM. For example, various types of customer information on social networking sites such as personal profiles, hobbies, and online postings can be used to develop personalized marketing messages to customers. In addition, social CRM can deliver insights that will help drive real customer centric innovation.

SOCIAL MEDIA PLATFORMS FOR SOCIAL CRM

Social media represents a variety of dynamic and community-based web applications that place value on the power of distributed knowledge and provide users with rich interactive experiences. Social media became a web marketing media that offers one-to-one methods for meeting and interacting with companies and other customers (O'Reilly & Lancendorfer, 2014). Social media arose from web 2.0 that shifted the web paradigm from a business-centered focus to user-centered one. (O'Reilly, 2007). Web 2.0 refers to a web technology that has evolved beyond web 1.0 and features user-created-content and online communities that allow website visitors to interact dynamically with the site. While technological distinctions between web 1.0 and web 2.0 are often not clear in some areas, the social and technological environment for positive user participation and interactivity epitomizes web 2.0. Social media embodies the principles of web 2.0 and is continuously evolving and offers business improvement tools and support business processes, knowledge management, customer relationship management, and partner relationship management. Since the mid-2000s, social media has paved new ways of accessing customers for businesses and conducting business activities. Marketing professionals are already active users of the various social media-based channels such as social networks and blogs.

Marketing professionals are realizing that social media affects a wide spectrum of marketing activities from brand awareness to promotions and after-sales services. Investing in social media applications will enhance relationships with customers and provide the opportunity to better understand the customer needs. Without customer-oriented channels, companies will have challenges in making their marketing initiatives engaging and truly valuable to consumers (Schultz & Peltier, 2013). Therefore, it is crucial for companies to select their social media platforms, develop tools and metrics to continually monitor customers' online activities, and quickly respond to customers' needs. A successful social CRM should integrate the best practices of both social media practices and traditional CRM.

Social media enables consumers to be content creators as well as content users (Hajli, 2015). Users contribute to the generation of content through writing comments and recommendations on social media sites such as Google, Yahoo, Yelp, TripAdvisor, and Facebook. Companies analyze user-generated contents for various reasons such as word-of-mouth maketing, new idea solicitation, and customer preference identification. For example, Amazon uses content generated from their customers in order to recommend products to other customers. For a potential purchaser who is interested in a certain product, Amazon lists products that other purchasers of the same product also looked at or may be interested in. Leveraging user-generated content, companies can generate an interactive stream of communication with consumers rather than a one-sided brand push (Hennig-Thurau et al., 2010).

Social media platforms refer to established online communities where their members share and seek common interests, activities, experiences, and information. Social media platforms provide archival data

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

and real-time feeds, as well as sophisticated analytics tools. Business applications of social media platforms are widespread across all industries. Different social media platforms created unique ways of user involvement in content creation and collaboration with companies. For example, Twitter is a real-time information network that connects users and followers to the latest stories, ideas, opinions, and news. On the other hand, Yelp is a site where customers publish unsolicited reviews and viewers read them.

Customers are actively choosing and using social media to meet their specific needs and tend to use a mix of social media platforms. Therefore, managers should understand how different social media platforms will affect CRM and develop a comprehensive social media integration plan for CRM. Managers also need to monitor the changing landscape of social media platforms and keep up with technological advances in social media platforms. The following introduces five types of social media platforms that can be embedded into social CRM: social networking sites, collaborative platforms, blogs, social bookmarking, and media content sharing. It is possible for companies to integrate multiple social media platforms to develop a comprehensive social CRM campaign.

Social Networking Sites

Social networking sites such as Facebook, Google+, Snapchat, and LinkedIn have created massive social network communities of people who are willing to network, communicate, and collaborate with each other. Many companies leverage social networking sites (SNS) to increase productivity in the workplace. SNS facilitate recruiting and connecting potential contributors for distributed innovation processes. Companies can also use SNS to engage in direct market research and maintain a positive relationship with customers.

To build relationships with customers, companies began to use SNS in CRM. First, SNS are used to solicit feedback on customers' product experiences and to provide customized value to individual customers. According to Lynch (2009), Texas Instruments (TI) noticed a problem in its customer service department in 2004, the main customers of which are engineers who buy and use some of the company's most technical products. To respond to customer questions more effectively, TI decided to build "E2E," which stands for engineers to engineers. Launched in 2008, E2E became a private social networking site where TI engineers interact with customer engineers. E2E proved to be a transparent portal where customer engineers and TI engineers could share best practices that help enhance TI's value proposition to customers. Second, SNS provides a forum for open innovation involving customers in the innovation process. Opening the innovation process to final customers is a new variant of Open Innovation (Chesbrough, 2003). By creating a social network with customers and seeking innovative ideas from customers about the company's products, a company can enhance the performance of social CRM. There is significant competition among the various social media platforms. For example, Google created Google+ in an attempt to compete against Facebook. LinkedIn pursued a niche area social networking services and created a specialized social networking site focusing on professional relationships.

While studies on social media typically focus on its benefits, but the dark side of social networking sites is considerably less investigated. Fox and Moreland (2015) find that although Facebook users often experience negative emotions, they feel pressured to access the site frequently due to the fear of missing out and to keep up with relationship maintenance demands. Some participants reported privacy violations due to Facebook's visibility, connectivity, and persistence. Mobile social networking sites (SNS) can contribute to increased enjoyment and convenience, but their pervasive nature can also result in exces-

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

sive use and consequently negative outcomes may entail. Zheng and Lee (2016) find that excessive use enhances cognitive preoccupation and there are negative consequences related to family, personal and professional life of excessive use of mobile SNS.

Collaborative Platform

Collaborative platforms allow users to post, delete, or update contents via a web browser. Wikis is a popular collaborative platform for organizations and groups to enable networking, idea sharing, and collaboration. Internal corporate wikis can be used as a collaborative platform tool to tap the expertise of a large group. For businesses, wikis serve as an excellent collaborative platform for collective intelligence and can facilitate innovations (Tapscott & Williams, 2007). External corporate collaboration sites enable companies to have the opportunity to seek collaboration from the public that participate in the corporate projects.

By allowing consumers to contribute ideas revolving around the company's products, the company can not only forge a core customer relationship, but can also create values for any customer that can benefit from the collaborative works. Microsoft SharePoint is a collaborative platform which provides a platform for employees and customers to work collaboratively through various methods. Other social media platforms include Zoho, Adobe Acrobat, Google Docs, and Wikispaces.

Yang and Lai (2010) evaluate the effects of both conventional and self-concept motivation on individual willingness to share knowledge in Wikipedia. Their results showed that internal self-concept motivation is the key motivation for knowledge sharing on Wikipedia. To understand users' participation behaviors in Wikipedia, Xu and Li (2015) investigate the impacts of several motivational factors on two different types of user behaviors: content contribution and community participation. They find that content contribution is more often driven by extrinsically oriented motivations such as reciprocity and the need for self-development, while community participation is more often driven by intrinsically oriented motivations such as altruism and a sense of belonging to the community.

Blogs

Blogs are online jornals that are characterized by short entries and regular updates and managed by one person/user that provides interaction with others. Blogs are inherently flexible and can be used for a variety of purposes, ranging from posting personal opinions to corporate knowledge management and customer relationship management. Personal or public blog sites are used to host blogs and the posted messages can be distributed to other sites or readers via RSS (Really Simple Syndication). One of the most useful features of blogs is the functionality that allows readers to comment on each post. This feature enables readers to engage in an open dialogue for every post. The collective comments and links on blogs form a clustered network termed the blogosphere. A variety of public blogging services are available to individuals and companies. For example, Twitter is the most popular social networking and microblogging service firm. Members of Twitter post text-based messages of up to 280 characters displayed on the author's profile page and delivered to the author's subscribers who are known as followers.

The publication of a blog enables the company to interact directly with customers. Leading companies like Intel, IBM, P&G, Ford, and Cisco are all early adopters of corporate blogs. While the blog can be used for customer relations as well as public relations, it can also be used to promote new products and

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

receive consumer feedback to products and services. Senior management can also utilize internal and external blogs to make announcements, connect with customers, and seek inputs from various stakeholders. WordPress, Blogger, Tumblr, Medium, and Twitter are popular blog hosting sites available to individuals and companies.

Sina Weibo is the most popular micro-blogging website and highly influential in China. Guan et al. (2014) analyze 21 hot events that were widely discussed on Sina Weibo in 2011 and find that (1) male users are more likely to be involved, (2) messages that contain pictures and those posted by verified users are more likely to be reposted, while those with URLs are less likely, (3) the gender factor, for most events, presents no significant difference in reposting likelihood. Ifinedo (2017) investigates factors influencing undergraduate students' continuance intention to use blogs for learning in a management information systems course. The results show that perceived self-efficacy, personal outcome expectations, and perceived support for enhancing social ties are antecedents to students' initial acceptance of blog use for learning and perceived playfulness has a significant effect on students' blog continuance usage intention as does attitude toward blog use for learning.

Social Bookmarking

Social bookmarking is the process of adding, annotating, editing, and sharing bookmarks with others via social bookmarking websites. Companies are increasingly using bookmarking sites like Delicious, Reddit, Digg, and StumbleUpon to promote new products and services and also to save, organize, and remember the web pages or web contents users find interesting on the website. Social bookmarking utilizes tagging to collectively classify and find web pages. For example, at Digg, users can "tag" web pages, labeling their name, which in turn allows the company to catalog shared tags of users. CiteULike and BibSonomya are widely used social bookmarking sites for managing and discovering scholarly references in academia.

Benbunan-Fich and Koufaris (2013) find that contributions to a social bookmarking site are a combination of intentional and unintentional contributions. They find that a significant relationship between intentional public contributions of bookmarks and an egoistic motivation to see one as competent by contributing valuable information and there is a significant but negative relationship between public contribution and altruism whereby users concerned with the needs of others limit their public contributions.

Based on the empirical analysis of the Connotea users, who are primarily in academia, Du et al. (2014) find that experienced academic users generally prefer to use social bookmarking while moderately experienced, and novice users still prefer to use the traditional bookmarking methods such as creating and using bookmarks on a dedicated computer. Experienced academic users were also found to create more tags per bookmark compared to the other two groups.

Media Content Sharing

Media content sharing is a social media platform that enables users to create, store, and share their multimedia files (photos, videos, sounds) with others. Media sharing websites allow users to upload their photos, videos, and sounds to the sites that can be accessed from anywhere via web browsers. There are the main two forms of media sharing sites: videos and photos. Instagram, Pinterest, and Flickr are popular photo-sharing sites. These sites are used for companies to gain followers and engage customers

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

in sharing photos and videos. Companies are able to build customer relationships and brand by posting well-developed contents (e.g., images and videos), and monitoring and responding to comments and questions posted about the company-generated contents.

YouTube is a powerful video sharing site that companies can utilize to create their own video publication channel. Well-developed video content can be viral and engaging. YouTube also offers free analytics that can provide information on users' viewing habits and their demographics. YouTube has become the second largest search engine only next to Google since 2013. Companies can upload promotional and informational videos for customers which are engaging, entertaining, and educational. YouTube enables companies not only to connect with existing customers and but also find new customers due to its expansive reach and presence.

Hu, Zhang, and Luo (2016) examine the effectiveness of self-construal and community interactivity in promoting user participation on video sharing communities. Based on the analysis of 184 valid responses from users from a video sharing community in China, they find that self-construal (independent-construal and interdependent construal) and community interactivity (active control and reciprocal communication) are positively associated with user participation and In turn, user participation significantly increases perceived customer value. They also find that self-construal positively moderates the relationship between community interactivity and user participation. Cha (2014) finds that those males who use the Internet for emotional pleasure and excitement, and content variety are more frequently using video sharing websites, and content variety mitigates the negative effects of content quality, loading speed, screen size, display resolution, and audio quality on video sharing websites.

SOCIAL MEDIA ANALYTICS FOR SOCIAL CRM

Social media is not free, but is labor-intensive and requires sound analytical capabilities and strategies to get the message delivered (Khan, 2017). Social media analytics refers to the practice of gathering data from social media platforms and analyzing the data to help decision makers address specific problems (Lee, 2018). Social media analytics enables companies to rapidly collect data from social media platforms and develop an in-depth intelligence of their competitive environment (Arrigo, 2014). Social media analytics equipped with advanced techniques has significantly affected a company's ability to leverage otherwise unattainable social media intelligence. Various social media platforms generate enormous amount of customer data and the popularity of social media analytics surged accordingly. Social media analytics has been used by a wide range of people including human resources professionals, marketing managers, and data scientists.

Various social media metrics allows companies to prioritize and monitor the social media sites, and social media analytics plays an important role in listening and analyzing customer data obtained from various social media sites. According to Accenture's 2014 survey of business managers, social media analytics creates a huge and untapped opportunity, but much more needs to be done to fully leverage social media analytics for consumer-packaged goods (CPG) companies (Accenture, 2014). The same survey suggested that marketing is the primary area of social media analytics. Managers acknowledge the value of social media analytics in innovation and product development, followed by customer service, operations, and strategy. Nearly half of the respondents believe that information technology as the department in which analytics competencies and roles are concentrated, followed by an analytic unit

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

within departments and business units, and a centralized analytics unit at the enterprise level. Social CRM needs close cross-departmental efforts between information technology and marketing, as analytics is an essential part of social CRM.

Social media analytics can analyze social media data for obtaining consumers' opinions and sentiments about their products and services as well as building relationships. Among many types of organizations, enterprises are the most active users of social media analytics. Analyzing social media data to better understand why customers buy the product plays an important role in sustaining competitive advantage (Brooks, Heffner, & Henderson, 2014). For example, Walmart has an abundance of social media data and Walmart Labs team monitors Facebook and Twitter and sends data to Walmart's purchasing managers. Walmart's supply chain buying decisions now rely extensively on sentiment data mined from Twitter and Facebook. Marriott, a multinational hospitality company, operates their social media center, called M Live, where about a dozen employees are analyzing Twitter feeds, Instagram photos, and Facebook posts in an effort to engage in social conversations with clients, increase the hotel chain's brand presence and keep up with the latest trends (CNBC, 2016). PepsiCo has relied on social media for a "DEWmocracy" promotion and has created new varieties that have been added to their brand as a result of social media analytics data (Research Optimus, 2014). The Coca-Cola Company operates a social media center called Hub Network, which deploys a suite of social listening, analysis, and engagement tools to deliver a better, faster and more efficient response to real-time social media opportunities and issues (Coca-Cola, 2014).

Customer analytics for social media data has been widely adopted by companies, and popular metrics include the size of social media pages, response time to complaints, posts, engagements (the number of comments, likes, or shares for each post), retweets, demographics of the people connected to a user, and followers. Customer analytics can be classified into real-time customer analytics and non-real-time customer analytics and is discussed below.

Real-Time Customer Analytics

Real-time customer analytics allows companies to manage conversations with customers, respond to their issues, and deliver information that is timely and relevant on social media channels in real time (or near real time) (Walters, 2013). It is important to identify and resolve individualized incidents that may spread out quickly via word-of-mouth. Continuous monitoring of online reviews or blogs is seen as a practice for preventing personalized issues from damaging the company's reputation. Improved customer intelligence obtained through real-time customer analytics enables the company to formulate a more precise, timely response. An empirical study shows that the more rapid the response to the consumer is, the more valuable that response is (Weiss, Lurie, & MacInnis, 2008). For example, Wells Fargo set up a command center to better monitor social media sites such as Twitter, Pinterest, and Facebook, engage with consumers on topics that are trending, and respond quickly to specific customer queries (American Banker, 2014). As part of its social media outreach, Wells Fargo has a dedicated social care unit to which it refers many of its customer complaints.

Non-Real-Time Customer Analytics

While real-time customer analytics is used to formulate reactive marketing strategies, non-real-time customer analytics focuses on developing proactive marketing strategies based on the analysis of customer data over time. Non-real-time customer analytics may produce simple quantitative metrics such

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

as the frequency or duration of the web page visits and demographics and geolocation of the visitors, the number and growth of the members on a social media, and the conversion rate. In addition to the simple metrics, companies collect more qualitative information about sentiment or opinion. Using accumulated historical customer comments, companies can analyze how customer behaviours evolve over time and may design marketing messages that have the higher reach and response. Starbucks launched a corporate social network site, www.mystarbucksidea.com, to inform customers about their new products and promotions and analyze customers' needs and expectations about their products and services in non-real-time as well as real-time. J.P. Morgan's media relations team also actively develops social media campaigns, and regularly reports on social media campaign performance and listening insights.

MAJOR METHODS FOR SOCIAL MEDIA ANALYTICS

Analyzing social media data has become a popular research and business activity due to the user-generated content accessible through web-based APIs provided by major social media sites (Batrinca & Treleaven, 2015). Social media analytics utilizes an array of methods developed to derive specific metrics from social media data. Based on the survey of the existing commercial tools, we find that sentiment analysis, social network analysis, and statistical methods are most widely used. Image analysis and video analysis are in an early stage of technology development.

Social Network Analysis

Social network analysis is the process of measuring the social network structure, connections, nodes, and other properties by modeling social network dynamics and growth (network density, network centrality, network flows, etc.) (Lee, 2017). Social network analysis was originally developed before the advent of social media to study relationships among actors in modern sociology. The relationships are typically identified from links directly connecting two actors or inferred indirectly from tagging, social-oriented interactions, content sharing, and voting. Social networking sites such as Facebook, Twitter, and LinkedIn provide a central point of access and bring structure in the process of personal information sharing and online socialization (Jamali & Abolhassani, 2006).

Social network analysis uses a variety of techniques pertinent to understanding the structure of the network (Scott, 2012). These techniques range from simpler methods (such as counting the number of edges a node has or computing path lengths) to more sophisticated methods that compute eigenvectors to determine key nodes in a network (Fan & Gordon, 2014). Social networking sites have been a popular subject of social network analysis. Marlow (2004) employs social network analysis to describe the social structure of blogs. He explores two metrics of authority: popularity measured by bloggers' public affiliations and influence measured by citation of the writing.

Sentiment Analysis

Sentiment analysis, also called opinion mining, refers to the application of computational technologies such as natural language processing and computational linguistics to identify and extract subjective information from the vast amounts of user-generated content. Sentiment analysis mainly uses two methods: (1) a machine-learning method with which the analytics learns to evaluate sentiment through acquisition

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

and integration of knowledge gained from a large number of sentiment examples and (2) a lexical-based method with which the analytics evaluates sentiment by utilizing a large dictionary of pre-scored words and phrases. Sentiment analysis has been used successfully for businesses including predicting stock market movements, determining market trends, analyzing product defects, and managing crises (Fan & Gordon, 2014). Sentiment analysis needs to be interpreted with a grain of salt due to potential sampling biases in the data (e.g., satisfied customers remain silent while those with more extreme positions express their opinions) (Fan & Gordon, 2014). For example, many online users are lurkers who join an online community with the aim of passively participating for a period of time before making a decision to actively participate in the community (Nielsen, 2006). Lurkers are more likely to post neutral messages that are not detailed enough to give up their identity (Nonnecke, Andrews, & Preece, 2006).

Machine learning methods often rely on the use of supervised and unsupervised machine learning techniques. One advantage of machine learning methods is their ability to adapt and create trained models for specific purposes and contexts. On the other hand, it is known that labeling data might be costly or even prohibitive for some tasks. Lexical-based methods use a predefined set of words which carry a specific sentiment. They include simple word (or phrase) counts; the use of emoticons to detect the polarity (i.e., positive and negative emoticons used in a message) (Park, Barash, Fink, & Cha, 2013); sentiment lexicons (based on the words in the lexicon that have received specific features marking the positive or negative terms in a message) (Gayo-Avello, 2011); the use of psychometric scales to identify mood-based sentiments. Sentiment analysis divides into the following specific subtasks (Batrinca & Treleaven, 2015):

- Sentiment context: to extract sentiment, one needs to know the context of the contents, which may vary significantly from specialty sites to general sites where contents can cover a wide spectrum of topics.
- Sentiment level: text analytics can be conducted at the word, sentence, or document level.
- Sentiment orientation/polarity: a sentiment in a text can be positive, neutral or negative.
- Sentiment strength: the strength of a sentiment in a text can be weak, moderate, or strong.
- Sentiment subjectivity: a given text may be an opinion or a fact.

Statistical Analysis

Traditional statistical methods have also been used for social media analytics. Some of the statistical methods include Markov chain Monte Carlo methods, regression models, logistic regression, factor analysis, and cluster analysis. These statistical methods typically require transformation of the original contents into a coded format suitable for statistical methods. Regression analysis has been widely useful for understanding causal relationship between various factors obtained from factor analysis. Qu, Zhang, and Li (2008) analyze the content of review data collected from Yahoo's merchant review system. Based on the content analysis, they selected fourteen factors and conducted regression analysis to identify factors that have major impacts on customers' evaluation of online merchants. Xiang, Schwartz, Gerdes Jr., and Uysal (2015) apply a text analytical and statistical approach to a large quantity of consumer reviews extracted from Expedia.com to deconstruct hotel guest experience and examine its association with satisfaction ratings. First, they conducted factor analysis to identify the underlying factors of customer

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

reviews. Then, linear regression analysis was used to examine the relationship between guest experience and satisfaction using the identified factors as independent variables and average satisfaction rating as the dependent variable.

PROCESSES FOR SOCIAL MEDIA ANALYTICS

This section presents four-stage analytics processes (Lee, 2018). Stage one focuses on developing key performance/evaluation metrics. Stage two focuses on choosing social media platforms that generate data and monitoring and listening to the chosen social media platforms. Stage three focuses on analyzing data using various analytics tools. Step four involves building social media intelligence. The entire processes are iterative and evolve over time as new social media platforms and tools emerge and the environment changes.

Stage 1: Develop Key Social Media Metrics

Companies need to decide the objectives of social media analytics. Some of the widely-used objectives include building brand awareness, increasing website visits, increasing revenue, enhancing corporate reputation, and improving customer service and customer satisfaction. These objectives must be accompanied by both quantitative metrics (e.g., the number of followers or fans, the number and frequency of postings, the number of "likes" or tweets, and the response time) and qualitative metrics (e.g., sentiment orientation, strength, and subjectivity) necessary to understand the attitude and opinions of customers and competitors.

Stage 2: Choose, Monitor, and Listen to Social Media Platforms

The specific information obtained from engaging in social listening activities is highly dependent on where we listen (i.e., selectively monitoring only a single social media site or monitoring multiple sites) and how the data is analyzed (Schweidel & Moe, 2012). Social media monitoring offers organizations quick access to valuable information about users' consumer profiles, brand awareness/interest/liking/preference and user ability to understand the brand (Lin & Rauschnabel, 2016). Monitoring customers' conversations on social media sites allows the company to respond to both positive and negative feedback quickly, provide timely customer services, and prevent reputation damage. Companies which monitor and listen to the social media conversations will also have the opportunity to counter competitors' move in a timely manner.

Stage 3: Perform Social Media Analytics

A number of analytical tools are available to help managers conduct social media analytics. While some social media data are structured, social media data are mainly unstructured and semi-structured, leading to high diversity, ambiguity, and textual disorder. These unstructured and semi-structured data require pre-processing and cleaning before data analytics to eliminate missing data, incorrect data, and

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

inconsistent data. The process of data cleaning may involve spell checking, removal of typographical errors or duplicates, validating and correcting values against a known list of entities, and tagging data with metadata. It is also necessary to transform the cleaned data into structured data.

Stage 4: Build Social Media Intelligence

Social media analytics retrospectively describes what has already happened. It does not prescribe or guide an organization's next steps (Moe & Schweidel, 2014). On the other hand, social media intelligence enables mangers to prescribe what should be done with the results of social media analytics. Social media intelligence is achieved by combining knowledge generated from traditional intelligence activities and knowledge gained from the social media analytics and helps managers develop better actionable market decisions that align with the company's objectives (Walters, 2013). According to Moe and Schweidel (2014), social media intelligence allows the company to:

1. Understand the behaviors driving the creation of online opinions from both a psychological and sociological perspective,
2. Assess the implications of these behaviors on how we interpret social media, and
3. Integrate these insights into an overall strategy.

CONCLUSION

Wong and Eyers (2011) suggest that management need to make a sincere effort to promote an honest and open relationship with its consumer. Social media has been instrumental in connecting and empowering customers. Realizing the unique advantage of social media for the customer engagement and co-value creation, CRM professionals have been integrating social media into CRM processes since the mid-2000s. As social media becomes one of the main stream marketing tools and methods, a deep understanding of social media is imperative for businesses. Social media are fundamentally different from any traditional or other online media due to users' social networking and active involvement in content creation. Social CRM is a subset of CRM specifically focusing on relationship management with customers with social media-intensive CRM practices. The selection of social media platforms should depend on the impact of those platforms on their businesses (e.g., the number of customers who are using the social media platforms) and accessibility of the content on those social media platforms.

Along with the choice of social media platforms to manage, it is crucial for the companies to select the right type of social media data and analyze them with social media analytics. Knowledge gained from the social media analytics helps managers develop better market decisions. For example, social media analytics are used to monitor and listen to the word-of mouth that spread in social media platforms and conduct thorough analysis of consumer opinions on products and services.

Many companies integrate social media into their business operations, but ignore the use of social media metrics to measure the performance. It is imperative to identify key performance metrics, establish the target values, and generate periodic performance reports. It is also important to prioritize key performance metrics. In order to establish target performance of various social media applications, competitors' performance metrics can be benchmarked. Key performance metrics include the number of social connections and followers, the number of reviews and review scores for products, the number of

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

posts and reposts at blogs, the number of comments, response time to comments, social media development costs, and conversion rates (e.g., email subscriptions, and downloads).

It is noted that the convergence of social media and CRM creates pitfalls including the organization's lack of control over message diffusion, big and unstructured data sets, privacy, data security, the shortage of qualified manpower, etc. (Malthouse et al., 2013). Social media creates dynamic networks of consumers and brands and managing customer relationships in such networks is challenging. It is noted that along with the growth of social media platforms, the influx of big data became one of the biggest challenges (O'Reilly & Lancendorfer, 2014). SAS notes that companies will face challenges in processing speed, data interpretation, data quality, visualization, and exception handling of big data (SAS, 2013). As companies adapt to the rise of social media, they need to pay special attention to these pitfalls and challenges to ensure the success of their social CRM in the marketplace.

Chapter 7
Ethical Behavior and the Development Paradigm

Punam Gupta
Dev Samaj College for Women, India

Dinesh Kumar
Amity University, India

ABSTRACT

Marketplace ethical behaviour is quite difficult to practice because it stands at cross purposes with commercial objectives. Both companies and consumers look for short term benefits in preference over practices that are sustainable or planet friendly. The thinking that dominates development economics globally is to buy, use and throw. Companies like to launch new products all the time encouraging consumers to buy new and bigger models, packaged attractively, on which margins are higher, throwing away perfectly fine and working products. Ethical behaviour – whether it is sourcing of raw materials to paying workers adequately – entails additional costs and efforts. Modifying behaviour or inculcating long term thinking is not an easy task. This chapter looks at existing behaviour both of companies and consumers. It also describes ways in which business and government policy needs to change to encourage long-term thinking in society to change lifestyles across the board.

INTRODUCTION

The world as we know it faces massive disruption and even destruction because of global warming and deterioration of habitats. It is becoming imperative that both companies and consumers start thinking about the long-term impact of their choices and behaviour. Unfortunately, the present paradigm of instant gratification for consumers and of meeting quarterly profit targets for companies does not encourage long-term ethical behaviour. However, it is increasingly becoming clear that behaviour both of companies and consumers must be modified for long term health of the planet and survival of the human race.

Modifying behaviour or inculcating long term thinking is not an easy task. This chapter looks at existing behaviour both of companies and consumers. We draw on research to show how prevalent human

behaviour is detrimental to the planet. The chapter also describes ways in which business and government policy needs to change to encourage long-term thinking in society to change lifestyles across the board.

Ethical behaviour – whether it is sourcing of raw materials to paying workers adequately – entails additional costs and efforts. An ethically produced product incurs more expenditure, which is in conflict with consumers' desire for cheap products. Even if we assume that some rich consumers will pay high prices for ethical consumption, millions of middle class and poor people across the world will continue to prefer cheap products, regardless of how they were produced. For them immediate survival and meeting of family budgets is more important than being ethical or long-term survival of the planet. This poses a unique problem both for countries and individuals.

Drawing from examples in India and across the world, we show how the prevailing development paradigm has resulted in immense pollution and hardships for the people. We discuss how ideas of economic growth and development have deleterious effects on the planet. We question whether it is time to change our thinking on economic development and show how that change is beginning to occur. We discuss alternate development philosophies and study examples of how companies are modifying their business models to include disadvantaged sections of society through social innovation.

The chapter is organised as follows. First, we discuss modern lifestyles that are influenced by the development philosophy that measures everything in terms of GDP growth. There is little room for ethical behaviour here. We then discuss ethical behaviour and conclude that personal ethics must shape societal ethics for the health of the planet. If not checked, we face serious consequences of economic growth such as waste generation, pollution, reduction in living spaces, and inequality. We discuss the capitalist disorder that is a direct consequence of such lifestyles and the thought process that is leading to change in the capitalist system that is required today. Such rethinking on the world order brings us to sustainable models and sustainable business. We discuss alternate development ideas of Schumacher and Gandhi, and how they are resulting in a new type of business model, called the social business model. This is much more sustainable and inclusive. Examples of taobao model in China, microfinance in Bangladesh and milk co-operatives in India, illustrate that several companies have already started building on this alternate development model.

MODERN LIFESTYLES

Marketplace ethical behaviour is quite difficult to practice because it stands at cross purposes with commercial objectives. Both companies and consumers look for short term benefits in preference over practices that are sustainable or planet friendly. The thinking that dominates development economics globally is to buy, use and throw. Companies like to launch new products all the time encouraging consumers to buy new and bigger models, packaged attractively, on which margins are higher, throwing away perfectly fine and working products. As a consequence, we generate enormous amounts of waste. We guzzle energy and pollute our surroundings, waste natural resources recklessly and destroy natural resources. The planet is fast approaching its maximum carrying capacity; its survival and that of the human race itself is being threatened today as effects of climate change and global warming destroy traditional livelihoods and usher in huge changes whose effects are still not totally known.

It is not wrong to say that our lifestyles, shaped by notions of modern economics, are responsible for this widespread destruction. There is hardly any room for ethical thinking and behaviour when everything

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

is quantified at the altar of GDP growth. Instead of selling a perfectly functional small car, for instance, SUVs are bought and sold over the world. This illustrates the paradigm of development economics that encourages short term and psychological gains over long term and logical behaviour.

Ethical and sustainable living is thus pushed into the background. It is now becoming clear that such short-term thinking is not sustainable. We need to modify our societal behaviour in the interest of long term survival of the planet and the human race.

ETHICS AND SOCIETAL BEHAVIOUR

Ethics is a branch of philosophy that studies morals and values. Aristotle referred to character, which he called "ethos", as the most potent means of persuasion. He also identified elements of virtue as "justice, courage, temperance, magnificence, magnanimity, liberality, gentleness, prudence, and wisdom". Ethics was incorporated into the legal system during the Roman Empire which also educated lawyers concerning ethics, morality and law. Napoleon established a code of thirty-six statutes based on the concept that all citizens, regardless of circumstances of birth or social stature, should be treated fairly and equally. Utilitarianism in ethics considers how moral actions produce the greatest overall good for everyone.

The realisation is slowly dawning that ethics does not concern individual decisions only. It is no longer about individual behaviour only but societal behaviour. This is because our lifestyle choices as consumers impact not only the rest of the society but the planet as a whole. Since the capitalist system rewards individual entrepreneurship, it hardly promotes "greatest overall good for everyone."

Today we face serious choices as our planet – our only home – is threatened by the weight of unbridled human consumption and waste. There is urgent need to control this, and this can happen only if our economic thinking and our lifestyles change and become more sustainable over the long term. It is time that we understood and acted upon the consequences of mindless development that we follow today.

CONSEQUENCES OF MINDLESS DEVELOPMENT

The idea of development that we follow today encourages unethical behaviour among both companies and individuals. It consists of waging a relentless war on the environment, squandering resources and piling up noxious waste in landfills. "There is a tremendous waste of the earth's resources for short-term pursuits," writes Vance Packard in his book, *The Wastemakers*, an apt title for modern societies. Galbraith had written that today's affluent society had adverse or destructive tendencies and must be saved from them. This section sums up the destructive tendencies of modern societies and the consequences of development that we follow.

Unbridled Consumption

The development paradigm that we have followed – of consuming products that are ever bigger, larger, newer – has led to widespread destruction of habitats. Development has ushered in what is known as the throwaway society, in which we throw away perfectly working products as they go out of fashion. We are encouraged to buy the latest design, the latest model and the latest fashion even though there is

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

no specific need for it. Ethical considerations of thrift, saving and environment protection go against the lifestyles and consumption philosophies that we follow today.

Continued GDP growth depends on people buying continuously. Modern marketing encourages a "I want it now" generation, consisting of "voracious, wasteful, compulsive consumers" that want instant gratification. Modern society is characterised by consumerism and over-consumption on one hand and excessive production of short-lived and disposable items on the other. There is a "systemic attempt of business to make us wasteful, debt ridden, and permanently discontented individuals," writes Packard.

Generation of Waste

Few countries have been able to figure out how to handle the enormous waste that we generate. Our cities are dotted with landfills. Out of 275m tonnes of plastic waste generated in 2010, between 4.8m and 12.7m tonnes entered the ocean, reports *The Economist* (2015). If we consider that 4.8m tonnes is roughly the same as the entire global tuna catch, we realise the quantum of the pollution. At current rates of economic growth, by 2025 the cumulative total dumped in the sea could reach 155m tonnes. According to World Bank estimates, current global waste generation levels are approximately 1.3 billion tonnes per year, and are expected to increase to approximately 2.2 billion tonnes per year by 2025.

Solid waste generation rates are influenced by economic development, industrialization and public habits. Generally, the higher the economic development and rate of urbanization, the greater the amount of solid waste produced. Income level and urbanization are highly correlated: as disposable incomes and living standards increase, consumption of goods and services correspondingly increases, as does the amount of waste. Urban residents produce about twice as much waste as their rural counterparts.

The solid waste is dumped in lakes and landfills overflowing with garbage, from where toxic wastes leak into the air and groundwater, destroying livelihoods for miles around. In emerging countries like India, there is no policy to regulate waste disposal. Where landfills are not available, the waste collected is dumped in low-lying or watershed areas, roadsides and even on vacant plots and fields. This has resulted in the disappearance of urban water bodies and wetlands. In Mumbai, builders dump solid waste in the coastal mangroves and creeks.

Pollution

The pollution of air, land, rivers and lakes is phenomenal. Earlier, most waste was bio-degradable. During the 20th century, however, the development of plastics, composites and other synthetic materials has produced a new generation of materials that are impossible to break down. For example, it is estimated that a plastic bottle, which we use for only a few minutes, will take 500 years to degrade. Recycling is only done only for a small percentage of the waste generated. With products made from countless metals and other chemicals, all tightly bonded together, it is almost impossible to dismantle them and reuse them.

The poisoned land and air is not without costs. Incidences of pollution-related illnesses have been reported around the world, and are only increasing. WHO reports that in 2012 around 7 million people died - one in eight of total global deaths – as a result of air pollution. This finding more than doubles previous estimates and confirms that air pollution is now the world's largest single environmental health risk.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Reduction in Spaces

Across the world, the increase in the number of cars on roads has been phenomenal. Instead of using public transport, people prefer to use cars, the bigger the better. Not only do they add to air pollution but productive land is needed to make roads and car parks. Cars idle in traffic jams, increasing commute times and reducing quality of life. However, companies continue to sell more cars globally, which continue to add to the woes of people. The increase in the number of cars results in reduction in public spaces in countless cities.

Inequality

The capitalist system by its nature encourages inequality. Oxfam has calculated that the richest 62 people in the world have as much wealth as the poorest half of the global population. Its study says that the wealth of the richest 1% has overtaken the rest of the world, that is just 1% of the population owns 99% of the wealth in the world. This sows the seeds of conflict and wars. It also raises questions on the concept of development. "Satisfying an abundance of false needs at the expense of keeping multitudes in misery can never be authentic development," writes Lebret (1954).

War on Nature

The development model that we have followed over the years involves large scale war on the planet. Countries plan and build huge dams, mines and roads. Our consumption too leaves a trail of destruction. Forests, rivers and lakes have been sacrificed for quick gratification. Two examples stand out: cutting trees to make tissues that we throw away thoughtlessly, and the use of large cars for our personal transport. Recycling is just lip service, and there is a mad rush to consume and throw away. We throw away functioning or easily repairable products, making a virtue of wastefulness.

All of the above can hardly be said to be intelligent or ethical behaviour. It adds to the capitalist disorder. Fortunately, voices are now being heard that question the system that we follow mindlessly. The next section describes how capitalism is sought to become more humane, ethical and long term in its approach.

A SLOW REALISATION

A slow realisation is now dawning that companies cannot continue to operate in the unsustainable ways they have in the past. There is also a rethinking about the model of capitalism that dominates world economies. It is increasingly being felt that while capitalism has contributed to increased wealth and better quality of life, it has also caused deep negative environmental and social impacts. Thus, the understanding that profit generation and maximization, while being legitimate objectives of companies, must also be accompanied by economic, social and environmental betterment. In other words, the world is heading to a more "humane capitalism." Companies realise that the "business-as-usual" approach – one in which natural resources are exploited ruthlessly – is creating problems of pollution and sustainability across the globe. If such development goes unchecked, we are in for great social and environmental upheavals that may well destroy the planet.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

The re-orientation of business as a social enterprise is now recognised as essential for the future of business itself. Writing that the global economic system is under threat, Bower, Leonard and Paine point out in their book, *Capitalism at Risk* (2011), "business must serve both as innovator and activist – developing corporate strategies that effect change at the community, national, and international levels." Reich writes in his book, *Saving Capitalism* (2016), "we are lurching toward a capitalism so top-heavy it cannot be sustained."

Stigliz had echoed this in his book *Globalization and Its Discontents* (2002), "Globalization today is not working for many of the world's poor; it is not working for much of the environment; it is not working for the stability of the global economy." That is, we have a system today in which the rich are reaping the benefits of development, while vast numbers of poor live in traditional livelihoods bordering on poverty. It is also being felt that the limits of sustainability have been reached – the planet cannot sustain the runaway consumption that the economic system dictates. This can best be described as an unstable system. A positive future for the planet depends on a new paradigm that links business and development and promotes social, economic, and environmental stability around the world.

Corporations realise that have a broader role in society. Porter and Kramer (1999) had written, "We are learning that the most effective way to address many of the world's most pressing problems is to mobilize the corporate sector where both companies and society can benefit." It is time that companies understood that social and economic goals are integrally connected. Preserving the environment benefits not only society but companies too, because reducing pollution and waste leads to a more productive use of resources. Boosting social and economic conditions in developing countries can create more productive locations for a company's operations as well as new markets for its products.

Bower, Leonard and Paine (2011) argue that businesses must identify the issues that could disrupt the global market system in the coming decades: they look to modifying the market capitalism system in which business must lead as an innovator and as an activist, mobilizing resources to spread the innovations. All this will shape the future of business: it will depend on how companies fulfil their objectives of profits, sustainability and inclusive growth.

In sum, capitalism can be seen to have at least four major shortcomings.

- First, capitalism leads to inequalities. Although average income levels increase, the gap between the rich and the poor increases
- Second, the capitalist system can be very unstable. The repeated financial crises illustrate this instability.
- Third, ecological issues and sustainability are totally ignored. Short-term thinking has dominated modern capitalism and that there are many appeals for sustainability.
- Fourth, many communities and individuals, do not participate in the capitalist system and are consequently excluded from the wealth creation process. This exclusion happens within countries and between countries

Martin and Kemper (2012) write that there are two opposing theories. The first was given by Thomas Malthus, who feared that at prevailing population growth rates the planet would eventually be unable to feed itself. This means that consumers and companies must do more with resources, recycle and process their waste more efficiently, and curb consumption. The second was given by Robert Solow, who wrote that environmental and other problems can be resolved through human ingenuity. Both point to change in thinking towards sustainable living and innovative solutions.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Sustainable Models and Sustainable Business

Questioning the prevailing concept of economic growth leads us to new ideas about it. For that we have to get over what an essay in *The Guardian* (2011) calls, the "deadening consensus of globalisation." Schumacher (1973) had seen that the economic system was dehumanising and too focused on profitability rather than human needs. He questioned economic growth as the central measure of growth, and insisted that human happiness would not be achieved through material wealth. He advocated people-centred economics leading to environmental and human sustainability.

These thoughts echo those of Gandhi, who had advocated a model of development based on collaborative economic system. This was based on cooperative groups of small farmers and artisans, cooperative institutions of credit and marketing, industries organized on the trusteeship principle. Everyone was encouraged to be a producer in his or her trade. The development of local communities and clusters would involve communities and lead to inclusion, leading to zero unemployment. He called for encouragement of appropriate technical innovations rather than having a few factories and millions of people dependent on them. Local infrastructure needs could thus be met by local communities. These ideas were in direct contrast with the development paradigm being followed in the West.

Though these ideas have been ignored for years, they are becoming popular once again. Many businesses in developing countries have realised that serving markets is not simply selling products. They have expanded the nature of their businesses from mere commercial motives to social ones as well. They realise that the future rests on three paradigm shifts taking place in rural approaches: innovation, transformation of companies into social enterprises, and technological advancements that bring rural consumers closer to companies.

That is to say, companies re-invent their business models and their very approach of doing business. Such companies stand a greater chance of success and long-term survival. As part of our research on marketing to bottom of the pyramid consumers, we have studied a number of companies (see Table 1) that have modified their business models for the good of all, aiming at social inclusion. These companies have gone beyond their profit-making objectives and have incorporated social objectives in their business models. Companies like Alibaba in China, Grameen Bank in Bangladesh and Amul in India have included in their business models the communities that were neglected earlier. They have thus empowered a large number of people in their countries. Such companies show that it is possible to be both ethical and profitable, and show the way to the future of business.

The companies, we find, followed the design thinking pattern: a solution focused and action oriented mind-set towards creating a preferred future. Vaitheeswaran (2012) writes that to tackle the world's most wicked problems, we need a paradigm of *design thinking*, the open-minded, no-holds-barred approach that designers bring to their work, rather than the narrow, technical view of innovation traditionally taught at many business and engineering schools. Firms invest in distribution and training of local resources, develop innovative products and processes, involve stakeholders, and above all, build a social purpose in their objectives.

The task is not easy, of course. Still, the thrust for transforming business has happened because companies seek new markets, the growing need for sustainable business activities, to reach a large, under-served market, and to develop good corporate citizenship and corporate image. Radjou and Prabhu (2012) write that multinationals have realised the importance of enhancing their capabilities in emerging economies. Products developed in the West are too expensive for developing countries, so MNCs are investing in local R&D and factories to design and produce locally relevant products and services. In their thrust

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Table 1. Companies that have gone beyond business objectives and incorporated social objectives in their purpose

Company/Brand	Business	Social Objectives
Alibaba	Online portal	Organising villages in China to become producer communities
Amul	Milk and milk products	Organising milk co-operatives, helping farmers with livestock and to get higher milk prices
Aravind/Nirmalaya	Healthcare	Providing world class health care while reducing cost, village outreach
Bandhan Bank	Banking	Providing micro-credit; organising village thrift societies
Cafe Feminino	Coffee growing	Establishes high trade standards for coffee and other products. Introduces "Fairtrade" - certifying companies that pay producers a living wage and meet other social and environmental standards
Essilor	Eye care	Providing eye care and spectacles at low cost
Fabindia	Apparel, furnishings, health products	Organising artisan communities and get better prices for their products
General Electric (GE)	Machines for medical diagnosis	Re-inventing machines to make them cheaper and portable for poor countries
Google	Digital Services	Internet penetration in villages, capacity building
Grameen Bank/Bandhan Bank/Grameen Phone	Banking/Telecom services	Organising people for microfinance/Cheap telecom services to villages in Bangladesh
ITC	FMCG, Consumer Products	Providing information and trading portal through IT couples
Jaipur Rugs	Carpets and rugs	Training local artisans and empowering them
Novartis	Medicines	Providing healthcare and branded medicines to villages
SELCO	Solar lighting	Providing cheap lighting solutions to villages
Kiva/Rangde	Crowd-sourcing	Providing funding for small businesses in villages through crowd-funding

to be sustainable, between 2003 and 2007, multinationals have invested some $24 billion in more than 1,100 R&D centres in India and China. "This approach has clear advantages over importing and selling high-priced products and services developed and produced in the West," they write.

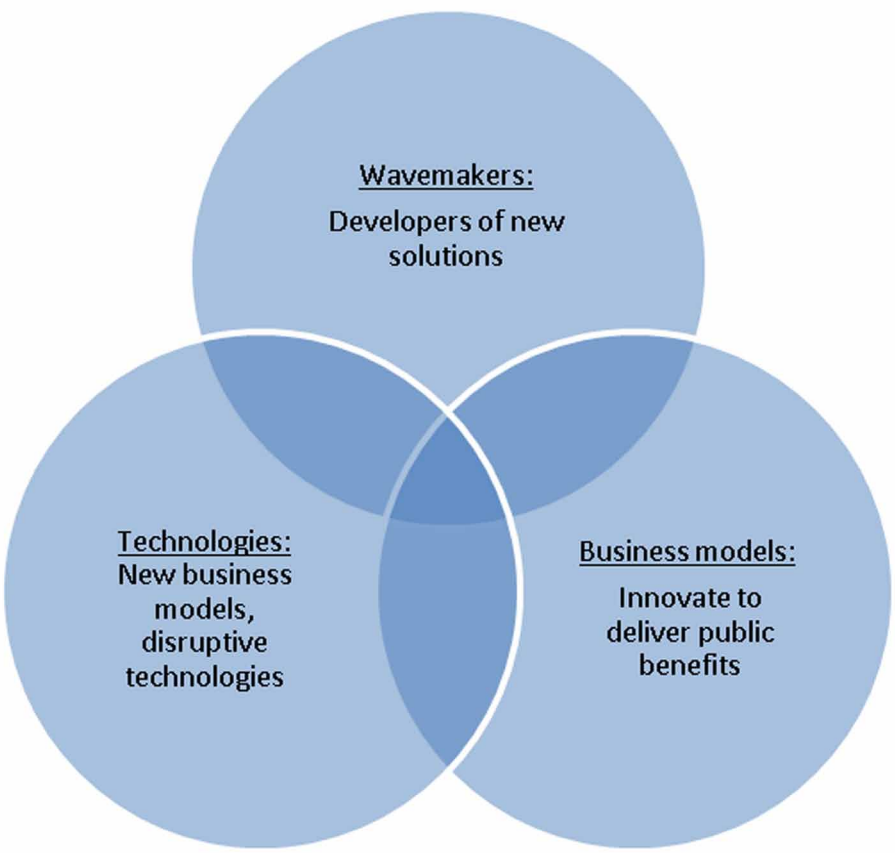
Pressure is also mounting on organisations to focus on good corporate citizenship. Such organizations pursue their objectives while building a social business. Kanter (2011) writes that firms have to think of themselves as social institutions than merely profit-making companies. This gives them a long-term perspective to invest in the human side of the organization.

Such thinking has resulted in interventions like the invention of microfinance, information and problem solving apps, and impact-investing for difficult and problems. Eggers and Macmillan in their book, *The Solution Revolution* (2013), explain how this is giving rise to the "Solution Economy" in which individuals, businesses, and sometimes governments work together to solve societal problems and also make a profit. The *solution revolution* can be seen as an interaction between three crucial factors: wave makers, technology and innovative business models, as described below. All three have to operate simultaneously as shown in Figure 1.

Sabeti (2011) writes that there is a blurring in boundaries between for-profit and non-profit models and a different model is emerging, called "for-benefit" corporations – "…that generate earned income but gives top priority to an explicit social mission." At heart of these models is sustainable behaviour and social innovation.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 1. Crucial factors of the solution revolution



The earlier approach of business was focused on profits and shareholder returns, as made famous by Milton Friedman quote in *Capitalism and Freedom* (1962): "There is one and only one social responsibility of business — to use its resources and engage in activities designed to increase its profits so long as it stays within the rules of the game, which is to say, engages in open and free competition without deception or fraud."

However, it is increasingly becoming clear that companies must solve the problems of society in which they operate. Companies will be more inclusive if they serve social objectives. Indeed, companies that have incorporated social objectives in their missions have been more successful in finding new markets and growth.

The future thus depends on companies transforming themselves to serve rural consumers in some way. Ironically, it is going back Gandhian economics: "Recall the face of the poorest and the weakest man whom you may have seen, and ask yourself, if the step you contemplate is going to be of any use to him. Will he gain anything by it? Will it restore him to a control over his own life and destiny? In other words, will it lead to *swaraj* (self-rule) for the hungry and spiritually starving millions?"

This conventional wisdom sums up ethical behaviour of society – "the greatest overall good for everyone." This, ultimately, is ethical behaviour.

Chapter 8
Transforming Crises into Opportunities to Generate Sustainable Business in Brazil

Marcia Juliana d'Angelo
Fucape Business School, Brazil

Janette Brunstein
Universidade Presbiteriana Mackenzie, Brazil

Emerson Wagner Mainardes
Fucape Business School, Brazil

ABSTRACT

Meeting the sustainable development complex requirements in a scenario, which involves multiple social actors, relationships, contexts, and interests, has demanded new business models. Thus, this chapter discusses how one of the largest companies in Latin America's chemical segment formed a network with 23 social actors and has built a Corporate Social Entrepreneurship model to deal with the dialectic between return on investments for its shareholders and benefits for its stakeholders. Research was conducted based on Boje's narrative analysis. The data was built through interviews, informal conversations, textual and audiovisual documents, and non-participant observation. The chapter describes the Corporate Social Entrepreneurship model's elements and in this manner contributes to the discussion of the role of Academia, Industry, and Government in entrepreneurship.

INTRODUCTION

Meeting the sustainable development complex requirements in a scenario, which involves multiple issues (economic, environmental, social, political, cultural and geographic dimensions; several social actors, conflicts of interests, contexts, interrelations, partnerships, and power relationships), has demanded new business models. Therefore, actors such as the Academia, Industry and Government along with

its collaborative networks are striving to develop news ways to find viable solutions for complex social and environmental problems.

Several approaches, such as the social learning for sustainability in organizations have contributed to the resolution of these issues (D'Angelo & Brunstein, 2014). Corporate Social Entrepreneurship is another approach that can help understand how organizations not only support a problem resolution but also take advantage of such situations to lever its business and generate a societal change (Austin, Leonard, Reficco, & Wei-Skillern, 2006).

Corporate Social Entrepreneurship is a concept, which has emerged from other conceptual frameworks – entrepreneurship, corporate entrepreneurship and social entrepreneurship – to address societal issues, based on collaboration and partnerships by creating social and economic value (Reficco & Austin, 2009). However, this concept is still emerging as an area for academic inquiry with a few studies on this field (Hemingway, 2005; Kuratko, Hornsby, & Mcmullen, 2011; Wickert & Schaefer, 2011; Spitzeck, Boechat, & Leão, 2013) and its theoretical underpinnings has not been adequately explored, and needs more contributions to theory and practice.

Thus, this chapter will present a case study to discuss and analyse how a large organization –The Chemical Company – and its network of multiple social actors are engaged in a sustainable business web and building up a Corporate Social Entrepreneurship model in the town of Bebedouro, in the state of São Paulo, Brazil. This town is part of one of the most developed agriculture business regions in Brazil.[1]

It is about a case which has started 30 years ago, involving around 20 cities in states of São Paulo, Paraná, Santa Catarina and Mato Grosso; 122 agriculture properties; 43.000 hectares diagnosed; more than 70,000 people reached by environmental and education actions; 29 million students benefited by Theatre actions; 7.013 children on ecological trail; 35.000 students beneficiated by Environmental Atlas Book; and 300 teachers qualified (Foundation, 2011; The Chemical Company, 2013).

By the end of this chapter, we hope to contribute to address the issue about the role of Academia, Industry and Government collaborative networks in entrepreneurship, as well as, the role of the Government in Academia – Industry – Government (state or municipal) networks.

BACKGROUND

The Sustainable Development's Principles Operationalization by Organizations

The dynamics of the contemporary development process will be more or less sustainable as a function of the combination of human life different dimensions, such as economic, sociological, politic, cultural, technological, environmental etc., well grounded in distinct fields, but complementary: competitiveness, sustainability and flexibility (Becker, 2002).

Competitiveness is a result of the transformation process due to the economic globalization process, led by large corporations, whose objectives also become nation, regions, other organizations and institutions' objectives. Sustainability is the other side of competitiveness, giving it an organic character. In other words, each reality – local, region or nation – needs a different dialog and resources to get inserted in such transformational process. Finally, flexibility unfolds in participation, partnerships, networks, chains, consortiums, alliances, integration, common markets, and so on. It a way to approach groups, organizations, regions and nations to deal with common interests, including partnerships between competitor firms and nations (Becker, 2002).

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

These authors understand that the development process should take into account the society's political, economic, social, structure and organization conditions. And this is possible due to the technological progress, which strengthened the humankind's analytical capacity to work with the increasing quantity of available information, and also to the modern society organization.

Since 2002, one of The United Nations World Summit on Sustainable Development's conclusions have been about the involvement of three fundamental social actors: organizations, governments and civil society, guided by the scientific knowledge (World Summit on Sustainable Development, 2002). However, according to Sachs (1981, p. 115), the civil society needs to find its own voice to help to rebalance the power relationship before state and public and private institutions. For him, viable solutions can only manifest where people live, which means, locally. Thus, for each place, each local, each community, each region, each state, each nation, each continent needs to produce its own mechanisms of participation. It means, learn how to develop sustainable solutions for local environmental, economic, social, politics, cultural and technological problems (Becker, 2002).

Some public and private organizations are really making a move and supporting the civil society's efforts. But, which way such organizations are assimilating the above concepts and ideas? How are they generating answers?

Among the initiatives which aim to operationalize the sustainable development's principles by organizations are: 1) the exercise of Corporate Social Responsibility (Carroll, 1991, 1999, 2000); Schwartz & Caroll, 2008); 2) Social Entrepreneurship (Dees, 1998; Mitra & Borza, 2010, 2011); and 3) Corporate Social Entrepreneurship (Austin et al., 2006); Reficco & Austin, 2009).

According to Reficco and Austin (2009, p. 2), 'Corporate Social Entrepreneurship (CSE) is a process aimed at enabling business to develop more advanced and powerful forms of Corporate Social Responsibility (CSR)', which in turn, is already a significant evolution of the traditional concept and practice of corporate philanthropy. The relationships among these concepts are shown in Figure 1.

Figure 1. Evolution of businesses' approach to societal responsibilities

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

As this chapter will discuss how one of the largest companies in Latin America's chemical segment, together with its 23 social actors network, is dealing with the dialectic between return on investments for its shareholders and benefits for its stakeholders, the focus of this literature review is on the Corporate Social Entrepreneurship concept.

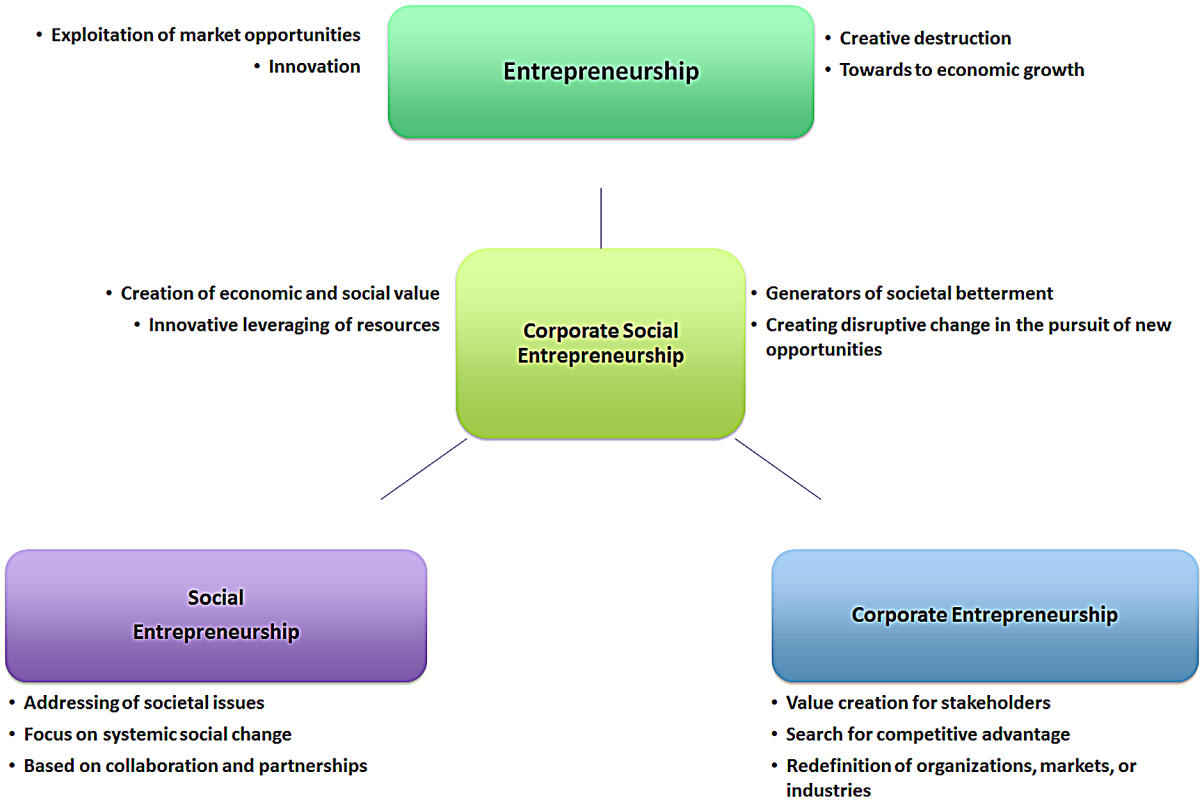
Corporate Social Entrepreneurship

For Reficco and Austin (2009), Corporate Social Entrepreneurship has emerged from and has built on three other conceptual frameworks: 1) entrepreneurship, 2) corporate entrepreneurship, and 3) social entrepreneurship. Figure 2 shows the main characteristics of this concept building.

Entrepreneurship means create a new enterprise (Low & MacMillan, 1988). Schumpeter (1934, 1942) defined entrepreneurs as individuals who exploit market opportunities, such as, the introduction of a new good or a new method of production, opening of a new market, conquest of a new source of supply of raw material, especially through entrepreneurial innovation. In general, this author advocates that entrepreneurs wish power and independence play a role as the key drivers of economic growth.

However, not all market opportunities are entrepreneurial opportunities – situations in which new goods, services, raw materials, and organizing methods are exploited to have superior organizational performance, generating economic value (McMullen, Plummer, & Acs, 2007; Companys & McMullen, 2006; Casson, 2003; Shane &Venkataraman, 2000).

Figure 2. Concept building characteristics of corporate social entrepreneurship
Source: The authors



EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

A preliminary typology of entrepreneurial opportunities by Companys and McMullen (2006) introduces the economic opportunities, which also encompasses the technological opportunities, and requires human, financial, technological, methodological and informational resources to create new markets, products, services, experiences and ideas to be commercialized for wealth creation. This type of opportunity requires discovery and exploitation by alert entrepreneurs.

In cultural cognitive opportunities, entrepreneurs engage in innovative interpretive processes by recombining existing beliefs and practices, in order to develop new ways to interpret the world, as to enact new social and economic realities. That´s why these situations are subjective. It encompasses producer opportunities (supply side of cultural cognitive opportunities) and consumer opportunities (demand side of these opportunities). A requirement for this opportunity is the development within cultural communities, once consumer opportunities include the attachment of value to new and existing goods and services to cultural innovations initiated by consumers (Companys & McMullen, 2006).

Sociopolitical opportunities, unlike cultural cognitive opportunities, are objective situations and grounded on network structures. There two subtypes: network opportunities and political opportunities. The former can results from existing social relations and there is a presence of knowledge heterogeneity and the latter requires that network participants leverage different ideological frames to interpret the world, as to enact such opportunities. Network opportunities, like the economic opportunities, also require discovery and exploitation by alert entrepreneurs (Companys & McMullen 2006).

Corporate entrepreneurship involves a combination of competition, competitiveness and the search for competitive advantage. For some scholars, corporate entrepreneurship have been understood as an approach in which organizations can adapt to dynamic competitive environments through innovative activities (Hornsby, Kuratko, Shepherd, & Bott, 2009; Ireland, Covin, & Kuratko, 2009; Kuratko, Hornsby, & Mcmullen, 2011). Covin & Miles (1999, p. 50) understand this concept as 'the presence of innovation with the objective of rejuvenating or redefining organizations, markets, or industries in order to create or sustain competitive superiority'. For other academics, commercial entrepreneurs take advantage of the given opportunities on capitalist markets to obtain a competitive advantage (Kirzner, 1982). For such entrepreneurs, the primary mission is based on financial independence value creation for stakeholders (Borza, 2008).

Covin and Miles (1999) present four forms of corporate entrepreneurship. The first is regeneration, in which organizations introduce new products and services or enter new markets in a continuous way to take advantage of market opportunities. Of course, organizations, which are involved in sustained regeneration, have an innovation culture and are able to respond very fast to market demands. When the organization needs to modify its management mechanisms like business processes and organizational structure, the organization is involved in organizational rejuvenation or organizational renewal to get a better competitive position. The third form is strategic renewal that has to with the environmental context, in particular, with the relationship with its markets or industry competitors. The objective is this case, is to define a strategy to launch of new products or to exploit new markets. This form of corporate entrepreneurship is adequate for organizations facing turnaround situations or seeking the maintenance of competitive superiority. The last form of corporate entrepreneurship, is domain redefinition, which embraces proactive actions to exploit new markets or new products and provoke a radical change in the competition. According to Covin and Miles (1999, p. 54),'firms that engage in domain redefinition are entrepreneurial by virtue of the fact that they exploit market opportunities in a preemptive fashion, redefining where and how the competitive game is played in the process'. The objective is to take the competition to the highest degree while establishing new bases for sustainable competitive advantage.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Social entrepreneurship encompasses the addressing of societal issues, such as social needs, social problems, and social inclusions by creating social value and sharing resources among the different partners. For Borza, Mitra, Nistor, & Bordean (2009), social entrepreneurship is understood as a process to deal with such issues by providing viable solutions and improving access to socialservices, health, education and so on. Social entrepreneurs focus on systemic social change by sharing the necessary resources via partnerships (Nicholls, 2006). Mitra and Borza (2010) also understand this process is based on collaboration and partnerships, grounded on long term goals, projects and mechanisms to get participation and involvement from all stakeholders in this complex web of social issues. Social entrepreneurs accomplish their objectives by incorporating a high degree of innovation (Hatten, 2009). For Austin, Stevenson and Wei-Skillern (2006), social entrepreneurship also addresses social value through innovative ways and partnerships within government sectors and other profit and nonprofit organizations. Organizations engaged in addressing social issues, can do that through a social mission based model supported by collaborations and partnerships, in order to create social value (Mitra & Borza, 2011).

Therefore, **Corporate Social Entrepreneurship** (CSE) is an evolution of Corporate Social Responsibility once it is an approach, which encompasses a model for transforming crises into opportunities to generate sustainable business. Its primary objective goes beyond the traditional societal actions and programs. It is about how to provide the necessary actions and activities within a company and through collaborative networks to structure solid business models to face the challenges of the sustainable development while formulating strategies for superior organizational performance paradigm (Austin et al., 2006).

These authors have been conceptualized **Corporate Social Entrepreneurship** (CSE) as:

The process of extending the firm's domain of competence and corresponding opportunity set through innovative leveraging of resources, both within and outside its direct control, aimed at the simultaneous creation of economic and social value. The fundamental purpose of CSE is to accelerate companies' organizational transformation into more powerful generators of societal betterment (Austin et al., 2006, p. 6).

Like all entrepreneurship, is not about managing existing operations or Corporate Social Responsibility programs; it is about creating disruptive change in the pursuit of new opportunities. It combines the willingness and desire to create joint economic and social value with the entrepreneurial redesign, systems development, and action necessary to carry it out (Austin et al., 2006, p. 6).

Reficco and Austin (2009, p. 3) suggest five elements that they understand are central to the process of transformation of the way a company operates: 1) creating an enabling environment; 2) fostering corporate social intrapreneurs; 3) amplifying corporate purpose and values; iv) generating double value; and v) building strategic alliances.

The first element – **creating an enabling environment** – has to do with giving the organization means to adopt an entrepreneurial culture to move from Corporate Social Responsibility approach to the adoption of Corporate Social Entrepreneurship model. These means involve top management commitment to change the culture not only from focus on revenue generation but also to social value creation by formulating a vision and strategy according to these principles; forming cross-functional teams; and making the appropriate changes in the organization's structures and processes. These authors also recommend that 'must be performance measurement indicators for the economic and social value generated and the incentive and reward system must be aligned with these indicators' (Reficco and Austin 2009, p. 3).

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

The **Corporate Social Intrapreneur** is the second element, once multiple change agents or intrapreneurs power Corporate Social Entrepreneurship process. In this case, there is a difference between the roles of the social or corporate entrepreneur from the role of managers. In general, corporations need to be entrepreneurial in order to innovate and go beyond their traditional managerial approaches when addressing issues, such as transforming crises into opportunities to generate sustainable products and services to attain competitive advantage. Some roles for CSIntrapreneurs, according to these authors, are:

- Champions: they defend the integration between social and business value creation;
- Communicators and listeners to articulate about the rationale and importance of the transformation to various stakeholders;
- Creators of innovative solutions;
- Catalysts to support the change and create synergies in the whole organization;
- Coordinators: they are able to reconcile interests to incentives;
- Contributors: they are team players;
- Calculators: they have knowledge of the whole corporate environment and aware of cost-conscious and bottom line.

The third element aim to **amplify corporate purpose and values**, which means the organizational values must mirror the organization's actions, for sure. According to Reficco and Austin (2009, p. 4), 'the goal is not just to comply with the law, or to be responsive tokey stakeholders: the agents seek to lead through example, to exceed expectations, and to set newstandards'.

Value creation and the double return, the fourth element, are about finding innovative ways to deal with the dialectic between return on investments for its shareholders and benefits for its stakeholders, by generating sustainable products and services, in a complementary and synergistic way rather than competing (Paine, 2003; Reficco & Austin, 2009).

Finally, **co-generating value** is about sharing resources through strong and strategic partnerships with businesses, civil society, or governmental. 'Strategic alliances that combine complementary core competencies can create new resource constellations that enable innovative solutions to long-standing social and economic problems' (Reficco & Austin, 2009, p. 5).

That's these elements which will be identified and discussed along of the Programme for Environmental Compliance and Education discuss and analyse how a large organization – The Chemical Company – and its network of multiple social actors are engaged in a sustainable business web and building up a Corporate Social Entrepreneurship model in the town of Bebedouro, in the state of São Paulo, Brazil.

Methodology

As the objective was to understand the Programme for Environmental Compliance and Educationas well as its whole context in-depth, it was conducted a single case study based on the narratives and stories of this Programme. Also it is about a phenomenon that is still in progress, and has been expanded to other towns, despite it started-up in 1984. Besides, it encompasses several elements, such as multiple issues (economic, environmental, social, political, cultural and geographic dimensions; several social actors, conflicts of interests, contexts, interrelations, partnerships, and power relationships) and the definition of strategy for supporting sustainable business.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

The data was collected through multiple procedures, like semi-structured interviews, informal conversations occurring in person or by telephone; documents provided by the social actors; and non-participant observation in activities with students and teachers. And to interpret and discuss the data, it was used antenarrative analysis of Boje's (2001).

BUILDING UP A CORPORATE SOCIAL ENTREPRENEURSHIP MODELIN BRAZIL TO GENERATE SUSTAINABLE BUSINESS IN A NETWORK OF SOCIAL ACTORS, RELATIONSHIPS AND INTERESTS

Implementing The Chemical Company's Corporate Social Entrepreneurship Model

The Chemical Company's Corporate Social Entrepreneurship model operates and presents some elements, which were critical for the implementation of this model, as suggested by Reficco and Austin (2009), as follows.

Creating Value and an Enabling Environment

The Chemical Company arrived in the town of Guaratinguetá, Brazil, in 1959, and since then, has become the one of the largest companies in Latin America's chemical segment. And by that time, has already acquired areas for its industrial installations around by devastated ciliary forests (native forest) on the banks of the Paraíba River, in this town. This environmental problem was the result of the sugarcane and coffee crops cycles since the eighteenth century and led to some negative consequences and conflicts of interest among landowners, government, Guaratinguetá communities, such as noncompliance with environmental legislation, floods, erosion.

To deal with these issues, in 1984, The Chemical Company launched a Ciliary Forest Recomposition Programme. Supported by the Municipal Urban Services and Agriculture Office of the Town of Guaratinguetá and IBAMA (Brazilian Institute of the Environment and Renewable Natural Resources), The Chemical Company, over the course of 23 years (1984−2007), has recovered the whole area. As a result, the area has been completely recovered and transformed into an open-air classroom for the environmental education in the town of Guaratinguetá and The Chemical Company has developed competences for recovering ciliary forests in degraded areas and interrupting loss of diversity. Since the beginning of the Programme, the government has played a determining role by defining the rules to guide the rural producers in how to adopt lasting environmental practices. It is about a coercive relationship since the farmers have to comply with the legislation to avoid penalties. Despite of this relationship, the government, at least, has provided standardized directions and procedures for all rural producers. However, it does not mean that all farmers are complying the environmental legislation.

In order to **create economic, social and environmental value**, in other words, return on investments for its shareholders and benefits for its stakeholders, since 2005, this successful experience has been strategically replicated to the Crop Protection Unit's clients. Along with The Chemical Company's Foundation support, the original programme was redesigned and renamed to Programme for Environmental Compliance and Education to operate in a complementary and synergistic way. From the environmental

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

compliance perspective, winning the loyalty of large clients (the rural producers) by supporting them to comply with the Brazilian environmental legislation, as well as, showing them the benefits of biodiversity control for a good quality harvest, is one of the Programme strategic objectives. From the environmental education view, actions include activities in public schools, teacher training and raising young people's awareness of the importance of sustainability through Environmental Atlas Book, the ecological trail and the theatre activities, in the town of Bebedouro – SP.

So, from this moment on, The Chemical Company has started up to **create anenabling environment**to adopt an entrepreneurial culture to move from Corporate Social Responsibility approach to the adoption of Corporate Social Entrepreneurship modelwhen formulated and approved the strategy with focus not only on revenue generation but also on social and environmental value creation. It means, that the objective, besides complying with the law and responding to key stakeholders' demands, is to lead through example and to expand this successful experience to other agents (Reficco & Austin, 2009).

Amplifying The Chemical Company's Purpose and Values

Thus, besides complying with Brazilian environmental legislation and being responsive to the key stakeholders in the town of Guaratinguetá, The Chemical Company and its Foundation, since 2005, have launched the Program for Environmental Compliance and Education through its own example and experience. The experiencewas replicated for the clients along with the contribution to sustainable agriculture only after the development of competences – a body of knowledge, abilities and attitudes on recovering ciliary forests in degraded areas and interrupting loss of diversity.

At a certain point, it can say that The Chemical Company together with its Foundation went beyond and exceed expectations, by integrating the social education actions, environmental compliance and economic and strategic objectives. Therefore, it is possible to say that The Chemical Company is a **value-based organization, by amplifying its corporate purpose and values**. As the programme has been expanded to other cities, the social and environmental value creation has become a structural component, a cornerstone of The Chemical Company and Agro Crop Protection Unit's identities, as suggested by Reficco and Austin (2009).

To do that, it was necessary its top management involvement. The Agro Crop Protection Unit and the Foundation formed the first cross-functional teams. With the transfer of this programme's strategic management to the Foundation, the Crop Protection Unit does not lose its focus on developing new businesses and selling, and furthermore, has the Foundation as a strong ally, an extension of the unit itself to implement the programme with its clients.

Co-Generating Value

Since the Foundation is not structured to cover all the needs of the Programme, this initiative was implemented through human, financial, technological, methodological and informational resources shared among the different partners, but with no additional costs for the rural producers, students and teachers. These partnerships assume different roles and responsibilities, as shown in the Table 1. So, in the Program for Environmental Compliance and education, there is collaboration with otherorganizations – businesses, civil society, or governmental.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

However, as this complex implementation involves diverse issues, the Foundation hasto coordinate and articulate to integrate all multiple issues (economic, environmental, social, political, cultural and geographic dimensions; several social actors, conflicts of interests, contexts, interrelations, partnerships, power relationships), by finding innovative solutions and solving conflicts, at the same time, accomplishing with all proposed objectives. Therefore, it was necessary to structure a very specific implementation and management model.

So, besides the elements mentioned above, The Chemical Company's Corporate Social Entrepreneurship model present very specific elements when implementing this whole model. For example, it is necessary to raise the awareness of social actors whilst qualifying them, since it is important to provoke interest and convince them that sustainable results are achievable, as long as there is correct application and use of the methods and tools and that these are user-friendly instruments'. Also, this model is supported by giving support and guidance, in particular, to the rural producers and teachers, over the course of the cycle, since it is not based on methodologies and tools of the 'apply yourself to your local reality' types. It is about an experienced-oriented model to complete the qualification cycle (D'Angelo & Brunstein, 2014, p. 13).

The Corporate Social Intrapreneur

Since the Foundation is an extension of The Chemical Company, it assumes the position of company's main CSIntrapreneurs. These actors have the following roles:

- **Champions:** they defend the integration between social, environmental and business value creation: join the social (environmental education in a region whose income comes from agricultural production); environmental (guides and supports rural producers in the recovery and restoration of permanent preservation areas) and economic (strategy of winning the loyalty of large clients) dimensions;
- **Communicators and Coordinators:** To articulate the complex, involving various elements of the Program for Environmental Compliance and Education and reconcile interests: 23 social actors and their multiple interests; diverse contexts and interrelations; various power relations that permeate the participation and engagement of this programme's social actors;
- **Creatorsof Innovative Solutions**: The Chemical Company, supported by the Municipal Urban Services and Agriculture Office of the Town of Guaratinguetá and IBAMA (Brazilian Institute of the Environment and Renewable Natural Resources,) undertook actions to find a viable solution for the environmental problem of ciliary forest devastation.
- **Catalysts and Contributors:** To support the change and create synergies not only with The Agro Crop Protection Unit, but also with the partners, enabling other groups: the clients, such as the Cooperative; teachers, students, and Bebedouro's community.

The discussion above shows that The Chemical Company has been able to develop competencies of recovering ciliary forests in degraded areas and interrupting loss of diversity in such region, as well as, meeting the requirements of Brazilian environmental legislation. Therefore, it has also been able to extend its domain of such competencies through innovative leveraging of resources with strong and strategic partnerships to create economic and social value. Doing that, The Chemical Company has given a small

Table 1. Some multiple issues of the Programme for Environmental Compliance and Education

The Social Actors in Bebedouro	Interests and Sources of Conflicts	The Contexts	The Power Relationships
The nature: • The lands in Guaratinguetá • Santa Julia Farm (the environment)	Be recovered in terms of fauna, flora, soil, hydric system etc.	• A profit organization • Non-governmental organization (The Foundation) • Schools for collective teaching • Rural properties, where the recovery of the protection and legal reservation area occur • The forest, where the Ecological Trail training is conducted • A stage (Program itinerant theatre and bus), for dissemination of socioeducational knowledge for the Bebedouro community • The University, responsible for providing the qualification in environmental recovery methodologies and creation of the Environmental Compliance Map for the rural properties)	• Consulting relationship and creative relationship among The Chemical Company, The Municipal Department of Agriculture and Urban Services of Guaratinguetá and IBAMA • Co-active relationship between the Foundation, GIZ and DEG • Attractive relationship between the rural landowners' Cooperative and rural landowners
The organization: • Crop Protection Business Unit + Guaratinguetá's Business Unit • The Chemical Company's Foundation	• Comply with environmental legislation • Support its clients also to comply with environmental legislation • Get the large clients' loyalty		
The clients: • The rural landowners' Cooperative • The rural landowners' financial institution • The rural and agricultural technicians and landowners – Santa Julia Farm • Bebedouro Experimental Station	• Comply with environmental legislation • Have high quality harvests		
The community: • Teachers from School: EMEF Yolanda Carolina Giglio Villela • Students from School: EMEF Yolanda Carolina Giglio Villela • Bebedouro community	Teach and learn how to contribute for the sustainability in a region, which depends on agriculture business income		
The partnerships: • Ecological trail coordinator in Bebedouro – SP • United Nations and Food and Agriculture Organization (FAO) • GIZ (Deutsche Gesellschaft für Internationale Zusammenarbeit) • DEG (Deutsche Investitions – und Entwicklungusgesellschaft mbH) • Geodinâmica – sustainable social entrepreneurship organization • Instituto Romã – organization of educational process of experiences with nature • Bellini Cultural – culture project organization • Agricultural High School Luiz de Queiroz (ESALQ/USP)	• Provide methodologies and tools of sustainable environmental and educational processes • Facilitate dialogue that act as impartial mediators, aiming to obtain the expected results or even conflict resolution • Have influential leadership, attracting more people to the programme through their example • Multiply to form and train other social actors • Standardise the guidelines to direct actions • Provide financial resources and generators of knowledge		
The Government: • Forest Code and Environmental Policy • Public employees – Culture Department (Rouanet Law) • Public employees – Brazilian Institute of the Environment and Renewable Natural Resources, IBAMA • Public employees – Municipal Department of Agriculture and Urban Services of Guaratinguetá - SP • Public employees – Municipal Department of Education and Culture of Bebedouro	• Provide guidelines for the standardisation of safe environmental practices and with lasting results • Ensure compliance with environmental legislation • Support the local schools with adequate	• Public bodies responsible for the regulatory aspect	• Coercive relationship between the rural landowners and the government, due to the imposition of environmental legislation

Source: The Authors

contribution while a generator of societal betterment, as suggested by Reficco and Austin (2009). In this case, help the rural farms to have a good quality harvests and raise Bebedouro community's awareness of the importance of sustainability and environmental education in a region whose income comes from agricultural production. With its Foundation, its partners, and its economic objectives, The Chemical Company has combined the willingness and desire to meet both its economic objectives and social value, through entrepreneurial redesign and action necessary to carry it out, as suggested by Austin et al. (2006, p. 6).

FUTURE RESEARCH DIRECTIONS

Reficco and Austin (2009, pp. 7-8) said: 'The penetration of the social realm into corporate strategy has gathered momentum in the last years', and the 'Corporate Social Entrepreneurship process will contribute to our collective quest for superior organizational performance and societal betterment. This is the great opportunity and action imperative'.

In this sense, The Chemical Company's case study above has shown the viability of a Corporate Social Entrepreneurship model as a way for the creation of a competitive advantage by combining the environmental, economic, social, political, cultural and geographic dimensions. From the sustainability paradigm perspective, to meet the local and global challenges, business opportunities and business strategies also should address the societal needs.

However, given the model complexity, many resources and huge efforts are necessary to put it into action. For this reason, some organizations are willing to invest in Corporate Social Responsibility or the Social Entrepreneurship rather than in Corporate Social Entrepreneurship.Therefore, Advances in Business Strategy and Competitive Advantage (ABSCA) Book Series can inspire and support such organizations and scholars, in particular, in addressing regional development strategies with focus on:

- Local challenges, business opportunities and the needs of society;
- On the regional innovation concept is based on an interactive set of private and public interests, formal institutions and other entities that operate in accordance with organizational and institutional agreements and establish relationships leading to the generation and dissemination of knowledge.

Thus, as a suggestion for future research, it is recommended the study of Corporate Social Entrepreneurship in other profit-based organizations in different industries, like services, once the elements which composes the Corporate Social Entrepreneurship model will depend upon company's societal and economic objectives.

CONCLUSION

By the end of this chapter, we hope to have contributedto show that organizations can move from Corporate Social Responsibility approach to the adoption of Corporate Social Entrepreneurship model. Its implementation is viable but requires efforts and resources, as discussed above.

All organizations, which desire to create economic and social value, can achieve these objectives through a Corporate Social Entrepreneurship model. Its implementation is viable if have the right partners to support the model. Despite the elements which composes the Corporate Social Entrepreneurship model will depend upon company's societal and economic objectives, a key element is partnership to co-generate value by sharing human, financial, technological, informational and methodological resources. Of course, the power relationships vary among the social actors and partners, but which one has an important role in this model structuring.

We also hope to have contributed to discuss the Academia – Industry – Government collaborative networks' role in innovation and entrepreneurship, as well as, the role of the Government in Academia

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

– (I) Industry – (G) Government networks, by examining the elements of the Corporate Social Entrepreneurship model from one of the largest companies in Latin America's chemical segment.

In general, in the Program for Environmental Compliance and Education, Government has had the role to provide a set of regulatory command and control instruments to direct and standardize the adoption of safe and long-lasting environmental practices (Brazilian legislation), as well as, methodologies and tools to make that (Ibama's role). Academia (Escola Superior de Agricultura Luiz de Queiroz – ESALQ/USP) was responsible for providing the qualification in environmental recovery methodologies and creation of the Environmental Compliance Map for the rural properties. And Industry, The Chemical Company, has the role of finding innovative ways to create social value by formulating, implementing a strategy to meet all the issues addressed by a Corporate Social Entrepreneurship model. Also Industry has the role to articulate and coordinate all the necessary issues, such as conflict of interests, several social actors to put into action viable solutions to solve the complex social and environmental problems surrounding the world.

But much remains to be done.

By enabling an appropriate environment to move from Corporate Social Responsibility approach to the adoption of Corporate Social Entrepreneurship model, Reficco and Austin (2009, p. 3) suggest 'there that must be performance measurement indicators for the economic and social value generated and the incentive and reward system must be aligned with these indicators. Furthermore, it is important to highlight the need to implement an approach for environmental and sustainability assessment in this Program, which embraces the Program's complexity and its several elements, as discussed above.

KEY TERMS AND DEFINITIONS

Biodiversity: A variety of plants, animals and micro-organisms in different ecosystems - inter alia', terrestrial, marine, and other aquatic ecosystems.

Ciliary Forest: A native forest necessary to protect rivers, lakes and reservoir. The origin name comes from the fact that the eyelash is important to protect the eyes. Note: in Portuguese Language eyelash is "cílios" and ciliary is "ciliares".

Competencies: A body of knowledge, abilities and attitudes on recovering ciliary forests in degraded areas and interrupting loss of diversity.

Dimensions of the Sustainable Development Paradigm: These dimensions encompass mainly the economic, environmental, social, political, cultural and geographic issues.

Experienced-Oriented Model: A way to implement actions based learning by doing" and with support and guidance from experts.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Multiple Issues: Issues that encompass the dimensions of the sustainable development paradigm; the social actors; the conflicts of interests; the contexts for interrelations; the partnerships and the power relationships.

Societal Issues: Issues that encompass social needs such as social equity, social responsibility, social support, social justice and so on.

Sustainable Business: Business that develops products, services, experiences and ideas to meet the sustainable development paradigm requirements: economically viable, socially accepted and environmentally appropriate.

Chapter 9
Social Entrepreneurship and Entrepreneurial Ecosystems:
An Empirical Examination

J. Cadima Ribeiro
University of Minho, Portugal

ABSTRACT

Entrepreneurial ecosystems and social entrepreneurship are receiving increasing attention for their ability to foster economic and social development. This study adopts the entrepreneurial ecosystem approach to analyse the extent to which the perceived favourability of external environment promotes or deters the launch of new ventures by social entrepreneurs. The research was based on a survey that collected data through a questionnaire emailed to Portuguese social entrepreneurship ventures. The results show that a favourable entrepreneurial ecosystem has low importance in the decision to develop new social ventures. This result is particularly consistent in more innovative social ventures. This conclusion supports the idea that many social ventures are not based on social innovation, but derive from a traditional approach to social problems. Therefore, the development of new innovative social ventures has to be supported by institutional stakeholders in order to support social entrepreneurs, regardless of the level of favourability of the entrepreneurial context.

INTRODUCTION

Innovation is one of the main drivers of economic growth, while the entrepreneur is the main driver of innovation in modern economies. However, today's challenges have taken on an increasingly social dimension, and innovative responses to problems and needs should be conceived and initiated on the ground by social entrepreneurs (Hoogendoorn & Hartog, 2011).

Some of the most prominent societal challenges are increasing unemployment, which is often linked to crime, and social exclusion, with its long-lasting consequences, not only for those who lose their jobs, but also for their children, who have fewer opportunities in society (European Communities, 2011). The emergence of social actors' initiatives to satisfy specific social needs and offer solutions to different problems derives mostly from the employment crisis and the reshaping of State interventions (Bouchard, 2011).

Social entrepreneurship has been recognized as a helpful instrument of social and economic policy, particularly when dealing with unemployment, social exclusion and sustainable regional and local economic development (Alvord, Brown & Letts, 2004; Borzaga & Galera, 2012; Friedman & Desivilya, 2010; Lambru, 2012; Parente, Barbosa & Vilhena, 2012a; Quintão, 2004). Azmat (2013) argues that social entrepreneurship could contribute to more sustainable growth in developing countries and regional development in divided societies (Friedman & Desivilya, 2010). Azmat (2013) recognizes the potential of social entrepreneurship to help in solving the more persistent social problems and to promote wealth in communities and societies through innovative strategies and creative solutions. According to Azmat (2013), social entrepreneurs usually adopt innovative approaches with the potential to take a positive and critical role in poverty reduction and to help with the promotion of sustainable growth in developing countries, even in hostile environments. In the same way, Yiu, Wan, Ng, Chen and Su (2014) argue that social entrepreneurship plays an important role in the community development of emerging economies, and Nega and Schneider (2014) highlight the significant role of social entrepreneurship in economic development. For McAnany (2012), social entrepreneurship has a great potential to contribute to: (i) social change; (ii) the development of local communities; (iii) the enhancement of economic growth; (iv) poverty reduction; and (v) environmental sustainability.

Social entrepreneurship and social innovation are interrelated concepts that explicitly aim to provide innovative solutions to unsolved social problems, putting social value creation at the heart of their mission in order to improve individuals' and communities' lives and increase their well-being. An increasing number of institutions and local entities have endorsed social innovation as an instrument of political action with respect to employment, intergenerational population stability, economic development and sustainability and other social issues. In the European Union's policy, social innovation is mentioned as a strategic element of a Europe that is more intelligent, sustainable and inclusive, and serves as a fitting response to the social challenges of the internal market (European Communities, 2011).

These new strategies are pursued at the local level, not only by domestic governments and local authorities (largely supported by European funds), but also by not-for-profit and private organizations through corporate social responsibility initiatives. The objective focuses largely on local problems, where proximity is a critical factor to identify and evaluate the problems and to improve efficiency in the actions taken. These actions relate to the dynamism of the entrepreneurial ecosystem, the vitality of the formal and informal social economy and the emergence of new forms of intervention local organizations embrace. Some of the more innovative responses to problems and needs have been published in the form of research reports by various international organizations (e.g. the European Commission) and foundations (e.g. the Young Foundation) (Choi & Majumdar, 2015).

To the best of our knowledge, academic research on the link between entrepreneurial ecosystems and social entrepreneurship is scant. Our purpose is to investigate how a particular entrepreneurial ecosystem in which social entrepreneurs are located is capable of promoting or inhibiting the development of social entrepreneurship initiatives. To achieve this objective, two secondary objectives were derived. Firstly, we intend to ascertain the extent to which the entrepreneurial context has the same importance

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

for all types of organization, regardless of the level of innovation their activity requires. In addition, we aim to understand the role entrepreneurial ecosystems can play in supporting the innovation of different kinds of social ventures.

The chapter begins by presenting the background of the research and proceeds by reviewing the academic literature on the influence of the external environment on social entrepreneurship, grounded on the entrepreneurial ecosystems approach and related models. Next, we present the methodology, sample, results and implications derived for public policy. The paper ends with the conclusion.

BACKGROUND

The upsurge of social innovation among researchers has not been accompanied by a consensus in the literature regarding the scope and dimensionality of the concept. From an institutional point of view, social innovation is about "new ideas (products, services and models) that simultaneously meet social needs (more effectively than alternatives) and create new social relationships or collaborations" (European Communities, 2011, p. 9). According to OECD (2010), social innovation seeks new answers to social problems by: i) identifying and delivering new services that improve the quality of life of individuals and communities; and ii) identifying and implementing new labor market integration processes, new competencies, new jobs, and new forms of participation, as diverse elements that each contribute to improving the position of individuals in the workforce.

From an academic perspective, social innovation is a "creative process, mostly collective, driven by the purpose of social utility that tries to establish a link between knowledge and competences of various actors in order to obtain a certain level of well-being starting from a community that plays the role of disseminator" (Guida & Maiolini, 2014, p. 15). Clarence (2014, p. 47) defines social innovation as looking for "…new ideas and ways of working to meet unmet needs, involving concepts, products, and organizations to address social problems and challenges…". Social innovations usually happen by trial and error, learning-by-doing, and exchanging ideas within groups where exchange of opinions assures new ways of doing things.

The key distinction between social innovation and other types of innovation (i.e. commercial and technological) is that social innovation is oriented to the social and public good rather than to the market (Edwards-Schachter, Matti & Alcântara, 2012). Another difference occurs both in its outcomes and in its relationships, as well as in the new forms of cooperation and collaboration that it brings (Murray, Caulier-Grice & Mulgan, 2010). As Phills, Deiglmeier and Miller (2008) pointed out, social innovation refers to any novel and useful solution to a social need or problem, that is better (i.e., more effective, efficient, sustainable, or just) than existing approaches and for which the value created (benefits) accrues primarily to society as a whole rather than to private individuals. According to Phills et al. (2008) the microfinance and the fair-trade examples could illustrate the prior definition. Novy and Leubolt (2005) state that social innovation mainly steams from the satisfaction of basic human needs; an increased level of political participation from deprived groups; and the increased socio-political capacity and access to resources needed to enhance rights to enable the satisfaction of human needs and participation.

One important contribution for the study of social innovation derives from the review of 49 studies conducted by members of the *Centre de Recherche sur les Innovations Sociales* (CRISES) (Tardif & Harrison, 2005). The analysis found five common dimensions: transformations, innovative character, characteristics of innovation, actors involved, and process of developing the innovation (Klein, Fontan,

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Harrisson & Levesque, 2012; Maurer & Silva, 2014). The transformation dimension refers to the context in which the innovation is developed and includes three aspects: i) macro and micro contexts with the identification of crisis, ruptures, discontinuities and facts that force people to rethink their actions and develop new solutions for times of social and economic crises; ii) territorial contexts (local, regional and national) that are adapted or developed to promote change in production, consumption and work relations; and iii) social context with the identification of problematic contexts in social structures (e.g. marginalization, and socioeconomic exclusion). The second dimension refers to the innovative character that indicates the central role of social action as a source of innovation in a given territory, since actors are induced to search for innovative solutions to problems they identify in their context.

The third dimension comprises the types of innovation (technical, socio-technical, social, organizational and institutional), their scale (local or localized innovations) and purposes (individual, collective, general, or common good). The fourth dimension includes the actors (individuals, organizations, institutions and intermediaries) involved in the social innovation process. The individuals comprise civil society, cooperative movements, associations and unions. The organizations can be companies, social economy organizations, collective organizations or beneficiaries. Institutions are understood as the state as well as established norms, values and identity. Lastly, the intermediaries emerge from the interaction among the different actors, and committees, social networks, alliances and innovation networks. The fifth dimension relates to processes and involves three elements: i) methods of coordination that indicate the way in which the actors interact and structure the process of social innovation, as well as how they share and disseminate information, knowledge and practices as they develop social innovations; ii) modes of implementation which encompass cooperation, partnerships, integration, negotiation, and diffusion, among others; and iii) constraints including complexity, resistance, tensions and uncertainties among the actors when faced with something new.

Social innovation is accelerated by the pressures caused by societal changes (Moulaert, MacCallum & Hiller, 2013). In the words of the same authors (2013, p. 14) social innovations can be understood as "reformist 'solutions' for the scarcity of the resources in the welfare state" and as a "reformist approach to solve social problems". Thus, social innovation increases the satisfaction of social needs such as exclusion, deprivation, alienation, and lack of wellbeing and allows for the attainment of significantly higher wellbeing and human progress, as well as development. In this sense, social innovation is seen as a kind of innovation, characterized by its intentionality, which evolves by reshaping the society and aspiring to bring more effective and efficient solutions to social problems (Franz, Hochgerner & Howaldt, 2012).

Klein (2013, p. 9) argues that social innovation is seen as a "tool box that could provide rapid solutions to pressing problems", of the most vulnerable segments of society. But it is also considered to be a way to foster the social cohesion of territories. Social innovation is further seen as being able to positively contribute to social, spatial and ecological development, at the same time that recognize the principle of social justice (Dyck & Broeck, 2013). As stated by OECD (2014, p. 148) "innovation can make a substantial contribution to dealing with social challenges such as poverty, ageing, social exclusion and health". Therefore, innovation is considered to be an important driver of growth, while it plays a key role in shaping inequalities and in helping to support well-being (OECD, 2014). As stressed by Cosseta and Palumbo (2014) innovation is considered as the unique antidote to the crisis and to the inequality that exists in the society.

Opportunities for social innovation are shaped by historical circumstances (Mulgan, 2012). Social innovation is highly contextual and path dependent, since it is strongly embedded in the social-cultural and social-political context (Moulaert et al., 2013). Also, it is socio-spatially embedded and time-bound

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

as it is closely interlinked with the stakeholder ecosystem and embedded in local systems and territorial networks (Cosseta & Plumbo, 2014; Moulaert et al., 2013). Therefore, as stressed by Dyck and Broeck (2013), innovation should be conceived under its spatial-historical context, taking into account the material territoriality, as well as the social dimension of territories. Furthermore, social innovation can emerge from the actions taken by communities in order to alleviate social, political and/or material issues (Moulaert et al., 2013).

Social entrepreneurship is related to social innovation, as it is the social entrepreneur who carries out the innovation. In a somewhat simplistic or reductionist way of seeing things, without the commitment of the social entrepreneur to put the idea into practice, there would "only" be inventions to solve social problems and challenges.

A comprehensive definition of social entrepreneur stresses efficiency in the management of resources (people, buildings, equipment), the mission (to satisfy unmet social needs) and innovation in delivering welfare services (Leadbeater, 1997). Furthermore, social entrepreneurs are innovative and changing agents seeking to accomplish their vision and use their entrepreneurial talent to solve social problems (Drayton, 2002). Dees (1998) argues that a successful social entrepreneur will: (i) adopt a mission to create and sustain social value (not only private value); (ii) recognize and search actively for new opportunities to accomplish the mission; (iii) engage in a process of continuous innovation, adaptation and learning; (iv) act energetically without being limited to the resources held at a moment in time; and (v) demonstrate high accountability to stakeholders regarding the results of the activity.

As a social construction the entrepreneurial activities influence and are influenced by the environment, which comprises all the external influences that affect the entrepreneur's behaviour and performance (Friedman & Desivilya, 2010; Cajaiba-Santana, 2010; Covin & Slevin, 1991; Mair, 2010; Welter, 2011).

Environmental influences can be classified as economic, technological, demographic, social, cultural, and governmental/institutional (Hill & Jones, 2013). Indeed, social innovation and new social ventures are not developed in a vacuum (CASE, 2008) but are constrained by a particular environment (Weerawardena & Mort, 2006).

As stated by Katz and Kahn (1966) in the Open System Theory, the emergence of organizations (mainly private companies) derives from the interaction between agents and environment, which suggest a strong influence of the environment on the creation of organizations. The same applies to social innovation and social entrepreneurship, as the environmental forces could incite or deter the launching of new social ventures (Mair, 2010; Urbano & Ferri, 2011; Ziegler, 2009).

THEORETICAL PERSPECTIVES

The external environment matters for success in innovative activity and is at least as important as internal factors (Porter, 2001). A set of innovation models highlight the critical importance of the characteristics of the external environment that surrounds the social entrepreneur in fostering the development of new social ventures. The entrepreneurial ecosystems approach provides a valuable conceptual tool to link the social entrepreneur to the external environment, namely the role of governmental and non-governmental institutions in creating and adjusting the regulatory framework and support system for facilitating the activities of social entrepreneurs. In both approaches it is argue that an attractive external environment for social entrepreneurship depends markedly from the components of the entrepreneurial ecosystem. The contributions that follow help to explain the role of environment in the promotion of new social ventures.

Territorial Innovation Models

A wide variety of territorial innovation models have emphasized the characteristics of the territory as a place for innovation. The basic idea is that the geographical space links the "software" of the entrepreneur to their "hardware" – made up of the social community, the formal and informal institutions, and the tangible and intangible infrastructures that exists on its territory (Leoncini & Montresor, 2008).

The innovative milieu approach argued that firms have a support space constituted around three types of relations: i) qualified or privileged relations with regard to the organization of productive factors; ii) strategic relations between the firm, its partners, suppliers and clients; iii) strategic relations with agents belonging to the territorial environment (Aydalot, 1986; Moulaert & Sekia, 2003; Camagni & Maillat, 2006; Santos & Simões, 2014). The GREMI (Groupe de Recherche sur les Milieux Innovateurs) studies have empirically demonstrated the existence of a dynamic and embedded productive system in different regions and countries (Camagni, 1991; Maillat & Perrin, 1992).

Building on a new interpretation of Marshall's work, Becattini (1990; 2015) develops the industrial district concept as a socio-territorial entity characterized by the active presence of both a community of people and a population of firms in one naturally and historically bounded area (Becattini, 1990; Sforzi, 2015). The concept postulates that economic change emerges concretely within and between places, and so economic change is a socio-economic place-based process (Santos & Simões, 2014; Sforzi & Boix, 2015). The concept of industrial district has been supported empirically indicating the importance of the place within various types of localities, including countries, regions, big cities and rural areas (Pyke, Becattini & Sengenberger, 1990; Sengenberger, Loveman & Piore, 1990; Pyke & Sengenberger, 1992; Benko & Lipietz, 1992; Bellandi & Propis, 2015).

The local innovation system is a generalization of the industrial district view of local economic development (Moulaert & Sekia, 2003). It is characterized by the territorial proximity of productive units (firms, plants, service suppliers, R&D centers, training institutions) interlinked in different forms (formal and informal, material and immaterial, market and non-market). Industrialization is perceived as a process occurring in urban or rural areas with an explicit artisan tradition (Courlet, 2008). The results of the empirical evidence emphasize the factors on which local productive systems based their reproduction and renovation, such as external economies, non-transferable knowledge, specific forms of regulation, and strong local identity (Courlet & Pecquer, 1992; Moulaert & Sekia, 2003; European Union, 2014; Ferreti & Parmentola, 2015).

The new industrial spaces paradigm goes beyond the agglomerated production systems by encompassing: i) the coordination of inter-firm transactions and the dynamics of entrepreneurial activity; ii) the organization of local labor markets and social reproduction of workers; and iii) the dynamics of community formation and social reproduction (Moulaert & Sekia, 2003; Gathfield & Yang, 2006). The research of Scott (1988, 2014) leads to the identification of new industrial spaces in North America, Western Europe and Norway (Isaksen, 1994).

The cluster of innovation approach reinforces the role of local institutions and culture as well as industrial structure and corporate organization for economic performance (Moulaert & Sekia, 2003). According to Porter (1998) a cluster is a geographic concentration of interconnected companies, specialized suppliers, service providers, firms in related industries, and associated institutions (for example, universities, standards agencies, and trade associations) in particular fields that compete but also cooperate. A large number of studies have identified clusters all over the world in different industries (Enright &

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Roberts, 2001; Feser, 2002; European Communities, 2008, Potter & Miranda, 2009; Chatterji, Glaeser & Kerr, 2013).

The regional innovation system perspective is usually understood as a set of interacting private and public interests, formal institutions and other organizations that function according to organizational and institutional arrangements and relationships conducive to the generation, use and dissemination of knowledge (Doloreux, 2003). The theory of regional innovation system stresses the role of collective learning based on deep cooperative relationships between members of the system (Moulaert & Sekia, 2003). This learning process combined with firm-specific competences can lead to regional competitive advantages if the learning is based on localized capabilities such as specialized resources, skills, institutions and shared common social and cultural values (Braczyk, Cooke & Heidenreich, 1998; Doloreux, 2002; Santos & Simões, 2014). Cooke and Morgan (1994) identify a regional innovation system in Baden-Württemberg; Diez (2002) in the metropolitan areas of Barcelona, Stockholm, and Vienna; and Doloreux (2003) in Beauce in Québec (Canada).

Drawing on the work of evolutionary political economy, learning regions provide the crucial inputs required for knowledge-intensive economic organization to flourish: a manufacturing infrastructure of interconnected vendors and suppliers; a human infrastructure that can produce knowledge workers, that facilitates the development of a team orientation, and that is organized around life-long learning; a physical and communication infrastructure that facilitates and supports constant sharing of information, electronic exchange of data and information, just-in-time delivery of goods and services, and integration into the global economy; and capital allocation and industrial governance systems attuned to the needs of knowledge-intensive organizations (Florida, 1995; Morgan, 1997; Santos & Simões, 2014). Some empirical evidence of learning regions can be found in the technology districts of France, Italy and the United States (Storper, 2007).

Entrepreneurial Ecosystems Approach

Territorial innovation models show that economic activity has a 'natural' tendency to cluster in specific geographical locations. A related concept to the territorial innovation models is the entrepreneurial ecosystems approach (Feld, 2012; Isenberg, 2011; Kantis & Federico, 2012; Mason & Brown, 2014; Napier & Hansen, 2011). The word entrepreneurial, in Schumpeter's view, refers to entrepreneurship, a process by which individuals exploit opportunities for innovation. The second word is ecosystem, which has been derived from biology and emphasizes a community of interdependent actors where entrepreneurship takes place. The entrepreneurial ecosystem approach often claims that entrepreneurship is an important source of innovation, productivity growth and employment (Mason & Brown, 2014).

The literature on entrepreneurial ecosystems focuses on the role of the context in allowing or restricting entrepreneurship (Stam, 2015).

Territorial innovation models show that economic activity has a 'natural' tendency to cluster in specific geographical locations. A related concept to the territorial innovation models is the entrepreneurial ecosystems approach (Feld, 2012; Isenberg, 2011; Kantis & Federico, 2012; Mason & Brown, 2014; Napier & Hansen, 2011). EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

The literature on entrepreneurial ecosystems focuses on the role of the context in allowing or restricting entrepreneurship (Stam, 2015). According to Vogel (2013, p. 446) an entrepreneurial ecosystem is "an interactive community within a geographic region, composed of varied and inter--dependent actors (e.g. entrepreneurs, institutions and organizations) and factors (e.g. markets, regulatory framework, support setting, entrepreneurial culture), which evolves over time and whose actors and factors coexist and interact to promote new venture creation". Mason and Brown (2014, p. 5) presented a definition of entrepreneurial ecosystem as "a set of interconnected entrepreneurial actors (both potential and existing), entrepreneurial organizations (e.g., firms, venture capitalists, business angels, banks), institutions (universities, public sector agencies, financial bodies) and entrepreneurial processes (e.g., the business birth rate, numbers of high growth firms, levels of 'blockbuster entrepreneurship', number of serial entrepreneurs, degree of sell-out mentality within firms and levels of entrepreneurial ambition) which formally and informally coalesce to connect, mediate and govern the performance within the local entrepreneurial environment". In a constructive synthesis of the concept Stam (2015) defines the entrepreneurial ecosystem as a set of interdependent actors and factors coordinated in such a way that they enable productive entrepreneurship.

The approach developed by Isenberg (2010, 2016) provides the identification of six domains within the entrepreneurial system: culture (success stories and societal norms); finance (financial capital); policy (government and leadership); markets (early customers and networks); human capital (labour and educational institutions); and supports (infrastructure, support professions and non-governmental institutions). Every ecosystem is unique, as many of the components will differ from one ecosystem to another. Local cultural attitudes, the structure of local banking systems and educational policies will all affect the nature of these local ecosystems (Isenberg, 2010, 2016). Another popular conceptualization (World Economic Forum, 2013) lists eight factors that contribute to the success of an entrepreneurial ecosystem, each with a number of components. The listed pillars and components focus on the presence of accessible markets (domestic and foreign), resources (human capital and workforce), support systems and mentors, funding and finance, government and regulatory framework, education and training, major universities as catalysts and cultural support (Table 1).

Table 1. Sample characteristics (World Economic Forum, 2013, 6-7)

Pillars	Components
Accessible Markets	Domestic market - Large/medium/small companies as customers, governments as customer Foreign market - Large/medium/small companies as customers, governments as customer
Human Capital Workforce	Management talent, technical talent, entrepreneurial company experience, outsourcing availability, access to immigrant workforce
Funding and Finance	Friends and family, angel investors, private equity, venture capital, access to debt
Support Systems/Mentors	Mentors/advisors, professional services, incubators/accelerators, networks of entrepreneurial peers
Government & Regulatory Framework	Ease of starting a business, tax incentives, business-friendly legislation/policies, access to basic infrastructure, access to telecommunications/broadband, access to transport
Education & Training	Available workforce with pre-university education, available workforce with university education, entrepreneur-specific training
Major Universities as catalysts	Promoting a culture of respect for entrepreneurship, playing a key role in idea-formation for new companies, playing a key role in providing graduates to new companies
Cultural Support	Tolerance for risk and failure, preference for self-employment, success stories/role models, research culture, positive image of entrepreneurship, celebration of innovation

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

In an effort to unify social entrepreneurship and entrepreneurial ecosystems literatures, Roundy (2017) suggests that social entrepreneurs are likely to be affected by many of the same factors in entrepreneurial ecosystems as conventional entrepreneurs, such as the amount of early stage investment capital available (Breznitz & Taylor, 2014) and the ecosystem's transportation and telecommunications infrastructure (Isenberg, 2011). However, some characteristics of the ecosystem have to be fulfilled, such as diversity of resource providers (e.g. funding options), sufficient support organizations (business-oriented human capital), the culture of the ecosystem (pro-social and altruistic) and opportunities for vicarious entrepreneurial learning (entrepreneurial human capital). On the other side, the activities of the social entrepreneur can also influence the ecosystem's diversity, attractiveness and attention to an entrepreneurial ecosystem (Roundy, 2017).

In general, the development of an entrepreneurial ecosystems requires a blend of top-down and bottom-up approaches. The first category includes appropriate supporting conditions by non-government institutions (entrepreneurship promotion in non-profit organizations, business plan contests, conferences, entrepreneur-friendly associations); the essential role of government (institutions, financial support, regulatory framework incentives, research institutes, venture-friendly legislation); and the excellence of educational institutions (professional and academic general degrees, specific entrepreneurship training). However, there is also a need for bottom-up initiatives to improve the environment, such as the active role of social entrepreneurs (social legitimacy, entrepreneurial networks, etc.). The social entrepreneurship policy is concerned with supporting entrepreneurs that require relational rather than transactional assistance and are likely to benefit most from peer-based support for experiential learning and tacit knowledge sharing (Mason & Brown, 2014). In this case entrepreneurial activity is considered the process by which individuals create opportunities for social innovation. This innovation will eventually lead to new value in society, and this is therefore the ultimate outcome of an entrepreneurial ecosystem, while entrepreneurial activity would be more an intermediary output of the system. This entrepreneurial activity has many manifestations, such as innovative start-ups, high-growth start-ups, and entrepreneurial employees (Stam, 2014).

This section has presented two different approaches to study the influence of the external environment on social entrepreneurship. The entrepreneurial ecosystem emphasizes the role of governmental and non-governmental institutions in promoting a regulatory framework and support system that encourage social entrepreneurs. Additionally, we provide a set of related models of innovation based on the territory that go beyond the institutional framework and focus on different components of the innovation system.

METHODOLOGY

Based on the entrepreneurial ecosystem approach and innovation models based on territory, we argue that the external environment is essential for understanding how new social ventures are created, defined and limited in their actions. Thus, the adoption of these two perspectives could enhance our understanding of how an entrepreneurial ecosystem can promote or deter the emergence of new social ventures in Portugal.

As noted earlier in the literature review, external variables can trigger social entrepreneurs to create social ventures. By analysing the external environment, an individual can build on the initial perception of the favourability of the entrepreneurial ecosystem.

Consequently, we considered the two following hypotheses:

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

H1: The launching of new social ventures is positively associated with the presence of a favourable entrepreneurial environment;

H2: The launching of all types of new social ventures is independent of the favourability of the entrepreneurial environment;

In other words, we analyse the social ventures that have been created in Portugal and, from there, inquiring on the significance of the entrepreneurial environment assessment in the decision of someone endowed with entrepreneurial spirit to proceed with a social venture. Although recognition of social entrepreneurship is growing, there are not yet sufficient instruments for identifying and quantifying this phenomenon (Parente, Costa, Santos & Amador, 2011; Perista & Nogueira, 2009; Quintão, 2004).

Following the European tradition, in Portugal social and solidarity economy has been considered the appropriate area for the integration of social entrepreneurship (Parente, Santos, Marcos, Costa & Veloso, 2012b; Quintão, 2011; Ramos, 2004). However, the Portuguese third sector is a very diverse and heterogeneous field (Ramos, 2004), which enclose sub-segments of organizations having different entrepreneurial levels (Namorado, 2006).

Therefore, for our sample we have considered the branch(es) of the social and solidarity economy that we understand to be closest to the spirit of social entrepreneurship and to select those organizations endowed with the status of non-governmental organizations for development and cooperation (NGOs). Additionally, we have also included in our sample projects listed on the Portuguese Social Stock Exchange (PSSE), due to its innovative character. Our sample, therefore, was built on the basis of the typical features of these organizations. The sample is random as previous procedures of randomness (two stage sampling) were adopted during the process of collecting the data.

The contacts of NGOs and projects listed on the PSSE were gathered by consulting the web site of the Portuguese Institute for Development Assistance and the web site of the Social Stock Exchange, respectively. In order to understand, from an independent perspective, the factors that lead civil society to develop new social ventures, we excluded from the sample organizations with religious, political or partisan connections or held by other organizations of corporate character. This selection was based on information collected in institutional web sites, blogs and other available internet sources. This screening resulted in a sample consisting of 99 NGOs and 29 projects listed on the PSSE.

A quantitative research method was used, in the form of an online survey. As the unit of analysis, we considered the entrepreneurs behind the creation of the socially entrepreneurial organizations existing at the time the investigation was undertaken. By using filtering questions, we ensured that only those individuals that had taken the initiative of creating the organizations would answer the survey.

The research questionnaire began with a group of questions aimed at obtaining a general characterization of the organization and of the respondent. The next group of questions asked, by means of a five-point Likert scale (1 = very low importance; 5 = very high importance), the influence of various external factors on the decision to create a new social venture. To attain a more comprehensive insight on the topic, a few other questions aiming to analyse relevance of personal skills in the decision-making process was also included. We ensured the anonymity of all respondents in order to encourage honesty and to avoid distortion in the answers (Vissak, 2010).

Before sending the questionnaire, we contacted the selected organizations by telephone in order to present the research project, to confirm the e-mail contacts and to make the organization aware of the schedule for submitting the survey replies. Telephone contact was also used to follow up with reminders for those failing to fill in the questionnaire on the established schedule.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

The data collection process was carried out between September 19, 2012, and January 2, 2013. At the end of the process, 68 replies were collected, 24 provided by projects listed on PSSE and 44 by NGOs. The total response rate was 82.8% among projects listed on PSSE and 44.9% among the NGOs.

For data analysis, we first used descriptive statistics to characterize and describe the data collected. Then, in order to test our research hypothesis, we used student's *t* test (one-sample t test). We also conducted principal components analysis, using the statistical software SPSS, version 20, in order to simplify the analysis and better understand the results obtained.

Sample

Through the process of data collection, we got 68 replies, 24 (35.3%) provided by projects listed on PSSE and the remaining 44 (64.7%) referred to NGOs. In this section, we will describe the general features of social entrepreneurial ventures and the profile of the entrepreneurs that made the decision to undertake them.

Regarding seniority, as Table 2 shows, almost half of the organizations under observation (45.6%) are 10 or more years old, and only 5 are less than 3 years old. The low representation of younger organizations can be explained by the sampling method used – specifically, by the time required by organizations for acquiring NGOs status or for taking the steps necessary to be listed on the Portuguese Social Stock Exchange.

Regarding geographical location, we have opted to classify the answers according to level two of the common classification of territorial units for statistical aims (NUTS II). The respondent organizations are distributed among the various regions of the country, although there is a noticeable concentration in the greater Lisbon area (52.9%), followed by the northern and central areas (each with 14.7%) and Alentejo (7.4%). The Algarve and Islands regions contained only one initiative each.

A few organizations (5) reported a simultaneous presence in various geographical locations, and a few indicated having an international presence. Regarding scope, about half of the organizations (54.4%) reported operating internationally, while roughly a quarter (23.5%) operate nationally. The remaining organizations indicated operating regionally (10.3%) or locally (11.8%). Contributing to this result is the international activity focus of NGOs (77.3%), whilst the projects listed on the PSSE indicated a national (41.7%) or local (29.2%) base.

Regarding the public(s) whom the organizations seek to serve, we observed that the responding institutions cover almost all social areas. As Table 2 indicates, the most cited segment deals with socially excluded people (44.1%), followed by people with financial needs (32.4%) and other organizations or associations (30.9%). To a lesser extent, we found that organizations devote their activity to the elderly (23.5%), ethnic minorities (19.1%), or people with physical disabilities or special needs (16.2%). There are not significant variances among the organization types (PSSE or NGOs) regarding the target audience.

The item 'other' was reported by a significant number of organizations, where work with children and/or young people (12 organizations) or the entire population (5) stands out.

Organizations tend to concentrate their activity on a limited number of social issues, whereas almost half of them (45.6%) indicated working exclusively in one of the categories surveyed, while only around a quarter operated in more than three.

Regarding the aims of the activities developed, it is worth noting that only one third of the organizations (32.4%) acted in areas that were not served by the public or the business sector. The vast majority (79.4%) performed activities in areas in which there was already some intervention, complementing the

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

services supplied by the public sector (48.5%) or by other organizations (30.9%). Only a small proportion of them (10.3%) indicated competing with other social organizations.

The online questionnaires included a filter question, which allowed us to identify the responses provided by persons involved in the launching of the social ventures (45 cases, out of a total of 68). Only these respondents were asked about the influence of the external context in the process of initiating the social venture.

Results

The main goal of this research is to assess the extent to which individuals' perception of the favourability of the entrepreneurial context has an influence on the launching of a new social venture (Table 3).

From the variables in the analysis, the one found to have the greatest importance in the decision-making process was the existence of support and advice in this type of organization (average of 2.7 on a scale of 1 to 5), identified as having a high or very high importance by 24.4% of the respondents. The following most important variables, with an average of 2.6, *ex-aequo*, were: the existence of a favourable legal regime; the existence of a favourable tax regime; and facility in obtaining information to start the project. Finally, the variable identified as less valued was the facility and simplicity of administrative procedures for launching the project, with an average of 2.5.

Table 3 also shows that the average score of each variable is always below the neutral point of the scale (point 3 in the graphic scale of 5 points). This suggests that these factors are considered in the decision-making process for the creation of a new social venture, even though they are not assigned as critical for the implementation of the entrepreneurial intention.

To capture the structure of the data collected, we used principal components analysis (PCA), applying an orthogonal rotation through the varimax method (Table 4). The evaluation of the determinant of the

b. Test value =3, α=0,05;

matrix of correlations, the Bartlett's test of sphericity and Kaiser-Meyer-Olkin measure of sampling adequacy (KMO) confirmed that the data were suitable for implementing PCA (Field, 2005; Maroco, 2007).

In order to ensure statistical significance (for $\alpha = 0.05$) for building the principal components, we only considered variables with factor loading equal to or above 0.7 (Hair, Anderson, Tatham & Black, 1998). Following Kaiser criteria (Hair et al., 1998; Field, 2005), we extracted two factors. The first component accounts for 37.7% of the variability of the total original variables and comprises those concerning the relevance of the favourability of the external ecosystem and received the designation of "favourability of the entrepreneurial context". The data reduction process also led to the extraction of a component related to the perception of ownership of personal skills. This latter factor will not be analysed in this paper, although from a theoretical point of view the relevance of the entrepreneurial context should be considered within the framework of the individual's perception of ownership of personal skills and feasibility of the social venture.

The questionnaire shows a very good internal consistency, since Cronbach's alpha (α) equals 0.91 and 0.79, respectively, suggesting a very good reliability of test scores (Field, 2005; Hair et al., 1998). Next, we constructed factor scores based on the weighted sum score method, in order to ensure that items with the highest loadings on the factor would have the largest effect on the factor score (DiStefano, Zhu & Mîndrilă, 2009; Field, 2005) (Table 4). As the individual variables analysis suggested, the presence of a favourable entrepreneurial ecosystem has a low relevance in the individuals' decision-making process (average of 2.6, lower than the scale neutral point).

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

By using upper quartile analysis, we found that three quarters of the respondents attached an importance of 3.2 or below to the entrepreneurial environment. In addition, frequency analysis (Table 5) reveals that the presence of a favourable entrepreneurial context is considered important or very important in the decision-making process only by a small proportion of the respondents (35%). The majority of the respondents (60%) considered this factor to have a low or very low importance (negative point of the scale) in the launching of a new social venture.

When analysing the activities social organizations pursue, we have considered three types of organizations: (i) organizations that complete services supplied by other providers; (ii) organizations that compete with other providers; and (iii) organizations that perform activities in areas not addressed at all by other entities. We observe that individuals who have founded organizations that compete with other entities similarly rate the relevance of having a favourable entrepreneurial context and possessing appropriate personal skills, since both are considered important (average of 3.4 and 3.5, respectively). For the other two types of organizations in the analysis, we observe a very different scenario. In these cases, respondents attach a high relevance to possessing the required personal competences when deciding to start a social venture of low importance (below the neutral point of the scale) to the entrepreneurial ecosystem.

These findings suggest that organizations acting in areas where there are already other social organizations are more sensitive than others are to the level of favourability of the external environment. Differently, social entrepreneurs who have decided to start a venture in a new area (not served by other entities), support their decision mainly on the feeling they have the required personal skills to launch the new social venture. The same result is observed in individuals who were responsible for starting a social organization aiming to complete services supplied by other institutions.

To test the hypothesis that the presence of a favourable entrepreneurial ecosystem influences positively the establishment of a social venture in Portugal (H1), we used the student's *t* test (one-sample t test). Based on the Central Limit Theorem ($n \geq 30$), it is not necessary to verify the normal distribution of data to use this t test (Martinez & Ferreira, 2008).

By testing the neutral value of 3 (in a scale of 1 to 5) (presented in Table 3), the *t* test indicates that the entrepreneur's perception of the favourability of the external context has a low effect on the adoption of a social entrepreneurial behaviour. The test also shows that the decision to launch the social venture was not made as a result of the individual's perception that the entrepreneurial environment was favourable for the development of the organization. Taking a significance level of 5%, the statistical test does not reject the null hypothesis that the existence of a favourable entrepreneurial ecosystem has a neutral influence on the creation of a social venture. Therefore, the available empirical evidence allows us to conclude that the hypothesis that the presence of a favourable entrepreneurial environment positively influences the establishment of a new social venture in Portugal (H1) was not validated.

Table 5. The relevance attached to a favourable external context in accordance with the activities pursued by social organization (authors` own survey)

	Favourability of the External Entrepreneurial Ecosystem	**Perception of Personal Capabilities**
To complete services supplied by other providers	2,4	3,9
To compete with other providers	3,4	3,5
perform activities in areas not addressed by other entities	2,6	3,7

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

The data analysis revealed that the (favourable) entrepreneurial ecosystem has very little weight in the decision-making process related to the launching of a new social venture. Further, the results suggest that the social entrepreneur is not deterred from acting because he or she considers the ecosystem to be unfavourable. As such, our results are consistent with the institutional void theory and with the approaches of those researchers who claim that new social ventures are created in response to the weakness or inability of existing institutions in meeting current social needs (Estrin et al., 2011, 2013; Mair, 2010; Terjesen et al., 2012).

The empirical results obtained also are in line with the pattern found by Leahy and Villeneuve-Smith (2009) and by Villeneuve-Smith and Chung (2013) with regards to a strong concentration of social entrepreneurship ventures in disadvantaged communities, since it is not because social entrepreneurs perceive the institutional environment as inhospitable that they are discouraged to go ahead with the venture.

With regard to the other dimensions that constitute the perception of feasibility of the social venture, it should be noted that these are considered more important in the decision-making process than the perception of the existence of a favourable entrepreneurial ecosystem (Table 5). The student's t-test analysis indicates that, unlike what occurs in the presence of a favourable entrepreneurial environment, the perception of desirability of the venture and the ownership of specific personal skills have a statistically significant positive effect on the creation of new social ventures.

Meanwhile, the results regarding the neutral influence of the presence of an entrepreneurial context (favourable or unfavourable) on the decision to create a new social venture are, apparently, inconsistent with those of other researchers, who have identified a negative relationship between the perception of risk and the decision to start a new social project (Harding & Cowling, 2006; Hoogendoorn, Pennings & Thurik, 2010; Hoogendoorn, Zwan & Thurik, 2011, Smith, Stevens & Barr, 2010). In addition to the financial risks associated with the failure, social entrepreneurs are concerned with the stigma resulting from their personal failure, namely the risks in terms of reputation, honesty and loss of credibility in their personal relational networks, which are, according to Hoogendoorn et al. (2011), important elements for social entrepreneurs. One possible explanation for this apparent paradox is related to the (relevant) role of the perception of desirability of the venture and the ownership of personal capacities in the decision-making process.

The analysis undertaken indicates that the perception of feasibility is positively related to the creation of social organizations. This fact is clearly influenced by the perception of desirability of the venture and by the possession of personal capacities, as both have a positive effect on the implementation of new social projects. Also, the perception of the presence of a favourable entrepreneurial ecosystem has a reduced moderator effect on the launch of new social entrepreneurial initiatives.

The findings suggest that when we are analysing the decision to start a social venture, what really matters is individuals' entrepreneurial empowerment, rather than the favourability of the entrepreneurial ecosystem. Thus, even in the presence of an adverse entrepreneurial context, if they perceive they have appropriate competences, they will not be deterred from acting. Another critical enabler is the perceived social impact their actions will generate on the target audience.

To test the hypothesis that the launching of all types of new social ventures is independent of the favourability of the entrepreneurial environment (H2), we have used the Mann-Whitney U-test (Table 6). The test results do not allow us to reject the hypothesis that social entrepreneurs score factors affecting the decision to start a venture differently, in accordance with the activities pursued by a social organization.

The only exception is observed in social ventures that complete the services supplied by other providers, which rank the relevance attached to the favourability of the entrepreneurial context in a very

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Table 6. Mann–Whitney U test for comparing the relevance attached to a favourable entrepreneurial context in different kinds of social ventures (authors` own survey)

Organization Type	Favourability of the External Entrepreneurial Ecosystem		Perception of Personal Capabilities	
	U Statistic	Sig.	U Statistic	Sig.
To complete services supplied by other providers	328.000	0,049	193.500	0,250
To compete with other providers	32.000	0,158	72.000	0,681
Perform activities in areas not addressed by other entities	234.000	0,844	284.500	0,335

different way. In fact, as descriptive statistics have already suggested, such social entrepreneurs have assigned a lower relevance to this variable (favourability of the entrepreneurial ecosystem) when they have decided to implement social entrepreneurial intention.

This result reveals that for the creation of more innovative social ventures, which escape from the traditional logic pursued by other providers, the personal characteristics of social entrepreneurs are critical. For the launch of organizations characterized by greater competitive intensity, in turn, the favourability of the entrepreneurial ecosystem is seen as equally relevant in the decision-making process. Since the organization will develop its activities in areas already exploited by other players, entrepreneurs' creativity and innovation will not be enough to encourage them to start a new venture. In this case, the perception that a favourable entrepreneurial ecosystem exists will also be important as they could carry on social activities in a sustainable way, partly because other organizations might already have a competitive advantage.

Hence, we can argue that social entrepreneurs need to be particularly innovative in order to be encouraged to act, regardless of the degree of favourability of the entrepreneurial ecosystem and the unfavourable entrepreneurial context. However, from the angle of territorial innovation models, it is critical to understand the extent to which territory could foster and strengthen social innovation, promoting the development of social entrepreneurship initiatives even in ecosystems considered hostile.

The empirical results support the importance of territory for social entrepreneurship. Specifically, as underlined by Porter (1998), the development of clusters in the social area, comprising closely interconnected entities and long-term strategic partnerships, could be fundamental to the flourishing of the sector. Beyond that, collective learning, advocated by the concept of regional innovation systems and learning regions, will be important for the development of entrepreneurial skills and appropriate competences for such an idiosyncratic field as social entrepreneurship. As Moulaert et al. (2013) argued, social innovation is leveraged by the pressures provoked by social changes. Hence, regions endowed with a less favourable ecosystem could be more conducive to social innovation, even if pursued on a local scale.

SOLUTIONS AND RECOMMENDATIONS

Social entrepreneurship is a way of providing an answer to social problems based on searching for an innovative solution to well-known complex social problems, aiming to give them a sustainable answer. Various researchers have underscore the potential of social entrepreneurship in terms of employment creation (Alvord et al., 2004), social inclusion (Friedman & Desivilya, 2010) and sustainable regional

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

development (Azmat, 2013; Borzaga & Galera, 2012; Friedman & Desivilya, 2010; Lambru, 2012; McAnany, 2012; Parente et al., 2012a; Quintão, 2004).

Most countries have a range of policies to promote the creation of new social ventures. The key forms of support are typically information and advice for new entrepreneurs (Bennett, 2012). According to our empirical results, it is worthwhile to question whether these are the most effective responses to the Portuguese case. The results obtained show that they are not powerful drivers, since the presence of a favourable entrepreneurial environment is not confirmed to have a positive effect on individuals' decisions.

The neutrality of the entrepreneurial ecosystem means that individuals are prone to develop an entrepreneurial activity regardless of entrepreneurial ecosystem characteristics.

The investigation pursued revealed that to make individuals feel they are capable of engaging in an entrepreneurial activity, they need to possess a range of specific expertise, rather than a perceived level of favourability of the entrepreneurial context. Thus, the research has a very important practical implication. Public entities will be more effective in conceiving policies aimed at supporting social entrepreneurship if they are focused on the development of citizens' entrepreneurial competences.

Capacity building, through the provision of specific training courses in schools, colleges and universities, could play a critical role in stimulating social entrepreneurship.

Universities are also scarce in their offerings of specific programs in these areas. We also suggest the relevance of public institutions accurately mapping the competences individuals possess, and their perceptions about holding the required skills, to pursue social initiatives. These programs will enable individuals concerned with social causes to develop appropriate skills and support the implementation of their social entrepreneurial intentions. After training these key skills, people will feel more confident to start a social venture and manage the social venture more efficiently.

The empirical work indicates that this fact will be particularly critical for the constitution of more innovative social ventures. Complex social problems societies are currently facing demand the development of particularly innovative intervention models. Social entrepreneurs could perform a key role in the development of an innovative ecosystem, suggesting the relevance of bottom-up processes in the social entrepreneurship field.

On the other hand, stimuli the government provides to drive innovation could enhance the development of new social ventures, since this will reinforce the entrepreneurial ecosystem, which means individuals will be even more prone to act as social entrepreneurs. In this sense, the role of public entities will contribute to the structure of an innovative local system, compatible with the interests of the social sector. In addition, the public's role should also optimize the way territory is managed to stimulate the behaviour of individuals who intend to be social entrepreneurs.

Even if, in a certain sense, public authorities admit their incapacity to deal with the social problems that need to be solved, promoting empowerment programs, fostering the development of entrepreneurial competences and strengthening innovation networking. Nonetheless, this could be a first move to engage civil society in conceiving new responses to persistent social problems. Since social innovation is closely interlinked with the stakeholder ecosystem, public entities when working to promote the reinforcement of territorial networks could contributing to foster the development of social ventures initiatives.

Governments can also promote the emergence of new social ventures by removing legal barriers and encouraging social entrepreneurs to take an active role in addressing social problems or actively pursuing broader reforms to develop a friendly environment for social entrepreneurship. In this regard, government interventions should maintain minimum thresholds for the social organization to achieve efficiency and scale.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Moreover, social entrepreneurship is an effective instrument for stimulating regions' entrepreneurial ecosystems, primarily because social entrepreneurs often work in dysfunctional areas in which business ventures have no economic interest in starting their activities (Hart, Laville & Cattani, 2010). As claimed by institutional void theory, social entrepreneurship initiatives arise as a response to the incapacity of institutions to solve existing (social) problems (Estrin, Mickiewicz & Stephan, 2011; Nissan, Castaño & Carrasco, 2012; Roy, Brumagim & Goll, 2014). In addition, appropriate public policies designed to support social entrepreneurship could achieve a broader impact on the reinforcement of the entrepreneurial ecosystem, due to the spill over effects social entrepreneurship could produce on (economic) entrepreneurial activity (Estrin et al., 2011; 2013).

We could also mention that even assuming the favourability of the entrepreneurial ecosystem has no effect on the motivation to constitute a social organization, it could shape the day-to-day challenges they have to overcome and, accordingly, individuals' perceptions about the competences needed for facing social challenges.

FUTURE RESEARCH DIRECTIONS

This study allowed us to capture the way the external context acts on the decision to go ahead with a social venture. However, more research is needed, specifically research addressing a deeper analysis of the external constraints associated with the motivations towards the social venture. Also, some efforts could be made to evaluate the impact of the entrepreneurial ecosystem on the performance of social organizations emerging from new social ventures.

This paper suffers from some limitations, which derive from the nature of the investigation (quantitative), the sample used, and the number of questionnaires collected. However, it represents closely the emergent phenomena of the entrepreneurial social sector in Portugal. Also, qualitative research methods (such as focus groups or depth interviews) are needed as values, reasons and motivations residing at the subconscious level of the social entrepreneur could be disguised from the outer world by rationalization and other ego defences. Since the focus of the study was on actual social entrepreneurs, it could be interesting to interview potential entrepreneurs that never established a social venture to discern their reasons for not doing so.

CONCLUSION

Social entrepreneurship is an area that has been developed recently and experienced a fast growth, responding to deficits found in the provision of certain social services, either by public or private entities. Following its development, it has succeeded in capturing the interest of more and more researchers aiming to better understand the motivations behind the launching of social ventures and the capacity of organizations to give efficient answers to the social problems they try to solve.

The empirical research in this study sought to understand the influence of the external social environment on the emergence of new social ventures in Portugal. The analysis undertaken allowed us to conclude that a favourable entrepreneurial ecosystem seems to have little influence on the decision-making process related to the creation of new social ventures. Conversely, the sense individuals hold about the skills required to develop the new venture and the previous knowledge that their action will produce a

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

desirable outcome have a significant weight in their decision. Therefore, the question that can be raised is whether public authorities or any kind of social institutions can drive individuals to take entrepreneurial initiatives of a social nature that allow for attacking existing problems, particularly in territories where that initiative is more scarce and therefore more needed.

The investigation reveals that the relative importance attached to a favourable entrepreneurial context is not the same for all kinds of social ventures. This relates closely to the individual factors impacting the decision to launch a social organization.

The results also confirm the critical role innovative ecosystems can play in encouraging the development of a greater number of social entrepreneurship ventures. The establishment of new social ventures, even when confronted with a hostile environment, is most probable, since social entrepreneurs perceive they have the appropriate skills to act and are dealing with more innovative social organizations.

KEY TERMS AND DEFINITIONS

Entrepreneurial Ecosystem Approach: Approach that emphasizes the role of governmental and non-governmental institutions in creating a regulatory framework and support system for improving the activities of social entrepreneurs.

Social and Solidarity Economy: Autonomous branch of economic activity included between the public and the private sphere, composed of entities or organisations aimed at promoting the general interest of the society.

Social Entrepreneurs: Individuals inspired by a desire for social change who focus their efforts on designing, conceiving and developing an entrepreneurially social organization whose main purpose is the resolution of a social problem.

Social Entrepreneurship: Field of activity dedicated to the identification and exploration of social value-creating opportunities. This field employs innovative models and entrepreneurial practices in order to create social value in a sustainable and lasting way.

Social Innovation: Process of doing things differently in order to be able to produce higher social value.

Territorial Innovation Models: Set of theoretical approaches that discuss the role territory could perform in encouraging innovation.

Chapter 10
On the Configuration of Crowdsourcing Projects

Mahmood Hosseini
Bournemouth University, UK

Keith Phalp
Bournemouth University, UK

Jacqui Taylor
Bournemouth University, UK

Raian Ali
Bournemouth University, UK

ABSTRACT

Crowdsourcing is an emerging paradigm, facilitated by the ease and scale of online connectivity, which harnesses the power of the crowds to solve problems and contribute knowledge. Crowdsourcing has been tried in practice and there are several commercial general-purpose crowdsourcing platforms on the web. Although the paradigm feasibility and impact have become evident, we still lack engineering methods and principles which aid the construction of quality crowdsourcing-based solutions. One of these aspects is the compatibility between the various configuration choices of the elements of a crowdsourcing project. In a previous work, the authors surveyed the literature and extracted a taxonomy of the various features which describes each of the four pillars of crowdsourcing: the crowd, the crowdsourcer, the crowdsourced task and the crowdsourcing platform. In this paper, the authors study the inter-relations between these features when configuring a crowdsourcing project. They start with an initial template and then confirm and enhance it by an expert study which involves 37 experts who applied crowdsourcing in practice and published research results. Their study helps crowdsourcers and crowdsourcing platform developers to better understand the several peculiarities that may arise by combining these features and thus assist them in the configuration of crowdsourcing projects with more awareness.

1. INTRODUCTION

Crowdsourcing harnesses the power, wisdom, or financial resources of usually a large, diverse group of people to solve problems that are usually impossible, difficult or time-consuming to be solved by computers. . While the crowdsourcers benefit from the typically fast and cheap solutions that crowdsourcing promises them, the crowd also gets incentivised, usually by being paid a nominal amount of money or a sort of intangible reward such as social recognition. Consequently, crowdsourcing has become available as an alternative to outsourcing and several commercial crowdsourcing platforms are now available on the web. Amazon Mechanical Turk (Buhrmester et al. 2011, Kittur et al. 2008) and Threadless (Brabham 2010, Wu et al. 2010) are examples of such platforms.

By utilising the diverse knowledge, scale and speed of the crowd, crowdsourcing has attracted several domains of study. Crowdsourcing has been used in environmental sciences (Fraternali et al. 2012, Gao et al. 2011), in medicine (Foncubierta Rodrguez & Müller 2012, Yu et al. 2012), in business and marketing (Chanal et al. 2008, Whitla 2009), in sociology (Heinzelman et al. 2011, Wexler 2011), in astronomy (Gay et al. 2014, Harvey et al. 2014), and in computer sciences (Hosseini et al. 2014b, Sherief et al. 2014). In spite of this popularity, there is still a lack of engineering approaches for crowdsourcing projects. One of the engineering challenges is the configuration of a crowdsourcing project in terms of the choices made for each of the pillars: the crowd, the crowdsourcer, the task to be solved and the platform which accommodates the project (Hosseini et al. 2014a).

In (Hosseini et al. 2014a), we proposed a taxonomy for crowdsourcing. The taxonomy was elicited by analysing 113 papers on the crowdsourcing topic which clearly defined the concept. The taxonomy discussed the four main pillars of crowdsourcing and proposed a set of inter-relations between various crowdsourcing features. These relations are mainly about the compatibility (*excludes* and *hinders*) and dependencies (*requires* and *supports*) between features. The exploration of these relations and when they apply will guide the configuration of crowdsourcing projects. That is, similar to a configuration of a software product line (Clements & Northrop 2002), they will guide the choice between features when setting up a crowdsourcing project.

The beneficiaries of the analysis and specification of these relations between features are various. The platform developers could use that as a baseline for their configuration wizard or recommendation system. Crowdsourcers will be aware of the inter-dependencies and obstacles while taking certain options. Ultimately, the quality of the crowdsourced task and the crowd experience could also improve when setting up a crowdsourcing project is informed by best practice experience.

In this paper and to get that best practice, we consolidate our initial template of the inter-relations between features proposed in (Hosseini et al. 2014a) by consulting with experts through an expert opinion study. The study included 36 experts in crowdsourcing who applied it in practice and published research results. Our analysis led to discover further relations and different views on the relations between the different pairs of features. The diversity in views and arguments is expected, given the nature of many of the features which relate to the behaviour and perception of individuals and crowds. We report on those arguments and explain the various views. Our study enriches the body of knowledge on crowdsourcing with a guide to configure and set up a crowdsourcing project. It also encourages further research to refine and extend our findings.

The rest of the paper is structured as follows. In Section 2, we provide the background of our study and provide the crowdsourcing taxonomy. In Section 3, we explain the methodology we have used to

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

conduct our study. In Section 4, we present the results of this study and reflect on these obtained results. In Section 5, we present our discussion and also discuss the threats to the validity of our paper. In Section 6, we conclude our paper and describe the future work.

2. BACKGROUND: CROWDSOURCING TAXONOMY

In our previous paper (Hosseini et al. 2014a), we proposed a taxonomy for crowdsourcing. The taxonomy was extracted by analysing 113 papers which gave clear definitions of the concept since it was first coined in 2006 until 2014. We built the taxonomy around four pillars which should be described in a typical crowdsourcing project:

- The crowdsourcer which represents the entity which owns the business task and would like to get the job or the solution done by the crowd
- The crowd which represents the people who participate in the problem solving and doing the tasks for the crowdsourcer, and typically get certain incentives
- The crowdsourced task which is the piece of work to be done by the crowd for the crowdsourcer
- The crowdsourcing platform which provides a medium for the interactions between the crowd and the crowdsourcer and for setting up the task and providing the solution.

For every pillar, we identified a set of features, which we extracted from the literature on crowdsourcing, namely from the definitions given to the concept. A full description of this taxonomy can be found on (Hosseini et al. 2014a). Table 1 summarises the features of the first pillar, the *crowd* to be recruited, and short descriptions for every feature. The crowd is typically described through five main features: diversity, anonymity or unknown-ness, largeness, randomness or undefined-ness, and suitability. These features can have their own sub-features as shown in the table.

Table 2 summarises the features of the second pillar of crowdsourcing, the *crowdsourcer*, and short descriptions for every feature. The crowdsourcers are characterised through four main features: the incentives provision mechanism they adopt, whether they recruit the crowd through open call provision, ethicality provision and privacy provision. These features can have their own sub-features, which are also summarised in the table.

Table 3 summarises the features of the third pillar of crowdsourcing, the crowdsourced *task*, and short descriptions for every feature. A task can be characterised through eight main features: having a traditional operation alternative, being an outsourcing task, modularity of the task, complexity of the task, solvability of the task, automation characteristics of the task, being mainly user-driven, and contribution type of the task. These features can have their own sub-features, which are also extracted from the literature.

Table 4 summarises the characteristics of the fourth pillar of crowdsourcing, the crowdsourcing *platform*, and short descriptions for every characteristic. A crowdsourcing platform would typically need to offer four main facilities; facilities that deal with the crowd, facilities that deal with the crowdsourcer, facilities that deal with the crowdsourced task, and facilities that are related to the platform, itself. The sub-features of these four main features are also listed in the same table.

Table 1. Features of the crowd

The Crowd Features	Short Descriptions
1. Diversity	*The state or quality of being different or varied*
1.1. Spatial Diversity	*Diversity in location (geographical, department, etc.)*
1.2. Gender Diversity	*Diversity in gender (male or female)*
1.3. Age Diversity	*Diversity in age*
1.4. Expertise Diversity	*Diversity in skills, knowledge, or proficiency*
2. Unknown-ness	*The condition or fact of being anonymous*
2.1. Not Known to Crowdsourcer	*Being anonymous to the crowdsourcer*
2.2. Not Known to Each Other	*Being anonymous to other individuals in the crowd*
3. Largeness	*Consisting of big numbers*
3.1. Number Fulfils the Task	*Enough individuals to solve the problem*
3.2. Number Not Abundant	*Enough individuals to avoid confusion or management issues*
4. Undefined-ness	*Not being determined, random*
5. Suitability	*Suiting a given purpose, occasion, or condition*
5.1. Competence	*Ability and expertise in performing a task*
5.2. Collaboration	*Working together with other individuals*
5.3. Volunteering	*Offering capabilities to perform a task*
5.4. Motivation	*The inspiration to perform a task*
5.4.1. Mental Satisfaction	*Joy of performing a task*
5.4.2. Self-Esteem	*Feeling proud and confident*
5.4.3. Personal Skill Development	*Developing individual's abilities*
5.4.4. Knowledge Sharing	*Distributing the personal information*
5.4.5. Love of Community	*Caring about one's community*

Table 2. Features of the crowdsourcer

The Crowdsourcer Features	Short Descriptions
1. Incentives Provision	*Providing stimulation for the participants*
1.1. Financial Incentives	*Providing monetary incentives*
1.2. Social Incentives	*Providing community recognition*
1.3. Entertainment Incentives	*Providing gamified and enjoyable experience*
2. Open Call	*Providing an open audition for participation*
3. Ethicality Provision	*Providing and following ethical practices*
3.1. Opt-out Procedure	*Providing a method for participants to opt out*
3.2. Feedback to Crowd	*Providing feedback about participants' performance and results*
3.3. No Harm to Crowd	*Providing a physically and mentally safe environment*
4. Privacy Provision	*Providing privacy options for participants*

Table 3. Features of the crowdsourcing task

The Crowdsourced Task	Short Descriptions
1. Traditional operation	*How the crowdsourcing task is conventionally performed*
1.1. In-house	*Task performed by employees*
1.2. Outsourced	*Task performed by outside organisations*
2. Outsourcing Task	*The true nature of a crowdsourced task is that it can be outsourced*
3. Modularity	*How task can be broken up into smaller tasks*
3.1. Atomic Tasks	*Task is indivisible*
3.2. Divisible to Micro Tasks	*Task can be divided into micro tasks*
4. Complexity	*The complexity measurements of the task*
4.1. Simple Tasks	*Task is simple and straightforward*
4.2. Complex Tasks	*Task is difficult and not straightforward*
5. Solvability	*How task is solved*
5.1. Simple for Humans	*Task is simple enough to be solved by individuals*
5.2. Complex for Computers	*Task is too complicated to be solved by computers*
6. Automation Characteristics	*How task can be automated*
6.1. Difficult to Automate	*Task is difficult (if not impossible) to automate*
6.2. Expensive to Automate	*Task is expensive to automate*
7. User-driven	*The individuals' perception of the task*
7.1. Problem Solving	*Task is a problem to be solved*
7.2. Innovation	*Task needs individual's innovation*
7.3.Co-creation	*Task needs individuals collaboration in production*
8. Contribution Type	*How task can be performed*
8.1. Individual Contribution	*Individuals perform on their own to reach a solution*
8.2. Collaborative Contribution	*Individuals need to collaborate to reach a solution*

3. CONFIGURING CROWDSOURCING PROJECTS: METHODOLOGY

In Section 2, we listed the various features which describe the four pillars of a crowdsourcing project. All these features may not exist in one project, and sometimes it is not even possible to have some of them together in the same project due to incompatibility reasons. The configuration problem, mainly reliant on the interdependencies between features, is well-known in the software product lines engineering literature (van der Linden et al. 2007). The extracted taxonomy is a form of feature model (Lee et al. 2002) without those inter-relations between the features. We observe the choice of certain features could exclude other features or, instead, it may make them required. For example, *Privacy Provision*, a crowdsourcer feature, requires *Hide Results from Others*, which is a platform facility. In another example, *Provide Authentication*, a platform facility, excludes *Not Known to Crowdsourcer*, which is a crowd feature. This paper is to identify these inter-dependencies so that it aids the design of future recommendations tools for configuring crowdsourcing projects.

Table 4. Facilities of the crowdsourcing platform

The Crowdsourcing Platform Facilities	Short Descriptions
1. Crowd-related Interactions	*Facilities in the platform that relate to the crowd*
1.1. Provide Enrolment	*Means to enrol the individuals*
1.2. Provide Authentication	*Means to authenticate the individuals*
1.3. Provide Skill Declaration	*Means to help the individuals declare their skills*
1.4. Provide Task Assignment	*Means to assign tasks to the right individuals*
1.5. Provide Assistance	*Means to help the individuals during the performing of the task*
1.6. Provide Result Submission	*Means to help the individuals to send their results*
1.7. Coordinate Crowd	*Means to coordinate performers in a certain task*
1.8. Supervise Crowd	*Means to supervise individuals during their performance*
1.9. Provide Feedback Loops	*Means to give feedback to individuals about their performance and about the results*
2. Crowdsourcer-related Interactions	*Facilities in the platform that relate to the crowdsourcer*
2.1. Provide Enrolment	*Means to enrol the crowdsourcers*
2.2. Provide Authentication	*Means to authenticate the crowdsourcers*
2.3. Provide Task Broadcast	*Means to broadcast the task to the right individuals*
2.4. Provide Assistance	*Means to help the crowdsourcers for announcing the task*
2.5. Provide Time Negotiation	*Means to help crowdsourcers negotiate time requirements with the individuals*
2.6. Provide Price Negotiation	*Means to help crowdsourcers negotiate performance prices with the individuals*
2.7. Provide Result Verification	*Means to verify whether submitted results meet the needs of crowdsourcers*
2.8. Provide Feedback Loops	*Means to give feedback to crowdsourcers about individuals' performances*
3. Task-related Facilities	*Facilities in the platform that relate to the task*
3.1. Aggregate Results	*Means to collect and unify submitted results*
3.2. Hide Results from Others	*Means to hide individuals' results from each other for privacy reasons*
3.3. Store History of Completed Tasks	*Means to keep a history of the completed tasks and related information (such as who completed them, the spent time, etc.)*
3.4. Provide Quality Threshold	*Means to guarantee the required quality of results*
3.5. Provide Quantity Threshold	*Means to guarantee the required number of responses*
4. Platform-related Facilities	*Facilities in the platform that relate to the platform itself*
4.1. Online Environment	*Means to keep the platform online and accessible to individuals*
4.2. Manage Platform Misuse	*Means to report if there are instances of platform misuse*
4.3. Provide Ease of Use	*Means to keep the platform simple to use*
4.4. Provide Attraction	*Means to keep the platform attractive to use*
4.5. Provide Interaction	*Means to keep the platform interactive*
4.6. Provide Payment Mechanism	*Means to enable crowdsourcers to pay individuals in their preferred way*

3.1. Inter-relations Ontology

Our specification of the inter-relations between crowdsourcing features is meant to help crowdsourcing platform developers in setting crowdsourcing projects correctly. This does not only mean the quality of outcome and the technical correctness but also the sustainability and reputability of the project given the heavy human-related elements in crowdsourcing projects.

The two popular relations in Feature Models (Kang et al. 1990, Kang et al. 1998) which express these inter-dependencies are *requires* and *excludes*. This does not suffice in our case. Since crowdsourcing, analysed via the taxonomy proposed in Section 2, includes social features which typically have a fuzzy nature and relates to human perception and judgement, we need a softer version of each of these two deterministic relations. To accommodate this need and make the configuration process even more informed, we also introduced two more relations to describe these inter-dependencies, *supports* and *hinders*. The semantics of our set of inter-relations between features are as follows:

- **X Requires Y:** X cannot exist or function without Y.
- **X Excludes Y:** X can only exist or function if the Y does not exist.
- **X Supports Y:** The existence of X facilitates the functionality or quality of Y.
- **X Hinders Y:** The existence of X obstructs the functionality or quality of Y.

We also define two more combined relations, the *inverse* relation where experts choose both *hinders* and *excludes*, and the *coexist* relation where they choose both *supports* and *requires*.

3.2. Inter-relations Initial Template

We analysed the four taxonomies of features described in Section 2 to identify inter-relations between them. This identification was informed by the literature from which we extracted the taxonomy. Typically, each paper in the collection of 113 papers had certain assumptions about the core features of crowdsourcing and the optional and alternative features. When applying the definition on case studies, the choice amongst those optional and alternative features was based on a sort of argument and then discussed in light of the results. We also used factual dependencies to identify those relations, i.e., dependencies which are based on sound argument. In all cases, we considered our identification as an initial template and sought to confirm and enhance it through another phase by asking experts in crowdsourcing as we describe in Section 3. Our initial template can be found in (Hosseini et al. 2014a).

3.3. Expert Opinion Study

Our next step was to consult with experts on the list of inter-relations which we identified in our initial template. This is to judge the extent to which our identified relations reflect those experts' experience with crowdsourcing. To this end, we prepared an expert survey which consisted of five different crowdsourcing scenarios and a set of forty pairs of features and the possible relation between each pair. The five scenarios helped to stimulate the experts' thoughts in variations that exist among crowdsourcing tasks, and also to attract their attention to the need for careful configuration of crowdsourcing under diverse circumstances and in various settings. In this paper, we report and reflect on such crowdsourcing settings which explore the possible relations between each pair of crowdsourcing features.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

The initial set of relations between different pairs of crowdsourcing features was discussed in the previous section. This phase was introduced to further confirm or otherwise refine the relation set. To do so, we needed to consult with the experts in the field of crowdsourcing.

After the preparation of the survey questions, we started the identification of crowdsourcing experts to participate in our study. To achieve this, we used Google Scholar to track experts in crowdsourcing. We listed people who had at least three related quality publications in the field of crowdsourcing. To ensure that our survey has premium quality, we designed it as an invitation-only survey, and invited the experts by sending an invitation email.

A total of 139 experts were invited to the survey through email. The experts came from different backgrounds and domain expertise to ensure diversity. 50 experts partially completed the survey, and 36 experts completed the survey. In this paper, we only report and reflect on the opinions of those experts who completed the survey. The experts' affiliation and type of expertise in crowdsourcing are summarised in Table 5.

4. CONFIGURING CROWDSOURCING PROJECTS: RESULTS

In this section, we report and reflect on the results of the experts' opinion survey on the relations between the various features of the four pillars of crowdsourcing. We note here that this study relates only to one-to-one relations, while there could be still some grouping to discover in future studies. The analysis is based on the experts' choices of the relations and also the comments they gave to explain that. We emphasise here that we have reported on experts' opinions, believing that all experts' opinions are valid, and we advocate that even minorities could reflect particular cases which still need to be considered. Thus, we do not interpret that as a disagreement among experts but rather as an indicator of the peculiarity of that relation. We asked the experts to choose the relation which could be stronger in their opinion. So their disagreements with other experts show their differences in their evaluation of the strength of the relation.

Obviously, each of the concepts and features studied in this paper could be further refined to more subtle concepts and facets. Our paper took a pragmatic approach to that from the beginning, i.e. we extracted our taxonomy from the literature, and researchers and studies in crowdsourcing seem to have developed a common understanding of the meanings of these concepts. Our review of 113 papers on crowdsourcing to come up with the features and choosing participants who researched the topic in the survey enabled such consistency with the common interpretation even though some features are fuzzy by nature and hard to quantify and define in a crisp manner.

Table 5. Summary of experts' information

Types of Expertise in Crowdsourcing		Major Expertise in Crowdsourcing
Academia Industry Both	86.5% 2.7% 10.8%	Social sensing, Crowdfunding, Citizen Science Project, Crowdsourcing for multimedia quality assessment, Trust and privacy in crowd-enhanced systems, Structured volunteer crowdsourcing, Quality assurance in crowdsourcing, Micro tasking platforms

4.1. Relations of Crowd Features with Other Features

In this section, we report and reflect on the relations which are driven by the crowd features. The crowd features depict what choices in the crowd are preferred in their interaction with the crowdsourcer, how these features influence the crowdsourced task, and how they may change or alter platform facilities. Mainly, these features are supposed to entail other features in the other three pillars and reduce the space of variability of their possible configurations. The list of relations between crowd features and other features are as follows:

- **Crowd Unknown-ness Versus Social Incentives (Inverse, No Relation):** The first view advocated an inverse relation between anonymity of the crowd and social incentives. The obvious reason is that social incentives are based on recognition by the community, and providing such incentives will be impossible when an individual's real identity is not revealed. The other view saw no relation between the two features. This was motivated by the fact that some people enjoy being helpful to the community and being recognised by their usernames instead of their real identities. Within the same view, some experts did not even believe in social incentives all together, as crowdsourcing is usually seen as a business model which should utilise tangible and monetary incentives.
- **Crowd Unknown-ness Versus Crowd Collaboration and Collaborative Contribution (Inverse, No Relation, Supports):** The first view supported that the anonymity of the crowd excludes crowd collaboration and collaborative contribution. The reason for such an assumption was that an individual's identity is needed to establish a trust relation which is a baseline for collaboration. The second view identified no relation between these features. This view was assumed because some experts believed that unlike real, offline environments, individuals in the crowd can remain anonymous and still cooperate with each other to solve a problem or crowdfund a business. Interestingly, some of the experts also identified a *supports* relation between these features. It can be argued that anonymity does not always reversely affect the collaboration. In other words, collaboration may decrease if you know who you are collaborating with, since you may not want to collaborate with certain people, and that anonymity may ease you of some pressures that you would feel otherwise (Chester & Gwynne 1998). Indeed, when collaborating for sensitive tasks which require revealing personal views anonymity may be a requirement of the crowd.
- **Crowd Largeness Versus Crowd Coordination (Hinders, Requires, No Relation):** The first view advocated that crowd largeness hinders the coordination of the crowd in the sense it adds complexity and extra overhead to the process. Experts also saw a *requires* relation between these two features, which could mean that when the crowd is large, it requires to be coordinated. These two views are consistent and ultimately mean that coordination becomes a requirement when the crowd is large. However, this is not always necessary as some tasks, e.g. filling in a survey, could require a large crowd but no coordination. This was the main reason why other experts could not find a direct relation between the two features as this heavily depends on the task being crowdsourced. This also shows an obvious instance of how relations between crowdsourcing features can be complicated, context-dependant, and task-dependant. Consequently, it illustrates the need for a crowdsourcing configurator which can address all these peculiarities.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

- **Crowd Largeness Versus Crowd Diversity (Supports, No Relation):** The first view was that largeness in the crowd supports crowd diversity. This was confirmed by the majority of experts. The second view advocated that there are no relations between the two, possibly because largeness does not necessarily bring diversity, especially when the crowd is homogeneous and similar-minded.
- **Crowd Competence Versus Task Complexity (The Choice of a Complex Task) And Task Solvability (Supports, No Relation):** The first view was that crowd competence supports the inclusion of complex tasks and their solvability in a crowdsourcing project. That is, a competent crowd can more efficiently address and solve complex tasks, and therefore the crowdsourcing project can include such tasks. The second view saw no relation between them, explaining that the incompetence of the crowd in the domain of the crowdsourced task may also yield an overall good solution. For example, suppose that there is a task for designing a web interface for the staff of an organisation to organise meetings on the fly. Asking those who are experts in organising meetings may result in a system that works well for them, but not necessarily for those who have not developed an advanced mind-set in how this should be done yet.
- **Crowd Competence Versus Co-Creation, Innovation and Problem Solving as Crowdsourcing Task Types (Supports, No Relation):** The first view was that crowd competence supports such crowdsourcing task types. This was obviously the case as competence is usually seen as a desirable feature in the crowd. The second view saw no relation between these features, with a similar argument to the previous one in the point above. That is, there are certain crowdsourcing co-creation or innovation tasks where competence does not play a pivotal role, and thus can be neglected as a crowd feature. This is indeed true in certain crowdsourced tasks. For example, when the choice of the new design of a certain product is crowdsourced, we might also need to know how those who are non-experts in that certain product would think of it, as they may later become potential users of that product.
- **Crowd Volunteering Versus Crowd Motivation (Coexist, No Relation):** The first view observed a coexistence relation between crowd volunteering and their motivation. This means that the experts identified a *requires* relation where motivation is needed to lead to volunteering (i.e., motivation is seen preliminary to volunteering because if you are not motivated, you will not volunteer in an activity), and a *supports* relation where motivation benefits from volunteering (i.e., volunteering is seen preliminary to motivation because volunteering encourages motivation). Other experts saw no relation between the two features, which could be because volunteering, as explained, may or may not lead to motivation after all.
- **Crowd Suitability Versus Crowd Undefined-ness (No Relation, Inverse, Supports):** The first view advocated that suitability has no relation with undefined-ness. This could be the case when a random selection of individuals would still make them appropriate for certain crowdsourced tasks, such as identifying the number of stones in a photo, or CAPTCHA solutions. The second view was that suitability of the crowd inversely affects the ability to keep them randomly chosen, since random selection of the individuals in the crowd may not lead to a group of apt individuals who are fit to the crowdsourcing activity. On the other hand, some experts stated that crowd suitability supports undefined-ness. Their interesting vision might be due to the fact that to achieve suitability, the individuals should better be randomly selected to remove any bias and preconception on the activity.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

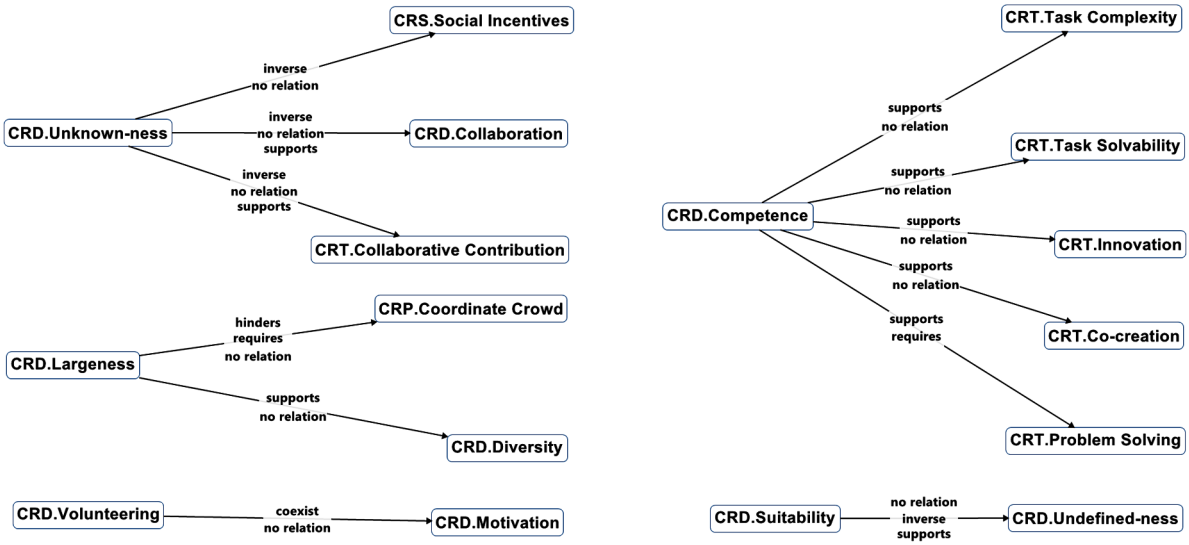
Figure 1 shows the relations between crowd features and other crowdsourcing features. We list only the top two relations voted by the experts for every pair of features, including the "no relation". Furthermore, in this figure and in the upcoming figures, we have used the following contractions: CRD for the crowd features, CRS for the crowdsourcer features, CRT for the crowdsourcing task features, and CRP for the crowdsourcing platform facilities.

4.2. Relations of Crowdsourcer Features with Other Features

In this section, we report and reflect on the relations which are driven by the crowdsourcer features. The crowdsourcer features depict what choices the crowdsourcer might take in their interaction with the crowd, how these features influence the crowdsourced task, and how they may change or alter platform facilities. Mainly, these features are supposed to entail other features in the other three pillars and reduce the space of variability of their possible configurations. The list of relations between crowdsourcer features and other features are as follows:

- **Incentives Provision Versus Crowd Motivation (Coexist):** The prominent view was that providing incentives to the crowd will motivate them. This relation has been the source of many studies (Goel et al. 2013, Kaufmann et al. 2011), does not necessarily refer to financial incentives. However, financial incentives are studied to be very strong motivation factors in crowdsourcing projects (Mason & Watts 2010, Pilz & Gewald 2013).
- **Incentives Provision Versus Crowd Largeness (Supports, No Relation):** The first view was that providing incentives to the crowd will increase the number of participants. This relation was supported by the fact that incentives attract more participants to any task, including crowdsourced tasks. The second view saw no relation between these features. This could be true in non-profit crowdsourcing platforms, where people are usually motivated intrinsically and do not place any

Figure 1. Crowd features and their relations with other crowdsourcing features



EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

value on extrinsic motivations and incentives. In these platforms, providing incentives would have no effect on the number of participants. One expert also stated that providing incentives will hinder the largeness of the crowd. This, in part, could happen in certain cases where incentives are limited to the best performers and the crowd may feel the possibility to gain no incentives as it is a competition, as also noticed in (Brown 2011).

- **Open Call Versus Crowd Largeness, Crowd Undefined-ness and Crowd Diversity (Coexist, No Relation):** The first view was that providing an open call by the crowdsourcer supports these crowd features and also requires these features to be present in the crowd. This means that by providing open call, the crowdsourcer will have a higher chance of recruiting more diverse, random participants. The second view was that there are no relations between these features. This might arise as providing an open call still does not guarantee any of these features. That is, a crowdsourcer may still find a low number of participants or a non-diverse group of participants, for example as a result of requiring solutions for a very complex task, and that the crowdsourcer will still have the opportunity to select certain individuals and therefore obliterate the notion of undefined-ness.
- **Open Call Versus Providing Task Broadcast Facilities (Coexist, No Relation):** One view was that providing an open call by the crowdsourcer to recruit the crowd requires and supports the crowdsourcing platform to provide task broadcast facilities. This means that crowdsourcers can broadcast their tasks in the platform for potential participants to see. It also means that open calls benefit from broadcast facilities in the platform. The rest who saw no relation believed that the broadcasting facility is an intrinsic part of any crowdsourcing platform and would not be linked to other features.
- **Opt-Out Provision Versus Crowd Motivation, Crowd Volunteering and Crowd Largeness (No Relation, Supports, Hinders):** Some experts identified no relation between opt-out provision and these crowd features. Some experts believed that providing an opt-out procedure by the crowdsourcer supports these features. Interestingly, some of the experts also identified a *hinders* relation between these pairs of features, respectively. The experts believed that providing an opt-out procedure offers a method of getting out of the crowdsourcing activity and therefore the crowd may lose their motivation to continue to the end, the crowd may no longer volunteer if they lose motivation and eagerness, and that the number of individuals in the crowd will decrease over time when they opt out and therefore crowd largeness will be negatively affected.
- **Privacy Provision Versus Crowd Unknown-ness (Coexist, Inverse, No Relation):** Some experts stated that providing privacy by the crowdsourcer supports and requires anonymity in the crowd and to the crowdsourcer. However, other experts identified an *inverse* relation between them, either choosing a *hinders* or an *excludes* relation. The reason could be that being unknown makes little sense of having privacy. Privacy concerns start when someone participates with some sort of real identity. The rest of the experts identified no relation between them, probably due to the complex nature of online privacy and online presence using nicknames, usernames, etc.
- **Privacy Provision Versus Hiding Results from Others (Coexist, No Relation):** The first view was that providing privacy by the crowdsourcer requires the platform to hide results from crowdsourcing activities of one individual from another, and also supports the platform in providing this facility. Other experts did not see a significant relation between the two, mainly because hiding results from others could make privacy provision irrelevant.
- **Feedback to Crowd Versus Crowd Motivation (Supports):** The prominent view of the experts was that providing feedback to the crowd will support their motivation. This illustrates the im-

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

portance of keeping in touch with the crowd though feedback, as they will feel more valued and therefore more motivated.

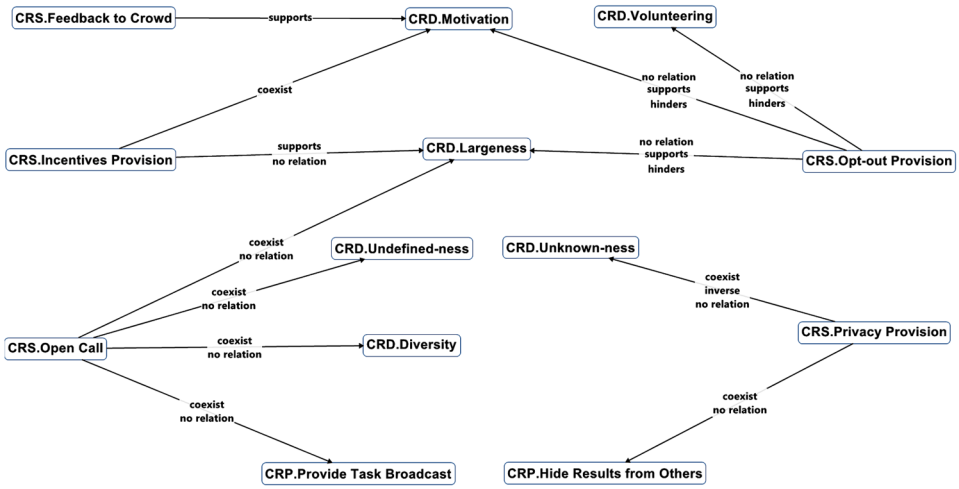
Figure 2 shows the relations between crowdsourcer features and other crowdsourcing features. We list only the top two relations voted by the experts for every pair of features, including the "no relation".

4.3. Relations of Crowdsourcing Task Features with Other Features

In this section, we report and reflect on the relations which are driven by the crowdsourced task features. It depicts how the selection of certain task features can influence some features of the crowd and the crowdsourcer, and how it may change or alter platform facilities. Mainly, these features are supposed to entail other features in the other three pillars and reduce the space of variability of their possible configurations. The list of relations between crowdsourced task features and other features are as follows:

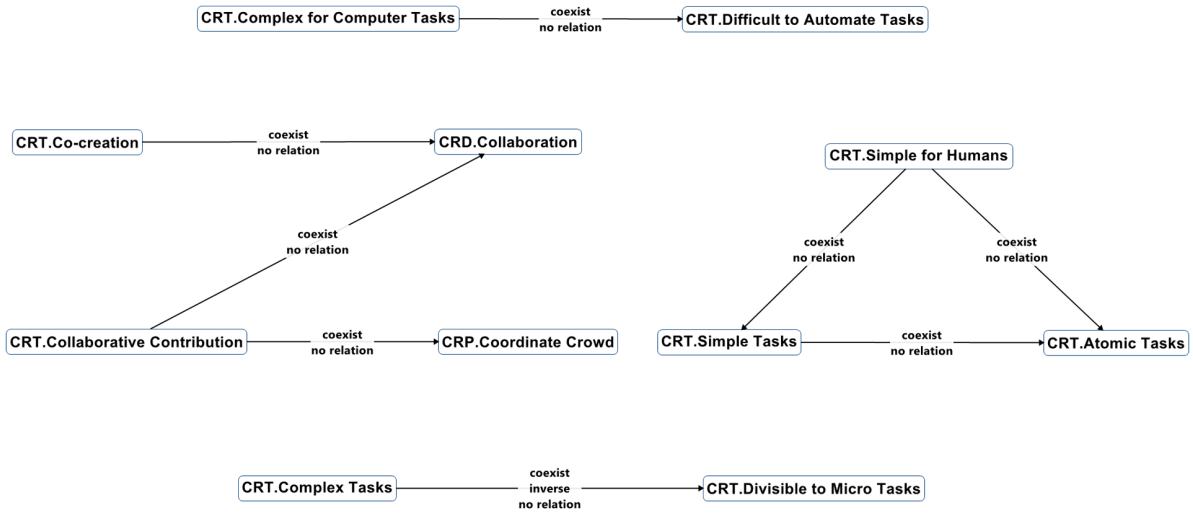
- **Complex Tasks Versus Divisible to Micro Tasks (Coexist, Inverse, No Relation):** Some of the experts specified that complex tasks support and require divisibility to micro tasks. This means that complex tasks in a crowdsourcing platform are usually broken down into micro tasks for the crowd to perform. However, some experts also identified an *inverse* relation between these features as *excludes* or *hinders* relations. This is justified by the fact that the complexity of some tasks is because they cannot be actually divided into micro tasks and they should be performed in whole. The rest of the experts saw no relation between them. Consequently, the relation between these features remains highly controversial.
- **Complex for Computer Tasks Versus Difficult to Automate Tasks (Coexist, No Relation):** One viewpoint of the experts was that tasks that are complex for computers require being difficult to automate, while these tasks also support tasks which are difficult to automate. Other experts identified no relations between these features. The reason for this divergence is that the kind of complexity which requires cognition is hard to automate, while the kind of complexity which

Figure 2. Crowdsourcer features and their relations with other crowdsourcing features



EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 3. Crowdsourcing task features and their relations with other crowdsourcing features



could be translated to discrete problems could become easy to automate. This is consistent with the main usage of crowdsourcing which typically relates to tasks which are difficult for computers and simple for humans.

- **Co-Creation Versus Crowd Collaboration (Coexist, No Relation):** Some experts discussed that co-creation in a crowdsourcing task requires and supports collaboration within individual members of the crowd. This view advocates that people start to collaborate when the task intrinsically requires co-creation, while it also advocates the desire for collaboration is preliminary to starting performing of co-creative tasks. Other experts identified no relation between these features.
- **Collaborative Contribution Versus Crowd Collaboration and Crowd Coordination (Coexist, No Relation):** Some experts stated that tasks which are based on collaborative contribution require and support an established collaboration within the crowd and coordination mechanisms of the crowd. Their argument is similar to the previous point, where the nature of the task motivates the crowd to adopt certain behaviour, i.e., to collaborate and adopt certain coordination methods.
- **Simple for Humans Tasks Versus Atomic Tasks and Simple Tasks (Coexist, No Relation):** Some of the experts indicated that tasks which are simple for humans require and support atomic tasks and simple tasks. In this particular case, these two opinions are essentially the same and relate to those cognitive abilities of humans who are able to solve problems which are not computationally easy to solve but are still of small scale.
- **Simple Tasks Versus Atomic Tasks (Coexist, No Relation):** Some experts stated that simple tasks require and support atomic tasks. The explanation here is similar to that in the previous point.

Figure 3 shows the relations between crowdsourcing task features and other crowdsourcing features. We list only the top two relations voted by the experts for every pair of features, including the "no relation".

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

4.4. Relations of Crowdsourcing Platform Facilities with Other Features

In this section, we report and reflect on the relations which are driven by the crowdsourcing platform facilities. It depicts how choosing some platform facilities can influence the crowd features and the crowdsourcer abilities, and how they can affect the crowdsourced task. Mainly, these facilities are supposed to entail other features in the other three pillars and reduce the space of variability of their possible configurations. The list of relations between crowdsourcing platform facilities and other features are as follows:

- **Provide Attraction Versus Crowd Largeness (Support, No Relation):** Several experts believed that an attractive crowdsourcing platform supports the largeness in the crowd. The rest who saw no relation advocated that the decision to participate typically happens before the crowd engage with the platform to see the attractive features it provides in a particular crowdsourcing project.
- **Provide Ease of Use Versus Crowd Largeness (Support, No Relation):** Experts generally agreed that an easy to use crowdsourcing platform supports the largeness in the crowd. The rest saw no relation for a reason similar to that in the previous point.
- **Provide Authentication Versus Manage Platform Misuse (Coexist, Inverse, No Relation):** Some experts argued that a crowdsourcing platform with authentication facilities for individuals in the crowd supports and requires managing platform misuse. Some other experts saw an *inverse* relation, meaning that authentication could make such management difficult. It could only be the case when authentication procedures could only add to the complexity of misuse management, for example in cases where registration is open to anyone and malicious users systematically misuse the platform through multiple IDs and fake profiles. The rest who specified no relation commented that authentication is a very basic feature which contributes only moderately to the management of platform misuse. In their opinion, managing platform misuse is a big challenge and requires more advances mechanisms.
- **Provide Authentication Versus Not Being Known to Crowdsourcer (Inverse, No Relation, Supports):** Experts stated that a crowdsourcing platform with authentication facilities for individuals in the crowd excludes or hinders their anonymity to the crowdsourcer. Some other experts identified no relation between these features, which could mean crowdsourcers may have other ways of identifying the crowd, e.g. through demographics and personal questions inside a survey which is independent of the crowdsourcing platform. The rest of the experts also identified it as a *supports* relation. This might mean that authentication procedures could enforce even more the choice of an individual to be deliberately hidden from the crowdsourcer. This is similar to the case when some online survey systems offer the registered and trusted users the right to hide their IP addresses which is typically used to check blacklisted locations and participants.
- **Provide Feedback Loops Versus Feedback to Crowd (Coexist):** Experts almost unanimously agreed that providing feedback loops as a crowdsourcing platform facility supports and requires feedback to the crowd by the crowdsourcer. Both views are consistent and identify mutual dependencies between the two features of these two pillars of crowdsourcing.
- **Provide Quality Threshold Versus Crowd Competence (Coexist, No Relation):** One view stated that providing quality threshold as a crowdsourcing platform facility requires and supports competence in the crowd. Both views mean there is a correlation between the potential compe-

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

tence in the crowd and the activation of a quality threshold feature in the platform. The rest of the experts identified no relation between these features.

- **Provide Quantity Threshold Versus Crowd Largeness (Coexist, No Relation, Hinders):** Some experts said that the activation of the feature of a quantity threshold in a crowdsourcing platform requires and supports potential largeness in the crowd. The same explanation as the previous relation applies here. However, some of the experts expressed that providing a quantity threshold hinders crowd largeness. This can be explained as these experts saw the threshold as a barrier for further participation of the crowd. The rest of the experts identified no relation between these features.
- **Provide Skills Declaration Versus Provide Task Assignment (Coexist, No Relation, Hinders):** Several experts reported that declaring skills in the crowdsourcing platform by the crowd supports and requires task assignment to them. This could be seen as the more obvious relation, as the platform can more efficiently assign tasks to the crowd when their skills are declared in the platform beforehand. However, some other experts saw no relation between these features. This is especially the case when crowdsourcers are dealing with tasks which require common sense and not specific skills, such as finding a specific colour, which implies a certain deficiency, in medical imagery. The rest of the experts thought skills declaration can actually hinder task assignment, as this could mean that the platform will have more difficulty in finding the right crowd.
- **Provide Skills Declaration Versus Not Being Known to the Crowdsourcer (No Relation, Hinders):** Some of the experts identified no relation between these features. This is mainly because they did not consider skills as a sensitive identifier to a person. Other experts stated that declaring skills in the crowdsourcing platform hinders anonymity of the crowd to the crowdsourcer. Their viewpoint is basically opposite the previous group, as they think people cannot remain anonymous when their skills are declared and exposed to crowdsourcers.

Figure 4 shows the relations between crowdsourcing platform facilities and other crowdsourcing features. We list only the top two relations voted by the experts for every pair of features, including the "no relation".

To conclude this section, it is interesting to observe how diverse the experts' opinions can sometimes be, and how subjective and contextual some relations between certain features can become. This makes the configuration of crowdsourcing projects even harder and calls for more cautious approaches, which are to some extent missing in current crowdsourcing platforms.

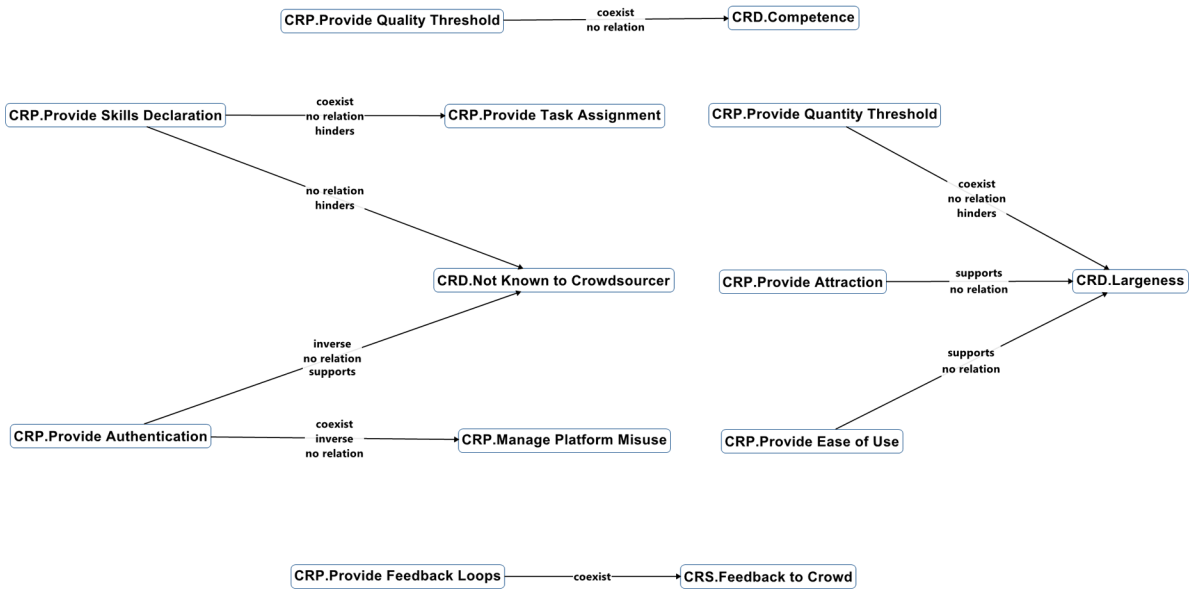
5. DISCUSSION AND THREATS TO VALIDITY

While analysing the results of the survey, we identified several instances of disagreement among experts. Such disagreements partially occurred due to the nature of such surveys, where experts may have different opinions about a given topic. However, part of the disagreement was due to the fuzzy nature of some features. Some of the concepts in question, such as competency or anonymity, could be interpreted as binary concepts where the person either is competent or not, but could be also interpreted as non-binary concepts where the person may have different levels of competency or anonymity.

Given the different possible interpretations of the same concept, we were interested in gathering all explanations about the possible relations between those concepts. Thus, even when a small number of

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 4. Crowdsourcing platform facilities and their relations with other crowdsourcing features



experts advocated a relation as a first relation, we reported that in the paper as long as they gave a valid explanation in the text entry boxes.

Our empirical expert survey involved a relatively wide number of experts, namely 36, which is a good number for expert opinions studies (Cooke & Probst 2006). The survey questions were followed by comment boxes to allow experts to add their further insights, which also helped us interpret the reasons of their choices. Furthermore, the survey was conducted in an invitation-only manner to allow only experts with a proven track record in the field, manifested by research papers and projects applied in practice, to express their opinions. However, our study still has few threats to validity:

- Our work studied the relations of crowdsourcing features for the purpose of configuring crowdsourcing projects. As the results reveal in a few cases, such configuration may be incomplete or partial if the context and the crowdsourcing project types are not fully considered. On the other hand, several relations are also independent of the context in which the crowdsourcing project is performed, or the project itself. The high percentage of agreement among experts for several relations under study confirms this.
- Our work is based on the initial template that we proposed in (Hosseini et al. 2014a). Even though we tried to consider all possible relations between crowdsourcing features, there might still be other relations that we did not detect, or relations that may arise as the consequence of running a certain crowdsourcing project in a certain context. However, while not claiming completeness, our study allowed the discovery of a significant number of relations which were not trivial. For example, for certain pairs of features, the final results identified more than one relation while some individual experts provided only one of them.
- Our work is based on pair relations, i.e., relations between two crowdsourcing features. However, there might exist some relations that connect three or more features together. For example, the two

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

crowd features of largeness and diversity may collectively hinder managing platform misuse. The complexity of such relations would require a further study and we would probably need multiple studies to cover all possible combinations.

6. CONCLUSION AND FUTURE WORK

In this paper, we advocated the need for engineering approaches on setting up a crowdsourcing project. Systematic approaches informed by best practice experience will help get a more efficient platform, higher participation rates, and better, more quality results. To inform such configuration settings, we identified a set of inter-relations between crowdsourcing features which, when neglected, could lead to conflicts between crowdsourcers and crowd, to problems in the design of the platform and finally to adverse effects on the crowdsourcing project. These inter-relations were initially hypothesised, and were confirmed or otherwise rejected by the experts in the field of crowdsourcing.

For future work, we plan to develop a crowdsourcing platform configurator, which is an online tool that uses the experts' opinions in this study to aid the crowdsourcing configuration for a given crowdsourcing project. The tool will provide help to both crowdsourcers in the selection of the right crowd and platform developers in the selection of the right configuration. We also propose that some work be done on inter-relations among three or more features as part of a future study. The configurator, being open to all, will also enable the users to provide knowledge and experience on further enriching the best ways on configuring and setting up crowdsourcing projects.

ACKNOWLEDGMENT

The research was supported by an FP7 Marie Curie CIG grant (the SOCIAD Project) and by Bournemouth University through the Fusion Investment Fund (the BBB, BUUU and VolaComp projects) and the Graduate School Santander Grant for PGR Development.

Chapter 11
Entrepreneurial Process and Financial Well-Being Generated by a Colombian Association of Vulnerable Individuals

Liyis Gomez-Nuñez
Universidad del Norte, Colombia

Luis Javier Sanchez-Barrios
Universidad del Norte, Colombia

ABSTRACT

Entrepreneurship is considered relevant in the economic growth of nations because of its impact in the creation of new jobs and innovations in the social and economic fields. Thus, governments and academia worldwide have shown interest on how to leverage on entrepreneurship in order to develop strategies that improve the quality of life of individuals. Entrepreneurship as a development strategy is extensive; it goes from the creation of new enterprises born as a result of a high market potential to those that arise as the only income-generating alternative. This chapter addresses the study of the entrepreneurial process in organizations created by associations of vulnerable individuals engendered by the income generation need, and using as reference the case of AGROSEC, located in Colombia. Data were collected from primary and secondary sources. Five interviews were completed using pre-established protocols that were applied to 3 members of the association.

INTRODUCTION

The study of entrepreneurship has focused more on the analysis of innovative companies that arise due to market needs than on those arising from the income generating need of entrepreneurs. The existing cases in the latter have been anecdotal, leaving behind the fundamental aspects of entrepreneurship, like the distinctive features of the entrepreneurial process from entrepreneurs living in highly supportive environments and the differences of such process when it is performed by individuals in less supportive

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

ones, as well as the impact in each surrounding community. This has been the case despite the power and importance of entrepreneurship in the reactivation of highly vulnerable regions and economies, from the point of view of employment generation (Audretsch & Fritsch, 2003; Wennekers, Van Stel, Thurik & Reynolds, 2005).

Given the lack of literature mentioned above, this chapter addresses the analysis of the entrepreneurial process in organizations created by vulnerable individuals grouped in associations, emphasizing its characteristic aspects and the way in which it impacts their communities. It is based on the concepts of social and collective entrepreneurship and the theoretical models proposed by Gartner (1985) and Timmons (1999), using as empiric reference the case of a Colombian organization created by individuals displaced by the armed violence which took place from the mid-twentieth century until almost the second decade of the twenty-first century.

The chapter begins with a concise presentation of basic entrepreneurship concepts such as: entrepreneurship, types of entrepreneurial initiatives, individual features that distinguish entrepreneurs from non-entrepreneurs and the entrepreneurial process. Other concepts such as social entrepreneurship, collective entrepreneurship and financial well-being are then presented given their relevance for the case that was analysed. These concepts are then used to analyse the case of an associative initiative of a vulnerable community in Colombia. The chapter concludes with issues, solutions and future avenues of research regarding the entrepreneurial process of vulnerable communities in Latin America.

BACKGROUND

1. Entrepreneurship and Economic Development

Entrepreneurship is a socioeconomic phenomenon of unquestionable importance. Motivations to study this field include the need of countries and regions to boost their economies through job creation and the impact of entrepreneurship dynamics (Wennekers & Thurik, 1999; Verheul, Wennekers, Audretsch & Thurik, 2002; Thurik, 2003; Audretsch & Fritsch, 2003; Wennekers, Van Stel, Thurik & Reynolds, 2005; Carree, Van Stel, Thurik & Wennekers, 2007). Additionally, Baumol (2004) considered that entrepreneurship is crucial for economies to flourish.

More than a large-scale economic development, new venture creation is based on pull and push factors that motivate individuals to improve first their personal economic development and then that of their families, neighbourhood, regions and countries.

The pull factor drives individuals who are interested in starting a new venture because of high expectations on the benefit that a new business can generate in the future; this is considered entrepreneurship driven by an opportunity. On the other hand, push factors motivate individuals to become entrepreneurs when conflict and negative situations surround them; in that case, entrepreneurship is motivated by necessity.

Entrepreneurship is not a new term. It was derived from the French term “entrepreneur” which has been used since the mid-1700s. The earliest reference to the term entrepreneurship has been traced to Richard Cantillon in 1734, who defined it as self-employment with an uncertain return (McMullan & Long, 1990, as cited in Sharma & Chrisman, 1999). Conceptually, there are plenty definitions for entrepreneurship; the most cited definitions were introduced by Cole (1953), Timmons (1990) and Gartner (1985). Cole (1953) defined entrepreneurship as several productive factors being used by one productive

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

factor to create economic goods. Gartner (1985) defined entrepreneurship as a process that is executed by one or more individuals in a particular environment that results in a new business. A similar standpoint was adopted by Timmons (1990), who defined entrepreneurship as a creative act that leads to the creation of a new enterprise right from the start, requiring only energy and initiative.

Later on, Sharma & Chrisman (1999) identified two different schools of thought regarding the meaning of entrepreneurship: One focusing on entrepreneurship characteristics (i.e. innovation, growth, uniqueness) led by Schumpeter (1934), and a combination of these and another that emphasizing the outcome of entrepreneurship (creating a new venture) led by Gartner (1985). According to Sharma & Chrisman (1999), both approaches are valuable and overlap even though they are distinct. It is important to note that coming up with new combinations may lead or not to the creation of a new company. Likewise, the creation of a new company may involve new combinations that may result in radical innovative activities. They consider that entrepreneurship refers to renewal/creation acts within existing or new organizations, led individually or within existing corporations.

Low & MacMillan (1988) defined entrepreneurship as creating a new enterprise, considering it is a multidimensional phenomenon. Finally, Shane & Venkataram (2000) considered problematic associating entrepreneurship solely with the creation of a company, as such standpoint provides a limited view regarding the variation in the quality of opportunities and leads researchers to neglect measuring them. They defined entrepreneurship as a thorough examination of opportunities to create goods and services (Venkataraman, 1997; Shane & Venkataram, 2000).

For the purpose of this chapter, entrepreneurship refers to the activities an individual goes through from the development of an idea until the creation of an enterprise, following the standpoint of Gartner (1985), who considers in a broad and precise way the different elements involved in the process of creating a company or organization. Also, Timmons (1999) was considered as he proposed a complementary model to that of Gartner (1985). Both authors are mandatory theoretical referents to analyse the entrepreneurial process.

Because of the development of entrepreneurship as an academic, field, other types of entrepreneurship beyond the individual have emerged. These include corporate entrepreneurship and social entrepreneurship. The former refers to new initiatives undertaken by established businesses; the latter includes the creation of business organizations aiming to benefit the welfare of the most vulnerable members of society. These types of entrepreneurship are further explained in Table 1, based on three features: (1) Who performs the entrepreneurial activity? (2) Is the objective to generate profits? and (3) Will the business pay dividends?

Individual entrepreneurship refers to those businesses created by individuals based on an income generation need or based on a market opportunity. In this case, the main purpose is to generate profits that are distributed among the entrepreneurs as dividends or income.

Table 1. Types of entrepreneurship

Type	Who	Profit		Dividends
Usual	Individual(s)	Yes		Yes
Corporate	Established enterprise	Yes		Yes
Social	Individual(s) / Established enterprise	Yes	No	No

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Corporate entrepreneurship refers to an established enterprise that decides to create a new business as a means to diversify or extend their existing business activities (Burgelman, 1983; Covin & Slevin, 1991; Guth & Ginsberg, 1990; Schendel, 1990; Zahra, 1995). Similar to individual entrepreneurship, the aim is to enhance the profits of the company and pay dividends (Spann, Adams & Wortman, 1988).

Social entrepreneurship differs significantly from individual and corporate entrepreneurship. It can be an initiative from either individual(s) or an established enterprise. Even though the focus is not to generate profits and there are some that do not do it, a new enterprise should generate profits for it to be sustainable and mainly to provide economic wellbeing to the community in which it is based. Given the specific features of associative entrepreneurial initiatives, special emphasis is given to social entrepreneurship. This type of entrepreneurship is further explained in the following section.

Regardless of the type of factor (pull or push) or entrepreneurship (individual, corporate or social), any business generates employment and should increase per capita income. Carre, Van Stel, Thurik & Wenneker (2007), GEM (2004) and Wennekers, Van Stel, Thurik & Reynolds (2005), showed that as the income per capita raises, so does the rate of new ventures creation, hence boosting the economy. This is particularly relevant for social development and entrepreneurship at the Base of the Pyramid (BoP).

2. Social Entrepreneurship

Social entrepreneurship usually refers to organizations that aim to supply basic human needs that are not fulfilled by existing economic or social institutions. It combines elements of traditional entrepreneurship with a social mission (Seelos & Mair, 2005).

Some authors define social entrepreneurship considering different aspects of its social mission. According to Mort, Weerawardena & Carnegie (2003), it is a multidimensional construct that uses entrepreneurship as a means to achieve a social mission; Alvord, Brown, & Letts (2004) define it as a series of innovative solutions to immediate social problems which results in a long-term sustainable and social transformation; Roberts & Woods (2005) define social entrepreneurship as the design, assessment and pursuit of social change opportunities led by visionary, passionately dedicated individuals. A similar approach was adopted by Austin, Stevenson, & Wei-Skillern (2006) who classified any entrepreneurial activity with an embedded social purpose as social entrepreneurship.

Alternatively, Martin & Osberg (2007) consider social entrepreneurship should include three components: a marginalized segment of humanity lacking financial or political help to achieve any transformative benefit, an opportunity to create added social value challenging the stable hegemony, and the forging of a new stable equilibrium that alleviates the suffering of a targeted group.

In terms of profits, unlike regular individual or corporate entrepreneurship, social entrepreneurship has a social mission rather than wealth creation. The purpose is to improve living conditions of communities through the generation of sustainable and dignified income. Value created by these initiatives is measured via survival and growth instead of the revenues (Dees, 1998). Yet social entrepreneurship can result in businesses that generate profits, this is relevant for sustainability purposes. Lepoutre, Rachida, Siri & Bosma (2011) identified different types of social entrepreneurship in terms of the social mission of the company, revenue model, and innovativeness, as explained below.

Non-for-profit organizations state explicitly their social mission and less than 5% of their revenue relies on market-based income (Lepoutre, Rachida, Siri & Bosma, 2011). In lack of profits, third parties, donors or volunteers financially cover the deficit (Dees, 1998); usually wealthy individuals support this type of social entrepreneurship with philanthropic interests.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

The hybrid category encompasses businesses that are both market and social based. These social organizations either derive at least 5% of their revenue from sales or realize their social objective mainly by attending those in the bottom line (Dees, 1998; Austin, Stevenson, & Wei-Skillern, 2006; Lepoutre, Rachida, Siri & Bosma, 2011). In their initial stage, these organizations are mainly non-for-profit oriented and hence rely financially on third parties; as profits increase, they become self-sustainable.

Finally, profit-oriented enterprises mainly rely on profits but pay good attention to social and environmental objectives in connection with their mission, even though their identity is not social per se (Dees, 1998; Seelos & Mair, 2005; Lepoutre, Rachida, Siri & Bosma, 2011).

It is important to note, however, that strictly speaking, social entrepreneurship ventures usually do not pay dividends as profits are reinvested in the community and the business itself. Reinvestment strategies include salaries, creating social areas, providing training or any other initiative that benefits the community and its wellbeing. Thus, regardless of the category they belong to, a distinctive feature of social enterprises is their social mission in contrast to usual organizations. (Dees, 1998; Seelos & Mair, 2005; Lepoutre, Rachida, Siri & Bosma, 2011; Metelka, 2014;)

Social entrepreneurship refers to improving the wellbeing of a community or a group of individuals. Creating jobs and wealth and solving social problems at a collective rather than individual level, achieve this. Therefore, collective entrepreneurship becomes a relevant concept. This is further explained in the following section.

3. Collective Entrepreneurship

Social and collective entrepreneurship are substantially interrelated. In terms of social identity, Lounsbury (1998) identified collective entrepreneurship as a means for groups of individuals that share similar roles across various organizational contexts to professionalize their activity. This is achieved through the construction of a new occupational identity and the mobilization of resources to improve the status of their occupation. It is the result of a shared sense of social marginality and linkage to a wider social movement.

According to Johannisson (2003), collective entrepreneurship can be interpreted as a category of entrepreneurship, a distinctive feature of entrepreneurship and as a paradigm. The first interpretation was further supported by Ribeiro-Soriano & Urbano (2010) that consider collectiveness at the core of businesses created as a collective entrepreneurship initiative. The second interpretation states that entrepreneurship is a collective phenomenon in which various actors interact; this agrees with understanding entrepreneurship as a process involving interactions between individuals, the environment and the organization (Gartner, 1985). The third interpretation considers understanding entrepreneurship as the outcome of individual imagination and social interaction.

Johannisson (2003) presented a taxonomy of entrepreneurship in terms of calculative or social commitment and level of collectivism; such taxonomy exhibits clearly the interrelation between collective and social entrepreneurship. As it is shown by Johannisson (2003), cooperatives exhibit the maximum level of social commitment and collectivism. Values are shared among members, crisis are solved through joining forces and such alternative offers both ownership and control (Johannisson, 2003).

Finally, Montgomery, Dacin & Dacin (2012) highlighted the collective aspect of social entrepreneurship as actors collaborating to solve social problems through the application of business principles. They identified three main types of collective actions: social movements, community cooperatives and cross-sectional collaboration. Social movements refer to various businesses that support a social cause; community cooperatives that include consumers, organizations and movements to enhance social and

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

economic welfare of citizens and cross-sectorial collaboration that includes businesses from different sectors to solve complex social problems.

Financial well-being should therefore result from collective entrepreneurships, particularly in those involving vulnerable communities. It refers to overall satisfaction with financial circumstances and having enough money to cover one's financial needs (Vlaev & Elliot, 2014).

4. Entrepreneurial Process

New businesses are not created by accident. The creation of an enterprise is a result of a deliberate act driven by necessity or personal fulfilment needs. Initial studies on new venture creation assumed that entrepreneurs and their new ventures were a single subject. Gartner (1985) contributed to raise awareness of the differences between entrepreneurs and their ventures; this was the result of understanding new venture creation as a complex and multidimensional phenomenon that links two concepts: entrepreneurship and process. He identified four dimensions that interact for new venture creation: individual(s), the stages required to start a new venture (process), the organization he/they aim to create and the environment.

McClelland (1961) identified human motivations that are distinctive among entrepreneurs such as: the need for achievement, locus of control, a desire for independence, having a vision and passion, being a risk taker and self-efficacy. Brockhaus (1982) also identified among entrepreneurs the need for achievement, locus of control and risk-taking propensity. Other individual features such as: job satisfaction, previous work experience, entrepreneurial parents, age and education have also been identified (Gartner, 1985), together with planning capacity, contact management, effective communication, information search, creativity, teamwork, decision making and leadership (Paredes & Flores, 2015).

An essential feature identified in previous studies is hence the need for achievement which is reflected in personality traits, background or psychological profile of the entrepreneur (Gartner, 1985; Paredes & Flores, 2015). As mentioned by McClelland (1961), such need for achievement is directly related with economic growth and ultimately should result in the economic development of nations.

The entrepreneurial process can be understood through different standpoints. This section presents the views of Gartner (1985), GEM (2016) and Timmons (1999), which refer to actions, stages and forces as components of the entrepreneurial process respectively. Gartner (1985) defined process based on common behaviours an entrepreneur completes to create a new venture, such as identifying a business opportunity, accumulating resources, marketing products and services, manufacturing a product, creating an organization and responding to government and society needs. Similarly, it has been proposed that opportunity identification is the starting point of entrepreneurship and then an idea is developed (Shane, Locke & Collins (2003) as cited in Metelka, 2014).

According to Timmons (1999), 4 forces drive the entrepreneurial process: opportunity, resources, entrepreneurial team and fit and balance between these components. This author considers the entrepreneurial process a market opportunity that is used by an entrepreneurial team through the conjunction of certain resources. Moreover, he states that the entrepreneur designs a strategy, builds networks, prepares the business plan and gathers a team. The opportunity depends on market demand, structure and size, as well as on margin analysis (this feature is useful to differentiate an opportunity from an idea) (Timmons, 1999).

Resources or firm assets are required to establish a new business. However, owning assets does not guarantee success. Conversely, an entrepreneur may lack resources initially, but as time goes on, he/she

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

might develop a new business. This is because resources mainly rely on the entrepreneur´s knowledge, existing connections and ideas to develop the business (Timmons, 1999).

The team includes the leading entrepreneur and those selected to become part of the business. This is a crucial element of the entrepreneurial process and should not be underestimated. The team leader should train and learn from his/her team; be honest and dependable; foster entrepreneurial culture and an adequate working environment within the organization. Team members should be experienced, motivated to excel, committed, determined, persistent, creative and flexible; they should tolerate risk, ambiguity and uncertainty; finally, they should focus constantly on the opportunity. The aspects mentioned above are considered key success elements (Timmons, 1999).

Under a holistic perspective, fit and balance between the previous three driving forces is required. This implies permanent assessment and revision of strategies and tactics (Timmons, 1999).

Finally, the Global Entrepreneurship Monitor (GEM, 2016) defines the entrepreneurial process using a timeline with three clear stages. The first stage starts when a potential entrepreneur with specific knowledge and skills identifies a business opportunity until its conception. The following stage refers to setting up the new business (nascent entrepreneur) until the creation of the firm. The firm then becomes a new business that has been growing for approximately 42 months. Once the early stage is completed, the firm is considered an established business.

On the other hand, Gartner (1985) defined organizations as firms started by individuals who followed the entrepreneurial process. Individuals are key for the entrepreneurial process, as without them a new entrepreneurship cannot take place. Decisions regarding strategic choices should be made to characterize organizations and how they will compete, taking into consideration their business environment in order to be successful. The literature review on strategic choices is extensive and is beyond the scope of this chapter.

Finally, entrepreneurs do not create isolated businesses; they respond to an existing environment. Such environment can be understood as a set of given conditions to which the organization must adapt or as a reality created by the perceptions of organizations; Gartner (1985) referred to them as environmental variables. A high supportive entrepreneurial environment will lead individuals to the creations of new ventures, while a less supporting one can create social exclusion (Gartner, 1985). This social exclusion can be both internal and external; when it is internal, it is related to the acknowledgment of the resources and opportunities and how to use them properly (entrepreneurial profile); while the external one, depends on the environment and the territory to which the person is linked (social prejudice, labor practices or public policies) (Rodriguez & Borge, 2014). In this case, vulnerability is both associated to the profile of the person or their implicit qualities (education, gender, race, etc.) and the environment that surrounds them.

Existing literature has not approached the entrepreneurial processes followed by vulnerable communities and, in general, by social entrepreneurs; previous studies are rather anecdotal. Therefore, the research questions approached in this chapter were:

What are the distinctive features of the entrepreneurial process of new businesses conducted by a specific vulnerable community?

How does such process differ from that followed by individuals living in highly supportive environments?

What is the impact of the social entrepreneurship under analysis on its environment and the financial well-being of individuals that belong to it?

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

In order to answer these questions, the next section explores the case of an entrepreneurial initiative started by a vulnerable community in Colombia, *AGROSEC, Asociacion de Agricultores de Productos Organicos de la Secreta*, from idea inception until its current situation.

Data were collected from primary and secondary sources. Five interviews were completed using pre-established protocols that were applied to 3 members of the association (1 manager and 2 employees/ regular members), 1 community member and 1 government officer. The objective was to triangulate versions and hence obtain an enriched picture of the topics that were analyzed (i.e.: the entrepreneurial process followed by vulnerable communities and the impact on financial well-being and the community). Thematic analysis was used to analyze data collected from interviews and secondary sources.

ENTREPRENEURIAL PROCESS AND FINANCIAL WELL-BEING GENERATED BY *AGROSEC*

1. The Origins of *AGROSEC*

Conditions and entrepreneurial process vary depending on the context where the business is developed. This section presents context conditions within which *AGROSEC* was created.

AGROSEC was established in 2005 in Cienaga, a municipality located in the Magdalena Department. It took its name from an existing village called "La Secreta". The Magdalena Department is located in the north of the Colombian Caribbean region with a total area of 24.188km^2 (SOGEO, 2011) and a population of 1.259.822 inhabitants (DANE, 2015).

Economy in Magdalena revolves around farming, ranching, tourism and port activities. In general, in 2014 it contributed with 1.3% of the national GDP, which is equivalent of COP 9.547 million (DANE, 2015). Just as the Sierra Nevada snow peak is popular tourist attraction for local and international visitors, it is also a site for illegal economic activities (e.g. illicit crops and illegal mining), which are sources of income for armed groups.

This scenario fosters the existence of a vulnerable population who suffers the consequences of illegality: the Magdalena Department recorded 337.168 victims of some kind of violence (RNI, 2016). Between 1985 and 2012 approximately there were 330,000 victims of forced displacement, making it the third department in Colombia with the highest rates in this category. Additionally, it came up fourth in terms of resettled displaced people. Another social indicator related with vulnerability is poverty. In the Department, 48% of the population is poor, and 15.6% live in extreme poverty; in average, monthly income per capita is approximately COP 328,000, which is significantly below the national average of COP 200,000 (DANE, 2015).

Entrepreneurs of this study live in *La Secreta* and were victims of armed violence from paramilitary groups. After killing many people in October 1998, paramilitaries took by force possession of lands; surviving inhabitants had to abandon the village. Some families were able to return two years after the tragedy, while others could only return after the Colombian demobilization process started in 2006. One of the founding members of *AGROSEC* stated:

AGROSEC brought us back to life. Thanks to it we could return to our homes and provide a better future to our children. Currently my three children are educated at university level, are employed and have happy families.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

When farmers returned to their land they found nothing. However, thanks to the support of organizations that provide assistance and comprehensive victim reparation, the village slowly revitalized and inhabitants re-claimed their territory. Such organizations include Unidad de Restitucion de Tierras- Land Recovery Unit, Departamento para la Prosperidad Social- Social Prosperity Department (DPS) and Instituto Colombiano de Bienestar Familiar- Colombian Institute for Family Wellbeing (ICBF), among others.

AGROSEC was established under specific context conditions as any other entrepreneurship. However, it is unique as it was an alternative to individuals that were hit by violence and wanted to make a fresh start as regular people. When inhabitants of *La Secreta* returned home, *AGROSEC´s* founder and 11 other individuals realized they needed to generate income to survive. After analyzing context conditions and individual capabilities, they identified an economic activity with which they and their families were familiar with: growing coffee. Moreover, land and weather conditions were appropriate to grow organic coffee.

Entrepreneurs face similar difficulties, such as: identifying an adequate opportunity and gathering resources to launch the business. Yet *AGROSEC* entrepreneurs faced two additional obstacles: mistrust between potential members and disbelief in governmental institutions as a result of the tragedy they suffered and constant threats against their lives as a result of the armed conflict, as stated by the leading founder, Mr Polo:

"Believing in institutions was the greatest challenge, because of all the suffering we had to go through. We were uncertain about the effectiveness of Law 1448, released by the Government".

2. The Bravery of the Entrepreneurial Leader and his Entrepreneurial Team

Prior to creating *AGROSEC*, Mr Polo belonged to a family of coffee growers. He was born in Cienaga but relocated to Cartagena to avoid being kidnapped by illegal armed forces. He started high school studies there and then returned to Cienaga to finish his studies in the late 80s. As soon as he finished his studies he started working in coffee farms owned by his family. He was willing to enter Law School but it was not possible; nowadays he wants to pursue a degree in Business Management degree. Mr Polo and his team were persistent in the creation of an organization that would allow them work together in the growing and commercialization of Colombian coffee for the luxury market, which is currently sold in Japan and the United States.

The development of *AGROSEC* pushed him away from the farm to an administrative role in which he dealt with customers and other commercial issues. Nowadays he has several roles in the association and the community: He is the legal representative and manager of AGROSEC and leads other associations and various community action boards. He represents victims of the township of *Cienaga* at a national level and is a member of the departmental board. Individual features of Mr. Polo confirm several theories behind the behavior of entrepreneurs, which state that they pursue dreams regardless of circumstances (McClelland, 1961, Gartner, 1985, Paredes & Flores, 2015). Before leading the association, he was an employee for 20 years. In that period of time he was not able to achieve what he has achieved in 2 years at *AGROSEC.* This includes economic and personal satisfaction from helping his community. He states:

The key to entrepreneurship is associating, trying to achieve something alone is very hard, but when you are working together it is possible to achieve greater things.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

As a team, *AGROSEC* started with 12 members. The team expanded after success was evident. Currently there are 56 owners/active members certified as organic farmers; the waiting list includes approximately 70 individuals. Applicants need to meet specific requirements and to be certified for organic coffee production; this is verified through *in situ* visits and audits. In case requirements are not met, they enter a transition stage to receive advice and make the expected changes.

AGROSEC has been a channel through which inhabitants of La Secreta have taken back their lives. They were evicted from their own lands and migrated to other places where they were not able to find a job. As stated by Mr Zamora, a member of the association:

Leaving behind our source of income made it impossible to pay our children education, but we had to do it just to stay alive. Once the demobilization process began, many decided to return to their homeland in search of a better future. Today, members of the association they are able to provide their children a better future; they have strengthened community ties and even united in spiritual matters…

This confirms the impact of social entrepreneurship as stated by Mort, Weerawardena & Carnegie (2003).

3. The Entrepreneurial Process

Identifying the business opportunity was a group initiative of some community leaders such as Mr. Polo and Mr. Zamora. They gathered to grow and sell organic coffee, motivated by world and national trends to consume it. Initially, the association sold coffee through intermediaries at a very low price compared to that in the market; this scheme was aborted. Nowadays the association produces and sells most of the coffee it grows; the aim is to sell the whole production directly and completely avoid intermediaries.

AGROSEC was founded in 2005; however, it took 7 years to consolidate organizational, productive, commercial and administrative processes. In 2012 farmers were able to return to their lands and could work together in an organized way.

The association started its operations in a small house as a collection center owned by the community in the town center. This premise was used to receive and process the coffee before sending it to Santa Marta, the capital city of Magdalena Department. Land and machinery used for production and shipment of coffee were rented from third parties and paid by members.

The success behind their product was based on a usual practice among them: not using additives to grow their crops. They were also aware of growing demand for organic products; which further motivated them to follow their dream. Clearly, value added by the association is producing export type coffee grains that are 100% organic to domestic and international markets. This provides the association with a competitive advantage versus its competitors.

Next step was being internationally certified to guarantee that coffee is 100% organic. The association was also advised in terms of processes and organizational topics. As much as it was a complex transition, it was worthwhile. *AGROSEC* is an entrepreneurial initiative motivated by necessity, according to the theoretical framework of the Global Entrepreneurship Monitor (GEM, 2014), as entrepreneurs need to generate income for them and their families. This is the Colombian case, in which even though opportunity entrepreneurship has gained importance throughout time, necessity entrepreneurship is still major (GEM, 2014).

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

The association has made relevant progress; intermediaries were excluded from the value chain. Yet the only process they are not able to complete by themselves is exporting. Because of this, coffee is sold to toasters who then sell the coffee under their own brands and not as a product of the association. On the other hand, local commercialization is in person; coffee is also consumed at events organized by the Colombian Ministry of Agriculture, which results in further sales to new customers.

Initial capital invested per member (12 in total) was half of the minimum wage in Colombia; total amount invested was approximately COP 6 million (less than USD 2,000 nowadays). This amount was enough to complete initial stages. Yet further resources were needed to expand production and sell to international markets; this was the motivation to use bank loans. They were also supported by international organizations, and as stated by Mr. Polo:

The founding stone of this association was provided by United Nations through a program to strengthen beekeeping and renew coffee growers.

Afterwards, they were recognized by other organizations that were curious about La Secreta. Once lands were restituted, further aid was obtained from DPS, the Ministry of Housing and the Ministry of Agriculture.

The Colombian government has encouraged several projects started by *AGROSEC* based on the willingness of partners to advance in the promotion of their products and the desire to improve the quality of life of their families and the environment. To cite some, DPS has provided approximately COP 30,000,000 (USD 10,000) to acquire specialized machinery to process and manufacture roasted and ground coffee; this improves the commercialization of their main product and diversifies their portfolio. They believe that without this support they would have not been able to enter the roast and ground coffee market. Thanks to the acquisition of new equipment and workforce increase they were able to boost their production up to 60%, processing and selling 350.000 kg of coffee beans. Mr. Polo stated:

I would like to be visited by the Director of DPS, Tatyana Orozco, so she can see what they have done of us. They gave meaning to our lives.

4. The Organization

Currently *AGROSEC* is an association of small farmers that manage their businesses individually and follow farming guidelines defined by the organization. The association is a collection centre in which the product is selected, packaged and sold. Its main product is organic coffee, which is exported to Japan, the United States and potentially, Korea. They also produce other organic products such as: avocados, mangos, honey and some vegetables for local sale. The association was born in La Secreta but has expanded to other municipalities; therefore they are looking to change the company name to a more inclusive one, as stated by one the founders:

La Secreta is not a secret anymore. It is being recognized for what it is doing at an organizational level and is an example for other communities.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

A distinctive feature is camaraderie among members. For instance, if soil needs to be treated and coffee plantations need to be renewed, all members work together in a single farm and perform such tasks quicker. Associates are deeply fond of *AGROSEC.* A member stated:

We as members consider AGROSEC our own child. We love the organization the same way we love our family or kids, because we have been through tough times and have fought like a family to keep moving forward.

This agrees with collective entrepreneurship being a channel through which individuals with similar characteristics associate to launch an entrepreneurial project with its core mission is to benefit the community and achieve better results (Lounsbury, 1998; Johannisson, 2003; Ribeiro-Soriano & Urbano, 2010).

As a result of constant and sustainable growth of the association, employees have received their salaries on time. It has generated 12 direct positions and many more through its members, which provide in average 10 positions including family members. Nevertheless, the effect of the association in its members goes beyond an increased income; it significantly improves their quality of life through permanent investment in their farms and houses. The association has built self-confidence and hope among members. They are willing to continue working for the development of the association. A founder stated:

I stopped being just a farmer and started to be a businessman in the farming industry.

Currently, farmers have renewed coffee plantations and are able to increase production every year. Before the association was created, there was no electric power in the village; today every farmer has a solar plant, bathrooms, septic tanks and other basic elements that have improved their quality of life.

5. Financial Wellbeing

The association had an important social impact on a community that was recovered after being affected by armed violence. It brought hope to people and demonstrated them that there are alternative solutions to violence and that through collective work it is possible to achieve ambitious goals. AGROSEC is seen as a role model of perseverance for those who have returned as well as for those who are still displaced. According to Mr. Polo:

The main characteristic of AGROSEC is that is focuses on helping producers. No efforts or resources are spared when it comes to the wellbeing of partners.

Previously, farmers had to sell their products in advance at a price below 40% of the actual price in order to count with funds to survive until the next harvest. Nowadays, the association has a revolving fund to provide associates with loans to solve monetary issues, eliminating the need to use third parties or financial institutions. This benefits their financial situation, as they do not have to pay high interest rates that deteriorate their quality of life.

The association has also affected positively the community. Thanks to the Social Fair Trade Award it received, the village benefitted via road improvements and housing projects. This has also been possible because Mr. Polo is also a community leader. His recognition among community members has presented alternatives to access resources and collective projects.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

AGROSEC has driven community progress. In 2017 they plan to embark on an ambitious project that will provide water to the village and other neighboring villages. This initiative is being supported by the Municipality and the Unit for Integral Attention of Victims. The association is also leading an initiative to form a second level association of coffee producers in the Magdalena Department. According to Mr. Polo:

What has always motivated me is what we have achieved in the community. We have raised awareness among the inhabitants; they moved forward without relying on someone else. An independent business with a clear vision is able to change the lives of founders and their surrounding community.

ISSUES, CONTROVERSIES, PROBLEMS

The analysis presented before in terms of entrepreneurial process and financial well-being generated by an association of vulnerable individuals was useful to identify distinctive features of this type of entrepreneurship. This needs to be highlighted to contribute to entrepreneurship as a field. First, it was found that the entrepreneurial process includes elements defined by Gartner (1985): the entrepreneur, the organization, the process and environment. Yet the main differences between entrepreneurships from vulnerable individuals and those living in highly supportive environments is its origin, time taken to become an established business and financing sources.

The main challenge vulnerable entrepreneurs face is being understood in terms of their context, their values and circumstances that surround the entrepreneurship. Lifecycle stages of these initiatives need to be understood in terms of elements of the entrepreneurial process and of the financial wellbeing provided to them. This approach is more convenient than focusing merely on the opportunity behind the entrepreneurship.

SOLUTIONS AND RECOMMENDATIONS

New ventures started by vulnerable individuals are more feasible if they associate. This means they should organize associations, as the organization is created to tackle a need shared by the community. This transcends joint work, an individual need or an opportunity. Individuals associate and then identify joint productive activities they might be familiar with prior to or after the organization is created.

Regarding the time required to become an established business, associative entrepreneurships may take more than 7 years to achieve this. This contrasts with a time period of 42 months as defined by GEM (2016). *AGROSEC* was created in 2005 and only until 2014 it sold regularly organic coffee. This occurred because its only goal was not just developing a product that would appeal consumers; it mainly aims to generate income for the survival of vulnerable individuals. This contrasts with entrepreneurships in highly supportive environments, which mainly focus on gathering the team required to serve the market. This is a long-term objective for vulnerable communities. These distinctive features have been understood by some but still more awareness needs to be raised among other stakeholders.

Funding available for associative vulnerable initiatives differs substantially from those living in highly supportive environments. Even though the latter also face difficulties to gather seed capital, business angels might provide funding; in contrast, the former only count on them initially. After they demonstrate the ability to manufacture a product, they can benefit from NGO's or the Government. Business angels

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

and venture capital funds are not available to them. Access to formal loans also takes longer. Because of the reasons mentioned before, governments should implement effective programs to support this type of entrepreneurship guided by social drivers, as is the case of investment in education and health programs.

The case analysed shed light on how associative initiatives of vulnerable communities embrace as a main goal impacting positively members and their communities. These entrepreneurships belong more to the community rather than individuals, which results in immediate and tangible benefits. In the long term the aim is that such initiatives include the whole community, which guides the diversification strategies. Collateral benefits related with *AGROSEC* such as: improvement of roads, housing and building schools demonstrate that it is possible to tackle vulnerability through the support of entrepreneurial initiatives.

FUTURE RESEARCH DIRECTIONS

Future research in entrepreneurship of vulnerable communities and individuals is very pertinent, especially in economies in which the majority of individuals are vulnerable. Research in this field should analyse theoretical or central aspects of entrepreneurship such as: the entrepreneurial process and the multidimensional role of context, which includes other features in addition to it being highly supportive or restraining.

Re-defining opportunities in this type of entrepreneurship is a novel topic. This could include identifying opportunities in the creation of entrepreneurial teams, which contrasts with the usual belief that such teams are only created to react to market needs. Regarding the environment, there are circumstances that impact entrepreneurship positively or negatively; in particular, causes behind vulnerability need to be studied to inform academics and decision makers when designing programs and policies that impact positively these communities.

Finally, studying vulnerable individuals will shed light on understanding how necessity-guided entrepreneurships grow throughout time and impact positively communities even though the original drive motivation was not a market opportunity.

CONCLUSION

A distinctive feature of associative entrepreneurships of vulnerable individuals is their impact on communities. They benefit not only members but also the community to which they belong; it is hence a powerful tool for economic and social development. This entrepreneurship is deeply embedded in the heritage of the community. In the case analyzed, it was found that AGROSEC is more than organization; it is the village itself, that is, La Secreta. Inhabitants that are not members of the association consider it theirs. A member of the community stated:

The secret behind La Secreta is AGROSEC; similar to the Coca-Cola recipe.

Another distinctive feature of the case analyzed is the ability to start a new venture with more than 3 individuals. This is not usual in entrepreneurships started by individuals under normal circumstances. *AGROSEC* was created by 12 individuals and nowadays it has 56 members; there are more than 70 applicants waiting to become members. Mr. Polo stated:

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

At the initial stages, we were worried about gathering more than 20 members; nowadays we are concerned about how to include so many people that are willing to become members.

Finally, given that this type of entrepreneurship originates from a collective need to overcome vulnerability and provide a better future for entrepreneurs, their families and communities, it is them and not an external party who suffer adverse conditions and motivate the new venture creation. They are aware that the entrepreneurial process takes longer than individual initiatives; however, they embrace such challenge and feel fulfilled once they succeed.

ACKNOWLEDGMENT

The authors thank specially:

Lorena Acosta, for her permanent support and assistance in data collection and data analysis of this chapter.

Silbert Polo, manager and founding member of *AGROSEC*, for his enthusiasm in sharing data required to write this chapter.

Adalberto Alzamora, member of the founding team of *AGROSEC* for his useful input to write this case.

Departamento Administrativo para la Prosperidad Social (DPS), for the data provided. Special thanks to Tatyana Orozco (Director), Sergio Barraza (Productive Inclusion Director), Farid Juliao (Deputy Entrepreneurship Director), Guillermo Cadena and Juan José Echeverry.

Universidad del Norte. Special thanks to María Cristina Arzuza, Tito Natera, Adriana Quiceno and Tomas Maldonado, who as operators of one of the projects that benefited *AGROSEC*, provided us with valuable information to prepare this case.

Chapter 12
Nascent Social Entrepreneurship:
Economic, Legal, and Financial Framework

Cristina López-Cózar-Navarro
Universidad Politécnica de Madrid, Spain

Tiziana Priede-Bergamini
Universidad Europea de Madrid, Spain

ABSTRACT

In the past few decades a new way of responding to social and environmental problems has emerge: the social entrepreneurship. It is presented as a special type of venture, in which the creation of social value prevails over the maximization of profits. Thus, the main objective of these type of venture is to serve the community and to search for a positive social change. In this chapter, in addition to presenting the concept of social entrepreneurship within the so-called third sector and its various approaches, the main legal forms are also presented, from the cooperatives to the newest initiatives carried out in different countries. Likewise, the different sources of funding that can used by social entrepreneurs, especially business angels and crowdfunding, are detailed. Finally, new trends such as the bottom of the pyramid and the positive social change are addressed within social entrepreneurship.

INTRODUCTION

Given the current economic climate, it is increasingly difficult for governments to supply the goods and services of so-called welfare state, and generally to serve a society that gradually demands more support, thereby increasing public spending. In this context, the social enterprise emerges as an organization capable of providing innovative and efficient solutions to social and environmental problems, as a starting point for the creation and consolidation of a more sustainable and balanced social and economic order. Due

to the growth of social enterprises around the world in many different sectors of the economy, research and article publication has grown substantially in recent years (Santos, 2012; Zahra & Wright, 2016).

The social entrepreneur, by generating ideas and investing resources, effort and personal commitment, can find solutions to issues such as: fair access to housing, inclusion of vulnerable groups, equal access to employment and training, managing the dependence, etc. Thus, social enterprises allow a different form of development; this is, innovative, inclusive and sustainable; highly necessary for today´s global market. In this economic context, the role of these types of businesses is growing, even considered by the European Commission of great importance, which has led to the implementation of many initiatives and research projects, offering different ways of development. In this regard, the European Commission published in 2011 the Social Business Initiative, in which eleven key actions to promote the development of social enterprises are presented, grouped around three main intentions: to increase the visibility of social entrepreneurship, to improve the legal environment and to facilitate access to financing (European Commission [COM], 2011).

The issue is clearly of some importance, as these social entrepreneurship ventures may vary in their business models, ownership structures, legal forms and financing (Zahra & Wright, 2016); it is therefore very appropriate to expand the existing knowledge in order to contribute to a better understanding of the concept and to delve into the differentiating aspects of this particular organization. Indeed, we consider this work particularly timely as different countries are developing initiatives in terms of legal forms and new financing sources to foster the development of nascent social entrepreneurship.

The objectives of this chapter are:

- To know the dimensions of the third sector as a framework for social entrepreneurship.
- To understand the concept of social entrepreneurship and social enterprise.
- To recognize the legal framework for the nascent social enterprise.
- To identify the financial alternatives available for nascent social entrepreneurs.
- To understand the bottom of the pyramid model and the positive social change approach.

To achieve these objectives, the chapter is organized as follows: first, the concept of the third sector is presented, distinguishing between the different approaches according to the entities that comprise it. Next, the concepts of social entrepreneurship and social enterprise are presented; the legal and financial frameworks are exposed, and related to the concepts of Bottom of the Pyramid and Positive Social Change. We finish the chapter including solutions and recommendations, future research directions and the main conclusions.

THE THIRD SECTOR

Throughout history, in all ages and cultures there have been individuals and organizations who have acted on behalf of vulnerable and disadvantaged groups. Directing solidarity, altruism and own and others efforts, they have identified the needs of these groups and have carried out various actions to address them. However, from the last third of the twentieth century a significant growth about these issues has been developed worldwide and is shaping as an important part of the economic system. Therefore, is a matter of increasing attention by both politicians and academic literature (Monzón, 2006; Defourny, Hulgård & Pestoff, 2014).

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Social entrepreneurship can be developed in the third, commercial and government sectors. Indeed, most definitions in the academic literature focus largely on social entrepreneurship within the non-profit and business sectors (Austin, Stevenson & Wei-Skillern, 2006). Nevertheless, it is certainly a new concept different from classical business and traditional non-profit activity, linking the social aim with a market focus and following standards of financial and economic performance (Galera & Borzaga, 2009).

The term third sector comes from the reference to the other two institutional sectors of the economy: the public sector and the private sector. Hence, it is presented as an option other than public bodies and traditional capitalist enterprises, in order to meet needs or fill gaps that neither others are able to address, or do it poorly (Monzón & Chaves, 2008).

From this general concept, it is possible to distinguish different approaches. Following Monzón (2006), Sajardo and Chaves (2006) and Monzón and Chaves (2008), in this section the main features of each of these perspectives are set, noting the similarities and differences between them.

Non-Profit Approach

The non-profit approach of Anglo-Saxon origin, according to which third sector organizations are those that meet the following characteristics (Salamon & Anheier, 1992):

- Private organizations (although they may have public funding).
- Formal structure, i.e. they must have some degree of institutionalization.
- Autonomous and self-government; that is, these entities have their own governing bodies and are not controlled by external entities.
- With job and other voluntary resources.
- Entities that are subject to the principle of non-distribution of profits among its members.
- Not focused on market competition.

Under this approach, the non-profit entities have a main social purpose and in any case the profit is going to be distributed between the people who is controlling the business; instead is intended precisely to fulfill its social aim or to help people -which cannot exercise any control over the organization-. It is based on philanthropic and charitable traditions, and the most representative entities of the same are foundations and charities.

Social Economy Approach

The focus of the social economy, with a French origin, has also spread to other European countries, including Belgium, Portugal and Spain, as well as Latin America. It can be said that emerges during the late 70s of the last century when the so-called *Comité nacional de liaison des activités coopératives, mutuelles et associatives*[1] (CNLAMCA) defines the social economy as a set of entities outside the public sector, with democratic management, and with a special regime of property and distribution of profits. Since then, there have been various efforts to make a conceptual delimitation of the social economy. Note the wide definition proposed by Barea (1990, p. 110), according to which the social economy "includes companies operating in the market in order to produce, secure, finance or distribute goods or services, but in which the profit distribution is not directly related to the capital contributed by each member and

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

the decision making process is not taking into account the capital of each partner; indeed, when making decisions the weight is the same for everyone, regardless of the contributed capital"

Thereafter the European Social and Economic Committee[2] (ESEC), in its report on the social economy in the EU, proposes a similar definition: "the set of private, formally-organized enterprises, with autonomy of decision and freedom of membership, created to meet their members' needs through the market by producing goods and providing services, insurance and finance, where decision-making and any distribution of profits or surpluses among the members are not directly linked to the capital or fees contributed by each member, each of whom has one vote, or at all events take place through democratic and participative decision-making processes. The social economy also includes private, formally organized organizations with autonomy of decision and freedom of membership that produce non-market services for households and whose surpluses, if any, cannot be appropriated by the economic agents that create, control or finance them" (Monzón & Chaves, 2012, p. 22).

So, according to the above definitions, a broad understanding of the third sector arises and are considered social economy entities those meeting the following principles:

- Private organizations with a legal form.
- Democratic. In the decision-making process the people and their work contributions and / or services provided, are prioritized over their contribution to the equity.
- Autonomous and self-government; that is, these entities have their own governing bodies and are not controlled by external entities.
- Freedom of membership.
- They can distribute profits, although not linked to the share capital. This is, the distribution of the results obtained by the economic activity is carried out based on work performed or the services provided by partners or by its members and, where appropriate, the application to its social order.
- They develop a market-oriented economic activity, in order to meet the needs of its members and the society as a whole.

Therefore, the social economy includes not only non-profit entities, legally made up of associations and foundations, but also other commercial entities market-oriented, such as cooperatives, mutual entities, etc. Thus, the term social economy is broader in its conception and frames to a wide variety of organizations created with the aim of responding to the shared needs of certain social groups. It includes entities with various legal forms, which give primacy to the people and the social objective over the equity contributed, both in management and decision-making.

It can be seen that there are differences between the nonprofit approach and the social economy, among which it can be highlighted the market orientation and the possibility of profit distribution (although with limits). Indeed, for the non-profit approach the entities are not focused at all on market competition, while for the social economy the entities are developing a market-oriented economic activity. Moreover, the requirement of non-distribution of profits in the non-profit approach is considered by diverse authors as too strict and restrictive, and would not allow to include within the social economy organizations such as cooperatives. For this reason, the focus of the social economy is broader than the non-profit approach, including more types of entities, and is considered superior to better answer today society´s needs.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

The Solidarity Economy Approach

The solidarity economy approach, also originated in France, during the 80s of the last century and is based on the idea that the economy has a plural nature, and therefore should not be reduced strictly to monetary issues and trade. Is clear in its ambition to strengthen cooperation and solidarity among different agents, generally on a voluntary and reciprocity basis This perspective includes a set of organizations, with different forms, performances and economic activities, which pursue social utility in favor of disadvantaged groups; as its name suggests, the common element is solidarity.

It is proposed as a combination of voluntary citizen participation, collaboration and public support, and as such is articulated on the following areas:

- Fair trade.
- Solidarity finance.
- Local Initiatives.
- Non-monetize exchange.
- Local exchange trade systems (LETS).

In this approach converges the market economy, the non-market economy and the non-monetary economy. Thus, there are involved organizations operating in the market selling goods and services; entities that perform functions that are traditionally assigned to the public sector and collaborate on support from public grants and donations; as well as various forms of self-production and mutual exchange between individuals. In short, the main objective is the creation of synergies between different players such as governments, private enterprises, local authorities, citizens, etc. offering new services and, at the same time, creating workplaces. For example, the associations for the development of proximity services in France which join together local communities, organizations of social housing and inhabitants to manage their territory (Moulaert & Ailenei, 2005).

The Economy for the Common Good Approach

The new model called Economy for the Common Good (ECG) has recently developed in Europe. This wide approach aims to develop a new economic, political and social order, with the intention of building -from the ground- a sustainable and more balanced society. The first ideas associated with this new trend appeared in Austria developed by Christian Felber. It is based on the belief that the economy must be at the service of citizens and not the opposite, and consistent with the values and objectives contained in most countries´ Constitutions. Since the beginning, the movement has undergone significant development in several European countries, with the support of individuals, companies and organizations that back the initiative in different ways.

The ECG is an alternative to existing models: the free market economy and the centrally planned economy. Unlike these traditional economic models, the ECG places the human being and any entity associated with interpersonal relationships, in the center of economic activity, achieving this way the common good. It is an alternative system built on widely accepted values such as equality, justice, solidarity and sustainability, among others; through which it intends to initiate an economic, political and social change that must be set as pattern of behavior towards a better future. Therefore, following

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Felber (2012), the ECG is a holistic model, which may be a new option over the existing socio-economic systems, understood as an inspiring force for a real global change.

In the same line, and based on the principles established in its conception, the Association for the Promotion of the Economy for the Common Good (2016) also considers the ECG as a catalyst for change through this threefold perspective: economy, politics, and society.

- From an economic point of view, the movement develops an alternative appropriate to all business organizations regardless of their characteristics, size or legal status. The economic purpose and the evaluation of success of these organizations must be based and defined on the values actually aimed at achieving the common good, and must be measured not by classical financial reports and purely economic criteria, but through new tools applied in both, companies and the global economy.
- From a political perspective, legislative changes arise willing to facilitate an equitable life and ensure the basic needs of people and respect for all living beings.
- In the social sphere, the movement aims to create general awareness and motivate many people and organizations as possible, through a joint action towards the common good.

Thus, the goal of the ECG is to provide better living conditions for all inhabitants of the planet, on the basis of a social, political and economic system, mainly focused on achieving an overall profit. In this way, human dignity, equity, solidarity, ecological sustainability, social justice and democratic participation are considered inherently linked to the movement values and are the basis on which to build the change to achieve that objective.

Facing this new challenge, social entrepreneurship finds an appropriate framework for development, since these entrepreneurs are seen as the protagonists of a new market economy and a different way of doing business, focusing on growth and prosperity, but at the same time creating social value.

SOCIAL ENTREPRENEURSHIP AND SOCIAL ENTERPRISE

Social entrepreneurs identify business opportunities searching to solve social problems such as fair access to housing and water, integration of people at risk of exclusion, or initiatives aimed at reducing ecological damage, developing a business project. Not to be confused with charity or altruism (Kroeger & Weber, 2014), this consists of creating a business model, based on the implementation of an innovative and creative solution, and motivated by a desire to help others and implement positive social change. The social entrepreneur wishes to provide an effective and efficient response in order to create financial, social and environmental wealth (Zahra & Wright, 2016), as a starting point for the creation and strengthening of a consolidated and more equitable social and economic order (Priede, López-Cózar, & Rodríguez, 2014).

Austin et al. (2006) offer a comparative analysis of commercial and social entrepreneurship; they define the latter as an innovative, social value creating activity, and identify four key differences between the two concepts: market failure create different opportunities for social and business entrepreneurship; differences in mission; differences in resource mobilization; and differences in performance measurement.

Although there are many approaches to the concept of social enterprise (SE) made by different authors, there is no commonly accepted official definition (Moreira, Urriolagoitia, & Vernis 2011). In this regard, the European Commission, based on the recommendations of the Network of European Research

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

(*Emergence of Social Enterprises in Europe, EMES*)[3], proposes a description of common existing characteristics to SE in most Member States.

The approach is based in nine indicators to define the SE. Following Defourny and Nyssens (2012) these could be presented in three main groups: economic, social, and corporate governance criteria.

- **Economic Indicators:** SE must produce goods and services for the market and must compete with traditional companies; they must accept financial risk and be self-supporting on its activity; and they must have employees.
- **Social Indicators:** They must have a clear objective for the community; and must be led by citizens from these community; they also present a limited profit distribution in order to avoid the maximization of profits, but instead the creation of social value.
- **Corporate Governance Indicators:** They must have independent management, this means not being part of any other organization, but having their own statutes and developing independently; decision making power is not based on shareholder ownership; they must exercise an open door democratic management including all stakeholder's interests.

Thus, in order to develop a general framework to identify them in Europe, they are considered to be active in the market offering goods and services, but are characterized by three main elements: they conduct their business in a socially innovative way, indeed the social objective is their main goal; its benefits are mainly reinvested in the pursue of the social aim; and they have a way of organization and ownership also conditioned by this social mission, based on principles such as democracy, accountability, participation and social justice. Hence, the European Commission is not intending to set a normative definition, but to respect the different economic, political and social choices possible in Europe, and will adopt a more precise definition -if necessary- for regulatory issues in the future (Defourny & Nyssens, 2008, 2012; Fisac-García, Alves de Carvalho, Moreno-Romero, Moreno-Mateos & Rojas, 2012).

Based on this first approach, the SE, regardless of the legal form, has a strong social purpose beyond the pursuit of wealth for their owners. This objective can be achieved in two ways. First, by providing products and social services to vulnerable people, such as: health care, access to housing, agricultural support, assistance to people with disabilities, etc. Secondly, facilitating professional and social integration of disadvantaged or at risk of exclusion people, through the access to employment and training in the company. In sum, SEs are neither public or charities, nor traditional capitalist companies, with a clear mission of serving the community, operating in the market through resource extraction and the production of goods or services, as well as offering innovative, effective and efficient solutions to social unresolved issues.

As a result, in view of the arguments described so far, SE are organizations identified within the social economy; as well, they could also be identified as key elements for the development of the ECG representing a wider modern approach of change, which is gaining strength in recent years.

LEGAL FRAMEWORK FOR NASCENT SOCIAL ENTREPRENEURSHIP

As mentioned before, SEs are characterized by serving a social purpose irrespective of their legal form, but the regulatory deficiencies can have serious consequences for the legal position of the SE within the social economy. The legal framework could hinder the creation of new forms if the existing ones do not

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

answer the needs of this type of entrepreneurship. In this sense, the new regulations appeared in recent years in different countries have been intended to provide a way for the development of an emerging social reality (Monzón & Chaves, 2012). This heading shows the development of the legal frameworks in various countries, describing the main legal forms available for nascent social entrepreneurs today.

Europe

Social Cooperatives

The SE concept appeared in Europe in the early nineties. In particular, the first impulse was produced in Italy in 1991 with the publication of a new Law to regulate the creation of the *Cooperative sociali* (social cooperatives), intended to ensure the general interest of the community, promotion of people and the social integration of citizens. A distinction was made between cooperatives engaged in providing health, and social services and education (*cooperative social di tipo a*), and the ones created to help facilitate the employment of disadvantaged people regardless of the activity (*cooperative social di tipo b*). Two new hybrid legal forms created to adapt the needs of SEs. Italy shows a great number of these organizations and an important development of the social sector.

Following the Italian example, other European countries also began to establish new legal cooperative forms to attend the social needs and with the implication of different stakeholders and the government. Thus, in 1997, in Portugal was created the *Cooperativa de solidariedade social* (social solidarity cooperative). In 1999, appeared in Greece the *Koinonikos Syneterismos Periorismenis Eufthinis* (social cooperative of limited liability); and in Spain, *the cooperativas de iniciativa social* (social initiative cooperatives) are created. Two years later in France the Societé Coopérative d´interét Collectif (cooperative of common interest) was created (Galera & Borzaga, 2009). All of them are non for profit organizations, with the aim of promoting the social and labor integration of the most vulnerable groups in the society (children, people with disabilities, etc.), as well as to produce and supply goods or provide social services (such as social assistance, education, and medical services) to the community at large, or to a particular social group (Defourny & Nyssens, 2008, 2012; Priede et al., 2014).

Tag: “Social-Oriented Company”

Parallel to the development of cooperatives, in 1997 arises in Belgium the *Société à finalité sociale* (social purpose company); in this case, it is not a new legal form, but Belgian law introduces the possibility for nascent enterprises to achieve the grade of “company with a social purpose”, becoming this way the first European country introducing this new trend. This tag could be acquired not only by cooperatives, but also any other type of business, such as limited liability companies or public limited companies, meeting certain requirements, basically not profit seeking partners, social objectives, and presentation of an annual social report to prove the achievement of the social aim. In short, these are companies developing commercial activities, but mainly non-profit seeking (Galera & Borzaga, 2009).

In the same line, and mainly because of the great development experienced by cooperatives, in Italy during 2005 and 2006 it was approved a new Law which became a major change in the Italian legislative framework for SE, adopting a more open system less based on the cooperatives. Thus, under this law, any private organization, including trading companies, could acquire the qualification of SEs provided its engagement with a social aim. Therefore, companies will be created according to the traditional laws

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

for incorporation but should explicitly mention its social character, including in the company name the title "*impresa sociale*" (social company) (Defourny & Nyssens, 2008, 2012). Meanwhile, other European countries have also introduced specific legislation on SEs. In Finland came into force a Law in the year 2004; in the same way Lithuania has a social business law since 2004; In Slovenia it entered into force the Law on social entrepreneurship during 2011, and Romania and Netherlands approved a draft law on social enterprises in 2012 (Chaves, Monzón, Pérez de Uralde & Radrigán, 2013).

Community-Interest Companies (CIC)

However, the European country with a further development on the legislation of these types of social initiatives is United Kingdom (Nicholls, 2009). In 2002, the British government intended to encourage SEs and established the "Social Enterprise Unit" (SEU) to coordinate England and Wales's actions. Four years later a plan of action was adopted to promote and support the development of SEs throughout the British economy (Spear, Cornforth, & Aiken, 2009). The British Government, in its efforts to support the creation and development of SEs, has tried to improve the fiscal and regulatory surrounding environment.

Indeed, in 2005 a new legal form for SEs was introduced, the CIC, combining the flexibility of the limited liability company with a social purpose. It is a type of limited company designed specifically for those wishing to operate for the benefit of the community, instead of personal profits. Hence, the social entrepreneur can attract investment by issuing shares, while the profits are to be reinvested in the organization or in the community. One of the main characteristics of CICs is the mechanism called "asset freeze" through which social benefits are safeguarded, preventing this way that assets can be transferred to any other owner as well as limiting the distribution profits.

United States

In the North American culture it has aroused a great interest in the creation of new specific legal forms to meet the needs of SEs, as it is considered that this movement has grown very fast in recent years, and has been constrained by the limitations of a legal system that turns obsolete when satisfying the social entrepreneur's needs. In fact, they often had to adopt non-profit legal forms or a hybrid structure, mixing sometimes non-profit and for-profit elements.

Benefit Corporation (BC)

In this context, at the beginning of 2013 a new legal form called BC was created in the United States, which has spread rapidly through the country. In fact, in 2015 the legislation has passed in thirty one states and is moving forward in several others. This is the most innovative, comprehensive and flexible legal form to meet the needs of entrepreneurs, investors and the general public, as it offers a clear differentiation in the marketplace and a comprehensive legal protection for entrepreneurs and investors, expanding thereby funding opportunities (Clark & Vranka, 2013).

The BCs are companies that are subject to the same legal standards that govern traditional companies except in three specific issues: the corporate purpose, responsibility for accountability and transparency. As to social purpose, these companies must specifically create a material positive impact on society and the environment. Regarding the second point, the decisions made within the company should meet the needs of all stakeholders, both internal and external, and consider the impact on these groups, the general

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

public and the environment. Finally, in terms of transparency, BCs are required to publicly report on their social and environmental performance, using an independent third party standard, reliable and complete.

In this latter point of the definition, it should be clarified that the legislation establishes specific requirements for defining these third party reviewers, as considered a relevant concern in the design of such legal form. However, it leaves much freedom in this respect, not forcing the BC to adopt a particular type of standard, but choosing freely between existing evaluators. Moreover, the government is not responsible for assessing whether the standard is acceptable or if the BC has fulfilled its social commitment.

It is important to clarify that sometimes the BCs are confused with Certified B Corporations by the similarity in the names. The B Impact Assessment is one of the agencies through which the BCs can certify that is really meeting their social and environmental objectives, nevertheless, this certification can be obtained by any business, regardless of its legal form, that meets the rigorous standards of measurement, whether social businesses or not (Priede et al., 2014).

Low-Profit Limited-Liability Company (L3C)

Another legal possibility for nascent social entrepreneurs in the United States is the so called Low-profit Limited Liability Company (L3C). It is a variety of the Limited Liability Company (LLC) and a mixture between for-profits and non-profits organizations. It can be considered a hybrid structure that combines the advantages of a non-profit, such as ease of organization and start- up, possible tax advantages and flexibility; together with the advantages of a for profit structure, such as limited liability, fundraising and the ability to freely transfer ownership (Galpin & Bell, 2010).

The L3C operates as a limited company and must be profitable. However, the difference with a traditional business is that the main objective is not profit maximization, but the pursuit of a social purpose, being the profit consecution of secondary nature obviously necessary to achieve the main aim. In short, L3Cs are limited partnerships that have been created to improve the development and achievement of social goals. In short, the L3C must look for a social purpose, cannot be created for profit-making-but is allowed to make profits- and cannot be formed for political purposes. Finally, it is noteworthy that, unlike the BCs, the L3Cs are not subject to the evaluation of their social impact by a third party, they are free to self-regulate their social activities and their degree of dissemination and communication. Table 1 shows the main legal forms available for social entrepreneurs in Europe and USA.

FINANCIAL CONTEXT FOR NASCENT SOCIAL ENTREPRENEURSHIP

In addition to having an appropriate legal environment, the access to financial resources is one of the main problems that nascent social entrepreneurs have to face (Lehner, 2013; Lehner & Nicholls, 2014; López-Cózar & Priede, 2015); actually, literature suggests that social entrepreneurs have a disadvantaged position when searching for funds compared to commercial entrepreneurs (Calic & Mosakowski, 2016). Therefore, in this section the main financial instruments available for them are addressed.

Low-profit Limited Liability Company	2008	USA	Low Profit Limited Liability
Benefit Corporation	2011	USA	Benefit Corporation

Traditional Funding

In general terms, to start-up a social business an entrepreneur`s own savings are the most common sources to financing the new venture. Additionally, funds from family and friends, known as the 3Fs (family, friends and fools) are often employed, being people who, motivated by their personal relationship with the entrepreneur, agree to contribute funds to the project, with the idea of supporting the initiative, rather than achieving high financial returns. This is in line with the theoretical basis of SEs in which self-financing is used to fund growth and development, profit-sharing is limited, and earnings are used to enhance the achievement of objectives and create social value (Defourny & Nyssens, 2008, 2010; Priede et al., 2014).

Moreover, nascent social entrepreneurs can also count on funding from other sources, such as state aid in the form of non-repayable grants or aid from private companies. Certain institutions aimed at promoting social entrepreneurship provide funds for the best projects submitted, providing the winners with financial backing, technical support and know-how. In any case, these options are feasible in the early stages of the creation process, but the proceeds are usually quite limited and, therefore, rarely sufficient to cover the amount of capital necessary for the consolidation of the organization (Lehner, 2013).

Access to credit from private banks is often an unsuitable option, due to the social entrepreneur's inability to provide sufficient guarantees or collateral. As it is common for financial institutions to ask for personal or real guarantees, emerging enterprises, with limited financial resources and low bargaining power, have less chance of receiving funding. Nevertheless, ethical banks could be a solution to social entrepreneurs -excluded in many cases from the commercial banking system- because ethical financing search to achieve a positive impact in society investing in social and environmental activities (Febea, 2016). In fact, commercial institutions distinguish between "good and bad borrowers" by the use of tools such as credit scoring. In this case, a good borrower is paying back the loan. In contrast, for ethical banking the good borrowers are those searching to create social value. Thus, there is a ris-

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

ing interest to include social issues into the credit score systems, in order to assess the social impact of the project and the commitment of the candidate, and not only its failure probability. In this same line, microfinance institutions or certain credit cooperatives, among others, grant socially responsible loans (Gutiérrez-Nieto, Serrano-Cinca, & Camón-Cala, 2016).

Alternative Means of Funding

Most developed countries have articulated measures and instruments that complement traditional financing mechanisms in order to help nascent entrepreneurship with limited possibilities for obtaining resources, such as the social entrepreneurs, both in raising equity or debt.

Mutual guarantee systems in various countries aim to solve the major funding problems for many organizations, helping to solve the existing limitation in obtaining credit due to lack of guarantees or collateral. Therefore, mutual guarantee institutions provide its guarantee against the financial institution when negotiating the allocation of funds. Hence, the conditions obtained by the entrepreneur in credit lines are usually preferred in terms of interest rates and repayment terms, due to the support offered by the guarantee institution. These mechanisms are particularly important in financing new business projects.

Another possible vehicle for financing social enterprises is through venture capital which have become one of the main instruments of corporate finance in advanced economies. This are independent institutions that provide a minority time-limited investment in the equity of a company who may also participate in management decision-making, at medium or low level of risk. The ultimate goal of the investor is to obtain capital gains from the sale of the stake after the success and development of the funded project. It is a stable source of funding, and therefore is a very interesting tool whatever the life cycle stage of the project. Additionally, these investors can offer expertise, knowledge and professional contacts. However, given that the objective is a return on investment, they are often very demanding in terms of the entrepreneurs' skill levels and expectation of business growth, presenting in many cases difficulties for start-ups with little experience and a social focus (López-Cózar & Priede, 2015). It's very interesting to highlight that recently, venture capital has entered the social entrepreneurship field as social venture capital institutions (SVC), which provides capital to socially oriented enterprises, and are highly concerned with the social evaluation of the candidate, improving the usefulness of this source of financing for these type of entrepreneurship (Gutiérrez-Nieto et al., 2016).

Business Angels and Crowdfunding

In recent years, a range of other financing options for social entrepreneurial start-ups have emerged, such as business angels and crowdfunding, which have grown in use and popularity and are expected to develop even faster in the future, driven by the need of innovative solutions for financing new ventures and the availability of new technologies (Bruton, Khavul, Siegel & Wright, 2015).

Business Angels

A business angel is an individual investing in a project and contributing with own money and other resources to the progress of a business, especially for small entrepreneurs with an innovative idea. Although the investment could be done at any phase of development of the company, business angels

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

often play a key role at the time of creation, supporting entrepreneurs in the early stages of their projects (Legazkue et al., 2014).

Business angels work in a similar way to venture capital as they contribute with equity, for a limited time and with a minority stake. Its goal is as well not to stay in the company a long period of time, but they invest with the expectation to retire in the medium term obtaining a capital gain, when the project consolidates its market position. In addition to financial resources, these investors also bring their experience, knowledge, time, offer advice and networking. It is interesting to promote and encourage this special source of financing creating channels to enable information and professionalize the activity, to make it more accessible for social entrepreneurs.

While the business angels respond to a heterogeneous profile, and therefore it is difficult to classify, there are some features that are common to all of them and that serve to differentiate them from other types of investors:

- They invest their own money (individuals), unlike venture capital investing other people's money (institutions).
- They make their own investment decisions.
- They search profitability, although it does not have to be the only motivation to invest.

Crowdfunding

Crowdfunding -also known as collective or mass-financing- is a new method for financing a range of initiatives such as businesses, cultural activities, social projects, etc. allowing the founders to request funds from a large number of people each who usually provides a relatively limited sum (Belleflamme, Lambert & Schwienbacher, 2014; Mollick, 2014). This funding model represents a new mechanism of financial disintermediation, which has been developed on the basis of the new currently existing technologies and has experienced significant growth in recent years, adapting very appropriately to the financing needs of the SEs.

The practice is based on an open offer, usually raised through a website, allowing individual founders to develop their ideas by requesting funds to a large number of people, providing a very interesting alternative to other traditional sources of financing. A crowdfunding process will normally involve three types of participants: the entrepreneur, the group of individuals who choose to contribute funds to support the initiative, and technological platforms that allow contact between them. The business can be of different dimensions, small, large, artistic, etc.

According to Wardrop et al. (2015), there are three types of crowdfunding. One type called donation-based crowdfunding, is when participation is motivated by the desire for an expected social outcome, as may be the case in humanitarians or solidarity projects, and participants will not receive a financial or material compensation by the donor and no legally financial obligation is incurred by recipient. The second type is the reward-based crowdfunding that could focus cultural, sport and other projects. Participants have an expectation and will receive a symbolic tangible compensation (not financial), such as a copy of the future product, some sort of promotional gift or public recognition for their contribution. The third type is called equity crowdfunding and is characterized by the involvement of agents with a strict investment behavior and is motivated by the expectation of a financial return. Investors may be offered shares or units of the company funded or a certain percentage of profits. However, there is also

Table 2. Main sources of financing for nascent social entrepreneurs (author compiled)

Source	Definition
Own savings and 3Fs	Funds provided by the entrepreneur/family/friends.
Grants	Public or private non repayable funding.
Ethical Banking	Type of banks search to achieve a positive impact in society investing in social and environmental activities.
Social Venture Capital	An institution providing capital to socially oriented enterprises highly concerned with the social evaluation of the candidate.
Business Angels	An individual investing in a project and contributing with own money and other resources to the progress of a business.
Crowdfunding	Request funds from a large number of people each who usually provides a relatively limited sum.
Donation-based Crowdfunding	Where no financial or material returns are expected by the donor and no legally binding financial obligation is incurred by recipient.
Reward-based Crowdfunding	Where backers have an expectation that recipients will provide a tangible (but non–financial) reward or product in exchange for their contribution.
Equity-based Crowdfunding	The sale of registered security by mostly early–stage firms to investors.

the possibility of receiving interest on the amount provided and the recuperation of the quantity invested at maturity (Ahlers, Cumming, Günther & Schweizer, 2015). Table 2 shows the main sources of financing (own and debt) studied throughout this section in order to summarize those that are most suitable for social entrepreneurship.

BOTTOM OF THE PYRAMID AND POSITIVE SOCIAL CHANGE

The bottom of the pyramid (BoP) refers to the millions of people who have to subsist with a very low income, 4 dollars a day. This name comes from the segmentation of the world's population into three groups according to the per capita income. Most of the world's population (4000 million people) live under these conditions, and expectations show that this segment will grow exponentially overtime. Current estimations suggest that for 2050, around 9000 million people (approximately 85% of the population) will live in developing countries. It seems, therefore, that there is a need to engage with these collective. This poorest population rise an extraordinary managerial challenge for the wealthier companies around the world, developing new strategies to serve the poor and, at the same time, helping them to improve their lives by producing and distributing products and services in a different way (Prahalad & Hart, 2002).

Poverty is not uniform, on the contrary, is segmented by age, gender, marital status, race, education or incomes, making a different poverty according to the country or region. However, it is possible to identify the main features to meet the business model in the BoP to succeed. Following Mutis and Ricart (2008), the population of these markets of low income is characterized by living either in remote rural areas or in urban slums, and very often are not registered. In general terms, it is people with no access to the basic goods and services; with a very low income at daily basis and with a very informal commercial behavior. Therefore, companies must:

- Adapt costs to the difficult situation in which the population is living.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

- Establish relationships with local governments, small businesses in the area and NGOs. These partners provide knowledge of the customs of the community, help to build confidence, provide access to distribution channels, etc.
- Develop strategies for local production and small-scale operations.
- Use the appropriate technologies according to the environmental conditions.

So far, most business initiatives in the BoP are confined within the framework of corporate social responsibility (CSR). For traditional companies, strategies which are focus on serving the needs in the BoP look also for financial improvement. All companies can use these strategies to address the needs of the population living in poverty conditions and, at the same time, foster a different entrepreneurship (Zahra & Wright, 2016). However, today many organizations are gradually looking to go one step further to influence the strategy of the business. Hence, it is necessary to delve into new business models that are prepared to provide value to its customers in low-income markets, which really cooperate in reducing poverty, that are environmentally responsible, and are able to increase the competitiveness of the company.

Some traditional companies are already aware of this reality, and search in low income markets a good opportunity to develop new strategies and business models: innovative, profitable, sensitive, responsible and sustainable; to develop the necessary activities in order to meet their needs, while, helping to reduce poverty (Prahalad & Hart, 2002; Mutis & Ricart, 2008). But, nevertheless, as already mentioned before, social entrepreneurship is prepared to answer the needs of this new target group, based on its main characteristics and its change maker spirit. In both cases, the profitability is a common focus, however, the SE provides primacy to the social objective over other goals and motivations, while traditional companies that develop strategies in the BoP within the framework of the CSR, are mainly looking for financial aims.

Likewise, another notable difference is the degree of autonomy by those responsible for decision making. This autonomy reflects the perceived importance for each approach CSR, SE, BoP and its relevance in the strategic process. The higher the value of these activities, the greater autonomy in decision-making. So, while SE projects are carried out mainly by independent entrepreneurs, s CSR and BoP usually develop within the organization with less autonomy of decision for the responsible managers. There is, therefore, a need to integrate CSR, SE and BOP in order achieve blended value (Zahra & Wright, 2016).

Management research on these issues is growing but still remains fragmented. Nevertheless, in recent years a new concept called Positive Social Change (PSC) has emerge for organizations to better understand their external effects, change processes and its further implications. At the same time, it helps to integrate the huge stream of research on CSR, SE and BoP. PSC is defined as "the process of transforming patterns of thought, behavior, social relationships, institutions, and social structure to generate beneficial outcomes for individuals, communities, organizations, society, and/or the environment beyond the benefits for the instigators of such transformations. The "beneficial outcomes" of this process are often referred to as (positive) social impact" (Stephan, Patterson, Kelly, & Mair, 2016, p. 1252).

PSC is then a new integrated, multilevel, transformative process of change supported by the organization, which is applicable in different issues such as: environment, social and economic inclusion, health and well-being, and civic engagement. PSC is based on an inclusive, open, multi-stakeholder participation in corporate governance and strategic management. The organization is no longer providing solutions and direction but is open to co-develop products and services, and even strategies. In our understanding, this new holistic approach is an interesting starting point for further research in this field and a deeper knowledge on the PSC processes within the organizations.

SOLUTIONS AND RECOMMENDATIONS

Nascent social entrepreneurs still find today in many economies a lack of efficient financial markets able to meet their needs, as well as not appropriate legal and institutional framework for the promotion and consolidation of their latent creativity. It is a booming business reality that requires a specific regulation tot suit its peculiarities and contribute to enhancing its future development. Consequently, all governments should provide answers to this new reality, offering a new economic, fiscal, legal and financial framework to foster its development which is very important to answer many social needs.

Moreover, since in recent years the interest in social entrepreneurship in most countries has increased, the academic community need to be concerned with this reality. Thus, a responsible entrepreneurial spirit must be fostered among young people, with the aim of achieving a business network in which new initiatives are capable of ensuring their economic viability and, at the same time, progress towards a greater social integration, a greater environmental respect and a more coherent and balanced growth model.

The general trend of the education systems, including different levels, should be directed towards the training of highly concerned citizens, capable of generating employment and wealth, but also capable of carrying out their activities in an ethical, responsible and sustainable manner. In this line, social entrepreneurship is configured as a feasible and adaptable alternative that must be globally promoted. In brief, we believe that it is necessary a greater institutional support and social recognition in order to encourage new entrepreneurs to start the path towards a more sustainable and responsible economic model.

FUTURE RESEARCH DIRECTIONS

This chapter has studied the legal forms specially identified for nascent social entrepreneurs in Europe and United States. Nevertheless, we consider that it would be interesting to expand the analysis to other countries in order to compare results and to understand the development in other world areas. Likewise, the main financial alternatives available for social entrepreneurs are shown. This chapter is limited to analyze the legal and financial problems, but nascent social entrepreneurs have also other concerns to face, such as lack of professionalization and a low development of management skills; poor staff training; low experience in many cases; absence of processes of innovation and development, as well as scarcity of other resources. Finally, we consider that it could also be interesting to perform a review of a set of case studies as well as a quantitative analysis using databases, that include information about the legal form and the use of various sources of financing employed by social entrepreneurs, as well as other interesting aspects mentioned above.

CONCLUSION

Nowadays it's increasingly common to find entrepreneurs who not only pursue financial returns, but also seek social objectives. For this reason, in recent years has greatly increased the interest in social enterprises, which contribute to a major change by offering innovative solutions to problems affecting society, in line with the objectives set by the Europe 2020 Strategy, marking the road to smart, sustainable and inclusive growth. Facing this new challenge, social entrepreneurship must develop in all economies,

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

since the SE becomes a key agent in the market economy and show a different way of doing business, focusing on growth and profitability but with the aim of achieving social value.

The three different approaches when considering the entities that comprise the third sector are non-profit focus, the social economy and the solidarity economy approach. SEs are organizations identified within the social economy; as well, they could also be identified as the cornerstone for the development of the ECG which represent a wider modern approach of change, which is gaining strength in recent years.

However, despite its importance as agents of change and their growing presence in most economies, nascent social entrepreneurs encounter more difficulties than the traditional ones in the access to financial resources as well as dealing with poor legal framework which not contemplate, in many cases, the special characteristics of this type of entrepreneurship. In Europe, SEs began adopting the cooperative structure, but later in different countries, especially the United Kingdom, there have created specific legal forms designed to respond to their special needs. Meanwhile, also in the United States there have been developed -in recent years- adapted legal forms for SEs entrepreneurs, although, with different characteristics.

In general terms, the more frequently funding sources used by nascent social entrepreneurs are their own resources: entrepreneur´s savings for the implementation of the project, and self-support to promote the growth and development. These alternatives are more readily available and considered the most suitable for this type of entrepreneurship, which rarely use other sources of financing, possibly due to their complexity and their lack of knowledge. Indeed, regarding the use of credit from private banks, it is an option that requires a process of prior negotiation with the entity; because nascent social entrepreneurs do not usually meet the necessary requirements to access such negotiations, it is an option sparingly used by such entrepreneurs. However, it is interesting to highlight the rise of new financial alternatives, especially crowdfunding, which can be considered a feasible and interesting option. In this sense, the nature of the SE must involve citizens collectively, so a funding source as crowdfunding allows the society to be part of the initiative.

The BoP market is related to the poorest population in the world which presents an extraordinary managerial challenge for entrepreneurship nowadays. Developing new strategies and new business models to serve the poor and help them to improve their lives by producing and distributing products and services in an innovative, profitable, sensitive, responsible and sustainable way, is the main idea of this approach. In short, SE, BoP markets and CSR actions can be included in the new holistic method called PSC.

KEY TERMS AND DEFINITIONS

Bottom of the Pyramid (BoP): People who have to subsist with less than one dollars a day.

Crowdfunding: Also known as collective or mass-financing, is a new method for financing a range of initiatives such as businesses, cultural activities, social projects, etc. allowing the founders to request funds from a large number of people each who usually provides a relatively limited sum.

Economy for the Common Good: Is a holistic model, which may be a new option over the existing socio-economic systems, understood as an inspiring force for a real global change. It is a new economic, political and social order, with the intention of building -from the ground- a sustainable and more balanced society.

Positive Social Change: Process of transforming patterns of thought, behavior, social relationships, institutions, and social structure to generate beneficial outcomes for individuals, communities, organizations, society, and/or the environment beyond the benefits for the instigators of such transformations.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Social Economy: Set of entities outside the public sector, with democratic management, and with a special regime of property and distribution of profits.

Social Enterprises: Are neither public or charities, nor traditional capitalist companies, with a clear mission of serving the community, operating in the market through resource extraction and the production of goods or services, as well as offering innovative, effective and efficient solutions to social unresolved issues.

Solidarity Economy: Is clear in its ambition to strengthen cooperation and solidarity among different agents, generally on a voluntary and reciprocity basis.

Third Sector: Is option other than public bodies and traditional capitalist enterprises, in order to meet needs or fill gaps that neither others are able to address, or do it poorly.

ENDNOTES

1 Formed June 11th 1970 by organizations representing the cooperatives, mutual societies and associations. During 2001 it becomes CEGES (*Conseil des entreprises, employeurs et groupements de l'économie sociale*).

2 First founded in 1957, is an advisory body of the European Union; is currently is comprised by 350 members out of the 28 UE member states.

3 Founded in 1996 by an international group of scholars with the support of the UE. EMES is an international research network for building theoretical and empirical knowledge about social enterprise, social entrepreneurship, social economy and solidarity economy.

This research was previously published in Nascent Entrepreneurship and Successful New Venture Creation edited by António Carrizo Moreira, José Guilherme Leitão Dantas, and Fernando Manuel Valente, pages 132-152, copyright year 2018 by Business Science Reference (an imprint of IGI Global).

Chapter 13
Social Entrepreneurship Taxonomy:
Extremadura Case (Spain)

Alicia Guerra Guerra
Universidad of Extremadura, Spain

Lyda Sánchez de Gómez
Universidad of Extremadura, Spain

ABSTRACT

Regardless of the bubbling social entrepreneurship research, a generally accepted concept for this term. In fact, the current limited conceptual framework undermines the bases of this entrepreneurship and hinders rigorous scientific progress in this area of study. In this paper, the authors attempt to fix the conceptual framework of the social enterprise, for which we have opted for an integrated, broad open view of the concept, given the heterogeneous nature of its agents and its continuous evolution, as well as the type of social enterprises that may be inferred from it. They close by exploring the keys to success of these enterprises, certain specific factors of which only a few are shared by traditional enterprises. By applying a qualitative and quantitative methodology, which they triangulate, this analysis is implemented for Extremadura (Spain), a region that embarks on fostering social entrepreneurship based on the current view in a territory with a thin social enterprise network.

1. INTRODUCTION

The notion of Social Enterprise (SE) runs into the absence of a definition and, when one tries to define it, it varies according to the different country realities. There is not a single agreed upon definition in the academic, professional and public authority world due mainly to the fact that the legal, cultural, economic, and historic differences hinder this objective, but also due to the complex and interconnected realities of today's society, constantly generating new projects that occupy the line between the SE, other entities, especially those known as the Third Sector –or Social Economy in several European countries-, and

traditional businesses (Chiliova et al., 2011). Besides, many of them are dynamic projects that evolve with time –starting as social projects, or businesses that become SEs when they identify a social challenge to undertake. The many businesses already committed to Corporate Social Responsibility (CSR) blur the SE boundaries even more, although we could consider CSR the first generation of enterprises moving towards a New Economy, while SEs represent a second generation advancing its principles. (Troncoso, 2014).

This symbiosis between the SE and its context makes exporting SE models from a country or continent to another successful only if rooted in the importing environment; otherwise, it becomes a passing trend. That is why it is impossible to map out SE entities even in the same continent such as Europe.

The polyhedral reality of the SE is due also to the different understanding of the term itself from the theoretical viewpoint of the different schools of economic thought where each one originates.

Nevertheless, and though the richness and broadness of the SE concept may be one of the keys to these companies' success, it is essential to mark the SE territory for very different reasons. In the first place, as a formula to emphasize the focus of these businesses towards a social objective.[1] Also, in order to help understand this type of agent, since the social enterprise lacks visibility and recognition, as the Social Entrepreneurship Initiative (2011) for Europe points out, which makes it even worse, giving the diversity of existing SE concepts (European Commission, 2014). This exhaustive knowledge of the phenomenon would benefit from a better analysis and comparison of the existing data, which, at the same time, would help adapt and coordinate public policy.

Finally, the economic crisis has wrecked the current capitalist model centered in the short term and the maximum profit as the main business objective. Porter and Kramer (2011) blame this mostly on outdated treatment of value creation in business. The harmful social and economic effects of this crisis are a stimulus to formulate an alternative proposal to improve current capitalism. From a balanced viewpoint between social and economic impact, we will enjoy a more cohesive and sustainable society, a more enriching one; and more so when a standard social value measurement system is adopted (Kroeger and Weber, 2014). The initial challenge is ascertaining the nature of SEs, their value propositions and their key to success factors, not only as an ethical goal also as an economic one.

Thus, they find several approaches to determine the SE boundaries: a set of required characteristics to qualify as an SE, a formal definition, or an alternative would be to model the SE in terms relative to other social and economic organizations. Of all them, this last one offers a greater, more justified view of the SE field, in theoretical and empirical terms, which translates into the most complete conceptual framework and taxonomy. Even more so when we are aware that achieving a universal definition generally accepted by all parties is hardly possible (Choi and Majumdar, 2014).

In addition, it is advisable to resort to institutional statements or reports linked to them issued by supranational organizations with the purpose of viewing the ES from the broadest and longest lasting scope. Nevertheless, the field of action is Europe.

Given this situation, the objectives for this work focus on designing a conceptual framework to include the notion of SE in all its different forms, as well as on exploring the subsequent possibilities to characterize the SE. Finally, to investigate the nature of key success factors of this type of enterprises in order to guide the development of public plans to drive social entrepreneurship.

Given the deep-rooted cases of SE formats, the authors resort to the case of Extremadura (Spain) and its Social Entrepreneurship and Innovation Network, recently created by the Government of Extremadura with the mission of promoting social entrepreneurship as one of the axes of its RIS3 Strategy and, therefore, of the EU 2020 Strategy. The methodology employed has been consultative and interactive in some

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

processes through the *work in progress* method applied with participation of the region's SE, national organizations linked to the SE, and those responsible for the Program. With it, they have thrown some light to this nebula that is the SE, always in process of transformation and expansion.

2. THEORETICAL BASES OF THE SOCIAL ENTERPRISE

2.1 Hybridization Economy

The financial and economic crisis that the world economies have suffered since 2007 has exposed numerous weaknesses in the current political, social, and economic system. This is how the new concepts started to take shape around the middle of the last century.

New management ways appeared, integrated into which Lara et al. (2011) call the New Economy –or knowledge-based economy for the European Commission- characterized by two ideas:

1. **Informalization:** This is due to the fact that its agents' productivity and competitiveness (be they businesses, regions or countries) depend basically on its ability to turn information into knowledge, that is, into something useful for the agent.
2. **Globalization:** The value chain (purchases – production – sales) and its components (capital, labor, commodities, long-term assets, information, technology.) are organized directly or through a network of contribution between the economic agents.

In short, by New Economy we do not we mean a productive sector but a new way to produce and to consume as a consequence of the technological changes linked to ICTs (Information and Communication Technologies) and to globalization of the economies. It covers novel business environments generating, among others, the so-called Green, Digital, Creativity, Open, Confidence, of the Assembly, Humanities, Hybridization, *Reset Economy,* Failure, Data and Accessibility Economies (Lizarralde and Ferro, 2013) with the following characteristics:

- Its main objective is the creation of value as well as its appropriation.
- This creation of value is based on new opportunities born with a high element of creativity.
- Intensive use of ICT.
- Organizational structures tend to be flat, integrated and flexible, as well as open because decision-making is decentralized and participatory for interest groups (stakeholders) that are not even integrated into the management bodies.
- The actual, although diffuse, participation of the stakeholders makes, in many cases, share capital and relational capital more important than economic capital.
- A relational capital built on confidence
- They relate to a new way of life that does not set boundaries between professional and personal life.
- Often, consumer communities are generated around values, in the broad sense of the term.
- Physical size has little relevance: size is considered synonymous to ability to manage its participation in value networks.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Among them, hybridization economy should be understood in a very general framework: new products, new business, new types of organizations. We have an example in the growing number of social needs that are being financed by market activities: these hybrid organizations systematically integrate civil society and markets, exchange solidarity shared by financial and non-financial resources, calculate the market value solidarity and showcase it to obtain financial and non-financial resources (Jaeger and Schroeer, 2014). In other words, they are organizations focused on social aspects that connect the for-profit and non-profit sectors (Haigh and Hoffman, 2014).

In the specific business field, it is about innovating through the intersection of different sectors, markets and knowledge areas. More specifically, to hybridize is mixing isolated pieces until now to generate a solution, disruptive in many cases, combining different areas separated until now, to generate new market products and integrated value added solutions.

This broad concept of hybridization offers us a framework to approach the notion Social Economy and, specifically, of SE.

2.2 Theoretical Origin of the Social Enterprise

Researchers and business schools have contributed diverse theoretical bases that support the concept of social enterprise. Thus, Dees and Anderson (2006) propose two schools of thought as the origin of the social enterprise, especially the American social enterprise:

1. *Income generation* school of thought. Prescriptive, intended to drive non-profit organizations towards commercial activities, i.e., business. The extended version covers all commercial initiatives that we call business. Focus on the mission, an especially social mission, i.e., businesses with a social purpose (including for-profit enterprises).
2. *Social innovation* school of thought. Schumpeterians highlight SE's innovation (Young and Lecy, 2014). This school focuses on the social entrepreneur profile in the sense that entrepreneurs in the non-profit sector are creators of change because they carry out new combinations in at least one of these: new services, new service quality, new production methods, new production factors, new organization forms or new markets. With it, the social enterprise can be a question of results instead of just a question of income.

It may be said that both schools of thought converge in the sense that the idea of social enterprise would be that of a business oriented towards a social objective that requires being competitive and, therefore, inspired by social innovation.

To these schools of thought, a third one that would prove transcendental in the empirical and theoretical aspects is added: the EMES European Research Network. At the end of the eighties and beginning of the nineties, primitive social enterprises arise in Europe: the recently created *social cooperatives*. But it is not until the second half of the nineties when the objective to identify social enterprises valid for any European country is seriously undertaken.

These indicators were not conceived as characteristics an organization must meet to qualify as a social enterprise, but rather as a construct to let professionals and researchers know that they are in *the social enterprise universe* when situating a type of entity in reference to the others and create subsets of social enterprises with diverse purposes (public policies, in-depth analysis …).

The EMES approach has a number of bases (Defourny and Nyssens, 2012):

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

- It combines several knowledge areas: economics, sociology, political sciences and management.
- It aims at combining the historic and cultural differences and national sensibilities of all the EU countries.
- It chooses, from the beginning, to operate with indicators instead of designing a definition. It does not it intend to offer, however, a list of normative criteria, but rather an overview of a SE.

3. EUROPE: SOCIAL ECONOMY

3.1 Nature of the Social Economy

SEs falls within the larger scope of the Social Economy (SE). Though the idea of the SE went dormant for years after the end of World War II, it was taken up again in France at the end of the seventies This revival occurred with the publishing in 1980 of the Social Economy Letter by France's National Liaison Committee for Mutual, Cooperative and Associative Activities clearly defining SEs as the group of organizations that do not belong to the public sector, they operate in a democratic way, their shareholders have equal rights and obligations, and they practice a particular property and profit distribution regime, using surpluses to expand the company and to improve services provided to its members and to the company (Monzon, 1987); this concept covered cooperatives, mutual or benefit societies, associations and foundations.

The SE profile continues to develop until it culminates in a second milestone that was the statement of the involved organizations closest in the time (Spanish Observatory of the Social Economy, 2015): the Letter of Principles of the Social Economy (Permanent European Conference of Cooperatives, Mutual Benefit Societies, Associations and Foundations). This pronouncement delves into the social nature of SEs by making reference to the following criteria as defining of the organizations of the SE:

- People and the social objective are considered above capital.
- Responsible and supportive behavior.
- Free and open membership.
- Democratic management by its members in decision making.
- Combination of the user members' interest and/or the general interest.
- Independence from public authorities.
- Allocation of the majority of the surpluses to achieving the objectives of the organization.

Later, Monzon and Chaves (2012) drafted a report on The Social Economy in the European Union for the European Social and Economic Committee (EESC) in order to update the previous one (Monzon and Chaves, 2008) in which it is emphasized for the first time that it includes private market production companies when defining the SC as the formally organized assembly of private enterprises, autonomous in their decisions and membership, created to satisfy the needs of their members through the production of market-oriented goods and services, in which decision-making and the distribution of surpluses or profits are not directly linked to capital or fees contributed by its members. It also included those formally-organized private organizations with decision autonomy and freedom of membership that produce *non-market* services for households, whose surplus, if any, cannot be appropriated by the economic agents that create, control or finance them.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

From this definition, very recent and, therefore, completely valid, we can infer the definite characteristics that all SE entities share and that delimit them:

- They carry out an economic activity aimed at satisfying the needs of the people and the families, i.e., of their members, of their users or the general interest. For that reason, they are *organizations of people,* not *of capital*. We can say that *they operate thanks to capital* but *not for capital*. In other words, primacy of the person and the social objective over capital.
- They are private, i.e., they are not part of the public sector nor are they controlled by it.
- Since they are organizations, their resources are organized and they have legal identity.
- Membership is not mandatory (freedom of membership).
- They have autonomy of decision, i.e., they have full capacity to elect and to dismiss their governing bodies, as well as to organize and to control all their activities.
- They defend and apply the principles of solidarity and social responsibility.
- They are democratic organizations, as they are managed by means of participatory and democratic decision-making processes. Thus, most first-tier companies apply the principle of *one person, one vote*, regardless of the capital or fees contributed by each one of them.
- Use of most of the surpluses to pursue sustainable development objectives, services of interest to the members and the general interest.

The same European Social Economy Conference (2014) admits that the concept of the SE combines many common features, summarized in the common goal they share, and it only adds two notes to the previous listing: management with long-term perspective and the reinvestment of profits in the objectives of the company.

3.2 Categories of the Social Economy

The latest features of the SE listed in the previous section lead us to the conclusion that the SE sector is divided into two large subsectors:

1. The *non-market subsector.*
2. The *market subsector.*

It should be pointed out that both subsectors lack, in many occasions, defined boundaries between them, since they share an essential characteristic of the SE: they are organizations dedicated to carrying out an activity with the purpose of satisfying the needs of the people rather than generating profits for the investors.

1. The *non-market* subsector is made up of non-profit institutions in a strict sense. It includes all the SE organizations whose production is mostly delivered for free or at significant lower prices than those of market. According to Lara et al. (2010), these are private organizations with autonomy of decision and freedom of membership that produce non market services –in the economic sense- aimed at helping families, and such that if have surpluses, these cannot be considered property of the agents that create, finance or control them, so there is no surplus distribution. Therefore, the service recipients become the real beneficiaries. Specifically, they are mainly associations and

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

foundations, plus certain other organizations of different legal nature such as political parties, unions and churches.

2. The *market* –or business- subsector is basically made up of cooperatives, business groups formed and controlled by SE organizations, mutual societies, labor companies, certain types of non-profit organizations servicing SE businesses, as well as other SE businesses. All these institutions have the common features of all SE companies, but the Satellite Accounts Manual for Companies in the Social Economy, drafted for the European Commission by Barea and Monzon (2007) and widely accepted by the academic and professional community, highlights three characteristics of SE businesses for these *market* companies:
   a. They are organizations created in order to satisfying the needs of its members by applying the principle of self-help, i.e., they are businesses which usually comply with equality between member and user since the main purpose of these businesses is to take care of the needs of its members, which are basically people or families. SEs belong in this category, in which some of their members act as recipients of the activity but they are not permanent members; however, a reciprocally beneficial relationship is more common.
   b. The production of SE enterprises is mostly allocated to be sold in the market, and thus, at market prices.
   c. If they obtain profits or surplus, they can be distributed among the member users, but the distribution criterion is not determined by their capital or fees contributed to the business, but rather according to the activity that they perform in the organization. This feature underlines that the fact that profits or surpluses are not distributed among the members is not an essential characteristic of SE businesses.

It is necessary to point out that in certain countries they are given the legal identity of trading companies; therefore, their decision-making takes capital into account, although they would be in the SE category only if the majority of the stock were in the hands of the working members and equally distributed among them.

In short, and according to the above-mentioned Manual, we can classify the companies that make up the market subsector of the SE as follows (Figure 1, Appendix):

1. **Cooperatives:** Despite the different legal treatments, at times even nonexistent, of the SE cooperatives, the link that joins them is made up of the basic core principles of every cooperative, collected in the European Cooperative Company Statute (2003), which helps them meet all the conditions to be considered SE agents.
2. **Mutual or Benefit Societies:** Although they share their legal diversity in the EU with cooperatives, they are all created for people to satisfy common needs such covering social welfare and health risks (health and provident mutual societies) or certain areas related to life insurance (mutual of insurance). Their operation, similar to that of cooperatives, confirms their condition as SE agents.
3. **SE Business Groups:** They are created when a SE business or group of businesses, or any another SE agent, make up and control a business group in order to meet their objectives more efficiently. Therefore, they are aimed at improving the rank and file members, regardless of the legal form or the economic sector they belong.
4. **Social Enterprises:** This is the core subject of this paper, so we dedicate a later chapter to its analysis.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

5. **Other SE Companies:** It refers to certain type of non-financial companies present in some countries, set up for the purpose of creating stable employment for their members, and in which most of the capital stock is in the hands of the workers –who control the decision-making bodies- and distributed among them –making democratic self-management and fair profit distribution possible. They generally take the legal form of corporations or limited liability companies, i.e., of a commercial nature, but the above features make them social companies.[2]
6. Other financial institutions in certain countries could be included, such as saving and credit companies and savings banks that maintain the essence of the SCE business definition already offered by these authors.
7. **Non-Profit Institutions at the Service of SCE Entities:** They are the only non-profit companies of the SCE market subsector. Their incomes come from the fees or subscriptions of the group of businesses they serve for the services provided, the reason why they are considered market production companies and, therefore, members of the subsector. There are two categories: non-financial companies, if they service cooperatives or similar subsector businesses, and financial institutions, if they service credit unions, mutual or other financial entities of the SCE.

4. AN APPROACH TO SOCIAL ENTERPRISES IN THE EUROPEAN ENVIRONMENT

If we delve into the fact that SEs take on multiple forms according to the reality of the environment where they arise, we can see how continental Europe places the SE at the crossroads of the market, civil society and public policies by emphasizing the different financial sources to which they can resort (Fisac et. al., 2011). On the other hand, the Anglo-Saxon tradition emphasizes the focus on the market and the generation of incomes through as key factors of the SE.

This last view is shared by Third World countries, though with certain differences. Thus, if in Europe labor integration is the mission of numerous SE, in developing countries, with a limited social welfare system, a high number of SEs are created to offer basic services at affordable prices or to produce or sell products for low income level groups.

In this regard, we should also point out the significance achieved by the so-called *B Enterprises*, a business concept born in the United States extending all over the continent and to other countries in the world, over forty countries by now, including Europe (B Corps, 2015). B enterprises are for-profit companies included in the hybrid organization spectrum aimed at generating a positive social and/or environmental impact through the products they sell on the market and/or their labor, environmental and stakeholder relationship management practices (Troncoso, 2014; Muñoz, 2013) on which they are innovating in their sector. In short, B enterprises have a dual mission: generating reasonable income for their owners and creating public value for their different stakeholders (López, 2013). They only achieve this status if they obtain the B-Enterprise certification issued by the B-Lab non-profit organization after meeting its sustainability standards.

This B concept, as we will see, is in line with that of the SE as it shares the two-fold economic and social/environmental value creating enterprise, with the second value dominating over the first, so that the revenue generated must be reasonable so that it may become the tool ensuring the enterprise's survival. Thus, we can speak of two concurrent concepts of enterprise: *the market at the service of the common good.*

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

The American origin of B enterprises confirms that SEs are born to address the challenges of their respective societies: for different realities, different answers. This despite the continuous creation of SEs to respond to global problems or to those of developing countries. To illustrate, we offer some SE initiatives as examples (Table 1, Appendix).

Despite this, we believe that is possible to overcome these differences by formulating a conceptual framework to offer us a relevant and representative view of the SE as a whole.

We begin by pointing out that these novel forms of SCE that are the SEs include a wide range of businesses with legal forms that are quite different from cooperatives and mutual businesses -though in many cases they adopt the legal nature of cooperatives-, as well as trading or similar companies.[3] Basically, they meet the SCE conditions presented to the EESC, though their condition as market-oriented production agents is included as a main distinctive feature of the SE, as we can see below:

- They are created with the objective of benefitting the community.
- They are private companies created by groups of people.
- People affected by the activity (users) participate directly.
- They are continuously engaged in the production of goods or/and services.
- They act with a market focus in the sense that a significant part of their income comes from the market (direct sales to users) or from contracting with public authorities.
- They assume a degree of financial risk of the market itself.
- They are managed with a high degree of autonomy.
- Their decision-making is not based on ownership of capital.
- They use remunerated labor.
- The distribution of profits and surpluses is willingly limited.

The European Commission stated as much through its Social Business Initiative (2011) where it briefly defines the SE as a SCE entity whose main *objective is its beneficial impact on society rather than generating profits for its owners or shareholders.* But it also incorporates important considerations in search of a highly competitive market social economy, such as the generation and marketing of goods or/and services in an entrepreneurial and innovative way, and the creation of value typical of online collaboration between the business and its interest groups (employees, suppliers, clients, local community, public administrations, …). In other words, these considerations result in the European Commission's complete and official definition[4] of SE when referring to those businesses that show these characteristics:

1. They operate in the market offering goods or/and services in an entrepreneurial way.
2. Their economic reason for being –their mission- is a common social objective that frequently translates into a high degree of social innovation. Therefore, their main goal is to have a social impact rather than to generate profits for their owners.
3. As a consequence:
   a. Their operation and ownership are based on democratic or participatory criteria focused on social justice.
   b. Their profits are basically reinvested in pursuit of this social end.
4. Their management is responsible and, therefore, transparent, especially through the commitment of workers, customers and all those affected by their activities (interest groups or stakeholders). This translates into a high degree of CSR application.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

5. It shows long-term vision.

To this definition, the European Commission (2015) incorporates the common SE characteristics of encouraging solidarity and social cohesion, member self-management, flexibility to adapt to social and economic changes, as well as being based on active and committed members. In relation to the last one, Tan et al. (2005) believe that the role of the social group on which the SE is focused is to be the recipient of the value created for it so that the group is involved and committed to the process.

The viewpoint applied by the European Commission undoubtedly alludes to the economic nature of the Enterprise. This is confirmed from the European institution itself by those who point out that acting in a more fair and responsible way is compatible with market success, or that social enterprises should follow an economic model allowing them to generate sufficient funds to be able to invest in the future (European Commission, 2014). This makes SE into new organizational models that hybridize economic and social objectives in order to meet current society's consumer expectations in an innovative way (Vaccaro, 2014).

With this pronouncement, the European Commission does not intend to offer a legal definition and, therefore, a mandatory one that may constrict how these businesses operate, but rather a concept proposal of SE based on common characteristics in the member states. At the same time, the Commission thus aligns the SE with European policies given that it sees it as a partner:

1. In the intelligent growth of the EU, which it manages by applying social innovation to meet certain needs or unsolved problems.
2. In sustainable growth, considering environmental impact and its long-term vision.
3. In integrated growth by focusing on human problems and social cohesion.

In other words, the three principles guiding the growth objectives of the EU 2020 Strategy (2010).

Likewise, it is aligned with the European Small Business Act Initiative to promote sustained growth and competitiveness of European SMEs (Small Business Act, 2008) –later amended by the 2020 Entrepreneurship Action Plan (Entrepreneurship 2020, 2012) -, though this refers to the adoption of what sometime later would be the Social Entrepreneurship Initiative.

This view of the SE adopted by the EU requires a deeper look into at least its most striking features. Thus, Chiliova et al. (2011), in tune with this view, base SEs on three pillars (Figure 2, Appendix):

1. *The creation of social value as a priority objective.* The fundamental purpose for which SEs are born and exist is creating social value. How is this achieved? By addressing needs or solving social problems, i.e., by meeting social challenges. They are businesses that give priority to social benefits over profits.

This mission requires great adaptation of the businesses to their own economic, social, environmental, technological, legal and political environments.

It is important to note that the creation of social value goes beyond meeting the needs/problems of groups at risk of exclusion, given that, especially in developed countries, there are many SEs whose activity is environmental protection, responsible consumption or other areas that themselves are not directly related to the improvement of a certain excluded group. Even beyond that, many SEs are born

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

or intend to play roles such as that of fostering value-based behaviors, aiming at becoming key drivers of cultural transformation.

A fundamental point of tension is the weight of the ever-present social objective in the business: positions range from those who claim that this should be the sole objective that the business should pursue and those who view[5] business that generate income and, therefore, profits as SE. Therefore, the core of this issue pending consensus is whether the objective of social utility is the sole, main, important objective or simply a secondary objective (Curto, 2012): if this full range were accepted, we would be looking at a very broad and flexible version of SEs that may dilute the nature of these businesses even further. In this regard, the previous debate over reinvestment of the profits would be the second part of this more general debate: profit obtained by those businesses with a calling to generate profits that goes hand in hand with social utility can be reinvested in the activity or to make it possible to operate.

In this regard, social entrepreneurship offers the most general position. Considering the terms entrepreneurship and *social* (Peredo and McLean, 2006) and that social entrepreneurs are a subgroup among entrepreneurs, Pomerantz (2003) considers that the key element of the SE is applying a business and innovative approach to the provision of services to the community. This way, the line that separates the social entrepreneur from the traditional one is the commitment of the first one with the creation of social impact (Curto, 2012).

2. *The creation of economic value as necessary objective*. The fundamental role of the financial profits is to allow and support business activity, this is, a requirement for the survival of the business. This makes it a basically instrumental objective: the generation of social value is linked to the essential creation of economic value. Not surprisingly, the SE is it the only type of organization that manages not only to create value –social-, but to capture value –economic- to be able to operate sustainably (Agafonow, 2014). In short, the obtaining of profits, at least in the long-term, should inevitably become one of the objectives of a SE.

Once this is made clear, the real dilemma is whether economic value should come from the market or be *consideration* for its production originating from public authorities or donations; in other words, whether an SE that is economically feasible thanks to subsidies or donations can be considered as such. Again, continental Europe and Anglo-Saxon answers differ: if, on the one hand, public financing or donations can guarantee the existence of those SE that the market by itself cannot not support if it wishes to comply with its social utility objectives, on the other hand, these policies may run the risk of discouraging the capability of the business to increase its competitiveness in the market while it blurs the boundaries between SEs and *non-market* entities of the SCE. This means that, although it is true that many SEs share the characteristic of reinvesting profits to achieve their social purpose, we do not believe that this reinvestment should become a basic requirement for a business to be considered a SE; proof of this are SEs endeavored in developing competitive advantages given the strong social motivation driving them, which is one of the reasons that prompts SEs to take the legal forms of traditional businesses.

3. *Strategy and business model.* The creation of social value and, to do so, economic value, requires managing the SE's resources and capabilities according to business competitiveness criteria, a concept originating in traditional business.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Therefore, if the success of traditional businesses is measured by the increase of wealth that the activity generates for its owners, in SEs it is measured by the achievement of its social objective, which requires economic success.

This conceptualization of the SE, in tune with GEM (2014), makes it difficult, nevertheless, to distinguish SEs from organizations that are not, and this due to a double difficulty: to separate SEs from traditional businesses, as well as SEs from other SCE entities like organizations that are completely non-profit. There are some inherent limitations to applying a definition or characterization to a concept whose boundaries are tremendously difficult to set.

What it is indeed possible is to divide SEs in two large categories, although both can be harmonized into the same business:

- Businesses that provide social services or supply goods or/and services to a vulnerable group. This means having access to housing, receiving care, disability or senior citizen assistance, inclusion of groups at risk of exclusion or excluded, daycare, access to employment and training, management of dependents.
- Businesses whose production of goods or/and services is intended to achieve a social objective (social and professional integration through access of disadvantaged people to employment, particularly because of low qualification or of social or professional problems as the origin exclusion and marginalization), but whose activity may also include goods or services that are not social.

We have before us an extensive taxonomy of SEs that is apparently open to include a range of activities that we could put together as giving solutions to social challenges. Nevertheless, it does not seem to include areas covered by the idea of social value supported by Chiliova et al. (2011), i.e., those not directly related with the improvement of a vulnerable group, such as food safety, sustainable agriculture, marine research, energy efficiency, clean energies, sustainable and intelligent transportation, climate change, digital society, … (Fundecyt-Pctex, 2015), all of them characterized by a strong social innovation component.

According to Seymour (2012) when he blames methodology aspects for many of the difficulties associated with SEs -such as defining them-, this restriction is likely to arise from the method applied to delimit the field of SEs: a definition, though based on characteristics and a the appropriate taxonomy. Then, a different viewpoint and methodology would be necessary to identify a SE. This it is the decision adopted by the European Research Network EMES when it applies a novel approach based on positioning the business in a structured position within the SCE.

5. POSITIONING OF THE SOCIAL ENTERPRISE

EMES uses nine indicators to position a company within the SCE and, therefore, also a SE. This becomes a proposal of empirical and theoretical value in the area of the SE. Since it places the SE within the SCE with a system of principles that contributes an open and broad view, it is endorsed by European Commission (European Commission, 2014) in everything that links it to its Social Entrepreneurship Initiative (2011).

EMES proposes applying nine indicators (Defourny, 2001) grouped in three large areas (Table 2, Appendix). Basing on the work of different authors, which implies diverse economic agents and logic (Evers

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

and Laville, 2004; Laville, 1994; among others), it devises a triangular version that makes it possible to place SEs in the economy as a whole (Figure 3, Appendix). As economic actors of the State, private for profit companies and communities; as resources and reasons –logical- by which these agents operate are:

- **Market:** As a mechanism of supply and demand for goods and services that sets a balanced price
- **Redistribution:** The market does not guarantee the distribution of an economy's income and wealth, so the State adopts measures to achieve a more fair distribution of both by means of instruments such as taxes (Mankiw, 2012)
- **Reciprocity:** As a principle of all economic activity based on symmetry since the agents that maintain a reciprocal relationship are complementary and interdependent at their own will.

By applying this approach, the SCE is no longer completely separated from the private for profit sectors and public sectors, but rather appears as an intermediate sector. Since these SCE organizations are in relation to the three logics, there is a great variety of actors and resources hybridization. This underlines the symbiosis instead of drawing up boundaries between sectors, which is the reason why the limits between the different agents and logics are drawn as discontinued lines (diffuse boundaries).

In fact, hybridization areas around the discontinued lines clarify some of the tensions of the organizations of this sector. On account that the SEs are born or belong to the SCE, and as many SE are located in these areas around the boundaries, also they suffer these tensions:

- Conflict between profit maximization and distribution of the market itself set against the supremacy of the social objective and democratic values of the SEs Thus, many SEs are clearly focused towards the market, so although they pursue mainly a social objective, they can distribute part of their profits among their owners; in other words, they are found around the boundaries between the areas of organizations that allow a limited distribution of profits and for profit organizations, which may give rise to the risk of deviating from the mission.
- SEs may also be found in the upper part of the circle, such as those sponsored and supported by the public authorities for labor integration of unemployed people at risk of exclusion, in the current framework of the State outsourcing social services, On the one hand, they are subject to a rigorous state legislation, but on the other, these organizations are also linked to the market, driven by the recent reforms that promote the market and competitiveness. This is a second source of tension.
- In the area joining formal and informal organizations conflicts can be generated with the change from informal activities, and innovative in the way they meet social demands, to formal: treatment of volunteers versus hired workers, change from taking decisions based on common feelings to formal decision-making processes, …

This approach prepared by EMES, in addition to being a theoretical and empirical reference in this field and being adopted by the European Commission, was the approach applied, with the necessary adaptation, by important initiatives of the United Nations Program for Development (PNUD) since it is based on the three SE schools of thought mentioned above (Table 3, Appendix). All it shows that this proposal is applicable to very diverse world contexts. A proposal, in addition, that does not only make it possible to identify and to position a SE within the SCE but avoids the need to resort to mapping a SE as a resource to produce a SE taxonomy.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Although this is a flexible approach, it should be clear that the vision of a SE is a profitable business making an added contribution to society or the environment which makes it a complement to the traditional enterprise. We agree with Defelippe (2015) that there should not be any doubt that the SE acts as a supplement to the traditional enterprise, which it does not aim to replace but rather live side by side with as its ideal complement: in fact, both types of enterprise coexist as a sample of what we call New Economy.

6. SOCIAL ENTERPRISE BEHAVIOR: A REFERENCE TO EXTREMADURA

6.1 A Social Enterprise's Key to Success

SE's are actors that generate social and economic value and compete in the market- Traditional business can learn a great deal from social entrepreneurship, get ideas, experiences and innovative business models that can contribute to the principle of business differentiation as a way to improve competitiveness. This usefulness make SE relevant, not only in the field of ethics, but also in the economic.

For this reason, it is necessary to get to the essence of SEs and understand their value propositions and identify their keys to success. We understand that the first two issues have already been dealt with, so the third must be tackled.

Although it is difficult to explain the keys to success the SEs share because of the subject's nature and diversity (Michelini y Fiorentino, 2012), we propose specific dimension-based keys to SE success. Specifically, we refer to the following (Lara et al., 2010; Chiliova et al, 2011):

- **Birth of the Project:** We focus on the motives behind the creation of the company.
- **Business Model (Business Model):** Although resource dynamization, available skills and the type of leadership committed to the creation of social value are part of the business model of the SE, other variables could be added to it.
- **Innovation:** The SE perceives a need/problem in its surroundings that requires a solution, and it must design a business value proposition to meet or solve it. This itself requires a new way of thinking, since the need or problem had not even been detected before or properly solved, while innovative thinking is also necessary to find a solution, often itself innovative, to choose novel resources and integrate them in an innovative way, to activate them to develop new capabilities, to achieve win-win relationships with other agents, to take advantage of opportunities and strengths, while softening threats and weaknesses. By doing so, the problem will become opportunity and, therefore, the company will be able to develop a good part of its competitive advantage. For this reason, the lack of ability to innovate jeopardizes the SE in the short, but also in the long term.
- **Corporate Culture:** This is a supra-factor that includes most of the others, although it makes reference to elements that are not included in the rest of success factors such as the role of creativity, adaptability to change, SCR, generally accepted values, staff leadership style, …
- **Organizational Structure:** It refers to decision-making and working methods.
- **The Company's Network of Value:** Closely linked with innovation, corporate culture and resources and skills, we decided to consider it as a separate item because of its significance in today's business management (Good, 2008).

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

- **Ability to Mobilize Resources and Generate Capabilities:** More necessary than in traditional companies, SEs show a natural tendency to mobilize the necessary resources to meet their social objectives and, as it often happens, to achieve that transforming vision of reality beyond the confines of their businesses. This is so because they are used to *doing more with less*. To manage to do this, they often resort to outside resources with volunteer work and collaborative agents that are a priority partners in their activity model (SCR, partnerships,…) by creating of value ecosystems and even integrating into their business strategy relationships with agents entitled to participate in some way in the life and activity of the business.
- **Ability to Extend Its Impact beyond Its Original Scope of Action:** I.e., that where they operate directly. Proving to society that they are real benchmark models for it or for other companies may become one of the most outstanding virtues of SEs, whether intentionally or involuntarily. This might not be considered a critical success factor, but it is in this situation of economic crisis, which is also an identity and value crisis: SEs become agents of reference from which to learn, as they combine social and economic welfare.
- **Committed Leadership and a Vision of Social Value:** It is the SE's creation and consolidation lever, so it is essential in any SE.

To make these dimensions operational, indicators are assigned to each one of them.

6.2 Methodology

The SE's adaptation to its environment suggests the need for narrow it geographically for this analysis. We selected the region of Extremadura mainly for the following reasons:

- The Social Entrepreneurship Initiative (2011) of the EU is interpreted as an invitation to national and regional governments, as well as to the rest of the actors involved, to create ecosystems within their territories to foster SEs.
- Spain continues to be the European country with the lowest rate of social entrepreneurship (GEM, 2014). In order to remedy this, in 2011 the Spanish Government passed the Social Economy Act, supplemented by the imminent Third Sector Social Action Act (2015), regulation that despite having relative endorsement from the country's Third Sector Platform (2015), is restrictive of SE in terms of concept and classification; thus, the first of these laws only considers SEs the special employment centers, insertion companies and fishermen's associations (CEPES, 2015).
- All this makes the country a fertile ground for the success of the still few social entrepreneurship initiatives in comparative terms.
- The government of Extremadura recently approved the Entrepreneurship and Social Innovation Program of Extremadura (2015) aimed at generating an ecosystem that may foster social entrepreneurship in the region. This ecosystem, made real through the established Entrepreneurship and Social Innovation Network of Extremadura, acts in accordance with the guidelines of the Program, whose specific objectives are the identification of new business opportunities and the creation of social and business value generating activities, as well as comprehensive mentoring to create a company.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

In other words, it applies the broad view of the SE that we have been supporting throughout this paper, which is why it is in tune with it. Thus, and in line with EMES, it applies a conceptual model which places the SE at the intersection of the Private Sector, the Public Sector and the Third Sector (Figures 4 and 5, Appendix).

To carry out the empirical work, we have resorted to a consultative and interactive methodology in some processes. The methodological tools have been, on the one hand, the creation and forwarding of an online questionnaire that explores the keys to success of the SE surveyed. This questionnaire includes the indicators listed above and applies a Likert scale of 0 to 10 to those that can be quantified. The quality of the answers to the questionnaire is guaranteed by the fact that they are provided by the president, CEO, manager, or managing director.

In order to triangulate (Ruiz, 2007), we applied the *work in progress* method, which translated into the input to the concept and classification of the SEs surveyed, which collaborate with us to that end through their feedback.

The dimension indicators (Lizarralde and Ferro, 2012) have been selected for the first six on the list provided, from which we will also infer the results to meet the remaining dimensions (Table 4, Appendix). These indicators, along with general company information, make up the survey questionnaire. This is completed by including the following items: Key factors for success in the opinion of the company, idea and SE classification. The last two questions are asked to obtain collaboration in the concept and classification of SEs, which are the objectives of this paper, in application of the *work in progress* method.

Likewise, this method has prompted us to gather the opinion of the main public entity in the region in innovation management - and which manages the Social Entrepreneurship and Innovation of Program of Extremadura-, Fundecyt-Parque Científico y Tecnológico de Extremadura (Fundecyt-Pctex), in terms of the concept and classification of SE.

The second entity surveyed was APAMEX, a leading regional social integration association.

We submitted to them the SE definition of the Social Entrepreneurship Initiative (2011), supplemented by European Commission (2015), together with the generic classification of SE provided by these sources and Chiliova et al. (2011). This choice was based on its current value, prestige and relevance for the entire EU.

To determine the size of the company, we applied the 2003 Recommendation of the EU_(European Communities, 2006), which combines the number of employees, net assets and sales figure criteria.

Our view on business innovation and types of it is that provided by the Oslo Manual (2005), which divides innovation into product, process, management and commercial innovation.

The sample selection has been to create a random sample of the three major SE groups in the region: Special Employment Centers (SEC), insertion companies(IC) and innovative companies aimed at social challenges (which we call Social Innovation Companies -SIC-), all of which are included in the program description. Because our objective requires a fairly exhaustive exploration of each company, we decided to have a small but representative sample. Even in the IC group, the surveyed companies represent the only currently existing ICs in Extremadura, so in this case, the sample matches population. The sample description is included in Tables 5 to 7 (Appendix) and Figures 5 to 9 (Appendix).

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

6.3 Contextualization: Best Practices of Social Enterprises

Before analyzing the results, we should introduce some examples of SE success stories to put the study in context. To do so, we define the social purpose of each of the three main categories of SE present in Extremadura (CEPES, 2015), we select an SE from each of the three categories in the region, and we apply Chiliova et al.'s three-pillar structure (2011) in order to examine how it fulfills each one of them (Tables 8 to 10, Appendix).

The Special Employment Centers (SEC) are SEs whose main purpose is to promote the employment of people with disabilities. This is achieved by directly hiring them so that its staff includes the largest number of people with disabilities that its production capability allows, which cannot be less than 70% of its total staff. In addition to remunerating these people, it guarantees their training and continuous support in their personal and social life in order to advance their integration.

Insertion companies (IC) share the same mission but not by so much direct hiring like the SECs; this is because they are business initiatives that apply labor insertion methods to their business vision aimed at hiring people with disabilities for themselves, for a different company or for freelance projects. This is done by providing an insertion itinerary as a personal employment plan towards their integration into the regular labor market.

What we have called Social Innovation Enterprises are characterized by using innovation as a means to achieve business success in a social or environmental area. They try to deal with social or environmental challenges by means of innovative business solutions but in a way that obtaining large benefits is not the purpose.

In these examples, we find that SEs tend to deal with specific problems in their area of action.

6.4 Analysis of the Results

The sample presents the typical SE notes: mainly micro, followed by small and medium; recently created; mostly limited liability companies -business-, followed by cooperatives; and linked to the territory given their preferences for local markets followed by national markets.

From the results of the questionnaire (Table 11, Appendix), following behaviors can be inferred[6]:

1. **Birth of the Business Project:** The reasons that led to creating and continuing with your company are related to social values you wanted to put into practice.
2. **Business Model:** It has the following characteristics:
    a. Goals aligned with the social purpose of a SE, likewise pursued by its target customers - for whom you believe you are creating social value-.
    b. You quickly perceive changes in your surroundings in order to introducing them in the company, and you do so considering proposals based on creativity.
    c. They are not in favor of differentiation strategies or those based on costs, or on valuation of the phases of their value chain.
    d. You place a greater value on the ability to manage value networks than on the size of your company.
    e. Cohesion of activities enables you to create company reputation.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

   f. Your main competencies are in tune with the above features.
   g. They have introduced remarkable level of ICT and place much more value on their intangible than on their tangible resources.
   h. There have been general increases in profits, which are mostly reinvested in the company. Personnel costs represent a high percentage of its total costs.
3. **Role of Innovation:** They assign a remarkable score to the innovation in your company, introducing basically progressive innovation of the four types of innovation.
4. **Corporate Culture based on:**
   a. Fostering creativity and innovation. The staff is involved to some extent -, learning, practicing relationships of trust and universal values - which leads them to implement SCR-.
   b. High influence in the company of its sponsors' ideology and values.
   c. High adaptation of people to changes that occur in the company, participatory decision-making and very strong motivation of managers toward employees, with whom they relate from a leadership perspective.
5. **Organizational Structure:**
   a. Fairly flexible staff organization and decision-making that tends to be decentralized and open.
   b. High teamwork ability
6. **Value Networks:** Working in collaboration with other organizations, be they business or not.
7. **Dynamization of Resources and Capabilities:** It is observed in the high inclination toward innovation -involving the staff-, learning, the intangible, its quick adaptation to changes, calling to establish partnerships, competencies in keeping with its SE nature and activity, remarkable use of ICT, the drive to get the staff involved, as well as a value imbued management.
8. **Extent of Its Social Impact:** The desire to extend its impact beyond its scope is observed (to*consolidate the agro-ecological role in rural* areas, to *practice an economy at the service of the people*, among other motives and goals).
9. **Committed Leadership:** Observed in aspects such as the purpose that led to the creation of the company, its goals, its values-based management or the reinvestment of most of the profits in the company.

In short, we believe that the dimensions that include the keys to success of the SE have been fulfilled, in some cases with a high score. In fact, these companies find the keys to their own success in their own nature.

Furthermore, the high homogeneity of results between the businesses surveyed is surprising, confirmed by the low coefficient of variation of the quantified variables, which shows the internal cohesion of this group of companies.

Table 12 (Appendix) summarizes the contributions offered by the SE surveyed to the concept and classification of SEs. Few are the conceptual developments that they offer to the SE that have not been mentioned already, but they make clear that they are non-profit, the primacy of people over profits, as well as a desire to transcend the activity itself in pursuit of improving their environment.

With regard to the feedback, Fundecyt-Pctex and APAMEX (Table 13, Appendix), differ somewhat in their idea of a SE: broad and open in the first case -since it is in line with EMES and Defourny and Nyssens (2012)- and, therefore, in tune with the final perspective of our work, while the second relegates the idea of a SE as a company that must compete in the market to the background. They are in favor of an open classification as well, since that presented to them is open to multiple possibilities.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

7. CONCLUSION

Once this theoretical and empirical exploration was completed, we wanted to stress the need to implement a vision SEs that includes the multiple possibilities offered by social entrepreneurship and, even more, which it can offer in the near future due to the SE effervescence that has them constantly evolving. Therefore, we opted for an idea of SE pictured through a conceptual schema rather than by a definition, regardless of how complete and described it may be. The Network EMES focus lends itself to this goal by providing a comprehensive proposal and allowing placement of to the background current and future initiatives of social entrepreneurship. Consistent with this, the classification of SE it must rise from a conceptual framework of these features. We believe that future research in this field must continue in this direction.

On the other hand, the relevance and potential of SEs requires more intense research into the keys to success of this type of business, differential because of the specificity of the SE, which have not been sufficiently studied yet.

KEY TERMS AND DEFINITIONS

Creating Social Value: Provide a solution to a social problem that has not yet been solved.

Creating Value: Offer a solution to a need that has not been covered.

Interest Groups (Stakeholders): Groups of people or individuals affected by the actions of an organization.

Non-Profit Businesses: Enterprises whose goals are not generating profit (social or social or environment objectives).

Reinvestment of the Profits: Do not distribute profits among owners, but keep them in the enterprise for future investments.

Responsible (Socially) Behavior: Management exhibits a high level of social and environmental commitment (i.e. CSR: Corporate Social Responsibility).

Traditional Businesses (For-Profit Businesses): Enterprises whose objective is to make a profit for their owners or shareholders.

ENDNOTES

1 We include the environment within the term social.

2 A well-known case the Labor Companies in Spain -corporations or limited- (Law of Labor Companies, 1997).

3 Currently, most social enterprises are micro, small or medium businesses (European Commission, 2015).

4 Also in terms of the EU Operation Treaty and the EU Court of Justice case law.

5 Among them Bill Drayton, founder and president of ASHOKA, the largest social enterprises association, when declaring that a social entrepreneur is not only an altruistic person, but he or she must show a clear determination to contribute to society.

6 Means are accepted because of their coefficients of variation are $\leq 0{,}5$ (Bioestadística, 2015).

7 Such as Ashoka (Social Entrepreneurship World Network), Extremadura Sana-Asap (Ecological Production and Consumption Network of Extremadura), CLM-Extremadura (Alliance for the People's Food Sovereignty), Seed Network of Extremadura–to recover agricultural biodiversity-, Reas-Extremadura (Alternative and Solidarity-based Economy of Extremadura).

8 En proceso de transformación hacia Sociedad Cooperativa Especial.

Table 1. Examples of SEs focused on solving global problems

Problem	Solution
The health systems of many *developing countries* are usually completely or almost inaccessible for a large part of the population in rural areas because of long distances and difficult communication.	SE *Enlace Hispanoamericano de Salud* (EHAS) http://www.ehas.org/ This enterprise has adapted telecommunications technology to improve healthcare deficiencies. Specifically, it has used long distance wireless networks to enable communication between doctors and supporting staff. This, in addition to improving patient care, reduces cost. Peru, Ecuador, Colombia and Cuba have already implemented these communication networks, but it is still working to extend this model to the rest of Latin America, Asia and Africa.
Over half the population of the world is exposed to endemic diseases transmitted by insects or arthropods. For example, approximately a million people in the world die because of malaria every year.	SE *Malaria Spot* http://malariaspot.org/es/ Its founder has designed a simple online game accessible from any computer or mobile device that enables collective diagnosis so that anyone with a connection to Internet can contribute to diagnosing malaria by quickly identifying the parasite. It is a simple, fast, low-cost method that is also scalable, as it can be applied to diagnosing other diseases.

Table 2. EMES social business indicators structure

Dimension of the Social Enterprise	Indicators	
	Name	**Descripciòn**
Economic and business dimensions	A continuous activity that produces goods or/and services	They do not carry out activism activities (as some non-profit organizations) as their main activity: the production of goods and/or services for people is the reason, or one of the main reasons, of their birth
	A significant level of economic risk	Since it is not a public institution, it depends on its own economic viability and, therefore, of the work of its members and employees
	A minimum remunerated work load	It can use employees and volunteers, but it requires a minimum number of hired workers
Social dimensions	An explicit objective to benefit the community	One of the main objectives of a social enterprise is to serve the community or a specific group of people. Accordingly, they wish to promote a culture of social responsibility at the local level
	It represents an initiative in charge of a group of citizens or civil society organizations	These businesses are the result of collective initiatives that imply people in a community or a group sharing a common need or purpose. This collective view, that should always remain, must be harmonized with the leadership of a person or small group of people (leaders)
	A limited distribution of profits	The social objective is a priority, so the distribution of profits is restricted. The spectrum ranges from organizations characterized by the fact that they do not distribute profits to those that limit their distribution. This way, profit maximization is controlled.
Participatory government	A high degree of autonomy	They are businesses created and managed by an autonomous group of people with an autonomous project. They may depend on public subsidies, but they are not managed by public administrations or other organizations (federations, private enterprises, …).
	Decision making that is not based on ownership of capital	A decision-making process that is not connected to capital of the members of the government body that makes the last decision. The principle of *one member, one vote* is generally applied.
	A participatory nature involving different parties affected by the activity	Its features are representation and user and customer participation, the influence of other interest groups (stakeholders) in decision making: that is to say, a participatory management. In many cases, one of the objectives is to improve democracy at the local level by means of its activities.

Table 8. Example of a solution to a social-environmental problem: Extremadura (I)

Insertion Company (IC)	**Enterprise** ALUCOD
Pillar 1: Creation Of Social Value As A Priority Objective ALUCOD Reciclaje, S.L. is a non-profit enterprise. Its activity consists of offering holistic care for addiction, mental health and social exclusion in order to improve the health and situation of patients. They and their families receive advice and support, medical treatment, social and legal assistance and job insertion; it also organizes drug addiction prevention campaigns and offers personalized educational group sessions. All this is done by applying excellence to business and ethical management But it states that all revenue is allocated to continuing its social work. This not only places its social mission above economic goals, but it also makes them a mere instrument to achieving its social purpose.	

Source: Prepared by the author.

Table 9. Example of a solution to a social-environmental problem: Extremadura (I)

Special Employment Centers (SEC)	**Enterprise** Sercom
Pillar 2: Creation Of Economic Value As A Necessary Objective SERCOM, S.L. is a service enterprise that has inherited over 20 years of experience from its predecessor, the association APROSUBA 8. This SEC-type SE originally comes from the association APROSUBA 8 (A8). A8, a non-profit due to its private association status – *nonmarket* subsector-, was founded in 1977 with the mission that every person with disabilities and his or her family may develop their quality of life project. The change from association to SEC enabled it to achieve this goal more effectively by becoming an enterprise (se) engaged in maintenance and gardening activities, the sale of nursery plants, catering, cleaning and the retail sale of fruit, flowers and vegetables, various bookbinding and silk-screening tasks, the sale of work clothes and accessories, as well as any activity that may encourage social integration of people with disabilities. To that end, the great majority of its staff are people with physical, psychological or sensory disabilities. Business success has made it possible to extend the scope of its social success.

Table 10. Example of a solution to a social-environmental problem: Extremadura (III)

Social Innovation Enterprise (SIE)	**Enterprise** red calea para el desarrollo agroecológico
Pillar 3: Business Model RED CALEA: a commitment to consolidating the role of agroecology. Although it was born with the mission of strengthening agroecological production, its vision on how to do it is innovative as it is used as a tool for real sustainable development in rural areas based on social ecology criteria. Therefore, the network is made up of a team of people who work in collaboration with consumers, public administration, business and social entities that share their values and project ideas. In short, based on agroecology, they apply a business model developed from the following process: 1. **Strategic Thinking Model:** **a. Values:** Quality production and service by including professional attitudes, supportive human relationships and fair economic exchange while respecting the environment and contributing to rural development. **b. Mission:** Agroecology consolidation **c. Vision:** Agroecology goes beyond the mere productive process to include sustainable development of rural areas. 2. **Strategy:** This line of thought is executed by means of the following strategies: a. Considering that the enterprise's human capital is its most important factor. b. Offering comprehensive services in the enterprise. Specifically, working in the areas of production and sale of ecologic food, engineering, training, consulting and international cooperation. c. Applying innovation to all goods and services offered. To do so, they have a cross-sectional area that acts on the entire value chain: the area of research, dissemination and imagination R+D+i. i. Relying on mutual support provided by online collaboration. In addition to the partnership directly related with the enterprise's activity -the networks-, participating in creating alternative regional, national and international networks[7] aimed at developing a social fabric working to achieve agroecological rural development. ii. Increasing its scope of action. Considering that it is a comprehensive model that may be extrapolated, its work is carried out at the regional, border and international level through collaborating with other countries.

The EMES network approach, enhanced by the work of Defourny and Nyssens (2012), was openly adopted. The program for entrepreneurship and social innovation of Extremadura continues to explore some innovations in this area (description), an unfinished work.	It shares the definition but assigns less relevance to two aspects: 1- it operates in the market offering goods or/and services in a business fashion, 2- it is a flexible company in the sense that it adapts to economic and social changes	It confirms the limited nature of the social economy act: entrepreneurship is ahead of the law. Entrepreneurship and Social Innovation Program of Extremadura continues to explore some innovations in this area (typologies), an unfinished work.	No comment, so it is considered in agreement.

Chapter 14
Developing an Integration Framework for Crowdsourcing and Internet of Things With Applications for Disaster Response

Rameshwar Dubey
Symbiosis International University, India

ABSTRACT

The crowdsourcing and Internet of Things (IoT) have played a significant role in revolutionizing the information age. In response to pressing need, we have attempted to develop a theoretical framework which can help disaster relief workers to improve their coordination using valuable information derived using comprehensive crowdsourcing framework. In this study we have used two-prong research strategies. First we have conducted extensive review of articles published in reputable journals, magazines and blogs by eminent practitioners and policy makers followed by case studies: stampede in Godavari River at Rajahmundry (2015), earthquake in Nepal (2015), flood in Uttarakhand (2013). Finally we have concluded our research findings with further research directions.

INTRODUCTION

With the advent of computers (in1970's), World Wide Web (www) (in 1990's) and internet of things (IoT) (present), the global society has moved to the "information age". The information age offers huge information created due to convergence of internet of things and crowdsourcing which can offers huge opportunities in terms of predictive analytics and forecasting events which are highly unpredictable in nature. The proliferation of semiconductor devices and their applications coupled with the ease and speed of online dissemination enables people to both witness and documents the accidental or unexpected and has permanently changed the way we understand and respond to events around us (Tierney, 2014).

The Internet of Things (IoT) and Machine-to-Machine (M2M) communications connect millions of devices to generate data which is voluminous, high variety and high velocity. Johnson (2014) in one of his blogs has argued that to achieve high level of interconnectivity, the enterprises that depend on those machines need them to work reliably, securely, and cost-effectively – without human intervention. Thus in such case crowdsourcing could offer most efficient and reliable solutions. The word crowdsourcing has become quite popular lexicon in business dictionary. However the word crowdsourcing has been extensively used in various contexts in these days. There are multiple explanations to offer shape to the emerging context. However the common understanding related to crowd sourcing is deriving data from crowd who are quite active in digital space to get broader picture. Afuah and Tuci (2012) have attempted to provide an explanation related to crowdsourcing as a tool for solving complex firm related problems rather than relying on its own internal resources or contract to external partners like suppliers. Franzoni and Sauermann (2014) have further attempted to investigate the role of growing crowd science in open collaborative projects. Bloodgood (2013) in response to Afuah and Tuci (2012) work further suggested the need for capturing the value from crowdsourcing. Luttgens et al. (2014) have further attempted to identify the success factors behinds implementation of crowdsourcing and the barriers of the crowdsourcing initiatives. Chiu et al. (2014) have further to decision support systems literature by proposing a framework in which they have argued the role of crowdsourcing at various phases of decision making process.

Gao et al. (2011) have argued that how crowdsourcing applications based on social media applications such as Twitter and Ushahidi provide a powerful capability for collecting information from disaster scenes and visualizing data for relief decision making. Narvaez (2012) has argued that crowdsourcing can be effective in disaster preparedness if properly supported by better usage of technology. Sievers (2015) has further argued for embracing crowdsourcing as a strategy to address emergency planning by state and local governments. As we have noted that there is a rich body of literature on crowdsourcing and its application in disaster relief activities, research on crowdsourcing and IoT integration is scant. Santos et al. (2013) have argued that how IoT support responses to urban disasters. Tierney (2014) has further argued in the favour of crowdsourcing using social media platform to impact the disaster response. However, it is less understood from review of existing literature that how crowdsourcing can further support IoT to generate more reliable data which improve the efforts of disaster relief workers (i.e. disaster response). Hence in an attempt to answer our research objective, we posit some specific research questions as:

RQ1: What are the enablers of crowdsourcing which can guide disaster response?
RQ2: What are the enablers of IoT?
RQ3: How can crowdsourcing and IoT can be integrated?

The rest of the paper is organized as follows. The second section of the paper is devoted to classification of literature based on guiding research questions. The third section is devoted to research methodology. The fourth section is devoted to case analyses. The fifth section is devoted to discussions based on case analyses and theoretical framework. Finally we conclude our research and identified further research opportunities to advance the current research to next orbit.

RELATED RESEARCH

Crowdsourcing

Estelles-Arolas and Gonzalez-Ladron-de-Guevara (2012) have attempted to define crowdsourcing based on extensive literature review. They have attempted to establish some commonalities among existing definitions on crowdsourcing. The common characteristics which shape crowdsourcing definition are the crowd, the task at hand, the recompense obtained, the crowdsourcer or initiator of the crowdsourcing activity, what is obtained by them following the crowdsourcing process, the type of process and the call to participate. However we have also reviewed some of the important articles which have contributed to the crowdsourcing literature (see Howe, 2006 & 2008; Alonso et al. 2008; Brabham, 2008; Vukovics & Bartolini, 2010; Behrend et al. 2011; Armstrong et al. 2012; Franzoni & Sauermann, 2014). Tarrell et al. (2013) have attempted to provide a brief snapshot on the evolution of crowdsourcing based on 135 articles drawn from information sciences journals and other conference proceedings. Charalabidis et al. (2014) in their studies have attempted to develop a passive crowdsourcing framework for government agencies, exploiting the extensive political content continuously created in numerous Web 2.0 social media (e.g. political blogs and microblogs, news sharing sites and online forums) by citizens without government stimulation, to understand better their needs, issues, opinions, proposals and arguments concerning a particular domain of government activity or public policy based on Greece, Austria and UK users.

Crowdsourcing in Emergency

On the basis of preceding section discussions based on review of academic literature we can argue that crowdsourcing is a model that uses crowd knowledge and expertise to decisions which is quick and cheaper than any other sources of information. Rogstadius et al. (2013) have argued that use of SMS texting is one of the most robust forms of communication during disasters. During massive catastrophe (e.g. a 9.0 earthquake), electric wire cables get uprooted resulting into power failure hence most of the sensors which are supported by power may stop functioning but people continue to have reduced but useable access to SMS texting through their mobile devices. For example, though voice communication was lost on landlines and cellular lines in the recent earthquakes at various locations (e.g. Nepal, Christchurch, Japan, Haiti), SMS texting continued to be operational, making Twitter, with its SMS framework and GPS coordinates, a valuable disaster tool. Tierney (2014) has argued that in emergency situation, crowdsourcing describes a method of information collection that utilizes data received from volunteers to enable stakeholders to participate in disaster response through online forums, such as wikis and crisis mapping. In recent years the volunteers have exchanged views and opinion using social networking platform like Twitter which is one of the social networking service has played significant role in guiding response towards disasters. Tierney (2014) argued that information generated using social networking platform is automatically geotagged with longitude and latitude coordinates that is, in turn, processed onto a centralized map for public inspection and verification, serving as a source of information for relief operations. The social media has played significant role in recent days. Twitter feeds assisted in coordinating help, shelter, and food for the distressed. Mobile food truck drivers scrambled into operation, micro-blogging their locations while distributing provisions to the cold and famished (Tierney, 2014).

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

As microbloggers uploaded geotagged information, hybrid alliances formed between online platforms and offline places. An interactive crisis map of Manhattan with links to Facebook, Twitter, text, or email connected those in trouble with local evacuation centers and emergency shelters with real-time updates from the Red Cross, FEMA, and other municipal agencies. Narvaez (2012) has further argued that if information gathered using social networking platform is properly organized, then it is believed that crowdsourcing can offer better supports in terms of ground actions. Kawasaki et al. (2013) have further investigated the impacts of geospatial technological developments on disaster response. Houston et al. (2015) in their recent published work have made an attempt to study social media and its usage in disaster planning and preparedness.

From preceding discussions we can argue that crowdsourcing is people-driven programs, like information related to disaster affected places, traffic related information from thousands of commuters, and weathers related information, crowd behaviour at religious places or any large events.

Internet of Things (IoT)

Internet of Things (IoT) has attracted significant attentions from practitioners and academia. Xia et al. (2012) argued that IoT refers to the networked interconnection of everyday objects, which are often equipped with ubiquitous intelligence. Hence, IoT will increase the ubiquity of the Internet by integrating every object for interaction via embedded systems, which leads to a highly distributed network of devices communicating with human beings as well as other devices. The Internet of Things (IoT) connect millions of diverse machines over networks, the goal is to make the combination of those machines greater than the sum of each type and to provide people with greater information and insight as the ecosystem expands (Johnson, 2014). Da Xu et al. (2014) argued that to achieve high level of interconnectivity, businesses that depend on those machines need them to work reliably, securely, and cost-effectively – without human intervention. Johnson (2014) argues that in such case crowdsourcing can be high beneficial. Johnson (2014) further argues that crowdsourcing is often associated with crowd but however, once machines and sensors become connected, they can directly collaborate through data to provide a more comprehensive crowd-sourced view of a vast number of scenarios. Jian et al. (2015) further argues based on their research that various types of micro-sensors in smart communication devices can measure a significant amount of potentially useful information. Jian and colleagues further argues that mobile crowd sensing (MCS) between users with smart mobile devices is a new trend of development in IoT. With the powerful sensing capability of smart device and user mobility, various services could be provided by building a trusted chain between service requesters and suppliers (Yang et al. 2013). However, the research related to integration of crowdsourcing with IoT in context to emergency response is still underdeveloped.

METHODS

The preceding discussions surrounding literature may have provided some directions related to evolution of crowdsourcing practices and its perceived usefulness in emergency situation. However, the literature is incomplete and it is clear that crowdsourcing, IoT and its impact on disaster response need to be investigated to provide a clear understanding regarding what are the enablers of crowdsourcing, IoT and how the integration of independent source of data can help to improve disaster response. In the present study we have used case study approach as suggested by Eisenhardt (1989) in case of new topic

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

or emerging research areas like of ours. Pagell and Wu (2009) attempted to build comprehensive theory surrounding sustainable supply chains using case studies of ten exemplars organizations. Ketokivi and Choi (2014) have further noted that in recent years the case study approach has been mis-used due to lack of guiding framework. Hence in our present research we have adopted Ketokivi and Choi (2014) "case research decision tree". We first examined our research question using duality criterion (i.e. Can the empirical context and data ultimately lead to more general theoretical insight?). Hence, we felt "yes" thus we finally decided to use case study approach.

Sample

To answer our three fundamentals questions:

RQ1: What are enablers of crowdsourcing which can assist disaster response?
RQ2: What are the enablers of IoT?

To answer this fundamental research question we have identified three recent disasters occurred in India. First, we selected Nepal earthquake (2015), stampede in Godavari River at Rajahmundry (2015) and flood in Uttarakhand (2015). The data were collected between 2014 January to 2015 July. There are varied opinions regarding selection of number of cases in multiple case research studies. However in our research we reviewed Eisenhardt (1989) and Pagell and Wu (2009) suggests seven cases as the maximum that a person can mentally process. Yin (1994) and others are more circumspect in regards to hard numbers and instead suggest that data should be collected until saturation. In operations and supply chain management research there are numerous examples of multiple case study research using from three to eleven cases (e.g. Pagell, 2004; Wu & Choi, 2005; Matos & Hall, 2007; Pagell & Wu, 2009). We used three cases as we felt that we have enough data to process in one study.

We followed theoretical sampling approach (see, Eisenhardt, 1989; pagell & Wu, 2009) across different events occurred at three different places because social media has played significant role in guiding disaster relief team unlike a decade ago when SMS, Twitter and other social networking space were not popular.

Interview Protocol

As suggested by Eisenhardt (1989) and Pagell and Wu (2009) we have used semistructured interview protocol for two reasons. We had designed the sample to include disasters of different nature; hence the semistructured protocol has offered us immense flexibility to gather data related to crowdsourcing and use of IoT in disaster relief activities. Second, there was some theoretical underpinning for items included in the protocol as suggested by Kounelis et al. (2014), Afuah and Tuci (2012) and Brabham (2008).

Data Collection

Our research design was based on the recommendations of Eisenhardt (1989), Yin (1994) and Pagell and Wu (2009). The initial protocol called for interviews with senior members of disaster relief team who played significant role in each of these three events. We requested to interview:

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

- A senior member from Border Road Organisation (A body under Ministry of Defence).
- A senior member from a NGO.
- A senior member from local state government.
- A spoke person from the local team who were the first to reach to disaster affected place.

Our collection included multiple researchers, a taped and transcribed record of the conversations, multiple respondents, an opportunity to visit some of the locations at Nepal and Rajahmundry. We have used Triangulation approach to validate data. Triangulation involves combining observations from multiple researchers, data from multiple sources (in this study interview, and observational from the tours) to reduce biases and improve reliability and validity (Eisenhardt 1989; Yin 1994; Pagell & Wu, 2009).

Coding and Analysis

Miles and Huberman (1994) have argued that only following Triangulation of data may not be sufficient enough to prevent biases. In such cases the coding and final model building should happen after the data is completely collected. Hence we strictly followed the instructions as suggested by (Miles & Huberman, 1994; Pagell & Wu, 2009). We have finally performed coding using multiple iterative processes. Coding was done to identify the enablers of crowdsourcing and IoT in disaster relief process. We have identified some of the enablers through literature review but we have also included some others enablers which were unique but not captured by the literature. We used within case analysis and cross case analysis as suggested by Pagell and Wu (2009). The enablers were presented in Table 1 and Table 2 as:

CONCLUSION

Our analysis suggests that the enablers of crowdsourcing which enhances the response of disaster relief teams are equal parts of the enablers which are reported in prior literature and some new enablers. Our findings are summarized in the Figure 1.

The model (CS-IoT) is based on analysis using three case studies which we have included in our research based on Ketokivi and Choi (2014) guidelines for case analysis. Literature indicates that social

Table 1. Enablers of crowdsourcing previously identified in literature

Enablers	Previously Linked to Crowdsourcing	Uttarakhand Flood (2013)	Nepal Earthquake (2015)	Stampede at Rajahmundry (2015)

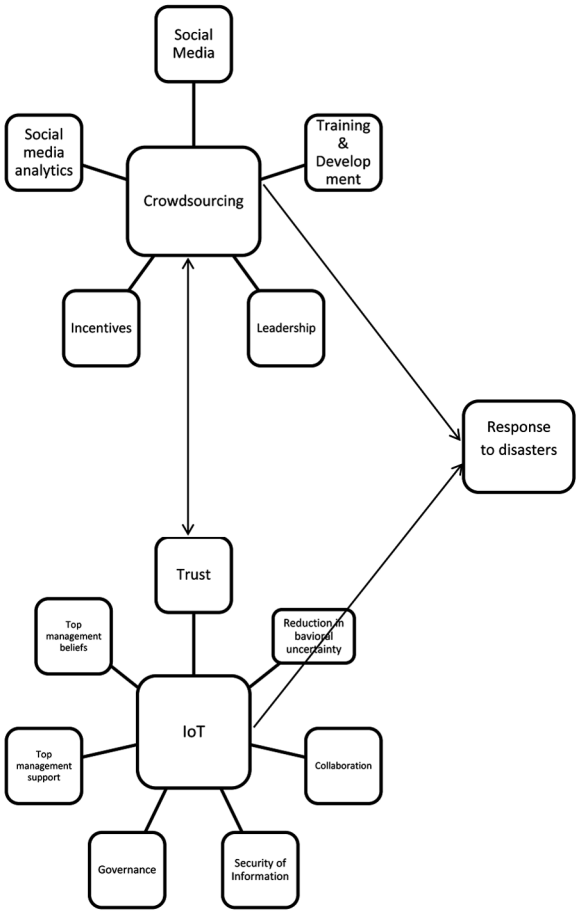
Figure 1. CS-IoT model



EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

media, social media analytics and incentives to the volunteer have significant influence on the data collected using crowdsourcing. However our case analysis further conform the literature and further identifies that training and development and leadership styles have significant influence on the volume, variety, velocity, veracity and value of the data. Our analysis further suggests that IoT can be exploited in most beneficial way if trust between IoT and human can be established. It has been identified that collaboration among humanitarian supply chain network partners have strong influence on IoT performance which is not well argued in existing literature. Our analysis further suggests that reduction in behavioural uncertainty among the partners will further help to build effective coordination. Hence our analysis using three case studies helps to explore some interesting insights which current literature failed to reflect. The present study can be largely benefitted if the integrated framework (CS-IoT) can be empirically tested using longitudinal data.

Chapter 15
Industrial Guidelines for Stimulating Entrepreneurship With the Internet of Things

Mohammad Zarei
University of Tehran, Iran

Ahmad Jamalian
University of Mazandaran, Iran

Rohollah Ghasemi
University of Tehran, Iran

ABSTRACT

Entrepreneurs are known as the engine of economic growth and prosperity. Entrepreneurs have relocated resources for the aim of introducing new economic, social, or socio-economic values. Revolutionary technologies such as the Internet of Things (IoT) have provided opportunities for entrepreneurs. The IoT is globally known as a new paradigm that rose from the world of ICT and changed dynamics of businesses and communities. However, there has been a lack of guidelines for promoting entrepreneurial initiatives by using of the IoT in industries. By conducting a comprehensive investigation of more than 120 commercialised IoT-based cases, this chapter identified 80 opportunity areas, and categorised them into the 13 main industries/sectors. Analysing 29 Iranian corporate, social, and SME entrepreneurs with the use of Analytic Hierarchy Process (AHP) technique, this chapter measured the importance of each industry. Based on the results, this chapter presents recommendations to promote entrepreneurial activities.

INTRODUCTION

The IoT is a paradigm that aims at enhancing our awareness of the environment. The IoT is not in infancy anymore and it has been adopted rapidly by many industries. For example, the IoT has played a significant role in the transportation sector with several capabilities such as navigation, vehicle to vehicle connections, fleet management, vehicle controls, and infrastructure monitoring. The IoT has

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

also been a great source of improvement for the supply chain partners. Real-time monitoring and tracking has improved visibility of material flows and facilitated collaborative activities of the supply chain partners. In addition to the positive impact on the established businesses, the IoT can be a great source of innovation for entrepreneurs.

Entrepreneurs aim to create new values by identifying unexploited opportunities and relocating the resources to achieve a higher level of productivity. One of the bottlenecks for having a successful entrepreneurial process is opportunity recognition (Jones & Butler, 1992; Kirzner, 1985). Recognising the valuable opportunities with a high ability or potential of commercialisation is crucial for all kinds of entrepreneurship. In spite of the significant implications of the IoT on the entrepreneurship, there have been few guidelines for entrepreneurs to exploit the IoT. The purpose of our study is to provide evidence-based guidelines to stimulate entrepreneurship with the IoT. To achieve our purpose, entrepreneurial opportunities of the IoT were identified by conducting a survey and analysing a number of industrial IoT adoption cases.

The remaining parts of this chapter are as follows: first the literature review of the definition, challenges and economics of the IoT is presented. Next, corporate entrepreneurship, social entrepreneurship, and small and medium-sized (SME) entrepreneurship are discussed. Then, the research methodology and the Analytic Hierarchy Process (AHP) model are elaborated. Finally, the research findings and various challenges are discussed.

LITERATURE REVIEW

Definition of the IoT

Atzori et al. (2010) discuss the very first definition of the IoT as a things oriented concept which includes Radio-Frequency IDentifications (RFIDs) tags and smart devices. Jara et al. (2011) suggest the IoT has an ability to provide a global connectivity and a management architecture of several devices. Vermesan et al. (2011) describe the IoT as an integrated part of the Future Internet with the capability of self-configuration. Xu et al. (2014) refer to the IoT as a dynamic global network infrastructure based on the protocols where virtual and physical things such as sensors and RFIDs have identities, and can be integrated in the information network. Gubbi et al. (2013) depict the IoT as an infrastructure for enabling the innovative applications by connecting devices from different platforms through a unified framework. Some components are large scale ubiquitous sensing, data analytics, and cloud computing. Wu et al. (2014) refer to the IoT as a new network paradigm and interconnected physical/virtual things with the minimum intervention of humans that pursue two main goals: 1) bridging the physical and the social world together to form an intelligent physical-cyber-social system, and 2) enabling smartness – from resource allocation to automatic network operations. Vermesan (2013) believes that, the full use of things will be attained by offering several distinguished services.

The IoT in Industries and Its Applications

Several industries/sectors which adopted the IoT have been mentioned by various IoT studies: Healthcare and life science (Al-Turjman et al., 2013; Atzori et al., 2014; Gubbi et al., 2013; Perera et al., 2014; Zheng et al., 2011); Transportation (Xu et al., 2014; He et al., 2014; Kortuem et al., 2010; Vermesan et

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

al., 2013; Zheng et al., 2011); Environment (Chui et al., 2010; Da Xu et al., 2014; Miorandi et al., 2012; Tsai et al., 2014; Zheng et al., 2011), Accommodation (Akyildiz et al., 2002; Atzori et al., 2010; Xu et al., 2014; Kortuem et al., 2010; Perera et al., 2014); Retail (Chui et al., 2010; Konomi & Roussos, 2007; Thiesse & Köhler, 2008), Industrial production (Xu et al., 2014; Gluhak et al., 2011; Vermesan et al., 2013); Energy (Gubbi et al., 2013; Miorandi et al., 2012; Perera et al., 2014; Vermesan et al., 2013); Government (Miorandi et al., 2012; Tsai et al., 2014); ICT (Chui et al., 2010; Vermesan et al., 2011); Military (Akyildiz et al., 2002; Vermesan et al., 2013; Xu, 2002). Zarei et al. (2016) based on the Iranian "1404 economic outlook" prioritised five industries/sectors: Healthcare, Transportation, Smart home, Energy, and Retailing for the aim of achieving sustainable development by the country. They argue that the IoT brings continuous social, environmental, and economic progress, and introduced the term of "sustainable IoT".

Except a few studies such as Vermesan et al. (2013), most previous studies have two main issues: firstly, they have generally mentioned IoT applications based on their imaginations not commercialised samples. Secondly, most studies discussed the IoT from a technical perspective. Our study tries to address these issues.

In the past few years various IoT products and services from several industries have been successfully launched and introduced to the market. For developing an industrial guideline for entrepreneurs and classifying the most active industries in the field of the IoT, we applied a bottom-up approach; we reviewed the commercialised/launched IoT products and services from various industries around the globe by surveying almost 147 cases. At the same time, we categorised the commercialised samples into 80 main groups, as is shown in Table 1, that are called "recognised opportunity areas". For categorising "recognised/ commercialised samples" into "recognised opportunity areas" as is shown in Table 2, we applied a grounded theory methodology (GTM). In our study, only the first round of coding has been used. The GTM method was developed by Glaser and Strauss (1967).

Table 1. Recognised, industry/sector and opportunity areas based on IoT

Industry and/or Sector	Recognised Opportunity Areas	Recognised/Commercialised Samples
Accommodation and Residence	7	15

Limiting Factors to the IoT

In spite of the growing interest in the application of the IoT in industries, the IoT industry struggles with some challenges. IoT challenges are far greater to be tackled by individual companies. As a result, various international associations, societies, strategic alliances and jointly research projects, and research clusters around the world have collaborate to address the IoT challenges. Some of these groups are: European Research Cluster on the Internet of Things (IERC), Global System for Mobile communication (GSM) Association, Organisation for Economic Co-operation and Development (OECD), and METIS consortium that has collected more than 29 global partners including manufacturers, telecommunication operators, and academic institutions.

Some of the IoT challenges discussed by Weber (2009) include: control, data protection, identity management, interoperability, naming, privacy, security, and standardisation. Privacy, security, and trust are among important challenges for context-aware computing (Perera et al., 2014). The European Consumer Voice in Standardisation (ANEC) and BEUC have supported the commission for improving the

Table 3. Place and/or location

Abbreviation	Extended Meaning

C	Company, corporate, and/or SME
D	Place and/or location

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

current situation in term of security (Weber, 2009). Governance is another challenge for implementing of an international network infrastructures. On top of the above-mentioned challenges, there have been several other technical complications (e.g., the heterogeneity of devices or the IoT).

Another challenge in the IoT is related to the market size of the IoT, because still the market size and even revenue for the IoT products and services are vague at best. Without having a clear prediction of the market size no company is able to invest in the IoT with confidence. A number of companies and market research institutes such as Cisco, Gartner, Markets and Markets, IDG Enterprise, and TCS have predicted revenues of the IoT. For instance, Blanter and Holman (2014) announced the $3.5 trillion revenue by 2020; TCS (2016) predicted $7.1 trillion by 2020; Statista (2016) announces $1.7 trillion by 2019; Grand View Research (2016) declares $1.88 trillion until 2022. However, the measurements have not been standardised (e.g., smart phones and the other time microprocessors have been included in some predictions, but not included in other predictions).

ENTREPRENEURSHIP

Entrepreneurship is an old concept with more than 250 years of history (Austin et al., 2006). The term has rooted in the fields of economics, sociology, psychology, and management. Entrepreneurialism is a school, an approach, a concept, and a collection of thoughts that has at any time or shape sought to bring novel values – economic, social, or both. Based on the targeted market which an entrepreneur has decided to create value for, entrepreneurs can be divided into three main categories: corporate entrepreneurs, social entrepreneurs and SME entrepreneurs. Attributes of entrepreneurship include opportunity recognition, innovation, commercialisation, and risk taking.

Entrepreneurialism literature can be divided into two dominant group of investigations. First, cognitivism or ontology studies that aim to draw a comprehensive view of the field by discussing its components and branches. These kinds of studies are rare but valuable (Jones et al. (2011). The second group can be known as exploratory studies which a researcher by conducting a qualitative, quantitative or mixed methods aims to investigate the relationships between two or more dimensions or aims to explore an unseen effect; such as the relationship between corporate entrepreneurship and firm performance, or the effect of pure social capitals on entrepreneurial networks and launching a business. In the following sections, several types of entrepreneurship will be briefly discussed.

Corporate Entrepreneurship

Corporate entrepreneurship is studied in the context of an established business (Antoncic & Hisrich, 2004; Biniari, 2012; Ferreira, 2001; Kuratko et al., 1993; Shepherd et al., 2009; Zahra, 1991). During a corporate entrepreneurship process a corporate entrepreneur aims to bring innovation into the organisation by renewing strategies, increasing the competitiveness, introducing, or opening-up a new market, product, and service. in this regard, Lumpkin and Dess (1996) refer to corporate entrepreneurship as an organisational process that contributes to the firms' survival and performance.

Castrogiovanni et al. (2011) express corporate entrepreneurship as a set of activities which an organisation undertakes to enhance its product and process innovations, risk-taking and pro-active responses to the environmental forces. Miles et al. (2003) clarify the corporate entrepreneurship as activities that are designed [within an established organisation] to capture a unique business opportunity. Antoncic

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

and Zorn (2004) by examining sample of 477 Slovenian established firms and investigating process innovativeness, new venture formation, organisational support and etc. show that corporate entrepreneurs have had a significant role on organisational performance. Furthermore, the authors argue that corporate entrepreneurs have had an important influence on organisational performance, economic development, wealth creation, developing of new products, services, technologies, administrative techniques, strategies and competitive, process innovation. One of the main features of corporate entrepreneurs is opportunity recognition (Jones & Butler, 1992).

Social Entrepreneurship

The number of non-profit organisations in the recent years has been increasing steadily. Some of these non-profit organisations are social entrepreneurs. The main driver for social entrepreneurs is to solve social problem (Austin et al., 2006), and simultaneously generating wealth for their stakeholders. However social entrepreneurship has not been adequately explored (Austin et al., 2006). Social entrepreneurship is a nascent but important subject for societies because of its contribution to societies, so there has been an increasing interest in the domain during the recent years (Rey-Martí et al. 2016). The apparent form of social entrepreneurship can be discussed in the context of society. Austin et al. (2006) discuss that the term has been used in different backgrounds such as society, corporate, non-profit sector, governmental or even across sectors.

SME Entrepreneurship

The ability of governments to recruit individuals and establishing businesses for the citizens are extremely limited by global phenomena such as decentralisation and privatisation. As a result, individuals have to find out solutions to create job by and for themselves, and nascent businesses have been launched by individual/business/SME entrepreneurs around the world. Haltiwanger et al. (2013) argue that young firms and start-ups are known as the important sources of job creations. SME entrepreneurs have been known as a great source of economic development. Mazanai and Fatoki (2012) discuss the SMEs as the spine of economic welfare, and Lin (1998) labels the SMEs as one of the main economic progress engines. SME entrepreneurship is frequently discussed as the act of starting a new business and to some extent such entrepreneurs can be recognised by their start-ups (e.g., see Liñán, 2008; Liñán and Chen, 2009).

Other Kinds of Entrepreneurship

Entrepreneurship in the broad point of view has not been limited to the corporate, social, and SME entrepreneurship and there have been several other kinds of entrepreneurship.

International Entrepreneurship

McDougall (1989) refers to International entrepreneurship as the expansion of new international ventures or start-up in a new international market. Some businesses have been born as international, and others been launched in a domestic market and after a while export their products/services into the international market. The contributor to such international businesses can be known as international entrepreneurs. These kinds of entrepreneurial activities are commonly discussed in the context of Internationalisation.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

For the aim of investigating and fostering the internationalisations, several models have been developed including Foreign direct investment (FDI)-expansion model, Innovation-related models, Internalisation model, Product cycle model, Structural model, and Uppsala internationalisation models (Cuervo-Cazurra & Ramos, 2005, p.111).

Government Entrepreneurship

The function of government entrepreneurship is somehow distinguished from other types of entrepreneurship, since, this type of entrepreneurship aims to develop a supportive business ecosystem for the aim of supporting entrepreneurs, and this aim can be achieved by tools such as legislations and implementation of supportive policies. Yu (2001) discuses when the private sector fails to respond properly, the government entrepreneurship can be important – e.g., in the times of recession. Government entrepreneurship is not limited to the governments and is used for the individuals as well. For instance, Purwaningsih (2015) alludes to the Prime Minister of Singapore as a government entrepreneur, and the author argues a government entrepreneur as a leader who has the skills and spirit of entrepreneurship.

High-Tech Entrepreneurship

Lin et al. (2006) describe a high-tech entrepreneurship as a complex phenomenon with a variety of factors such as entrepreneurial strategies and societal contexts. Some of these factors interrelated with each other. Due to the state of the art technologies used by high-tech entrepreneurs, this type of entrepreneurship is limited to those who have fairly good academic background in high-tech fields (e.g., nanotechnology or the IoT). Because of the high rate of technological changes these entrepreneurs have been faced with the high rate of failure (Lasch, 2011). However, entrepreneurial failure rate is generally high (Jing et al., 2016). In addition, high-tech entrepreneurs should keep themselves up with what is the most recent in their field. It is worth mentioning that developing high-tech entrepreneurship relies on the research and development capabilities (Zhou & Peng, 2008).

RESEARCH METHODOLOGY

The aim of this study is to provide guidelines for entrepreneurs to create value from the IoT. The preferences of entrepreneurs toward each of 13 industries/sectors industry/sector are assessed and ranked. We identified the corporate entrepreneurs based on the Castrogiovanni et al. (2011) and Miles et al. (2003); Social entrepreneurs were chosen from the Austin et al. (2006) definition of the term; and finally, SME entrepreneurs were selected from those who successfully launched their businesses during the past three years.

Determining samples for the three types of entrepreneurs was a challenging and time-consuming job. In this study, snowball sampling was used. As Heckathorn (2002) discusses, snowball sampling or chain sampling is a non-probability sampling that is appropriate for identifying the hidden populations. By deploying Snowball sampling 35 entrepreneurs were identified - 11 of them were corporate entrepreneurs, 12 social entrepreneurs; and 12 SME entrepreneurs. To prioritise industries/sectors, Analytic Hierarchy Process (AHP) was used.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Analytic Hierarchy Process (AHP)

The AHP is coined by Saaty and widely known as a method for multi-criteria decision support (Durbach et al., 2014). AHP is a technique for decision-making that is widely manipulated for assessing typically multiple conflicting criteria. The technique also has been used for determining the performance of each alternative (Abdullah & Najib, 2014). AHP as a multiple criteria decision-making tool is an Eigen value method for the pair-wise comparisons. The range of the scale could be from 1 to 9; that 1 is used for equal, and 9 for absolutely more central ones (Vaidya & Kumar, 2006). Cay and Uyan (2013) describe the main steps of AHP as follows:

- A (n × n) pairwise comparison matrix should be created. The sample of such matrix is drawn below:

$$A = \begin{bmatrix} a_{11} & a_{12} & \cdots & a_{1n} \\ a_{21} & a_{22} & \cdots & a_{2n} \\ \vdots & \vdots & \vdots & \vdots \\ a_{n1} & a_{n2} & \cdots & a_{nn} \end{bmatrix} \quad (1)$$

The a_{ij} specifies to what extent important the i^{th} objective is with regards to the j^{th} objective. It is necessary for all *i* as well as *j*, that a_{ii} equals to 1 and a_{ij} equals $1/a_{ji}$. As Table 4 shows, for evaluating the value of a_{ij} the pairwise comparison matrix can be used.

Intermediate Values

- Then, each value in column *j* should be divided by the total values of the column j. As a result, a new A_w matrix will be generated, so the normalised pairwise comparison matrix is found, as shown below:

Table 4. AHP evaluation scale

Numerical Value of aij	**1**	**3**	**5**	**7**	**9**	**2, 4, 6, 8**
Definition	Equal importance of i over j	Moderate importance of i over j	Strong importance of i over j	Very strong importance of i over j	Extreme importance of i over j	Intermediate values

Cay & Uyan, 2013.

Table 5. RI table values

n	1	2	3	4	5	6	7	8	9	10	11	12	13
RI	0.00	0.00	0.58	0.90	1.12	1.24	1.32	1.41	1.45	1.49	1.51	1.48	1.56

Yavuz et al., 2008.

Table 6. The achieved weights and ranks by industries/sectors

Industries/Sectors	Corporate Entrepreneurship		Social Entrepreneurship		SME Entrepreneurship	
	Weights	Ranks	Weights	Ranks	Weights	Ranks
Accommodation and Residence	0.031	12	0.042	9	0.181	**1**
Agriculture and Animal Husbandry	0.029	10	0.088	5	0.047	9
Energy	0.145	**3**	0.031	11	0.045	10
Enterprise, Manufacture, Production	0.171	**1**	0.033	10	0.065	8
Entertainment, Media, Recreation and Sports	0.041	8	0.055	6	0.120	**2**
Environment	0.018	13	0.228	**1**	0.040	12
Finance and Insurance	0.066	6	0.028	12	0.074	6
Healthcare and Life Science	0.051	7	0.137	**3**	0.091	4
Information and Communication Technology (ICT)	0.128	4	0.043	8	0.105	**3**
Military and Defence	0.088	5	0.027	13	0.040	11
Public Administration, Governmental and Public Safety	0.029	11	0.150	**2**	0.035	13
Research and Education	0.037	9	0.089	4	0.087	5
Transportation and Retail	0.165	**2**	0.050	7	0.070	7

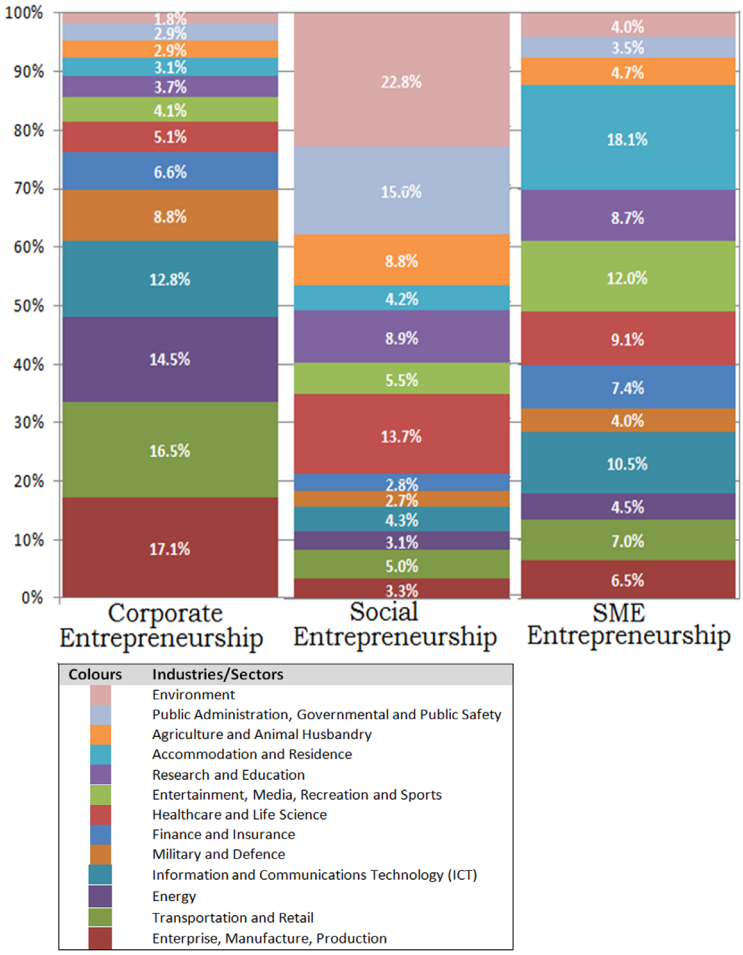
$$A_w = \begin{bmatrix} \frac{a_{11}}{\sum a_{i1}} & \frac{a_{12}}{\sum a_{i2}} & \cdots & \frac{a_{in}}{\sum a_{in}} \\ \cdots & \cdots & \cdots & \cdots \\ \cdots & \cdots & \cdots & \cdots \\ \frac{a_{n1}}{\sum a_{i1}} & \frac{a_{n2}}{\sum a_{i2}} & \cdots & \frac{a_{nn}}{\sum a_{in}} \end{bmatrix} \tag{2}$$

- Then we calculated c_i as the mean of the values in the row of i of A_w matrix to generate the column vector C. Furthermore, c_i value displays the relative degree of weight of the i[th] objectives.

$$C = \begin{bmatrix} c_1 \\ c_2 \\ \vdots \\ c_n \end{bmatrix} = \begin{bmatrix} \frac{\frac{a_{11}}{\sum a_{i1}}}{n} + & \frac{\frac{a_{12}}{\sum a_{i2}}}{n} + & \cdots & + \frac{\frac{a_{in}}{\sum a_{in}}}{n} \\ \cdots & \cdots & \cdots & \cdots \\ \cdots & \cdots & \cdots & \cdots \\ \frac{\frac{a_{n1}}{\sum a_{i1}}}{n} + & \frac{\frac{a_{n2}}{\sum a_{i2}}}{n} + & \cdots & + \frac{\frac{a_{nn}}{\sum a_{in}}}{n} \end{bmatrix} \tag{3}$$

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 1.



- For the aim of assessing the consistency of the weight values (c_i), first the A×C matrix should be calculated. The sample of A×C matrix is drawn below. for calculating the x_i, the A matrix should be multiplied at C matrix.

$$A \times C = \begin{bmatrix} a_{11} & a_{12} & \cdots & a_{1n} \\ a_{21} & a_{22} & \cdots & a_{2n} \\ \vdots & \vdots & \vdots & \vdots \\ a_{n1} & a_{n2} & \cdots & a_{nn} \end{bmatrix} \times \begin{bmatrix} c_1 \\ c_2 \\ \vdots \\ c_n \end{bmatrix} = \begin{bmatrix} x_1 \\ x_2 \\ \vdots \\ x_n \end{bmatrix} \tag{4}$$

After achieving the A×C matrix the λ_{max} by using of the following formula is calculated:

$$\lambda_{\max} = \frac{1}{n} \sum_{i=1}^{n} \frac{x_i}{c_i} \tag{5}$$

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

By calculating the λ_{max}, the Consistency Index (CI) can be considered according to the following formula:

$$CI = \frac{\lambda_{\max} - n}{n - 1} \tag{6}$$

- In the final step, to make sure about consistency of the pairwise comparison matrix the consistency has to be checked. For this, CR can be calculated based on the following formula. CR is known as Consistency Rate.

$$CR = \frac{CI}{RI} \tag{7}$$

Because of the number of the criteria – 13 industries/sectors – that have been used in this research we had to follow the RI table values of Yavuz et al. (2008), that is drawn in Table 5, and also it is noted that all of the RI values are developed based on the Saaty (1990) consumptions of AHP.

Data Collection and Analysis

By snowball sampling a total of 35 entrepreneurs were identified. For corporate entrepreneurship, the total of 7 questionnaires were collected, for social entrepreneurship the total of 8 questionnaires collected, and for the SME entrepreneurship 9 questionnaires were gathered for analysis (the total of 24 collected questionnaires). The other 11 entrepreneurs' questionnaires were discarded because of the unfilled and inappropriate co-operation with the researchers. Also based on the group aggregation procedures a geometric mean has been used. As mentioned, the Consistency Rate for the pair-wise comparison matrixes should be lower than 0.1. These rates for corporate entrepreneurship, social entrepreneurship, and SME entrepreneurship were 0.0767; 0.0305; 0.0952, respectively. Table 6 shows the achieved weights and ranks by industries/sectors for each entrepreneurship.

The cylinder chart of the achieved ranks and weights for each industry/sector based on the three types of entrepreneurship are presented in Figure 1.

DISCUSSION AND CONCLUSION

Corporate Entrepreneurs

Our results show that corporate entrepreneurs have ranked the industries/sectors as follows: 1) Enterprise, Manufacture, Production, 2) Transportation and Retail, 3) Energy, and 4) Information and Communication Technology (ICT). These industries/sectors need a heavy financial investment and strong R&D units, which are completely congruent with the nature of corporate entrepreneurship.

On the one hand, corporate entrepreneurs are among the real assets of organisations. On the other hand, they have simply been affected from the organisational culture and social capital of organisations.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

As a result, those organisations which try to be the pioneer of a IoT market have to promote entrepreneurial culture through various ways (e.g., encouraging employees to be aware about the abilities and applications of the IoT). In this regard, developing an appropriate rewarding system is important as well.

Resource availability has been known to positively influence a firm's entrepreneurial activities within the R&D units. Thus, corporate entrepreneurs should be given an opportunity to act entrepreneurially by experimenting and launching IoT prototypes in the market.

Social Entrepreneurs

Social entrepreneurs have ranked the industries/sectors as follows: 1) Environment, 2) Public Administration, Governmental and Public Safety, and 3) Healthcare and Life Science. These industries/sectors need high level of social capitals and really make sense with the nature of social entrepreneurship, since they have been among the best sources of social ventures. Social capital has had an important role for all kinds of entrepreneurship, especially for social entrepreneurs, due to the fact that their social missions are deeply rooted in their social and cultural background. To gain these capitals, broadening the entrepreneurial networks can be proposed as a strategy. These networks can even be a great source of crowdfunding.

SME Entrepreneurs

SME entrepreneurs have ranked the industries/sectors as follows: 1) Accommodation and Residence, 2) Entertainment, Media, Recreation and Sports, and 3) Information and Communications Technology (ICT). Smartness is one of the main features of the IoT in accommodation and residence sector. Developing smart home applications can be a good investment for an SME.

In this study, we examined Iranian entrepreneurs and Iran is known as a transition economy. The entrepreneurial reactions toward new technologies can vary from one economy to another. Global Entrepreneurship Monitor (GEM) declares that it is not applicable to deliver one specific prescriptive policy to all regions in term of promoting entrepreneurship (Kelley et al., 2011). Etemad (1999) argues in developing countries such as Iran low protections have been received by SMEs from governments. Our study needs to be extended to the other countries such as the innovation-driven ones to generalise our findings.

In spite of the relative maturity of the IoT in the developed world, the Iranian IoT is still in infancy. According to the Moore's (1993) evolutionary stages of business ecosystems, it can be argued that the Iranian IoT-business ecosystem is in the stages between birth and expansion. The Iranian entrepreneurs who have wanted to generate value from the IoT should take the following challenges into account.

In the birth and expansion stages of the IoT-business ecosystem they have two main challenges, which are cooperative and competitive challenges.

- In the birth stage of the IoT-business ecosystem entrepreneurs have to "Work with customers and suppliers to define the new value proposition around a seed innovation." To overcome cooperative challenges, entrepreneurs have to "Protect your [their] ideas from others who might be working toward defining similar offers. Tie up critical lead customers, key suppliers, and important channels." (Moore, 1993).

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

- In the expansion stage of the IoT-business ecosystem entrepreneurs have to "Bring the new offer to a large market by working with suppliers and partners to scale up supply and to achieve maximum market coverage." To overcome competitive challenges, entrepreneurs have to "Defeat alternative implementations of similar ideas. Ensure that your approach is the market standard in its class through dominating key market segments." (Moore, 1993).

KEY TERMS AND DEFINITIONS

Analytic Hierarchy Process (AHP): A method for multi-criteria decision support and a technique for decision-making that is widely applied for assessing typically multiple conflicting criteria and determining the performance of each alternative.

Corporate Entrepreneurship: A corporate process that aims to increase innovation and performance of an established organisation through various ways and techniques such as: renewing strategies, increasing the competitiveness; finding new raw materials, improving the processes, exploring a new market, starting-up a spin-off, etc.

Internet of Things (IoT): A technological paradigm that aims to grow our knowledge from our business environments, by gathering and computing data through heterogeneous and unique embedded devices on various networks.

IoT-Business Ecosystem: An advanced cross-industry interactions, exchanges, and networks among all the actors of IoT value chain consist of suppliers, producers, and competitors.

SME Entrepreneurship: SME entrepreneurship is known as a kind of entrepreneurship that is frequently discussed as the act of starting a new business. All entrepreneurial start-ups to some extent have developed under uncertainty and some other limitations.

Social Entrepreneurship: A kind of entrepreneurship that concentrates on solving social problems and generating economic values simultaneously.

Chapter 16
Innovation, Sustainability, and Organizational Change in a Social Portuguese Organization:
A Strategic Management Perspective

Fernando Barbosa
University of Minho, Portugal

Fernando Romero
University of Minho, Portugal

Jorge Cunha
University of Minho, Portugal

ABSTRACT

Social economy has been a prominent topic among scholars, politicians, and practitioners. Social economy organizations are mission-driven with the purpose of creating social value, overcoming a social problem, and contributing to attain sustainable social development. In this chapter, a particular weakness underlying those organizations is addressed: lack of managerial skills and the importance of a well-structured process of strategic management and organizational innovation. Based on the analysis of a Portuguese case study, the goal is to increase the knowledge on the facilitating factors and barriers to the improvement of the quality of service and the efficiency of the management of a social economy organization, in order to understand how it creates and delivers social value and ensures its future sustainability. The findings highlight a number of best practices in the design of a structured innovation process which were supported by the Portuguese program Q3-qualifying the third sector, which may help similar organizations to improve their innovation and organizational processes.

INTRODUCTION

The concept of social economy has been a highly prominent topic among scholars, politicians and practitioners (Spear, 2013). However, there is no widely agreed definition of that concept (Noya & Clarence, 2007). As a working definition, social economy is understood in this chapter as integrating the set of activities with social and economic expression, managed by non-profit entities and aimed at satisfying needs not met by market mechanisms (Borzaga & Tortia, 2007). Within this context, organizations belonging to the social economy are mission driven organizations with a social purpose, since they try to meet a social need or tackle a social problem (Millar & Hall, 2013). Social economy organizations do not belong either to the public or the private sectors, they develop their activities within the economy as a whole, forming a third sector, whose role is to provide services that address social needs that are not served by the state or the market. Social economy organizations are characterized by democratic and participative decision-making processes, and profits are employed to expand the organization and improve its services to its members and to society (Bastida, Marimon & Tanganelli, 2017). In this way, they differ from the organizations of the business (or market) sector, which are profit-maximization oriented. Social economy organizations have grown in number and relevance, contributing to employment, social inclusion, democratic participation and community building (Noya & Clarence, 2007) and they have focused, particularly, on improving social cohesion, on achieving sustainable development, on protecting the environment and consumers, and enhancing/complementing social security policies (Monzon & Chaves, 2008). Examples of social economy organizations are (Pérez & Perdomo, 2017): cooperatives; mutual associations; foundations; philanthropies; social enterprises; holy house of mercy; and private social solidarity institutions.

The importance of the social economy in the overall economic context of a country is increasingly recognized (Bastida, Marimon & Tanganelli, 2017). For example, the European Commission highlights that a "significant proportion of Europe's economy is intended to make profits for people other than investors or owners." (European Commission, https://ec.europa.eu/growth/sectors/social-economy_en). In Europe, there are 2 million social economy organizations, contributing to about 10% of the output of the European business sector, with a share of about 6% in total employment (about 11 million people), revealing an industry that will be called to give a greater contribution to the current problems of unemployment and social cohesion due to the social and economic transformation under way. In the particular case of Portugal, this sector has a dimension as large as or more important than other traditional sectors of the economy, not only for the universe of 55,000 organizations that constitute it, for the 227,000 people it employs, but also for being responsible for 5.5% of national paid employment and 2.8% of gross value added (Decree-Law no. 172-A / 2014).

The main sources of funding for social economy organizations are (Dragan & Popa, 2017): public funds; private sources; revenues from the sale of goods and services and user contributions. However, it should be noted that, especially, for those organizations that are primarily aimed at responding more directly to the satisfaction of social needs, public funding is the major source of funds (López-Arceiz, Bellostas & Rivera-Torres, 2017). It is, however, imperative that these organizations move towards ensuring the conditions for greater financial autonomy.

In spite of the growing importance of the social economy, research on the phenomena of the Social Economy still lacks in many respects, concerning, for example, its role in the development of local, regional and national competitiveness (López-Arceiz, Bellostas & Rivera-Torres, 2017). There is a lack of

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

methodologies, tools and indicators appropriate to the social economy, which allow the reconciliation of the satisfaction of basic needs with the optimization of economic and social value (Granados, Mohamed & Hlupic, 2017). This could be caused by the complexity and diversity of the organizations, on one hand, which is a barrier to their comparability, and on the other hand, to their late and recent recognition on the production/provision of public services. Changes on public policies, the economic and financial crisis, the spread of unemployment and poverty, brings to the light the importance of these organizations (López-Arceiz, Bellostas & Rivera-Torres, 2017), which are ceasing to be residual in economic terms, and are becoming, alongside the State and the Market, a mainstay of the economy (Veltmeyer, 2017).

In this chapter, we focus on a particular weakness found in several social economy organizations (Cardoso, Meireles & Peralta, 2012): lack of entrepreneurial skills and the fact that social organizations managers and/or starting social entrepreneurs must be aware of the importance of a well-structured process of strategic management and innovation, in order to understand how the organization creates and delivers social value. This is an important research topic since it is in the social economy organizations that the greatest capacity to respond to new social and societal challenges can be found (Chaves & Sajardo-Moreno, 2004), by innovating, advancing, and pooling resources and wills, particularly in areas where addressing increasing inequalities, social exclusion and poverty require solidarity solutions and mobilization of the community (Kerlin, 2006).

The aim of this chapter is to contribute to the empirical literature on the organizational sustainability of social economy organizations, based on the analysis of a Portuguese case study. Specifically, in this case study we look at the process of organizational change and innovation in a non-profit institution (the Luis Bernardo de Almeida Foundation, LBAF). Departing from a review of concepts related to social economy and to strategic management and innovation in social mission organizations, an analytic framework to be used in the analysis and interpretation of the case study was designed.

The remainder of the chapter is organized as follows. Next section comprises a brief description of the conceptual framework supporting the study undertaken, where the concepts of social economy and social economy organizations are presented, a brief explanation of the Portuguese social economy sector is provided, and the resource-based perspective is described. Section 3 presents the research methodology undertaken in this study – the case study approach. Section 4 presents the case study, describing the profile of the social economy organization analyzed. Section 5 describes the process of organizational change followed by this organization, emphasizing the main findings. Section 6 discusses the main findings. Finally, section 7 draws the main conclusions of the chapter and presents avenues for future work.

CONCEPTUAL FRAMEWORK

Social Economy and Social Economy Organizations

Usually, the term social economy is understood as a broad concept (Araújo, Rodrigues, Telles, Vaz & Bittencourt, 2017). As underlined by Noya and Clarence (2007), several terms can be found in the literature to name the same phenomenon "without any strong delineation of the distinctions" (p. 10). Some examples of those terms are: social economy, solidarity economy, third sector, non-profit sector, and third system. The reason for this maybe be the fact that authors are trying "to capture both the social element as well as the economic element, inherent in those organizations which inhabit the space

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

between the market and the state" (Noya & Clarence, 2007, p. 10) and the fact that the concept of social economy has evolved in a way that reflected "the historical dimensions and developments of a range of different organizational types which have come to be identified with it" (Noya & Clarence, 2007, p. 10)[1].

Social economy is at the center-stage of the European Union action regarding active social policies (Fekete, Hubai, Kiss & Mihály, 2017) addressed to overcome problems of poverty and social exclusion of persons in a vulnerable position, and as a way to achieve the Sustainable Development Goals, contributing for a sustainable and inclusive growth (Moore, 2015). The social economy symbolizes the driving force to achieve a more stable and decent process of job creation, social cohesion, local sustainable development and social innovation (Laurentiis, Klaer & Martignetti, 2017). In fact, the social economy can be understood as an agency of social transformation, a space for social cooperation and grassroots solidarity action within a broader macroeconomic system, allowing the creation of spaces within the system for poverty reduction based on local sustainable self-development, the social capital of the poor and the empowerment and agency of the poor (Veltmeyer, 2017). Thus, as emphasized by Salustri and Vigano (2017), the social economy can constitute a powerful driver of territorial cohesion and community development, since it can be seen as the missing link between the market economy and local development, and, many times, it is backed by participative social movements. In this sense, the broader societal anchorage of the social economy can easily serve as a way to raise awareness of social change needs (Hudon & Huybrechts, 2017).

The core element of the social economy are social economy organizations, which have been growing in number and relevance whether in developed countries or in emerging or transition countries, and their relevance for balanced social and economic development is now widely recognized (Borzaga & Tortia, 2007). Those organizations put the pursuit of social aims at the heart of their economic activity, therefore embracing a holistic approach to social change (Hudon & Huybrechts, 2017), with an aspiration to transform social relationships based on self-help, mutual support and social solidarity (Vézina, Malo & Selma, 2017), and having a multi-bottom line (with both social and economic goals) and a multi-stakeholder dimension with a focus on finding sustainable solutions and empowering stakeholders (Granados, Mohamed & Hlupic, 2017). Underlying social economy organizations action (or practice) is the adoption of a bottom-up approach to solve societal challenges, because they often experiment with grassroots innovations responding to local social problems, and taking into account the needs and expectations of local communities (Hudon & Huybrechts, 2017). In fact, social economy organizations are able to compensate the lack of private and public provision of social services and to narrow spatial inequalities by fostering the connection between market and non-market economic activities and by exerting a productive and distributive function (Salustri & Vigano, 2017).

In the context of what can be called the social economy, a great diversity of organizations can be included in that sector of an economy. Taking into account that diversity and different schools of thought, Young, Searing and Brewer (2016) proposed the idea of a "Social Enterprise Zoo" to analyze the conceptual developments and practical experiences of this type of organizations. As stated by those authors "the zoo serves as a metaphor to signal that designation of social enterprise is an intentional construct, reflecting the limits within which we are willing to call something a social enterprise versus a conventional business, nonprofit, cooperative, association, or governmental entity" (p. 10) and "is particularly well suited for appreciating the complexity and diversity of social enterprise and the likelihood that no one simple model will suffice to understand social enterprise as a phenomenon or to advance it as a social strategy" (p. 10).

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

According to Dragan and Popa (2017), from a legal and institutional point of view, social economy organizations can be grouped in three categories of organizations: non-governmental organizations (associations and foundations, the non-market sub-sector of the social economy), cooperatives and mutual societies (the market or business sub-sector of the social economy). In this context, there are some common characteristics that allow one to classify an organizations as belonging to the social economy, as for example: independence of action, self-government and autonomy from government authorities; freedom of involvement, implying voluntary and open membership; democratic control by members; the person and the social objective taking precedence over capital, reconciling the interests of the members and the general interest; provision of services aimed at members and communities; and the protection and enforcement of the principles of solidarity and responsibility.

In a nutshell, the main motivation of social economy organizations is to overcome deficiencies of social policy and their ability to recognize both long-standing and new social needs (Laurentiis, Klaer & Martignetti, 2017), and to address them through original solutions emerging from new collaborations established among and within a variety of sectors (private sector, public sector or third sector) and scales (international, national, regional or local levels). As emphasized by Terziev (2017, p. 12), there are two main characteristics through which social economy organizations demonstrate their potential: "First, they act locally networked with multiple stakeholders and knowing well the local problems and they can offer solutions proven to work in a place like reach those groups at risk of poverty or social exclusion to which active social policies reach very rarely in comparison to purely passive assistance. Second, social economy organizations have the potential to mobilize and activate people that are themselves at risk of poverty and social exclusion and thus enable them to engage in improving their living situation".

A Brief Description of the Portuguese Social Economy Sector

According to CASES (2010), the term social economy is ambiguous because it accommodates a wide range of concepts, such as the "third sector", "non-profit sector", "social economy", and "alternative economy", among others. It is very difficult to establish a single concept and define the frontiers of social economy. As emphasized by Parente, Marcos, Costa and Amador (2013), the themes of social economy and social economy organizations in Portugal raise in the discourse a series of concepts that are more or less associated with them, which are influenced by theoretical and ideological points of view. The Portuguese national statistics office (INE) and the non-profit institution CASES (Antonio Sergio Cooperative for Social Economy) use the definition proposed by CIRIEC (2012) on the pilot project Satellite Account of Social Economy for Portugal (SASE)-2010:

Set of private firms, formally organized, with autonomy of decision and freedom of membership, created to meet the needs of its members through the market, producing goods and services, ensuring financing, where the process of decision making and benefit or surpluses sharing is not directly linked to capital or contributions of each member, but corresponding to each member one vote. The Social Economy includes also private entities formally organized, with autonomy of decision and freedom of membership that produce non-market services for households and whose surpluses, if any, may not be appropriated by the economic agents that create, control or finance them.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

In Europe, social economy activities contribute to about 10% of the output of the European business sector, with a share of about 6% in total employment (about 11 million people), revealing an industry that will be called to give a greater contribution to the current problems of unemployment and social cohesion due to the social and economic transformation under way (Dragan & Popa, 2017). According to the CIRIEC (2016) report, in spite of this important role of the social economy in Europe, its impact and weight differs among EU countries. As stated in that report, "while employment in the social economy accounts for between 9% and 10% of the working population in countries such as Belgium, Italy, Luxembourg, France and the Netherlands, in the new EU Member States such as Slovenia, Romania, Malta, Lithuania, Croatia, Cyprus and Slovakia the social economy remains a smaller, emergent sector, employing under 2% of the working population" (CIRIEC, 2016, p. 67). However, it can also be seen that regarding the evolution of paid employment in the social economy, Austria, Croatia, Cyprus, Hungary, Luxembourg, Malta and Slovenia have an important increase in this values whereas countries such as Bulgaria, Denmark, Lithuania, Poland and Sweden experienced a sharp decrease in paid employment. In terms of the types of organizations of the social economy, according to the same report, "measured in terms of employment, associations, foundations and other similar forms remain the main social economy 'family', comprising most of the social entities / enterprises and about 66% of the employment in this social sector" (CIRIEC, 2016, p. 67). As would be expected, social economy organizations (e.g. cooperatives, mutual societies, associations, foundations and similar entities) are in higher number on those countries with a larger population, such as United Kingdom (about 876,941 entities), Italy (350,356), France (195,584), Spain (189,538), and Germany (113,963), and are less numerous on those countries with less population (e.g. Malta, 749; Luxembourg, 845; Cyprus, 5,196; Denmark, 13,766; or Latvia, 19,611) (CIRIEC, 2016). However, if the indicator social economy organization's density (meaning that one organization covers a given number of inhabitants) is taken into account the ordering of countries changes. Countries like Germany, Belgium, Luxembourg, Malta, Denmark, Romania, Poland, France and Austria show a higher density (ranging from 725 to 306) whereas Hungary, Sweden, Lithuania, Slovakia, Latvia, Croatia, Czech Republic, United Kingdom, and Finland show a much lower density (ranging from 151 to 38).

Regarding the Portuguese case, and following the zoo metaphor of Young et al. (2016), the panorama concerning social economy organizations is not much different from what has happened in other countries. In fact, an increasing complexity and diversity of the social economy organizations should be recognized because the ways in which these organizations can potentially address societal problems and needs are manifold. Those social economy organizations can be differentiated by their legal nature, by the way they are internally organized, by their primary area of intervention (e.g. social service, health, education, culture), by how social organizations interrelate and behave, among others. In Portugal, this sector, according to INE and Cases (2013), comprises Cooperatives (2,260 units); the Mutual Societies (119 units); a network of charities known as Santa Casa da Misericórdia (Holy House of Mercy) (381 units); Foundations (537 units) and Associations and other organizations in the Social Economy (52,086 units), involving 55.383 organizations, with a share of 5.5% of the total paid employment, representing a proportion of 2.8% of the gross value added.

According to Soares et al (2012) two thirds of the expenses of these organizations are related to the cost of goods sold and materials consumed (including the cost of food), staff costs, services and utilities costs. On the other hand, they indicate on their budget a great proportion of State contribution. The Social Economy Sector is facing a huge set of challenges and weaknesses, which include, among others,

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

the following: (1) the high dependence on financial support from the state; (2) the requirement to fulfill a set of criteria and rules imposed by the State, in order to maintain public support, particularly in terms of professionalism, quality and accreditation; (3) sustainability in a context of economic crisis, with a probable reduction in support and growth of social problems; (4) the need to reinvent their business models in order to avoid chronic shortages; (5) professionalization of top management; (6) economies of scale; (7) the qualifications of employees; (8) leadership; (9) equipment and facilities; (10) ICT integration; (11) demographic change; (12) asymmetries in population distribution.

To face these challenges and weaknesses it is imperative to improve the quality of the services and the effectiveness of management, thus contributing to competitiveness and sustainability. The following areas are particularly important: (1) forms of organization and management; (2 value chain of services; (3) integration of ICT; (4) improvement of procedures for quality certification; (5) development of internal skills: training and development for leaders and training for employees; (6) models of inter-institutional cooperation.

Parente (2016) undertook a study attempting to operationalize the notion of social entrepreneurship within the context of social economy organizations in Portugal, and concluded that these organizations show a fragile form of social entrepreneurship, reflected on state dependency both in terms of models of financial management and the definition and regulation of activities, recipients and social intervention. Also, Pais and Parente (2015) focused on the issue of how work-teams are represented and work in social economy organizations. Resorting to a case study methodology, they concluded that no significant differences between the way teams work in these organizations and in profit-making organizations were found.

Social economy organizations need to rethink their operating logic, without, however, neglecting the purposes for which they were established, so it seems particularly relevant the establishment of structured practices on strategic management and innovation. These weaknesses can be addressed through a program to support the development and qualification of individuals and organizations, integrating actions of training and consultancy.

Thus, one can argue that these organizations can apply principles, methodologies and practices of strategic and innovation management that for-profit organizations also regularly apply. The use of these principles and practices is not incompatible with their not-for-profit nature and, on the contrary, can provide a basis on which their activities and their purposes can be pursued and achieved on a more consistent, sustainable and effective way. In the following paragraphs elaborations are made on the concepts of strategy and innovation management and their articulation with the activities and purposes of social economy organizations. Specifically, the arguments are based on a resource-based perspective of the organization, where specific competencies provide the means by which organizations can leverage their resources and fulfil their purposes.

Strategic Management and the Resource-Based Perspective

To Rumelt, Schendel and Teece (1994, 1991) strategic management (also called "policy" or "strategy") is related to the course of an organization, including the issues that are at the heart of top management preoccupations and those who are associated with the reasons why a business succeeds or fails. Hitt, Ireland and Hoskinsson (2011) state that "the strategic management process is the full set of commitments, decisions, and actions required for a firm to achieve strategic competitiveness and earn above-average returns", or in other words, it is the successful formulation and implementation of a strategy

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

that creates value. These statements are perfectly applicable to social economy organizations, if terms such as "competitiveness" are replaced by "effectiveness", and terms such as "returns" or "value" are understood in the context of non-profit objectives.

The basic elements constituting the cycle of strategic management are the analysis of the environment, the formulation and implementation of strategy, assessment and monitoring. The analysis of the environment includes analysis of: the general environment, the industry/sector, competition, organizational structure, organizational culture and the resources that the organization has at its disposal. The process of formulation of strategy is closely linked to the progress of long-term plans in order that an organization deals effectively with the opportunities and threats that it faces in its environment, in light of its strengths and weaknesses. Strategy formulation is then made by the mission, objectives, strategies, (comprehensive description of how the organization will achieve its mission and objectives) and policies (which are lines of action that will support decision making). Strategy Implementation is related to the execution/implementation of strategies through the explanation of programs (activities necessary for the completion of a plan), budgets (programs in financial terms) and procedures (sequential steps that describe in detail how to perform a specific task or function). Assessment and control are processes that allow the tracking of activities and results of the organization in order to be able to compare the actual to the desired performance, allowing the introduction of measures to mitigate the observed deviations.

Hrebiniak (2006) argued that there is a gap between strategy formulation and strategy implementation. A possible reason for that is the fact that managers are not trained to implement strategy as well as they are to plan and formulate strategic intentions (Barbosa & Romero, 2014). Another problem is related to the general conviction that strategy implementation plays a minor role in terms of the hierarchy of strategic actions, being more adequate for lower levels of management, forgetting that management commitment is essential to a successful implementation. The author also argues that the top six obstacles that managers face are: (1) inability to manage change; (2) poor or vague strategy; (3) not having guidelines or a model to guide implementation efforts; (4) poor or inadequate information sharing; (5) unclear responsibility and accountability; (6) working against the organizational power structure. The case study addressed in this article shows the importance of such items, and the role that competencies related to strategy formulation and implementation can play in the performance of the organization.

The gap between strategy formulation and strategy implementation can be analyzed through the lens of the resource-based view theory of the firm (Hadjimanolis, 2000), which, we argue, can be applicable to social economy organizations taking due account of their different motives, management preoccupations and priorities and objectives in terms of the services that are provided and to whom they are provided. In any case, whether it is a for profit firm or a nor for-profit organization, both types of organizations need to acquire, integrate, develop and deploy competencies and skills that are needed to the provision of goods and services to their customers or to the recipients of their services, in a way that it is effective and sustainable (Vézina, Malo, & Selma, 2017). The resource-based view theory of the firm tries to explain the source of sustained competitive advantage of a firm by asserting that such a sustained and competitive position is dependent on the acquisition and leverage by the organization of valuable, rare, inimitable and non-substitutable (VRIN) resources and capabilities (Kraaijenbrink, Spender and Groen, 2010). Among the many resources and capabilities that an organization can master, there are specific types that seem particularly important to achieve that aim, which are the so-called "dynamic capabilities". According to Teece (2007) "…dynamic capabilities can be disaggregated into the capacity (1) to sense and shape opportunities and threats, (2) to seize opportunities, and (3) to maintain competitiveness

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

through enhancing, combining, protecting, and, when necessary, reconfiguring the business enterprise's intangible and tangible assets…" (Teece, 2007, pp. 1319).

These capabilities are intimately linked to the obstacles faced by managers and referred to above. Social economy organizations face particular challenges regarding these issues, due to a somewhat differential approach to the style and practice of management, which is not exclusively based on hierarchal systems, typical of for profit firms, but are instead based on a more cooperative and collaborative stance, where employee loyalty and common value sharing may condition the management approach of the organization (Sanzo-Perez, Álvarez-González, & Rey-Garcia, 2015).

Strategy and innovation are distinct concepts both in terms of definition and function, being innovation a source of competitive advantage which grows out of specific (dynamic) competencies that are developed inside the organization. In the context of non-profit organizations, the "competitive" advantage of the organization is translated into its capacity to deliver the goods and services in a sustainable and effective way, under certain identified resource restrictions. Thus, innovation and strategy are complementary and feed on each other (Dobni, 2010). According to the Oslo Manual (2005), which establishes the guidelines for the collection and interpretation of data on innovation, developed by the OECD: "An innovation is the implementation of a new or significantly improved product (good or service), or process, a new marketing method, or a new organizational method in business practices, workplace organization or external relations". Social economy organizations provide and develop essentially services, which have a set of characteristics that distinguish them from goods: (1) Intangibility; (2) Heterogeneity; (3) Simultaneity; and (4) Perishability. According to Dantas and Moreira (2011), and Booz, Allen and Hamilton, cited by Edvarsson et al (2000), innovation in services can be classified into categories that range from "Worldwide new services" to "Cost reductions". Social economy organizations output could also be eventually classified into those categories, although the purpose of this chapter is to look at the internal organizational innovation, and so at the innovations classified by the Oslo Manual (2005) as "process innovations", but also, and primordially, at innovations classified as "organizational innovations".

Organizational change is the process of converting an organization from its current state to a desired future state (O'Sullivan & Dooley, 2009). All innovation results in change, but not all change is innovation. The core techniques referred in the management literature for managing organizational change include: (a) Strategic planning: The changing areas are called objectives or strategies and are intended to guide the teams in the development of ideas or projects to achieve objectives; (b) Performance Evaluation: Assign measures or indicators to critical aspects of organizational performance; (c) Management of Creativity: Generating ideas or problem solving; (d) Project Management: Need to effectively manage multiple tasks and initiatives; (e) Knowledge management: How to effectively manage change for managing the information associated with the change.

All these techniques are potentially applicable within the environment of social economy organizations, with due adjustments that reflect their nature, their management ethos and practices, and their "costumers" (Rodriguez & Guzman, 2013). To define and implement a structured process of strategic management and innovation, it is important that the organization defines how it creates, delivers and gets value (business model). The business model is like a plan for a strategy to be implemented through organizational processes and systems structures. The application of this concept is new in the area of social economy (Picciotti, 2017). In the remainder of this chapter, through the presentation of a case study, it will be shown how these concepts and elements were applied in this area, namely how an organization acquired management competencies and dynamic capabilities related to strategy and innovation.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

RESEARCH METHOD

The research strategy used in this work was the case study. This methodology is used as a valid way of exploring existing theory and as an exploratory way to provide an integral vision and a general understanding of a phenomena (Yin, 2009). The research qualitatively describes and analyses the phenomena of organizational change operated on a Social Portuguese Organization. It was an intentional and thought out process that the organization implemented within a defined time period and in collaboration with an external consultancy organization. The case study is focused on this specific event that changed the whole organizational structure of the Foundation and, as such, it disregards intentionally other events and phenomena, for which information was collected, but that do not have meaningful implications on the specific phenomena of organizational change. The decision to include or exclude events from the description and the analysis of the case is based on the subjective perception of the researchers. The research process was made in two distinct phases. The first phase consisted of a literature review. The two main themes addressed in this review were strategic management and the social economy. Other subthemes addressed consisted of the resource-based view and social innovation. The main, but not exclusive, query on the literature review was the search for studies that integrated the main themes and subthemes on specific situations. The second phase consisted on the collection of data from the object of study. Secondary data was extracted from reports and other documents of the Foundation. Primary data was obtained from in-depth interviews conducted with eleven managers in Luiz Bernardo de Almeida Foundation. The fact that the primary data was obtained from several managers of the organization, which occupied different hierarchical positions and had different responsibilities, made it possible to compile a much more complete perspective of the change phenomena, than it was otherwise possible if the interviews were restricted to just one or a few top managers. This primary data constitutes the main empirical evidence on which the case is based. The integration of the different sources of the primary data into a coherent perspective, and using conceptual frameworks provided by the literature review, was made by the authors.

The methodology is not prone to generalizing the results, which is a characteristic of the case study strategy, and due to the specificity of the context, but it highlights a set of practices concerning the key factors for the establishment of an effective innovation and sustainability strategy for social economy organizations, based on established conceptual frameworks from the management literature.

CASE STUDY DESCRIPTION

The Luiz Bernardo de Almeida Foundation (hereafter LBAF) is located in the municipality of Vale de Cambra, district of Aveiro, Portugal, and was established in 1957 in order to fulfil the testamentary disposition of Commander (by honorable distinction) Luis Bernardo de Almeida. Its heritage consists on the assets of its founder and the other values acquired throughout its existence. The institution provides a diverse set of services aimed at the elderly and the children. The institution started functioning with a nursing home in 1972, and in 1985 implemented a Home Support Service, directed at the elderly. This service was one of the first to be created at the District level. The institution also manages a Day Centre, where the beneficiaries are also elderly people that are independent in terms of mobility. In 1999 an Office of Family and Community Support was created. In October 2004, a nursery school was built. The Family Support Service is directed at kindergarten level children.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

In fact, social economy organizations with their links to local communities and their ability to harness resources from those communities, play an important role on the provision of social services, particularly for those more vulnerable groups of the society (such as the elderly and the young), and in that way fostering social inclusion (Noya & Clearence, 2007). However, due to the increasing concern with long-term financial sustainability, social economy organizations (such is the case of LBAF) need to develop new organizational structures and adopt new business models to allow them to achieve both their social and economic goals and to ensure their future sustainability (Hudon & Huybrechts, 2017). Furthermore, for those social economy organizations that rely heavily on public funding (such is the case of LBAF) that dependence may become problematic if a decline in public support is experienced. In the last six years, the Portuguese state budget was faced with severe financial constraints which prevented public funding from growing at an appropriate rate to support organizations of the social economy. In this context, revenue diversification is crucial to ensure longer-term financial sustainability.

A broader forward-looking long-term perspective is needed if the socio-economic success of the social economy organizations is to be achieved. One possibility to explore is to call for a strategic management perspective and a focus on the adequate process of organizational change and innovation. As pointed out by Kinyuira (2017), social value creation and economic performance management should be seen as a strategic process capable of making wealth creation more effective and fair, implying the adoption of a systematic management and reporting framework integrating both social and economic dimensions. In the particular case of the LBAF organization some of the most important weakness found (as will be described and explained in more detail in the following section) were: slow level of organizational response compared to environmental changes; difficulties on inter-departmental communication; narrow vision of the organizational objectives; lack of unity of command and difficulty in determining the extent of the authority and competence of managers and inadequate control range. To overcome these problems and to the accomplishment of their social and economic mission, management ability and skills need to be improved, enabling the LBAF to adapt to the new environment in which it operates.

THE PROCESS OF ORGANIZATIONAL CHANGE

The Initiation of the Process

The process of organizational change begun when the board of LBAF took certain decisions that proved to be crucial for the survival of the institution. These decisions were followed by an application to the so-called Q3 Program (Qualifying the 3rd Sector), a national program that aims at developing skills and organizations of the 3rd sector, improving the quality of their services, the effectiveness of management and contributing to their competitiveness and sustainability through participated and sustained processes of consultancy and training. The aim of the board was to ensure the sustainability of LBAF, and the improvement of the quality of services. There was a strong belief that the organization had a poor organizational performance, which was translated into weak economic and financial results and on poor service provision, so it would be extremely important to know the causes of this poor performance in order to mitigate or even eliminate them.

Besides providing financial support, the Q3 Program would provide access to an integrated, impartial and experienced vision by an external and recognized entity, that would identify the main problems that the institution was facing and provide a framework to manage the actions to mitigate or extinguish those

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

problematic situations, through actions of training and consulting made to fit the organization profile, its size, the problems identified and the defined objectives. The Q3 Program involves a strong partnership between some important organizations in Portugal: AEP (Chamber of Commerce and Industry), Fenacerci (National Association of Social Solidarity Cooperatives), Minha Terra Federation (Portuguese Federation of Local Development Associations), CPCCRD (Portuguese Confederation of Culture, Recreation and Sport communities), UTAD (University of Trás-os-Montes and Alto Douro), among others. The intervention follows a model, which involves several phases: recruitment and selection, conducting a diagnosis, preparation of a development plan, implementation measures, review plan and recommendations. All activities are evaluated externally and internally validated, and all actors (consultants and trainers) have certified skills in order to act in accordance with the procedures to ensure the quality and effectiveness of the intervention. The intervention on the organization had a duration of about one year and followed the steps described below.

In analytic terms, and under the resource-based perspective, this phase corresponds to the efforts of organizations in sensing and trying to learn, acquire and integrate the required resources and capabilities that would benefit the organization. The following phases, described in the following sections, corresponds to the efforts of integration and leverage of resources and new capabilities, which involved the reconfiguration of tangible and intangible assets of the organization.

Organizational Diagnosis

This phase began with the signing of the Development Contract - the document which defines the commitments between the organization and the organization that manages the intervention in order to promote the desired organizational development of the beneficiary of the intervention.

The organizational diagnosis is essential because at this stage all the problems are identified and the goals that are the target of the intervention are defined. It is, therefore, necessary to resort to the holders of the knowledge of the organizational reality, elements that experience the daily life of the organization and make the exploration of problematic situations. The idea is to maximize the participation of the whole organization in gathering problems, where the consultant only assumes the role of a listener/agent/moderator.

In the realization of the organizational diagnosis, the main reference activities that sustain it are: (1) Listening to people; (2) Documentation review, (3) Sectoral framework and context; (4) Problem tree; (5) Current Situation/Desired Situation; (6) Objectives Tree.

In addition to listening to people, there are also, at this stage, activities that promote their participation in all stages of the process: (1) Meetings with Top Management; (2) Meetings/contacts with an internal facilitator; (3) General Sessions held for the entire organization. On the analysis of the tree problem, a key tool of the diagnosis, it was found that the general problem of LBAF was a poor organizational performance. Seven intermediate problems were identified as causes of this general problem: poor organizational structure; poor planning of activities; poor management practices in human resources; scarcity of financial resources; poor implementation of quality and a lack of employee skills, having been detected 85 terminal problems as causes of these intermediate problems.

To analyze the organizational structure, five basic components of it were considered (Mintzberg, 1999), where some terminals problems of LBAF were fit:

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

- **Strategic Level:** The strategic level comprises the organizational decision makers, here materialized in the board function. The problems identified relating to this component were, among others: poor strategic management and reduced operational presence of the board.
- **The Techno-Structure:** Comprising the rules and procedures for managing the behaviors of employees. In this component were identified, among others, issues of horizontal and vertical differentiation, which were manifested in a poor communication between hierarchical levels and lack of team spirit; problems of formalization as a poor definition of roles and tasks and also problems located at the level of centralization, such as an excessive number of tasks and responsibilities centralized in the Technical Director.
- **The Support Staff:** Includes employees that are not directly involved in producing goods or services. However, they have the responsibility to support the primary activities, such as, for example, cleaning and feeding. In this field, several problems were detected, including deficient HACCP (a quality norm related to food processing) and cleaning practices.
- **Intermediate Level:** Includes managers who make the connection between the strategic level and the operational level. The services and technical direction, as well as the sector supervisors, are included in this level. In this component, problems such as poor management of teams (inadequate control range), lack of sectoral meetings, lack of performance evaluation, and a poor distribution of tasks were identified.
- **Operational Level:** Includes all employees of the institution running the production of goods or services. Here problems were also detected, among others, difficulties in interpersonal relationship, resistance to change and lack of a training plan.

Although the weaknesses of each component of the structure were identified above, the weak points in this structure, in general terms, were due to a slow level of organizational response compared to environmental changes, to inter-departmental communication difficulties, to a restricted vision of the organizational objectives, to a lack of unity of command, to a difficulty in determining the extent of the authority and competence of managers and to inadequate control range.

The Process of Implementation

The Development Plan

In this section the development plan established to bring change to the organizational structure is presented, showing the main results of the actions made. A summary of the evaluation of these actions is made in the next section.

On this phase, it was crucial to develop two enabling dimensions: (1) an active participation of all members of the organization in order to promote an open debate, generating and sharing ideas to jointly achieve the targeted objectives and (2) an approach based on management by objectives (MBO) in order to establish appropriate objectively verifiable indicators, using the SMART (Specific, Measurable, Assignable, Realistic and Time-related) philosophy to monitor and evaluate the implementation and to decrease the resistance to change.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

The Development Plan establishes the training actions which allows the transition from the current situation to the desired situation. The plan is based on the following tools: (1) Actions tableau; (2) Actions tableau by activities; (3) Project Planning by Objectives Matrix; (4) Implementation Schedule. In the development plan we look for appropriate and feasible solutions to solve the problems of the current situation and achieve the goals of the desired situation. The technical expertise of the consulting team and of the elements of the organization was instrumental, seeking to expand the use of the knowledge hold by these elements, and using creativity to find the most appropriate, diversified and financially encompassed solutions.

Under the Q3, all the predicted actions are of a training nature, and may fit into the following types:

- **Employees Qualification:** Within this typology the following training activities directly related to the problems of organizational structure identified above were established: (1) Operations Management; (2) Interpersonal and conflict management; (3) Quality Management - Food Area and (4) Customer Service.
- **Implementation of Improvement Projects:** Within this typology, the following training activities aimed at solving problems related to organizational structure were established: (1) Strategic Management Practices; (2) Quality Management System; (3) Cooking Techniques; (4) Geriatrics; (5) Team management and (6) Human Resources Management.
- **Thematic Workshops**.

The development plan was pre-validated by the management and was discussed with everyone in the organization before the final version, benefiting, therefore, of the participation of all in the definition/specification of the actions to implement. The presented development plan solely corresponded to the set of eligible actions under the Q3 Program, although the board itself draw up a set of own actions in order to simultaneously eliminate or mitigate problem situations not eligible by the Q3 Program.

Implementation Schedule

The capacity to monitor and control the development plan was essential to the success of the implementation. There were some mandatory mechanisms and requirements which were necessary to achieve that: (1) an external team of consultants that provided a detached and an independent view of the work; (2) a high degree of commitment and skills of the liaison consultant in charge of the process, namely his capacity to monitor and control the process and his capacity to articulate the functioning of a team, in particular regarding the specialists consultants in charge of the implementation of the specific measures and actions, through a clear and fluid communication channel; (3) knowledge of the development plan and active participation of the members of the organization in its execution which established a commitment of the entire organization with the external team in order to achieve the goals without deviations from the original plan.

A timeline was stipulated for the implementation of training activities leading to the resolution of identified problems, which had a duration of five months. The entire project had a one-year duration, and it was composed of approximately one hundred hours of consultancy and two hundred and forty hours of training activities.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

In the initial diagnosis eighty-five terminal problems were detected that resulted in eighty-five goals. Thirty of these were not achievable by conducting training activities, so the eligible objectives supported by Q3 funds were fifty-five. These resulted in twenty-three results to be achieved. In addition to the actions recommended in the Q3 Program, eight actions were established in conjunction with the board of the organization, in order to achieve the objectives not covered by the Q3 Program. An activity tableau of ten actions/activities was prepared, but it was possible to perform one more action in addition to the initial proposal (Management Control).

Results of the Actions

Results Achieved

All twenty-three expected results were achieved. In addition to these, the intervention allowed for several changes, which affected several areas of management and operation of the organization, particularly with regard to its organizational structure. From the results achieved, it is particularly important to stress those that are most directly related to the organizational structure. A new organizational structure was defined whose main goal was to move from a mechanistic bureaucratic structure to a horizontal structure. The main motives which motivated the development of this type of structure were related to greater customer proximity based on speed, efficiency and quality of services, a greater flattening of the organizational structure, the search for competitive advantage in a turbulent external environment, the creation of real teams and the facilitation of collaboration, a greater emphasis on operational processes as a creator of value, a delegation of work to the lowest level.

In order that the implementation of the new organizational chart was successful, the chart was redesigned, adding activities and services actually rendered by the organization and which were not reflected in the older chart, having as a direct result the ability to clearly define the roles, tasks and responsibilities of each member in the organization.

It was also implemented a methodology for evaluating the individual and team performance and development, identifying the training needs of each element in order to maximize their performance at the individual level or at the level of working groups. In order to simplify procedures and minimize the resistance of employees in its implementation, two training actions were undertaken in quality management systems, and the organization decided to move forward in the implementation of the ISO 9001: 2008 standard in its five dimensions.

A final observation is due related to the conduction of training activities directed to all managers, in order to develop skills in implementing effective leadership, and two training activities designed to improve the skills of employees in teamwork and conflict resolution.

Summary of Actions Assessment

In order to know if the problems were solved and what improvements the organization experienced, the opinion of the organization leaders and the facilitator were sought considering the Actions or Activities implemented and the most important results, either in the immediate or short term. There was a strong commitment in the implementation of the Actions and in achieving the expected results, which led to a successful result. All the implemented measures were considered very important by the leaders and the

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

facilitator. The measures that were believed to have a greater impact in the organization, and that fitted the problems related to the Organizational Structure of LBAF identified above, were the following:

- Quality Management System.
- Quality Management-Food Area.
- Strategic Management Practices.
- Human Resources Management.

Regarding the results achieved which had the greater impact, they were those derived inherently from the above actions:

- Implementation of Quality Management System in Social Responses.
- Implementation of HACCP System.
- Strategic objectives definition.
- Organizational Structure Restructuring materialized in the design of a new organizational chart, with a consequent redefinition of roles, tasks and responsibilities.

In general terms, it can be said that the following constituted good practices in the implementation of the organizational process of change:

- The involvement of Top Management.
- The involvement of the operational teams.
- The existence of a structured, tested and friendly methodology.
- Independence, experience, openness and involvement of the external consultant.
- Tailor made to the problems of the organization.

DISCUSSION OF FINDINGS

Social economy organizations are being promoted as a responsive and innovative way for the provision of public services (Millar & Hall, 2013), based on the idea that such social organizations have the potential to deliver greater responsiveness, efficiency and cost effectiveness. But at the same time, those organizations are increasingly requested to demonstrate the social and economic value they create. In this context, such organizations need to have (or implement) formal standards and administrative procedures that allow to measure their performance. However, it is often argued that emphasis on outcomes and evidence-based performance misses out important features of the social economy organizations functioning (Millar & Hall, 2013).

From the findings presented in the previous section, one can have an idea of the perception of the Board of LBAF about the strengths and weaknesses of the Q3 model intervention, and the results of the external evaluation, conducted by UTAD (University of Trás-os-Montes), regarding the implementation of the program. The board of LBAF recognized that the positive aspects or strengths far outweigh some of the negative aspects or existing weaknesses. The managers interviewed even had some difficulty in identifying negative aspects or weaknesses of the intervention. The concentration of the implementation of the various steps/activities within a relatively short period of time, five to six months, was the weak

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

point mentioned by the interviewees. This resulted, for example, in the reduction of the availability of time by managers and employees in the implementation of the actions, which in some periods was very demanding. In general, the strengths of the intervention were highly valued by the leaders of the organization.

The Q3 project increased motivation and the degree of participation of the people in the organization; it identified in a clear way the existing needs; it improved internal operations (e.g., by redefining organizational structure, new processes and services); it forced members of the organization to look inward and to look for solutions; it allowed new learning through training focused on very specific needs; it allowed to have an enlarged, both external and internal, vision. Essentially, the project's strong point was the creation of favorable conditions for change in the organization which, as mentioned above, involved large parts and several dimensions of the organization, and which is a fundamental dynamic capability that fosters innovation and sustainability of the organization.

The methodology of participatory action training, implemented by external elements with facilitation skills and processes in the field of management, as well as sensitivity and experience in the context of non-profit organizations, is an efficient and effective tool for organizational change, adaptable to various circumstances. However, their success depends largely on its appropriation by the organizations, through the commitment and participation of managers, technicians and employees. In addition, the state of necessity and awareness of the urgency of change in organizations is also a factor of great importance (Baptista, 2011).

The final evaluation report of the implementation of the Q3 Program, conducted by UTAD in partnership with CETRAD praised the implementation of the Q3 program in LBAF, considering it an example of best practice in implementing change that crossed several fields of management and operation of the organization. It highlighted the participation of the leaders, including the Board, its commitment and permanent participation (it followed daily activities, being present in the training sessions), the degree of employee involvement, which was marked by adherence to the process and the interest and potential that they saw on it. These results corroborate the idea of Granados, Mohamed and Hlupic (2017) that social economy organizations may rely on external sources of knowledge to support their operations and strategies. This knowledge transfer is essential to accurately tackle and assess their social impact. Furthermore, Bastida, Marimon and Tanganelli (2017) stressed that alliances with other stakeholders are important for social economy organizations, because they are mainly of relatively small and medium size and need to collaborate to improve their access to resources and knowledge, so that they can improve their performance and enhance their creation of social and economic value.

This case study showed how the process of change in a social economy organization was sustained by an approach based on the acquisition of competencies related to strategy formulation and implementation, and to practices of innovation management, leading to the development and consolidation of dynamic capabilities, which, according to the resource-based view of the organization, are important factors that provide competiveness and sustainability to organizations, and in particular, to social economy organizations, that can benefit from this management perspectives to improve their service providing potential. Dynamic capabilities that were acquired during this process included capabilities related to developing and integrating learning processes, capabilities to strategically manage processes and procedures and capabilities related to establishing and maintaining a network of external relations. Resources developed by these processes included the new organizational layouts, the improved processes for interdepartmental communication and the revised roles for managers and employees, among many others. The acquisition of competencies was made possible through the financial support of a government program and by the

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

intervention of a set of external actors that acted as vehicles of knowledge transfer. As stated above, it is difficult to generalize the perceptions of this case study, but it seems that some factors may be very important points to have in consideration: a structured approach to strategy formulation and implementation, a systematic consideration of innovation practices, an interface between external knowledge providers and the organization to enable effective knowledge transfer ad a capacity and willingness to acquire and absorb knowledge.

Social economy organizations play an extremely important role not only in attaining economic growth but also achieving sustainable social development (Juliani, Silva, Cunha & Benneworth, 2017). Taking into account that those organizations cannot grow or develop without a forward-looking long-term perspective, adequate processes of strategic management and of organizational change assume a preponderant role also in these organizations of the social economy. Some of these organizations succeed, while others fail, so the strategy adopted by their top decision-makers is important (e.g. in terms of social value creation, meeting the needs of their target public/community, and the motivation of their employees). The definition of this strategy is based on the identification of the actions that the managers intend to put into practice, in order to achieve a higher level of performance and a competitive advantage.

A difficulty that social economy organizations face is related to the fact that their main source of revenue is, essentially, government funding (López-Arceiz, Bellostas & Rivera-Torres, 2017). Given the financial constraints on which the Portuguese economy, in general, and the public administration, in particular, went through in recent years, these state-sponsored support is becoming increasingly scarce, causing an important negative impact on those organizations. Confronted with this situation, the challenge that social economy organizations face is to find other sources of revenue and forms of funding, in order to ensure their future sustainability. In this context, it is understood that the implementation of a strategic action that takes into account an adequate process of organizational change coupled with a clear focus on social entrepreneurship initiatives is essential to contribute to the creation of social value while ensuring its economic-financial viability. However, as pointed out by Noya and Clarence (2007, p. 20), it is necessary to recognize that "there is no simple solution to how social economy organizations can achieve financial sustainability, although it is evident that social economy organizations need the opportunity to exploit the full range of potential resources". In this context, sharing knowledge, experiences and good practices across social economy organizations might play an important role if these organizations intend to have a major impact upon the lives of individuals and communities.

The practice of social economy organizations points to a successful and sustainable experience due to the multiple interactions and social relations established with all the stakeholders. Thus, their impact is felt not only on the social and economic dimensions but also on the cultural and territorial ones. They contribute to community development, through job creation, increased income and poverty eradication, and to overcome problems of social exclusion, especially those affecting more vulnerable and disenfranchised groups of the society. As highlighted by Hudon and Huybrechts (2017), in the practice of social economy organizations, democracy, a participatory mode of governance and collective action are implemented to empower stakeholders that are not traditionally given a voice in the shaping of organizations, promoting social justice and social change and helping to increase the well-being and social capital of people as well as to respond to the emergence of new societal needs.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

CONCLUSION

Due to their characteristics, social economy organizations have been responsible for the existence of a different approach to socio-economic activity, which is to privilege people instead of capital. Until recently, the frontiers of the social economy were seen as a blurred concept between the market and the state (Defourny & Nyssens, 2013). However, nowadays social economy represents an important part of the economy and social economy organizations face significant challenges in terms of management ability and knowledge, resource allocation, social entrepreneurship, and social accountability (Besana, 2017), while, at the same time, they thrive through the effort of dedicated individuals and organizations committed to ethical entrepreneurship (Amin, 2009). Those organizations can be seen not only as organizations producing goods and/or services, but also as enablers of social connections and collaborative action, a fundamental aspect for the creation of social value and social capital. Actually, these kind of organizations are well-placed to address the grand challenges of the 21st century, namely ageing of population, high rates of unemployment, inequality in income distribution, and social exclusion problems, as well as, to foster active citizenship, solidarity, and democratic participation (Cunha, Benneworth & Oliveira, 2015).

The current empirical study offers a significant contribution to the literature on the use of the strategic management approach and the process of organizational change in the context of a social economy organization, providing an important contribution to assessment of the validity and appropriateness of those tools in that kind of organization. However, it should be bear in mind that the empirical study was focused on only one case study, within the specific context of a social care provision institution, and conducted at a particular point in time. Thus, one should be careful when trying to generalize the findings to other contexts. From the actions and/or activities implemented the following main results were achieved. Firstly, a new organizational structure was defined, whose main goal was to move from a mechanistic bureaucratic structure to a horizontal structure. Secondly, the organizational chart was redesigned, adding activities and services actually rendered by the organization and which were not reflected in the older chart, having as a direct result the ability to clearly define the roles, tasks and responsibilities of each member in the organization. Thirdly, a methodology for evaluating the individual and team performance and development was implemented, identifying the training needs of each element in order to maximize their performance at the individual level or at the level of working groups. Finally, it should be stressed that a strong commitment in the implementation of the actions and in achieving the expected results, which led to a successful result, was observed. As underlined by López-Arceiz, Bellostas and Rivera-Torres (2017), it is most likely that the success of social economy organizations is due to their capacity to seek new opportunities, diversify their activities, innovate, and develop new strategies and management models.

The social economy can be seen as an important incubator for the support of social innovation initiatives (Hubrich, Bund, Schmitz & Mildenberger, 2012). Social economy organizations might be a fruitful ground for social and organizational innovation contributing to solve social needs and to achieve social change (Juliani, Silva, Cunha & Benneworth, 2017), which means that start-ups and innovation in the social economy need to be encouraged. In fact, the development process of social economy organizations shares some characteristics with the social innovation process, namely in terms of being a localized, bottom-up process, with multiple actors, democratic governance, a social inclusion and cohesion perspective (Benneworth & Cunha, 2015), and with an objective of transforming the policy framework in order to advance new agendas (Vézina, Malo & Selma, 2017).

KEY TERMS AND DEFINITIONS

Organizational Change: Occurs as a response to the drivers of change, leading organizations to implement new strategies and management models that can ensure success in the process of adaptation to the environment in which they operate.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Organizational Innovation: Relates to changes in an organization's organizational methods and structures in order to gain a competitive advantage over its competitors. This type of innovation has a more intangible nature than product or process innovation.

Social Economy: Includes those organizations with their own management and positioned between the market and the state. Such organizations view the possibility of profit as a mere instrument rather than an end in itself, since they are more focused on accomplishing social goals. The main objective is to serve the population, always based on the private sphere of the society.

Social Economy Organization: An organization that delivers a service and is social mission oriented in order to create social value.

Social Entrepreneurship: A field of action involving different kinds of actors, in which sociocultural and historical contexts emerge as key features, where individuals, the social entrepreneurs, construct outcomes, using entrepreneurial alertness and motivation to solve societal problems.

Social Innovation: A true social innovation is systems-changing by developing novel solutions in border spanning learning communities to create social value and promote community development, challenging existing social institutions through collaborative action developing wider networks.

Social Mission: The willingness of an individual or organization to pursue social goals focused on helping social excluded citizens, improving the quality of social services, and contributing to increase social responsibility.

Social Value: The value that accrue to society from social entrepreneurship/social innovation initiatives and that allow to solve social problems and create social capital.

Strategic Management: Relates to the definition by the top management of an organization of its main objectives and action plans to achieve those objectives, taking into account the resources available in the organization and an assessment of the internal and external environments in which the organization operates.

ENDNOTE

[1] A review of the literature about the concept of social economy is beyond the scope of this chapter. The working definition presented in the introductory section is assumed to fit the needs of the current chapter.

Chapter 17
A Social Enterprise Business Model and a Case Study of Pacific Community Ventures (PCV)

In Lee
Western Illinois University, USA

ABSTRACT

While there have been a significant number of studies in the management and operational side of social enterprise, the current theoretical framework of the business model in the strategic management area does not adequately take into consideration the unique characteristics of social enterprise and the context within which they must operate. By applying theoretical foundations in the strategic management, this paper fills the current research gap and develops a social enterprise business model. The proposed social enterprise business model is illustrated with a case study of Pacific Community Ventures. Finally, management guidelines of the social enterprise business model are discussed for social entrepreneurs.

INTRODUCTION

Social enterprises aim to achieve sustainability through stable revenue and profit generation while pursuing their own social mission (Peredo & McLean, 2006). Different types of social enterprises have emerged, ranging from non-for-profit to for-profit organizations (Global Entrepreneurship Monitor, 2009). For some types of social enterprises, social missions are directly embedded into goods and services. For other types of social enterprises, the profits generated from their non-social mission businesses are used to support their social missions. While it is a rapidly growing sector in the economy, their growth in large part depends on government policies, private and corporate donations, and government contracts. Furthermore, many social enterprises fail in the long run due to poor management, lack of innovation, or shortage of resources (Casselman, 2007).

Haugh (2005) indicates that the social enterprise is under-studied and the value of social enterprises to society is difficult to quantify where management practices, performance metrics, and business models are not well established. While a number of business models have been proposed and case studies have been conducted in corporate settings, no study has yet investigated the applicability of business models for social enterprises. To establish a well-defined social enterprise business model, the business model needs to take into consideration both the unique characteristics of social enterprise and the theoretical foundations of business models in the strategy area.

This study attempts to fill the gap between the current research and the pressing need for a solid business model by social entrepreneurs. We lay theoretical foundations for the social enterprise business model by reviewing literature on the business model and social enterprise. The purposes of our study are two-fold:

1. To develop a social enterprise business model and the components essential for successful value creation and management of social enterprises, and
2. To conduct a case study of Pacific Community Ventures (PCV) using the proposed business model and present management guidelines for the social enterprise business model.

The rest of the paper proceeds as follows. The second section develops theoretical foundations of the social enterprise business model. The third section presents a social enterprise business model reflecting the unique characteristics of social enterprise. The fourth section illustrates the proposed social enterprise business model with a case study of Pacific Community Ventures (PCV). The fifth section discusses management guidelines of the social enterprise business model. The sixth section concludes.

THEORETICAL FOUNDATIONS

Definitions of Social Enterprise

There is no one well established definition of social enterprise. Social enterprise is a relatively recent idea and its definitions vary between different countries and contexts. Different terms such as social enterprise, social businesses, social-purpose businesses, community enterprise, and social ventures are used interchangeably by different authors and organizations. Social enterprise is difficult to define, since the social, economic, legal, cultural, and political expectations required by the society at the time have to be taken into consideration. Therefore, one definition may only explain a part of social enterprise.

This lack of a widely accepted definition contributes to the challenges of gathering and analyzing statistical and other data and mapping social enterprises (Lyon & Sepulveda, 2009). For example, the US Social Enterprise Alliance's definition has been kept deliberately open to allow a wide range of organizations that define themselves as social enterprises to be included (Smallbone & Lyon, 2005). The Social Enterprise Magazine Online defines social enterprise even more broadly than the Social Enterprise Alliance. In the UK, the Social Enterprise UK was established in 2002 by members of the social enterprise movement to unify the competing interests. Their current members include social enterprises, private businesses, charities, and public sector organizations. The Social Enterprise UK's definition differs from that of the UK Central Government's Department for Business, Innovation & Skills in that the

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Social Enterprise UK narrowly defines the key characteristics of social enterprise such as reinvestment requirements and autonomy from the state. Table 1 summarizes the various views on social enterprise.

As shown in Table 1, social enterprises have been referred to as not-for-profit private organizations (Defourny & Nyssens, 2010), legal forms (OECD), businesses (Bull & Crompton, 2006; Social Enterprise West Midlands; Social Enterprise UK; Thompson & Doherty, 2006), and hybrid forms which mix for-profit and not-for-profit (Social Enterprise Magazine Online). In all definitions, primary objectives are social purposes or missions rather than personal/shareholder wealth or profit.

Table 1. Definitions of social enterprise

Sources	Definition
Social Enterprise Alliance (https://www.se-alliance.org)	Social enterprises are businesses whose primary purpose is the common good. They use the methods and disciplines of business and the power of the marketplace to advance their social, environmental, and human justice agendas.
Social Enterprise Magazine Online (http://www.socialenterprisemagazine.org)	Mission-oriented revenue or job creating projects undertaken by individual social entrepreneurs, nonprofit organizations, or nonprofits in association with for-profits
NESsT (http://www.nesst.org)	A social enterprise is a business created to further a social purpose in a financially sustainable way. Social enterprises can be both non-profit and for-profit in form.
Organisation for Economic Co-operation and Development (OECD) (http://www.oecd.org)	Social enterprises are organizations that take different legal forms across OECD countries to pursue both social and economic goals with an entrepreneurial spirit. Social enterprises typically engage in delivery of social services and work integration services for disadvantaged groups and communities, whether in urban or rural area.
Social Enterprise UK (http://www.socialenterprise.org.uk)	Social enterprises are businesses that trade to tackle social problems, improve communities, people's life chances, or the environment. They make their money from selling goods and services in the open market, but they reinvest their profits back into the business or the local community.
Social Enterprise West Midlands (http://www.socialenterprisewm.org.uk)	A social enterprise is a business that trades for social or environmental purposes. Social or environmental purpose is central to what they do. The profits they make are reinvested towards achieving that purpose.
UK Central Government's Department for Business, Innovation & Skills (https://www.gov.uk)	Social enterprise is a business with primarily social objectives whose surpluses are principally reinvested for that purpose in the business or in the community, rather than being driven by the need to maximize profit for shareholders and owners.
Korean Social Enterprise Promotion Agency (http://www.socialenterprise.or.kr)	Companies and organizations which pursue social mission as a top priority and perform business activities as well.
Smallbone, Evans, Ekanem, & Butters (2001)	Social enterprises are 'not-for-profit' organizations, involving some measure of community ownership and control, aiming to contribute social or community benefits.
Bull & Crompton (2006)	Businesses with the specific purpose of addressing 'social', 'community' or 'environmental' aims through a business structure that allows them to be sustainable.
Thompson & Doherty (2006)	Social enterprises are organisations seeking business solutions to social problems.
Defourny & Nyssens (2010)	Social enterprises are not-for-profit private organizations providing goods or services directly related to their explicit aim to benefit the community. They generally rely on a collective dynamics involving various types of stakeholders in their governing bodies, place a high value on their autonomy, and bear economic risks linked to their activity.
Johanisova, Crabtree, & Fraňková (2013)	Social enterprises are loosely defined as organisations involved at least to some extent in the market, with a clear social, cultural and/or environmental purpose, rooted in and serving primarily the local community and ideally having a local and/or democratic ownership structure (one member- one-vote rather than one-euro-one-vote).

Business Models

A business model is a relatively new term. The term rose to its prominence at the end of 1990s with the prevalence of the web and e-commerce (Ostenwalder, Pigneur, & Tucci, 2005). Mayo and Brown (1999) argue that a company should design key interdependent systems that create and sustain a competitive business. Many successful ventures have been created based on innovative business models that provide unique values to customers. However, a business model has not been clearly defined and a number of terms have been used alternatively, including strategy, business concept, revenue model, and economic model (Morris, Schindehutte, & Allen, 2005). In the literature, a business model is defined as a statement (Stewart & Zhao, 2000), a system of interdependent activities (Zott & Amit, 2010) an articulation (Teece, 2010), the organization (Timmers, 1999), a representation of management thinking and practice (Chararbaghi, Fendt, & Willis, 2003), and a method (Afuah & Tucci, 2003; Rappa, 2004). Zott, Amit and Massa (2011) find that the business model has been employed mainly in trying to address or explain three phenomena: (1) e-business and the use of information technology in organizations; (2) strategic issues, such as value creation, competitive advantage, and firm performance; and (3) innovation and technology management. A business model can become outdated through competition or shifts in technologies and markets (Linder & Cantrell, 2001). The competitive advantage resulting from a previously successful business model vanishes. For example, Blockbuster, one of the successful video rental stores, went of business after Netflix introduced online movie subscription business model. The web and e-commerce are changing the way the companies do business and are a principal driver of the surge of interest in electronic commerce (e-commerce) business models (Zott, Amit, & Massa, 2011). More studies are needed to understand business model dynamics and model development issues.

A number of studies have presented the logically interrelated components of a business model. For example, Morris et al. (2005) suggest six fundamental components: value proposition, customer, internal processes/competencies, external positioning, economic model, and personal/investor factors. Johnson, Christensen, and Kagermann (2008) propose four interlocking elements: customer value proposition, profit formula, key resources, and key processes. Like the definition of the business model, there exists no general agreement on the required components of a business model. Table 2 summarizes various definitions and components of a business model developed by the prior studies.

In sum, all these definitions share a common idea: it concerns what is produced and sold, how, and to whom it is sold. How is the value of the product or service derived? What is the business logic behind the revenue generation? Across these 14 definitions, one can find 53 different business model components. To derive essential components among the business models, we categorize the various components into groups based on their underlying similarity. We identify six major categories: value proposition, organizational governance, market scope, networked activities, resources, and sustainability.

Unique Characteristics of Social Enterprise

In developing a business model for social enterprise, it is imperative to identify the unique characteristics of social enterprise that should be embedded in the business model. Austin, Stevenson, and Wei-Skillern (2006) present the following four dimensions to guide the comparison between social enterprise and commercial enterprise. First, commercial enterprise' social market failure gives rise to social enterprises which can take advantage of the market failure. Commercial enterprises failed to meet the social needs (Weisbrod, 1975) or service beneficiaries could not afford the services. Social enterprises fill the gap

Table 2. Definitions and components of a business model

Study	Definition	Components
(1) Venkatraman & Henderson (1998)	A business model is a coordinated plan to design strategy along three vectors: customer interaction, asset configuration, and knowledge leverage.	Customer interaction, asset configuration, and knowledge leverage
(2) Timmers (1998)	An architecture for the product, service and information flows, including a description of the various business actors and their roles; a description of the potential benefits for the various business actors; a description of the sources of revenues.	Business actors and their roles, benefits, and sources of revenues
(3) Mahadevan (2000)	A business model is a unique blend of three streams that are critical to the business. These include the value stream for the business partners and the buyers, the revenue stream, and the logistical stream.	Value Stream, revenue stream, and logistical stream
(4) Amit & Zott (2001)	The content, structure, and governance of transactions designed so as to create value through the exploitation of business opportunities	The content, structure, and governance of transactions
(5) Chesbrough & Rosenbloom (2002)	The business model is the heuristic logic that connects technical potential with the realization of economic value.	Value proposition, market segment, value chain structure, revenue generation and margins, position in the value network, and competitive strategy
(6) Dubosson-Torbay, Osterwalder, & Pigneur (2002)	A business model is nothing else than the architecture of a firm and its network of partners for creating, marketing and delivering value and relationship capital to one or several segments of customers in order to generate profitable and sustainable revenue streams.	The products and services, the relationship capital, the infrastructure and the network of partners, and the financial aspects
(7) Afuah & Tucci (2003)	The method by which a firm builds and uses its resources to offer its customers better value than its competitors and to make money doing so.	Customer value, scope, pricing, revenue sources, connected activities, implementation, capabilities, and sustainability
(8) Morris et al. (2005)	A business model is a concise representation of how an interrelated set of decision variables in the areas of venture strategy, architecture, and economics are addressed to create sustainable competitive advantage in defined markets.	Value proposition, customer, internal processes/competencies, external positioning, economic model, and personal/investor factors
(9) Shafer, Smith, & Linder (2005)	A business model is a representation of a firm's underlying core logic and strategic choices for creating and capturing value within a value network.	core logic and strategic choices for creating and capturing value
(10) Brousseau & Penard (2006)	A pattern of organizing exchanges and allocating various costs and revenue streams so that the production and exchange of goods or services becomes viable, in the sense of being self-sustainable on the basis of the income it generates	Costs stream, revenue streams, production and exchange of goods or services, and income generation
(11) Johnson, Christensen, & Kagermann (2008)	A business model consists of four interlocking elements that, taken together, create and deliver value.	Customer value proposition (CVP), profit formula, key resources, and key processes

in the underserved market. Second, the mission of the social enterprise is to create social value for the public good. On the other hand, the commercial enterprise is motivated to generate maximum profit. Profit making activities of the social enterprise are the means to achieve their social mission. Third, resource mobilization restriction of the social enterprise makes them more difficult to tap external financial resources from investors than the commercial enterprise. It would be more difficult to recruit and maintain qualified staff due to limited monetary compensation than the commercial enterprise. Fourth, the performance measurement of the social enterprise is more complicated than the commercial enterprise due to the measurement challenges of creating and measuring nonfinancial social values which are often non-quantifiable. It is noted that there is a continuous spectrum from the pure social enterprise to the commercial enterprise and all social enterprises may be explained with distinctive positions on the continuous spectrum of the above-mentioned four dimensions.

DEVELOPMENT OF SOCIAL ENTERPRISE BUSINESS MODEL

Social enterprises often times fail despite the presence of market opportunities, innovative business ideas, good resources, and talented entrepreneurs. A possible reason is the deficiency of the underlying business model driving the business operation (Morris et al., 2005). While there exists an abundance of studies on the classifications, theories, and operations of social enterprise, little attention has been given to a business model development. The available research on social enterprise business modeling tends to be anecdotal, only citing success stories and different types of social enterprises. In light of the current research gap in this area, it is urgent to establish research questions or establish research agenda related to social enterprise business models.

In this section, we elaborate on the business model for social enterprises and explore how the unique characteristics of social enterprises can be reflected in the model components. We identify both the similarity and difference in social enterprises and commercial enterprises for each model components. Social enterprises have tended in the past to be grant-dependent and self- insufficient. To support their social value, social enterprises should pursue their endeavors in a thoroughly entrepreneurial way (Chell, 2007).

While the social enterprise business model was not given its much deserved attention, several studies focus on performance metrics of social enterprises. Rotheroe and Richards (2007) propose the social return on investment (SROI) analysis to operationalize performance management systems in order to quantify the value it creates. One criticism of the metric is that it may underestimate the true social value creation, because one cannot monetize certain impacts. Bull (2007) outlines the development of a sector specific business performance measurement tool called 'Balance', drawing on Kaplan and Norton's Balanced Scorecard (1992), and Kolb and Fry's organizational learning cycle (1975) as a conceptual framework. While these two measurement tools are useful for the ex-post analysis of social enterprise performance, they by no means help create innovative social enterprises ex-ante. Austin, Stevenson, and Wei-Skillern (2006) attempt to apply a commercial entrepreneurial model to social entrepreneurship. They apply Sahlman (1996)'s PCDO model with four interrelated components (the people, the context, the deal, and the opportunity) to social entrepreneurship. It is noted that the PCDO model is a business planning tool and therefore focuses on the "how" of entrepreneurship. A business model should be established before a business plan is developed.

A business model should be reasonably simple, logical, measurable, comprehensive, and operationally meaningful (Morris et al., 2005). Since there is no accepted definition of a social enterprise business

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

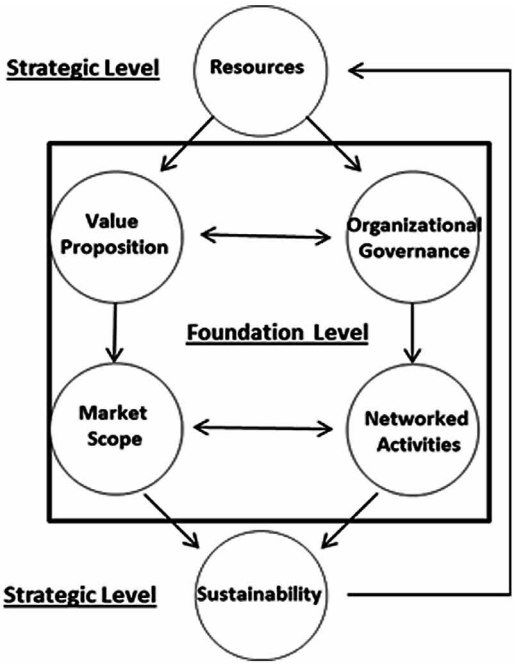
model, we develop a definition using the following two principles as guides. First, the definition should integrate and synthesize the earlier work in this area. Second, the definition should be simple enough so that it can be easily understood, communicated, and remembered (Shafer, Smith, & Linder, 2005). We define a social enterprise business model as:

A social enterprise business model is a decision-making framework for developing logically coherent activities to support social mission-driven value creation and formulating strategies to sustain competitive advantages.

Along with this definition, we adopt the six logically related business model components categorized in Section 2: value proposition, organizational governance, market scope, networked activities, resources, and sustainability (Lee, 2015). These components interact with each other to generate social value and economic value to achieve sustainability of the social enterprise.

These six components are divided into two levels: the foundation level (value proposition, organizational governance, market scope, and networked activities) and the strategic level (resources, and sustainability). The foundation level is concerned with decisions related to creation, delivery, and management of social value and economic value. The strategic level is concerned about creating competitive advantages in the market through the combination of resource and sustainability of social enterprise. The strategic level helps social entrepreneurs find ways competitive advantages can be created and provides measurable metrics for the sustainable competitive advantages. Later, an award-winning social enterprise will be analyzed using the proposed social enterprise business model. Figure 1 shows the relationships between these six components. The rationale and description of each component follows. The unique characteristics of social enterprise are reflected in each component and emphasized in italic style.

Figure 1.



EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Foundational Level: Creating Value

At the foundation level, four components have been identified based on the various prior studies, including those summarized in Table 1. Considering the unique characteristics of social enterprise and the commonality of different types of social enterprises, four components are selected: value proposition, organizational governance, market scope, and networked activities. The details of each component and theoretical foundations are as follows.

Value Proposition

Value proposition is a classical concept in marketing and can be understood as the relationship between an offer and customer needs (Porter, 1998). Value proposition refers to a description of the customer problem and needs, the solution that addresses the problem and needs, and the value of this solution from the customer's perspective. The creation of value is often thought of as a fundamental cornerstone of the management discipline (Anderson & Narus, 1999).

For social enterprises, value proposition may include (1) the value of products/services to the target group, which is an underserved, neglected, or highly disadvantaged group of people that lacks the financial means or educational background to achieve desired state on its own, (2) the value of providing employment/training of the target group, and (3) the value of products/services to target consumers for profit that is in turn used for the social mission.

These three types of products/services may exist in any combination. The value of products and services to the target group must exceed the cost of the products and services to have a sustained business (Porter, 1998).

Organizational Governance

Governance is formally defined as "systems and processes that ensure the overall direction, effectiveness, supervision and accountability of an organization" (Cornforth, 2003). Organizational governance typically decides the size of the organization, the type of the organizational structure, and organizational policies. A social enterprise's organizational governance sets the goal of the social mission, establishes objectives of the social mission and profit-seeking activities, develops metrics for performance evaluation, evaluates the performance against the metrics, and maintains transparency to the stakeholders.

The particular organizational governance of a social enterprise should be based on the consideration of which governance structure would most effectively mobilize the resources and accomplish social mission and sustainability.

Pearce (2003) argues that accountability to the organization's constituents and the wider community shall be a fundamental principle of social enterprises. Transparency of organizational governance is especially important for social enterprises, since social enterprises engage in a social mission as well

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

as profit-seeking and in part are operated with the financial support of donors. The expectation of the organizational governance of a social enterprise differs from that of a commercial enterprise, since the performance reward from a social market is not based on the economic value, but based on the social value.

There is no one-size-fits-all type of governance structure. Social enterprises can choose from a wide range of governance structures such as a management team, a single board, committees, advisory board, council, multi-tier (such as a board of directors and a management team), and task forces. A combination of these structural options can create various forms of hybrid structures.

The members of the governance structure may include internal stakeholders such as staff and owners and external stakeholders such as community leaders and government officials. Some governments have recognized special needs for social enterprises and established legal forms that protect the social mission as well as financial needs of the social enterprises. These legal forms include Benefit Corporations (B-Corps), Low-profit Limited Liability Companies (L3Cs), Community Investment Company (CIC), and Social Purpose Corporation. The decision on the governance structure may be influenced by tax rates and geographical locations. It is expected that governance structures evolve over time with changing environments. For more details on organizational governance, refer to Schöning et al. (2012).

Market Scope

Market scope determines specific market segments for the products or services that have appealing value propositions to the target groups. The market scope will be determined by a number of factors such as the particular social mission, needs of the market, competition in the market, and human and financial resources. A precise market segmentation study can be conducted by geography (e.g., cities, states, regions, and counties), demographics (e.g., age, income, gender, family size, occupation, education, and ethnicity), and psychographics (e.g., lifestyles, beliefs, values, interest, activities, and attitude).

The social enterprise's market is quite distinct from the commercial enterprise's market. The size of the former often is much smaller and provides fewer consumption alternatives to social beneficiaries than the latter. In addition, most of the social beneficiaries have little economic means to pay for the products and services provided by the social enterprise. For the commercial enterprise, the market size must be large and their industry must be structurally attractive. However, a recognized social need, demand, or market failure usually creates a more than sufficient market for a social enterprise. (Austin, et al., 2006)

Networked Activities

Social enterprises commonly operate through networked activities with partners, suppliers, government agencies, and other social enterprises. Partners of the network include internal stakeholders (shareholders, employees, and board of directors) and external stakeholders (government, community, donors, large corporations, suppliers, dealers, retailers, competitors, and non-governmental organizations) that add value to the supply chain of the products/services.

The significance and weight of the stakeholders are ranked by the magnitude of their value addition to the products/services. That is, the higher the value the stakeholder generates, the greater the role the

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

stakeholder played in the network. These high-value stakeholders would need special attention in the supply chain. Wood and Jones (1995) suggest that

… the stakeholders are the ones who assess the degree of success of the companies' response to social issues. Some external stakeholders stipulate that the company perform socially desirable activities. It is critical for the social enterprise to proactively create their own network of strong supporters and invest time and effort in communicating the social value to stakeholders and expediting the value creation process. The innovative use of the social networks of donors and volunteers becomes a key success factor for the social enterprise, since the social business operations hardly will reach a breakeven point without donations and government grants, even with entrepreneurial earned-income operations. (Foster & Bradach, 2005)

Strategic Level: Creating Sustainable Competitive Advantages

The foundation level activities are easier to replicate due to the widely known best-practice business logic and programmable business processes readily applicable to the four components. To gain a competitive advantage, social entrepreneurs need to develop hard-to-imitate resources and strategies. The unique resources and innovative strategies are more difficult to imitate. This strategic level is concerned about creating sustainable competitive advantages through resources and sustainability. The details of each component and theoretical foundations are as follows.

Resources

This component provides a conceptually grounded framework for assessing sustainable and developmental resources, and enables these resources to be examined in terms of the opportunities and threats for establishing sustainable competitive advantages. From a resource-based view, every firm has a unique set of resources that the firm can leverage to exploit opportunities and counter threats (Wernerfelt, 1984). Since not all resources are equal in creating sustainable competitive advantages, many researchers focused on identifying advantage-creating resources. Barney (1986, 1991) suggested that the advantage-creating resources must be firm-specific, rare, and difficult to imitate. In a changing environment, a social enterprise must continuously invent and upgrade their resources if they are to maintain a competitive advantage and growth.

Resources are strategic and a source of competitive advantage when they are valuable, rare and difficult to imitate or substitute (Reed & De Fillipi, 1990; Barney, 1991). In general, intangible resources would be more difficult to transfer and imitate than tangible resources (Carmeli, 2001). Each social enterprise has a different set of firm-specific resources to utilize. Two important questions for social entrepreneurs are:

1. What kinds of existing resources the social enterprise can leverage, and
2. What resources it needs to differentiate itself from the competitors.

The key resources of a social enterprise include the employees, donors, volunteers, technologies, products, facilities, equipment, marketing channels, and brand. All of these resources are utilized to deliver the value to the targeted customers and achieve social purpose. Acquiring and retaining resources are key

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

resource development activities including hiring qualified workers, employee relationship management, recruitment of volunteers, enlisting of donors and volunteers, government relations, and public relations.

Social enterprises compete with each other for donations, government grants and contracts, volunteers, clients or customers, and public recognition within their communities and societies. The resource related challenges of social enterprises include limited access to and retention of the best talent, fewer financial institutions and instruments, low employee compensation, and inherent strategic rigidities. (Austin et al., 2006)

Sustainability

Sustainability is concerned with the development of the ways a company can gain a sustainable competitive advantage in the market. While being sustainable, companies can maintain their competitive advantage in the market (Johnson & Scholes, 2002). This component lays a ground work for how a social enterprise will attempt to develop a sustainable competitive advantage and use it to improve its competitive position in the market.

The missions of the social enterprise are alleviating social problems in the society and community. However, the sustainability of the social enterprise is achieved only through the revenue and capital that they generate. (Dacin, Dacin, & Matear, 2010; Woolley, Bruno, & Carlson, 2013)

To achieve sustainability of a social enterprise, two types of performance metrics should be established: (1) nonfinancial performance (social mission performance and product/service performance), and (2) financial performance. Financial performance measurement is used by social enterprises to check their financial accountability (Bagnoli & Megali, 2011). Nonfinancial performance such as social mission performance also becomes important in assessing a social enterprise's success (Bagnoli & Megali, 2011). In general, a high level of nonfinancial performance and high level of financial performance will have better sustainability than a low level of nonfinancial performance and low level of financial performance. In addition, performance-enhancing strategies must be developed for a long-term nonimitable competitive advantage. While profit making is not the primary objective, social enterprises need to generate appropriate profit to become self-sufficient in the long run and to reinvest in the business to assure its sustainability.

Among nonfinancial performance categories, social mission performance may measure the environmental mission outcomes, community development outcomes, and other social mission outcomes. Product/service performance measures quality of products and services, innovation in products and services, and consumers' company/product/brand awareness, repurchase intention, and positive recommendation. Typical financial performance measures include government grants, individual and corporate donations, donation per employee, operating profit per employee, donation/grant to total asset, and liquidity ratio.

Figure 1 shows the dynamic interactions among the components. The dynamic changes occur in any component of the business model and lead to changes in other components directly and indirectly. For example, a change in the value proposition may affect the market scope and the organizational governance, which in turn can lead to changes in the networked activities of its employees, partners, volunteers, and sponsors. The change in the sustainability (e.g., strategy) may strengthen or weaken the

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

existing resources and competences, which in turn can lead to changes in the value propositions and organizational governance. While the internal changes initiated by the social entrepreneurs are the main driver of the model dynamics, external factors such as government regulations, competition, and the economy may also affect the model dynamics. For detailed discussions on the business model evolution, refer to Demil and Lecocq (2010).

A CASE STUDY OF PACIFIC COMMUNITY VENTURES (PCV)

The objective of this case study is to provide an empirical exploration of how a social enterprise may use the social enterprise business model in their entrepreneurial activities. While this case can only provide limited empirical evidence for grounded theory building, it illustrates the business model from a practitioner point of view and may lay the groundwork for future research. Below we choose Pacific Community Ventures (PCV) and analyze their business activities with the proposed social enterprise business model. PCV was selected as one of the Top 33 Social Entrepreneurs in 2011 by Forbes (Impact 30, 2011). PCV is a *hybrid social enterprise* which has a for-profit unit for community development venture capital investment and an affiliated not-for-profit unit which provides such social impact services as free business advising for SMEs and research services to investment and philanthropic institutions. The strategic challenge for this type of hybrid social enterprise is the integration and balance of public and private value (Florin & Schmidt, 2011). This case study uses qualitative data as the main source. The qualitative case study can benefit professional practice or evidence-informed decision making (Creswell, 1998). Data were collected using business publications, Internet sources, and corporate materials from both internal and external organizational sources. Construct validity has been adequately addressed by using multiple sources of information (Yin, 2009).

Pacific Community Ventures

Pacific Community Ventures (PCV), founded by Bud Colligan in 1998, is a fifteen-year-old California-based company headquartered in San Francisco. Its mission is to provide capital and business expertise to small and medium-sized enterprises (SMEs) that can bring economic benefits to low- and moderate-income (LMI) communities in California. In 1998, Bud Colligan explored the possibility of applying a venture capital model to SMEs as a means to alleviate poverty in underserved communities in California. PCV developed a robust business model that has sustained turbulent times including the aftermath of 9/11 and the crash of Wall Street in 2008 that devastated the US economy. Since its founding in 1998, PCV has grown rapidly, invested prudently, and achieved social missions for the LMI communities in California. The following describes the business model of PCV.

Foundation Level

Value Proposition

PCV's value proposition is to provide both double-bottom line funds and business advising to SMEs in the LMI communities in California, particularly in ways which will have a direct impact on the success of the SMEs and their low-income employees. PVC noted that SMEs are an important element for

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

community economic development, yet many SMEs operating in the LMI communities in California are not connected well from the financial resources needed to grow their businesses. PCV attempts to breaking down the barrier to the financial resources for SMEs in LMI communities. The social return is an essential component of PCV's value proposition. To seek financial resources from PCV, SMEs must pass a social return screen, in which PCV considers a company's employment opportunities or "job quality" for LMI employees.

In addition to the financing services to qualified SMEs, PCV provides two other services: free business advising services and InSight. PCV's network of advisors, entrepreneurs, and partner organizations provide qualified SMEs with free business advising services to help them and their employees excel. PCV developed InSight, which is an independent evaluation instrument for social and environmental outputs. InSight is used by some of the most prominent investment and philanthropic institutions in the US.

Organizational Governance

The organizational governance of PCV consists of the board of directors and the core management team. The independent board of directors is a group of high-caliber individuals with experience in venture capital, marketing, business management, legal services, and community networking. Out of eleven members, three are internal members. These directors act as champions for PCV and enlist their own business networks to secure ongoing funding and partnerships.

Market Scope

PCV designed a hybrid profit/nonprofit marketing program, refined over the past fifteen years, to deliver capital and free business advising for SMEs, and research services to investment and philanthropic institutions in the US. PCV targets growth-oriented SMEs that typically go under the radar of venture capital firms but that demonstrate a sound growth capability and the potential to provide quality employment in the LMI areas in California (Caplan, Irie, & Cheplick, 2006). Their market profile include equity investment, California businesses with focus on the San Francisco Bay Area, Los Angeles, San Diego, and/or Central Valley, portion of work force from low- or moderate-income communities, primary industry focus on food products and distribution, low-capital-intensive manufacturing, and other high-growth sectors, including sustainable and green businesses, alternative energy, health and wellness, trade schools, and for-profit education (Innamorati, 2011).

Networked Activities

PCV secures funding from investors who are willing to explore ways to balance their community values and their interest in superior financial returns. These investors include banks, pension funds, insurance companies, and other institutional and individual investors. PCV utilizes networks of PCV's volunteer business professionals to act as PCV champions in market expansion, to expand to established community/economic development organizations, and to encourage SME owners to participate in PCV's business advising program. In the business advisory service, SME owners work individually with volunteer advisors to address key business development objectives and to solve management problems. In making these one-on-one matches, the PCV staff analyzes the functional fit between an advisor's qualifications and

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

an SME's needs with the consideration of industry experience, interpersonal dynamics, and logistical constraints (Caplan, Irie, & Cheplick, 2006).

PCV also created a business network of experienced entrepreneurs and business people and provides SME owners with access to their business network. Before joining PCV's business network, most PCV financed SMEs lacked access to business networks that could support them with management resources and innovative ideas. Through PCV's growing business network, SME owners continue to maintain informal connections and receive new management knowledge and skills even after the end of their financing period.

Strategic Level

Resources

PCV's critical resources include investment funds, internal staff, community partners (business advisory service volunteers, media sponsors, and PCV partners), donors (corporate sponsors, individual cash donors, foundation grants, and in-kind sponsors), organizational infrastructure (best-practice business processes and a web-based information system), and government contracts. Through the business advising program, PCV recruits local business leaders to volunteer their time to help SMEs exploit their business potential. PCV's community partnerships create strong presence in their business locations and facilitate knowledge sharing and information exchange in the communities. PCV recruit high caliber internal staff who can ensure superior product/service quality, effective communication, and efficient business process execution across different geographic locations.

Sustainability

While PCV's investment fund business is sustained by the fees they receive, PCV's business advising program relies on donation to support the bulk of their activities. PCV envisages that these services will eventually be supported by the income generated by investment funds. PCV's network of volunteers, board members, and SMEs has facilitated service expansion into new locations. Securing strong private sector leaders from the local community to serve as program champions has also been a key to successfully replicating the PCV model in new geographic locations. These local leaders establish a ground work for creating local ownership for the program. In addition, PCV made sure that business processes are well articulated to guarantee consistent program quality and provide process compatibility among different locations.

Realizing that local SMEs usually do not have the potential for exponential growth, PCV shifted their funding target from early-stage SMEs to growth-stage SMEs (Caplan, Irie, & Cheplick, 2006). This is an example of PCV's learning-from-failure organizational culture which led to positive results for investors as well as the entrepreneurs. At organizations, successful learning-from-failure requires context-specific strategies. Detection, analysis, and experimentation are three essential activities of all successful organizations (Edmondson, 2011). PCV detected the funding problems to the early stage SMEs, analyzed the problems, and successfully experimented with funding to the growth-stage SMEs.

According to the 2012 financial report, PCV generated a total revenue of $3,191,512 (fund returns & management fees 17%, government 26%, insight project fees 16%, foundation 25%, corporate 9%, individual 4%, and board directed investments 2%) and a total expense of $2,889,955 (program: insight

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

33%, business advising 30%, investment services 21%, general & administration 11%, and fundraising 4%). PCV achieved a net profit of $0.3 million in 2012. In terms of the social mission outcomes, PCV-financed SMEs created 198 new quality jobs in LMI communities and an LMI employment growth rate of 7% compared to 1.69% job growth in the nation. PCV worked with 147 small businesses through their business advising program and affiliated equity funds (PCV Annual Report, 2013).

In the past fifteen years, PCV has established a focused and differentiated market presence in California. To enhance their social mission, product/service, and financial performances concurrently, PCV successfully employed resource-based, differentiated, replication of the best-practice, and learning-from-failure strategies.

Dynamic Interactions Among Model Components of PCV

During the first few years of the establishment, PCV had to determine whether equity or debt was the better form of value proposition for their purposes. Eventually they chose equity as the best investment vehicle, since it allowed them to be more involved and to offer additional support to their financed SMEs (Innamorati, 2011).This decision also led to a change in their market scope in terms of an optimal investment size and target industry.

Similar to the change in the PCV's equity investment, PCV made a change in the value proposition of its business advising services during the first eight years and led to a shift in the market scope for the services. In the early years, nearly all PCV financed SMEs received both advising services and equity investment. In 2002, as PCV shifted its investment targets to larger, more developed SMEs, the number of SMEs in the PCV's advising services began to dwindle due to the decline in the number of the financed SMEs. In 2003, PCV developed new advising services to target the early-stage SMEs that PCV had once served before shifting its investing focus to the more mature SMEs.

The sustainability issue also led to the change in the market scope of PCV. PCV believes that long-term financial sustainability is positively related to social and environmental performance, which is often not reflected in the short term investment analysis. In 2000, PCV invested in SMEs with $250,000 to $3 million in annual revenues. Realizing the equity investment was not right for the SMEs in these revenue scales and sustainability of PCV is in jeopardy, they shifted their market scope to SMEs with $1 million to $5 million in annual revenue. Finally, PCV shifted their targets further to $5 million to $50 million SMEs.

MANAGERIAL GUIDELINES

Based on the analysis of the case in Section 4, this section will discuss the managerial guidelines for social enterprise business model development.

Evolution of the Social Enterprise Business Model

Many previous studies analyzed the business model in a relatively static point of view. However, the static view has limitations in describing the evolutionary nature of the business model. Business model evolution is viewed as a fine-tuning process involving intended and emergent changes both between and within its core components (Demil & Lecocq, 2010). In the dynamic view of the business model, the

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

business model transforms itself over time and manifests its evolution with the dynamic adjustment of the components in interaction with the environments. Different types of accumulated resources interact with each other and with other parts of the firm's infrastructure, thereby creating unique combinations that will vary within the firm, and which produce and determine the firm's idiosyncratic set of capabilities (Kor & Mahoney, 2000). With a new set of capabilities, the social enterprise can build new value propositions and tap new markets.

Our case study shows that PCV continues to evolve their business model in terms of their value propositions and market scope. PCV is growth-oriented and entrepreneurial with strong leadership constantly seeking new opportunities to further their social mission. PCV began in 1998 as a small social-mission-oriented startup in San Francisco. Through the expansion in program and location, PCV now serves the state of California from its headquarters in San Francisco. Learning from investment failure in the early stages of the company, PCV shifted their funding targets from early-stage SMEs to growth-stage SMEs, which ultimately enhanced PCV's sustainability.

Taking Advantage of Network Externality for the Social Enterprise Business Model

The benefits of expanded business network can be explained with network externality. Network externality theory was used to explain the increased value of telecommunication adoption by a large number of subscribers in the 1970s (Rohlfs, 1974), and the theory has been developed and refined over time to model many organizational technology adoption decisions (Economides, 1996).

As more SMEs and business professionals join the PCV business network and free business advising services, still more people want to be part of the PVC business network and free business advising services. To strengthen their network externality, PCV adopted social networking services extensively. PCV uses private blogs and public social networking services such as Twitter, Facebook, and LinkedIn to disseminate knowledge and connect internal staff with SMEs, business advisors, and donors. PCV's web-based advisory hub represents PCV's entrepreneurial spirit and disciplined approach to creating, developing, and scaling technological solutions to community and economic development efforts. LinkedIn is used to recruit volunteer business advisors who can help promising SMEs grow and create jobs in the LMI communities.

Fit of the Social Enterprise Business Model

In the strategy area, the internal fit between the strategy and the structure of firms (Learned, Christensen, Andrews, & Guth, 1965) and the external fit between the structure and the environment of firms (Pennings, 1987) have been widely studied. The internal fit among reinforcing activities can create and sustain a competitive advantage because it makes competitors' imitation difficult (Porter & Rivkin, 1998; Rivkin, 2000).

For the social enterprise business model, the internal fit can be achieved via both coherence and mutual reinforcement among the components of the social enterprise business model. On the other hand, the external fit can be achieved by developing a business model consistent with environmental conditions in the market, industry, and economy.

To achieve the internal fit, PCV recruited high caliber, business-oriented professionals who have a good fit with PCV's diverse set of stakeholders, value proposition, and social mission. As PCV has expanded

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

into new markets, they tried to ensure consistency in the model and refined the PCV business model with the unique needs of the local communities. PCV's solid organizational infrastructure, which consists of standardized processes and a web-based system, has also been critical to ensuring the internal fit.

Replication of the Social Enterprise Business Model

The business model replication is one strategy for early and rapid expansion of innovation. Szulanski and Jensen (2008) suggest that significant growth often requires more than innovation of the firm. It requires exploitation in the form of replication in order to maximize growth potential. According to Winter and Szulanski (2001), business model replication refers to the innovative firm's activities of choosing the essential components to replicate in the model, developing capabilities to routinize knowledge transfer, and maintaining the replicated model in operation.

Business model replication is one of the important drivers of success at Pacific Community Ventures. PCV starte in the San Francisco Bay area, and then expanded geographically with model replication. PCV now serves the state of California from its headquarters in San Francisco. To achieve the successful replication of the business model, PCV made sure that PCV's processes are standardized and sophisticated to guarantee consistency of program quality, compatibility of business processes, and scalability of business operations at different locations in California.

CONCLUSION

Reflecting the unique characteristics of social enterprise, this paper developed the two-level six-component social enterprise business model. These six components should be coherently developed and fit with the environment to maximize the social enterprise's double-/triple-bottom line. The foundation level of the social enterprise business model consists of value proposition, organizational governance, market scope, and networked activities. These four components define the standardized set of decisions that can be operationalized. The strategic level consists of resources and sustainability. These two components define resource base, performance metrics, and strategies to gain a sustainable competitive advantage. The proposed social enterprise business model can help social entrepreneurs conceptualize innovative business ideas and refine them through iterative model building processes.

After the case study of PCV's business model, four managerial guidelines of the social enterprise business model were presented. The social enterprise business model must evolve over time to adapt to the changing environment and social mission needs. In addition, the development of the business model should take the internal and the external fit into consideration to deliver the best-fit contextual business model. Social media has now become an indispensable tool for the cost-effective and timely realization of the network externality. Finally, business model replication should be considered for the early and rapid expansion of innovation, especially when social enterprises expand into different locations with the same or similar value propositions.

Despite the long history of social enterprise studies, there is still a paucity of studies on the business modeling side. This lack of a social enterprise business model makes it very challenging for social entrepreneurs to make effective decisions in regard to operational and strategic activities. Our study is one of the first studies on the social enterprise business model and sheds valuable insights into critical modeling activities. Our study contributes significantly to the literature of social enterprise by linking

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

social enterprise with a business model in the strategy area, defining the social enterprise business model, establishing the essential model components, and presenting guidelines for effective model management.

Finally the following limitations to this study are acknowledged. First, only a few articles on the use of business model for social enterprises have been published in journals. Therefore, theories and literature review to support the development of the social enterprise business model is limited. Second, due to the interdisciplinary nature of the social enterprise business model, the literature is widely divergent ranging from social entrepreneurship to business models. The literature review was extensive, but lacked a focus to some extent. Third, although our case study could be justified as a qualitative case study, the research is limited to a single case. Therefore the generalizability is limited.

ACKNOWLEDGMENT

KEY TERMS AND DEFINITIONS

Business Model: A decision-making framework for developing logically coherent activities to support value creation and formulating strategies to sustain competitive advantages.

Governance: Systems and processes that ensure the overall direction, effectiveness, supervision and accountability of an organization.

Social Enterprise: Social mission oriented not-for-profit, for-profit, or governmental agencies which pursue profit to sustain their social missions.

Social Enterprise Business Model: A decision-making framework for developing logically coherent activities to support social mission-driven value creation and formulating strategies to sustain competitive advantages.

Value Proposition: A description of the customer problem and needs, the solution that addresses the problem and needs, and the value of this solution from the customer's perspective.

Chapter 18
Implementation of a Social Innovation Model for Economic Value Creation

Edgar Muñiz Avila
Tecnológico de Monterrey, Mexico

Lucia Rodríguez-Aceves
Tecnológico de Monterrey, Mexico

Mario Adrián Flores-Castro
Tecnológico de Monterrey, Mexico

ABSTRACT

This chapter reviews and discusses the multidimensionality of social innovation literature and relates it to some aspects of economic value creation. Moreover, it proposes a model for micro-businesses creation as a solution to reduce asset poverty. The model, characterized as a social innovation, was adapted to an academic program at the Tecnológico de Monterrey, which is one of the largest private universities in Mexico. The results of the pilot implementation clearly showed a positive impact in the increase in sales, job creation, and –consequently– the creation of economic value. Finally, the chapter highlights social innovation as an important input for governmental economic plans because the development level of a country is more important than its economic growth.

INTRODUCTION

Increasingly, private firms, public organizations and community groups are becoming aware of their responsibility and role in solving social problems that have not been attended by traditional approaches (Lettice & Parekh, 2010). New generations are now engaged in innovative ways of value creation and exchange that might contain the basic elements of true knowledge organizations. In academy, the term social innovation is present in Economics, Sociology and Political Science, hence new journals have

been created (e.g. Stanford Social Innovation Review, International Journal of Social Entrepreneurship and innovation). Even more interesting is the extraordinary upsurge of social innovation forms that have emerged: mutual self-help, microcredit, cooperatives, trade unions, reading clubs, think thanks, foundations among many others.

It is the purpose of this chapter to review and describe the social innovation literature and some aspects of economic value creation, in order to clarify the variety of approaches and the different nature of lines of inquiry. In addition, the chapter describes a case study of an academic course that contributes to reduce asset poverty through the development of a program that promotes the micro-businesses creation. Such program can be characterized as a social innovation.

The implementation of the case study was based on a model that considers a continuous learning process focused on the quality of the person and the business (Walton, 1986). In order to measure the effect of the model, 25 Mexican business owners participated in the program and were supported by students and mentors from the Tecnológico de Monterrey (a private Mexican University). The results showed that the model, characterized as a social innovation, had important positive effects in promoting sales, jobs creation and growth acceleration of the microbusinesses.

The chapter concludes highlighting the importance of social innovation in our rapidly changing world, its multidimensionality and systemic approach. The main contributions of the chapter are the social innovation literature review that maps the current academic view and the case study description in an interesting context. Moreover, the chapter presents some implications of social innovation for leaders, policy makers, funders, academic and practitioners. Finally, the chapter reveals further research lines.

SOCIAL INNOVATION

Theoretical Background

As in other fields like Knowledge management, Social innovation has grown up as a field of practice with a relatively little attention to theory. Over the last two centuries, innumerable social innovations have emerged. They include the invention and spread of trade unions and cooperatives, the spread of collective insurance against sickness and poverty, the spread of new models of the university in the 19th century, the spread of the kindergarten, among many others (Mulgan, Tucker, Ali & Sanders, 2007). Actors behind such social innovations have changed in history. During some periods, civil society provided the impetus driving the mutual self-help and microcredits in the 19th century. In some others, social movements took the lead, as was the case of the antislavery movement in late 18th century. Governments also have been main characters, for example in 1945 when democratic governments built welfare states and schooling systems. It is hard to think in any field in which social innovation has not played an important role (Mulgan, et. al, 2007).

Academic literature on social innovation goes back to Max Weber (1922) and the concept of social action, as well as the analysis of action systems based on it by Talcott Parsons (1951). In 1934, Joseph Schumpeter created another theoretical landmark by establishing the fundamental role of innovation and structural change in the organization of society and the role of the entrepreneur as a driver of development. The social innovation concept currently draws from four theoretical sources: innovation, social investment, change and open society (European Commission, 2011). The literature related to innovation,

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

which comes from management studies, stresses the social processes in which innovation has to be embedded. The literature on social investment and social capital brings to the fore the relationship between social innovation and economic growth (Heckman & Navarro-Lozano, 2004). The literature on change helps to confront the theories on how change occurs, and peer-to-peer and open-society literature drawn from IT open source systems are forging new business and community value models.

Social Innovation Definitions

Recently, a number of scholars have focused their attention on studying Social Innovation. As a result, several definitions have emerged. After a review of social innovation literature and based on Michelini (2012), a list with the main definitions in chronological order was integrated (see Table 1).

As it is shown in Table 1, social innovation definitions are broad in the sense that some of them focuses on the process, the outcomes, the actors involved, the motivations, among many other aspects. For such reason in the next lines a discussion of some of the main concepts is presented.

Anderson, Curtis and Wittig (2014) categorized social innovation definitions by focus and by nature. Focusing in the noun "innovation", the authors suggests that social innovation is driven by the transition from an industrial to a knowledge and services based society. In a similar vein, Degelsegger and Kesselring proposed to conceptualize social innovation as a new paradigm of innovation management, research and assessment rather than being considered a distinct form of innovation in itself (2012, p.70). In this sense, all innovations have social effects, and accordingly innovation theory needs a new paradigm to reflect this, rather than attempting to find a distinctive definition for social innovation (Anderson, et. al, 2014).

Another line of inquiry is the focus on the adjective "social", framing their definitions within the theoretical framework of the social sciences and emphasizing the distinction of social innovation from other forms of innovation. In particular, economic and technological innovations, arguing that social innovation is more than a "mere requirement, side effect and result of technical innovation" (Howaldt & Schwarz, 2010, p.8). Such definitions mainly focuses on social practices in certain areas of action or social contexts. A more direct focus on social outcomes defined by the practice, intention, and outcomes of social justice is apparent in the definition proposed by Martinelli (2012, p. 172). The definition characterizes social innovation by its contribution in satisfying human needs that would otherwise be ignored, empowering individuals and groups, and changing social relations (Anderson, et. al, 2014).

Accordingly, a definition focused on intention and outcome and perhaps one of the most spread in the academic literature is "a novel solution to a social problem that is more effective, efficient, sustainable, or just than existing solutions and for which the value created accrues primarily to society as a whole rather than private individuals" (Phills et al., 2008). In similar vein, Hochgerner suggests "social innovations are new concepts and measures that are accepted by impacted social groups and are applied to overcome social challenges" (Hochgerner cited in Howaldt & Schwarz, 2010, p.23).

A number of broad definitions that expand the notion of social innovation to include activities across a range of sectors and varying levels of society also exists (Anderson, et al., 2014). For example, "Social innovation may be considered any activity that expands the capability to act (of parts or the whole of society), and enables or leads to concrete action" (Hochgerner, 2012, p.91). To sum up, there is a huge variety of definitions focusing in different aspects and derived from a theoretical perspective. In this chapter, a definition of social innovation considered as a conceptual framework is: "to apply new ways to overcome social problems in a more effective approach, compared with the existents, where the

Table 1. Main definitions of social innovation in chronological order

Source	Definition
OECD/LEED forum on Social Innovations (2000)[6]	"Implies conceptual, process or product change, organizational change and changes in financing, and can deal with new relationships with stakeholders and territories. Social innovation seeks new answers to social problems by: • Identifying and delivering new services that improve the quality of life of individuals and communities; • Identifying and implementing new labor market integration processes, new competencies, new jobs, and new forms of participation, as diverse elements that each contribute to improving the position of individuals in the workforce.
Centre de recherche sur les innovations sociales (CRISE / UQAM) (2003)	A social innovation is an intervention initiated by social actors to respond to an inspiration, to provide for a need, to benefit from an opportunity to modify social relationships, to transform established patterns of behavior, or to propose new cultural orientations.
Christensen et al. (2006)	Social innovation is a subset of disruptive innovations whose primary objective is social change.
Little (2006)	Social innovation is the use of social, environmental or sustainability drivers to create new ways of working, new products, services and processes, and new market space.
Skoll World Forum on Social entrepreneurship and Social innovation (2007) / (Skoll, in Westall, 2007)	Social innovation can simply be understood as new ideas that work to address social or environmental needs. It may occur as a result of addressing new needs, reframing circumstances to make unmet social needs clear and urgent, or changing organizational structures to grasp the opportunities to add social value. New programmes, models, or ways of thinking—sometimes a combination of all three—may be the result. Social innovation is more than just invention. Diffusion or the scale of ideas is an integral part of making its impact effective, as is coordinated actions by a wide range of people and organizations spanning social, government and business sectors.
Mulgan (2007)	innovative activities and services that are motivated by the goal of meeting a social need and that are predominantly developed and diffused through organizations whose primary purposes are social"
Nussbaumer and Moulaert (2007)	Social innovations can be macro or micro, structural or local, they are introduced by an entrepreneurial spirit and through solidarity, either to improve the functioning of the organization or to transform the organization into a social enterprise, an enterprise with social objectives, an organization pursuing social objectives or to empower it with a more participatory governance system.
National Endowment for Science, Technology and the Arts NESTA (2008), United Kingdom,	Social innovation refers to: • New ideas (products, services and models) developed to fulfill unmet social needs; • Many of those supported by the public sector, others by community groups and voluntary organizations; • Social innovation is not restricted to any one sector or field; • It can take the form of a new service, initiative or organization, or a new approach to the organization and delivery of services; • Social innovation can either spread throughout a profession or sector—like education or healthcare – or geographically from one place to another.j
Phills, Deiglmeier and Miller (2008) / Stanford Social Innovation Review	Any novel and useful solution to a social need or problem, that is better than existing approaches (i.e., more effective, efficient, sustainable, or just) and for which the value created (benefits) accrues primarily to society as a whole rather than private individuals. A social innovation can be a product, production process, or technology (much like innovation in general), but it can also be a principle, an idea, a piece of legislation, a social movement, an intervention, or some combination of them.
Pol and Ville (2009)	An innovation is expressed as social innovation if the implied new idea has the potential to improve either the quality or the quantity of life.
Bisgaard (2009)	New products, services, business models, processes, distribution channels and so on, that are able to solve global challenges related to both environmental issues and social problems.
Harris and Albury (2009)	Innovation that is explicitly for the social and public good; innovation inspired by the desire to meet social needs which can be neglected by traditional forms of private market provision or be poorly served or unresolved by services organized by the state. Social innovation can take place inside or outside of public services and can be developed by the public, private or third sectors, users and communities; however, some innovations developed by these actors do not qualify as social innovation because they do not directly address major social challenges.
Westley and Antadze (2010)	"a complex process of introducing new products, processes or programs that profoundly change the basic routines, resource and authority flows, or beliefs of the social system in which the innovation occurs. Such successful social innovations have durability and broad impact"
OECD (2010)	Social innovation seeks new answers to social problems by: identifying and delivering new services that improve the quality of life of individuals and communities; identifying and implementing new labour market integration processes, new competences, new jobs, and new forms of participation, as diverse elements that each contribute to improving the position of individuals in the workforce. Social innovation therefore can be seen as dealing with the welfare of individuals and communities, both as consumers and producers. The elements of this welfare are linked with their quality of life and activity. Wherever social innovations appear, they always bring about new references and processes. Social innovation is different from economic innovation because it is not about introducing new types of production or exploiting new markets in themselves but is about satisfying new needs not provided for by the market (even if market intervene later) or creating new, more satisfactory ways of insertion in terms of giving people a place and a role in production.
European Comission (2011)	Innovations that are social in both their ends and their means – new ideas (products, services and models) that simultaneously meet social needs (more effectively than alternatives) and create new social relationships or collaborations. They are innovations that are not only good for society but also enhance society's capacity to act. Social innovations take place across boundaries between the public sector, the private sector, the third sector and the household
Social innovation Europe (2012)	Social innovations are new ideas, institutions, or ways of working that meet social needs more effectively (than existing approaches).
Bachra, Chisholm, King, Pike and Stanton (2015)	"Social Innovation creates systemic change by engaging the public, private, and non-profit sectors to solve serious social problems that affect the wellbeing of citizens in ways that improve effectiveness, efficiency, sustainability, or justice, such that the value created accrues primarily to society as a whole rather than to private individuals"

Source: Own elaboration based on Michelini (2012).

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

participation of different stakeholders from private and public institutions is required and the expected outcome is to create socio-economic value".

Laura Michelini (2012) analyzed social innovation literature in order to capture the common denominators of existing definitions and came out with a list of social innovation's main features. The first feature is the social goal, which refers to generate a positive social impact as for example maintaining quality at a price that is affordable. The second feature is the motivation, which goes from generating profit to only creating social impact. The third aspect is the novelty (i.e. new forms of ideas, activities, products, services, business models), because innovations should be new to the user, the context, or the application. The fourth characteristic relates to the actors that promote social innovation (i.e. governments, private sector, and civil society). The fifth feature is the scalability that consists on increasing the scope or reach of an activity, program, project, or initiative so that it serves more people. The sixth aspect is sustainability, meaning that social innovation must meet economic and environmental challenges.

From a more practical perspective, it is considered as a good characterization of social innovation the one proposed by the European Commission in its reports of 2012 and 2013[12]. In general, social innovation approaches are open rather than closed when it comes to knowledge-sharing and the ownership of knowledge. Tends to be multi-disciplinary and more integrated to problem solving than the single department or single profession solutions of the past. Internally, the main characters are participative and empowered citizens and users, rather than 'top down' and 'expert-led.' The approach is definitely demand-led rather than supply-driven. Interestingly, it is tailored rather than mass-produced, as most solutions have to be adapted to local circumstances and personalized to individuals (European Commission, 2013).

Social innovations can be schematically classified into three broad categories. Firstly, the (generally) grassroots social innovations that respond to pressing social demands not addressed by the market and are directed towards vulnerable groups in society. Second, a broader level that addresses societal challenges in which the boundary between 'social' and 'economic' blurs and which are directed towards society as a whole. Third, the systemic type that relates to fundamental changes in attitudes and values, strategies and policies, organizational structures and processes, delivery systems and services (European Commission, 2011).

Social Innovation Process

Some scholars assumes that social innovation is a process and for such reason have focused on modelling its phases or stages (Bachra, et. al, 2015; European Commission, 2013; Mulgan, 2006). According to Bachra et. al, (2015), stage one focuses on identifying problems and generating ideas for solutions. Stage two involves testing ideas against metrics for success in order to determine which ideas merit the investment of scarce resources. Stage three centers on gaining access to financial and other forms of capital that are necessary to expand an innovation beyond the pilot-project stage. Stage four incorporates examination of what has occurred so far, assessment of what new priorities have emerged as a result, and determining how to institutionalize and build upon the innovation project.

Mulgan (2006) suggests that the first stage of an innovation is to identify an idea of a need that is not being met and couple it with an idea of how it could be met. The second phase involves taking a promising idea and testing it in practice. The third stage of the process comes when an idea proves itself in practice and can then be grown, replicated, adapted, or franchised. In a fourth stage, innovations continue to change, learning and adaptation turns the ideas into forms that may be very different from

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

the original. The author explains each of the phases and exemplifies them for social innovation. He also clarifies that the linear account innovations provides a useful framework, but not necessarily, the stages are always consecutive.

For the European Commission (2013), social innovation describes the entire process by which new responses to social needs are developed in order to deliver better social outcomes. This process is composed of four main elements. The first one consists of the identification of new/unmet/inadequately met social needs. The second regards the development of new solutions in response to those social needs. The third, lies on the evaluation of the effectiveness of new solutions in meeting social needs. The last one entails the process of scaling up the effective social innovations (European Commission, 2013).

Regarding social innovation inhibitors, The European Commission have identified three main obstacles to the development and mainstreaming. First, the traditional risk-averse and cautious organizational cultures of administrations. Second, closed systems which favors single-issue solutions developed within clusters of organizations, lacking mutual awareness, communication, networking and trust, fragmented capacities (resources, infrastructures and intermediaries) and skills (training, design tools, monitoring, validation and evaluation) preventing the development of a rich 'eco-system' for enabling social innovations. Third, insufficient stable, seamless and sustainable funding throughout all stages of the innovation cycle (European commission, 2011). The field of social innovation remains fragmented and there is a need for more developed networks as well as innovation intermediaries for brokering the connections needed to nurture and scale up social innovations. To sum up, inhibitors of a social innovation are power monopolies, restrained communication and lack of independent sources of money.

From the point of view approached in this chapter, which is on social innovations that derives on replicable models and programmes, two drivers of innovation are identified. On the one hand, innovation becomes an imperative when problems are getting worse, when systems are not working or when institutions reflect past rather than present problems. On the other hand, awareness of a gap between what there is and what there ought to be, between what people need and what formal institutions (e.g. governments, private firms and NGO s) offer. Such gap is constantly widened by a variety of factors, as is the emergence of new technologies and new scientific knowledge (Mulgan, et. al, 2007).

ECONOMIC VALUE CREATION

The primary purpose of business is to create and maintain value (Sirmon, Hitt & Ireland, 2007). Consequently, understanding what value is and how value is created has attracted scholars' attention over the past decade (Anderson, Narus & van Rossum, 2006; Bowman & Ambrosini, 2009; Lepak, Smith & Taylor, 2007). Different lines of inquiry have emerged regarding concepts like social value (Dees, 1998), shared value (Porter & Kramer, 2011), co-creation value (Prahalad & Ramaswamy, 2004) and collaborative value (Austin & Seitanidi, 2012). Social value refers to the combination of resources, inputs, processes or policies to generate improvements in the lives of individuals or society as a whole. Shared value focuses on identifying and expanding the connections between societal and economic progress. The concept rests on the premise that both economic and social progress must be addressed using value principles. Co-creation value suggest that both the firm and the consumer jointly create value, and the aim is to create experiences more than just product or services. Finally, collaborative value refers to value that is created by the independent actions of one of the partners or it can be created by the conjoined

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

actions of the collaborators. It is noteworthy to mention that this is not an exhaustive list of the different approaches regarding value and value creation, but an example of the variety.

Some of the main arguments proposed in previous studies regards the source of value creation and the level of analysis (Lepak, et. al, 2007). In particular, Bowman and Ambrosini (2000) introduced and differentiated two types of value at the organizational level of analysis: use value and exchange value. On the one hand, use value refers to the specific quality of a new task, product, or service as perceived by users in relation to their needs, such as the speed or performance level. On the other hand, exchange value is either the monetary amount realized at a certain point in time, when the exchange of the new task, good, service, or product takes place, or the amount paid by the user to the seller for the use value of the focal task, job, product, or service (Lepak, et. al, 2007). The exchange value derives from different point of views, for example Moran and Goshal's (1996) formulation of value creation as arising from the combination and exchange of resources.

Furthermore, previous studies have indicated that value creation is a dynamic and multi-stage process involving different users of value (O'Cass & Ngo, 2011). For example, economic actors as firms, customers, resource suppliers, employees (Bowman and Ambrosini, 2000) and targets of value like individuals, firms, consumers, government, society (Lepak, et. al, 2007). Based on Bowman and Ambrosini arguments, it can be said that value creation depends on the relative amount of value that is subjectively realized by a target user or buyer, who is the focus of value creation. Such target could be an individual, an organization or a society, and value realization must at least translate into the user's willingness to exchange a monetary amount for the value received.

In other words, it can be said that economic value is one of many possible ways to define and measure value. In addition, that economic value creation is generated in business when customers are willing to pay more than it costs to produce the good or service being sold. The profit (revenue minus costs) that a venture generates is a reasonably good indicator of the value it has created (Dees, 1998). Also in business, value creation occurs via the process of innovation, whether that is innovation in strategy, business model, products, processes, or services (Bingham & Spradlin, 2011). It is well known that customers are more willing to pay for innovative products or services, but also that returns above average are obtained when innovative strategies and business models are well implemented in organizations. In the next section, the relationship between social innovation and economic value creation is detailed, at an individual, organizational and regional level.

SOCIAL INNOVATION AND ECONOMIC VALUE CREATION

On the one hand, measures of economic value are standardize and commonly supports the basis for most economic activities in the world. It is based on individual preferences, choices and tradeoffs, given certain constraints as income or available time. On the other hand, social value is created when resources, inputs, processes or policies are combined to generate improvements in the lives of individuals or society as a whole. Social innovation is in the middle of such continuum because it creates socio-economic value by making use of resources, inputs, or processes; increasing the value of these inputs, and by then generating cost savings for the public system or environment of which the entity is a part (Emerson, Wachowicz, & Chun 2001).

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Social innovation can deliver socio-economic value by developing a prosperous economy, providing equal opportunities, and ensuring environmental sustainability, which impact directly to the wellbeing and quality of life of citizens. It can do so by unleashing the creative potential of public policymakers, non-profit operators, social and traditional entrepreneurs, and for profit companies. Programme and policy design can yield successful innovations that are both scalable and make a difference at the societal level (European Commission, 2013). If applied well, social innovation can deliver using fewer resources, for such reason, the challenge for policy makers is to identify which ideas are the most promising to take to the pilot stage, and to identify which pilots are best able to improve on existing models of practice. Then selecting from among those pilots, the projects that should be implemented to become sustainable ventures and the ventures that should be scaled up to achieve systemic changes (European commission, 2013).

A natural environment to foster social innovation are the so-called social innovation ecosystems (SIE). A SIE is a deeply inter-connected set of actors, institutions, and resources that combine to produce new ideas, organizations, and innovations. In order to be sustained over time, social innovation must take place within a dynamic ecosystem characterized by continual realignment of actors and resources that promotes harmonious system growth and agility in response to changing internal and external forces (Bachra, Chisholm, King, Pike & Stanton, 2015).

Examples of activities that generate socio-economic value are supported employment programs for the disabled or homeless, job training or entrepreneurship programs, or other initiatives that provide employment for those presently receiving public support and divert individuals away from public systems and toward private markets. In this sense, entrepreneurs and universities can contribute to social innovations and to economic development.

On the one hand, according to Schumpeter (1936), entrepreneurs are the innovators who drive the "creative-destructive" process of capitalism. In his words, "the function of entrepreneurs is to reform or revolutionize the pattern of production." They can do this in many ways: "by exploiting an invention or, more generally, an untried technological possibility for producing a new commodity or producing an old one in a new way, by opening up a new source of supply of materials or a new outlet for products, by reorganizing an industry and so on." Schumpeter's entrepreneurs are the change agents in the economy. By serving new markets or creating new ways of doing things, they move the economy forward. On the other hand, universities can provide the training to increase entrepreneur's abilities and possibilities to have success. In addition, the connectivity and physical infrastructure, as well as the human capital are assets that academic institutions can facilitate to promote entrepreneurship.

In the next section, a model to promote and encourage successful entrepreneurship, based on the participation of a University, its students and professors, all of them aiming to have an impact on economic development is described. Such model, contains the different stages where the entrepreneurs should develop competencies and skills to create social enterprises. In addition, the entrepreneurs count with the mentoring from the teachers and the students, whom monitors the process and facilitates the networking. This model is named SERCREA + Model, and according to the reviewed literature it could be characterized as a social innovation.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

MBIP AND SERCREA + MODEL

Some scholars have identified that the mechanisms for social innovation are the exchange of ideas and values, shifts in roles and relationships and the integration of private capital with public and philanthropic support (Phillis, et. al, 2008). According to Mulgan and his colleagues (2007), there are some opportunities for new creative solutions that could become social innovations: Rising life expectancy, growing diversity of countries and cities, stark inequalities, rising incidence of long-term conditions, behavioral problems of affluence, difficult transitions to adulthood and happiness. As is stated, sometimes, social innovations are initiated and encouraged by actors that shift their conventional role, as in this case a university getting involved in promoting economic development.

Micro Business Incubator Program (MBIP)

One particular model promoted at the Tecnológico de Monterrey is the Micro Business Incubator Program (MBIP), that is part of the strategy to foster the economic development of Mexico, aiming to support entrepreneurs in the growth and progress of their micro enterprises. The main objective of the program is that entrepreneurs develops the skills that help them to increase and strengthen their own business, as well as productive projects that promote social mobility in order to increase the quality of life and social inclusion.

The specific objectives of the MBIP are the following:

1. To form social leaders through the integration of young people in higher education system in the task of advising micro enterprise.
2. To enable growth and consolidation of existing microenterprises.
3. To promote and provide entrepreneurial culture accessible to all people.
4. To provide training, information and networking with other entrepreneurs, as well as access to distribution channels to promote their products.
5. To provide microcredit alternatives to support the growth and strength of existing microenterprises, and financing new projects.

The MBIP boots the development of existing micro enterprises through productive strategies by identifying business opportunities that advance the economic development of the country with strong bases. The stages of incubation model include three phases, accordingly with the maturity level of the micro enterprises Pre-incubation, Incubation and Post-incubation. It is worthy to mention that along the three phases tutoring service and expert advice is offered.

In Pre-incubation, entrepreneurs receives basic training and defines a structured idea. Moreover, in order to develop a viable project, the entrepreneur has the opportunity to take different business courses like marketing, finance, operations, legal aspects, among others.

In Incubation, entrepreneurs start operations in their own businesses, develop different business skills in order to survive the Death Valley (i.e. a business development stage where most of the companies die) and implement intelligent business strategies. Along this stage, special mentors and advisors in different business areas support entrepreneur's decisions.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

In Post-incubation, entrepreneurs have to achieve growth and consolidation of their micro enterprise. In addition, a business assessment by a public or private structure is performed. Entrepreneurs initiate their own board of directors in order to receive recommendations about the progress of their businesses. At this stage, entrepreneurs have meetings once a month and follow the action learning dynamic that consist in talking about their own businesses experience and share solutions with the rest of the group to particular problems.

The MBIP model was successful and well implemented by Tecnológico de Monterrey, but somehow required a complementary approach. For such reason, the SERCREA + model was proposed and implemented in one particular location of the university. In the next section, such model is described.

SERCREA+ Model

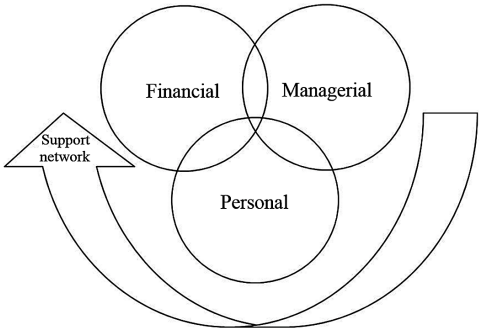
In Mexico, most of the management programs focus on the economics of the company and not so much on change management as an essential element for the training of entrepreneurships to ensure their medium and long-term sustainability, as well as to increase their productivity. One way to deal with this problem is through the SERCREA+ model that facilitates creation and development of new businesses in Mexico, in order to allow the emergence and formation of high-quality entrepreneurships to enhance Mexican business activities (Muñiz, Galindo & Méndez, 2012). In particular, through the SERCREA+ model it is possible to assist managers and business owners in carrying out the following tasks:

1. The prior feasibility of the project,
2. Consultancy,
3. Training,
4. Technical assistance, and
5. Follow-up of productive initiatives developed by individuals and social groups.

According to Guzmán and Santos (2001), the development of an entrepreneur should cover three dimensions: personal, financial and managerial (Figure 1).

Traditionally, a lot of attention has been given to the financial and managerial areas through excellent management training programs and funds specifically designed for entrepreneurs. However, SERCREA + posits its success on the personal sphere, as it is vital to encourage the entrepreneur to move forward. In the next paragraphs, each of the elements of the models is explained.

Figure 1.



EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Phase One: Personal Sphere

The personal sphere is the starting point for the work of mentors (i.e. mainly professors) and students. The purpose is to identify entrepreneur's attributes and motivations, as well as considerations of the business environment. The personal sphere contains:

1. **Personal Characteristics of the Entrepreneur:** It assesses whether the entrepreneur has leadership traits, perseverance, compliance, etc.
2. **Motivations:** It diagnosed entrepreneur's ability to identify an opportunity, the evaluation of such idea and its relationship with the entrepreneur.
3. **Environment:** It analyzes the context in which the entrepreneur is immersed.

Phase Two: Financial Sphere

The financial sphere refers to the viability of the business idea and the entrepreneur's abilities to work with resources. At the intersection between personal and financial sphere, the entrepreneur's life plan is developed together with the mentor. In such plan, the person's dreams and desires are visualized and detailed in goals.

Phase Three: Managerial Scope

In this sphere, the success chain proposed in the Model SER + (Sánchez, 2006) is created. The success chain highlights the humanistic vision of the company and shows how to use the business to make entrepreneur's dreams a reality. In this model, the company, the dreams and the environment connects in a single system.

On the one hand, the SERCREA+ model focuses on the quality of the entrepreneur. SER + (Sánchez, 2006; Walton, 1986; Shewhart and Deming, 1939) is a model of integral development based on the hypothesis that the company would be as efficient as is the manager, and that any one individual would be as good as a director as he is a person (Sánchez, 2006). The model is based on the following elements: S = dream; E = execute; and R = review. On the other hand, also focuses on the CREA + (Muñiz, Galindo & Méndez, 2012) which includes the process and management of the performance of the business, in particular on Analyzing, Structuring, Building and Redefining (i.e. CREA + by its acronym in Spanish).

The model considers a continuous process including a change management spiral model focused on the quality of the person and of the company (Walton, 1986). Its component Dream (Sánchez, 2006; Walton, 1986; Shewhart and Deming, 1939) refers to the self-motivation an entrepreneur shows when carrying out an entrepreneurial activity; therefore, it collects the entrepreneur's personal philosophy. The Execute element (Kaplan & Norton, 2004; Senge, 2006; Imai, 1986; Bolton & Thompson, 2004; Argyris & Boocock, 2002; Minniti & Bygrave, 2001) refers to the way in which the business activity generates goods and services. Finally, Review (Kaplan & Norton, 2004) is the act of making diagnoses to measure indicators of each of the procedures carried out by the manager, which are then compared to short-term objectives in order to find trends that allow the achievement of long-term goals.

SERCREA + is a model proposed to:

1. Promote local economic development and people skills.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

2. Incorporate a system to encourage production and business activities of individuals and social groups.
3. Promote, through academic Micro Planning classes, prospective schemes of self-sustaining productive projects for local development.
4. Monitor the performance of the projects and their impact on capacity building and social organization.
5. Create a support network among entrepreneurs aiming that project initiatives have an immediate impact.
6. Promote a culture of entrepreneurial support among Monterrey Tec students to live the experience as a learning process and not only as an activity to approve the subject.
7. Raise awareness among faculty mentors, which will act as class leaders and in turn monitors the development and progress of business projects.

Phase Four: Support Network

After starting the company, the Mentors support the students by tracking the development of the company with experiential learning tools to achieve a support network "Club of Entrepreneurs". In other words, the Club is a group of entrepreneurs that regularly meet to discuss common problems and possible solutions. They meditate and learn from their experiences, while strengthen their social network. Thus, entrepreneurs have access to a system of aid and contacts that connects them to the business world and the socio-economic structure. At the end, entrepreneurs become independent business owners.

In the next section, it is described the implementation of a pilot project based on the SERCREA + Model, which followed a case study approach.

SERCREA+ Model: Implementation of a Pilot Project

The operation of the model requires a feasibility analysis before another activity. Such analysis aims to identify the potential entrepreneur, the viability of its business project and the possibility to develop the project in the community where he or she lives. Afterwards, the development of a business plan starts, in order to incorporate marketing, operations, human resources, and the financial side. Then, it is necessary to work with the entrepreneur's personal finances in order to teach them to distinguish the money from the family and the company. Later, entrepreneurs work with a business simulator in order to learn how to start a business and to take decisions in a controlled environment but with real business experiences. Finally, the microenterprises starts operations with mentors support and the support network is formed.

Table 2 shows the stages, activities, roles and final products in the implementation of the SERCREA + model.

As presented in Table 2, students and mentors performed different roles throughout the process. They are:

1. Headhunters, to identify those with potential to be a successful entrepreneur;
2. Entrepreneur counselors, when working with entrepreneurs to maximize their potential;
3. Business advisors to meet specific situations in different areas of the company;
4. Instructors, by transferring knowledge in an academic way; and
5. Supervisors, when accompany the process, summarize the results and make corrections.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Table 2. Summary of the implementation of the proposed model "SERCREA +"

	Stage	Activity	Mentor Rol	Final Product
Personal	1	Identify the entrepreneur	Headhunter	Diagnosis of entrepreneurial profile
	2	Explain and design with the entrepreneurial life plan	Instructor - Advisor	Entrepreneur life plan.
	3	Identify with the entrepreneur the business ideas	Business Advisor	Idea description and evaluation
	4	Analyzing environmental	Executor	Evaluation of the opportunities and threats of the entrepreneurial environment
	5	Analyze the potential environmental impact of the project	Executor	Rubric of the possible environmental impact of the project
	6	Develop pre-feasibility Project	Executor	Pre-feasibility of the project to determine if it continues
Financial	7	Develop the business plan with the entrepreneur	Executor	Business plan
	8	Train entrepreneurs in family finances	Instructor	Family financial plan for the entrepreneur
Managerial	9	Play the business simulator	Facilitator	The entrepreneur understands the business life cycle.
	10	Train entrepreneurs in business management (Metodo SER+)	Instructor	Activities plan to implement and managerial the business
Network support	11	Frequent visits from the mentor to the entrepreneur business	Advisor and supervisor	Tracking and monitoring
	12	Create and develop the support network	Facilitator	Support network for the entrepreneur

Source: Own elaboration based on Muñiz, Galindo, and Méndez (2012).

The SERCREA+ Model assumes the following methodology:

1. The company started with a dream and goals that generally arise from the entrepreneur's personal or business philosophy.
2. Business philosophy founded a group of policies that govern each of the strategic activities of the company, by a group of procedures for each of the links in the chain of success.
3. The entrepreneurship proceeds to design and to enforce the activities proposed by the policies designed.
4. The established procedures produce results that must be reviewed by a battery of diagnostics and must be compared with the original dream goals.
5. The review could imply, if difficulties in achieving the goals appear, the introduction of decisions to correct the situation, trying to obtain continuous improvement and the achievement of the dream goals.

The action learning methodology (Gill & Beaty, 1992; Torres, 2005; Wenger, 1998; Taylor & Thorpe, 2004; Argyris & Schön, 1978; Revans, 1983) refers to the formation of networks of support (Wenger, 1998) to enable the entrepreneur to create a working group, stating that through a learning process (Argyris & Schoön, 1978; Dewey, 1999; Thompson, 2006; Argyris & Boocock, 2002;Wenger, 1998)

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

experience (Boussouara & Deakins, 1999; Sullivan, 2000) and reflection (Argyris & Schön, 1978), he can obtain more and better solutions to the problems that arise in the business activity.

Case Study

The objective of the pilot implementation was to identify which where the main variables that positively impact into the development of a sustainable social entrepreneurship during a particular period. The analysis performed consisted on an analysis of hierarchical clusters in order to search for groups on a set of observations. According to the criterion of similarity or distance, those belonging to the same group were considered to have similar aspects, while those that belong to different groups were dissimilar. In this case, the analysis started from a situation in which each observation is a cluster that joins in successive steps, so that finally all the observations are in a single cluster.

Tecnológico de Monterrey is a Mexican educational institution with presence in the national territory through 31 campuses, in 25 cities, and internationally in 11 countries through 20 locations and liaison offices[3]. This Institution is one of the largest private universities in Latin-American with over 90,000 students at high school, undergraduate and graduate academic programs. The university has an educational offer of 60 undergraduate programs, 42 masters and 12 Ph.D. graduate programs[4]. Such programs are accredited by recognized organizations as the EQUIS European Quality Improvement System; and more recently 5 stars at the QS Stars University Rating[5].

Additionally, the institution transfers knowledge to create, develop and grow businesses through 15 technology parks, a network of 33 business incubators and 16 business accelerators; thus contributing to the generation of employment, the development of an entrepreneurial culture and the strengthening of the national economy. Some of the results of such efforts are: 4,417 companies supported by incubators, 323 by accelerators, 170 companies by technology parks; and 19,419 jobs generated from 2009 to 2012.

In the case study, the SERCREA + program took place with a total group of 25 microenterprises located in the region of Querétaro Mexico. The whole program was supported by the Entrepreneur Academy of the Tecnológico de Monterrey Querétaro. In the program, 25 students leaded by a Mentor monitored and tutored the micro entrepreneurs.

In order to obtain a greater impact on the sample group, the micro entrepreneurs were segmented according to their maturity level (See Table 3):

Plan A: Carried out the design and creation of the company;
Plan B: Was the starting point of the company;
Plan C: Focused on the growth of the company; and
Plan D: Was the completion and development of the company.

The selection process began with a personal interview with each of the entrepreneurs and business owner. The topics were the business idea, their interest in starting a business, their skills and motivations, the time they want to devote to their projects and its short, medium and long-term objectives. The information collected allowed the correct assignment to the right stage.

The sessions of the Club of Entrepreneurs were held every three weeks for six sessions. A group of business owners meets to discuss topics of interest, learned from their own experiences and established business networks.

			Action plan		
			I Implementation		
Postincubation	Business strengthening	Entrepreneur Club	Entrepreneur meetings	Network support between entrepreneur	

Source: Own elaboration.

During 10 months, a SERCREA+ pilot program was conducted. A final survey was designed and responded by the 25 micro entrepreneurs. The survey focused on the following stages: 1) assessment of the idea, 2) entrepreneurial profile, 3) environmental impact, 4) pre-feasibility of the project and 5) life plan. The research design was approached with a mixed method, because the survey included qualitative and quantitative data.

The variables for the analysis were:

P1: Impact on the creation of enterprises;
P2: Improvement of the product or service;
P3: Increase in sales;
P4: Generation of profits;
P5: Generation of employment;
P6: Creation and sustainable development of the company;
P7: Documenting business processes; and
P8: Club of entrepreneurs.

The questions designed for each of the variables are the following:

1. Do you consider that SERCREA+ model could have any impact in the creation and development of entrepreneurs' projects and micro-enterprises?
2. Does the SERCREA+ model contributed significantly to improve the product or service of the projects of entrepreneurs and micro - enterprises?

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

3. Does the SERCREA+ model contributed significantly to achieve an increase in sales for the projects of entrepreneurs and micro - businesses?
4. Does the SERCREA+ model contributed significantly to assure that the projects of entrepreneurs and micro-enterprises have profits?
5. Does the SERCREA+ model contributed significantly to assure that the projects of entrepreneurs and micro-enterprises create jobs?
6. Do you consider that the model could be crucial in the creation and sustainable development of the projects of entrepreneurs and micro-enterprises?
7. Do you consider that the model would help to document the key processes of the projects of entrepreneurs and micro-enterprises?
8. Do you consider that regular meetings with entrepreneurs (support network) are fundamental in the creation and development of the projects of entrepreneurs and micro-enterprises?

Furthermore, a contingency analysis was performed in order to present different scenarios based on qualitative assumptions. The scenarios allowed identifying if an interaction between the variables existed.

The results provided an interpretation for the following hypothesis:

H1: The creation of a group of support (Entrepreneurs Club) is essential for the creation and sustainable development of enterprises.
H2: SERCREA+ model is essential in the creation and sustainable development of entrepreneurship projects. In this case, it also relates to increasing sales and to employment generation.
H3: SERCREA+ model is positively related to the increase in sales of the company.

Results

264 responses were obtained from the final survey. Such responses were grouped and organized into clusters in order to better understand their responses. The clusters are the following:

Cluster 1: 7 Mentors (PM).
Cluster 2: 194 students (A).
Cluster 3: 12 expert consultants (EC).
Cluster 4: 5 Micro Coordinators (CM).
Cluster 5: 25 Social Entrepreneurs (ES).
Cluster 6: 11 Successful Entrepreneurs (EE).
Cluster 7: 5 Experts on Poverty (EP).
Cluster 8: 5 Government Officials (FG).

The results of the contingency analysis are described in the next lines.

1. From the people that agreed that the Entrepreneur Club is fundamental for business creation and that SERCREA+ Program has and impact in the creation and development of enterprises:
   a. 84.6% confirms that the Program contributes to improve their product/service companies.
   b. 85.6% confirms that the Program is essential for the creation and sustainable development of the company.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

   c. 83.5% confirms that the Program can help to document the key business processes.
2. From the people that agreed that the SERCREA+ Program is essential for the creation and sustainable development of the company and the Program has and impact in the creation and development of enterprises, 95% confirms that the Entrepreneur Club is essential for business creation.
3. From the people that agreed that the Entrepreneur Club is fundamental for business creation and that SERCREA+ Program contributes to improve their product/service companies, 96.2% confirms that Program is essential for the creation and sustainable development of the company.
4. From the people that agreed that the Entrepreneur Club is fundamental for business creation and the SERCREA+ Program contributes to improve their product/service companies, 95% confirms that Program can help to document the key business processes.
5. From the people that agreed that the SERCREA+ Program is essential for the creation and sustainable development of the company and contributes to improve their product/service companies, 94.3% confirms that the Entrepreneur Club is essential for the creation of business.
6. From the people that agreed that the Entrepreneur Club is fundamental for business creation and the SERCREA+ Program contributes for the creation and sustainable development of the company, 97.7% confirms that can help to document the key business processes.
7. From the people that agreed that the SERCREA+ Program is fundamental for business creation and development and contributes for the creation and sustainable development of the company, 95% confirms that the Entrepreneur Club is essential for business creation.
8. From the people that agreed that the SERCREA+ Program is fundamental for business creation and development and the Program can help to document the key business processes, 95% confirms that the Entrepreneur Club is essential for the business creation.
9. From the people that agreed that the SERCREA+ Program contributes to job creation and increased sales, 83.8% confirms that Program helps to generate profits.
10. From the people that agreed that the SERCREA+ Program contributes to generate profits and increase the sales, 68.9% confirms that Program helps to job creation.
11. From the people that agreed that the SERCREA+ Program contributes to increase the sales and generate profits, 68.9% confirms that Program helps to job creation

To sum up, the SERCREA+ program had a positive impact for the Queretaro Region. The variables relating to the generation of employment through the contribution of SERCREA+ model and the creation and development of sustainable businesses with support of the model are related. For such reason confirms H2 y H3. That is, the model facilitates the sustainability of the companies over time, and this allows the creation of jobs. Entrepreneurs club has a significant impact on the creation and sustainable development of enterprises, therefore confirming H1. There is a relationship very significant between entrepreneurs club and increase in sales perhaps because of the advice and experiences of other entrepreneurs.

CONCLUSION

In our economy, new perspectives are required to diagnose the real social problems and to solve them. The multidimensionality by which social innovation is approached, help to diagnose, design solutions and evaluate implementation feasibility, in order to generate positive impacts for the society. In this chapter, it was proposed a model characterized as a social innovation because it facilitated the interaction of dif-

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

ferent actors and resources, in order to create socio-economic value. In particular, a university facilitated the access to human capital (professors and students) to micro-entrepreneurs and business owners, as well as infrastructure (physical facilities) to promote the creation and acceleration of micro-businesses. Knowledge creation and sharing was basal for the program, immersed in the whole process, from the planning to the implementation.

The results of the model implementation allowed the identification of interesting points to be considered in the traditional approaches of training and mentorship in entrepreneurship. First, entrepreneurs need a structure to follow in order to be efficient in the activities they performed, but such structure must be flexible and should be adapted according to the personal sphere of each participant in the program. Second, the entrepreneurs club proved to be successful for the participants in the program. Learning occurred by means of structured and formal activities, but also by the opportunity to interact in an informal manner. The club consisted of group sessions taking place regularly where business owners and entrepreneurs got together to discuss interesting topics and share lessons learned in the operation of their business. Third, monitoring and follow up of projects, was also a key activity in the program. Students and Mentors in a planned schedule, assessed the advances and provided support in terms of feedback of the managerial sphere, but mostly in terms of counselling in the personal sphere.

The implementation of the model had important externalities, for example regarding educational aspects. Students were highly involved in the program, sharing their knowledge and helping to solve particular issues to the micro entrepreneurs. Surprisingly, students devoted more time to the projects than the agreed, showed a substantial compromise to find additional resources (e.g. contacts, funds) and felt a sense of belonging by being responsible of a positive impact in their local context. From the educational point of view, students applied in a real situation the concepts revised during the academic course, which can be translated as Learning by doing. Professors that acted as mentors guided the students but also updated their knowledge by being close to experts and business owners.

Social innovation contributes to economic development, therefore it may be considered in the sectorial government plans. For such reason, an effective assessment is essential to ensure a good level of understanding of what social innovation can achieve, and how it can be developed quickly but competently. That means having in place metrics and knowledge on the field of social innovation for policy-makers. Nevertheless, the assessment is not easy because of a variety of factors. The complexity of relationships in social innovation makes it hard to attribute effects, therefore qualitative assessment are needed to reveal the essence of what is often a complex picture; The mutability of social innovation, particularly at the prototyping stage; The lack of knowledge regarding the concept; Its cross-cutting nature, because is not a specific sector it is not an easily defined activity; lastly, the diversity of measures of impact. Many tools and frameworks are available – each with different concepts and metrics. For example, SROI is a model that derives a monetary figure to show socio-economic impact. The two key indicators are based on monetary measures and can be collected through a randomized survey of program users. The results, therefore, provide quantitative evidence as to whether a program is having an impact on the financial situation of participants and assesses the level of impact on the larger economic environment (Bernard, 2003). As a future research line, development and testing of assessment models is the most prominent one.

KEY TERMS AND DEFINITIONS

Action Learning: A method to solve complex problems through implementation and reflection on the results. It is commonly used to support organizational and business development.

Economic Value Creation: The act of creating wealth in a particular context and in a period of time.

Entrepreneurial Club: A group of entrepreneurs that meet frequently in order to support each other and share their experiences.

Micro Business Incubator Program (MBIP): A support program to improve entrepreneurial skills and competencies in three dimensions; personal, managerial and financial.

SERCREA + Model: A theoretical model that approaches the development of the three spheres of entrepreneurship (personal, managerial, and financial) in order to identify the most important elements in the entrepreneurial process.

Social Entrepreneurship: A way to find solutions to societal problems from a business perspective, and therefore, measured by a positive return to society as well as economic profit and return.

Social Innovation: New ways to overcome social problems in a more effective approach.

Chapter 19
The Business Model of a Public Social Partnership: Contextual Determinants

Aldona Frączkiewicz-Wronka

Saioa Arando
Mondragon Innovation and Knowledge (MIK), Mondragon Unibertsitatea, Spain

ABSTRACT

The authors discussed the dynamic evolution of the public management manifesting innovative and collaborative methods of social service delivery transcending the public authorities' individual boundaries. The chapter purposely presented the inter-organizational cooperation and public social partnership as an effective business model for public/social value creation unleashing the potential of public organizations and empowering social actors in democratic and collaborative policy/decision making. The chapter identified two public social partnerships in Poland and Spain. The research was conducted in the regime of constructivism. As suggested by R. Rorty (1982), the researchers posed a question as to why the research was being conducted and then adapted the research strategy to it (a case study). In order to analyse obtained data, the so-called thick description was used revealing the contextual determinants that influence the architecture of the researched models.

INTRODUCTION[1]

A fundamental problem faced by the developed countries is to find such practices for public funds management that will allow for the effective achievement of social goals defined in the process of political choices made by citizens. As a consequence, the governments of many countries undertake initiatives aimed at the reform of the public sector (Pollitt & Bouckaert, 2000). One of the key issues for the public

sector is the effective provision of social services to citizens. Innovative solutions in this area often involve the cooperation between organisations that adopts the institutional format of a public social partnership.

The effective operations of a public social partnership rely heavily on the selection of organisations that will act as partners. The resources, values and goals of these organisations should be matched in such a way that the outcomes they produce can contribute to the creation of social value expected by stakeholders. The business logic of the public services where production and consumption occur simultaneously and involve co-production between professionals and users, leads the public management models into a new direction of inter-organizational network and sustainability growth mechanisms. Public services, as the result of complex service delivery systems being relational and process-based, require functional architecture and sustainable business models (Osborne, Radnor, Vidal, & Kinder, 2014, pp. 167-169). The reform strategies and business models for public services delivery need cultural change within public sector (Osborne, Radnor, Vidal, &Kinder, 2014, p. 169) and thus, this chapter aims to identify and compare the building blocks of the business models for public social partnerships established to provide social services. Therefore it examines some examples from Poland and Spain.

The chapter structure starts with a brief summary about the current need for innovation in the social service delivery systems, which gradually leads to the public social partnerships overview as a new significant model of inter-organizational collaboration for more effective social service identification, design and the social needs fulfilment. While the new social delivery systems are becoming highly complex, the authors discuss the business model definition and architecture that is relevant for public social partnerships. The authors refer to the Osterwalder's and Pigneur's (2002, p. 5-23) definition that describes the business model as a firm's architecture and its network of partners for creating, marketing and delivering value and relationship capital to one or several segments of customers. For better understanding of the building blocks of the networking architecture, the authors present two examples from Poland and Spain on the basis of the proposed Business Model Canvas that enables to analyse the sustainable business models of the sophisticated public social partnerships.

BACKGROUND

The harmonious development of a state is only possible if social needs that are satisfied with public funds are identified correctly. The institutional state ensures the fulfilment of social needs recognised by citizens as important and its obligation is to build the effective system for the provision of social services that meet these needs. It is in the process of determining social policy goals that the decisions on what services are necessary and how they should be delivered are made, while practical measures that allow for the implementation of these decisions are part of public management.

Social policy is a concept commonly used in public space to describe the socio-economic outcomes of a state's activity as a public authority. The scope and depth of the measures adopted in social policy practice reflect the economic, political and legal doctrines pursued by a given state. Additionally, social policy practice is also the product of historical and ideological conditions. Contemporary researchers increasingly often endorse the idea that the way in which social policy goals are pursued is strongly affected by a society's organisational culture and its manifestations in collective and individual activity.

The analysis of the Polish and Spanish social policy – or rather the way in which it is implemented – supports the assumption that it should gradually evolve towards the solutions that embrace institutional change defined as social innovation, the essence of which is cooperation on all organisational levels

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

– between organisations representing all sectors of the economy – and empowerment. All European trends in social policy management recognise the dominant role of initiatives aiming at the inclusion of a variety of actors in the process of pursuing social policy priorities in creating the rules for socio-economic growth (Grewiński, 2014). This means the necessity to build models embracing the cooperation between different organisations.

In terms of the scientific discipline of public management, the proposed thesis translates into the necessity to create organisational conditions conducive to the effective delivery of social services.

So far, the observation of practice supports the statement that organisations working together, choosing common goals and jointly deciding on how to use their resources often develop an ability to create new structures. The new structures, taking advantage of adopting the idea of collaboration, are capable of generating more positive outcomes than each of the organisations operating on its own.

In the public sector, the entities that create network relationships are a relatively young organisational phenomenon, the origin of which should be linked with the growing popularity of the idea of collaboration between organisations from different sectors. The emergence of network organisations offers a response to the challenges of practice, where it has been noticed that the solving of complex problems requires varied skills and resources, often held by many different actors of the economic life – not only businesses, but also public institutions and non-governmental sector organisations (Czakon, 2005, pp. 429-437).

New forms of cooperation between different actors, in particular partnerships and alliances, require such management practices that will facilitate the processes involving clashing interest and coordinate joint activities – hence the need for research into and reflection on them.

Social services – as services of general interest SGI, of which they are one component – underpin human dignity and guarantee the universal right to social justice and to full respect of fundamental rights, as set out in the *Charter of Fundamental Rights of the European Union (2000)* and in international commitments such as the revised European Social Charter and the Universal Declaration of Human Rights. The purpose of social services is to ensure social, territorial and economic cohesion by implementing the principles of social solidarity. The significance of social services for building the foundations of a modern state's growth was first strongly emphasised in the Lisbon Strategy, only to return in the *European Parliament resolution of 14 March 2007 on social services of general interest in the European Union*,[2] and Europe 2020 strategy

In terms of theory, the last conclusion the researchers observes the shift of the research focus from an individual organisation to the emerging multi-actor cooperation formations treated as social innovations (Wronka-Pośpiech, Frączkiewicz-Wronka, & Lara Montero, 2015, pp. 27-43).).

Social innovations play a crucial role especially in the sectors where the existing models of innovation are unsuccessful, obsolete or unable to take advantage of the opportunities arising in the environment (Mulgan, Tucker, Ali, & Sanders, 2007). These sectors are primarily education (Loogma, Tafel-Viia & Ümarik, 2012, pp. 1-19), health care (Beinare, McCarthy, 2012, pp. 889-893), environmental protection (Maruyama, Nishikido, & Iida, 2007, pp. 2761-2769), public finance (Philips, Laforest, & Graham, 2010, pp. 189-199), public and social services (Teets, 2012, pp. 15-32) and urban planning (Moulaert, Martinelli, Swyngedouw, & González, 2005, pp. 1969–1990). The literature review (Nicholls & Murdock, 2012; Caulier-Grice, Davies, Patrick, & Norman, 2013) reveals that social innovations emerge in the context of the following five areas:

- Social transformation (the role of civic society in the process of social changes and the role of social economy and social entrepreneurs in achieving economic growth and social integration;

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

the role of business in social change – corporate social responsibility and the role of enterprises in implementing the next wave of innovation and productivity through focusing on 'social' areas such as education or health care);

- Organisational management model (developing business strategies, embracing changes in human, institutional and social capital, which enhance organisational efficiency and improve competitiveness; organisational restructuring, the modernisation of industrial relations, and improved human resource management; non-profit management);
- Social entrepreneurship (developing new and innovative ways to deal with social challenges by engaging 'socially sensitive' entrepreneurs. Social enterprises are, first of all, enterprises with a social purpose and their surpluses are reinvested in the organisation);
- The development of new products, services and programmes (fulfilling social needs, innovations in the public sector and public services delivery by social enterprises and organisations of civic society; the delivery of public services and other redistribution means in the manner that can ensure budgetary savings in the welfare state);
- Governance as a management model manifesting the strengthened position and increased capacity of social institutions (enhanced relationships between different social actors, the improved skills, competences and social capital of social actors engaged in the development and implementation of social and economic programmes and strategies) (Wronka-Pośpiech, 2015, p. 128).

In further considerations, social innovation will be understood as a management model, clearly manifested in the concept of governance. In this particular case, the model of governance that is slowly becoming a new paradigm for organisations delivering social services and, more widely, for social policy the tasks of which remain within a state's remit, but are nowadays increasingly frequently performed by actors from different sectors.

There are numerous attempts to introduce changes in the public sector policy framework and architecture, both in the European Union (e.g. Joinup, the common portal for e-Government solutions) and globally (e.g. the OECD's Observatory of Public Sector Innovation) (European Commission, 2013a, p. 5). The necessity for innovation in the public sector has been underlined by the European Union in the recent research proving that there is a call for the 'New Public Movement' (European Commission, 2013b, p. 1). The latest comprehensive report of the Expert Group on Public Sector Innovation (European Commission, 2013b) describes the motives and significance of change and the crucial steps in the powering of the public sector and the creation of its new architecture. Relating to the report's findings, 'there is an urgent need to power innovation within the public sector itself in order to unlock radical productivity improvements and efficiency gains, to foster the creation of more public value and a better response to societal challenges' (European Commission, 2013b, p. 1). The European Union proposes four principles of the public sector innovation movement: (European Commission, 2013a, p. 6)

- Co-design and co-creation of innovative solutions (with other Member States, other
- Parts of government, businesses, the third sector and citizens);
- Adopting new and collaborative service delivery models (across public, private and non- governmental actors, both within and across national borders);
- Embracing creative disruption from technology (the pervasive use of social media,
- Mobility, big data, cloud computing packaged in new digital government offerings);
- Adopting an attitude of experimentation and entrepreneurship (government itself

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

- Needs to become bolder and more entrepreneurial).

Moreover, the change in the paradigm of public/social services delivery and changes in the environment cause that the process of providing complex and innovative services requires today inter-organisational collaboration irrespective of the sector in which an organisation operates (Agarwal & Selen, 2009, pp. 431-475; Lewandowski, 2013a).

The key drive of the public sector innovative actions is the proper value delivery determined by the frequently changing society requirements. From the general viewpoint, each organisation that strives for success in the modern competitive global market needs to create new value embedded in its products or services. Accordingly, public organisations aiming to operate effectively in the so-called new economy should seek a model that will allow them to deliver high quality services to citizens. The understanding of the notion of "value" may vary. Koźmiński and Jemielniak (2008) state that "value is something precious, something that people desire, strive for and act in order to get" (p. 419). The simplest way – typical of market organisations – is to define value in terms of above-average profit. Obłój (2002) proposes that a firm creates new value when it generates profits that are above the industry average and when they exceed alternative, safe ways of investing. In the situation when an explicit measure of success such as profit is not available, it becomes much more complicated to clearly define what constitutes profit for the customers of public organisations and what they perceive as desired value. This difficulty also translates into problems involved, on the one hand, in the identification of the factors contributing to the success of public organisations, on the other hand, of the ways of achieving this success.

The analysis of the reference literature confirms that value creation in every organisation stems from the application of such management methods that ensure concentrated effort, bring the focus on key value creating factors and their adequate integration, and facilitate the process of making strategic and operational decisions. As a result, an organisation's success relies on whether it can act in an integrated manner allowing for the flexible adjustments to the requirements of the market and environment, in other words, whether it is able to design and implement a business model for its operations. To perform this task, it has to identify value creating factors, define the areas where value is created, and discover the method for its creation. Every organisation creates value for its key stakeholders, while each participant of the economic and social process creates specific added value, contributing to the value chain. The key stakeholders, that is everybody who has a vested interest in the value created by the organisation, can be defined as: partners who benefit from their contacts with the organisation in terms of an increase in the value that they achieve; the organisation as such or rather different groups of its internal stakeholders; intermediaries who deliver value between the organisation providing the product and its end users. In this context, Moore's concept of public/social value is of particular relevance (Moore, 1995; Moore, & Khagram, 2004). Although the notion itself comprises the word "public", it is worthwhile to mention that in his texts the author uses it interchangeably with "social". The concept focuses more on understanding what creates this value and how it can be applied to the public management perspective rather than defining the final outcome. In this article, the Authors concentrate on the approach proposed by Moore in 1995, which proposed what the managers of institutions that are not profit-oriented should do in order to deliver value to society. Based on a series of interviews that he conducted with public administration workers, Moore concluded that the greatest difficulty lied in defining the goals, determining the methods to achieve them and measuring the outcomes in such a way that local communities perceived them as valuable. The conceptualisation of the goals important for all the stakeholders appears to be a critical factor for initiatives undertaken in the public sector and determines the overall framework for a relevant

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

business model. The observation of the practice of public organisations indicates that the collaboration of actors in the area of public/social service provision is becoming a value creating factor increasingly often (Frączkiewicz-Wronka, Szołtysek & Kotas, 2012, pp. 231-255). In public management practice, the collaboration between organisations from different sectors – aimed at the effective pursuit of shared goals – is becoming necessary (Frączkiewicz-Wronka, 2011, pp. 72-81). The well-designed configuration of partners within the collaboration framework creates an opportunity to develop and implement such a business model for a public social partnership that will respond to the needs emerging in a local community and that the outcomes achieved as a result of its operations will contribute to the survival and growth of the organisations making up the partnership though the creation of the desired public/social value.

THE SIGNIFICANCE OF INTER-ORGANIZATIONAL COLLABORATION FOR THE EFFECTIVE FULFILMENT OF THE NEEDS IDENTIFIED AS SOCIALLY IMPORTANT AND THE EFFICIENT SOCIAL SERVICES DELIVERY

The observed practice of the public sector confirms that public institutions tend to deliver social services within relationships with other autonomous private, quasi-public and voluntary organisations more and more frequently. This trend is one of the symptoms of social, political and economic changes taking place in the last two decades in the concepts concerning the management of the public sphere. Another shift concerns the role of public authorities, which move from their position of a service provider to the role of an institutional facilitator and controller of the process of service delivery as well as a collaboration moderator.

Modern public organisations undertake actions in the public interest and pursue their goals mainly by establishing relationships of collaboration with other organisations or groups of actors in the socio-economic life (Kożuch, 2011, p. 14), because this increases the value of an organisation, as numerous studies confirm (Conteh, 2013, pp. 501-521; Lewandowski, 2013b, pp.172-182). This means that the outcomes of their operations are becoming increasingly dependent on external partners (Frączkiewicz-Wronka, 2012, p. 275; Kożuch & Sienkiewicz-Małyjurek, 2013, pp. 82-95), with whom the inter-organisational bonds are created (Kastberg, 2016, pp. 33-56). As a consequence, the public sector is, to a growing extent, organised and steered by the relationships with external entities (Peters, 1998) and inter-organisational bonds (Hood, 1991).

The evolution – as a consequence of seeking a premium on the value created to meet stakeholder expectations – of the principles underpinning the public sector towards embracing first market mechanisms (NPM) and then network mechanisms (Governance) is a driving force behind the change in the actors operating in the domain of the public sector and it contributes to the development of public management theory. In their search for more effective methods of social services delivery, organisations seek solutions transcending their individual boundaries. An innovation and relational premium can be earned when organisational projects based on the collaboration between actors from different sectors are implemented in practice.

As a result of the emergence of new ways for delivering services, the level of interdependence between actors establishing institutional forms of collaboration is increasing (Klijn & Teisman, 2008). One of the reasons is the willingness, or sometimes even the necessity, to acquire resources that remain at the disposal of other organisations (Frączkiewicz-Wronka, 2014), which creates the need to build new

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

organisational projects and, in consequence, the new architecture of collaboration – unique for a given configuration – is developed (Fjeldstad, Snow, Miles & Letti, 2012, pp. 734-750). Bringing together organisations varying in terms of their legal form and ways of operating causes a number of problems in the process of negotiating shared goals and values that need to be defined in order to ensure the proper definition of collaboration principles and the development of a business model.

The fact of collaboration means that the organisations involved in it can be perceived as structures building a unique form of the operation, or rather co-operation, of private and/or social and/or public actors or as formations that are new structures created by the mentioned actors in the pursuit of a shared goal (Kożuch, 2011, pp. 109-134), which is social/public value creation. As Bryson argues (2004, pp. 28), a public organisation that wants to achieve success needs to present to its customers such a set of goals that respond to the questions about what the organisation is, what it does, why it does it, and what value its operations offer to end users. This realisation means moving towards the creation of such a business model that will contribute to the organisation's success in a local community and win the approval for its actions granted by local authorities. The accomplishment of the goals adopted requires the combination of the organisation's decisions and actions such as: participation, designing strategic actions, building a winning coalition, or implementing a strategy. Bardach (1998) defines it as "a method of interaction in a given situation that ensures the achievement of the goals and helps to seize some hidden opportunities to create value" (p. 36).

The process of building collaboration/networks increases the need to identify the conditions and components essential to designing such a business model for collaboration that will give the partners the foundations for long-term growth. The formal expression of such collaboration may be a public social partnership, which may be treated as an innovation.

The Overview of Public Social Partnerships

The new vision of the public sector and the recognition that the government does not hold monopoly in the delivery of social services require a more entrepreneurial and participatory approach of public institutions. Public collaboration with a wider range of partners 'can help unleash the potential of an innovative public sector with the capacity for generating new ideas and implementing them to create value for society, covering new or improved processes (internal focus) and services (external focus)' (European Commission, 2013b, p. 1). Therefore, the OPSI[3] highlights that public results are strongly determined by the contribution from multiple actors (OECD, 2016a), of which public social partnerships are a very significant mode of overcoming the public sector barrier to be transformed into an effective 'growth engine' for the local and European economy (European Commission, 2013b, p. 1).

Partnerships are widely accepted as an invaluable instrument for stimulating more sustainable socio-economic development and they are crucial to achieve the EU 2020 targets in the area of employment, social cohesion, economic development, environmental sustainability and the quality of life within the EU (European Commission, 2013c, p. 2). Nevertheless, the term is not commonly used and understood across Europe. In the literature discussing relations between the state and social partners, a number of terms are used to describe similar arrangements. The social partnership is the most widespread and commonly used term in Austria, Denmark, Germany, Ireland, France, and the Netherlands, whereas the more specific 'concertation' is prominent in Italy and Spain. In Great Britain, the expression that is more common is 'corporatism', which is the form of a social organisation where key political and social decisions are made by corporate groups in conjunction with the government (Boyd, 2002, p. 3).

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

"In Austria and many other Western European countries, public policy making continues to be the outcome of explicit negotiated formal or informal agreements between the government and social partners" (Boyd, 2002, p. 4). The social partnership can take different institutional forms across countries but its purpose is the same: "the government is prepared to offer the social partners a role in public policy making" (Boyd, 2002, p. 4).

Through the involvement, adequate consultation and participation of stakeholders, partnerships develop cross-cutting perspectives and integrated approaches to multidimensional problems that are 'too complex and interdependent for any one institution to effectively respond to alone' (European Commission, 2013c, p.1). Thus, public social partnerships are perceived as strategic partnering arrangements enabling more efficient delivery of public services and 'with more person-centred outcomes for users of services, by putting co-production at the heart of service design' (The Scottish Government, 2013, p. 4). With reference to European Economic and Social Committee, (European Commission, 2013c, p. 2) partnerships have become a key instrument of collective commitment and an important policy tool that contributes to better efficiency of public expenditures and public policies. According to ILO,[4] the partnership approach evokes social dialogue that leads to democratisation of social and economic policy-making and reduction of social conflicts (ITC, 2012, p. 13). It reflects the democratic principle, included in Article 11 of the Treaty on the European Union, that representative associations should be able to express their views, to be consulted by, and hold dialogue with the public authorities', and that workers and employers should be 'involved in decision-making on issues that affect them closely.'(European Union, Social Europe Guide, 2012, p. 12). The European Social Fund (ESF) Regulation refers to partnerships as a governance mechanism (ESF Reg., Art. 5) as well as territorial alliances (ESF Reg., Art. 3) 'through stimulating the involvement of diverse actors and approaches; clearly defining target groups, objectives and priorities; and building participatory democracy through collaborative decision-making' (European Commission, 2013c, p. 2). The Copenhagen Centre for Partnership Studies (Andersen & Mailand, 2002) defines the social partnership as a tri or multi-partite arrangement involving employers, trade unions, public authorities and/or others (e.g. the voluntary sector), which is concerned with areas of economic and social policy and might be based on a binding agreement or declaration of intent. Moreover, it does not necessarily require an institutional setting and can be described as a mode of policy making characterised by actively seeking compromise (Boyd, 2002, p. 3).

Nevertheless, public social partnerships are not always easy to set up as they are not suitable for every organisation or service, and they demand accurate level of trust or commitment and proper knowledge or tools to efficiently manage inter-organizational network. (The Scottish Government, 2013, p. 4; Daglio, Gerson, & Kitchen, 2015, p. 32). The European Commission (2013c) underlines the significance of partnerships in the labour market, where public employment services (PES) need to adapt to changing environments and work in close cooperation with other stakeholders to 'maximise job matching, secure pathways for vulnerable groups and improve labour market intelligence in the context of the new skills agenda' (European Commission, 2013c, p. 2). The partnership approach in the labour market area, inter alia, concerns partnerships at the local level between local employment offices and other stakeholders to ensure a co-ordinated strategic service offer and easy referral of individuals to support services and partnerships with employers and providers of education and training services in order to improve the way in which the training offer is tailored to demand (European Commission, 2013c, p. 2). Partnerships enhance competences and resources, which creates the mechanism that helps to solve problems in the labour market more readily than by institutions working in isolation. (European Commission, 2013c, p. 3). Partnerships are also crucial in the design and administration of public pension schemes. They play a

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

formal (public pension schemes through tripartite bodies) or informal (permanent, tripartite, or bipartite consultative bodies) advisory role in many European countries. In Belgium, social partners jointly manage the National Pension Office, while in France, they actually supervise the day-to-day management of the national pension fund in the private sector (Duchemin, & Weber, 2013). The more limited role of social partner organisations in tripartite decision-making may be seen in Cyprus, the Czech Republic, Malta and the UK, which can be attributed to different traditions of industrial relations. However, in some countries, such as France, Italy, Latvia, Spain, Poland, Slovenia, or Slovakia, the government is legally obliged to consult social partners via established bodies (Duchemin, & Weber, 2013). Furthermore, Innovation Labs as entities facilitating the development of public social innovation (PSI) models have become an important trend in the recent years. Labs are cross-government bodies or independent organisations whose mission is to generate ideas for the renewal of the government's operations by bringing together small interdisciplinary teams, bridging organisational and sector boundaries, with experience and expertise that reflect the complex nature of policy challenges. Denmark is a leading example in Europe through the establishment of MindLab in 2002 (Leon, Simmonds & Roman, 2012, p. 15; Daglio, Gerson, & Kitchen, 2015, p. 33).

Public Social Partnerships in Poland

In the Polish society, the culture of acting through partnership is growing very slowly and reluctantly, only after three decades following the political transformation. The associations involving inter-organisational collaboration tend to be negative and often relate to such expressions as "connections" or cronyism. This concerns both the social and economic sphere of life and is obviously rooted in the low level of social capital. In the Polish practice of developing inter-sectoral collaboration, Rymsza (2007) indicates three major periods of adopting relevant legislation. The first one is the phase of building space for civic initiatives while at the same time creating a set of "privileges" for formalized forms of civic activity (pp. 23-35). The phase comprised the years 1989-1993 and it was concluded with the adoption of the Act of Law on Associations (1989)[5], creating the legal framework for the realization of the freedom of association, and the granting of tax incentives to non-governmental organisations, which boosted the growth of the third sector organisations. The second period – the years 1993-2001 – was the phase of the declarative support given to the third sector by the state, while in fact its role was marginalized when it came to the social policy reforms.

At that time, the third sector organisations that did not have enough clout to be invited as partners in the social reforms stalled, though it needs to be stressed that the principles constituting cooperation – of subsidiarity and social dialogue – were included in the Constitution of the Republic of Poland. The adoption of this legal norm resulted in the first attempts to launch cooperation on the local level. The third period, comprising the years 2001-to date, has been the phase of defining the principles of inter-sectoral collaboration. The momentous event of the period was the adoption of Act of Law on Public Benefit and Volunteer Work (2003)[6] – the first legal act that regulated the issues relating to non-governmental organisations in a comprehensive manner and imposed the obligation of cooperation between non-governmental organisations and public administration. At the same time, efforts were undertaken to lay the foundations for institutional collaboration and develop standards for its management rules and practices. Collaboration between organisations, as a rule, is initiated to solve social problems through the delivery of social services. The legal act mentioned above addresses the issue of collaboration in a comprehensive way, providing its definition, listing its forms, and describing the rules for its implementation. The main

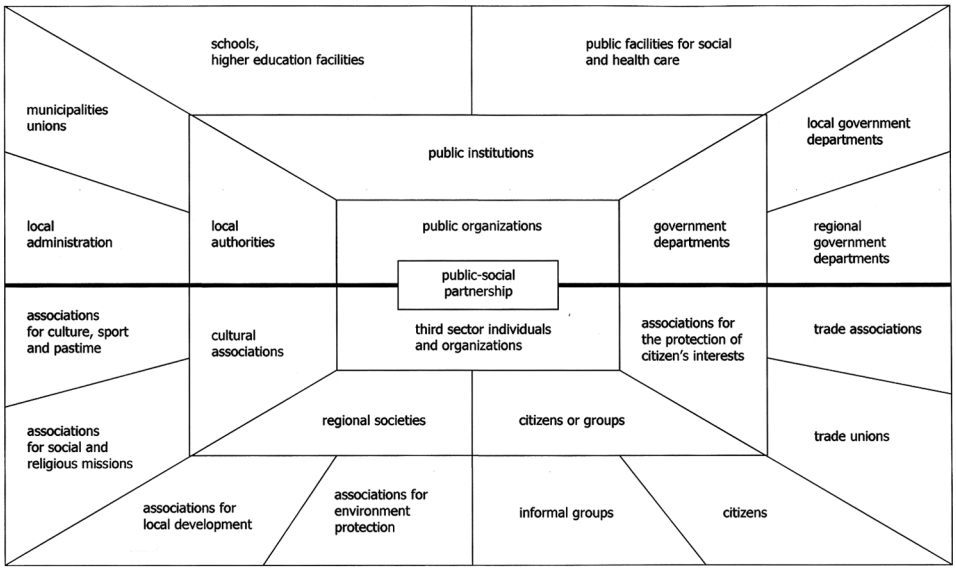
Source: own elaboration



principles determining the model of the cooperation between public administration and non-governmental organisations are the principles of subsidiarity, sovereignty, partnership, effectiveness, and transparency.

The contents of the principles determines the main forms of collaboration between non-governmental organisations and public administration, stipulated by the act of law, and it is these two types of actors that enter public social partnerships. The chart below shows the actors that can form public social partnerships in Poland.

Ontologically, public social partnership is the essence of the constitutional principle of subsidiarity, the special importance of which is conveyed by Luhmann's (1994, p.88) statement: as little state as possible, as much state as necessary. Public social partnership is an expression of public participation and new form of cooperation between local authorities and NGOs.

Public Social Partnerships in Spain

Spain does not have a long tradition of social partnership. For the greater part of the previous century, Spain's historical development was characterised by deep, violent social and political conflicts and confrontation, rather than co-operation and compromise, in industrial relations and politics, which caused the absence of the partnership approach. The constructive dialogue between the government and social bodies has been sporadic since the demise of Franco's dictatorship in 1974. Nevertheless, there was a period when agreements between the government, trade unions and employers were widely used in Spain leading to changes in policy. From 1977 to 1986, a number of income policy "grand pacts" were signed, which was the result of employers' willingness to respond to union strength at a time of immense political uncertainty (Boyd, 2002, p. 37).

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

The Spanish Economic and Social Council established in 1991 played a significant role in allowing the economic and social agents to participate in economic and social policy decision-making. The ESC was established to provide a formal channel for the participation of the economic and social partners in the process of introducing laws concerning socio-economic and labour matters, provide a permanent institutional forum for dialogue and debate between social partners and encourage social partners to review and consider economic and social issues (Boyd, 2002, p. 38). The number of partnerships on inclusion as well as on broader employment related issues increased in Spain during the 1980s and especially the 1990s. However, the multiplicity of levels, together with unclear divisions of responsibility led to very little co-ordination. (Boyd, 2002, p. 40). On 20 June 2002, Spanish trade unions called a general strike that was mainly triggered by opposition to the newly announced (May 25, 2002) government reform of the unemployment compensation scheme. One of the main oppositions related to the authoritarian decision making process without consultation of trade unions and social partners (Chabanet & Faniel, 2012, p. 167).

Political conflicts, confrontations, the lack of social dialogue or the participatory approach have caused distrust in the government in Spain. According to the 2013 Eurobarometer, the overall tendency to distrust the government reached 91% of respondents in Spain, which is 26 percent points above OECD-EU countries. The same high level of distrust is also evidenced at the regional/local level, where 78% of respondents do not trust the local authorities. As a result, Spain ranks third among OECD countries with the highest level of distrust of the government, which indicates a significant shortage of involvement of social partners in the policy-making process and the lack of transparency of the government (OECD, 2014, p. 229).

Responding to social challenges, Spain's government became a member of the Open Government Partnership (OGP),[7] a platform aiming to increase standards of Open Government sharing experiences at an international level. The government of Spain considers transparency as a current core principle of public action where only with accessible Public Institutions the citizens can participate in public decisions that concern them with better understanding of the government and higher trust in public decisions (OGP Spain, 2016). The main goal is to transform the bureaucratised, formalist, process-centred model of administration to a new kind of public management with mechanisms that facilitate citizens' direct supervision of public action increasing transparency, accountability and democracy (OGP, Action Plan, 2012, p. 1-2). Within the policies being carried out by the government of Spain, two action plans were published for the periods of 2012-2013 and 2014-2016 (OGP Spain, 2016). The recent commitments relate, inter alia, to public integrity increase through the Preliminary Draft of the Transparency, Access to Public Information and Good Governance Act, which has a three-fold purpose: 'expand and strengthen transparency in public activity, which is set forth as an obligation of the public administration and public agencies at every level; recognise and guarantee access to information, which is regulated as a far-reaching right; and establish the good governance obligations to be met by public officials' (OGP, Action Plan, 2012 p. 4). Additionally, the Spanish government has been recently working on channels and tools to engage the participation of social bodies in policy making and a number of proposals concerning IT projects that have been developed to enable citizen interaction through social networks and web-based technology (OGP, Action Plan, 2012, p. 7).

In recent years, the actions towards public sector innovation have become a strong tendency in Spain and, according to the Observatory of Public Innovation (OPSI), the Spanish government has been promoting innovation activities in the General Framework for the Improvement of Quality of Public Services in Central Administration. A number of initiatives have been implemented, such as the Span-

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

ish Inter-administrative Network, created in 2005 as a forum composed of central, regional and local administrations, as well as the National Agency for the Quality Evaluation and Accreditation. It indicates inter-organizational cooperation to share innovative experiences and knowledge aiming at the development of innovative initiatives, public sector management and 'the common framework of continuous improvement and innovation on the road towards excellence' (OECD, 2016a).

A BUSINESS MODEL: THE GENERAL CHARACTERISTICS OF THE CONCEPT

In the reference literature, a business model has not been defined in clear terms yet. The notion of a business model was first used in 1957 to consolidate in the late 1990's. Originally, the notion referred only to the practice of business organisations, but at the beginning of the 21st century it became a management instrument in organisations operating in the sectors that are not profit-oriented. Both in the public and social sectors, this is a new management concept that struggles to win acceptance, because for many years nobody has recognised the necessity of outcome oriented management in such organisations. In the authors' opinion, if an organisation has a proven method of creating, delivering and applying value, it also has a business model. The conviction that a business model is a concept created solely with reference to business organisations is wrong. Every organisation that wants to achieve results, create value and survive in its industry has to clearly formulate and develop a business model as it will not operate effectively without a stable model. It is of no significance whether it operates in the profit-oriented or not-for-profit sector, since all organisations have a business model, although some managers may still be unaware of this. The business model can be treated as a general concept that provides the framework for how the business is run and determines such characteristics of this business as innovativeness or competitiveness. The identification of the components of the business model contributes to the successful definition of value offered to customers, resources, operations, and relationships with partners, which all serve the creation of this value and ensure the success of the organisation. The skills involved in the suitable definition of the business model in not-for-profit organisations are crucial for their success, as they help to concentrate on the elements that contribute to value creation, while a well configured system of connections and causal links between particular components of the business model ensures the accomplishment of the goals designed by the organisation.

While analysing the meaning of the words making up the concept of a business model, the Authors conclude that a model is a simplified image of the reality, while business is an activity involved in value creation (Palo & Tahtinen, 2011, p. 378). The approaches to the business model rely on three basic ways of defining this category.

The first group of definitions relates to the concept of the value chain, the second one to the resource-based view, whereas the third one focuses on the interpretation of the business model as business architecture with the value creation process as its key component. Rudny (2013), quoting Demil and Lecocq, states that, "in general, the category of the business model refers to the description of relationships between elements the co-existence and collaboration of which ensure the creation and delivery of value for the customer and, as a consequence, for the enterprise" (pp. 12-13). Amit and Zott (2007, p. 181) argue that the business model can be treated as a kind of matrix that illustrates how the organisation runs its operations, how it delivers value to stakeholders, and how it links factor and product markets. The design of a business model is primarily affected by the sector since it is the way in which the organisation runs its activity in the environment that it identifies and diagnoses itself. This way embraces a unique

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

combination of resources, actions and products and services, offered by the organisation, that ensures the creation of value for the customer.

The successful design of the business model requires the knowledge of the sectoral context in which the organisation operates, as the model has to be rooted in a specific environment that determines the key assumptions adopted for the design and implementation of the activities planned by the organisation. This comprehensive understanding of the context is related to the definition proposed by Johns (2006, pp. 384-388) and places emphasis on such situational opportunities and constraints that affect the occurrence and meaning of the behaviour inside the organisation and of the organisation itself as well as shape the relationships between variables. The context in a narrower sense, on the other hand, can be defined as the aspect sensitizing an organisation to the way how particular environmental factors can act as temporal or spatial determinants of the business model (Cappelli, Sherer 1991, pp. 55-110). The complexity of the context affects the nature of actions undertaken both in business and not-for-profit sectors. Rudny (2013) and Nogalski (2009) alike argue that it is the character of the environment that gives meaning to business models and determines their usefulness.

The Business Model According to A. Osterwalder and Y. Pigneur

Originally, Doubosson-Torbay, Osterwalder and Pigneur (2002, p. 5-23) defined the business model as a firm's architecture and its network of partners for creating, marketing and delivering value and relationship capital to one or several segments of customers in order to generate profitable and sustainable revenue streams. Later on, they offered a more rigorous version of the definition, describing the business model as the conceptual and architectural implementation of the strategy and as the foundation for business processes.According to the scholars, the business model illustrates the fundamental premises for the organisation to create value and earn profits from this value. In general terms, the business model determines the ways of generating revenue in the organisation. A good business model aims to achieve or maintain competitive advantage. The structure of the business model Canvas proposed by the scholars quoted above is built from the sum of resources and actions that a given organisation manages and implements in order to deliver specific value to the specific customer.

The central part of the model is a value proposition. The value proposition for specific groups of customers is the core around which the revenue and cost parts of the business are built. They are arranged against the background of nine key elements, describing the model of every organisation's operations, irrespective of its market position and growth phase, such as: key partners, key activities, key resources, value proposition, channels, cost structure, revenue streams, customer segments, and customer relationships. While analysing the activities of a number of organisations, those authors argued that every business consists of the same areas presented above and they are most suitably represented as a graphic template which clearly shows all the relationships. The business model, on the other hand, is the sum of all the identified and mutually depended elements. When a business model is constructed, the adequate order of accounting for every element has to be maintained – the first one is always the value proposition, marked with digit 1, which is followed by the identification of the customer (who is the target for the value proposition developed by the organisation). The final element in the construction of the model is the cost structure, marked with digit 9. The first two elements are the key coordinating the composition of the resources and actions that are necessary for the creation and delivery of value for the customer. However, more extended business model frameworks have been also elaborated, like for circular economy for instance (Lewandowski, 2016).

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

The corporate link of business model has been recently reinvented into social area and public entrepreneurship and its various partnerships in social services delivery. So far, the Lean Model Canvas[8] has been very broadly used among social entities, however, the dynamic development in social economy sector and the turbulent environment has influence the emergence of various types of social bodies, survival strategies, networks or partnerships whose complexity has started to require different and more sophisticated models (Osborne, Radnor, Vidal, Kinder, 2014). The public social organizations have moved beyond traditional and narrow perspective as they are no longer just single organizations but 'systems' that need interactive sustainable models, complex architecture and knowledge that to be successfully transformed into effective public services delivery must by processed through relational mechanisms rather than discrete and transactional ones (Osborne, Radnor, Vidal, Kinder, 2014, pp. 167-170). As the single organizational profitability is no longer a measure of public entrepreneurship sustainability, the Business Model Canvas helps clearly articulate the architecture of the mutually inclusive partners or activities and other symbiotic elements in the inter-organizational network within public services delivery. The social economy development and the cultural change in social organisations has influenced numerous business model frameworks within social sector worldwide. The level of functionality of the social partnerships models and their architecture vary among countries, which encourages to observations and further deeper insight into the models active in Spain and in Poland.

The Identification of the Business Model for a Public Social Partnership Operating in Poland

The partnership that is the subject of this case study was launched in Rybnik, a city located in Upper Silesia (Sielsia Voivodeship, Poland) with the population of 141,400. Despite its dynamic socio-economic growth, it still has the districts where most residents are at the risk of social exclusion, hence the need to undertake initiatives aimed at combating poverty and social exclusion. The observed practice reveals that the highest chances for success lie with activities that are initiated in cooperation with various organisations (public and social) and the local community.

The leader of the partnership is the Social Welfare Centre (OPS), whose employees launched the project "Seize the chance", co-funded by the European Union within the EU Social Fund. The prime goal of the partnership was to raise the level of activity among the residents of the target districts and local institutions so that they could address the problems related to the risk of social exclusion themselves. The aspiration was to develop the model of community work based on cooperation with residents, volunteers and institutions operating in a given district. The conviction was that the initiative should contribute to a change occurring in the local community. In order to formalize the cooperation between the organisations operating for the good of the residents in the district, a public social partnership was established. The leader of the partnership was a public organisation – the Social Welfare Centre – that initiated collaboration with 6 public and 11 social organisations. The partnership was based on the following principles: voluntary participation, the equality of partners, shared goals, the sharing of risks and benefits, the involvement of residents, and supporting local initiatives. The analysis of the operations run by the partnership allowed for the creation of the description of the business model, based on the assumptions developed by Ostewalder and Pigneur (2010) and presented below.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

The Identification of the Business Model for a Public Social Partnership Operating in the Basque Country, Spain

The analysed partnership was established in Gipuzkoa province in the Basque Country in northern Spain. The Basque Country is divided into three provinces: Araba, Bizkaia and Gipuzkoa. The number of population in Gipuzkoa reaches 709,991 in total, which exceeds Araba (321,777), but it is lower than in Bizkaia (1,141,442). Gipuzkoa is the second biggest province in the Basque Country (EUSTAT, 2015).

Currently, there are many initiatives aiming at social innovation in the Basque Country. The Basque Government, for example, has included the promotion of social innovation in several of its plans – the Science, Technology and Innovation Plan and the Public Innovation Plan. The three Provincial Governments of Bizkaia, Gipuzkoa, and Araba have developed different policy instruments for the generation and selection of social innovation initiatives. Importantly, Basque authorities underline that social in-

novation is a strategy 'tackling the issues that really matter and doing so in a different way' (Agencia Vasca de la Innovacion, 2016, p. 1). Thus, they are exploring a participatory system for democracy and developing models for citizen participation and involvement in discussions and public decision making to combine different resources and processes to create public value. The focus is on shared social learning with the objective of generating new perspectives, new partnerships and new solutions that result in experimental projects. 'Basque institutions are helping to create a "market" which supports social innovation by incorporating it into their management process and into government structures and instruments (legislation, institutional development, etc.)' (Agencia Vasca de la Innovacion, 2016, pp. 1-2).

In general, social innovation initiatives have strong roots in the Basque history, which provide the solid base for the future participatory approach and partnerships. The model developed through an organisation called GUREAK was initiated four decades ago by CSO Atzegi Association sponsored by the local government. The association is aimed at rights and social integration of people with disabilities in Gipuzkoa (Mair & Noboa, 2003, p. 3). The main mode of the mission accomplishment is through the employment dimension. In the first phase, 1970-1975, Atzegi acted alone, but the mission of the social integration of disabled people through work required extensive resources. Acting in isolation, the CSO Atzegi Association did not have a capacity to manage the process effectively, therefore, in 1975, they chose to create a corporate structure called Gureak, with the non-profit corporation as their legal form, which developed into one of the foremost organisations in the field of social and work integration. It provided 2,008 jobs in 1997, of which only 174 where for people without disabilities (Mair & Noboa, 2003, p. 3; Vidal, 2014, p. 6). Relating to the latest data from 2015 (Gureak, 2016), it currently provides more than 5000 jobs, of which 84% are for people with disabilities including intellectual (36.7%), physical (23.9%), sensory (6.8%) and mental (15.5%). Today, it forms the Gureak group with investors and partners from public, social and private sectors, creating multi-sectorial cooperation to solve employment related issue in an effective manner.

Gureak has established strong cooperation with 2 local public authorities – the Gipuzkoa Government and the San Sebastian City Hall. The partnership is crucial in terms of financial support and the legal agreement to jointly manage public facilities and share activities in the same area. Additionally, Gureak has 3 shareholders in the third sector, namely the Kutxa Foundation, the Atzegi Association, and ILUNION. Atzegi, the pioneer of the Gureak group, is the leading shareholder with a 32.19% stake (Gureak, 2016).

The Gureak group has had a cooperation agreement with the province of the Gipuzkoa Government renewed annually since 1986. The government delegates the right to Gureak to manage a public service towards inclusion in the employment dimension (Vidal, 2014, p. 7). Furthermore, the local government funding accounts for 4.2% of the Gureak group's income, which is mainly devoted to the itinerary service focusing on the activities related to disable people in the area of personalized job match process, further professional training, adaptation, and the monitoring of the work integration success. Additionally, the Basque employment service cooperates with Gureak with respect to their mutual agreement providing the grant that accounts for 8.4% of the Gureak group's income (Gureak, 2016).

To facilitate the mission of work integration, the Gureak group has established strong cooperation with large and medium-sized companies operating in the Basque Country and it performs business activities in the following areas: industry, marketing, and services. The business corporations cooperating with Gureak comply with the legislation, which requires them to directly or indirectly create employment for people with recognized disadvantages (Vidal, 2014, p. 7).

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

The Gureak networking structure is unique in its form as it has been initiated by the social body rather than the public one and it has gradually involved public authorities to obtain the legal right to operate in the area of social services delivery and support local authorities in tackling the issue of exclusion. It acquired shareholders from the third sector and business partners from the private sector to increase resources and capabilities to entrepreneurially reach the political goal of work integration and fulfil legal obligations stemming from the public social agreement.

SOLUTIONS AND RECOMMENDATIONS

The capacity to fulfil the undertaken objectives of the analysed partnership is related to the ability to design such a configuration of partners, in which skills, values, and the sense of community are used in the right way, and within which organizations gather and share resources, activities and protocols, procedures and infrastructure that enable effective cooperation between multiple actors.

The two researched models have unveiled that the value proposition and the shortage of resources or knowledge crucial to design or deliver proper service or value are the key and primary determinants that precede the partnership model and its architecture building. The agreed value pursues the selection of partners, whose participation affects the process of service delivery to target customers. Additionally, the need for high quality service requires professionals, so the analysed networking structures involve entities specialized in the area of social inclusion in order to avoid potential limitations of proper service delivery. In both cases, the engagement of public authorities in the networking structure results in the transparency of public institution positively influencing the process of democratic decision-making and collective social services delivery.

Value Proposition

Both partnerships generate value in the employment dimension aiming at social integration. The partnership in Rybnik in Poland aims at the social integration of people excluded from the labour market through interactions with the local community evoking participatory approach and co-production of social services for the effective inclusion of the target group into the market. The partnership in Gipuzkoa, the Basque Country, Spain, is aimed at the social integration of disable people through work. It pursues its objectives by engaging social bodies to share responsibilities and knowledge and working with business partners to facilitate the achievement of its mission, which, in turn, leads to the creation of political and social value through collaboration with partners in the private sector. While in Rybnik initiatives are mainly focused on activation and mobilisation of the local community and the target group in seeking solutions, the Basque partnership focuses on delivering ready-made solutions and the effective implementation of the strategy for stable work opportunities for people with disabilities. The strategy requires collaboration with partners from public and social partners as a foundation and private partners in the area of the idea enforcement through advanced business activities. Both partnerships create value that would not be effectively delivered by organisations acting in isolation.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Customer Segments

The two partnerships models act in the employment dimension supporting groups excluded from the market or at the high risk of exclusion. The partnership in Rybnik, Poland, is aimed at people excluded from the labour market in the city districts that are affected by poverty. Additionally, it focuses on the local community, which is constantly being mobilized and stimulated to create its own initiatives seeking solutions to its problems. The partnership model in Gipuzkoa, the Basque Country, is aimed at people with intellectual, mental, sensory and physical disabilities in the Gipuzkoa Province – the created networking structure employs 5000 people and 84% of people with disabilities are directly or indirectly employed by the partners within the chain.

Customer Relationships

Professionalism and trust are the key customer relationship traits shared by the two partnerships in Poland and Spain. It might be assumed that trust is the effect of the bottom-up approach involving families, local communities and the affected group into the co-production of the delivered services. The networking structure in Poland strongly highlights the participatory approach of the local community and families during the process of creating the best strategy for the affected group to support them in the adaptation to the current labour market needs. The model in Gipuzkoa is significantly focused directly on the affected group monitoring their skills and abilities or potential limitations to ensure effective participation of disable people in the labour market. Professionalism stems from knowledge sharing among partners in the chain. In Gipuzkoa the network involves, inter alia, the CSO Atzegi Association or the Department of Mental Health providing crucial information about disabled people, while in Rybnik it embraces, inter alia, the local community and local authorities providing comprehensive data about the affected region and group. Interestingly, the partnership in the Gipuzkoa Province focuses on the personalised relationship with respect to the specific type of disability, which requires accurate analysis, research and individualized approach/relationship increasing the effectiveness of the job match process and the productive participation of every single disabled person in an organisation

Channel

The channels of value delivery differ with reference to the specific customer segments. The partnership model in Poland focuses on active presence in social media, offering and promoting their services through social networks and social portals to the local community. In contrast, the partnership model in Gipuzkoa targeting disabled people does not consider social media as an effective mode of communication and value delivery with respect to varied limitations of specific disabilities (more than 30% of people with mental disability; see Table 2). Social media are used as a channel to reach or update families of disabled people about current actions, as the relatives are involved in the process of the individuals' professional development and self-esteem/relationships building. However, both partnerships underline the importance of direct contact, where social or welfare agents contact personally with the local community (Rybnik) or professionals that work with disabled people on an individual basis, matching their skill to the specific type of work and preparing them for active participation in the labour market (Gipuzkoa). Additionally,

Source: Osterwalder, A., & Pigneur, Y. (2010). Business Model Generation. New Jersey: John Wiley & Sons, Inc

the partnership model in the Basque country uses the channels of institutions such as the Department of Mental Health, the Public Social Services, or other local associations that have direct contact with disabled people and their families, which facilitates effective communication and value delivery.

Revenue Streams

Both partnerships have varied streams of financial support. The partnership in Rybnik as an initiation based on European programme is primarily supported by the European Union grant. The Gureak group as an organisation active on the market generates a high percentage of its income from regular business activities. However, both partnerships are financially supported by local public authorities: the Rybnik organisation receives the grant from the municipality, while in Gipuzkoa the partnership obtains the

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

government grant from the Gipuzkoa Government or the Basque employment service grant. Importantly, the key public and social partners of the Basque partnership are also investors holding stakes of varying size. In Rybnik, the additional stream of revenue relates to potential sponsors, which does not guarantee regular income in comparison to the Gureak group with official and stable investors from public and social bodies (e.g. Atzegi, the Kutxa Foundation or the local government[9]).

Key Activities

The key activities in both partnerships focus on work integration services of the chosen customer segments (see Table 2). The main activities of the Basque partnership are highly specialized as they focus on one concrete customer segment including people with four types of disabilities. The key activities of the partnership in Gipuzkoa can be divided into legal activities formalizing the partnership and assigning responsibilities to public authorities, social bodies and private actors, and issue-oriented activities aiming at the employment challenges in the chosen customer segments including professional training and development, the job match and adaptation process, or further monitoring. The partnership in Poland offers a wide of range of activities in the area of active integration through numerous events with the local community and the target group in a form of specific group events, formal or informal meetings or workshops, and, additionally, temporary welfare support with respect to the social welfare service regulations.

Key Resources

Both partnerships use knowledge as the key resource for building the 'architecture' necessary for value proposition delivery. Knowledge is the determinant of the partnership's success, the basis of and the driving force behind the partnership model creation as well as the important resource needed to pursue the agreed mission. It is especially evident in the partnership active in Poland, where qualified workers in the chain are crucial to effectively interact with the local community to build networks and develop the participatory approach. Additionally, the knowledge of the involved public institutions and social partners is necessary for the delivery of secondary data that can be further re-used and updated through direct interactions with the community resulting in higher reliability of the data affecting the process of social services delivery in the region. In Gipuzkoa, the primary source of knowledge for the analysed partnership is the Association CSO Atzegi (see section 6.3), which specializes in the social integration of disabled people. The professional approach, the database and the long existence of the association in the centre of the affected group are a significant base for the partnership and Gureak itself, as they allow the networking structure to effectively design the accurate social service towards the successful integration of disabled people in the labour market. Apart from the knowledge about the target group, Gureak's mission of social inclusion through work requires specific resources to fulfil the mission in the real market, demanding entrepreneurial knowledge to achieve and, even more importantly, maintain the value proposition through advanced business activities. Nevertheless, the whole process of the mission active enforcement would not be possible without significant legal resources in the form of the agreement between the Gureak group and the Gipuzkoa Government on sharing activities in social service delivery in the area of employment of disabled people and the legal agreement between Gureak and

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

private enterprises that subscribe to its mission and comply with the Spanish LISMI law imposing the 2% employment of disabled people provided that the enterprise exceeds 50 workers – including alternative measures.[10]

Key Partners

The key partners are the strong determinant of the partnership's proper functioning and the creation of the networking structure. Different social services require specific 'architectures' of service delivery, so the selection of partners is preceded by the process of seeking additional resources by a single organisation aiming at overcoming limitations of value delivery. The two analysed cases present a pressing need for building partnerships allowing for capability enhancement. Both models involving public authorities, social bodies and private actors reveal the significance of network building in the successful achievement of the common mission through, inter alia, closer cooperation, risk and knowledge sharing among chosen partners. Interestingly, the partnership in the Basque Country was initiated by the social organisation (CSO Atzegi Association; see section 6.3) rather than the public one and it has gradually involved public institutions to increase resources and capabilities of the Gureak group to share activities and achieve the common goal. Comparably, in Poland the partnership was started by the public institution (OPS; see section 6.2) and it has been gradually involving social actors to increase the potential of public activities in social services delivery. In the two analysed areas, the created network adopts the participatory approach creating the bottom-up model of solving social issues, where the leading organisations (Gureak – Gipuzkoa, OPS – Rybnik) are at the centre of the target group and use social partners (associations, foundations, public authorities, volunteers) for, inter alia, knowledge enhancement and professional design and delivery of social services. Both network structures are characterized by mutual benefits where the public sector is 'unblocked' by sharing the responsibilities in the area of social integration with other partners and the social and business entities are empowered through financial and legal support by the public authorities.

Costs Structure

The costs structures of the two analysed partnerships cover the operational expenses for managing the network including administration and communication processes. Both models employ professionals, who need to be remunerated, that manage the whole architecture and interact with other partners in the chain. The Gureak group employs approx. 20% of people without disabilities including professionals and approx. 80% of people with disabilities (see section 6.3) and the partnership model covers the compensation for both of the group. Moreover, the leading organisation of the partnerships determines the costs structure. Therefore, the Basque partnership includes expenses for business activities as the Gureak group is a social economy enterprise with a strong presence in the market. The costs structure of the partnership in Poland mainly includes salaries and costs of the professional trainings of the employees involved in the network and costs of the social service design.

Value creation resulting from inter-organisational collaboration established in the public and social sectors is facilitated by democratization and decentralization, dynamic technological advancements, limited resources, and increasing organisational inter-dependencies, which generate the need to undertake initiatives stimulating cooperation between organisations. It is also relevant that information necessary to implement a given project is part of the resources held by many actors (a single organisation does not

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

have knowledge on all the aspects of a specific problem) and organisations are becoming increasingly specialized (they are often specialists in their area, so projects require inter-sectoral cooperation). In this situation, non-governmental organisations are growing in importance, as their role in the democratic society is gradually becoming more significant. Responding to these challenges, the modern state builds formal foundations for non-governmental actors.

FUTURE RESEARCH DIRECTIONS

The dynamic evolution of the principles underpinning the public sector towards embracing first market mechanisms and the networking structure as driving force behind the change in the actors operating in the domain of the public sector, contributes to the new vision of the public management whose innovative approaches require future theoretical and empirical elaboration. The chapter presenting possible departure from the state monopoly in the public sector, and moving towards the search for effective solutions of delivering services to citizens, prepares and introduces future research relating to social innovation, its adaptation and outcome. The gradually developing phenomenon of public social partnerships provides significant base and data for further observations that should encourage researchers to deeper and wider insight to the appearing models architecture. The chapter limits the application of the concept of partnership only to the cases in which the objectives of collaboration go beyond the usual consultation process, without detailed descriptions of, inter alia, implementation process, administrative and management structures within particular partnership. Therefore, it is a perfect area of future analysis towards contextual external and internal determinants of the individual models efficiency and the potential risks in the turbulent environment. In addition, partnerships differ strongly from the perspective of inter alia, subject of cooperation, value proposition and cultural background, which limits the assessment process of universal success determinants of the partnerships and it rises a challenge for future researchers. The analysed partnerships in the chapter pose a question about the level of cultural interference into the public management development and partnerships in varied countries. Moreover, the two analysed models have unveiled differences in the partnership leadership, which pursues future research directions to analyze the influence of the partnership leader on the partnership effectiveness.

CONCLUSION

Generally speaking objectives formulated by a partnership are characterized by the fact that without the cooperation of stakeholders from different sectors these objectives could not be reached, and the source of the cooperation are the people and their behaviour. This means that although the public-social partnership is a relationship between institutions (more or less formalized, or curbed by rules), its actual results are most frequently determined by interpersonal relationships between individuals jointly performing a task for a local community, as it is the individuals who create institutions and determine their character. A partnership is thus a reflection of interpersonal relationships and, similarly to bonds created by people, it undergoes different phases: integration, relation, normalization and effective cooperation. When forming partnerships, these phases play an important role in defining it as a formalized cooperation between public and social actors, which involves integrating processes, including co-management of the process of formulating a strategy and creating organizational structures. The proposed approach

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

limits the application of the concept of partnership only to the cases in which the objectives of collaboration go beyond the usual consultation process, that is to the cases without administrative structures and institutions aimed at implementing a particular purpose. In addition, partnerships differ strongly from other forms of commissioning, which represent a more traditional leadership-representative relationship, with a leader (e.g., department or public body) deciding upon the scope and methods of implementation of the plan on their own, and with the subject of cooperation (e.g., a private organization actively participating in local development) being responsible for the implementation of the decisions issued by the leader. Such a relation does not provide for co-operation in formulating a common policy, since the objectives are defined in a top-down agreement and created independently by a commissioner. Instead, partnerships assume joint objectives and their implementation, agreed and accepted by all parties involved in the decision making process, emerging as a consequence of a designed and deployed architecture of cooperation. The previous considerations clearly emphasize that cooperation between partner organizations emerges in response to identified social problems, and its organizational form might be described as an architectural response to these problems. The necessity to respond to disclosed needs by means of a certain structural form results in the fact that organizational work is undertaken, and the purpose of it is to design such an architecture of cooperation which will support the business model within which it will be possible to achieve the planned objectives.

Value creation resulting from inter-organisational collaboration established in the public and social sectors is facilitated by democratization and decentralization, dynamic technological advancements, limited resources, and increasing organisational inter-dependencies, which generate the need to undertake initiatives stimulating cooperation between organisations. It is also relevant that information necessary to implement a given project is part of the resources held by many actors (a single organisation does not have knowledge on all the aspects of a specific problem) and organisations are becoming increasingly specialized (they are often specialists in their area, so projects require inter-sectoral cooperation). The modern social public partnerships require strategic orientation and sophisticated sustainable business models that are value based and beyond single bottom line as they must face the challenge of sustainability of individual organization and simultaneously the sustainability of social service delivery systems and their governance mechanisms within inter-organizational networks. The new approach moves the public entrepreneurship from traditional models to specialized and effective systems that lead to sustainable innovation in social services delivery (Osborn, Radnor, Vidal, Kinder, 2014). The so far presented considerations head towards an observation that leaders direct and shape their organizations by adapting, accepting and refuting specific aspects of management theory and practice, as well as by creating new ways of managing, better suited to specific objectives. With regard to public-social partnerships, Authors claim that the leader of a partnership becomes an architect who, by rationally choosing elements, creates a properly collaborating whole and business model. The success of a partnership is determined by the knowledge of how to build and sustain a successful inter-organizational collaboration, reliable in the eyes of the partners, stakeholders and the local community. A partnership's leader ability to design such an architecture of cooperation, which will become accepted by potential organizational actors, that is the leaders of partner organizations and their members, affects the capacity to fulfill undertaken objectives and therefore contribute to the ultimate success of a collaboration. Such an approach enhances the status of the concept of *governance* together with its attributes, as the preferred model of management of organizations providing social services in the partnership formula. The ability to design such a configuration of partners, in which skills, values, and the sense of community are used in the right way, and within

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

which organizations gather and share resources and protocols, procedures and infrastructure that enable cooperation between multiple actors, becomes crucial to achieving the intended results.

Summing up the threads running through this paper, Authors state that, in the public sector of many EU countries, the management of public programs aimed at providing social services by means of using partnerships has become more of a norm than an exception. This is a consequence of the appreciation of the view, emerging among both practitioners and researchers, that the integration of services through multi-stakeholder networks - by reducing fragmentation and enhancing coordination of services - leads to a more efficient system and thus to better results of operation: customers gain more individual benefit, and cooperating organizations have a better chance to develop.

KEY TERMS AND DEFINITIONS

Business Model: The organizational architecture that allows to achieve new value, high quality services delivery, efficiency and flexible adjustments to the requirements of the market and environment.

Business Model for Public Social Partnership: The well-designed configuration of partners within the collaboration framework that responds to the needs emerging in a local community and that the outcomes achieved as a result of its operations contribute to the survival and growth of the organisations making up the partnership though the creation of the desired public/social value.

Collaboration: The network relationship of organisations choosing common goals and jointly deciding on how to use their resources developing an ability to create new structures.

Partnership: The networking structure that clashes interest and coordinate joint activities and resources to unleash the partners' potential to solve complex and multidimensional issues or challenges.

Public Management: The creation of organisational conditions conducive to the effective delivery of social services.

Public Participation: The involvement of those potentially affected by or interested in a decision-making process in public sphere.

Public Social Partnership: The multi-sectoral networking structure, taking advantage of adopting the idea of collaboration and capable of generating more positive outcomes and public/social value than each of the organisations operating on its own.

Social Innovation: The solutions that embrace institutional change and appear as a response to the unsuccessful and obsolete models that no longer apply to the changing environment. Social innovation can be understood as a management model, clearly manifested in the concept of governance.

Social Policy: The activity of a state and other actors pursuing pro-social goals, primarily subsidizing social groups that are marginalized or at the risk of marginalization and initiating actions aimed at improving the quality of life and stimulating growth.

Stakeholders: Everybody who has a vested interest in the value created by the organisation.

Value: The above- average profit with reference to market entities and the 'above-average' social services quality and delivery with reference to non- market entities resulting (in both cases) in satisfying the stakeholders' needs.

6 Ustawa z 24 kwietnia 2003 r. o działalności pożytku publicznego i o woluntariacie, Dz. U. 2003, nr 96, poz. 873.

7 OGP was launched in 2011 to provide an international platform for domestic reformers committed to making their governments more open, accountable, and responsive to citizens. Since then, OGP has grown from 8 countries to the 69 participating countries. In all of these countries, government and civil society are working together to develop and implement ambitious open government reforms. It brings together governments and civil society organisations as true partners at both the national and international level. At the national level, governments work with civil society organisations to develop and implement their OGP national action plan. Countries are encouraged to institutionalize a mechanism for ongoing dialogue and collaboration between government and civil society (OGP, 2016).

8 Lean Model Canvas is a simple problem-solution oriented approach, it does not lay much emphasis on customer segments, key partners or assessment of the given solution to the identified problem (Canvanizer, 2016).

Chapter 20
A Framework for Using Crowdsourcing in Government

Benjamin Y. Clark

University of North Carolina Wilmington, USA

ABSTRACT

Crowdsourcing is a concept in which the crowd is used as a source of labor, idea generation, or problem identification. Crowdsourcing originated in the private sector; though with any good private sector practice it is increasingly being utilized in government. This paper provides an overview of the concept of crowdsourcing, gives examples of its use in the private and public sectors, and develops a framework for how governments can begin to strategize and think about crowdsourcing to solve problems when engaging with citizens. The authors' framework is illustrated with a number of cases from current or past uses of crowdsourcing in government. They conclude with important considerations about how governments should strategize their crowdsourcing efforts.

INTRODUCTION

Governments on all levels in the U.S. are beginning to use or contemplate the use of crowdsourcing as a tool to implement policies/programs, engage the public, collect information, or enhance services in some way. The extent of the projects range in size, outcome, collaborative extent and, in many cases, efficacy. Nonetheless, a techno-engaged public capable of shaping how government functions and responds seems to be here to stay and many local, state and federal agencies are taking it seriously. For example, a consortium of about 40 federal agencies have utilized crowdsourcing to develop the U.S.

Public Participation Playbook (http://participation.usa.gov/). The Playbook "is a resource for government managers to effectively evaluate and build better services through public participation using best practices and performance metrics" ("U.S. Public Participation Playbook," n.d.).

Crowdsourcing is a general term used to describe a variety of ways that organizations, particularly in the for-profit sector, take advantage of the thoughts, inputs and ideas of the public. Daren Brabham (2013, p. xix) defines crowdsourcing as "an online, distributed problem-solving and production model that leverages the collective intelligence of online communities to serve specific organizational goals." We argue for a slightly broader definition of crowdsourcing that can include the coordination of information via the telephone, as well as slightly less advanced technology that can still gather information from the crowd widely and effectively through information technology.

Crowdsourcing is new to many in the public sector, thus guides, like the Playbook, are important for its use. Much of the discussion of crowdsourcing in the public sector has been largely empirical and not grounded in the literature or theories of public administration and policy. By more closely linking crowdsourcing to the public administration and policy literatures we hope to expand the dialogue on crowdsourcing in the public sector.

Crowdsourcing has been discussed as an innovative approach to share knowledge and engage the public. So we enter into this project with an image of a group of public sector managers sitting around a table, discussing ways that technology can be used to improve government services, do more with less, engage the public, and leverage existing resources that are not yet accessed or utilized. We will examine crowdsourcing by looking into what is already understood about knowledge generation and expertise, particularly as they relate to the public sector.

This article provides a framework for public managers to begin strategizing crowdsourcing approaches when engaging the public and implementing new programs. The framework provides a way in which to consider the benefits, potential applications, and determine which crowdsourcing approaches might be most appropriate for a particular case or goal.

Brabham (2013) classified crowdsourcing into four problem-based approaches for governance: knowledge discovery and management, distributed human intelligence, broadcast searching, and peer-vetted creative production. His typology provides a suitable framework for applying crowdsourcing to a specific problem type, but it says less about the decisions and pressures facing public administrators in the management of transactions costs while blending a diverse pool of knowledge developed by the crowd with administrative expertise (or in depth knowledge of a topic). Thus, we take inspiration from Brabham (2013), but our approach goes well beyond what he attempted. This article aims to extend Brabham's typology and provide a foundation of crowdsourcing in the public administration and policy literature by arguing that crowdsourcing may take a variety of distinctive forms, and that each has a different production function requiring varying degrees and types of administrative expertise–at different costs and benefits for governments.

We first describe crowdsourcing and mass collaborations. Next, we provide a brief background on Brabham's typology and explore the literature that forms the basis of our framework for examining crowdsourcing in government. We then offer a number of public sector crowdsourcing case examples to provide context to our proposed framework and discuss how crowdsourcing may shape the role of the public sector. We conclude by elaborating on those conditions or factors that make different forms of crowdsourcing useful for public organizations when making decisions, creating policy, and understanding social problems.

WHAT IS CROWDSOURCING?

The traditional firm or organization-based collaborative group is purposeful and organized—a group of people who are consciously working together and who have a shared organizational identity driving the collaboration. Contrast this idea to a crowd of people who are all in the same physical location but lack a common purpose or goal and who are not unified by a formal organization. The ambiguity as to what motivates the crowd and how its power can be harnessed is a fertile field for academic study—particularly as it relates to the study of government.

We argue that crowdsourced collaborations are typically less organized and less purpose-driven than those firm-based workgroups or research centers that have traditionally been the source of innovation in the public and private sectors. Crowdsourcing has tended not to seek answers to big questions; rather, it is a production process that seeks a large number of small contributions, ideas, revisions, or corrections to projects and products. Such a mechanism results in a project that might be owned by a company but sourced by the crowd. Also, we are not arguing that crowdsourcing is unorganized or lacks a clear purpose, rather that the formal structures of these collaborative endeavors have different structures, have different sets of rules or operating procedures, and have different sets of expectations or outcomes than traditional bureaucratic organizations.

Brabham (2009b) argues that crowdsourcing is most effective when problems are clearly framed and pertinent data are available. At the same time, the size or complexity of a project or problem should not be a barrier to the use of crowdsourcing as a possible solution. The ability of the crowd "to handle complex data should not be underestimated," as many high-tech and complex projects, such as Linux or Wikipedia, have successfully used crowdsourcing (Brabham, 2009b, p. 253).

Many current applications of crowdsourcing as a problem-solving technique are rooted in technology (Brabham, 2009a). Biases in availability may limit crowdsourcing to those with the appropriate technology, while leaving those without access on the outside—mirroring issues of the digital divide on a smaller scale. This uneven access has the potential to exacerbate the problems of the digital divide, particularly if the purpose of public-sector use of crowdsourcing is to generate more input from citizens. However, some recent studies have begun to show signs that mobile technology may be beginning to bridge the digital divide for public sector crowdsourcing applications (Clark & Brudney, 2014; Clark, Brudney, & Jang, 2013).

Government has not been immune to the siren call of crowdsourcing. President Barack Obama claims that "we are at the beginning of a new era applying available technologies to make public policy in better and more effective ways" (Schingler, 2009). The Obama administration has made public overtures to tap the power of the crowd. Among goals of using technology to improve transparency, national security, and efficiency were to unlock "public data to drive innovation by tapping into the ingenuity of the American people; increase agency accountability; and change the default setting of Washington to be open, transparent and participatory" (Kundra, 2010). Early in the Obama administration, crowdsourcing—defined broadly as a technological process to engage the public—was just beginning to gain perspective in Washington, primarily as a tool for soliciting real-time feedback through social media platforms.

However, one of the key challenges in crowdsourcing is that this engagement with the public is not free. Underlying crowdsourcing, and all other forms of government activities, are transactions costs (Williamson, 1985). Transactions costs, in the economic tradition, are the costs of finding partners, negotiating with them, and enforcing the contract you have agreed to. Each interaction between citizen

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

and government incurs a cost on either or both parties. The higher the transaction cost is, the more difficult it will be for citizens and government to collaborate.

In government crowdsourcing all three types of transaction costs are present: search and information costs (finding partners/collaborators/information), bargaining costs (negotiating the relationship), and policing and enforcement costs (assuring the contract is carried according to the negotiations). Each type of transaction cost has the potential to play a more or less prominent role in the different applications of crowdsourcing. A government wishing to utilize an application of crowdsourcing would have to gauge the payoff from the transaction—ascertaining if it would be more costly to engage the crowd or produce the good internally (Klein, Crawford, & Alchian, 1978). If the cost of the transaction (i.e. contracting with the crowd) were so large that it could not be done efficiently and effectively, then we would expect the government to pull back from that contract and instead produce the good internally. The development of new information technologies has enabled crowdsourcing by reducing the transaction costs associated with these potentially massive interactions (Kittur, Smus, Khamkar, & Kraut, 2011; Piller, Schubert, Koch, & Möslein, 2005).

Not all governments are engaging the crowd, implying that the willingness of these organizations to bear the transaction costs of this form of citizen engagement will vary substantially. The source of reluctance to engage via crowdsourcing, when viewed via the transaction cost perspective, may have its source in search costs, negotiation costs, or policing/enforcing costs. As such, transaction costs provide a theoretical approach for understanding the likelihood of utilizing crowdsourcing in government.

Applying the framework we develop in this paper will help to isolate the particular challenges government faces, the knowledge generation process it may require, and the types of transaction costs that may be hindering or creating an unwillingness to engage through this platform. With a better understanding of the costs that are creating the barriers to utilization or optimization, an organization can more effectively create a crowdsourcing tool to fit the needs.

In the private sector, long-term contracts or relationships between partners (buyer and seller) are typically used as the enforcement mechanism, rather than resorting to legal enforcement mechanisms (Klein et al., 1978). The threat of losing business/income keeps the seller responsive to the buyer's needs, pushing both parties to abide by the implicit contract between the partners (Klein et al., 1978). However, in the case of crowdsourcing the buyers (the governments) and sellers (the crowd) will vary depending on the application of crowdsourcing. This is further complicated by the fact that the people engaged via crowdsourcing may only periodically engage—and as in the case of many issues for governments, may only engage when government fails to deliver as expected.

For example, local governments utilizing 311 systems, the non-emergency versions of 911, have a more streamlined communication between citizens and their employees to communicate problems and concerns. These 311 systems are a good example of a multi-channel crowdsourcing mechanism that feeds tremendous amounts of information to governments on ills in the community. We call this a multi-channel crowdsourcing mechanism because 311 systems frequently have not only a phone line, but also have connectivity between citizen and government through websites and smartphone applications—and all three feed into the same service request referral databases. We would expect governments to maintain these service requests so long as their costs to engage the public do not lead to a decrease in productivity (Morrison, Dobbie, & Mc Donald, 2003). It is clear that 311 can reduce the search cost for information on problems within a city. Having millions of eyes on the street to detect problems (potholes, for example) is a bonus for cities. However, if the information a city receives via a 311 system becomes inaccurate or inconsistent, resulting in wasted resources chasing non-existent problems, we would then expect cities

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

to either disengage the public via 311 or find ways to improve the quality of the information (Clark, 2014) – reducing the enforcement cost. In the traditional view of transaction costs, limiting the number of parties increases costs because fully specifying the contract between parties becomes more difficult (Williamson, 1985). However, the value of having more people on the street for government is the key to the success of this type of crowdsourcing—the more people, the more information collected, decreasing the resources needed internally to detect these problems. The eyes have always been on the street, but technological advances associated with crowdsourcing facilitate a better connection to the energy (government resources) to fix these problems. Thus, the relationship creates a benefit that becomes more specialized, more beneficial to the city (assuming it is good information), and more useful to the citizens, so long as the city acts upon the information. Transaction costs are not, however, the only concern. From the citizen perspective, if the government does not follow through and fix the things they have identified as problems, then the transaction costs to provide the information can increase while diminishing the value of collaboration—which would likely lead to citizens becoming less inclined to engage.

Can You Design or Organize for Crowdsourced Government?

The short answer is yes—and not just that you *can* design programs for the integration of crowdsourcing, but rather that if you want to use crowdsourcing you *need* to plan for it. When governments make efforts to engage the crowd collaboratively "the greatest challenge is one of design" (Noveck, 2009, p. 41). There may be a temptation to design crowdsourcing efforts to reinforce the norms or interests within the government organization or of particular groups within the crowd (Noveck, 2009, p. 41). However, the crowd has the ability to evaluate one another and can point out these biases in the process. Organizing processes that allow for not just sharing opinion but a broader participation has the potential to look more like the community, thus be more representative (Clark & Brudney, 2014; Clark et al., 2013) and ultimately "technology makes it possible to organize decisionmaking in ways that might overcome abuses familiar from the offline world" (Noveck, 2009, p. 42).

As governments design their crowdsourcing efforts, not only should they think about the size of the task—again trying to find tasks that allow for individuals to choose how much time to devote to—but "special care must be taken in the design of the task, especially for user measurements that are subjective or qualitative" (Kittur, Chi, & Suh, 2008, p. 456). Prototyping crowdsourcing efforts to determine appropriate design is vital because both parties (citizens and government) need platforms that perform and deliver as promised—design as a form of inquiry is key to this.

CROWDSOURCING AS A MODE OF INQUIRY

Although no integration technique is foolproof, according to Bob Pearson, Dell's former Chief of Communities and Conversation, the technique is an effective and potentially very powerful way to connect a diverse listening public on an issue to produce outcomes (Howe, 2009a). Engaging the online community means having a sense for what to pay attention to and what to discard. Howe (2009b, p. xix) offers the example of Starbucks, which in 2009 employed close to 50 full-time moderators "whose only job [was] to engage the online community."

Knowing what to pay attention to implies a degree of administrative expertise toward inquiry regarding a particular problem as a whole rather than only a particular part or technical detail. It suggests that

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

for administrators to manage a crowdsourced activity effectively, they must have a sense for the mood or tone of the issue and how to best apply crowdsourcing as a tool of inquiry to extract useful content. Thinking through the early stages of the process means not only considering how to make sense of the information expected to be obtained, but also envisioning how to align the problem with the tool. It requires the administrator to imagine what might happen, and then pre-emptively design the crowdsourcing approach with the intention to stimulate relevant discourse to gather useful information that can be effectively managed.

Effectively planning for discourse means the administrator must have a conceptual understanding of the issue at hand and how it relates to the diversity of thought and level of technical expertise he or she wishes to engage through crowdsourcing.

Because the role and function of the administrator are connected to how others outside of the administration are engaged in gathering, processing, disseminating and deciding upon information, having an appreciation for the diversity of thought is essential (Denhardt & Denhardt, 2000; King, Stivers, & Box, 1998). According to Dwight Waldo (1955, p. 70), "administrative thought must establish a working relationship with every major province in the realm of human learning." There is an implication that the process of knowledge generation contains varying perspectives – indicating a diversity of thought, or what Farmer (2010) calls epistemic pluralism, when attempting to understand and solve public problems. Farmer's (2010) argument is probably best understood as remaining open to diverse beliefs brought about through the appreciation of various forms of inquiry. Applied to crowdsourcing, the idea of 'diversity of thought' suggests considering knowledge within a supercharged world of information adding a greater degree of uncertainty when distinguishing who to listen to, what is relevant, and perhaps even more important who and what to leave out.

These concerns for public administrators have deep roots in the literature. Determining what is credible (particularly in the world of crowdsourcing) when obtaining lightning fast feedback and rapid information dissemination requires not only an appreciation for the diversity of thought, which can trump the expertise confined to a bureaucracy, but also a sensitivity for a certain level of basic or situational knowledge (Hummel, 2008).

Brabham (2009b) argues that crowdsourcing can help encourage and increase civic participation in city and community planning. He notes that the Internet provides a medium for tapping into non-expert/non-mainstream knowledge that may lead to creative solutions unbounded by identity and history (Brabham, 2009b). Crowdsourcing is a way in which a question or problem can be explored (Howe, 2009b). If we consider that one of the roles of public administration is to learn more about social problems to devise potential solutions and make decisions, then the way in which the learning takes place–the modes of inquiry–are connected to the types of questions asked and, by extension, the tools and techniques applied (Lundberg & Young, 2005).

When the problem is narrowly defined and understood, the crowdsourcing process is designed for mere data acquisition, screening and manipulation. In other cases, though, where problems are more complex and ambiguous, the process might involve the creation of an idea synergy, or what has been referred to in the crowdsourcing literature as "idea jams" (Howe, 2009b). In these situations crowdsourcing functions more like a crowd-sharing approach in which the concept of sharing extends beyond the conceptual constraints of data and information exchange to involve a *we-approach* in which no one person has complete control of the data, the solution, or even a complete understanding of the problem (Zingale, 2013). Unlike traditional approaches, such as public hearings, where the citizen is often framed at the greatest distance from the issue (King et al., 1998), a crowdsourced activity permits a problem

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

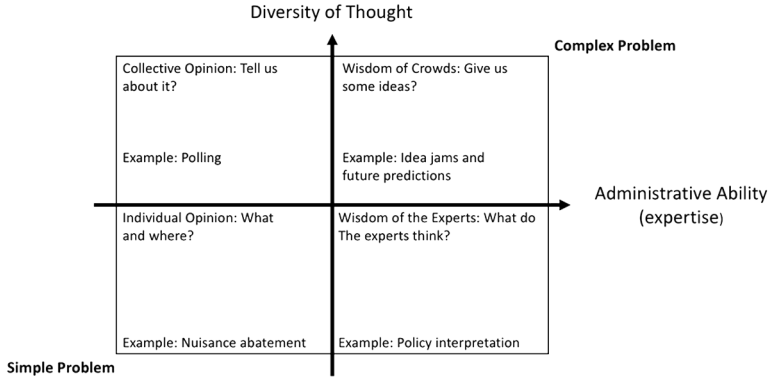
to be explored by the citizenry collaboratively, and the capability to draw from differing or multiple perspectives.

Having the ability to provide input on a problem builds trust and a greater opportunity for the discourse to create a two-way communication that allows both parties to learn from one another; King, et al. (1998) call this a dual learning process. Some (King et al., 1998; Stivers, 1994; White & McSwain, 1993) have argued that participation is most effective when citizens are involved "in the making of decisions instead of just judging" (King et al., 1998, p. 321). This perspective raises questions about how to integrate and engage in a crowdsourced initiative by combining three fundamental aspects of administrative inquiry: (1) the type and scope of the problem to be addressed– simple vs. complex; (2) the perception and knowledge of in-house expertise – does the agency know enough about the issue internally to solve a problem?; and (3) the diversity of thought required for engaging in discourse and developing solutions – the need for multiple perspectives for idea creation, on-the-ground intelligence, or vast data for algorithmic performance. Figure 1 provides a graphical display of how these three variables interact within a crowdsourcing application matrix.

As the assessment of problems for which crowdsourcing is being considered migrates from the simple (bottom left in Figure 1) to the complex (top right), the diagram depicts a greater need for a diversity of thought and administrative ability. Our basis for the simple to complex spectrum has less to do with expertise and more to do with the integration of ideas. A simple problem is one in which the issue of concern and its solution can be clearly identified. Conversely, complexity implies problem and solution ambiguity. The left-hand side of the diagram is more heavily weighted to problems in which opinion, whether individual or diverse, is sought. The right-hand side of the diagram displays a need for greater expertise. The top and bottom halves point out the need to consider the extent to which the crowdsourcing initiative requires outreach. Although the top quadrants imply a need to increase diversity and potentially involve a greater number of people, the bottom half denotes problems requiring more individual knowledge, situation-specific, or vertically integrated expertise.

Figure 2 shows a modified version of Brabham's typology of Crowdsourcing Problem Types for Government that has integrated the role of the crowd and the administrative expert. The *wisdom of the crowds,* depicted within the upper right-hand quadrant in Figure 1 and fourth row of Figure 2, suggests an increased need to connect a diversity of thought with administrative expertise. The term 'wisdom of the crowds' comes from James Surowiecki's (2004) book with a similar name, wherein he describes the

Figure 1. Analytic framework



EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 2. Brabham's typology, modified

Brabham's Origianal Typology			Our Additions to the Typology	
Type	**How it Works**	**Kinds of Problems**	**Our Analytical Framework**	**Administrative Expertise (AE) and Diversity of Thought (DT)**
Knowledge Discovery and Management	Organization tasks crowd with finding and collecting information into a common location and format	Ideal for information gathering, organization, and reporting problems, such as the creation of collective resources	Individual Opinion	Lower DT Lower AE
Distributed Human Intelligence Tasking	Organization tasks crowd with analyzing large amounts of information	Ideal for large-scale data analysis where human intelligence is more efficient or effective than computer analysis	Collective Opinion	Higher DT Lower AE
Broadcast Search	Organization tasks crowd with solving empirical problems	Ideal for ideation problems with empirically provable solutions, such as scientific problems	Wisdom of the Experts	Lower DT Higher AE
Peer-Vetted Creative Production	Organization tasks crowd with crating and selecting creative ideas	Ideal for ideation problems where solutions are matters of taste or market support, such as design or aesthetic problems	Wisdom of the Crowd	Higher DT Higher AE

process by which large groups of people (not necessarily just in the crowdsourcing realm) can produce results superior (collective wisdom) to those from an individual expert. The process can be integrated through customized screening approaches, designed with input from administrative experts, which allow the best ideas to rise to the level of discourse while crowding out less helpful ones. The outcome is to stimulate new ideas relevant to the problem by engaging the crowd in innovative, creative, "out-of-the-box" solutions or modeling futuristic outcomes and predictions. There is often a need for a benevolent dictator to act as an arbitrator to steer and call an end to the activity—these people are sometimes more kindly referred to as moderators, but suffice it to say they must have a higher level of expertise to maintain a feel for the subject matter being sourced. A challenge is getting people with the right skill set or necessary information to participate. According to Seltzer and Mahmoudi (2012), rewards and incentives can help, but it is equally important to keep Sturgeon's law in mind–for every 100 people involved, one idea will drive 10 highly motivated and engaged participants, while 89 will passively contribute.

Conversely, *individual opinion* related to more simplistic problems, such as reporting dead animals, potholes, or routine crimes, would fall into the bottom left-hand quadrant of Figure 1 and top row of Figure 2. This application of crowdsourcing assumes a lesser need for diversity and administrative expertise, as the problems are narrowly defined and situation-specific. Such situations are often resolved by connecting the problem reported directly to an agency resource. The feedback system can involve immediate attention to the problem (cleaning up the remains of the dead animal, for example), providing information on how the problem will be addressed, and notification that the problem has been addressed. Efficiency tends to be the principal driver with the technology primarily applied to link problem identification and individual notifications with public service offices for rapid response.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

In these instances, the transaction costs are based on collecting information about problems over a vast landscape. Engaging the crowd makes that process more efficient by having the population act as "sensors" of information. Identifying a pothole or dead raccoon does not require the same expertise as predicting oil prices in six months.

In the top left-hand quadrant of Figure 1 and second row of Figure 2 resides the condition often associated with assessing a *collective opinion*. For these types of crowdsourced initiatives, listening to a diverse set of opinions is often advantageous when coupled with a crowd-rating system or algorithm used to organize and manage input. This application conjures up the use of automated systems to gain a clearer perspective of what the crowd thinks about an issue and even engaging the crowd in data crunching and analysis. The primary purpose of collective opinion initiatives is to aggregate large amounts of data into easily deciphered information. The benevolent dictator in this quadrant often takes the form of a scientific algorithm (the person(s) who created the algorithms) predesigned to organize data into decision matrixes and models. This type of crowdsourcing will be explored in this paper by looking at the city of Boston's "street bump" smartphone application, which uses the power of smartphones to feel potholes without effort by the crowd.

By using this sort of automated platform, the transaction costs related to searching are cut substantially but only if a sufficient number of users participate. Because these systems rely upon bulk information to create accurate predictions of the problem, low turnout or participation may hamper their utility. At sufficient user volume, the amount of data emanating from these sorts of smartphone apps, which are running in the background and require limited further active involvement, can provide a great amount of information to a government. The bargaining or negotiating costs are also reduced in this sort of transaction. Once an individual agrees to use the technology, all further transactions between the crowd and the government have essentially ceased. The algorithm feature of this technology acts as the policing or enforcing mechanism.

Finally, the bottom right-hand quadrant of Figure 1 and third row of Figure 2 (*wisdom of the experts*) represents those crowdsourcing initiatives designed to engage a smaller group of highly trained experts who have a depth of knowledge on a subject matter, i.e., experts speaking to other experts. There is less need for diversity of thought because the experts manage the data integration. These problems are highly technical, detailed, and specific, requiring members to screen out ideas and concepts that are perceived to produce no useful material or that are easily falsified. The peer-review process serves as the benevolent dictator, as highly technical problems require a deep understanding of issues and often the need to call upon individuals within related or somewhat related disciplines to work together by applying more vertically integrated approaches. We will explore this sort of crowd in a case that looks at how NASA is using simple wikis to find ways to connect knowledge filed away in computers and storage cabinets and among experts across a highly bureaucratized organization.

The application of wikis allows for the collection of knowledge of experts by cutting the transaction costs in a number of ways. First, it lowers the search costs for these highly technical and scientific data and information. Reducing barriers within the organization allows users of the internal wikis to share knowledge in a more free-flowing and open manner, while not being as concerned with maintaining the information at this high-quality level. An implicit reduction in the bargaining costs is associated with an internal wiki. By becoming members of the organization, a set of explicit rules and the norms of the organization exist that all contributors are expected to follow, which will reduce the cost of the transactions to collect and disseminate the information across the organization. By limiting access to

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

only those within the organization, leaders could be limiting others' use of the knowledge, but they are also creating a better way to enforce or police the collection and maintenance of the information, thus reducing transaction costs. These internal wikis are added and edited only by known entities, and any change is tracked and associated with a particular person. This policing mechanism assures users that they are getting good information.

We acknowledge that there are not definitive distinctions between approaches primary to one quadrant or row of our proposed framework—and that often times these distinctions are more of a continuum between the extremes. Given that limitation, we feel that the framework provides a useful basis from which discourse within an agency can begin when attempting to discover how to engage in a crowdsourcing initiative, the type of expertise internal to the organization that is required, and the types of crowdsourcing platforms that might best serve the needs of the organization. Additionally, the framework also provides a way of weighing the advantages (payoffs) and disadvantages (or trade-offs) of each approach

CASE EXAMPLES

We illustrate the utility of our framework introduced in Figure 1 through a series of case examples. These cases were not randomly selected but rather selected because they help us to illustrate our framework model for government crowdsourcing. There are many additional public sector crowdsourcing examples that could have been used in this article but for the sake of parsimony we have limited these cases to one per quadrant, or a total of four, of the framework.

Case 1: Syria (Wisdom of the Crowd)

A development in foreign intelligence collection can be found in the paradox of crowdsourced intelligence. The traditional conception is the old-style of hard intelligence gathering, cloaked in the backrooms of high-level government officials and their inner-circles. These cultures are impenetrable to the average person. By contrast, amateur investigators, in the open, conduct a new breed of loosely connected and sometimes even casual collection and analysis of intelligence. Welcoming this surprisingly high-quality and free source of intelligence analysis is an increasingly useful supplemental source of information to the traditional craft of intelligence gathering because the proficiencies of established institutions are stretched beyond their capabilities.

In the town of al Kibar, Syria, on the banks of the Euphrates River, a boxy building exists with unclear purpose or contents. The current "Box on the Euphrates" (Box 2.0) is a replacement for the original, of which plenty is known. The earlier version of the Box (Box 1.0) was thought to have been home to a nuclear reactor. That earlier structure (Box 1.0) had existed for more than six years, and the reactor it housed, it is believed, was constructed with the help of North Korea. While the intent of Box 1.0 is unclear, some things are clear: During the September 2007 Six-Party Talks, Israel executed air strikes on the original building (Box 1.0). The following month the Syrian administration wiped out all evidence of the first iteration of the Box.

Decoding what was in the new Box was the unofficial job of a group of frequenters to a blog called ArmsControlWonk (http://www.armscontrolwonk.com). In an example of mass collaboration, this group was able to access dedicated satellite feeds and to wiretap suspects without the aid of government

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

security clearances or travel budgets of any sort. They subsequently created an intelligence estimate that complemented and competed with the products of the U.S. intelligence community and its global counterparts, using only information that was publically available. These individuals acted without the consent or direction of a government. They acted collectively because they were curious.

From October 2007, after the Israeli airstrike, until April 2008, blog commenters continued providing spontaneous analysis about the site using a surprising amount of publicly available information. They were able to determine the size of the new building, which led to comparisons to similar sites in North Korea. From these calculations and observations, they collectively made estimates on the size of the new nuclear reactor. Their work was corroborated in major newspapers (Sanger, 2008; Wright, 2008a, 2008b) and in the words of a prominent intelligence analyst, "is intel to die for" (Broad, 2008). The power of the crowd produced extremely high-quality work. These commenters and contributors are not intelligence officers by trade but rather a hodgepodge of educated individuals with specialties in other areas.

Case 2: Nuisance Abatement via 311 Systems (Individual Opinion)

Determining the location of something as un-glamorous as roadkill on city streets is a tedious and lengthy process but one that is certainly appreciated. Crowdsourcing tools are facilitating the location of roadkill, streetlight outages, missing stop signs, graffiti, trash and a host of other mundane but important quality-of-life nuisances. By facilitating connections between citizens and public officials, governments can create a network of citizen "sensors" able to quickly and easily report when something needs fixing. The primary tool used to connect these citizen sensors is 311 systems. These systems were initially developed to divert non-emergency calls away from 911 systems and are often thought of as a 411 information directory service for city-related questions. More recently, cities have augmented the telephone-based 311 reporting systems with websites and smartphone applications.

The 311, web, and mobile reporting systems can handle tremendous volumes of service requests or reports in a given year, though that volume differs dramatically from city to city. New York City receives about 7.7 service requests per 1,000 residents a day (Flowers, 2012), Baltimore about 2.7, San Francisco about 0.7, and New Orleans about 0.17 (Clark & Brudney, 2014). The addition of websites and smartphone applications complements the usual telephone-based 311 systems by not only allowing other methods for reporting incidents but also allowing easier citizen follow-up and access to information.

This type of crowdsourcing decreases the barriers to citizens to report problems, thereby facilitating more citizen participation. It additionally provides city leaders insight into the "pulse" of their cities and the problems faced. In San Francisco, the mayor receives reports generated from 311 data "on the types of calls it receives, so he knows what needs to be fixed. It's the next best thing to [Mayor] Gavin [Newsom] trying to take all our calls himself" (Sharrock, 2010).

Recent studies have also provided evidence that 311 call centers are not creating systems that distort the distribution of government resources, and that the users are representative of their communities (Clark & Brudney, 2014; Clark et al., 2013). There is also evidence that they can provide highly accurate information under the right circumstances—though the quality appears to be dependent on the complexity of the task and the number of participants (Clark, 2014). And there is also evidence to suggest that the use of 311 systems can improve satisfaction with government performance (Clark & Shurik, 2016).

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Case 3: Automated Nuisance Abatement Through the "Bump" Application- *(*Collective Opinion)

One potential drawback of using a 311 system to report problems is that it requires people to be actively participating to generate information regarding city problems. Boston has more than 800 miles of roads that potentially have potholes and, as a public works department spokesperson notes, "getting an accurate count of where every pothole is, is a gigantic task" (Ngowi, 2012). How can government gather information more easily and from a potentially larger crowd without increasing the burden on the public? One recent technological advance – Boston's "Street Bump" smartphone application – taps into the power of the crowd without necessarily being reliant on people actively participating. Nigel Jacob, co-director of the Boston Mayor's Office of New Urban Mechanics, puts it best when he states: "What this technology allows us to do…[is that] it essentially creates a new way for people to donate their data in solving public-good challenges" (Ngowi, 2012).

Street Bump runs on drivers' cell phones in the background and requires no active participation, but rather just a loan of technology within the phone. The accelerometer software application on the phone records a bump as motorists drive. Algorithms in the program can distinguish speed bumps from potholes. The application sends a GPS-located report to the city. After "at least three people hit a bump in the same spot, the system recognizes it as a pothole" (Ngowi, 2012). The hope is that the application can create a more current map of potholes, "eliminating the need to send out city trucks or contract an engineering company to troll hundreds of miles of roadways looking for damage" (Ngowi, 2012).

Case 4: NASA's Internal Wiki (Wisdom of the Experts)

A vast array of NASA work groups have developed Wikipedia-like websites for NASA employees. These websites allow anyone on NASA's intranet to add, edit and create webpages to share knowledge internal to the organization. Many in NASA, like other federal agencies, work in geographically dispersed groups. Because the distance between researchers is negatively related to their likelihood to collaborate (Katz, 1994), organizations such as NASA often seek ways to shorten the distance.

At NASA some research teams use wikis for "day-to-day operations and documenting their systems and the nuances, quirks, strengths, and limitations that they didn't know about previously" (NASA, 2011). Others are using the websites as a way to capture the "big picture" when many people work in distant labs on smaller parts of a project (Verville, Jones, & Rober, 2011). The wikis allow NASA researchers within a specified group to access a vast store of information that "was locked away in each engineer's own paper or digital file cabinet, or in an archived email, often buried very deeply. Specific things within this material weren't very easy to find, even for the engineers themselves!"(NASA, 2011).

Wikis allow collaboration to occur on the researcher's own time, unlike scheduled conference calls or meetings. Wikis are providing NASA a "usable, robust, and affordable" technological solution to facilitate collaboration that is also making the organization "a more highly collaborative culture" (Verville et al., 2011, p. 49). Organization culture is likely the most important obstacle faced when attempting to implement a wiki, because the technology to implement a wiki is simple and cheap. NASA's Jon Verville (NASA, 2011) notes:

In NASA, we're used to working in a very document and email-centric world where someone owns a document from cradle to grave and people share updates and answers to questions through email to

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

only who needs to know. New collaborative websites, such as wikis, have the potential to change this. It's not one person investing in an organization's knowledge, it's democratizing it so that everyone has an easy way to contribute to that organization's knowledge.

One common critique of Wikipedia is the fear of rampant and uncontrolled editing by anyone with access to the Internet. In the case of NASA, researchers want openness, to an extent. They want more control over content than an open-wiki platform can provide, which is why the NASA wikis are tightly controlled, developed, and tracked by NASA employees and open only to viewing and editing within the organization. The objective of these wikis is not to inform the general public but rather to facilitate information-sharing and collaboration within NASA.

The wikis have provided NASA with a feasible, affordable and flexible way to lower the transaction costs associated with collaboration in a complex and dispersed organization. Wikis provide a useful platform for employees to collate and transmit complicated expert-based information in a crowdsourced manner.

Discussion and Recommendations

As more data become readily available to the public – whether through websites, social media (Twitter, Facebook, or others), or governments' own websites – the public is better positioned to understand and contribute to their government in new, unique and perhaps exciting ways. There is real wisdom in crowds, as James Surowiecki (2004) points out, but harnessing the power of a highly skilled workforce in a meaningful way will be challenging. As managers get more accustomed to using crowdsourcing, methods for dealing with the noise and becoming more efficient when planning and implementing an initiative will likely emerge. Figure 3 provides a guide to our conclusions and discussion of how these managers can navigate the challenges and rewards of crowdsourcing.

Decoding Why and When Crowdsourcing Might Work in the Public Sector

We find three common themes that can be applied to understanding the selected cases. First, lowering the transaction costs of collaborating is key to inducing more participation. While the reduction in costs (or increase in benefits) may only occur on one side of the equation in some instances, benefits need to be visible. One key way in which transaction costs are lowered is by appropriating the diversity of thought and administrative expertise at the optimal scale and within a corresponding context. Another is by making the tasks of participating with government smaller, and ultimately easy enough for the public to "self-assign [and] do in a reasonable amount of time" (Noveck, 2009, p. 180). In many ways, the self-

Figure 3. Problems, success, roles, and resolution matrix

Cases	Matrix Location	Problem	Tools	Key to Success	Role of Government	Resolution
Case 1: Syria	Wisdom of the Crowd-Upper Right	Connecting Disconnected Intelligence Outside of an Organization	Moderated Online Discussion	Neutral Arbiter	Act on behalf of public interest to engage involvement (directly or indirectly)	Moderators keep discussion on topic, but are only able to collect the knowledge when collaborators are interested in the topic at hand
Case 2: Nuisance abatement via 311 systems	Individual Opinion-Lower Left	Collecting Small Pieces of Potentially Complex Information Over Wide Geography	311 Phone line, Web Reporting Site, Smartphone Application	System has to be response (i.e. did you fix my pothole?)	City Staff tasked with managing the 311 system & CRM System	City responds to the complains submitted. Mayors and managers are able to see a bigger picture of the problem areas the city as the types of complaints are tallied or how they cluster around the city.
Case 3: Automated nuisance abatement through the "Bump" application	Collective Opinion-Upper Left	Passive Collection of Information on Easily Identified Problems	Smartphone Application Running in the Background Without User Interaction	Algorithm/technology has to work	City Staff tasked with managing the 311 system & CRM System	The passive submission of data from smartphone applications provides a continuous feed of information on the potholes, which can then be addressed by the appropriate city staff.
Case 4: NASA's Internal Wiki	Wisdom of the Experts-Lower Right	Connecting Disconnected Intelligence Within an Organization	Closed Wiki With Moderation/User Controls	Show evidence breakdown intra-organizational silos. Find the information you need without needing to know who has it.	Remove barrier, penalties, or disincentives to share information.	Knowledge is more easily shared across a large and highly technical organization that is spread across the nation. The wiki helps to breakdown information silos and share information more easily.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

assignment to tasks "is not different from the way social movements have always operated. While some people write the handbills, other do the print. Some drive people to the polls, while others make coffee. The difference today is that the costs of coordinating distributed work have gone down" (Noveck, 2009, p. 180). The self-assignment of small tasks across a group of individuals can "diversify against [the] risk" any one individual corrupting or taking down these exercises in crowdsourcing (Noveck, 2009, p. 41). Thus, the chunking of projects into smaller tasks reduces the risk to the government and makes it easier for the average citizen to participate.

Second, for the crowd to want to participate they need validation and knowledge that their contributions are valued (Noveck, 2009). This validation needs to include feedback to users that the implicit or explicit contract between citizen and government is being upheld—their efforts are not going unused or resulting in any sort of action. "Many government departments forget to say thanks. This impacts on the level of trust between a government and its constituents" (Butteriss, 2015). The "thank yous" or validation for participation improves transparency and demonstrates responsiveness—which ultimately improves the quality of the relationship and it sustainability (Butteriss, 2015).

Third, for crowdsourcing to be successful it should not be seen as replacement for existing institutions and "boots on the ground" (Zingale, 2013). Nor is crowdsourcing a call for mass amateurization of technical work (in the case of NASA, the amateurs were left out from the start). Despite the popular rhetoric among politicians, sometimes government does know best—regardless of the format in which the information is gathered. Having realistic expectations of what crowdsourcing can accomplish will help to better align programmatic goals with these efforts. It will also help ease buy-in from employees if they don't view the crowd as a replacement for their jobs, but rather as a way to enhance their ability to do their jobs well.

The substantial dilemma posed by crowdsourced government is in agreeing upon what it is or what it should be. Is it an information collection mechanism? Or is it a way in which public managers can obtain "good" analysis of the issues facing the public? The crowd seems to be efficient at filtering the superfluous or unimportant information out of the discussions in favor of coherent and applicable analysis. However, this does not mean that public managers should expect to throw out their own expertise and experience because of this. Public managers throughout all levels of government still have to make informed decisions when the support of the crowd is absent, insufficient, or suspect.

SEEING SUCCESS IN THE CASES, BUT BEING AWARE OF FAILURE

The case of 311 demonstrates a way in which governments can create a system to signal where work is needed to improve the quality of life for citizens. In the 311 case, success is happening for a number of reasons. First, the cost of contributing by citizenry is relatively minor. They can contribute in small amounts of labor, at their discretion. These small pieces of information collectively lower a government's costs when searching for quality of life problems, particularly with regard to administrative expertise and resources. Second, 311 works as a means of crowdsourcing only when a city actually acts on the information citizens collect. If a city does not take action to fix the reported problems, the citizens will enforce the implicit contract between citizen and government by no longer participating in these forms of crowdsourcing. This enforcement action will increase the search transaction cost for government. For example, Clark and Shurik (2016) have detailed how the City of Cleveland's unresponsive (or very slow) reactions to citizen service requests via 311 effectively resulted in citizens no longer utilizing the

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

system. And finally, 311 and mobile phones are not intended to and will never replace expert assessments of city quality of life problems. They provide an opportunity for citizens to participate in the process of identifying problems. The citizens are sensors of problems that complement a highly-skilled workforce employed by cities, not the final arbiters of where resources need to be sent.

Success for the more automated systems, such as the "Bump" application, is driven by the technology actually working. By that we mean that the algorithms and technology that determine where the problems are have to actually work. If they cannot accurately detect where problems are automatically, government trust in the information will fade as the cost of utilizing the information becomes too high, and citizens will stop bothering to loan their computing/phone power to provide the information to the government. A positive feedback loop to both government officials and citizens that are engaging with this technology would likely improve participation—for example, if the Bump app sent confirmation to individuals that they helped to detect 12 potholes in the last month, a positive feedback is being provided justifying the loan of the citizens' phone. Similarly, if government managers across the government are aware that automated systems that generate actionable information are accurate and helpful, then they are more likely to seek out ways to automate their processes to tap into the power of the crowd. Thus, making it equally beneficial to communicate within a government the results of successful crowdsourced initiatives. And finally, 311 or the 'Bump' application should only be seen as a supplement to the other means of identifying problems, including those of government employees. The app will not fix a pothole—it will only help to identify where they are.

For intelligence gathering the quest is again the provision of accurate and actionable information. Determining the location of a dead animal or a pothole is a simple, one-dimensional task—a phone call or a few keystrokes can handle those problems. But gathering and analyzing intelligence "to die for" does not use the same crowdsourcing "engine" as a 311 system. The 311 systems involve unambiguous tasks and prompt actions based on mainly accurate reporting (Clark, 2014; Clark et al., 2013). By contrast, this type of intelligence gathering is much more complex and ambiguous and usually calls for a range of skill sets. The Box case worked not because a group of nuclear engineers or nonproliferation experts were collaborating online, but rather because a sufficiently large collection of people with a diverse set of skills were able to share their expertise. They were self-motivated and curious, which created a situation in which the wisdom and power of the crowd worked well. Similarly to the 311 case, success in the Box case can also be contributed to participants being able to take small pieces of work on at their own discretion and mesh this with a diverse knowledge base to be deciphered, and is some ways, managed and used by other experts. The chunking of work, as Noveck (2009) calls it, helps to lowers the burden on any one individual contributing to the project and spreads the risk of failure across the group. They are self-directed and moderated by an entity (blog moderator) that is seen as a neutral arbiter of the fact-finding mission, not a boss handing out duties to employees. However, failure was seen in a requested "assignment" post titled "Wonk School," on the ArmsControlWonk blog, where contributors were asked to examine several satellite images. The responses diverged compared to the Box case, when many of the same individuals who willingly contributed in the analysis of the Box saw this new assignment as a waste of time. Consequently, we need to understand that crowdsourced intelligence may not be an on-demand task and that the government need to be seen in the same light as the Box blog moderator—or "as the neutral arbiter in the public interest" that places a high value on the "the contributions of those outside of government" (Noveck, 2009, p. 42). For success, the crowd will also need feedback that their role is more than just an intellectual or fun exercise. In the case of the Box the positive feedback came to the group not only in the form of solving a puzzle, but also by public feedback from each other and

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

from public remarks that they had produced 'intelligence to die for.' Additionally, intelligence agencies involved in Box like cases need also to recognize that "some issues attract a huge number of people, obscure (yet important) decisions are made every day in government that could be made better if technology were used to open participation and oversight to a few dozen experts and enthusiasts […] the 5 or 10 or 100 people who understand a discrete question and who are passionate about getting involved in a particular way" (Noveck, 2009, p. 41). If crowdsourcing is to work in this capacity, public officials should buy into the idea that government's role is to make it easier "to find the areas where [the crowd will] want to work and contribute" (Noveck, 2009, p. 41). Allowing for self-selection of duties and small manageable tasks facilitates the ability of the crowd to participate on their own terms. And finally, it is clear that crowdsourced intelligence is very far from being a replacement to the traditional intelligence community, thus successful projects will not replace government employees but supplement their work in small, but potentially important ways.

For NASA, similarly to the intelligence gathering exercise, the wikis were utilized to better connect groups of highly trained individuals that all work for the same organization to produce a high value database of existing knowledge. The NASA researchers wanted to make their jobs easier, enhance the science, and improve their ability to collaborate internally. These researchers work on spacecraft and other scientific assignments that require them to maintain extremely high-quality standards without fear of rogue editing of information, thus the wiki was not open to the public. Furthermore, tracking who contributes is closely monitored. In this case, the organization was able to facilitate collaboration internally, thereby creating a higher quality and more in-depth encyclopedia of NASA than any one individual could have created. Further examining this challenge from a networked governance perspective, one could argue that the wikis used by NASA were used effectively to "bridge organizational information gaps and asymmetries" (Agranoff, 2007, p. 4), similar to what can be seen in the efforts to manage large multi-organizational networks. In bridging these gaps intra-organizationally, NASA was able to lower the transaction costs associated with finding information the NASA employees need without having to know who has this information while effectively breaking down information and expert knowledge silos within the organization. Allowing broad participation across the organization and creating a high quality product that is constantly being updated creates a positive feedback loop for the researchers at NASA, in that their efforts are scalable beyond one project. Wikis will not replace the work of NASA researchers, but will instead create a more connected organization that can do its job better.

In sum, success can be found in circumstances where crowdsourcing has the potential to reduce transaction cost for citizens, government, or both. Next, instances where those involved see the value of their contributions through validation or feedback will improve the likelihood of success. And finally, public officials and the front-line workers need to be assured that their jobs as administrative experts and public servants remain in high demand as new technologies, like crowdsourcing, reshape their approaches to work.

From Crowdsourcing to Policy

Before crowdsourcing can be embraced as a component of, or as adjunct to, policymaking, its role and limitations must be clarified. These clarifications have three policy implications: 1) the public sector must codify some degree of skepticism and confirmation; 2) it must depoliticize crowdsourced analyses by balancing sources; and 3) it must overcome the "not invented here" (for analysis) or "not generated here" (in the case of information) bias.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

First, where crowdsourced analysis is concerned, *caveat emptor*—buyer beware. Although crowdsourced analysis and notification can be a powerful complement to the traditional sources and processes of information gathering, crowdsourcing lies somewhere between the domains of the professional and the hobbyist. The crowd should serve as an aid to further investigation rather than be the end product itself. As Mergel, et al. (2009, p. 15) note, if the crowd is not "employed in a carefully planned way, it can potentially produce lots of data or products that are not helpful." An overproduction of information can lead governments astray, producing an increase in operating expenses in the form of data analysis, scrubbing, or even employing full staffs of content managers, similar to what Starbucks has done.

Crowdsourced government will be wrong at times — and perhaps spectacularly. We only need to look at the false identification of the Boston Marathon bombing suspects that accused a number of innocent people of a heinous act of terror, potentially ruining their lives (Sanchez, 2013). In the Boston case the crowd "showed none of the reserve or caution of the professionals" (Sanchez, 2013).

Second, governments should take an active role in depoliticizing the crowdsourced contribution to the extent possible. Any source incorporating the insights of the crowd will have biases. Government professionals working to engage and tap the power of the crowd must be transparent and collaborative to guard against biases of their own. They also must recognize that gaps in resource availability allow some in society more access to their governments (via computers, smartphones or personal contacts) than others. Taking such divisions into consideration in the implementation of crowdsourcing initiatives will assure that those who already have, and demand, more do not end up as the only beneficiaries of new mechanisms of this open government transformation.

Third, most organizations have a tendency to favor their own products over those created elsewhere, especially those created by "amateurs." Although it might be natural for agencies to show instinctive skepticism about crowdsourced contributions—and, as mentioned before, some degree of skepticism is healthy and necessary—these contributions are prevalent, and the products are becoming increasingly high-quality. Crowdsourcing efforts hailed for their impressive results span consumer electronics, mineral discovery, astronomy, biology, chemicals and pharmaceuticals. Skepticism may be a natural first response, but ignoring the growing body of work produced by enthusiastic, highly educated amateurs would be a loss to time-challenged, resource-confined agencies and the citizenry they serve.

CONCLUSION

Crowdsourcing fits within our growing societal-cultural context of connectivity. As such it is an enabling framework for public sector change, but it is not change in and of itself. Rather, it reflects an ongoing evolution for how public administrators engage with the community and with each other. The challenge is to optimize the relationships between government and crowdsourcing. The role for crowdsourcing relies on acceptance by the established culture of government, which may not always be forthcoming. The established cultures of organizations are based on years of experience in what "works" for the organization. Participants in crowdsourcing necessarily deal in publicly available information and analysis; they are not concerned with what has worked or who has done what in the past, as much as what may work better in the present and in the future. The crafts of intelligence and city management have been regarded historically as professions. The crowd consists mostly of amateurs with a few subject matter experts, often times, anonymously contributing insights. That the crowd is right and free might not matter; in the political environment of professional secrets, norms and values may reign supreme over

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

an amateur's speculation or insight. At the same time, the crowd has the ability to address issues that are not receiving attention, to pursue leads that turn into dead ends, and to connect the dots through the sheer processing power of numbers.

Crowdsourcing options are broad where traditional organizations are deep. They are agile where traditional organizations maintain bureaucratic inertia. Rather than espousing one over the other, we should encourage an interface between the traditional bureaucracy and the extra-organizational crowdsourcing. This interface can only occur under certain conditions. First, acknowledging that some efforts cannot be formalized is crucial to the success of harnessing the crowd's wisdom. Participants in crowdsourcing will contribute when they want to contribute, not because they are asked to contribute. This process will likely require a degree of hands-off tolerance to allow for chaos and emergence of ideas and concepts. Allowing the crowd to choose its own path for where it wants to contribute, how it wants to contribute, and when it wants to contribute is not something that can be written into an agency's annual plan or included in a budget line item.

Secondly, mutual respect must be nurtured and enforced on both sides; the professionals have tools and knowledge that the crowd does not, and the crowd has numbers and processing power that the public sector lacks. The two can be stronger together than in opposition. Understanding the technology will play a key role in changing attitudes internally and externally to allow the mutual respect flow. In many cases it may be possible to allow the crowd to develop the apps or other technology for the public sector, but the burden cannot be placed wholly outside of the traditional bureaucracy. As a more technologically literate and infused public sector workforce takes leadership roles, technology-based initiatives, such as crowdsourcing, will be commonplace in these organizations. However, active steps (i.e. hiring preferences and contracting) may also be required to bring in needed skills. Furthermore, change may be needed in public administration education to assure that graduates have an understanding of how the use of technology interacts with and can shape public engagement.

Crowdsourcing has changed and will continue to change the meaning of public involvement. Public administrators have always struggled with determining what is credible and worthy of time, attention and limited resources – these tensions are particularly pertinent in a world of crowdsourcing with expectations of near instantaneous feedback.

This is why it seems omnipotent that within crowdsourcing, converting data into information for understanding and making decisions requires a process of planning and integration. The approach is as diverse as the applicability of crowdsourcing systems; however, most systems are designed with "built in" screening mechanisms for assembling data into categories when establishing priorities for discourse. The cleanest approach has already been mentioned and comes in the form of content algorithms, similar to the systems applied to web searching. However, equally clear examples exist where the actions of the crowd itself and/or a site administrator (the benevolent dictator) facilitate the screening process by way of rating programs or other managed criteria designed to organize the responses while applying judgment to determine the best idea or most relevant direction for the discourse.

What our future holds is a likely scenario in which public administrators have far too much to be done and insufficient budgets and personnel to accomplish the goals. Learning how to engage the crowd through a properly designed crowdsourcing initiative is one way to help fill that gap.

Chapter 21
Crowdsourcing the Disaster Management Cycle

Sara E Harrison
University of Waterloo, Canada

Peter A Johnson
University of Waterloo, Canada

ABSTRACT

Crowdsourcing is a communication platform that can be used during and after a disastrous event. Previous research in crisis crowdsourcing demonstrates its wide adoption for aiding response efforts by non-government organizations and public citizens. There is a gap in understanding the government use of crowdsourcing for emergency management, and in the use of crowdsourcing for mitigation and preparedness. This research aims to characterize crowdsourcing in all phases of the disaster management cycle by government agencies in Canada and the USA. Semi-structured interviews conducted with 22 government officials from both countries reveal that crisis crowdsourced information is used in all phases of the disaster management cycle, though direct crowdsourcing is yet to be applied in the pre-disaster phases. Emergency management officials and scholars have an opportunity to discover new ways to directly use crowdsourcing for mitigation and preparedness.

INTRODUCTION

The use of the Internet in emergency operations has opened up new opportunities for improving communication during a crisis. Over the past decade, crowdsourcing, that is the volunteer-generated, decentralized contribution of information online, has become essential to emergency response efforts, as citizens experiencing a crisis often spontaneously share information about current conditions (Burns & Shanley, 2012; Haworth & Bruce, 2015; Liu, 2014; Starbird, 2012). In this paper, the authors focus specifically on two broad approaches to crowdsourcing: active and passive. However, the literature contains a wealth of crowdsourcing typologies and approaches that are outside of the scope of this paper, but are worth noting (for a detailed review see (Brabham, 2013; Estelles-Arolas & Gonzalez-Ladron-de-Guevara, 2012; Hossain & Kauranen, 2015; Lauriault & Mooney, 2014). Traditionally, crisis crowdsourcing efforts take

the form active crowdsourcing, in which specialized platforms and applications have been developed for users to actively contribute to a call for information (Loukis & Charalabidis, 2015; Tong et al., 2014). These platforms are usually developed and implemented by members of the affected public (e.g. Scipionus during Hurricane Katrina, the map-mashups during the 2007-2009 Santa Barbara wildfires) or by non-governmental organizations (NGO's) such as Ushahidi (Hiltz et al., 2014; Meier, 2012; Roche et al., 2011). The purpose of such platforms is to improve disaster response and resource allocation based on real-time reports from disaster victims that can be used to facilitate coordination with responders (Roche et al., 2011; Zook et al., 2010).

More recently, passive crowdsourcing via social media has emerged as a tool to communicate information in times of emergency (Charalabidis et al., 2014; Kaplan and Haenlein, 2010). Social media is increasingly being used by both NGO's and government emergency management agencies to determine public sentiment and reaction to an event (Bird et al., 2012; Flew et al., 2015; Fraustino et al., 2012; Laskey, 2013; Latonero & Shklovski, 2011; Lindsay, 2011; Taylor et al., 2012; Virtual Social Media Working Group and DHS First Responders Group, 2014). It is evident that the multi-directional flows of communication and information that crisis crowdsourcing online platforms facilitates can make response and recovery efforts more efficient and effective (Roche et al., 2011).

Despite the wealth of literature on crowdsourcing for emergency response, there is very little research on government use of crowdsourcing for emergency management. Given this focus on the individual contributor, rather than a government agency that would host a crowdsourcing platform, it is possible that the emergence of crowdsourcing during a crisis can be framed as a response to the failure of governments to act swiftly (Johnson and Sieber, 2013). In a study on bushfire safety in Australia, Brady and Webb (2013) suggest that unofficial community bushfire websites existed due to a gap in official online services. Though government agencies have been generally slow in adopting online crowdsourcing technologies, several agencies in the USA, Canada, Australia, and Europe have begun experimenting with these systems (Beaulieu et al., 2008; Koch et al., 2011; Lodge & Wegrich, 2014). Latonero and Shklovski (2011) describe the use of social media from the perspective of emergency management professionals as previous studies focused primarily on the use and application of crowdsourcing and social media information for response and rescue. Through a case study of the Los Angeles Fire Department, Latonero and Shklovski determined that the Public Information Officer within the department was the sole driver for the use of social media, specifically Twitter, for real-time interactivity during an event. The case study was limited in determining whether other emergency management agencies follow similar processes for integrating social media into their operations (Latonero & Shklovski, 2011). This limitation was addressed two years later in a project funded by the National Emergency Management Association (NEMA) in the USA to determine the level of adoption and use of social media by government emergency management agencies at the state, county, and municipal levels (San Su et al., 2013). The results show many agencies are using social media in their emergency management operations, however many agencies lack specific policies (San Su et al., 2013). In 2014, Hiltz et al. interviewed emergency management professionals to identify keys "barriers and wish lists" when adopting social media into government emergency management operations in the USA.

Outside of the USA, studies for government use of crisis crowdsourcing and social media are beginning to emerge. In Canada, the Defence Research and Development Canada (DRDC) Centre for Security Science (CSS) in partnership with the Calgary Emergency Management Agency (CEMA) held a workshop on Social Media for Emergency Management (SMEM) with emergency management professionals from various realms (e.g. volunteers, first responders, public servants, and NGO's) to facilitate discussions

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

around the integration of social media in emergency management operations in Canada (Kaminska et al., 2013). More recently, in Australia a study by Haworth (2016) was conducted to identify the impacts of crisis crowdsourcing in Australian government emergency operations.

These emerging initiatives illustrate the need for identifying the ways in which crowdsourcing can support all phases of disaster management, including mitigation and preparedness, rather than simply the response phase (Haworth & Bruce, 2015). The goal of this paper is to determine the use of crowdsourcing technologies within government, identifying how crowdsourcing links to all phases of disaster management. Drawing on interviews with emergency management staff in the USA and Canada, we characterize the current use of crisis crowdsourcing by these government agencies, and uncover how crowdsourcing is currently applied in all phases of the disaster management cycle.

CRISIS CROWDSOURCING

The development of a crowdsourcing platform for emergency response typically happens spontaneously, during or immediately after an adverse and impactful event (Burns and Shanley, 2012; Liu, 2014; Starbird, 2012). In addition, such platforms are developed and implemented by members of the affected public or by non-governmental organizations (NGO's) (Roche et al., 2011). The NGO, Ushahidi, became a major communication resource in the wake of the Haitian earthquake disaster in 2010: It is described as a resource and information sharing platform that allows users to send in information about a specific event unravelling on the ground via SMS, e-mail, or online form, for others to view (Roche et al., 2011). Another notable example of crisis crowdsourcing, the map mash-ups for the Santa Barbara wildfires of 2007 to 2009, further demonstrate how citizens built their own communication tools as a response to inaccurate government updates (Goodchild & Glennon, 2010).

Little research is available on government use of crowdsourcing for emergency management. Johnson and Sieber (2013) described emergency response as the most "prominent" use of VGI, though not by governments. Government agencies may be slow in adopting crisis crowdsourcing because of a lack of awareness or understanding of the benefits. Since the crisis crowdsourcing literature focuses on the use of it by NGO's and citizens and its associated benefits, it can be difficult for government agencies to determine whether adopting it into their own operations offers the same or different benefits. Interviews with government emergency managers identified several barriers to government use of crisis crowdsourcing, from a lack of personnel and proper training, policies and procedures blocking social media use, to the trustworthiness of the crowdsourced information (Hiltz et al., 2014). Additional challenges identified by Haworth (2016) include the digital divide, liability around accepting unverified information, and proper management of the information. Despite these challenges, some government agencies are using crowdsourcing and VGI for emergency management practices. Examples of these practices have been documented in the literature and are summarised in Table 1.

There is a growing literature focusing on the potential for social media, as a form of passive crowdsourcing, to enhance 911 emergency systems. In this way, social media acts as a crowdsourcing conduit for early detection, to determine public sentiment and reaction to response agencies' efforts, to enhance situational awareness, to coordinate amongst social media users, and to accelerate damage estimation processes based on information being posted by social media users (Avvenuti et al., 2016; Bird et al., 2012; Flew et al., 2015; Fraustino et al., 2012; Lindsay, 2011; Starbird and Palen, 2011). Several studies into the use of social media during crisis events show that social media offers emergency managers with

Table 1. Summary of active crisis crowdsourcing applications implemented by government agencies

Agency	Country	Application Name	Date Implemented	Description
USGS (Federal)	USA	Did You Feel It? (DYFI?)	1997	The first "fully automated earthquake detection intensity system." Citizens send in earthquake observations online, which are used for early detection and data analysis (Wald et al., 1999, 2011).
Miami-Dade County (County)	USA	Snapshot Damage Assessment & 311	2007	The county receives online reports of damage and 311 telephone calls to enhance their situational awareness during an emergency event (Castellanos et al., 2013; Schellong & Langenberg, 2007).
USGS (Federal)	USA	Tweet Earthquake Dispatch (TED)	2011	An earthquake detection procedure that relies on Twitter data alone. The procedure allows for rapid earthquake detection and a qualitative assessment of events (Earle et al., 2012).
USGS (Federal)	USA	Did You See it?	2012	A reporting application mirroring the DYFI? model to allow users to report instances of landslides experienced and witnessed (Baum et al., 2014).
FEMA (Federal)	USA	FEMA App	2013	The application provides weather alerts, emergency preparation tips, other disaster resources, and the ability for citizens to submit disaster photos onto a pubic web-map. The map is universally accessible, with no restrictions, thus allowing all emergency managers to view the information (Adamski, 2013).
Department of Energy (Federal)	USA	Lantern Live	2014	During an emergency or power outage, citizens can report the operational status of fuel stations, for other citizens to determine where fuel is available and identify where power outages are occurring (Department of Energy, 2014).
USGS (Federal)	USA	iCoast	2014	"Digital volunteers" compare before and after aerial photos of Hurricane Sandy and classify changes along the US coast caused by the hurricane. The application was designed to validate predictive models of coastal change (Liu, 2014).
Grundy County (County)	USA	Grundy EMA App	2015	The application educates citizens on local hazards and emergency practices, sends out alerts, and allows citizens to send in reports of damage after a severe weather event. The information gathered by the county is reported back to the National Weather Service (Litchfield, 2015).

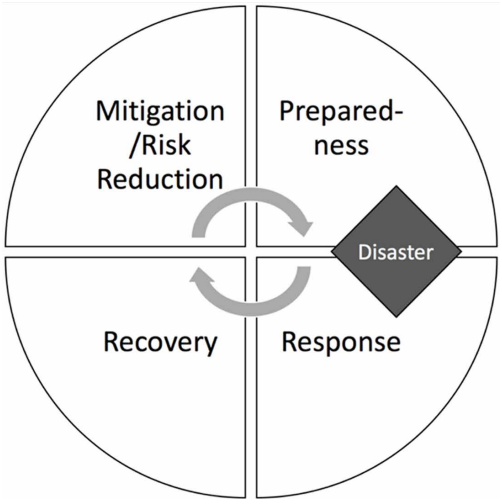
an opportunity to "use citizens as data reporters" (Starbird & Stamberger, 2010). Similarly, geo-located reports from social media can be used to populate a crowdsourcing web-map application to support crisis recovery and aid efforts (Gao et al., 2011). Most recently, the Canadian government participated in a resiliency experiment with the American government to assess the performance of social media for cross-border exchange of information during a simulated hurricane event (Cotter et al., 2015). It was found that social media can improve recovery operations, yet agencies are not fully exploiting these tools.

THE DISASTER MANAGEMENT CYCLE

When a disaster or emergency strikes a region, quick and effective decision-making is of the utmost importance. Crisis crowdsourcing technologies show potential to support this decision-making, within all four phases of the disaster management cycle; mitigation, preparedness, response, and recovery (see Figure 1). The disaster management cycle is a continuous process that moves through phases of reducing risk and exposure to hazards (i.e. mitigation) and planning and preparing for oncoming hazards and

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 1. The Disaster Management Cycle and the four phases. The cycle is split into two general periods, the pre-disaster period with the mitigation and preparedness phases, and the post-disaster period, with the response and recovery phases.



preventing a disaster (i.e. preparedness), to phases of reducing impacts of a disaster through response efforts and search and rescue (i.e. response) and restoration through clean-up and reconstruction (i.e. recovery) (Poser & Dransch, 2010). During the response and recovery phases, timely and accurate information is crucial to managing an unfolding event (Morton & Levy, 2011; Zhang et al., 2002), as such, crisis crowdsourcing is typically used in the response phase of an unfolding disaster. For example, Scipionus, a citizen-led crowdsourcing platform that emerged in the aftermath of Hurricane Katrina, became a crucial communication tool for victims of the hurricane to connect with each other and locate loved ones when traditional communication infrastructure failed (Roche et al., 2011). Additionally, all but one of the applications listed in Table 1 are used directly for response and recovery efforts. The only application that is not directly used in the immediate aftermath of a disaster is iCoast, which can be accessed by citizens any time, yet it uses imagery of before and after the hurricane disasters.

In these instances, crowdsourcing is used to gather information about current ground conditions to improve decision making, however there is a clear gap in understanding the role crowdsourcing can play in other phases of the disaster management cycle, chiefly mitigation and preparedness (Haworth & Bruce, 2015). Much of the focus within the disaster management realm has shifted to these pre-disaster phases rather than the post-disaster phases of response and recovery (Chikoto et al., 2013; Christoplos et al., 2001; Paton, 2003; Paton & Johnston, 2001), however the focus on crisis crowdsourcing remains in the response and recovery phases. To fill this gap, interviews with emergency management officials aims to understand how crowdsourced information can feed into the mitigation and preparedness phases.

Characterizing Current Government Use of Crisis Crowdsourcing

To assess how governments are currently using crowdsourcing, we conducted semi-structured telephone and face-to-face interviews with government officials in both Canada (n = 15) and the United States (n = 7). Interviewees were asked to assess their current tools and processes, and to discuss the overall

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

performance of crowdsourcing within their agency. Interviewees were selected based on their roles in emergency management, and involvement with existing crowdsourcing projects. In total, 48 officials were contacted for participation in the study from Canada and 52 from the United States. From this sample pool, there was a 31% response rate from Canadian officials, and a 14% response rate from officials in the United States (Table 2). Interviewees included community emergency management coordinators (CEMC), public safety director, oceanographer, seismologists, warning preparedness meteorologist, strategic initiatives coordinator, retired fire chief, senior systems analysts, manager of emergency planning, director of emergency services, director of operations, and communications and marketing officials. Interviews were audio-recorded, transcribed, and coded based on interview script themes.

Types of Crisis Crowdsourcing Tools and Implementation

Participating government agencies from both Canada and the United States use several approaches to emergency information communication (Figure 2). Some methods are traditional approaches that use telephones, and others are online, using social media or dedicated crowdsourcing applications. Though respondents from both countries were heavy users of social media, Canadian governments tended to favor traditional methods of communication, such as corporate telephone, 211 service, and 311 call centers. Given that crowdsourcing is a new phenomenon, it is not surprising that traditional methods like phone calls and call centers (e.g. 211 and 311) and email are still used. The entrenchment of these forms of communication was considered a product of the training that officials have, and that this information could be better verified, compared to social media. As indicated by two city-level officials from Canada, a Customer Service Supervisor and a Community Emergency Management Coordinator, respectively:

Phone call is still the best, it's still king because we have the person on the line and we can talk to them. And we're trained on how to deal when we have a person with us. We don't necessarily have training on how to get the most information out of social media and email. (Interviewee O, 2015)

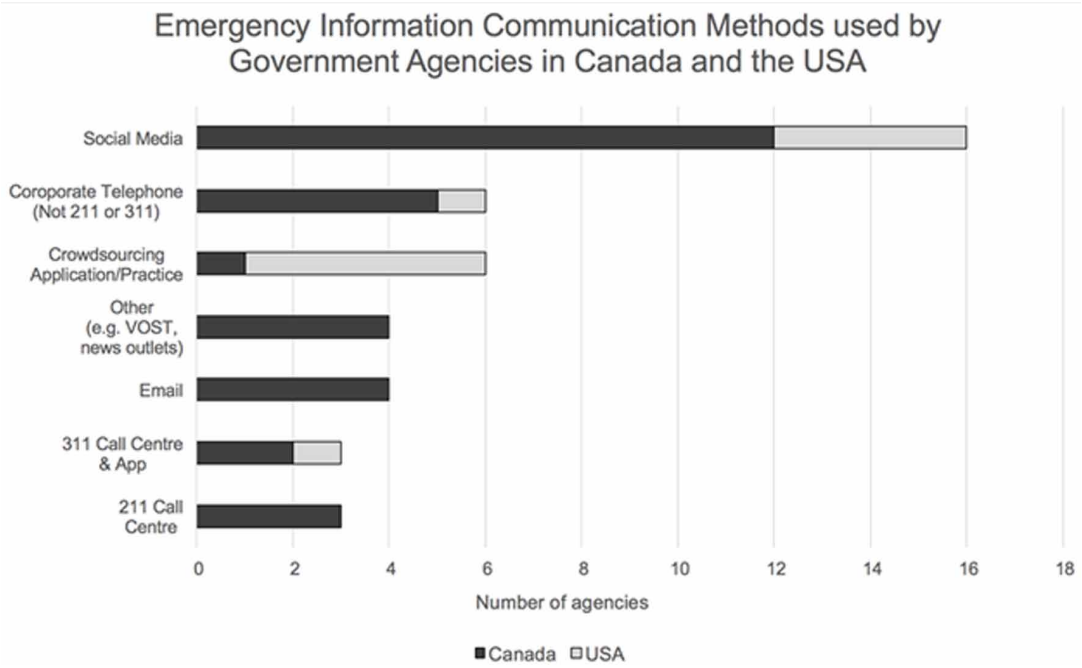
The [reports] that are called in are, for a better word, validated, you know we've got the name, we've got a phone number, we may have an email address, we have a way of getting back to the resident. (Participant K, 2015)

Table 2. Number of interviewees from each level of government in Canada and the USA

	Canada			USA		
	Contacted	**Participated**	**Response Rate (%)**	**Contacted**	**Participated**	**Response Rate (%)**
Local	17	5	29	10	2	20
County	26	6	27	8	1	13
Provincial/ State	4	2	50	26	0	0
Federal	1	1	100	7	4	57
Total	48	14	31	51	7	14

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 2. Methods used by government agencies to collect information from the public for emergency management



This finding contrasts to the US agencies, that employed dedicated crowdsourcing applications, considered to be unique interfaces that are created for active crowdsourcing, as opposed to passive social media-based crowdsourcing efforts. In total, only one participating Canadian agency used a dedicated crowdsourcing application, compared to five of the seven participating US agencies.

In addition to the types of methods used, the implementation of these methods differed between the Canadian and American agencies (see Table 3). For example, active crowdsourcing is primarily used by the participating federal government agencies in the USA. Alternatively, the participating agencies in Canada tend to use passive crowdsourcing methods (e.g. harvesting data from social media). Participating municipal agencies in Canada still relied on traditional methods of emergency information communication, such as corporate phone lines and call centers.

Results from interviews suggest that active crowdsourcing methods are predominantly used by federal-level agencies in both countries. For example, in Canada, the only federal agency to participate in the study was developing an active crowdsourcing model for collecting severe weather reports from trained weather watchers. Comparably, in the USA, the active crowdsourcing applications were open to the public. Passive crowdsourcing through social media was heavily used by participating government agencies in both Canada and the USA. Several uses of social media were described, with some agencies using social media for monitoring and harvesting information, while others used it for alerts. One interviewee from the provincial level in Canada outlined five reasons why their government used social media:

1. To evaluate the public's perception of the official emergency information being released;
2. To identify and help dispel rumors that could jeopardize public safety;

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

*Table 3. Summary of emergency crowdsourcing efforts used by participating agencies in Canada and the USA. *No data is available for state level governments in the USA because none could be recruited.*

		Canada	USA	Summary
Active Crowdsourcing	Federal	CANWARN	Did You Feel It? iCoast	The USA is leading the way in active crowdsourcing adoption for emergency management with two active crowdsourcing methods implemented at the federal level, and one at the county level. In Canada, one active method was adopted at the federal level, yet contributors to this method still require training. One city level agency is working towards active crowdsourcing through a new 311 mobile application.
	Provincial/ State	None	N/D*	
	County	None	Snapshot Damage Assessment	
	City	311 App	None	
Passive Crowdsourcing	Federal	Social Media	Twitter Earthquake Dispatch Project Virtual Social Media Working Group	Passive crowdsourcing through social media is heavily used in both countries, at all levels of government.
	Provincial/ State	Social Media	N/D*	
	County	Social Media	Social Media	
	City	Social Media	Social Media	
Other	Federal	None	None	Agencies in Canada are still heavily reliant on non-crowdsourcing methods for collecting emergency information from the public. Call centres and corporate telephone lines are the preferred method amongst lower-tiered agencies for communicating with citizens.
	Provincial/ State	None	N/D*	
	County	211 Call Centre	311 Call Centre	
	City	311 Call Centre	None	

3. To identify threats to the agency's reputation that can impede the ability to respond to an incident, e.g. criticism from influential agencies;
4. To isolate calls for assistance on social networks and forward them to 911;
5. To gather information that will provide situational awareness.

From the interview responses, there was a progressive trend in tool selection, where agencies start using social media as a one-way information tool to send out information and alerts to the public:

Social media is a very valid tool in providing emergency information that's prompt, accurate, and allows people to take the necessary steps to protect themselves and their families. You know, it allows us to update those affected almost instantaneously, it's faster than a web post, it's faster than distributing a news release from the media. (Interviewee H, 2015)

When asked what influenced an agency's decision to adopt social media into their emergency management agency, one county-level CEMC replied:

Initially getting into social media, the argument that won it for us was the same argument that was used a hundred years ago when we convinced council to let us have a telephone, right. If that's how people are communicating, then that's how we need to communicate with them. (Interviewee A, 2015)

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Next, agencies start monitoring social media for information control, for dispelling rumors, and to determine the public's perception of and response to the official information being sent out:

Because we were using social media extensively then and we knew it was important to be monitoring, not only what was happening with our information, was it being retweeted or shared on Facebook, but also to be able to respond and to monitor messages that were coming in on social media, either in response to our information or about the event. (Interviewee P, 2015)

So basically, way back probably even in 2011, the initial ideas came up and we basically wanted to develop the capacity to monitor, to kind of gain that situational awareness and be able to detect rumours and kind of determine how effective our messaging is when we did put out Tweets or whatever other platforms we were using at the time. (Interviewee M, 2015)

Finally, agencies use social media as a two-way communication tool, to send out alerts and to receive reports from citizens. One city-level Customer Service Supervisor from Canada described their transition from using social media for information dissemination to collecting reports from it:

Customer service, or our involvement in that has only been for the last year, because primarily it was used here at the town for just information out, you know, pushing information out, and we just have been flirting with, you know, receiving information, receiving complaints, receiving this, so on and so on. (Interviewee O, 2015)

It became clear from the interviews that agencies were at different levels of maturity in their use of social media. For example, one county-level official from Canada described that their agency first used social media for information dissemination and soon realized the value of monitoring social media to check how their information was being received and to monitor incoming messages, with social media monitoring now an official role in the agency's Emergency Operations Centre (EOC). Yet, in another county-level agency from Canada, the participating CEMC noted that their agency had yet to officially endorse social media for communication purposes, and were only considering it for information dissemination purposes.

Crisis Crowdsourcing Impacts for Government Emergency Management

Effective communication is critical in emergency management operations. Crowdsourcing and social media offer new ways to enhancing this communication. Interviewees identified several ways in which crisis crowdsourcing can improve communication and government emergency management (see Table 4).

Five areas of improvements or benefits of crisis crowdsourcing were described by the interviewees. With respect to government transparency and accountability, crowdsourcing can increase trust of citizens in their government by publicizing the information gathered by the agency and showing the citizens what the information is used for. Crowdsourcing also offers educational benefits by raising awareness about nearby hazards.

Crowdsourcing and social media can improve communication by offering a new avenue to connect with citizens, as described by a county level emergency manager in Canada:

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Table 4. Summary of benefits interviewees identified from using a crisis crowdsourcing model

Improvements and Benefits	How…
Transparency & Accountability	Increase in trust Education Citizen decision making Progress visual Updates (live vs. periodic) Resource allocation
Government-Citizen Communication	Timeliness Alerts and information dissemination Public engagement Gathering feedback Sentiment analysis
Internal Communication	Direct and fast Alternate routes Progress visual Resource allocation
Enriching the dataset	Risk analysis Order of magnitude Situational reports Aid field crews Photos Geographic information

I can go back to our Facebook page two years ago during our winter storm emergency, where we had somebody post on there, 'this was the best dissemination of information by a government agency ever,'... And we're pretty proud of that because we did work very hard to use social media to communicate with the affected public. (Interviewee A, 2015)

Citizens can share their own stories and experiences with their government, knowing that their information is useful, as described by a US federal level Research Geophysicist about their active crowdsourcing application to gather information about felt earthquakes:

I mean, I can't overstate the component of catharsis people seem to feel. Like I said, people want to go out and talk to their neighbours after an earthquake, people that they've never talked to ever, for any other reason. And so that instinct is somewhat satisfied by people filling out a questionnaire and knowing that it's being used and that their experience was valuable. That's a catharsis that you just can't get any other way (Interviewee G, 2015).

The timeliness of communication during an emergency can also be improved by allowing governments to send out more accurate alerts more quickly, and monitor real-time information to facilitate a feedback loop of updating alerts based on incoming information.

In terms of internal communication, emergency management agencies already have systems in place to maximize communication between departments and response crews. Not all these systems fully integrate social media or crowdsourcing, and many do not update "on-the-fly" for response crews in the field. Interviewees suggested that adding crowdsourcing and live updates to their existing systems could improve response times, resource allocation, and overall situational awareness. In Canada, one county level CEMC described how social media was used to improve their response efforts and resource allocation:

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

If I can go back two winters ago where we had some, we had a very serious snow incident here that shut down many communities for several days, where people were posting that they had real issues with either no heating in their home, or no food for their children, we were able to take that information and act upon it to provide them emergency social services. (Interviewee A, 2015)

Closely tied to internal communication, crowdsourcing and social media can enrich the data that agencies are collecting for situational awareness and response by adding real-time photos and geographic information, which can help responders determine what resources are needed and where. One county-level emergency manager from Canada described how photos and geographic information from social media help at their agency's EOC:

Geographic attributes and photos of damage are priceless in the Emergency Operations Centre. When I gather my emergency control group and we're in a room trying to determine our priorities and determine the validity of the information that's coming in, knowing the geography, seeing photos of damage really allows us to determine the severity and allows us to mobilize resources faster than we would otherwise. (Interviewee A, 2015)

This is especially important for government agencies to utilize limited resources most appropriately. The added photos and geographic information can also be used to draw a fuller picture in the agencies' command reports, after-action reports, and situational reports.

Crowdsourcing in the Disaster Management Cycle

Discussions with interviewees revealed that crowdsourcing feeds into all phases of the disaster management cycle. Interviewees who practice crisis crowdsourcing indicated that the crowdsourcing process starts when a disaster occurs by first collecting information from the citizens on the ground for response and recovery efforts, and then using the information to learn from the event and inform future mitigation and preparedness efforts. The following analysis will start with examples that demonstrate the use of crisis crowdsourcing in the post-disaster phases (i.e. response and recovery shown in Figure 1). Afterwards, examples that illustrate how the information gathered from crisis crowdsourcing feed back into the pre-disaster phases (i.e. mitigation and preparedness in Figure 1) are presented and discussed.

Response and Recovery

The response and recovery phases in the disaster management cycle occur after a disaster strikes, and are referred to here as the post-disaster phases. In the response phases, efforts are focused on conducting search and rescue operations and providing basic humanitarian needs for those impacted (Poser & Dransch, 2010). After the initial response, the recovery phase begins in which repairs to damaged infrastructure and property are made, ensuring that those impacted by the disaster are provided with the appropriate means to restore their livelihoods (Poser & Dransch, 2010). Much of the focus on crisis crowdsourcing has been in these post-disaster phases, particularly in the response phase. The interview results provide further support for this trend.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Social Media and Passive Crowdsourcing

Social media offers insight into the impact of a crisis on those involved. Interview results show that government agencies turn to social media to dispel rumors, reputation management, responding to calls for aid, enhancing situational awareness, monitoring citizen use of and response to official information (i.e. sentiment analysis), and for remote monitoring. Each of these uses apply to the post-disaster phases. Often, monitoring social media is used to keep track of false information during a disaster. An Executive Director of Public Safety Initiatives at the provincial level described how social media can be used by provincial governments in assuring that rumors are dispelled:

It's a great source of information, so you're looking to it from a sort of mining it for information, so an intelligence type use, but also to track the information for correctness of information. And when required we would correct wrong information. (Interviewee T, 2015)

The negative impacts of rumor spreading on social media can create unfounded fears amongst the impacted populations, as described by a Team Lead at the provincial level from Canada:

There was an extensive distribution of false information, rumours, fake pictures on Twitter, Instagram and Facebook during Hurricane Sandy that helped, perhaps, create some concerns or unfounded fears among the people in the areas that were impacted by the storm. (Interviewee H, 2015)

By controlling false rumors, response and recovery can be improved by avoiding unnecessary spread of fear and panic, which can distract responders from the real impacts.

Results from the interviews revealed that one of the primary uses of social media is to enhance situational awareness. Situational awareness refers to understanding of unfolding events that are impacting many actors and "moving parts" (Vieweg et al., 2010). By enhancing and maintaining situational awareness, emergency management officials can implement more effective response plans and manage requests for information (Cameron et al., 2012). Interviewees indicated that social media is an essential tool in building situational awareness. One county-level official from Canada described how social media is used to "augment our situational awareness, and it's also used to gauge what the community needs are" (Interviewee P, 2015). Social media provides an opportunity for officials to identify community needs and adjust their response efforts. The same interviewee also used social media to monitor the "response to our response", and uses sentiment analysis to determine how their information is being propagated, which then helps assess the effectiveness of their agency's communications reach.

The situational awareness built from social media can be used to inform the EOC, to update alerts, or to inform actionable decisions, such as sending out response crews. For example, a county-level CEMC from Canada monitored social media during a tornado-producing severe weather event. The interviewee followed reports of storm activity on Twitter and matched it up with alerts from Environment Canada, and used this to issue information over social media and email. At the provincial level, in Canada, situational awareness can improve information sharing between agencies, which can then inform decision-making:

[Social media] helps us build our situational awareness, and then what we do is we build a situation, we call it a common operating picture report, and then we disseminate that across government and to the

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

affected communities. And so, the advantage of that is that report takes the information we're gathering from all sources, collates it, verifies the information and then we push it out to those [affected communities]. So, it's, everybody has a common understanding of what's going on and the information they have in their hands is verified reliable information that they can act on. (Interviewee T, 2015)

Building situational awareness is critical in the response and recovery phases. The focus of interviewees on using social media for situational awareness demonstrates how it can improve response efforts and decision making in emergency operations. Additionally, the widely accessible nature of social media and its large user base provides can build situational awareness as it enables agencies to partake in remote monitoring. Now, agencies from across the country (even internationally) can offer help in an unfolding, large-scale disaster. One participating county-level agency in Canada did this when they were asked to monitor social media for a large-scale flood disaster in another province:

During emergencies, we've used it locally when we've had events. We've also used it to assist other municipalities, so during the Calgary floods, our communications team actually used Sprout Social to monitor social media activity in the Calgary area. So that's really allowed us to capitalise on our abilities. We were completely unaffected by that incident, but able to help out. And then when we get inundated with an incident, we're able to call on our partners or other communities to help us monitor social media. So, it's very helpful. (Interviewee A, 2015)

Active Crowdsourcing

Building on the situational awareness theme, an active crowdsourcing application allows emergency management officials to visualize current ground conditions on a map, and identify the neighborhoods in most need of aid. This approach was used by a county-level agency in the USA. The agency uses a web-application for citizens to submit reports of storm damage and flooding (Figure 3). In an online reporting form, citizens select a damage level (e.g. moderate, major, destroyed) and a flood level (e.g. street level, inside home) for the county to assess damage. The application does not have a verification process, and the crowdsourced information is published "as is". Because of this, the agency does not use it for responding to individual reports, and instead uses it to build situational awareness.

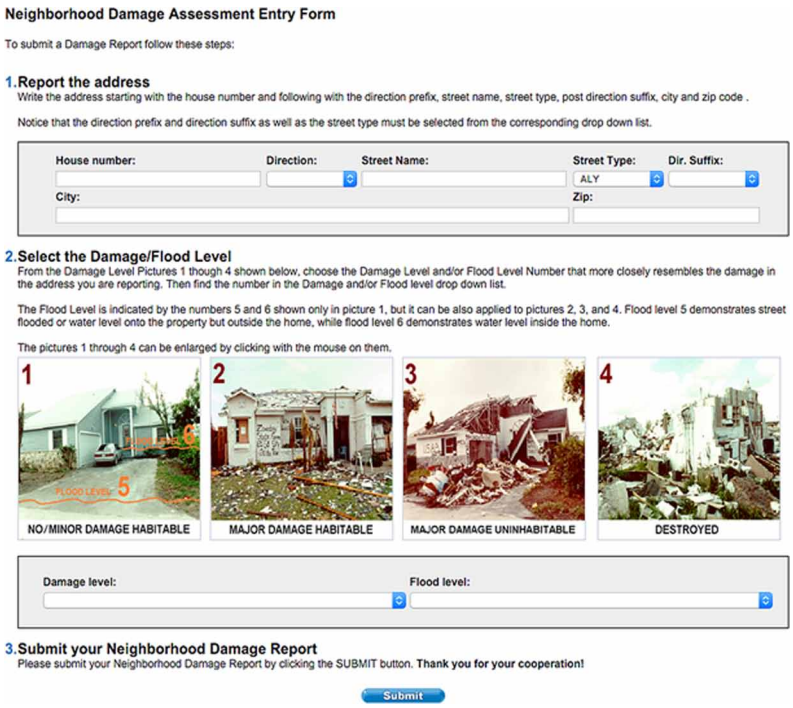
Interviewees indicated that both passively and actively crowdsourced information can be included in situational reports. During the response and recovery phases, these reports are distributed amongst other impacted communities to maintain open communication and coordination between jurisdictions. They are also used to apply for disaster relief funds from higher-tiered agencies (i.e. the provincial/state or federal government). This takes place in the recovery phase, when agencies and citizens are attempting to rebuild and are submitting insurance claims.

Mitigation and Preparedness

The mitigation and preparedness phases in the disaster management cycle (see Figure 1) focus on reducing risk and vulnerability to lessen disaster impacts. Mitigation involves continuous risk identification and analysis, and risk reduction through planning and education (Poser & Dransch, 2010). Preparedness follows mitigation with direct planning of response protocols if a disaster were to strike; monitoring

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 3. The online damage reporting form used by a county-level government in the USA



and forecasting of an approaching hazard is undertaken, and warning systems are implemented (Poser & Dransch, 2010). While much of the focus in the crisis crowdsourcing realm has been on its use in the post-disaster phases, interviews with officials from both Canada and the USA revealed that it is also valuable in the pre-disaster phases.

Social Media and Passive Crowdsourcing

During the mitigation and preparedness phases, social media is used primarily as a government- to-citizen communication tool. Social media has proven to be useful in educating the public around proper emergency preparedness practices and for sending out alerts and warnings (i.e. severe weather, flooding, wildfire, etc.). It was described by one county-level official as being their agency's "dominant method" of communicating emergency information and alerts to the public. Interestingly, many interviewees focused on how social media has improved their information dissemination for increasing preparedness. This reflects the shifting focus in the emergency management realm from response and recovery to mitigation and preparedness. Interviewees determined that social media is highly effective for government information dissemination because it connects with many people at once, is accessed daily by public citizens, and is comparably fast:

It's just been fantastic, like I said, being able to reach out to that many people, being able to control our message, and not rely on the media to take a press release, add their information, their spin to it and get it to the public. So, to be able to actually directly communicate the message to that many people all at once is fantastic. (Interviewee A, 2015)

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

… basically, as another form of information, so coming in information, but more as a tool for preparedness and education, so reaching out to the municipality. And if we know that we've got potential for a heat wave, so prior to the heatwave, in conjunction with the health unit, sending out reminders about how to protect yourself and be ready. (Interviewee K, 2015)

As an extension of information dissemination, social media can be used to understand the public's perception of and response to official emergency information. Government agencies want to ensure that their messages are being received and understood, otherwise they need to provide further instructions or clarification. Agencies can monitor social media for feedback on their awareness and preparedness initiatives, as one city-level official did during a special education session held during Emergency Preparedness Week in May of 2015. The feedback that officials received over social media confirmed there is value in hosting educational events.

In the USA, the federal government developed a passive crowdsourcing approach to earthquake monitoring by harvesting Twitter data. This application gathers qualitative descriptions of earthquakes experienced by Twitter users. For example, when the application was implemented in 2009 following the 2008 earthquake disaster in Wenchuan, China, the earthquake was detected on Twitter before seismologists could publish information based on earthquake data from seismometers. The Director of Operations from the federal agency described how this was possible:

How they detected this earthquake on Twitter before the seismologists published the information based on the earthquake data and this makes sense because, you know if you have seismometers a long ways away, the shaking waves won't get there, but if you have people closer they'll feel it faster and then feed that information, which travels at the speed of light and then you can get those tweets, so it's a matter of increasing the coverage of your sensors. (Interviewee C, 2015)

In response, the agency developed a Twitter harvesting system to detect earthquakes around the world, particularly in regions with sparse seismic networks. The early detection offers "a quick head's up that something's going on, and then a qualitative measure of the interest in that, and potentially the impacts of that earthquake" (Interviewee C, 2015). This application has evolved into a short-term earthquake alert system. Figure 4 shows a screenshot taken from the agency's Twitter feed of a recent earthquake that was detected. The tweet provides a quick warning about an earthquake situation unfolding so that the appropriate response agencies can prepare, supporting both immediate and short-term preparedness efforts.

Active Crowdsourcing

When considering active crowdsourcing, interview results indicate that while the crowdsourcing applications are typically used by citizens directly after an emergency, the information gathered can also be used to inform the pre-disaster phases. This is true for the federal-level crowdsourcing applications used in the USA and in Canada. In Canada, the federal government practices a unique form of crowdsourcing developed in 1978, when a volunteer Weather Watch Program was created with an unlisted 1-800 phone number for registered volunteers (i.e. storm spotters) to report instances of severe weather. Since then, the program has evolved to allow volunteers to submit reports over telephone, email, and social media (see Figure 5). There is no specially developed application for volunteers to download or report pn, but the process of collecting reports from the volunteers over the various mediums is well-defined and managed.

The primary use of this active crowdsourcing practice is in the mitigation and preparedness phases, with a more direct use in preparedness. The volunteer weather reports can be applied both in real-time and after an event to inform short-term and long-term preparedness, respectively. In real-time, the agency uses the reports from one geographic location to alert populations in another location as to what kind of severe weather is headed their way. Afterwards, the reports can still be "invaluable" for the agency's verification program by using the reports to evaluate the agency's performance in sending out their thousands of watches and warnings each year (Interviewee L, 2015). This crowdsourced information feeds into the short-term preparedness and mitigation of an event, as the agency uses reports to verify and update their warnings. In the long-term, the agency can use this information to continuously improve their monitoring and forecasting system, to understand how their alerts are being perceived and responded to.

Figure 5. Examples of severe weather reports posted on Twitter for the Canadian federal agency in a recent severe weather event

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

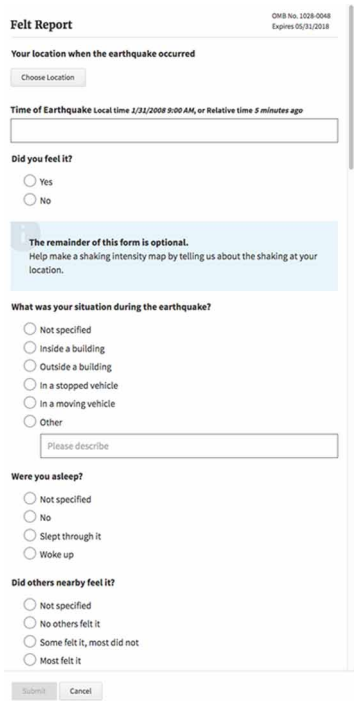
The US federal government uses two active crowdsourcing applications for preparedness and mitigation efforts. The first application, called "Did You Feel It?" (DYFI?), is specifically designed for measuring earthquake intensity and evolved from a traditional paper survey method. The paper surveys were typically only conducted for significant earthquake events and excluded the minor, felt earthquakes that happen on a regular basis, and were only filled out by postmasters and sent back to the government agency. This resulted in major gaps in the data. When the survey was brought online in 1999 and automated, it became accessible to anyone with access to the internet, thus resulting in a more complete, global dataset for earthquakes of any intensity. The application is primarily used to depict the shaking intensity and distribution in map-form after an earthquake of any magnitude based on information submitted by citizens through an online form (Figure 6). These "shakemaps" and the global earthquake database is used to inform earthquake management:

Our job is really to do the science for which decisions are made whether they're long term planning or response. (Interviewee G, 2015)

As the global database on felt earthquakes continues to grow, earthquake modeling and forecasting can be improved, further enabling mitigation efforts within earthquake hazard and risk management.

The second active crowdsourcing application implemented by the US federal agency included in this study, called "iCoast," aids in improving hurricane mitigation and preparedness. The initial idea of the application was based on using a large aerial imagery collection of coastlines before and after

Figure 6. A structured reporting form of felt earthquakes allows the agency to derive quantitative values from qualitative data



EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

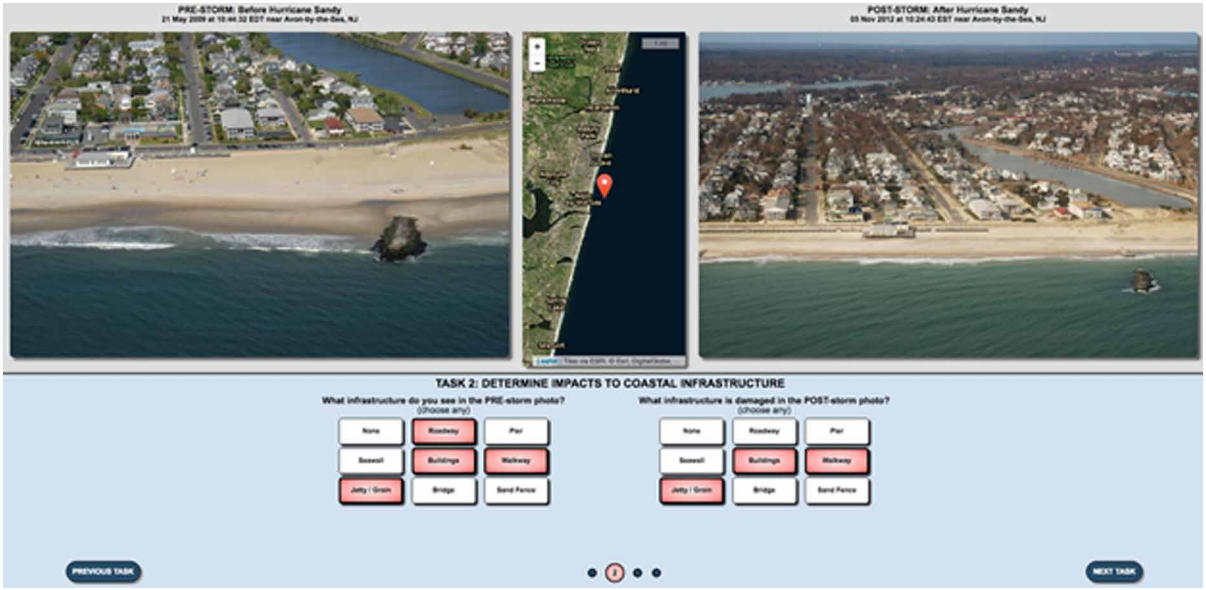
significant hurricane events. This application allows citizens to perform image analysis to improve modeling of coastal change processes caused by hurricanes. Citizens access the application through their computer's browser and are presented with aerial images of the eastern coast from before and after Hurricane Sandy, as shown in Figure 7. The citizens follow a step-by-step process to identify damage types caused by the hurricane.

It was found that iCoast provided an added benefit of raising hurricane hazard education and awareness. Taking the citizen through the entire process provided an opportunity for citizens to learn about the coastal hazards associated with hurricanes. Citizens living along the coast became more aware of the issues they may face on their coastal properties. The agency received feedback which outlined this:

We got some feedback from people who are participating and how they're starting to realize and learn what does coastal erosion mean? what are the issues that I need to be aware of living on the coast? and things like that. So, to some level it was educating people in a way where they're helping us but they're also learning how we are communicating our science. (Interviewee I, 2015)

There are two distinct uses for information produced from this project, both of which fit into the mitigation and preparedness phases: 1) to improve modelling of associated hurricane hazards such as coastal erosion, and 2) to provide an educational tool for contributors to learn about coastal hazards associated with hurricanes. Improved modelling can enhance efforts to reduce coastal erosion and flooding while the contributors who live on the coast can learn how their coastal properties are impacted. This application is enabling the US federal government to raise public interest towards hazard mitigation, and fuel voluntary mitigation practices at the individual level (Godschalk et al., 2003; Semenza et al., 2011).

Figure 7. Citizens are presented with a before and after aerial image along a section of the coastline to identify specific changes in the photos that may have resulted from Hurricane Sandy



EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

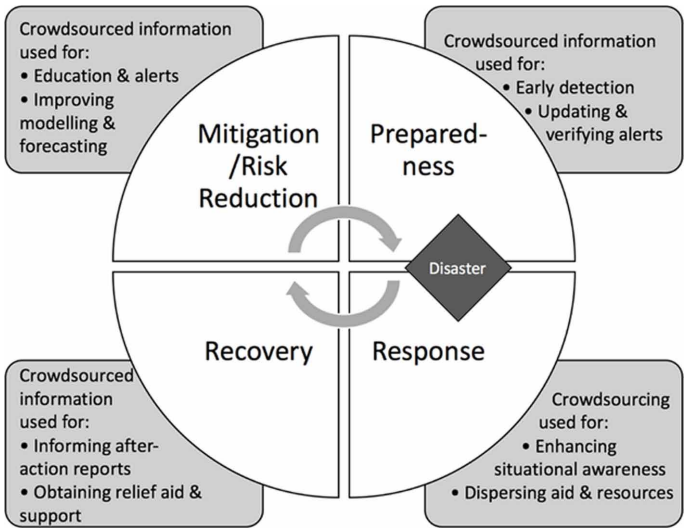
The above findings demonstrate that information gathered from passive and active crowdsourcing can inform long-term and short-term mitigation and preparedness efforts. Study interviewees suggested that photographic and geographic information gathered through crowdsourcing can be used to inform "after-action" reports. These reports are then used to learn from an incident, to identify what was done well and what could be done better in the future, thus improving mitigation and preparedness. They are also used to perform risk analysis, further enhancing mitigation efforts.

Government Crisis Crowdsourcing as a Contributor Throughout the Disaster Management Cycle

Interview results show that crisis crowdsourcing plays a role in all phases of the disaster management cycle. Moreover, there was a high-level of focus on using crowdsourcing information to further enhance mitigation and preparedness efforts. The findings are summarized in an annotated diagram of the disaster management cycle (Figure 8). The diagram illustrates disaster management as a continuous cycle that flows between pre-disaster to post-disaster, and the experiences from the post-disaster phases are used for continuous improvement of mitigation and preparedness efforts.

The interview results reveal a pattern in the adoption and use of crisis crowdsourcing for each level of government. Participating agencies from the federal level appear to use crisis crowdsourcing for mitigation and preparedness, while local and county-level agencies use crowdsourcing for response and recovery. This may be because lower-tiered agencies experience the direct impacts of a given crisis event, while higher-tiered governments are concerned with providing appropriate support and resources to mitigate those impacts.

Figure 8. Crisis crowdsourcing fits into all four phases of the disaster management cycle



EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

CONCLUSION

This study demonstrates the improvements that crisis crowdsourcing can add to current government emergency management operations. Until recently, research has been heavily focused on crisis crowdsourcing efforts by governments in the USA, however recent studies from Canada demonstrate the efforts that Canadian government agencies are taking towards crowdsourcing and social media adoption. This research characterizes the current state of crisis crowdsourcing amongst Canadian emergency management agencies. While some agencies in Canada have experimented with social media and found it to be beneficial, thus officially adding it into their routine operations, other Canadian agencies remain guarded, and are still assessing the costs and benefits associated with integrating into their operations. Results from those agencies in both Canada and the USA who have successfully adopted crisis crowdsourcing and social media shows that these technologies offer several benefits for emergency information communication between government and citizens.

This study is limited by some key factors. The primary data collection methods and sample size from both counties limits the extent to which the results can be generalized, as it is not a representative sample of all emergency management agencies in both countries. Accompanying surveys or questionnaires with the semi-structured interviews could enrich the data by gathering it in a standardized format, making it easier to identify trends. In addition, more sophisticated recruitment efforts (i.e. incentives, personalization of recruitment letters, etc.) could increase the response rate and overall sample size.

It is possible for some discrepancy to have occurred between telephone and in-person interviews, for example the inability to read body language and probe for more details, and time limitations which could potentially restrict in-depth discussion (Novick, 2008). However, telephone interviews do offer advantages for qualitative data collection, particularly for this study, such as decreased cost, communicating with professionals at various geographic locations that were, in various instances, several hours' flights away from the researcher's location, and maintaining a level of privacy and anonymity (Novick, 2008). When possible, it is preferred to conduct interviews in-person. However, in the case of this study, telephone interviews made it easier and cost-effective to schedule and conduct interviews with professionals across North America over the phone.

A lack of data pertaining to the interviewees' age, gender, and educational backgrounds and detailed roles (they provided a brief description of their role) potentially limits the analysis of this study. For example, during discussions with some interviewees and research colleagues the age of government officials arose as a potential barrier to the adoption of new technology, especially crowdsourcing. In addition, the educational background of the interviewees may have influenced their responses to the questions, such as their motivations and perceptions to adopting crisis crowdsourcing technologies. More data would allow for a more in-depth analysis of these issues.

Much like the shift in the disaster management literature from response and recovery to mitigations and preparedness (Chikoto et al., 2013; Christoplos et al., 2001), there is a shift in the crisis crowdsourcing literature from using crowdsourcing for post-disaster efforts, to exploring its use in the pre-disaster phases. Using data collected from both American and Canadian government agencies, this research determines that crisis crowdsourcing is currently applied in all phases of the disaster management cycle. Crisis crowdsourcing is directly used in the post-disaster phases, and the resulting information is indirectly used to improve mitigation and preparedness for future hazards. There is a clear gap in the *direct* application of crisis crowdsourcing in the mitigation and preparedness phases. Emergency management officials and scholars in this field have an opportunity to fill this gap through adopting crowdsourcing

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

directly for mitigation and preparedness. For example, the iCoast application uses crowdsourcing for mitigation and preparedness. This can increase citizen awareness and education of hazards, which then drives improved mitigation and preparedness efforts on an individual level.

Chapter 22
Incorporating Global Medical Knowledge to Solve Healthcare Problems:
A Framework for a Crowdsourcing System

Kabir Sen
Lamar University, USA

Kaushik Ghosh
Lamar University, USA

ABSTRACT

Global medical knowledge incorporates knowledge from diverse traditions which follow different 'grammar', making encapsulation of medical knowledge a challenging task. Current advances in technology enable the aggregation of medical knowledge from varied traditions to confront difficult health issues for which cure is yet to be developed. In addition to accumulating knowledge from wide-ranging sources, an ideal crowdsourcing system can benefit from the use of appropriate software algorithms to select the best solution. This research suggests a step approach scheme to develop a crowdsourcing system for medical diagnosis by applying an existing classification of crowdsourcing. The proposed crowdsourcing system will involve the crowd and medical experts from across the world, who together with the help of software algorithms, could provide useful solutions for hitherto difficult to solve health problems.

1. INTRODUCTION

In today's technology-driven world, an opportunity exists to share information or knowledge through internet-enabled systems. Global organizations have used crowdsourcing technology to solve a wide array of problems related to diverse topics, such as, new product ideas and the improvement of existing products or services (Afuah & Tucci 2012; Surowiecki & Silverman, 2007; Zimmerman, 2016). In gen-

eral, crowdsourcing has been employed to accomplish four main categories of tasks: problem solving, data processing, monitoring, and surveying.

In the healthcare domain, crowdsourcing has been used to answer important health-related questions (Ghosh & Sen, 2015). Generating ideas to solve medical problems is a more recent phenomenon in crowdsourcing in the healthcare sector (McCartney, 2013). This is illustrated with the advent of platforms such as CrowdMed, a crowdsourcing system that outsources rare medical cases to the crowd, which trained medical experts have not been able to unravel.

Medical knowledge signifies information relevant to the field of medicine. 'Global' medical knowledge incorporates knowledge from different medical traditions which follow a variety of 'grammatical rules' based on how the knowledge is applied. This makes the encapsulation of such a diverse body of knowledge difficult. Considering these challenges, in this paper we propose a framework to develop a medical crowdsourcing system that will allow obtaining relevant global medical knowledge from diverse traditions. The suggested crowdsourcing system will include the crowd and medical experts from all across the world representing different medical traditions. These entities together with the help of software algorithms will generate suitable solutions for health problems for which cure is not yet known. We believe that the solutions will originate from the aggregate knowledge coming from diverse medical philosophies as well as thoughts from a broad spectrum of medical practice and traditions. This knowledge will most likely cure the rare medical problems.

The paper is structured as follows. We begin by discussing crowdsourcing typology (Budescu & Chen, 2015). Next, we consider issues related to the creation of knowledge, types of knowledge, and its subsequent transfer (Hayek, 1945; Jensen & Meckling, 1996). We then explore the challenges associated with capturing global medical knowledge. Subsequently, we use classification of crowdsourcing based on the method used to analyze the crowd contributions (Prpić, Shukla, Kietzmann, & McCarthy, 2015) as a 'springboard' to recommend a step approach to develop a crowdsourcing system that involves the crowd, medical experts, and software algorithms for medical diagnosis of health issues for which a cure has not been developed. Finally, we present closing arguments on the promise of crowdsourcing systems that rely on bringing together knowledge from diverse sources.

2. CROWDSOURCING TYPOLOGY

There are many types of crowdsourcing systems with different objectives. Crowd polling systems are often used as a method for getting information from crowds about their opinions, while crowd-solving systems involve the incorporation of numerous individuals in teams undertaking creative work (Peisl, Selen, Raeside, & Alber, 2014). Crowd processing systems rely on large number of contributions. Contributors collectively process tasks in sizable numbers to minimize the use of traditional organizational resources (Budescu & Chen, 2015). Crowdfunding is a special type of crowdsourced product that is used as a method for generating funds from many individuals to sponsor businesses, creative projects, charities, and more.

Crowd-solving involves gathering ideas from individuals and the aggregation of 'intangible' goods in the form of the crowds' knowledge or information (Kamajian, 2015; Prpić, Taeihagh, & Melton, 2015). On the other hand, crowdsourcing strategies like crowdfunding and crowdpolling involve asking individuals to make 'tangible' contributions in the form of currency (crowdfunding) or votes (crowdpolling).

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Given the above distinction, crowdsourcing for medical diagnosis falls in the first category, which is crowd-solving; crowds contribute their ideas to solve medical problems by offering diverse solutions. Medical knowledge is often abstract and complex, a discussion that follows later in the paper. It is a greater challenge to capture this type of knowledge, than, for example, collecting ideas on improving the design for a product or gathering inputs on how to market a new product.

Successfully engaging a crowd and effectively acquiring the desired contributions from it are necessary but not sufficient by themselves to generate relevant and important knowledge from the crowd. Procedural rules and associated algorithms used by the crowdsourcing system are critical in achieving the desired objective of effectively organizing, filtering, and integrating the incoming crowd contributions. The processes employed by the crowdsourcing system must be able to integrate a diversity of opinions from the crowd. Furthermore, successful implementations of crowdsourcing systems should focus on fostering varied opinions. This may be achieved by selecting judges or experts with different backgrounds, eliciting their inputs independently, and injecting diverse thoughts to affect their original ideas (Herzog & Hertwig, 2009).

3. THE DISCOURSE ON KNOWLEDGE

Knowledge accumulation is a basic function of technology-enabled crowdsourcing systems (Ghosh & Sen, 2016). Once it is accrued, the system needs to filter the knowledge that is useful in solving the problem. This filtering process can be complex; it needs to recognize and identify portions of amassed knowledge that is 'relevant' knowledge (Garud & Nayyar, 1994). The next section attempts to explain the knowledge types, its sources, and problems associated with transfer of knowledge.

3.1. Knowledge Types

There are different types of knowledge based on its characteristics that the knowledge seeker finds interesting (Jensen & Meckling, 1996). Knowledge can be termed as either specific (relevant) or general. Specific (relevant) knowledge is 'private' knowledge that an individual has in relation to others, while general knowledge is 'commonplace' knowledge known to a large group of individuals. Further, relevant knowledge is the knowledge of "…particular circumstances of time and place…" (Jensen & Meckling, 1996, p.19), and the knowledge which is likely to bring about the most desired outcome. Sometimes, this type of knowledge can be termed as "important" knowledge.

3.2. Accessing Relevant Knowledge

Relevant knowledge can be accessed from a combination of resources that are widely dispersed and fragmented. As such, "…this [relevant] kind of information is not readily rolled up into statistical summaries …" (Jensen & Meckling, 1996, p.23). Relevant knowledge does not exist in 'concentrated or integrated form', but "…solely as the dispersed bits of incomplete and frequently contradictory knowledge…" (Hayek, 1945, p.5).

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

To capture relevant knowledge, it is essential to include a broad-range of knowledge sources. Unless an all-inclusive procedure is followed, obtaining relevant knowledge from a small group of individuals may limit the 'scope', that is the 'breadth' of the knowledge.

For crowdsourcing systems, while obtaining the key elements of relevant knowledge is a challenge, once that is overcome, another issue exists; to ensure that the security of the knowledge is not impaired during its transfer. A secure transfer will guarantee that the 'true' meaning of the knowledge is conveyed to the recipient of the knowledge. The section below highlights the challenges relevant to secure transfer of knowledge.

3.3. Issues with Knowledge Transfer

Successful dyadic knowledge transfer necessitates that both parties involved in the knowledge handover process develop an understanding of where the desired knowledge resides within the source. In addition, both parties must participate in the processes by which the knowledge is made accessible (Garud & Nayyar, 1994). Otherwise, in all likelihood, a recipient may ignore collection of a key knowledge component if there is a lack of understanding of where the knowledge resides within the source.

The role of cultural factors in knowledge transfer must be taken into consideration. The type of culture influences how its members process, interpret and make use of the available body of information and knowledge (Triandis, 2000). Paying attention to the cultural background provides a better understanding of the relationships between the various domains of messages. Furthermore, it is important to have a-priori knowledge of what pieces of information to sample and what kind of associations exist between the different items and domains of knowledge (Bhagat, Kedia, Harveston, & Triandis, 2002). In light of these factors, the transfer of knowledge between the agents in situations when their cultural paradigms are removed from one another may be difficult because, articulating particular knowledge or ideas may not be legitimized.

From the standpoint of crowdsourcing systems that involve transfer of medical knowledge, understanding cultural factors that contextualize the residual knowledge becomes imperative. Unless this is achieved, transfer of knowledge that will enable the provider (or entity providing consultation) to correctly interpret the information provided by the source (primarily, the patient), becomes problematic. Hereafter, we present ideas that are specifically linked to medical knowledge, the context being deliberated in this study.

4. MEDICAL KNOWLEDGE

Practice of medicine varies greatly, region to region, and from country to country. It is influenced by culture, history, personal attitudes, and philosophy (Zhang, 2000). This makes capturing and encapsulation of global medical knowledge a challenge. Diverse medical traditions (e.g. traditional Western Medicine, Homeopathy) follow different 'grammatical' rules. Similarly different pools of medical knowledge (e.g. Ayurveda, Arabic, Chinese, Greek) emanate from a variety of beliefs about how the human body responds to different treatments. In the following sections, we argue that global medical knowledge is an upshot of 'collective' thinking, and that it is derived from diverse traditions.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

4.1. Collective Knowledge

Citing the example of the disease syphilis, Fleck advances the idea that medical knowledge is the outcome of a collective process of interaction and communication amongst distinct thought collectives (Fleck, 1936). A key implication of this perspective is that medical knowledge is not 'discovered' by technical experts and then disseminated to a wider public. In contrast, both experts and the public, participate in verifying this type of knowledge. This idea is consistent with the view from actor-network theory in sociology (Latour, 1988). The theory proposes that facts are generated by networks of scientists and surrounding social groups (Arksey, 1994).

Some scholars have postulated that the knowledge base changes and develops with experience. The interactions between shepherds living nearby the Thermal Oxide (nuclear) Reprocessing Plant (Thorp) in northwest England and the numerous specialists responsible for monitoring of its functions and evaluating its impact were analyzed (Wynne, 1987). Results showed that the world in which the shepherds and their sheep live is so complex and fluid that specialized knowledge never manages to work. First, the experts' models were undermined by unexpected geological abnormalities. The shepherds knew far more than the researchers. The hypothesis that the forms of food and metabolism of sheep grazing in an enclosure are identical to those of sheep grazing freely, was effectively disproved. The experts acknowledged that their skills were incomplete and needed to be complemented by the observations and knowledge of the 'natives' (Wynne, 1987).

4.2. Culture (Tradition) as Context

Medical knowledge is inextricably linked to culture (Callon, 1999). Finding cures for medical cases through the application of specialized knowledge may not always be the best approach. Incorporating local knowledge embedded in the culture of the geographic boundary that the patient is located might be necessary. Many suggest that medical practice is an interpretive endeavor; besides the practitioner's scientific knowledge, his subjective understanding about the patient is vital for successful treatment. Every element of knowledge has its roots in specific culture. There are, for example the Chinese culture, which in important fields such as medicine, arrived at quite different realities from western medicine (Arksey, 1994). Scientific knowledge is implicitly structured to be consistent with wider cultural ideas, thus challenging commonly held beliefs of it being independent of such factors.

Further, medical knowledge is constantly evolving, yet medical practitioners are often not up to speed with these advances. For issues concerning health, there should be active contribution by lay people to 'boost' scientific knowledge or to participate directly in its production (Callon, 1999).

In sum, medicine is an interpretive activity, a learned inquiry and far from being objective or a matter of hard facts. It is grounded in subjective knowledge. In discussions involving medical knowledge, boundaries between specialists and non-specialists seem to be confounding. Such notions lend credence to the belief that in cases involving treatment of rare diseases, the management of disease condition may not be based on the scientific knowledge of the medical specialist(s). Inclusion of collaborative ideas that are grounded in the opinions and knowledge of non-experts, who may complement the formal specialized knowledge of medical specialists, might be desirable.

The 'grammar' or the knowledge base of the field of medicine is vast and varies from one culture or tradition to the other. Previous researchers show that only 10-20% of medical decisions are based on

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

evidence (Ranard, Ha, Meisel, & Asch, 2014). In medicine, crowdsourcing knowledge discovery could be approached by lowering the barriers of participation to traditional providers such as physicians and nurses. Simultaneously, the crowdsourcing service would extend an input role to non-traditional (for instance, individuals with no background in medicine), but interested contributors. The crowdsourcing and open data movements should present an opportunity to involve traditional providers and non-traditional resources of medical knowledge in knowledge creation efforts. They should also incorporate individuals from different medical traditions to maintain the sanctity of ideas that originate from individuals representing different cultural backgrounds. We shift focus now to envisioning a crowdsourcing system for the medical diagnosis and treatment of rare health issues.

5. CROWDSOURCING SYSTEM FOR MEDICAL DIAGNOSIS

An innovative solution to the challenges of encapsulating global medical knowledge to enable the diagnosis and treatment of rare diseases for which cure is yet to be found, is to evolve a crowdsourcing system that can capture relevant knowledge inclusive of the 'depth' and 'breadth' of medical knowledge related to the specific medical problem.

Human judgments may have built-in biases (Wu, Sun, Fang, Hu, Xie, Song, & Liu 2015). Software algorithms may also have preferences as a result of the prejudices of the individuals that developed them, thus making the process of arriving at the right solution flawed. Combining human (or the crowd) expertise with software algorithms may increase the likelihood of better decision making (Wu, Sun, Fang, Hu, Xie, Song, & Liu 2015; Xu, Zhang, Klein, & Zhao, 2016).

We propose a crowdsourcing system that will be based on the following: a step approach which combines humans and software algorithms in the process of crowdsourcing. This step approach attempts to identify and 'tap' different pools of medical knowledge (e.g. Ayurveda, Arabic, Chinese, Greek) and different approaches to medicine (e.g. Western medicine, Homeopathy, Acupuncture).

To provide a structure to the step approach, we adopt a classification of crowdsourcing based on the method used to analyze the crowd contributions outlined by Prpić, Shukla, Kietzmann, and McCarthy (2015). To the best of our knowledge, this is one of the first attempts to categorize crowdsourcing grounded on the ideas of process dimension of crowd capability construct. The process dimension refers to the internal procedures that a crowdsourcing system uses to organize, filter, and integrate crowd contributions.

Crowdsourcing applied towards solving health problems for which cure is still unknown presents unique challenges. The medical problems are very complex with high degree of 'intricacies'. Not many individuals have the knowledge or solution for treating a condition that is rare. We strive to reconstruct classification outlined by (Prpić, Shukla, Kietzmann, & McCarthy, 2015), while applying its fundamental tenets to develop our crowdsourcing model.

Next, we describe four steps that identify the appropriate solution for relevant medical problems. This modified taxonomy for crowdsourcing is among the first attempts to elucidate crowdsourcing process in the context of healthcare, specifically targeted towards medical diagnosis of health conditions for which remedies are unidentified. Further, as stated earlier, each phase in this step approach to crowdsourcing for medical diagnosis involves the crowd, medical experts, and software algorithms. *The step approach is outlined in Figures 1 thru 4 in the Appendix.*

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

5.1. Step One: Analogous Crowd Voting

Drawing on Prpić, Shukla, Kietzmann, and McCarthy (2015), we posit that a method similar to crowd voting will be the first step in crowdsourcing for the diagnosis of rare medical conditions. We begin with crowdsourcing the medical case; specifically, the crowd's input is requested in identifying the disease. Once the 'typical' crowd comprising individuals from diverse backgrounds provides inputs on the type of disease by specifying the name, symptoms, diagnosis, and prognosis, the crowd voting mechanism can be applied where input from the crowd is aggregated.

The aggregation method should be such that equal weights are assigned to individuals in the crowd, without distinguishing any level of expertise. The outcome of this approach may be optimum when it considers external information and reinforces the crowds' implicit wisdom. As is customary in crowd voting, contributions are taken at face value without any validation. The set of 'top' choices for the disease names are selected from the inputs provided by the crowd. Next, software algorithms will be used to select the 'one' disease that is most likely from this set. A logic within the algorithm that should drive this selection is to choose the disease based on the degree to which its characteristics (symptoms, diagnosis, and prognosis) match that of a known or well-established disease condition.

5.2. Step Two: Expert Panel Recommendations

While slightly distinct in certain aspects, the second step in the crowdsourcing process adopts the Prpić et al. concept of crowd idea sourcing in which several eclectic groups of medical experts (referred to as the 'super' panel) will now represent "the crowd" (Prpić, Shukla, Kietzmann, and McCarthy, 2015). Each group in the super panel will comprise seven medical experts, an ideal group size according to Blenko, Mankins, and Rogers (2010).

It is important to avoid a monopoly of any particular medical tradition when selecting each of these groups. Every group within the super panel must represent various cultural contexts, different medical backgrounds, and should comprise individuals that are open to the idea of extending credence to medical solutions that are derived from backgrounds substantively different from their own.

One of the group of medical experts in the super panel will be randomly selected and assigned the relevant medical problem identified in Step 1. This group will then broadcast the problem to the remaining groups in the super panel and solicit possible remedies. All groups, including the one that was assigned the problem, will provide their recommendations to create a pool of solutions. In following this process, the super panel will most likely avoid the dilemma of generating remedies that are biased towards a certain medical tradition.

Since each group within the super panel serves as an alternative to a typical crowd, this approach is a deviation from the fundamental tenet that 'wisdom of crowd' (Surowiecki & Silverman, 2007), or collective intelligence has immense potential to solve problems. A justification of this approach is that traditional crowds may not have the capability to provide solutions to highly complex problems. Further, they may also not possess the 'depth' of medical knowledge required to solve complex health issues. The depth of knowledge available to a specific medical tradition might offer the "hidden nugget" of information that provides solution to a hitherto intractable medical problem.

As each group in the super panel represents medical experts from a variety of medical traditions, it is expected that the set of proposed ideas from the super panel will embody a wide-ranging set of

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

solutions that cover the 'breadth' as well as the 'depth'. This entails that the solutions suggested will include traditional and non-traditional remedies, and those that are rooted in rigorously 'vetted' medical knowledge systems.

While offering their inputs, the medical experts should consciously or subconsciously avoid any personal bias that influences their judgment. Also, they should keep in mind that proposing 'personalized' cure, rather than a generic remedy to a medical problem should be important criteria when offering possible remedies. Here, personalized care refers to the type of cure that is individualized to the needs and preferences of the patient seeking inputs from the crowd.

A software algorithm will be applied to select and rank top three candidates from the set of solutions created by the medical expert groups within the super panel. While ranking them, the algorithm's logic should consider both quantitative and qualitative aspect of each solution included in the pool created. For instance, the quantitative attribute (or objective measure) of a solution may be a function of how many times the solution has proved to be successful in the past when treating a health condition. While the qualitative facet (or emotional trait) of a solution characterizes how satisfied a patient has been after receiving the solution. Moreover, the algorithm should be able to achieve a balance between the quantitative and qualitative traits of a solution. This will affirm the incorporation of objective-subjective thinking, and ensure satisfaction on the rational-emotional dimensions, in the proposed solution to the rare medical problem.

5.3. Step Three: Analogous Solution Crowdsourcing

Once the top solutions have been ranked, the stage is set for the third phase. This step will be similar to the concept of solution crowdsourcing proposed by Prpić, Shukla, Kietzmann, and McCarthy (2015). The 'typical' crowd's involvement will be requested in this step, and they will provide their opinions to select the final solution from the set of three ranked candidates created in Step 2. The crowd will be asked to submit their choice based on their cognizance of factors linked to the following; (a) whether the solution, once applied to an individual patient can be tested for its efficacy and effectiveness (b) if any patient has had a positive experience after receiving the solution/treatment, and (c) whether the solution is merely an opioid analgesic, as opposed to possessing the quality to actually cure the disease. Inputs from the crowd will be used to establish the 'single' most effective solution to be recommended to the individual or patient seeking medical advice.

5.4. Step Four: Analyzing the Solution

The final step in designing the crowdsourcing system involves testing the efficacy of the solution obtained in Step 3. This additional step is to augment the solution seeking mechanism; in conjunction with the process to select the solution itself, there is a condition appended that the solution proposed by the crowd, the medical experts, and algorithms is truly effective. To implement this phase, one needs to ensure that the patient or the individual seeking medical recommendations remains in contact.

The efficacy of the medical solution can be confirmed through standard laboratory tests or known medical examination procedures, as well as inputs from the patient. Further, when scrutinizing the solution offered by the medical crowdsourcing system, it would be pragmatic to evaluate its effectiveness in a continuum of failure and success, rather than simply labelling the solution as either a success

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Table 1. 2X2 Matrix for Step Four (Analyzing the Solution)

	Positive Scientific Laboratory Tests/Medical Tests Results	Negative Scientific Laboratory Tests/Medical Tests Results
Patient Not Happy/Not Relieved	***Solution is a Partial Success***	***Solution is a Complete Failure***
Patient Happy/Relieved	***Solution is a Complete Success***	***Solution is a Partial Success***

or a failure. The determination of where the solution falls in the continuum should be based on results provided by scientific evidence and the patient's reaction to the treatment.

The 2x2 matrix in Table 1 depicts were a particular medical solution selected by the crowdsourcing system would fall in the continuum of failure and success based on the results of scientific tests and patient's perception regarding the effectiveness of the solution. For example, a proposed solution will be deemed a complete success when the scientific or medical test results are positive and the patient suggests that his medical problem has been cured. Conversely, the medical solution will be considered a complete failure or placed at the other end of the continuum, when it does not relieve the patient of the medical problem, and the associated medical tests also suggest failure. When a situation occurs were the patient suggests that the medical issue has been mitigated due to the treatment offered, but the medical tests conducted reveal otherwise, the solution offered may be regarded as a partial success. Further investigations should proceed to see if the medical solution offered to the patient had a compelling semblance to some form of palliative cure. Another scenario in which the solution provided by the crowdsourcing system is also judged to be a limited success is when the patient is unhappy with the cure provided; however, medical or scientific tests show that the patient was provided the right treatment that cured his medical condition. Additional evaluation of the patient should follow to verify if he has high health anxiety or is a hypochondriac.

6. TECHNOLOGY 'MEANS' OF THE CROWDSOURCING SYSTEM

In order to successfully manage the crowdsourcing system, the supporting technology plays a key role (Prpic & Shukla, 2016). In this section, we discuss technology features that must be incorporated in crowdsourcing systems for medical diagnosis. Basic elements of technology-enabled crowdsourcing system must include a supporting platform that facilitates the integration and distribution of crowdsourced

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

data (Blohm, Leimeister, & Krcmar, 2013). Crowdsourcing systems should embrace tools that provide filtering mechanisms to identify high quality inputs from the crowd, aggregate them for evaluation, and 'purge' erroneous contributions.

Software algorithms should be designed to serve a complementary or synergistic role with the crowd (Doan, Ramakrishnan, & Halevy, 2011). Algorithms should be based on heuristics which continue to evolve with time and exposure to information and inputs from the crowd and medical experts. Technology should allow integration of the incoming crowd-derived contributions and capture the 'depth' and 'breadth' of knowledge from the crowd. It should also facilitate a dialog between experts from different medical backgrounds, ultimately leading to better understanding of medical grammar prevalent in different traditions.

Homogeneous contributions are those that fulfill some defined specifications. A crowdsourcing system that seeks homogeneous contributions values all valid contributions equally (Ranard, Ha, Meisel, & Asch, 2014). In comparison, a crowdsourcing system that requests heterogeneous contributions values every contribution differently, based on the unique attributes associated with each individual contribution. Owing to the complexity of medical knowledge, it is recommended that medical crowdsourcing systems should be designed with technological features that are capable of deriving values from both homogenous and heterogeneous contributions from the crowd.

Even so, while using the crowdsourcing systems interfaces, patients seeking cure for their health conditions should be able to 'virtually' interact with the crowd to obtain suggestions when entering information about their individual medical cases (e.g., medical history, specifics of the symptoms, etc.) at the input phase. This further implies that, in the future, medical crowdsourcing systems should include interactive features by borrowing ideas from current virtual reality systems to enable patients to experience real-world settings in highly interactive simulated environments and not limit them to sharing just medical information, images, and videos with potential medical problem solvers.

7. CONCLUSION

In general, medical crowdsourcing systems must include procedures to incorporate ideas from all levels of knowledge expertise; from the layperson to the medical expert. Creating layers of filter in the process of narrowing ideas should be an integral aspect of the crowdsourcing system's structure. Heuristic-based software algorithms that represent learning systems which gain knowledge continuously from diverse medical inputs and take advantage of the constant changes in medicine and technology must be engaged. This will make them robust enough to complement expert opinion and inputs from the crowd in the selection and filtering process.

This paper draws on ideas from the crowdsourcing classification outlined by (Prpić, Shukla, Kietzmann, & McCarthy, 2015) to propose a step approach involving both humans and software algorithms, to design crowdsourcing systems to offer the appropriate medical solution for a health condition for which cure is unknown. In our scheme, we argue that crowd cannot be the only entity involved in solving the problem. Due to the nature and complexity of the medical issue, we recommend the inclusion of an eclectic group of medical experts also referred to as the super panel. The knowledge base of the solutions proposed by the super panel must be derived from a breadth of medical knowledge and a depth of medical know-how.

Solutions to medical problems that are rare could reside in selected pockets of the global medical community that might not be considered conventional. Also, they may not have the legitimacy of the

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

typical approach to solving medical problems. There are some publicized success stories of the application of unconventional medical solutions to treat or cure medical problems. One such example is that of Gordie Howe, the legendary professional Hockey player who was paralyzed after suffering a life-threatening stroke. A needle was injected into his spinal canal to infuse stem cells in the hope that they would migrate to his brain and heal his body. Although the company that came up with the idea was located in the United States, the treatment was conducted in Mexico since, at that time the practice of injecting stem cells into human beings was not acceptable in the United States. The treatment was successful and Gordie Howe extended his life for a significant period.

There are other examples of medical solutions emanating from unexpected sources. The pancreas sits deep inside the human body which makes it difficult to scan using normal x-ray procedures. In addition, there is no 'trademark' symptom to alert an individual. A high school student from Houston, Texas, claims to have come up with a robust tool to detect pancreatic cancer (Safer 2013). Though his method is yet to be completely tested, well-known scientists have agreed that it holds promise. This is an example of how the advancement of medical knowledge can come from unknown sources, and not necessarily from prestigious research institutions or groups of scientists. Notwithstanding its humble antecedents, these solutions can pave the way for enhancement of medical knowledge.

The above examples emphasize the promise of the application of crowdsourcing to healthcare were diverse ideas from a variety of sources help solve medical problems. The attempt is to bring ideas from disparate sources, and not being restricted to the traditional way of thinking or generally established norms of practice followed by one particular medical tradition or philosophy.

The stringent scientific standards traditionally followed by modern Western medicine should continue to be the norm. However, the advent of an effective crowdsourcing service not only offers alternative remedies, but in some cases, may essentially open the eyes of followers of Western medicine to other non-traditional paths which not only have the evidence of the belief of ancient cultures behind them, but also have proven themselves in modern laboratory settings.

Thus, crowdsourcing has the potential of expanding the knowledge base of the dominant suppliers of most medical solutions which are typically rooted in modern Western medicine. The anchoring of the crowdsourcing service to stringent scientific standards will also alleviate the potential risk from lawsuits emanating from claims that the appropriate medical practices were not followed. The application of the suitable algorithm which reduces both drop and go errors should, over time lead to an expansion of the knowledge base about myriad health problems based on the collective wisdom of different medical traditions.

Crowdsourcing also has the potential of benefiting the healthcare industry by expediting the dissemination of information to improve the treatment of common ailments (e.g. Tuberculosis, Asthma, HIV/AIDS, etc.). In most cases, the medical solutions to these problems may be well known within certain organizations, but might be regarded as intractable to the rest of the world. Such problems are classified as "known-known" (Ghosh & Sen 2016). In these situations, the 'road block' for care providers to obtain solutions may not be medical ignorance, but the inability to effectively implement administrative policies and awareness programs in communities or geographic locations where circumstances (e.g. health awareness, socio-economic conditions) differ substantially from the 'normal'. An effective crowdsourcing service can provide a platform for healthcare professionals to share thoughts on how health programs can be modified to be managed successfully in these different communities or regions. Although the pertinent solutions might not all be health-related, care providers are expected to offer valid inputs as the underlying topics are related to medical treatments. Various solutions may be tried based on their

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

likelihood of success as determined by algorithms to enable relatively little "down side" in selection of effectual remedies.

In sum, an efficient crowdsourcing service not only has the potential of providing the most effective medical solution to individual patients, but also provides a synthesis of the stringent testing practices associated with traditional Western medicine with the more informal set of suggested medical solutions proposed by other traditions. In addition, it also has the potential to provide a platform where healthcare professionals can share their thoughts on the practical implementation of proven medical techniques under widely varying circumstances.

Chapter 23
Creating Market Inclusion: Assessing the Role of Social Entrepreneurship in Working Institutional Voids in a Developed Market

Jose Godinez
University of Massachusetts Lowell, USA

ABSTRACT

Understanding how social entrepreneurship as a tool of financial development has been in the center of the entrepreneurship and management disciplines for the last couple of decades. These studies have furthered our understanding of how social entrepreneurship helps the most vulnerable populations around the world. However, much of the literature on this subject has been devoted to analyze how social entrepreneurship aids such populations in developing locations. While this chapter does not try to diminish the admirable work carried by social entrepreneurs in developing countries, it points out that an analysis of this discipline in a developed location is overdue. To initiate a conversation, this chapter analyzes how institutional voids can arise in a developed location and the role that social entrepreneurship has in closing such gaps and to include vulnerable populations in the formal banking industry in the United States.

INTRODUCTION

Social entrepreneurship (SE) has been recognized as a vehicle for addressing social needs by public and private initiatives (Stephan & Uhlaner, 2010). Due to its popularity, SE has been analyzed by scholars during the last couple of decades (Estrin, et al., 2013). Also, SE, according to most studies, improves the lives of populations in developing countries (Mair, et al., 2012). Nevertheless, this activity also occurs in developed locations. However, scholarship in this particular phenomenon has not yet analyzed in the context of a developed location. Thus, the purpose of this chapter is to describe and analyze social entrepreneurship in a developed location to understand how the national context influences this activity.

Building on institutional theory (North, 1990; Scott, 1995) and enhancing it with the idea of institutional voids (Khana & Palepu, 1997), this chapter describes the role of social entrepreneurship in creating access to markets in a developed country. The main reason for this manuscript, thus, is to emphasize the importance of markets as catalysts for economic growth, the role of the institutional environment in a developed location to include (or exclude) individuals in market activities, and to understand the importance of social entrepreneurship in creating access to such markets. Therefore, in order to address how to build inclusive markets in a developed location, this study will answer two key questions: (a) how do institutional voids arise in a developed location? And (b) what is the role of social entrepreneurship to work these voids to include vulnerable populations in a developed location?

In order to illustrate how SE aids in including traditionally excluded populations into formal markets, this chapter uses the case of Community development financial institutions (CDFIs) in the United States and how they help vulnerable communities to be included in the formal banking system of the country. To do so, the case of Capital Good Fund will be used to illustrate how this DCFI deals with the two questions proposed above. The rest of the chapter is outlined in the following manner: a description of social entrepreneurship and its relationship with the institutional environment of a developed country is provided. This is followed by a case of how CDIFs help vulnerable populations participate in formal markets, and concluding remarks are offered.

TEORETICAL BACKGROUND

Social Entrepreneurship

Social entrepreneurship has been defined in several manners, and such definitions range from broad to narrow. The broader definition describes social entrepreneurship as innovative activities with social objectives in either the non-profit (Dees, 1998) or private sectors (Dees & Anderson, 2003), or a combination of both in a hybrid structural form (Oster, 1995). The narrower definition describes social entrepreneurship as the application of business acumen and market-based expertise in the non-profit sector for developing new approaches to generate income (Thompson, 2002). While there is debate in how to define social entrepreneurship, the majority of definitions agree that the fundamental reason for the existence of social entrepreneurship is to create social value, instead of shareholder or personal wealth (Zadek & Thake, 1997). Thus, for this manuscript we will combine both streams of definitions to denote social entrepreneurship as the set of organizational activities for an individual working on his or her own account to pursue pro-social goals to benefit people other than the entrepreneur (Bierhoff, 2002).

According to Mair and Marti (2006), one of the biggest challenges of analyzing and understanding SE is defining the boundaries of what is meant by *social*. The authors point out that at first, social entrepreneurship can be different from entrepreneurship in the private business sector due to the latter's association with profit motives, while social entrepreneurship is more associated with altruism. However, such dichotomous logic might not fully explain social entrepreneurship. One reason is that social entrepreneurship can be less altruistic since it can be used to achieve personal fulfillment. Also, entrepreneurship in the private business sector also encompasses a social aspect. In Venkataraman's words, "entrepreneurship is particularly productive from a social welfare perspective when, in the process of pursuing selfish ends, entrepreneurs also enhance social wealth by creating new markets, new

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

industries, new technology, new institutional forms, new jobs, and net increases in real productivity" (1997, p. 133). Thus, even if profit might be the central motivation for entrepreneurship, this does not exclude other motivations.

This means that the social part of social entrepreneurship denotes an individual, or an organization, that works in its own account to pursue goals that are set to benefit people other than the entrepreneur (Bierhoff, 2002). The definition provided by Bierhoff can be disaggregated in two parts. The first part, working for one's own account, builds on the work-related definition of entrepreneurship (Herbert & Link, 1982). However, this definition does not restrict the types of goals that entrepreneurs follow, meaning, social or economic wealth. Hence, this definition can be applied to both, social and commercial entrepreneurs. Thus, the stress over pro-social goals and social capital creation over economic wealth is what differentiates social entrepreneurship from its commercial counterpart (Mair & Marti, 2006).

Social entrepreneurship has been mainly studied in developing nations due to their need of improvement in their economic, social, political, and institutional environments (Mair & Marti, 2009). This line of research has helped understand the needs of the poorest of the poor as well as helped foster social entrepreneurship to address their needs. While these efforts are admirable, it is important to point out that understanding social entrepreneurship in a developed location is needed to alleviate the needs of the poor living in such locations.

By utilizing institutional theory to social entrepreneurship in a developed country, new insights for both, social entrepreneurship and institutional theory can be developed. This can be done because entrepreneurship studies build on economic institutional theory, which includes the self-interested actor model and the importance of incentives (Bowen & De Clercq, 2008). Also, how formal and informal institutions in a developed location influence a social entrepreneur's decisions should be discussed due to their pro-social interests (Zahra & Wright, 2011). Moreover, the influence of the government on social entrepreneurs in a developed country needs attention. This attention derives from the fact that in commercial entrepreneurship a larger government intervention can slow or even deter entrepreneurship (Aidis, et al., 2012), but when talking about social entrepreneurship such government intervention might benefit social entrepreneurs who depend partially or totally on the government support to achieve their goals.

Institutional Environment and Social Entrepreneurship

Institutions are described as the "rules of the game" act as constraints and guidelines for human behavior (North, 1990). Institutions are rules that can be tacit or explicit rules that are taken for granted by individuals and act as implicit parameters for an individual's actions (Powell & DiMaggio, 1991). Institutions can be divided into formal and informal. Formal institutions denote the objective incentives and constraints from government regulation of organizational and individual actions (Scott, 1995). Informal institutions, on the other hand, denote more implicit, culturally transmitted and socially fabricated guidelines for behavior (Scott, 1995).

Scott furthered the notion of formal and informal institutions by introducing two kinds of informal institutions, the normative and cognitive pillars, and the concept of formal institutions or normative pillar (Scott, 1995). According to Scott, cognitive institutions are the culturally shared understandings that are closely associated with cultural values. This pillar of social institutions puts emphasis on cognitions and shared perceptions of what is taken for granted (Trevino, et al., 2008). Hence, this component reflects symbolic systems shared among individuals (for example, shared knowledge). In this sense, Kostova

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

(1999, p. 314) argues that "cognitive programs such as schemas, frames, inferential sets, and representations affect the way people notice, categorize, and interpret stimuli from the environment." According to Scott (1995), the cognitive pillar of institutions leads to isomorphism, which encourages imitation of patterns of activities that have strong cultural support.

Normative institutions, on the other hand, are social obligations and expectations of what is appropriate and are modeled on existing norms or practices in a culture (Scott, 1995). The normative pillar of a location's institutional arrangement consists of "social norms, values, beliefs and assumptions that are socially shared and carried out by individuals" (Kostova, 1997, p. 187). Scott (1995) claims the normative component of institutions describe what is appropriate for a society's members. Thus, when an institution encourages the *right* behavior, even if the legal environment is absent, that institutional arrangement will influence individual and organizational actions by normative processes. Building on Scott (1995), Kostova (1997) describes the regulative pillar of a country institutional environment as the rules and laws in a particular environment that restrict certain behavior and encourages other. The mechanism of enforcement, and hence the main process identified, is mainly through coercive rules, boundaries, regulations and laws, and sanctions (North, 1990).

Different disciplines describe two streams of comparative entrepreneurship research, contingent on the institution, either formal or informal, selected to predict entrepreneurship (Jones, et al., 2011). In this sense, comparative entrepreneurship research grounded on institutional economics analyzes formal institutions (Estrin, et al., 2013); on the other hand, those based on cultural sociology usually examine informal institutions (Puffer, et al., 2010). Even though researchers in the institutional theory discipline in other disciplines have argued that institutions should be studied together (formal and informal), studies integrating both in comparative entrepreneurship are scarce (Stephan & Uhlaner, 2010), and such studies analyzing social entrepreneurship in a developed location are virtually inexistent.

DiMaggio (1988) introduced the concept of institutional entrepreneurship as an effort to explain how institutions surface and/or change. DiMaggio argues that institutional entrepreneurs are actors who have interest in changing current institutional structures or in generating new ones and who uses resources to generate new institutions or change existing ones. The initial new institutional research program stressed isomorphism and social conformity to elucidate legitimacy and institutional pressures (DiMaggio & Powel, 1983). However, this initial attempt to understand institutional entrepreneurship left little space for agency (Fligstein, 2001). Thus, DiMaggio (1988) introduced the concept of institutional entrepreneurship to close this gap.

Social entrepreneurs have been able to catalyze social change by modifying long-established organizational fields or institutions (DiMaggio & Powel, 1983). In fact, social entrepreneurs have changed some deep-rooted institutional tenets of the banking system. For example, microfinance institutions challenged established banking practices by lending money to the very poor without requiring collateral. Thus, it can be said that social entrepreneurship and its relation with institutional theory should be studied firstly by understanding the values underpinning the social enterprises, how such values shape the operations of these enterprises, and how these enterprises change the formal and informal institutions on which they operate.

Recently, scholarship has analyzed the efforts by development actors (such as the World Bank, and other non-profit organizations) in their attempts to transform the institutions needed for integrating the poor in market activities (Mair & Marti, 2009). The main assumption in these efforts is that markets are effective mechanisms to achieve lasting improvement in living standards around the globe, especially

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

in developing countries. In this sense, scholars have built on the idea of institutions as the requirement for markets to exist. However, even though existing scholarship has focused mainly on the institutions needed to build proper functioning markets, such research has not fully addresses the role of the institutional environment to enable access to markets in a developed location.

Institutional Voids in a Developed Country

Recent work on institutional theory in economics and strategy acknowledges the main role that institutions (and the lack of them) play in creating market economies and in creating the behavior of firms and entrepreneurs. When adequately designed and implemented, such institutions offer the rules of the game that create the foundation of markets. Nonetheless, if these institutions are weak or inexistent, institutional voids appear, and a compensatory social structure is required to incentivize market formation and operation (Khana & Palepu, 1997; Mair & Marti, 2009). Institutional voids have a direct effect on market formation, economic growth, and development (Stephan, et al., 2014). Also, an institutional environment that is weak or inexistent strengthens social inequalities such as limited access to markets and economic opportunities (Puffer, et al., 2010).

Current scholarship on institutional voids in economics and strategy acknowledges the main role that institutions (and their absence) play in creating market economies and in modelling the actions of a specific set of actors: entrepreneurs and firms. Mainstream scholarship argues that the source of market institutions is property rights and autonomy in state actions and rules (Campbell & Lindberg, 1990; La Porta, et al., 1998; North, 1990). If adequately designed and implemented, these institutions offer the rules that provision the creation of markets to form. If such institutions are weak or inexistent, however, then institutional voids arise and a social structure is needed to compensate for market formation and operation (Khana & Palepu, 1997). Expanding on Leff (1976), Khanna and Palepu (1997) argue that business groups replicate and substitute for inexistent institutions to make sure that markets function even when there are market failures because of institutional voids.

Building on Khanna and Palepu (1997), and taking into account research in the broad institutional theory sense, recent literature in organizational theory and strategy has centered on the consequences of institutional voids on business strategy. In this sense, Meyer and colleagues (2009) concluded that the relative weakness or strength of several institutional frameworks has a direct effect on entry modes in India, South Africa, and Egypt. Puffer et al., (2010) concluded that weak and missing formal institutions in China and Russia compel entrepreneurs to depend on trust within networks. Also, Chakrabarty (2009) argued that institutional voids can influence family ownership patterns in different countries.

Another stream of research analyzes the impact that institutional voids have on entrepreneurial processes in the base of the pyramid (BOP) markets and local informal economies. In this sense, Webb et al, (2010) proposed many forms on which institutional incongruence and lack of enforcement of formal institutions aid entrepreneurial processes in an informal economy. Alliances among commercial companies and local social entrepreneurships are also thought to be responsible for removing hurdles of employing BOP models by reducing uncertainty created by weak market institutions (Mair, et al., 2012). These studies underpin the central role of understanding the institutional environment of a location to create markets and the impact of voids on efficient market functioning. Such studies also display a productive collaboration among strategy scholars and institutional economists, a collaboration that highlights a common interpretation as institutional voids as spaces without institutions. This explanation contrasts

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

to that of anthropologists and sociologists, who stress the richness and complexity of institutions present in comparable contexts and situations and who pays attention on the people participating (or not) in markets (Friedland & alford, 1991; Geertz, 1978).

Connecting the strategy and economic line of research with the anthropological and sociological ones creates a salient debate on what needs to be considered to build markets for social interaction and economic exchange. Even though pervious scholarship has analyzed a wide set of consequences that result from the presence of institutional voids, this issue is still largely unknown. Topics such as how institutional voids are created, how they relate to existing institutional environments, what is their influence in local populations, and if such voids can be found in locations with different development levels should be carried out to better understand this topic.

Work on institutional voids has focused on businesses operating in developing economies. In this line of research, scholars argue that large business groups imitate and substitute for weak or inexistent institutions to guarantee market function in the event of market failures in case of institutional voids (Greif, 2006; Khanna, et al., 2005). Thus, institutional voids in a location have been represented as discouragers of Western-style markets (Mair, et al., 2012). In this chapter, we argue that institutional voids can arise in developed markets. Scholarship analyzing institutions have assumed that developed markets have strong institutions that facilitate transactions and encourage entrepreneurship (Puffer, et al., 2010). While for the most part this assumption might be appropriate, it does not account for those not being able to participate in formal markets in developed countries.

From an institutional point of view, it is reasonably to question whether or not institutional voids actually occur in a developed country. The concept of a developed country presupposes that its institutional environment is well established and works well. Implicitly underpinning the concept, then, is the assumption of very little impediments to market and the activities that can happen within them. However, there are individuals within any society that cannot fully participate in economic market activities in the place where they live because of the institutional arrangement of such location. Furthermore, this exclusion can also happen in countries where the institutional arrangement is supposed to work efficiently and effectively. Thus, institutional voids have an impact on entrepreneurial processes for the very poor regardless of the level of development of the location where they live. Even though formal institutions in a developed market work efficiently for the majority of the population, there is still a section of such population who cannot benefit from such institutional arrangement.

INSTITUTIONAL VOIDS IN THE BANKING INDUSTRY IN THE UNITED STATES

The banking system in the United States is one of the most regulated in the world (Viñals, 2014). This system is considerably more regulated than those of other developed nations (Financial Services Agency, 2013). While most of these countries only have one bank regulator, in the United States, banks and their activities are regulated at the federal and state levels. Thus, depending on its type and organizational structure, a banking organization can be subject to several state and federal banking regulations. For example, while in the United Kingdom and Japan the regulatory authority over banking, insurance, and securities industries is overseen by a single agency. In the United States, however, separate agencies regulate these activities at the state and federal level (Rolnick & Weber, 1986).

Banking regulations in the United States also address issues such as disclosure, privacy, fraud prevention, money laundering, anti-usury lending, terrorism, and the promotion of lending to low-income

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

populations (Viñals, 2014). Moreover, since the enactment of the Federal Deposit Insurance Corporation Improvement Act of 1989 (FDICIA), all commercial banks that receive deposits are required to have a FDIC insurance and to have a primary federal regulator. All these regulations make banking in the United States one of the most rigid and costly systems in the world. This means that low-income populations are less likely to fully participate in this industry since banks usually transfer the costs of compliance with all regulations to the end consumer.

In 2014, the total population of the United States was 318 million; of those, 68 million Americans paid the greatest price to manage their money because of unequal access to financial systems (Yeung, et al., 2014). More than 55% of those making under $15,000 a year do not have a bank affiliation, and more than a quarter of those making between $15,000 and $30,000 are also unbanked. Also, an estimated 17 million adults are unbanked, while 51 million of them are under-banked (Yeung, et al., 2014). This represents a 20% of households in the country. Yeung and colleagues show that in the United States Black and Hispanic minorities are disproportionately represented in the number of financially underserved consumers (Yeung, et al., 2014).

In their work, the authors point out that 26% of unbanked and under-banked households are African American, and 19.6% are Hispanic (Yeung, et al., 2014). These numbers, the authors argue, can be explained due to cognitive and normative attributes, such as lack of trust in banking institutions, and language, and regulative attributes, such as education level, income, and cost barriers. While some of these figures might seem discouraging, social entrepreneurs are helping these populations with their integration to formal markets. These actors are working to achieve financial inclusion by not only offering innovative products and services, but also by forming a bond with their clients through special education programs that are tailored to their needs.

Social Entrepreneurship to Work Institutional Voids in a Developed Market: The Case of CDFIs

Institutional researchers have established substantial empirical and theoretical arguments regarding the institutional infrastructures and rules that allow market formation and associated economic development (Mair & Marti, 2009). Their main conclusions are that the configurations of micro and macro institutions result in market formation. Also, they conclude that in the absence of institutional arrangements (the presence of institutional voids) there is an impediment in the establishment of markets and their subsequent benefits. The majority of this body of work, however, assumes that markets just "fall in place" and come into being in equilibrium (Mair, et al., 2012). Thus, such works has traditionally neglected how institutional voids are worked out to allow market building.

In a developed country, the formal institutional environment is assumed to work rather efficiently and effectively. However, as presented before, there may be individuals or groups that might not be able to benefit from such institutional environment. Institutional theorists argue that when formal institutions fail, informal ones take precedence (Scott, 1995). Therefore, it is safe to assume that when in a developed location, with strong formal institutions, those who cannot participate in such formal institutional arrangement turn to informal institutions to fill such void.

In the late 2000s institutions in the United States started recognizing that an important part of those living in poverty had been bypassed by formal banking services. As stated before, many banking programs have failed to reach out the very poor. Today, it is well known that the poor are not a homogeneous group and that differences exist between them. Defining characteristics of the poor in the United States

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

include education levels, cost barriers, and language (Yeung, et al., 2014), also, recent scholarship has acknowledged that a lack of trust in the banking system has alienated low-income populations from the banking system in the country. These characteristics have alienated these populations from participating in the formal economy in the United States. Nevertheless, social entrepreneurship programs are trying to include this population in the financial industry in order to better their lives. Of these, the Community development financial institutions (CDFIs) are the most successful institutions to help the poor participate in the banking system in the country. CDFIs are private financial institutions that are 100% dedicated to delivering responsible, affordable lending to help low-income, low-wealth, and other disadvantaged people and communities join the economic mainstream. One of the most common reason for the success of CDFIs is that part of their business model includes building trust with their clients.

Community Development Financial Institutions (CDFIs)

CDFIs are financial service providers that operate in the mainstream social banking sector with the main mission of encouraging community development. These institutions target underserved populations that cannot access traditional finance services. Thus, CDFIs seek to serve socially-disadvantaged populations and mainly niche groups like ethnic minorities, women, and low income customers that do not have access to conventional sources due to lack of collateral, enough capacity, or resources to borrow. In this sense, the main activities of these organizations is to solve financial problems that vulnerable populations face by not only providing loans and development investment to underserved populations but by also providing counselling and technical assistance in order to help their clients to be included in formal markets (Chinn & Ito, 2008).

The idea of the CDFI is believed to have its origins in the history of self-help finance that resulted because of the financial exclusion of some communities by traditional financial institutions (The U.S. Department of Tresury's CDFI Fund, 2005). The current form of this organization can be traced back to the late 1960s and early 1970s when community organizations began to offer affordable financial services to underserved populations in the United States. During that period of time the central government began initiatives to create development-oriented organizations to combat poverty and racial discrimination. Nevertheless, it was until the 1990s that the CDFI industry recorded a drastic boost in the country, which has since been replicated in other developed nations such as the United Kingdom (The U.S. Department of Tresury's CDFI Fund, 2005).

According to Dewees (2004), CDFIs have six basic organizational types: (1) community development banks, (2) community development credit unions, (3) community development loan funds, (4) community development venture capital funds, (5) micro-enterprise development loan funds, and (5) community development corporation-based lenders and investors. Each of these organizations has a distinct goal that helps their communities. The community development bank aims to provide capital to provide funds to rebuild low-income communities by targeted lending and investment. The community development credit unions seek to promote community ownership of assets and savings, to provide affordable credit and to provide access to savings mechanism. The community development loan funds' goal is to aggregate capital from individuals and organizations to help their customers develop housing and businesses at a low rate. The main goal of the community development venture capital fund is to provide equity and debt with equity features for medium-sized businesses. The micro-enterprise development loan funds function similar to the community development venture capital but they work to provide loans to micro-

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

entrepreneurs. Lastly, the community development corporations work to help revitalize neighborhoods by offering affordable housing, creating jobs, and providing social services to low-income populations.

The number of CDFIs in the United States is reported to be between 800 and 1000 with operations in every state and servicing both rural and urban communities (The U.S. Department of Treasury's CDFI Fund, 2005). These organizations encompass more than 500 community development loan funds, 80 venture capital funds, 275 community development credit unions, and 100 community development banks. According to a survey of 496 CDFIs in 2005, these organizations provided about $4.3 billion in funds to their customers and financed about 55,242 housing units, 9,704 businesses, and were responsible for creating 39,151 jobs (The U.S. Department of Treasury's CDFI Fund, 2005).

The main role of CDFIs is to serve the social, economic, and physical well-being of the communities on which they operate (Chinn & Ito, 2008). They aid in job creation, in economically empowering individuals, in building local businesses, in developing entrepreneurial initiatives, in developing small businesses, in providing affordable housing, and in providing essential community services such as child care, health and education. CDFIs, therefore, seek to help people escape poverty by facilitating self-sufficiency through individual initiatives and self-sufficiency programs instead of grants (The U.S. Department of Treasury's CDFI Fund, 2005). Hence, they work with the local population and motivate them to make a positive change in their financial and economic situation.

Overall, CDFIs can affect the institutional environment on which they operate in a positive manner by changing the economic growth of a region or sector. They might also have an effect on the political and economic status of a sector, for example, by shifting the rural sector from barter to a monetized economy. Also, CDFIs can be responsible for changes in the psychological aspects of individuals, households and communities by allowing them access to financial services (Ledgerwood, 1999). CDFIs can offer these changes due to the close relationship they have with their clients that might not trust regular financial institutions. Also, CDFIs understand the social barriers that their clients might have to participate in markets such as their education level, income, and cultural differences such as language abilities. In order to illustrate this process, the case of Capital Good Fund will be utilized. This organization was chosen because it helps illustrate how a CDFI tackles the problem of financial exclusion in an innovative manner that includes products and services as well as educational programs that are individualized to the population they serve. The data collected for this chapter was generated through conversations with the founder of Capital Good Fund, as well as information provided by their public documents.

Capital Good Fund a CDFI in the United States

Capital Good Fund is a non-profit, CDFI that takes a holistic approach to fighting poverty and promoting financial inclusion. Their mission is to provide equitable financial services that create pathways out of poverty. Capital Good Fund recognizes the endemic nature of poverty in the United States, as well as the interlocking problems that enact barriers to eradicate it. They use financial empowerment in a holistic manner to meet the needs of their clients, foster true social mobility, and eradicate opportunity and wealth gaps in the society on which they operate. Capital Good Fund has operations in Rhode Island, where it is headquartered, as well as in Florida and Delaware (Capital Good Fund, 2016).

Capital Good Fund was founded in 2009 in Rhode Island with the aim of encouraging entrepreneurship through microfinancing and other innovative financing methods. In 2015 the organization embarked on a plan to finance 17,000 loans over five years with the goal of covering all of their operating expenses

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

through interest income from their loan portfolio. In order to fund such growth they launched a $4.5 million direct public offering, which allowed individuals, foundations, and others to invest as little as $1000 in Capital Good Fund and earn up to 6% return on investment (Capital Good Fund, 2016). Also, in order to achieve their goal, they expanded operations to Florida and Delaware. Currently, the organization is self-described as successful due to the emphasis placed on helping those affected by poverty by offering products and services that traditional financial organizations do not.

Lack of Trust in Banking Institutions

One of the main reasons for low income individuals in the United States for not participating in formal financial services is their lack of trust in such institution. Trust is a critical element in relations when people are dependent or vulnerable to the actions and decisions of others (McElvy et al., 2003), especially when their assets are at stake. Trust is important in the banking industry since it influences the costs and efficiency of transactions that involve risks (Arrow, 1973).

Also, trust can potentially reduce risk and uncertainty, as well as lowering the need for control in certain situations. However, traditional financial institutions have not been able to gain the trust of many low-income individuals since such institutions can be seen as predatory due to the high costs associated with formal financial institutions. In order to close the institutional void of lack of trust, Capital Good Fund offers programs to help entrepreneurs and businesses that are underserved by traditional financial institutions. This organization provides a distinctive range of financial services and products in economically distressed target markets. In this manner, Capital Good Fund helps financially excluded populations in a developed location by firstly gaining the trust of their clients.

Capital Good Fund generates trust with their clients by not only providing funding to their clients, but also by offering technical assistance to them in order to build relationships with them, which helps closing the trust gap with them. According to a Capital Good Fund client, the fact that the organization is willing to create programs to teach borrowers to manage their finances and to improve their credit scores is a good sign that the organization is not going to take advantage of him (Capital Good Fund, 2016).

Capital Good Fund also hires people from the communities it serves. According to the organization, people are more likely to trust someone with whom the clients share a connection. In this sense, Capital Good Fund believes that if its human resource force has the same cultural connections than its clients, the clients will be more willing to trust the organization. Also, the organization recruits its best clients to serve as loan officers or client coaches. In this manner, Capital Good Fund ensures that its employees can understand its clients not only because they share a cultural link but because its employees have actually experienced the adversities that their clients face in their day-to-day endeavors (Capital Good Fund, 2016).

Education Level

According to Yeung and colleagues (2014), approximately 40% of unbanked consumers and 15% of under-banked ones in the United States have less than a high school education. This is in contrast to individuals with college degrees who represent only 1.1% of the under-banked. Such low education levels have a direct effect in low financial literacy, according to Yeung, et al., (2014). Education levels are important financial barriers since banking institutions often have complicated banking and services

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

options, and navigating such options need a minimum level of understanding their terms and conditions, as well as the costs and benefits.

Institutional scholars argue that education is a vehicle for institutional building (Greif, 2006; Trevino, et al., 2008). In the United States, there are several organizations committed to bringing financial education for those traditionally alienated from commercial banking. These institutions' primary objective is to provide knowledge to their customers regarding the benefits of participating in formal banking, as well as how to do so. These social entrepreneurial institutions fill the formal institutional void left by the expensive and rigorous banking system by providing equitable financial services that create pathways out of poverty (Mair et al., 2012). In fact, according to the Community Development Financial Institutional Fund, 7 out of 10 people who participated in a financial education program provided by a CDFI certified provider saw improvement in their participation in formal banking upon graduation of such program (Mair & Marti, 2006).

Several CDFIs close the education gap by providing programs to build financial skills with their clients. To provide education to its clients Capital Good Fund offers a year-long coaching program to its clients who wish to learn to improve their personal finances. In the coaching program clients create an action plan with the help of their coaches that tackles every aspect of their personal finances. These aspects include credit, debt, budgeting, banking, and saving. The organization provides education for their clients to improve their financial goals that include get out of debt, save for college, or to simply learn to manage their money more effectively (Capital Good Fund, 2016).

Income and Cost Barriers

Bank accounts and most of the services provided by such institutions in the United States are not designed towards low-income consumers (Yeung et al., 2014). The costs of maintaining a bank account, which includes minimum balance requirements and penalties for overdrafts and bounced checks, are simply not worth it for many consumers. Thus, bank clients routinely cited not having enough money as their main reason for not having a bank account. Also, high service fees are also a factor, but to a lesser degree.

Social entrepreneurs in the United States have noticed the negative impact in the lives of those who cannot afford to have a bank account and have taken action. In order to lower the cost of their services, CDFIs obtain their capital from national and community banks, socially-conscious individuals, foundations, corporations, and religious institutions. These organizations and individuals provide with funds to CDFIs at a below-market rate of interest. Also, CDFIs have a special arrangement with the federal and local governments on which complying with regulations is at a lower cost than traditional institutions. These decrease in costs and fees means that social entrepreneurs CDFI-certified can transfer the low costs to their customers and thus, lower the institutional barrier for such customers to participate in the banking industry.

To reduce the barriers created by the high costs of providing financial services to the poor, Capital Good Fund offers different loans to people at different rates. These services have different interest rates depending on the nature of the loan, but always significantly lower than regular loans. Their most popular loan is intended to cover emergencies. This loan, according to Capital Good Fund, works very similarly to pay day loans but without the extraordinarily high interest such loans carry. Instead, Capital Good Fund will only charge 10% of the cost of a pay day lender for the same service (Capital Good Fund, 2016).

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Another loan that Capital Good Fund offers is to help pay for a car. In a place like the United States a car is not a luxury but a necessity. Without a safe and reliable car, many people may not be able to keep their employment. Needless to say this issue affects the poor in a disproportionate rate. For this reason, Capital Good Fund offers car loans (either to buy or to repair a car) at a 7.60% to 16.66% annual rate to its customers. Finally, Capital Good Fund understand that one of the most important deterrents for financial advancement in the United States is the immigration status of its clients. Therefore, they offer special loans for immigration services. These loans can be between $700 to $20,000 and have a rate of 15 to 24% annual percentage rate (Capital Good Fund, 2016).

Language

In the United States Latino communities are particularly negatively affected by language issues in the banking industry (Yeung, et al., 2014). Also, Latino communities are more likely than other groups to not understand the terms and conditions of the documents they signed when using financial services. This issue was acutely manifested during the financial crisis in 2008, in which a disproportionally large number of Latinos were affected by predatory lending that was caused in large part to a lack of understanding on loan terms.

In order to fill the institutional void caused by language in the banking system in the United States, CDFIs have implemented a bilingual (English and Spanish) mandate for their participants. This mandate is the response to the issues experienced by the Latino population in the United States during and after the most recent recession. In fact, according to Nancy Negron, Chief External Affairs Officer at Opportunity Financial Network, once CDFIs offered all their literature in Spanish, CDFIs have been largely responsible for keeping the money flowing in the Latino community.

Capital Good Fund has purposely started operations in locations with a high percentage of Latinos. The organization recognizes that one of the most financially excluded populations in the United States is immigrants from Spanish-speaking countries. Also, Capital Good Fund traces such exclusion to language issues. For that reason, they provide all their services in English and Spanish and make a priority to hire employees that have an excellent command of the two languages. This policy along has been acknowledged by the customers as one of the most important reasons why they prefer Capital Good Funds to other CDFIs in the area (Capital Good Fund, 2016).

ISSUES, CONTROVERSIES, AND PROBLEMS

The topic described in this chapter raises numerous issues regarding financial inclusion in a developed market. Researchers, policymakers, and practitioners have adhered to the notion that developed countries have adequate financial structures to serve their populations. However, in reality, many residents of such locations have been left out of the formal banking industry in these locations. The main reason for such financial exclusion can be traced back to the high costs associated with providing financial products and services in developed markets. Also, mainstream financial institutions have often overseen cultural issues that prevent vulnerable populations from participating in traditional banking.

Also, the financial industry in a developed market, in this case the United States, has contributed to financial exclusion because of the rigidness of their operations. In general, traditional banks have adhered to a business model that requires expensive facilities and services that are not required by the

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

very poor. This business model, although profitable for most financial institutions in the United States, has neglected vulnerable populations. This practice has prevented traditional banks from increasing their business operations by including vulnerable populations as its clients.

SOLUTIONS AND RECOMMENDATIONS

Traditional financial institutions should take a look at what CDFIs are doing. CDFIs are helping underserved populations by including them in the financial system of a developed country by offering the financial products and services they need at an affordable price. CDFIs are achieving this goal by reinventing their business model, which entails cutting costs in places like bank subsidiaries and emphasizing more lean operations. CDIFs are also integrating education programs that not only build trust in their clients but also help them manage better their money, which increases repayment rates. If traditional banks emulate and collaborate with CDFIs, financial inclusion in a developed market can be a not-so-distant reality.

LIMITATIONS AND FUTURE RESEARCH

Finally, this chapter has its limitations. Mainly, the chapter's goal was to illustrate how institutional voids arise in a developed location and how institutional entrepreneurs are filling them. Further research should include rigorous analysis that includes empirical evidence. Such analyses should be performed in order to understand and measure the impact of institutional voids in vulnerable populations as well as the impact of firms attempting to close them.

CONCLUDING REMARKS

This chapter reports on the activities of CDFIs to alleviate institutional voids in the banking system in the United States. The chapter highlights the work carried out by Capital Good Fund that provides affordable financial products and services to traditionally underserved populations in the country. The example presented here, however, does not claim that this is the only way in which voids in this industry can be filled. Actually, it would be naïve to think that there is only one way to close such gaps (Mair et al., 2012). Thus, the intention of this chapter was to illustrate how market exclusion can be traced back to institutional voids and that such voids can arise in a developed location. Also, this chapter is an example of how there are intermediaries that have in place mechanisms to alleviate such voids.

The institutional environment perspective acknowledges that human behavior is shaped by formal and informal institutions at once (Trevino et al., 2008). Scholarship has analyzed these claims concluding that the institutional configuration of a location can encourage (or discourage) market inclusion depending on how well such configuration works. When analyzing such institutional environments, scholars have argued that the absence of a strong institutional environment in a location (the presence of institutional voids) can actually hinder the participation of certain populations in formal market activities (Bowen & De Clercq, 2008). However, such analyses have been performed mainly in developing locations. Thus, the aim of this chapter was to describe how institutional voids arise in a developed location and to illustrate how social entrepreneurship works these voids.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Institutional researchers have assumed that the institutional environment in a developed country is well established and works well. Tacitly supporting the concept, then, is the assumption of almost non-existing impediments to market activities within such markets (Greenwood et al., 2014). However, there are individuals within those societies that cannot take full advantage of the institutional environment of the location where they live (Mair & Marti, 2009). Hence, institutional voids do exist in a developed location and have an impact on their populations, especially those more vulnerable.

The banking industry in the United States is one of the most restrictive systems in the world and thus it is costly. This means that low-income populations are less likely to fully integrate in the formal economy, especially minorities (Yeung et al., 2014). The reasons for such lack of inclusion, besides the high cost, include lack of trust in financial institutions, education level, income, and language. In the United States, social entrepreneurship with the help of CDFIs has been actively working to close the gap left by these voids. One interesting aspect of CDFIs is that they rely entirely on government support. The trust placed upon government support makes these entrepreneurs different than those in developing countries since governments in such countries are far from reliable.

One example of how CDFIs are working to close the institutional voids left by the financial industry in the United States is Capital Good Fund. This organization has presence in three locations in the country, Rhode Island, Delaware, and Florida, and provides affordable products and services to traditionally unbanked populations. The key to their success is to establish trust with their clients. They establish this trust by providing low cost access to finance which is targeted at specific needs of the location where they operate. They also create trust by providing financial education programs to their customers. Finally, trust is created by hiring members of the community they serve. In this manner, Capital Good Fund makes sure that their employees understand the issues pressing their clients and in their own language. In this manner, the organization is able to work institutional voids to include traditionally vulnerable populations in the formal financial industry in the United States.

Chapter 24
The Crowdsourcing Scheme as an Innovative Management Tool in University Spin-Offs

Katarzyna Kopeć
Tischner European University in Krakow, Poland

Anna Szopa
Jagiellonian University, Poland

ABSTRACT

Crowdsourcing is an emerging technique adopted by companies in the process of innovation. It can be also adopted by university spin-offs that play the significant role in the process of knowledge and technology transfer. In recent years, they have been researched from diverse perspectives. However, there are hardly any studies based on university spin-offs that have implemented crowdsourcing. This chapter presents how crowdsourcing business model might be applied to develop a university spin-off. The paper explains the rationale behind the adaptation of crowdsourcing by innovation-driven spin-offs. One overarching question of the chapter is "Can crowdsourcing be well adopted by university spin-offs?" Our study will open new paths for research and discussion, and its results will be supportive for decision making in the context of innovation and entrepreneurship. The logic of this paper is to speculate how university spin-offs can create value with the groups of online users through adopting crowdsourcing in its operation.

INTRODUCTION

The creation of new companies from university, or the process of 'spinning-off', has received attention from a range of perspectives in recent years. They are not only to innovate, but also contribute to the productivity and creativity of a university (Hayter, 2013). The effects of the activity of academic spin-offs are well known in stories of the origin of the Silicon Valley and more recently in the biotechnology and IT industry (Chiesa& Piccaluga, 2000). The role of particular universities, such as Stanford and MIT in the USA or Cambridge in the UK, in these processes is also well documented (Rosenberg& Nelson, 1994).

There is no doubt that spin-offs are seen as a valid means of knowledge and technology transfer under certain conditions. However, there are several aspects of university spin-off companies that have not been widely canvassed. It is relatively rare to find case studies of spin-offs that have implemented the crowdsourcing business model. As Thomas Allen and Rory O'Shea (2014, p. 34-35) state there are six primary research groups focusing on the determinants of the spin-off activity within a university context (from 1 to 4) and on the consequences of spin-off activity (5 and 6), that is,

1. The attributes and the personality characteristics of academic entrepreneurs.
2. The resource endowments and capabilities of the university.
3. University structures and policies facilitating commercialization.
4. Environmental factors influencing academic entrepreneurship.
5. The development and performance of spin-offs.
6. Studies that measure the economic impact of spin-offs on regional economies.

Nowadays, information and creativity replaces material as the dominant currency, where stages such as product design, development and production are no longer solely the creation of business but can now be activated and accomplished by the crowd. Though it is hard to tell whether this revolution will ever enable individuals to completely overthrow large multinational corporations, however our analysis will help to assess the possible use of crowdsourcing in the spin-off environment. A key question guiding the paper includes: Can crowdsourcing be well adopted by university spin-offs? Our study will open new paths for research and discussion, and its results will be supportive for decision making in the context of innovation and entrepreneurship. The logic of this paper is to speculate how university spin-offs can create value with groups of customers and users via the web through adopting crowdsourcing in its operation.

BACKGROUND

The term crowdsourcing has developed on the intersection of various disciplines (e.g. management, economy, sociology). It is therefore not a coherent term. The idea of outsourcing a task to the web-based community closely relates to other concepts in the social sciences such as prosumerism (Toffler, 1980), user-innovation (von Hippel, 1988), open-innovation (Chesbrough, 2003), co-creation (Prahalad and Ramaswamy, 2004). These terms, however, overlap with the crowdsourcing term (Brabham 2013; Estellés-Arolas & González-Ladrón-de-Guevara, 2012). In consequence, scholar discourse mixes with popular media discourse which indicates the dynamic increase in the popularity of that approach in all possible contexts.

The term accentuates a novel business model to solve problems by leveraging the "collective intelligence" (Lévy, 1997) of crowds in which a major communication platform is based on the web. Crowdsourcing refers to situations where an organisation (*a crowdsourcer*) announces openly via the web a task to be fulfilled by any web user (*a crowdworker*) who can voluntarily submit his or her proposal to face an issue. In fact, the task could be undertaken by staff of an organisation, however, it might be of great importance to leverage the creativity of external groups of web users or enthusiasts of a field.

Brabham points out the following features that differentiate crowdsourcing from similar creativity-based processes: top-down management, shared process of bottom-up creativity, locus of control with regards to the creation process between an organization and the public. It is important to notice that the

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

concept of open source (e.g. Linux) and commons-based peer production (e.g. Wikipedia) are by Brabham excluded to be perceived as crowdsourcing activities (no top-down management, locus of control resides among the users) (Brabham, 2013). There are few approaches to classify crowdsourcing, including the most transparent taxonomy by Brabham (2013, pp. 44-50) presenting four dominant crowdsourcing approaches based on the kind of problems being solved: the knowledge discovery and management, the broadcast search, the peer-vetted creative production, distributed human intelligence tasking.

Literature profoundly analyses the use of crowsourcing in the case of business where crowd wisdom is essential to solve a business problem or gain competitive advantage (Kittur et al. 2013; Kleeman, Vox, & Rieder, 2008; Acar& Ende 2011; Aitamurto et al. 2011). However, the recent evolution of crowdsourcing shows the application of this phenomenon by a wide variety of organizations including start-ups emerging in different areas to solve social, ecological or technological issues.

Crowdsourcing can include diverse tasks which previously were developed within an organization (Garrigos-Simon, Narangajavana, & Galdon-Salvador, 2013, p. 32). The crowd can support the process of designing products, producing them, solving problems, creating content and many more. That is, crowdsourcing can "help an enterprise in every aspect of the lifecycle of a product or service" (Porta, House, Buckley, & Blitz, 2008, p. 8).

Crowdsourcing has been used in manifold contexts by a broad spectrum of entrepreneurs, and also policymakers and academics. It might be seen as an innovative management tool which contributes to the acceleration of the competitiveness and productivity.

The formation of new businesses from research organizations has historically been seen as one of the most effective ways in which knowledge and technology are commercialized. These spin-offs result from the transfer of people and intellectual property from the parent institution. Defining what constitutes a spin-off company is not straightforward (Howells& McKinlay, 1999). A simple definition captures the fact that a transfer of resources occurs between the parent and the spin-off. Rogers et al. (2001) define spin-offs based on the parent R&D organization as those including the government R&D laboratory, the university, the university research center, and private R&D organizations as examples. Nicolaou and Birley (2003) take account of the human element and state that a spinoff is formed by individuals who were former employees of the parent organization. A complex definition presents Callan (2001) the term spin-off defines as a small, new, high-technology company whose intellectual capital has its origins in a university or public research institution. Spin-off occurrence necessarily implies that founders formerly employed by a parent organization and core technology are transferred from the parent organization to a company. And Roberts and Malone (1996) identify four important entities involved in a spin-off process:

1. The technology originator, the person or organization that nurtures technology from basic research through the stages of innovation-development to the point where the transfer of technology can begin.
2. The parent organization, where R&D is conducted by the technology originator, assists or restricts the spin-off process by controlling the intellectual property rights to the technology.
3. The founder, who establish a new business venture based on the technology designed by the originator. 4 The investor who provides financial in return for partial equity ownership in a new company.

In the context of the spin-off activity consequences Pirnay, Surlemont & Nlemvo (2003) define a university spin-off as created for the purpose of commercially exploiting knowledge, technology, or research results developed within a university. In case of a university spin-off company transfer of re-

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

sources occurs between the university and the company. Therefore a spin-off is sometimes defined as a completely separate company representing a technology developed at university (Howells&McKinlay, 1999). For the purposes of this chapter, we defined a spin-off as: a company formed through the transfer of technology from an R&D company, which is independent of the parent company, and involves the transfer of human capital. University spin-off companies tend to operate in more of a business, rather than academic, model (Arnold, Rush, Bessant & Hobday, 1998).

Chiesa and Piccaluga (2000) review various surveys among university spin-off companies and, combined with their own studies, they described a model characterized by a lower tolerance of risk and higher comfort levels with academic life which acted as disincentives to academic spin-offs. And Radosevich (1993) found out the same reason for a lack of entrepreneurial spirit among employees of US Federal laboratories. Therefore, the question remains as to whether the crowdsourcing business model can be implemented into university spin-off companies.

THE CROWDSOURCING SCHEME IN UNIVERSITY SPIN-OFFS

Why Do Spinoff Phenomenon Matter?

As universities are under growing pressure to innovate with technology and disseminate the results (Dennison, 2014), they have to stimulate entrepreneurship strategically. One of its incorporations is spin-off entrepreneurship. There are several critical success factors to determine the rapid development of spin-offs at universities including among others (Hisrich& Kearney, 2012):

- Opportunity recognition leading to the successful capitalization of the concept;
- A unique business concept that takes the form of a product, service, or process;
- An individual leader able to balance vision with managerial skill, passion with pragmatism.

The phenomenon of spinoffs shows that a great number of technology companies were originated in university incubation ecosystems. The activity of university spinoffs covers a wide variety of different technologies including software, medical devices, communications equipment, and biotechnology. There are rich intersectoral examples illustrating the phenomenon including:

- **Digital Equipment Corporation:** A former major US company in the computer industry, was founded by Kenneth Olson who applied intellectual property he developed while working at Lincoln Laboratory at the Massachusetts Institute of Technology (Roberts, 1991).
- **Medtronic:** A company that develops innovative medical device technology emerged from the University of Minnesota (Chrisman, Hynes, & Fraser, 1995).
- **Google:** An Internet search engine was founded by Stanford University doctoral students (Pressman, 2002).
- **Genentech:** A university biotechnology spinoff emerged from the University of California at San Francisco and Stanford University to exploit the Cohen–Boyer genetic engineering patent (Parker & Zilberman, 1993).

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

University spinoffs compose a highly diverse group of entities – some of them develop innovative technology which is sold to external companies (e.g. Perry Rosenthal founded Polymer Technology Corporation to exploit contact lens technology he developed while a faculty member at Harvard University and later sold the company to Bausch and Lomb (Shane, 2004, p. 16.), some aim at consumer markets (e.g. Hangers Cleaners, a spinoff from the University of North Carolina at Chapel Hill and North Carolina State University, is using a patented technology to transform the dry cleaning industry (Pressman, 2002). It comprises 51 franchisees in 23 US states (Pressman, 2002).

Shane (2004) points the following valuable outcomes resulting from the spin-off activity at universities:

- Enhanced commercialization of university technologies;
- Effective commercialization vehicle for uncertain, early stage university technologies;
- Effective mechanism for involving inventors in the process of technology commercialization;
- Enhanced primary mission of a university (that is scholarly research and teaching, training students);
- Opportunity to conduct additional research.

How Can Spin-Offs Implement Crowdsourcing in Their Operation?

In general, crowdsourcing has been made possible thanks to the evolution of information and communication technology which, in turn, supports innovation and development of enterprises. Crowdsourcing seems therefore an interesting tool to be adopted by innovation-driven spin-offs. There are several ways spin-offs might apply crowdsourcing strategies. Aitamurto, Leiponen and Tee (2011) classify internal crowdsourcing initiatives (e.g. IBM innovation jams which take place internally within the IBM various divisions), external crowdsourcing initiatives (e.g. LEGO Group's LUGNET or DELL's IdeaStorm that enables users to publish their product-related ideas or product improvements) as well as collaboration initiatives that are outsourced to companies specializing in crowdsourcing innovation problems to the public (e.g. InnoCentive.com).

Innovation-Driven Spin-Offs

"The businessman investigates new products and production processes to see if they represent improvements that he could adopt. Similarly, the average human inquires both consciously and unconsciously into changes that will make his life easier and more enjoyable. While change is all around us, the most outstanding feature of innovation is its mysteriousness." (Knight, 1967, p. 478). Innovation is very important to all organizations to sustain their competitive advantage through creating new services and products. Therefore it is important to invest in different types of innovation. This differentiation of the innovation exerts strong impact on innovation orientation of an organization which allows to achieve different outcomes and impacts (Siguaw, Simpson & Enz, 2006). However, there have been few conceptual and methodological contributions to the classification of innovations so far. One early model of the four element schema of innovation was proposed by Kenneth Knight (1967), each type of innovation can be implemented into university spin-off activity with the usage of crowdsourcing process.

1. **Product or Service Innovation:** Which is concerned with the organization's new product or service offerings.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

According to Freeman (1982), product innovation includes the technical design, R&D, manufacturing, management and commercial activities involved in the marketing of a new (or improved) product. OECD defines product innovation as "the introduction of a good or service that is new or significantly improved with respect to its characteristics or intended uses. This includes significant improvements in technical specifications, components and materials, incorporated software, user friendliness or other functional characteristics." (Oslo Manual, 2005, p. 48). The document points at such examples of significant improvements as the introduction of ABS braking, GPS navigational systems, the use of breathable fabrics in clothing, improved speed and ease of use in Internet banking services, providing on-site rather than remote management contact points for outsourced services (Oslo Manual, 2005, p. 48).

According to Malerba and Orsenigo (1993), the technological environment in which a company is founded represents some of the most important economic properties of technologies and the characteristics of the learning processes involved in innovative activities. The technological environment can thus be characterized by the fundamentals of the knowledge characteristics underlying the technological regime, including the complexity, the tacitness, and the level of pervasiveness or scope of the technological knowledge base. Companies encourage users to take part in crowdsourcing initiatives by presenting the characteristic, but intangible quality of the open content culture. This is consistent with the domains in which crowdsourcing is commonly used: configuration, design and testing of products, innovation, configuration, and problem solution (Kopec& Szopa, 2014). According to Kleemann et.al (2008) calls for participation in the creation of new products represent one of the most popular forms of crowdsourcing process. These vary in intensity from simple opinion polls to elaborate schemes for the collaborative development of products by users. Brahman in his publication presents an example of product development in collaboration with crowdworkers in Fiat company for its new Fiat 500. In a few months, the call generated ten million clicks, 170,000 designs, and 20,000 specific comments. In this project crowdworkers created a mascot and almost 1,000 accessories. The campaign was also a complete success from crowdworkers point of view- they had the feeling that their opinion mattered, and the opportunity to apply their creativity. Product development in crowdsourcing business model is also generated through on-line voting whereby internet users select their favorite solution. There exist crowdsourcing calls proposed to mobilize crowdworkers for the creation of a product that wholly depends on their input, the whole process goes beyond the designing, configuring, and marketing. Such solution is used in start-up companies sometimes their strategy bases entirely on the crowdsourcing business model. Many of these start-ups are successful, in part because of the ready availability of good online tools for managing user input, and in part because a significant number of hard core internet users are aesthetes with an affinity for good design (Kleemann, Voß, & Rieder, 2008).

2. **Production-Process Innovation:** Referring to the changes to organizational operations and production; this is also usually initiated by technological advancements.

OECD defines process innovation as "the implementation of a new or significantly improved production or delivery method. This includes significant changes in techniques, equipment and/or software." (Oslo Manual, 2005, p. 49). The objective of the process innovation might be to reduce costs of production or delivery, to enhance quality, or to manufacture new or significantly improved products. This might include new production methods (e.g. new automation equipment on a production line, computer-assisted design for product development), new delivery methods (e.g. a bar-coded or active RFID Radio

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Frequency Identification goods-tracking system), new service methods (e.g. GPS tracking devices for transport services, a new reservation system in a travel agency). (Oslo Manual, 2005, p. 49).

The university spin-off company is an outcome of an entrepreneurial process based on exploitation of a university technology it is part of a macro environment where evolutionary processes, such as industry cycles, affect both timing and viability of the spin-off project. Reichwald and Piller (2006) in their publication indicate saving time for new product enhancement, wider acceptance of new products among customers, and strengthening of consumers' individual assessment of the new product's originality as important advantages of involving customers in the value creation process. In addition Ogawa and Piller (2006) in their publication Reducing the Risks of New Product Development suggest that due to crowdworkers engagement the product design process is an" effective way to reduce the risk of new product manufacturing", with the use of IT technology. In addition using the crowdsourcing model, university spin-off companies might break their giant research projects into micro tasks that are then farmed out to the crowdworkers.

3. **Organizational Structure Innovation:** Concerned with the organization's "authority relations, communication systems, or formal reward systems" (Knight, 1967, p. 482).

OECD definition sees organizational innovation as "the implementation of a new organizational method in the firm's business practices, workplace organization or external relations" (Oslo Manual, 2005, p. 51) that has not been used before in the firm and is the consequence of strategic decisions taken by management. This kind of innovation can be intended to enhance a firm's performance by cutting costs of supplies, administrative costs, improving workplace satisfaction, acquiring access to external knowledge).

The examples from the business practice include new practices to improve learning and knowledge sharing within the firm (e.g. establishing databases of best practices, lessons and other knowledge), practices for employee development and improving worker retention, such as education and training systems or management systems for general production or supply operations (e.g. supply chain management systems, business reengineering, lean production, and quality-management systems). (OECD Manual, 2005, p. 51)

Einar Rasmussen claims that university spin off creation and development can be explained by evolutionary process. A university spin-off organization process is located in a specific institutional context, but many factors outside the university influence this process. Examples of such external conditions are access to external capital, university and governmental regulations, labor market conditions, and regional industry composition (Shane, 2004). The external environment affects the spin-off process by influencing the opportunity, the individuals involved, and the university context. Examples of evolutionary processes where the spin-offs both participate and are influenced by are the development of new industries, the development of regional clusters, the development of university and government policies, and changes in markets and customers' needs and preferences. Network activities with the university, customers, suppliers, and the regional innovation network are crucial important for spin-off development (Pérez and Sánchez, 2003). Managing university spin-off companies is complex and rich. Crowdsourcing business process determines organizational innovation. In consequence, the link between enterprises and the groups of consumers is more and more evident. Crowdsourcing links an open creation process with conventionally managed top-down process (Kleemann, Voß, & Rieder, 2008).

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

4. **People Innovation:** Relating to changes to the people (staff) within an organization, including changes in staffing levels, personnel, job roles, cultures, and behaviors.

Definitions of entrepreneurship often include the individuals, the opportunity, the context, and the process over time. And the creation of a university spin-off companies can be explained as a process where an opportunity, individuals, and a context create the necessary properties for a new organization to emerge (Bruyat& Julien, 2001). Among other means, personal networks of academic and researchers, and graduates are very important channels for disseminating the latest knowledge from academia to the local high technology industry. This process can be developed through crowdsourcing business model where the new consumer type is defined as "working consumer" – creates immaterial labor, and adds value to market offerings (Kleemann, Voß, Rieder, 2008). Toffler uses the term "prosumer" to describe person who produces some of the goods and services entering his own consumption (Toffler, 1980). Czepiel, Solomon and Suprenant characterize "service encounters" and describe their active roles in various types of services (Czepiel, Solomon, &Surprenant, 1985). The new consumer type is providing services usually for free, however the capacities that he possesses are valuable economic assets. Since he takes part in the production process and can be utilized as value-adding worker. He is systematically integrated into corporate structures, and his activities are monitored and manipulated by project managers much as if he was an employee. The concept of the new type of consumer supplements existing approaches to consumer co-production, while challenging extensive changes tries to create an ethereal environment in which consumers and producers live in harmony. (Kleemann, Voß, &Rieder, 2008). Crowdsourcing in the context of new type of consumer can be explained through a theory of crowd wisdom, communicative planning and collective intelligence. Crowdsourcing remains model capable of collecting talents and leveraging ingenuity it leads to the time and costs and time formerly needed to solve problems. Surowiecki, in his book "The Wisdom of Crowds" discovers that "under the right circumstances, groups are remarkably intelligent, and are often smarter than the smartest people in them"(2004, p. xiii). Crowdsourcing is derived not from averaging solutions, but from aggregating them. Another theory is associated with collaborative processes involving a wide range of stakeholders. Communicative planning theory recognizes that all forms of knowledge are socially constructed, and collaboration between all participants in the process (new type of consumer, planners, and decision makers) is the process and context within which plans are made and new products and services are created. Plans emerge from the interaction of participants, and it is obligatory that planers ensure that power relations are known and anticipated in the design of the participatory basics of the planning process (Healey, 2006). The third crowdsourcing theory associated with the role of new consumer type is described by Pierre Lévy, who emphasizes that our living knowledge, skills, and abilities are in the process of being recognized as the primary source of all other wealth he claims that the most socially useful goal is to supply ourselves with the tools for sharing our mental abilities in the construction of collective intellect of imagination. Lévy claims that since "no one knows everything, everyone knows something, and all knowledge resides in humanity" (Lévy, 1997).

The process of innovation (product process, organizational and people) in university spin-off companies can be developed by following types of crowdsourcing:

- **The Knowledge Discovery and Management:** This approach is similar to commons-based peer production (e.g. Wikipedia), where users create online content. In this crowdsourcing case the organization manages the process of knowledge discovery (what information is needed, its objec-

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

tive, ways to collect this knowledge). Example: SeeClickFix, the US website where the internet community report non-emergency problems occurring locally (e.g. potholes, graffiti etc.). City governments use SeeClickFix to better understand local issues and to respond to them in a proper way.

- **The Broadcast Search:** This approach focuses on searching scientific solutions. It might be the case of the Innocentive or OpenIDEO (companies that crowdsource innovation problems to talented individuals who compete to provide novel solutions to challenges in e.g. engineering, life sciences, and business). Based on a statistical analysis Lakhani found out that solvers were able to solve 29% of the problems of the seekers (large companies with R&D departments) that had remained unsolved before (Lakhani, Jeppesen, Lohse, & Panetta, 2007). In the broadcast search approach, financial remuneration is commonly designed for problem solvers whose solution wins and the intellectual property belongs to a seeker.
- **The Peer-Vetted Creative Production:** In this approach – the creation process is open to online community and finally the best option is selected. This approach can be applied in the matters of user preferences, also one's business can be based on crowdsourcing strategy.
- **Distributed Human Intelligence Tasking:** In this approach the data is available but the problem includes data processing which can be split into small tasks done by people only. In this approach an organisation tasks a crowd with analyzing large amounts of information e.g. Amazon Mechanical Turk – an online platform that coordinates sets of effortless jobs which cannot be fulfilled by computers as they require human intelligence (e.g. tagging images, responding surveys, rewriting texts, transcribing audio, conducting internet research). It is a very interesting research due to opening up corporate boundaries to external labour via a digital platform (Bergvall-Kåreborn &Howcroft, 2013).

To sum up this part of the chapter we present the results of Poetz and Schreier' s research held in 2012. They asked a question: Can crowdworkers compete with professionals (e.g. engineers, designers etc.) in creating new ideas. Under their guidance, the company undertook an experiment focusing on an innovative product generated by its employees as well as by a group of crowdworkers. The quality of provided ideas was measured considering three factors: the novelty of a product, customer benefit, and feasibility. The study presented that user ideas score notably higher than professional ideas when it comes to the novelty and customer benefit whereas professional ideas are easier to be implemented. In consequence, the crowdsourcing initiative seems to be a valuable addition to products developed internally by professional staff.

However, crowdsourcing process has its drawbacks and not always can be implemented into the operation of university spin-offs. First of all legislative framework of crowdsourcing labor model is based on existing labor laws which does not address a variety of employment-related issues (e.g. status, issue of control, working equipment). In addition it is very difficult to revise the law due to the specific features of crowdwork. Since the work is anonymous and carried out online (Felstiner, 2010). Another crowdsourcing-related risk is consumer data security as enterprises can attempt to reveal data about their crowdworkers to external parties to support research and development. In addition, crowdsourcing initiatives raise ethical concerns like substituting company's own employees with lower-wage crowdworkers what shows the exploitative nature of crowdsourcing (digital sweatshop, slave labor) for the enterprise's benefits (Harris, 2011). A very important factor in the university spin-off activity is the level of qualifications of participants involved in the productive process. Corporate employees possess

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

very specific knowledge and qualifications. The issues relating to the qualifications of crowdworkers are unexplored. This means that companies take a risk in transferring knowledge and responsibilities to the crowd. Another problem is that consumers' expertise is very specific and relates only to the companies' front stage, to use. Crowdworkers know little or nothing about the processes, it makes them uninitiated in a core area of knowledge, which companies' professionals have at their disposal (Kleemann, Voß, &Rieder, 2008). Therefore it is suggested to take advantage of crowdworkers' fresh perspectives on the problems, and let experts estimate and use it in creating new solutions.

Allied Minds and Its Commercialization Model of Academic Research

Boston-based Allied Minds (Allied Minds, 2012) as a private equity company invests in university-derived inventions. It has operated since 2006 and its priority is to form, fund, manage, and build products developed by means of innovative technologies by the top US universities and federal research institutions.

Allied Minds identifies the most promising early-stage laboratory research leading to innovations which possibly might have an important impact on commercial markets. If an emerging technology passes the company's due diligence review process, Allied Minds develop a subsidiary company giving the inventors and their institutions a stake. The majority of subsidiary companies are financially supported by Allied Minds only, what differentiates them from typical venture-backed startups. Allied Minds employ experienced staff members including a leader who manages each phase of the product development cycle. (Allied Minds).

Allied Minds works with more than 33 universities (some of them exceed $1 billion each in annual research spending) and 32 federal research centers (including laboratories) run by the US Departments of Defense and Energy on a similar commercialization structure. It currently has 18 operating companies in the U.S. (FierceBiotech).

One example of the Allied Minds' activity is the Spin Transfer Technologies (STT), the company established together with the New York University. The company's objective is to develop and commercialize its Orthogonal Spin Transfer Magnetoresistive Random Access Memory technology (OST-MRAM). The STT technology was developed from research conducted in the laboratory of Professor Andrew Kent at the New York University. The discovery has major implications for the development of spin transfer MRAM devices, including faster switching times, lower switching energy, higher write endurance and greater scalability to smaller dimensions. (Spin Transfer Technologies). The New York University and the key scientist received an equity stake in the new venture. Spin Transfer Technologies received seed funding in 2007. In 2011 it received a $36 million private equity investment raised by Allied Minds and Invesco. "The capital goes toward scaling operations, purchasing equipment, and growing its team to accelerate development of its patented orthogonal spin transfer MRAM technology (OST-MRAM)." (Allied Minds). The Spin Transfer Technologies will make the technology commercially available for license in the future.

Another example of the Allied Minds activity is the AlliedMindStorm.com, an open innovation website designed to discover the best commercial application for a technological invention. The reason to establish the platform was the fact that in the past Allied Minds did not fund some breakthrough technologies because of the difficulty to identify any profitable applications for them (Cole). It enables universities to advance research towards effective commercialization. It is the first crowdsourcing platform within the institutional investment industry designed to promote technology challenges. The underlying idea of the platform was the problem how to make practical use of an early scientific breakthrough? "The decision

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

regarding which application to pursue first is a complex and important one. Allied Minds is creating an entirely new way for universities to make this decision, while showcasing their most interesting research, but also improving them through open collaboration." (Allied Minds, 2012). The platform posts regular challenges for the public (so called creative minds or thinkers) to brainstorm new commercial applications around technologies invented by US university researchers. Its only requirement is that the thinkers have LinkedIn accounts. Financial remuneration up to $25,000 is designed for any "creative mind" (thinker) whose specific application of the technology results in a new startup or who present best-in-class suggestions (Allied Minds, 2012).

To protect university intellectual property, Allied Minds only posts non-confidential information and forgoes rights to any IP generated from Allied MindStorm.com. There are no costs for universities or the public to participate.

The first three technologies posted on Allied MindStorm.com include the following initiatives where the public was invited to suggest new uses of the technology in the open innovation setting:

1. **Paper-Thin Plastic Battery Mash-Up (Brown University):** This new battery uses plastic to conduct electrical current. The hybrid device marries the power of a capacitor with the storage capacity of a battery. It can store and deliver charge over long periods of time with greater power and with twice the storage of a double-layer capacitor. Its power and paper-thin dimensions could be used for wrapping electronic devices but also be made into a fabric-like material. (Lawton, 2006). A description of the prototype is published in Advanced Materials, a leading international journal in Materials Science (Song& Palmore, 2006).
2. **Resurrecting 4,000,000,000-Year-Old Enzymes (Columbia University):** By measuring the properties of these enzymes, the scientists can examine the conditions in which the extinct organisms lived. The results shed new light on how life has adapted to changes in the environment from ancient to modern Earth. The discovery can be applied to other enzymes to get a clearer picture of what life was like on early Earth, but also in biotechnology, where enzymes are playing an increasing role in many industrial processes. (Researchers Resurrect Ancient Enzymes…, 2011).
3. **Silver-Ink Pens that Write Circuits (University of Illinois):** This is a silver-inked rollerball pen capable of writing electrical circuits and interconnects on paper, wood and other surfaces. The offers flexibility to apply ink directly to paper or other rough surfaces instantly, at low cost and without programming. The key advantage of the pen is that the costly printers and printheads typically required for inkjet or other printing approaches are replaced with an inexpensive, hand-held writing tool (Ahlberg, 2011).

FUTURE RESEARCH DIRECTIONS

University spin-offs are companies founded by an academic inventor. Their objective is to make practical use of a technological discovery done by a university researcher. University spin-offs transfer technology from a university (a parent organization) to themselves and then to external customers. This ability to develop industrial application of scientific knowledge (Bigliardi, Galati& Verbano, 2013) has received great attention from both researchers and practitioners. Spin-offs have shown growing economic importance, mainly because of scientific expertise which is of great value for bigger companies.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Universities market thousands of technology inventions to investment firms. Many of these are technologies with obvious commercial uses. Therefore it is a real chance for universities to commercialize the most ambitious research and not to pass it over to external companies. So, what is the best application to develop a sustainable product or service? Universities all over the world create incubation hubs to support the commercialization of entrepreneurial venture based on both student and faculty research. "Entrepreneurship entails commercialization of innovation and is driven not only by personal characteristics of entrepreneurial individuals but also to a large extent by the environment in which they operate" (Shah, Gao, & Mittal, 2015, p. 185). This is a starting point for the analysis of the adoption of crowdsourcing in the spin-off operation. In the future, more and more spin-offs may consider the creative potential of crowds to enhance their innovation processes. A more integrated view of the crowdsourcing scheme as an innovative management tool evokes new perspectives of adapting crowdsourcing by university spin-offs. Future research should further explore the opportunities of the adoption of crowdsourcing in spin-off environment.

CONCLUSION

By applying crowdsourcing business model, this chapter presents how opportunities and individuals, contribute to the emergence and development of university spin-off firms. This study have synthesized some of the fragmented knowledge about crowdsourcing and university spin-offs and provided theoretical explanations for the spin-off process. In this context university spin-offs are seen as a tool for technology transfer where the goal or outcome is to transfer university knowledge and its activity can be efficiently supported by the crowdsourcing process.

Enterprises create innovations in order to gain competitive advantage in the traditional, as well as in the cyber-marketplace. In this context, crowdsourcing is an original instrument for advancing products, developing services and organizational process. Crowdsourcing links an open creation process with conventionally managed top-down process in which crowdworkers play a significant role.

Since the process of the new product creation and development in university spin-off companies is more complex risky than traditional production and requires very specific knowledge, crowdsourcing business model can be used in contributing to product innovation, contributing to product improvement, evaluating customer service or participating in the configuration of a product or its production. Among the advantages of crowdsourcing we can indicate: cost effectiveness, the opportunity to involve crowdworkers in a business activity on demand, more efficient use of resources, increase of turnover, quality improvement using consumer knowledge, the increase of market acceptance of new products and consumers' willingness to buy them, and the increase of consumers' subjective perception of the actual newness of a new product.

Crowdsourcing is an emerging technique outside of its application by companies in the process of innovation. There are a lot of areas for additional research and activity. Simply the rapidly advancing practice of utilizing urban information flows to inform both decision makers and citizens represents an explosion of new work and opportunity.

KEY TERMS AND DEFINITIONS

Crowdsourcing: A business model in which one party (an individual, a company, a public institution) solicits a group of individuals for solving a task via the Internet.

Entrepreneurship: Social process through which individuals and teams create wealth by bringing together unique packages of resources to exploit marketplace opportunities.

Innovation: The process through which economic and social value is extracted from knowledge through the generation, development, and implementation of ideas to produce new or improved strategies, capabilities, products, services, or processes.

Spin-Off: A new venture founded by current students or faculty members of a university to develop and commercialize their inventions.

Chapter 25
Crowdsourcing as a Tool for Improving Learning in Tertiary Institutions in Developing Countries

Indo Benna
Mohammed AlMana College of Health Sciences, Saudi Arabia

ABSTRACT

Higher education in many developing countries faces the triple challenges of inadequate funding, need to improve quality of learning outcomes, and the pressure to increase quality of graduates. Crowdsourcing offers opportunity for institutions to face these problems with little resource expenditure. The chapter describes/analyzes how crowdsourcing can be applied in curriculum and teaching material development activities through collaborative efforts of higher education institutions from different parts of the world to develop suitable curriculum for teaching English for specific purpose. The chapter analyzes the process and the evaluates the outcome of the crowdsourcing tool and suggests that its application can keep higher education institutions in developing countries in forefront of education and research innovation, and prepares members in these institutions for innovative problem solving and for the challenges of the online world.

1. INTRODUCTION

There are many issues facing higher education, among them are the need to improve quality with increased intake, but with dwindling means for internal resources mobilization and for tapping from the global community of educators. The key challenge is the design and implementation of collaborative educational programs that integrate the students' culture and background as well as the anticipated future workplace demands. The discussion on how higher education is using or can use the emerging new tools such as crowdsourcing to achieve its broadening objectives with limited resources through collaboration seems to be muted and needs exposure to a wider community involved in the various sectors of higher

education, whose resources and opinions can be tapped relatively quickly and inexpensively (Sharma 2011). Additionally, while crowdsourcing is frequently discussed in terms of the power of a massive and anonymous publ**ic (**Estellés-Arolas 2012**),** however its techniques are also being applied to smaller, more specialized audiences. This application to more specialized or more specific audiences seems to be a gap in academic research that needs to be highlighted.

Careful exploitation of the opportunities offered by these two types of crowds, a crowdsourcing project can be used to create culturally suitable English for Specific Purpose (ESP) curriculum for higher education. In practice, however, there are many other benefits as well. For example, many communities or institutions have used it as a strategy for numerous new digital projects that aim to create or strengthen community spirit around and through crowdsourcing projects. Well-designed crowdsourcing tools endeavor to point out the value added to the project by each participant to the project as a whole.

This chapter seeks to explore how crowdsourcing can be used to develop and implement educational program that integrates the students' culture and background as well as their projected workplace demands. Progressively narrowing the scope of the study, its background is focused on the review of the growth and development of ESP in the Middle East, as good example of active regions of the developing world.

The chapter is divided into five main sections. After this introductory part, the next section explores the growth and development of ESP and crowdsourcing in the Middle East context. The third section explains the process of ESP curriculum development based on the Middle East using both theory and practice to produce curriculum components. In the fourth section, the evaluation and application processes of the developed curriculum are discussed. Finally, the direction of future research and the conclusion drawn from the experience are presented.

2. GROWTH OF ESP AND CROWDSOURCING IN THE MIDDLE EAST

English for Specific Purposes (ESP) and crowdsourcing are emerging strategies that are increasingly being used to achieve desired policy goals, including higher education. Higher education is a knowledge-based industry that needs an inflow of ideas and innovative ways of doing things - including those provided by ESP and crowdsourcing- in order to increase its own efficiency and productivity. In this section, we shall discuss the growth of ESP first and then explore the role of crowdsourcing on higher education in the Middle East.

- **ESP and Its Growth:** By way of providing a background to the growth of ESP, this section briefly explores its form, approach and rationale using the available literature and then identifies the major growth factors.

The primary focus of ESP focuses on language context rather than on teaching syntax and language structures (Lorenzo, 2005). In this sense, ESP is considered different from English language teaching in that it focuses on outcome rather than language syntax (Dudley-Evans and St. John 1998). Because of the diversity of global socio-economic activities Belcher (2004) observes that ESP increasingly encompasses a diversifying and expanding range of purposes. Regarding its teaching method, ESP bases all decisions with respect to content and method on the learner's reason for learning (Hutchinson and Waters 1987).

However, a definition of ESP, as Dudley-Evans (1998) maintains, 'requires much more than an acknowledgment of the importance of needs analysis.' This suggests that there are additional features

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

or characteristics that are central to ESP. In his extended definition of ESP, Dudley-Evans and St John (1998) proposed a definition of ESP with characteristics grouped into absolute and variable types as presented in Table 1.

- **ESP Growth Factors:** The growth of ESP may be attributable to a combination of a number of important factors, some of which are the following:

First, as Table 2 shows, English is important due to its emergence as the global lingua franca (Chan, 2017) triggered by the growing influence of globalization. In a recent study, it constituently was first in geographic spread, in application in the areas of economy, communication, knowledge, media and diplomacy. While languages with colonial spread –such as English, French and Spanish- benefited from the historic adventure, the rise of Mandarin may be associated with the recent performance of China in the areas of the economy, communication, as well as in knowledge and media.

Most of the development of ESP was influenced by the old style globalization, which is gradually giving place to a new form. The emerging form of the globalization is affected by geopolitical and technological transformations which are reshaping the economic, business, and political models of the old form of globalization, creating a completely different system with the following new features that are bound to influence changes in ESP programs.

Table 1. Absolute and variable ESP characteristics

ESP Characteristics	
Absolute Characteristics	**Variable Characteristics**
• Defined to meet specific needs of the learner • Related to or designed for specific disciplines • Makes use of the underlying methodology and activities of the discipline it serves • Centered on the language (grammar, lexis), skills, discourse and genres appropriate to these activities.	• Uses, in specific teaching situations, a different methodology from that of General English • Designed for adult learners, either at a tertiary level institution or in a professional work situation, and could also be for learners at secondary school level • Generally designed for intermediate or advanced students; • Assumes some basic knowledge of the language system, but it can be used with beginners.

Source: Dudley-Evans & St John (1998: 4-5).

Table 2. Ranking of global languages efficacy based on five domains

RANK	SCORE	LANGUAGE	NATIVE (MM)	GEOGRAPHY	ECONOMY	COMMUNI-CATION	KNOWLEDGE & MEDIA	DIPLOMACY
1	0.889	English	446.0	1	1	1	1	1
2	0.411	Mandarin*	960.0	6	2	2	3	6
3	0.337	French	80.0	2	6	5	5	1
4	0.329	Spanish	470.0	3	5	3	7	3
5	0.273	Arabic	295.0	4	9	6	18	4
6	0.244	Russian	150.0	5	12	10	9	5
7	0.191	German	92.5	8	3	7	4	8
8	0.133	Japanese	125.0	27	4	22	6	7
9	0.119	Portuguese	215.0	7	19	13	12	9
10	0.117	Hindi*	310.0	13	16	8	2	10

** If all Chinese dialects/languages (Mandarin being the largest) are considered as one it would not change the rank ordering. However, if Urdu and Hindi – and all the Hindi dialects – are taken as one it would vault it past Portuguese and Japanese.*

- **The New Economic System:** Instead of the unipolar world, the global economy is growing more multipolar, with growing number of regional economic growth poles. The emerging growth centers are becoming important centers of diverse activities including cultural and language development.
- **The New Business System:** Growing protectionism, changing production costs around the world, emerging new industries are slowing growth in trade and international investment. These factors are dispersing worldwide supply chains, while on the rise in digital systems are integrating regional businesses and activities. The global decentralization and regional integration of businesses are bound to have the impact of ESP use and learning.
- **The New Political System:** Global economic transformations are triggering political changes whereby national political interests are over riding global political concerns. However, international and regional political issues such as digital security, terrorism and money laundering are forcing nations toward collaborative actions, which may influence the future development of ESP.

Second, the tremendous development in all scientific, technical and economic activities on an international level required an international language that meets the needs of both the experts and the learners.

Third, in language institutes, a revolution in linguistics has helped to redirect the focus, the form and mechanics of the language to its actual use in daily communication in ways that the language curriculum can be designed to meet different and specific contexts.

Fourth, it appears that emerging developments in the field of educational psychology has influenced the growth of ESP by stressing the vital role of learners, their inspirations and needs so that curricula for the language courses consider them.

These factors created a new generation of learners of English language, learners who not only wanted to learn but were more significantly aware of why and how they would use it in their daily activities in such fields as commerce, economy, medicine, finance and engineering. Through this emerged English for Specific Purposes (ESP). Because of its global situation in the areas of crude oil sales and related financial flows, international commerce, huge spending in education, the Middle East has become an important global region in ESP growth and development.

- **ESP Research in the Middle East With a Focus on Saudi Arabia:** Arabic is the official language of most countries in the Middle East, although in most technology-oriented higher institutions this rule is relaxed to allow the official use of English as the medium. While relatively elevated at the university level, however, English teaching and learning has been given limited importance at the other levels of the educational system both by the authorities and students, who seem to study it only in order to go through examinations.

There are signs that there is a renewed interest in the region as the example of Saudi Arabia shows. According to Rahman & Alhaisoni (2013), the importance of English language has risen rapidly due to the increased worldwide demand for English and its recognition as the language of 'science and technology, business and commerce' as well as its global spread. The authors suggest that English is accepted as one of the important subjects in the school system of the Kingdom and is afforded that official recognition.

This point seems to be supported by the growing crop of literature on a range of ESP issues expressed in the last five years. Just to illustrate some of these issues, Ahmed (2012) has set out a theoretical framework on the growing demand for ESP in Saudi Arabian higher education. Saleh &Elyas (2015) focuses on ESP for linguistic analysis of Qur'anic Surah to help recent convert to Islam and Javid dis-

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

cusses the unusual role of students, teachers and teaching methods in response to the needs of growing ESP programs. While Koci (2016) emphasizes that students' needs analysis are vitally important in the development of ESP, Alsamani (2016) provides a conceptual framework for incorporating computer students' project assignment into ESP program, and Younes & Albalawi (2016) identifies ESP speaking needs for business students. More recently Fadel & Rajab (2017) study the English language needs of the female students in Computing and Information Technology.

The key findings of other similar studies may be summarized as follows: First, on the communicative needs of health professionals Alharby (2005) finds that the curriculum of English language course at the college level was not adequately defined in terms of the medical students' future occupational needs. The context of the medical field requires a high level of English communicative skills since these professionals deal with patients' lives. Communication skills literally have "life or death" consequences.

Second, regarding the effectiveness of ESP course for business administration by Liton (2012) reveals that the existing ESP Course syllabus is not tailored appropriately according to the students' needs in the workplace. It, therefore, suggests that ESP course should be redesigned in assimilating the learners' real needs in the job field and teacher-centered traditional ESP classes need to be replaced by the learner-centered task-based language teaching (TBLT) and communicative approach as a teaching technique.

Third, on the suitability of courses to students' needs and attitudes, Abdalla (2013) shows that the majority of respondents indicated that their needs for studying ESP course rest with the four language skills of listening, speaking, reading and writing together with grammar and vocabulary. Fourth, about the evaluation of the effectiveness of using ESP course for Preparatory Year Program (PYP) students by Al Fraidan (2012), referring to the two books they were using finds that both books would be appropriate if they are merged and additional materials included to form suitable ESP teaching material. Fifth, on the effectiveness of using ESP course for PYP students, Younes& Albalawi (2016) reveals that the existing ESP Course syllabus is custom-made to properly fit the students' needs in the workplace. It recommends that ESP courses should be re-structured to integrate the learners' culture and background.

Crowdsourcing and the Social Networking

Many researchers date the growth of crowdsourcing in the Middle East to the time when an informal trader called Mohamed Bouazizi, set himself on fire on December 17th, 2010 in protest of harassment and humiliation by Tunisian policeman. Bouazizi's protest led to a chain of events, assisted by Al Jazeera, got the video from nawaat.org and broadcast it back to Tunisia informing Tunisians of the unfolding story. Bouazizi's protest, assisted by Al Jazeera TV, snowballed into a full-blown revolution that engulfed not only Tunisia but also the Middle East. Most importantly it redefined the role of the "crowd" of largely students of higher education using networked smart-phones to provide the international news agency with live pictures of events and reactions to them from various streets, in different cities and in multiple countries. Thus, the Arab Spring - as this the Middle East revolutions came to be called- has shown the power of the social media and the young people who used it to trigger social and political change, thereby underlined the significance of crowdsourcing in a global political context.

Most of the media outside the Middle East as well as local Middle East media attribute the growth of crowdsourcing to the work of Jeff Howe (2006), who described crowdsourcing as "the act of a company or institution taking a function once performed by employees and outsourcing it to an undefined (and generally large) network of people in the form of an open call." However, crowdsourcing has long non-digital and non-cash history. For example, In 1714, according to McGonigal (2011), the British

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Government established a commission offering 20000 pounds (roughly 12 million dollars) to anyone who could invent a way to determine 'longitude' on a sailing vessel and the prize went not, to an Oxford don, but to John Harrison, an uneducated cabinet-maker from Yorkshire. Firms turned to crowdsourcing tool; Netflix too sought help from the crowd to solve a non-recurring challenge and awarded a 'Netflix Prize' to the team that came up with a solution. Such open innovation or crowdsourcing initiatives help companies gain a competitive edge over others.

Digitalization and globalization converge to create fertile ground for the emergence and growth of crowdsourcing, which many believe to be a potent problem-solving tool that combines knowledge, energy, and creativity of the worldwide online community to great effect. Internet-based companies with global reach such as Google, Amazon, Facebook, and eBay and MySpace have lucrative businesses that are dependent on the contributions of their users from across the world, both internal and external to their organizations. Howe (2008), on the original exponent of crowdsourcing, pointed out that it is not a single strategy but four. He explains its robustness by highlighting the four strategies derived from crowdsourcing based on the type or resources it uses in each case. The models include (a). Crowd Wisdom, that uses crowd's knowledge for specific themes, (b) Crowd Creation, which uses crowd's creative energy to develop plotlines and concepts; (c) Crowd Voting, the model using crowd's judgment to organize vast quantities of information; and (d) Crowdfunding, that which uses crowd's collective funds for projects development. The strategy functions as a distributed problem-solving and production process, which operate by sourcing tasks to generally undefined, large group of people or communities through an open call (Li & Hongjuan, 2011). These large individual participants or groups form the "crowd". Many authors have suggested that in the development of his crowdsourcing ideas, Howe was to a large extent inspired by Surowiecki (2004) who through an extensive research concluded that in most given situations the judgment of the group is smarter than that of the smartest among them; and this idea he defined as the "wisdom of crowds".

- **Educational Activities and Crowdsourcing:** Crowdsourcing may be used to enhance the activities in higher education in many ways. For example, a recent trend of crowd creation project in higher education is the rise of student-generated guide to colleges and universities through the appraisal by students-based "crowd." One such project is called Unigo, which is mainly student-generated that provides a useful guide to North American colleges for all interested parties including potential applicants. As described by Dee (2008), the project initially featured less than 300 colleges but it quickly grew to include over 100,000 institutions. At the same time its contents in terms of number and material-types, as well as the number of its users grew rapidly.

Other important examples are that the strategy can be applied to produce crowdsourced college textbook, create new and more relevant curricula as well as courses or class teaching materials. Solemon, et al, (2013) use the four crowdsourcing strategies identified by Howe (2008) to illustrate examples of projects that were developed in the USA. Table 3 summarizes examples of a few of the crowdsourcing projects for creating crowdsourced content in the USA. According to the authors, the Online Textbook project initiative of the Brigham Young University, USA sourced the contributions from over 680 students of Project Management course in order to produce an electronic textbook (Wiley, 2011).

Applications of Crowdsourcing in Translation and Language Learning

Due to the increased globalization and cross-cultural activities, the demand for translation and language learning is on the rise. The translations may be of textbooks, trade literature or culture related texts. The languages benefiting from the translated material are those associated with the global rise of their economies, such as Mandarin and Hindi.

It is increasingly being realized that the best people to help translate the content materials related to product or service are the relevant customers themselves. As indicated, above crowdsourcing is becoming a tried and tested strategy of increasing the global reach for multinational businesses, including higher educational institutions, and engaging local clienteles directly in their native languages. This strategy often opens up many other opportunities. First, it enables the tapping into the knowledge and resources of the local customers, enthusiasts, and brand advocates. Secondly, it affords high levels of scalability and flexibility, which are very important but usually not easy to achieve by other means. Thirdly, it provides an opportunity for a snowballing of closer interactions with the local customers and allowing them to shape the development of products and services in accordance with the preferences and culture of the local markets.

- **Engaging the Multilingual Crowd:** In the multilingual crowdsourcing solutions, some companies such as Moravia (2017) are able to get the best of the crowdsourced model by integrating it effectively with other translation processes and similar work activities. In other cases, the best approach seemed to be one that only manages, develops, and uses clients' current crowds. In yet other cases it is imperative to build client-specific crowds from the firm's large and global resource pool. There are many ways followed by different firms, however, for Moravia (2017) the most typical scenarios for crowdsourced solutions include the following steps:
  - First, translation of select types of the client- and user-generated content.
  - Second, the aggregation and analysis of reviews or user comments, e.g., from blogs, Twitter feeds, and onsite reviews
  - Third, product evaluation and testing, whether prior to an official release or as part of incremental updates

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

  - Fourth, keyword testing, which includes getting the most relevant local terms that are to be used to optimize the concise summary of the global strategies and online campaigns
  - Fifth, consists of suitable terminology and style advance and administration
  - Sixth, the language quality reviews and assessment
- **Crowdsourcing Language Learning:** Recently language learning is being crowdsourced. Doulingo (2017) for example is a new platform that consists of a language-learning website and application, as well as a digital language proficiency assessment. The platform provides all its language courses free at no cost to the users. It is a scalable system, which by the end of November 2016, offered "68 different language courses across 23 countries, with 22 additional courses in development" Doulingo (2017). It is a versatile application that is available on iOS, Android and Windows 8 and 10 platforms with about 150 million registered users across the world.

Its language courses components offer not only written lessons and dictation but also speaking preparation for the more mature learners. It has a scalable skill tree, which allows users to progress through according to the ability of the users. In addition, there is vocabulary section where learned words can be put into practice. In the process, users accumulate experience points when lessons are completed and skills are regarded gained when all lessons associated with the skill are completed.

- **Creating a Crowdsourcing Culture:** To better understand the different crowdsourcing capabilities, it is first important to appreciate the layers of actors involved in the process. 1. The client layer – a firm or person that has a task that needs to be fulfilled, and is occasionally called "the seeker." 2. The crowd layer – consisting of persons who are eager and able to undertake the required task as specified by the client company or persons, and 3. The platform layer – that is an online marketplace through which projects are announced to the crowd (Nylund, Mats, Gopalkrishnan, Asha 2014).

Thus, it is this collaborative effort between a news organization, its audience, that crowdsourcing culture is created, and through which the roles of citizen contributors are plainly well defined in ways to ensure generation of a new crowdsourcing culture. Philips (2012) defined this type of collaboration as open innovation and often uses both by business corporate companies and media firms in various combinations, as categorized hereunder with relevant examples:

1. **Suggestive/Participative:** This format encourages anyone with an idea to submit it, review and rank from others. For example, the company Yle Svenska (July, 2016) regularly welcomes varied ideas or pitches for shows to be telecasted on the channel.
2. **Suggestive/Invitational:** This (usually) event or campaign based initiative invites specific individuals or teams to submit ideas of their choice (on chosen topics). An example is when the Al Jazeera news media invites documentary filmmakers to submit stories or films focusing on certain themes (environment, activism etc.) IBM's IdeaJam periodically invites chosen people to submit ideas and this list of chosen individuals keeps getting updated (Philips 2012).
3. **Directed/Invitational:** In this case, the firm builds a web of selected individuals/partners to participate in innovation. For example Procter & Gamble's Connect + Develop program allows firms to partner with Proctor & Gamble in innovation activities.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

4. **Directed/Participative:** A sponsor directs a group to address a specific topic/problem or opportunity. For example, many journalists from media companies- such as BBC, CNN or Al-Jazeera- tend to use social media to connect with the crowd and crowdsource news either on a continuing basis or targeted to a particular happening/event.
5. **The Opportunities and Challenges of Crowdsourcing:** The benefits of crowdsourcing are immediately understandable: it is highly scalable; the workforce is available instantly, and one can get as many or as few resources as one requires. Revolutionize information collection and processing systems are emerging and are enabling in-depth, large-scale, and cost-effective information gathering, more accurate techniques for information extraction from data.

In the current business environment where goods and services are sent to open, international markets, many businesses demand that highly qualified individuals with extreme product knowledge translate the accompanying product instructions over ever-tighter production schedules. Some of the affected companies claim that over eighty percent of the crowdsourced projects have deadlines shorter than 24 hours. Admittedly, crowdsourcing has its challenges, too. Experience has shown, for example, that the larger the crowd, the more complex are its management activities. According to Philips (2012), some of these activities include:

- Recruiting and engaging the right in-country talent
- Creating a community where that talent can share their expertise
- Managing that community to ensure that business requirements are met

These changing and challenging situations suggest that it is also important to manage carefully the crowdsourcing process so that when volunteers are not available, professionals can step in and make sure that deadlines and quality standards are kept.

3. ESP CURRICULUM DEVELOPMENT: WITH MIDDLE EAST FOCUS

The development of ESP curriculum is an important component of higher education in many non-English speaking developing countries. The Middle East is emerging as an important global region of growing ESP activities. This may be due to its increasing importance to the stability of the global economy, especially in view of the rising flows of people, finance, information and trade between it and the rest of both developed and developing worlds. In this section we analyze the experiences and importance of crowdsourcing curriculum development both in general terms and as it relates to ESP.

Crowdsourcing Curriculum Development

A wide variety of new options and opportunities are created by the rapid increase of access to free high quality digital educational material and the growth of online workers, both of which are probably triggered by the expansion in Information Technologies. One of these opportunities is crowdsourcing that offers all development actors, including higher educational institutions to harness the time, knowledge and resources of large crowds of online users at any time and space. To the ESP departments and teach-

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

ers, crowdsourcing offers the opportunities to use the wisdom of the billions of online crowd as well as the offline crowd to develop and run new curriculum to meet the changing societal needs. Worldwide, crowdsourcing is a rapidly growing activity that is embedded in large and small organizations such that it is estimated by 2018 (Deloitte 2016), with crowdsourcing about seventy-five percent of all high performers, including educational institutions, will perform better, faster and produce goods and services at lower costs.

Other important benefits of crowdsourcing for businesses as identified by Deloitte (2016) are worth highlighting, as they may prove useful to higher educational institutions. Besides faster design and quick prototype production ability, is has proved capable of achieving these abilities with higher quality and more elasticity, besides its demonstrated capability to accomplish tedious tasks. In the area of talent identification and use, crowdsourcing has shown the capacity to open up new external talent pools and has the means of efficient management and retention of internal talent. Any team given the responsibility to develop new education curriculum, will find these emerging qualities of crowdsourcing as useful guides to draw up its action plans.

The diversity of backgrounds, knowledge, skills, and abilities within the global crowd is already helping ESP teams to develop new curricula proposed by Maggio et al. (2016), and Helps and Grant (2013). These crowdsourcing platforms are intended to promote issues of "openness" (open education, open access, open source, open science, open data, etc.) among the communities of educators across developing countries.

Maggio et al. (2016) created an online system that crowdsourced the curriculum for their massive, open, online course (MOOC) that was intended as a personalized learning experience. With the help of other instructors, the team led a 13-week course for over 12,000 learners from 178 nations. The instructors offered the participants the chance to "increase their understanding of the foundations of open knowledge creation, use, dissemination, and evaluation; collaborate with learners from other cultures and disciplines; work effectively in rapidly changing knowledge environments; and develop as independent, self-directed, lifelong learners." The result showed that personalized learning can be promoted through networked technology but allows learners to create their own learning involvement, that many students were unprepared for the flexible approach and preferred clear direction. Other observations were that personalized learning needs a balance between student autonomy and teachers' strong direction and between content openness and licensing and that effective personalized learning needs a blend of pedagogies with new technologies.

Helps and Grant (2013) proposed a system to house curriculum and teaching material on diverse fields and act as quality assured crowdsourcing platform. It will be flexible and open to all global community of educators to contribute and use to design quality curricula and support material suited to them, but which will be published and distributed worldwide for use by educators from the developing countries.

From the literature review, it is clear that there are few types of research on the use of crowdsourcing for the development of ESP curriculum in the Middle East which seems to be lagging behind other regions of the developing world. The application of crowdsourcing in ESP curriculum development is a potentially rich area for academic research which should be explored not only in the Middle Eastern countries, but also other developing countries.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

ESP Curriculum Development Process

Many researchers have used or proposed ESP curriculum development process around the world and in the Middle East. Smith (2000) suggests four ways of approaching curriculum theory and practice, which is applied for ESP, as a body of knowledge to be *transmitted*, an attempt to achieve certain ends in students – *product*, as *process* and as *praxis*. While viewing curriculum in these terms, it is important to stress that curriculum development must respond to the spirit of the time, by using emerging ideas and the digital technologies to maximize the effectiveness of the ESP curriculum. Hence, the author advocates the crowdsourcing of tasks, ideas, influence, and support.

As discussed above, crowdsourcing offers tremendous opportunities to mobilize diverse resources and support from the "crowd" to achieve an effective outcome. In the present case, the crowd may consist of people and organization internal and external to the institution and the mode of interaction with them may be online or offline. The internal crowd may include curriculum developers, other faculty, learners, administrative & technical staff, and other stakeholders for personnel, commercial resources, and political support. The external crowd may include public agencies, allied institutions, granting agencies or others who have supported the curriculum, professional societies, existing and potential consumers of ESP graduates, donors for funding, political support, researchers and authors, and curricular development institutions at the local, national and international levels.

The online exchange uses virtual or cyberspace that implies the use of the wired and wireless network often using free online collaborative tools such as Dropbox, Google Docs, Slack, Skype, Google Hangouts, Trello, and Asana (Flowerdew 2012), The offline is reality (i.e., real life) physical, face to face interactions based on the mechanisms of meetings, syllabus materials, reports, site visits.

Framework for ESP Curriculum Development

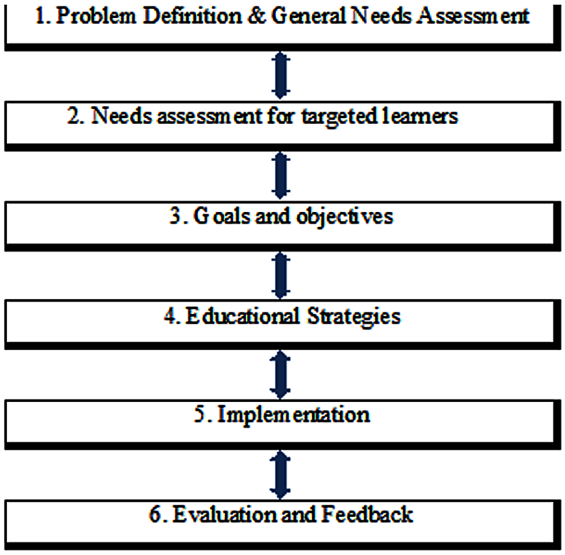
After a careful analysis of the ideas of these authors, the following six steps are accepted for use to guide the development of ESP curriculum in developing countries with emphasis on the Middle East. Figure 1 shows a framework for ESP curriculum development- based on the proposal by Lynn (2011) that forms the basis of discussion in this section. In each stage in the framework, main purpose, the process, and the key resources are identified, but these should be seen as part of a broader context of crowdsourcing with a wider reach in time and space. There is need to also emphasize that these stages reflect the fact that ESP is capable of self-renewal (Flowerdew, 2012) and is continually evolving in the process of which is widening and deepening its scope.

Stage 1: ESP Problem Identification/Needs Assessment

- **Purpose:** To identify the ESP problems related to the field that is to be addressed by the curriculum and to make a general needs assessment related to the relevant field, for example, business, health sciences, or engineering sciences.
- **Process:** Identify and analyze ESP needs & related problems; "what" and the "how" of a course, impact on clients, stakeholders, and society; define how it is currently being addressed; suggest how it should be addressed by stating an ideal approach.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 1. Framework for ESP curriculum development
Source: Developed by the author based on the proposal by Lynn (2011).



- **Resources:** Some of the researchers on this topic include Lynn (2011), Flowerdew (2012), and Smith (2000). Smith (2000) in particular suggests that there is a clear link between curriculum as a theoretical concept (Syllabus), which influences practical elements (process & praxis), which in turn affects the productive outcome (product). Douglas (2012) explores the theory and practice of assessment in ESP, then reviews specific areas of learning.

Stage 2: ESP Needs of Targeted Learners

- **Purpose:** To define, in operational terms, the target ESP learners' needs that should be met by the proposed curriculum.
- **Process:** A number of online and offline activities by the curriculum development team are to be carried out if the ESP objectives are to be achieved. The first activity is to identify the differences between the ideal and actual characteristics of the ESP targeted learner group and their environment. Second, the team needs to identify ESP targeted learners and define the appropriate educational intervention needed. Third, assessments are needed in the following areas: the existing and planned training; existing and perceived proficiencies, existing deficiencies and future needs; define learning styles and strategies, identify barriers, enabling and reinforcing factors; inventory existing recourses: crowdsourcing information, teachers, IT, and other factors.

Methods for target learners' needs assessment may include the use as appropriate the following: Informal discussions /formal interviews, focus group discussions, questionnaires, direct observation of skills, examinations, audits of current performance, and strategic planning session.

- **Resources:** Lynn (2011) provides a categorized list of the desired information about learners and suggests methods for learners' needs assessment. Toister (2014) provides good insight on adult

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

learning theory, understanding the four stages of learning, comparing active vs. passive learning, ways of overcoming learning barriers, and methods of turning theory into practice. Crowdsourcing of language skills is suggested by Paltridge & Starfield eds. (2012) while resources on the following skill areas are provided by the authors as follows: speaking skill by Feak (2012), listening by Goh (2012), reading by Hirvela (2012), writing by Hyland (2012), and the skill of vocabulary by Coxhead (2012).

Stage 3: ESP Goals and Objectives

- **Purpose:** To set the goals and objectives of the ESP curriculum, the curriculum development team has to define the general and the specific ESP educational and quantifiable targets covering all activities of the curriculum.
- **Process:** The ESP learners' needs analysis should lead to the definition of goals and objectives of the curriculum. They should guide the sequential choices of curriculum contents and assignments, suggest effective learning and evaluation methods, and inform on expected curriculum outcome.
- **Resources**: Talbot (2017) highlights the importance of long-term, goal-oriented, big-picture-driven professional practice, and how these could be incorporated in the process for designing and developing ESP curriculum using four objective-based questions. Lynn (2011) lists the functions of goals and objectives, suggests how to write goals and objectives, identifies the types and outcome of objectives including knowledge, skill, and attitudinal.

Stage 4: ESP Curriculum Educational Strategies

- **Purpose:** To generate suitable educational strategies that meet the needs of the learners in terms of material content and methods.
- **Process:** Define the ESP educational strategies that should have clear contents and methods based on quantifiable cognitive, affective and psychomotor objectives; preferably using multiple methods to meet varying learning styles and motivations of the learners. Then develop suitable methods for meeting cognitive needs, the choice of educational tools, skills learning, self-directed learning, and for promoting teamwork.
- **Resources:** Lynn (2011) provides useful strategies for selecting educational methods, plans for the choice of educational tools, methods for meeting cognitive objectives, approaches to advance self-directed learning, and identifies educational strategies for stimulating teamwork. Ilarde (2014) summarizes key elements of ESP course design, skills and strategies plan and its application in the developing world.

Stage 5: ESP Curriculum Implementation

- **Purpose:** To identify resources needed for the full implementation of the curriculum in terms of personnel (faculty and support staff), time (available from faculty, support staff, and learners), facilities (space, equipment, and utilities) and funds (direct, indirect and opportunity costs).
- **Process:** The implementation of the ESP curriculum needs adequate resources (personnel, time, facilities and funds) and support (internal and external, see crowdsourcing). Next, it needs an effective management structure that can deal with barriers and hurdles of financial shortage or re-

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

sistance from people & institutions. Finally, there should be an effective execution plan (piloting, adjustments, phasing of full implementation).

- **Resources:** Ahmed (2014) identifies key issues in ESP teaching -such as able to design teaching materials, develop effective teaching methodology, apply various technologies in ESP class and review teaching objectives. In addition, managing the curriculum requires careful consideration of instructors' teaching skills and learners' changing needs. While these are generally under control of the teaching faculty, there are issues beyond their control. For example, Storey (2007), Lynn (2011) and Flowerdew (2012) highlight the issue of mobilization of resources - including monetary support- for curriculum implementation in which intra- and inter-organizational management skills are crucial for support from senior administrators. Such support can be very important in assisting new opportunities or in helping to overcome challenges.

Stage 6: ESP Curriculum Evaluation and Feedback

- **Purpose:** To complete fully the curriculum development cycle by providing guidelines on how to enhance the curriculum, attract support for it, assess progress and satisfy external institutional and marketing demands.
- **Process:** This consists of the evaluation of the ESP curriculum after some years of application to provide a feedback for possible revision of the curriculum. The evaluation results may be used to mobilize support for the ESP curriculum, evaluate individual learner's achievement, fulfill external demands, and to serve as a basis for presentations and publications. The feedback normally defines the users, resources used in the curriculum to determine if it meets its goals and objectives. It consists of the evaluation questions carefully structured and their responses, includes explanations of how the ethical concerns are addressed, reports data collection and analysis; and includes a report on the methodology of data collection and analysis.
- **Resources:** The issues of evaluation and feedback have been highlighted by Smith (2000), Lynn (2011), Kelly (2009) and Bruner who is reported by Clark (2010) the leading advocate of the spiral curriculum that seek to revisit basic ideas, building on them until the student has grasped the full formal concept. A similar concept being promoted is the constructivist approach, which proposes that learning is best via pro-active engagement with the educational environment. These spiral and constructivist approaches to learning have democratizing tendencies and are supported and promoted by the application of online interaction and crowdsourcing activities.

4. DRAFTING ESP CURRICULUM

From the general staged ESP curriculum development description, the focus is now on the crowd to produce a draft ESP curriculum that will become much more instrumental and more relevant to local and regional needs, and therefore much more practical. To this end, this section will discuss the form and content of the following four action instruments that will guide the learners and the instructors in their daily activities:

- Course Information
- Course Syllabus

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

- Course Plan
- Student Learning Outcomes Alignment With Assessment

Course Information

The course information is a document that concisely describes the intended learning outcomes and it is the means by which these outcomes are accomplished. This section sets out the theoretical background against which the skills and knowledge contents must be seen. Thus, after a brief discussion on the theoretical approaches to course information, its main components are discussed as follows: general course information, learning outcomes and assessments, and the main learning resources.

Approaches to Course Design

Hutchinson and Waters (1987) identify three main types of approaches to course design: language centered, skills-centered, and learning-centered.

- **Language Centered Course Design:** The basic idea behind the language-centered approach is to create direct correlations between the language taught in the classroom and the language of the subject area as it is used in the real world. This approach is essentially the oldest type of course design in the ESP teaching method. Out of the many problems associated with the language-centered approach, is that it lacks depth and some researchers criticize as ”just a surface level approach” (Hutchinson and Waters 1987, p. 66).
- **Skill-Centered Course Design:** This approach seeks to guide learners in developing skills and strategies that will continue even after the ESP course by making learners better processors of information. This approach tries unlocking the processes that would enable the learner to perform better, to apply the processes to the ESP course. The approach, according to Hutchinson and Waters (1987), is based on two fundamental principles: the theoretical and the pragmatic: In the theoretical basis, the underlying language behaviors are certain skills and strategies, which the learner uses. The pragmatic principle is based on the distinction between goal-oriented courses and process-oriented courses. Needs analysis plays two roles in a skill-centered approach: first, it provides a basis for discovering the essential competence that enables people to perform in the target situation, it enables the course designer to discover the potential knowledge and abilities that the learners bring to the ESP course.
- **Learning-Centered Approach:** This approach is based on the principle that the learner determines the learning process. While teachers can influence what is taught, likewise the learners themselves determine what to learn. In this approach, Hutchinson and Waters (1987) remind us, learning is seen as a process in which the learners use what knowledge or skills they have in order to make sense of the flow of new information. Thus, learning is not just a mental process; it is a process of negotiation between individuals and society.

To sum up, it is clear that language-centered approach concentrates on performance, while the skills-centered approach concentrates on competence, and the learning-centered approach focuses on how to get competence.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

General Course Information

The general course information normally includes the name of the institution, department, course code and title, credit hours, core and pre-requisite if any, mode of instruction (e.g. lecture, blended, e-learning, etc.), basic instructor information (name, phone number, email, office hours). Under this part, is also the course objectives which state the main purpose of the course, the course description gives a general description of the course and what it offers to the students as well any plans for developing and improving the course that are being implemented.

Detailed course content may also be presented in this part. It shows the topics to be covered and the number of weeks it will take to cover the topics, contact hours and the weeks in which summative assessments are to take place.

- **Learning Outcomes and Assessments:** The second part of the course information deals with the learning outcomes and assessments. In this section, the course learning outcomes (categorized under different learning domain- knowledge, cognitive skills, interpersonal skills and responsibilities and psychomotor) should be spelled out and assessment methods and teaching strategies pointed out.
- **Student Academic Counseling and Support:** The third part of the course information may be on student academic counseling and support where the institutional requirements for availability of instructors for individual student consultations and academic advice are stated (the amount of time instructors are expected to be available each week to support students).
- **Learning Resources:** The last part of the course information may include the list of required and recommended textbooks for the course, reference materials, electronic materials (such as websites, supplemental readings, etc.) as well as the facilities that are required for the successful execution of the course.

There should also be a section which shows how the course will be evaluated and what the improvement processes are. The evaluation process depends on what individual institutions follow, for example, peer observation/evaluation, departmental surveys, etc. Whatever method is followed, there should be a clearly stated plan for improvement of the course based on the results of the evaluation.

Course Syllabus

The syllabus is an academic document that communicates course information and defines expectations and responsibilities (Storey 2007). It is descriptive (unlike the prescriptive or specific curriculum) and ensures that students have easy access to the course syllabus by either handing out hard copies on the first day of class or by posting a digital copy on the institutional website.

The course syllabus should contain the following minimum information: course title, time, required texts and other materials; course topics; major assignments and exams; course policies on grading, academic integrity, attendance rules and contact information of the instructor. The structure of the syllabus should consist of at least the following topics.

Course Profile

1. **General Course Information:** Title, time, course code and number, instructor's contact, etc.
2. Course Description
3. Course Objectives
4. Course Learning Outcomes
5. Course Contents (Topics to be covered)

Course Guidance

6. Teaching Methodology
7. Assessment Tools
8. General Rules
9. Recommended Books, References & Teaching Materials

Course Plan and Aligning Student Learning Outcomes With Assessment

The Course Plan provides details instructional guidelines for plan units of teaching, select materials, and learning activities, set up working groups, arrange the teaching-learning environment and seek to move students forward towards learning outcomes.

- **Define Course Goals:** The purpose is to determine what the students are to learn and accomplish. The goals should specify the content, cognitive development, and personal development.
- **Theoretical Background:** Establish sequence in order of succession, the content materials have to be organized to show what should be the sequence of topic/units. Ensure cumulative learning by reinforcement and integration of materials. In selecting an approach, consider the preferences of other instructors, while providing variety in the mode of learning (Ilarde 2014). With respect to the course material selection, select the main topics and arrange them is a sequence and where possible use the latest textbooks or the current literature. At the same time, use the desired content to refine the course goals.
- **Alignment of Student Learning Outcomes with Assessment:** An important curricula document that guide instructors on assessment (both formative and summative) is the alignment of the student-learning outcome to appropriate assessment procedures. For example, in an ESP course, to assess a speaking skill, a role play or simulation may be used with the help of a rubric. It is very important that each learning outcome under the four English language skill including vocabulary is carefully aligned to particular assessment modes.

Draft Curriculum Implementation: Piloting and Survey of Effectiveness

Review how other institutions have piloted new curricula as well as the evaluation of its effectiveness.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Process

1. Draft to be given to all members of the crowd within and external to the institutions for their comments and suggestions.
2. The feedbacks to be used to improve the curricula documents and get them approved by institutional policy-making body. The curricula will then be piloted for at least one semester.
3. After a semester of piloting, conduct a survey to assess the effectiveness of the curricula including opportunities & challenges encountered. Survey data should be collected from the learners and the ESP course instructors.
4. Make adjustment and improvement on the curriculum and get approval for final adoption
5. Review the curricula every three years or as deemed necessary by the policy-making body of the institution at the recommendation of the relevant departments.

5. DIRECTION OF FUTURE RESEARCH

The general worldwide trend in ESP research includes such topics as genre, corpus studies, English as a lingua franca, advanced academic literacies, identity, and ethnographic approaches to researching specific purposes of language use (Paltridge 2015). Of increasing importance are such topics as the need to develop courses that meet learners' needs and how to balance qualitative and quantitative types of research in ESP as well as the growing argument that teachers need to learn more about their learners' imagined communities and how this can be achieved.

In the Middle East, recent ESP research efforts include an investigation in the communicative needs of health professionals by Alharby (2005), a study on the effectiveness of ESP course for business administration by Liton (2012). Other studies related to crowdsourcing include the exploration of the suitability of courses to students' needs and attitudes by Abdalla (2013), the external and internal evaluation of ESP courses, and an evaluation of the effectiveness of using ESP course for PYP students by Al-Fraidan (2012). Also, Younes & Albalawi (2016) investigates the effectiveness of using ESP course for PYP students at Tabuk University from the teachers' perspectives. However, there is still need for research in the application of crowdsourcing in the development of ESP curriculum in the Middle East as well as other regions of the developing world.

With respect to future research direction, Gollin-Kies (2014) propose more studies applying mixed quantitative and qualitative techniques and more of the collaborative and larger scale types that are conducted across institutions as well as across nations and regions thereby encouraging multi-disciplinary approach. This will foster greater collaboration among faculty, students and institutions in ways that can spill over into other academic areas.

In addition to the importance of collaboration between institutions, there is also the need for members of these institutions to continue research engagement in the following areas:

First, studies that seek to identify current issues and future directions in their learners' professional areas

Second, enhance the management and development of research to eliminate, reduce or deflect issues in their learners' disciplines.

Third, researchers should seek to deal with the following Research Questions and/or Research Areas

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

1. Increase the effectiveness and equity or inclusion concerns in their learners so as to ensure a positive impact on the society.
2. Ensure greater efficiency and cost-effectiveness of their research on their students, in ways that have impact on the society.
3. Create the optimal combination of ESP teaching tools so as to enhance goals achievements.

6. CONCLUSION

The key challenge of this chapter demonstrates how crowdsourcing can be used to improve higher education through the design and implementation of collaborative educational programs that integrate the students' needs, culture and background as well as the anticipated future workplace demands. The ideas, experiences and materials from the offline and online digital crowds are used as key resources to design and implement ESP programs by constantly drawing resources from the crowds located across continents.

To strengthen the learner-centered approach, efforts should be on drawing authentic materials from worldwide experiences leaving the participating faculty to initially sieve these materials using local values and judgments. It is in the application and evaluation of the draft curriculum that the learners' understanding and judgments are fully employed and reflected in the final revised document before it is fully implemented as a program that meets learners' culture and background.

ESP is an offspring of globalization that was defined by specific types of economic, business, and political models prevalent in the last few decades, but these models have been affected by the profound structural shifts in the global socio-economic system, which have been triggered by digitalization (BCG 2017). These transformations in the political economy and network technologies are redefining the economic, business, and political models of the old largely non-digital globalization system, thereby creating quite a different paradigm. It is therefore very important for the institutions to be aware of this changing direction and the needs of paradigms, without this fundamental understanding, a mere review and replacing curriculum is like putting new wine in an old bottle! [or like watering a desert plant with a sieve]!

KEY TERMS AND DEFINITIONS

Collaboration: Cooperate and work with other people to produce teaching materials, for example, a curriculum and teaching resources.

Crowdsourcing: Individuals with diverse opinions or contributions relevant to a subject who are able to make a contribution both online and offline.

Curriculum: An educational program of study outlining course information, goals, objectives, plan, and assessment procedures.

Developing Countries: Countries that have relatively low GDP (gross domestic product), low level of health facilities, lower standard of living and life expectancy.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

English for Specific Purpose: A learner-centered approach to teaching the English language which focuses on developing communicative ability in a specific discipline such as business, IT, health sciences, and engineering.

Globalization: The interaction of people across the world through the flow of money, ideas, and culture.

Higher Education: An education which is attained at a post-secondary institution with experience in research, teaching, and community service relevant to the English language.

Middle East: A geographical and cultural region located between Asia and Europe consisting of the Gulf States, Iraq, Iran, Jordan, etc.

Chapter 26
Business-Oriented Analytics With Social Network of Things

Pawan Kumar
Government of India, India

Adwitiya Sinha
Jaypee Institute of Information Technology, India

ABSTRACT

In the modern era of technological advancements, internet of things (IoT) and social network of things (SNoT) have gained vitality with the extensive application of sensors for accumulation of socially relevant data. A colossal amount of social data collected becomes unfeasible to process and deliver with progress in time and domain. Therefore, a major problem lies in analysis, interpretation, and understanding of the huge amount of social data. This challenge has been greatly leveraged by context-aware computing, which permits storing context information so that meaningful analysis of data can be achieved. Also, the importance of context-aware social networking and network diffusion is elaborated with the aim to develop effective solutions to issues in this domain. The main concept here is people around a person share common experiences with that person, which in turn can be made interactive, thereby leading to collective and quick resolving of problems. Social network of things is closely coupled with context awareness to make interpretation of big data easier and compatible to recent trends.

1. INTRODUCTION

Social media and networking provides a platform for sharing content, opinions and views for interaction and building influential communities. The chapter is organized into four sub-sections to deal with several research oriented challenges and recent trends. The chapter would begin with a complete systematically introduction of fundamental concepts of social networking, business applications & analytics, social network of things. This is followed by explanation of tools, statistics and services of social networking with business perspective. In next section various categories of context is discussed along with their individual relevance. The basic definitions of context and context-enabled features are detailed. Later characteristics of context aware systems would be considered with deeper insight of context aware systems which further will lead to various usages of such systems in various fields.

1.1. Social Networking

Social network portals are gaining popularity via vast usage of mobile internet in present day scenario. It offers a massive ground for exchange of multimedia, entertainment, news, opinion, communication, microblogging, media sharing, bookmarking etc. Some of the major social network sites include, MySpace, Facebook, Hi5, Bebo, Friendster, LinkedIn, StudiVZ, Xing, YouTube, Imeem, Twitter, Digg, StumbleUpon, Delicious, Scribd, Flickr, SecondLife etc. are used for various applications such as photo, audio, video, virtual worlds, online gaming, social news, blog etc. for creating public or semi-public profile for social media users.

Information present on social network include contact, location, associations, personal information, work history, preferences, friendship etc. Social media promote brand or product to the potential customers and connects an individual with their friends. Advertisement in the social media connect consumer and company to share information about their products in community group who share same interest or ideas. The online advertisement in social media attracts mostly the younger population (Normally age between 18 to 30 years). The electronic messages generate more interest about a product due to internet rather than exposure to information provided by marketers.

Due to the popularity of online social network sites, people communicate with each other for communication, create and share content, give and receive recommendations. Social media changed the existing communication method. A social network is a social structure between actors, people, groups, organizations, information or knowledge processing entities through some links that shows relationship among them. The primary purpose of social network is for communication and exchange of ideas or interest among peer groups or communities.

Social network consists of a graph $G = \left(V, E\right)$ in which vertices represent node or individual and edges represent social link or relationship between them. The graph made by the social network is represented by adjacency list or matrix internally having binary values. If there is a relationship between two nodes, value is one otherwise it is zero. Social network analysis focuses on the relationship between people and groups of people. Social network analysis combines mathematical models with organizational theories to help the organizations and groups dynamics in which patterns can be discovered from which valuable conclusions can be drawn.

A social network consist individuals or organizations connected by kinship, friendship, beliefs, common interests, financial exchange and many other relationships. Inter network relationship of individuals in the social group access more knowledge or information rather than intra network relationship. These sub network are also connected by some type of relationship and acts as a connecting node or bridge. Social network provides a platform for the users to share and use information in all fields due to revolution in the digital world. With the increasing numbers of social network user, a large volume of dynamic raw data (structured, semi-structured and unstructured) is generated, which is parsed and interpreted to get reports and results with the help of several data mining tools. Social network analysis provides a media for knowledge sharing and helps in determining various results such as how the information flows with in nodes in an interconnected network, finding important or higher degree nodes, information popularity and other network metrics. Business intelligence tools analyse huge amount of data for getting patterns, recommendation, predicting future trends and forecasting possible opportunities from social media data that helps in decision making for business organizations to get better results and profit. It also provides

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

possibility for a node or an individual to join a certain group or a particular community in near future (Vibhav et al, 2015).

Social networking sites are now used for building and managing relationship, communication and online opinions/blogs for extracting more information and knowing more about their business. Social network and business analysis is a large multidisciplinary area of study which is evolving very fast. The number of social network users increased exponentially in last few years. Facebook and MySpace are most commonly used social network site. Younger respondents spend more time than older respondents. Reuniting with old friends, maintaining long distance friendship, and sharing photos are greatly simplified by social network sites.

Social media changed business process, politics, entertainment and other areas to a great extent. Most of the internet users prefer to connect with brands via social media ("Nielsen Social Media Report", 2012).

Social media spread message or information in very less time in the entire network to their users. Social media has become popular in last few years. Now a days organizations use online social media for brand awareness and marketing to find out the potential customers. Social network analysis has various applications such as finding potential customers and promotional scheme based on their past purchase history, identifying loyal customers who are vocal, active and passionate. They can be characterized as brand ambassadors, identifying central Connectors, determining the likelihood and impact of activity, detecting patterns, establishing linkage between individuals.

1.2. Business Application

The use of social networking services has become popular and integral part of daily communication in the world. Social media acts as a viral marketing of the new information with the help of new users, direct/indirect friends and interested group. People create community or network with unknown/known users in the social network all over the world. The content posted on social network include uploading photos, audios and videos, install application, messaging friends, writing a blog, dating, promoting a brand, currently occurring events, posting status message and comment, joining several groups that belong to same interest. The number of users on social network is location dependent. Percentage of active users on social networking site vary from country to country.

Social network sites provide real time behavioural data. The data from social network sites can be collected through the use of tools or directly from the company data warehouse or repository. Social media can be used for internal communication as well as for existing and potential customer interactions. Social media is growing rapidly with web and mobile based technologies.

Social media is used in several fields like as increasing brand awareness, product promotion and development, knowledge sharing and feedback mechanism. By the use of social media, companies perform better in creating brand awareness and image. Social media helps in determining marketing strategy. With the creation of profile, page and group social media provides a way for users to connect with others virtually. Individual share information about themselves and identify others in the network. Online social media provides collaboration and communication, instant informal commenting and feedback.

Social media has impact on brand recognition and business revenue. Users can freely create content and transmit information irrespective of its location instantly to a large population in online social media. Twitter is a micro-blogging site allow users to share news, information or thoughts with other user (followers) with 140 characters or less known as tweets within their network. Twitter share information

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

or news faster to a large audience online. In LinkedIn, company or business organization access user information through their profile data for advertisement and reaching towards their members. All group members write at least one tweet message for solving problem for teaching and learning purpose. Social media acts as an extension for marketing strategy.

The business organizations increase awareness about their product by engaging customers on the social media and forms virtual communities. Global as well as local companies are adopting online advertisement, campaign and marketing using online social network sites rapidly. Organizations generally use social media data to understand customer behaviour and their needs with respect to the organization current and future services or products. The combination of network and text mining reveals new insights into customer behaviour in social media which is not possible by using any one of these techniques alone.

1.3. Business Analytics

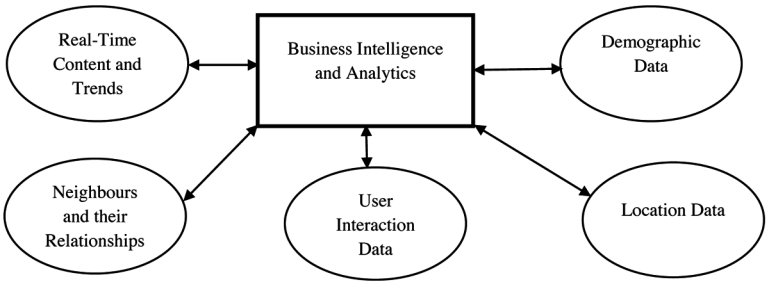
The main objective of business analytics is to explore data for generating knowledge, understanding and learning support for decision making and performance management. It focus on discovery, interpretation and communication of meaningful pattern in data. Decision making in business today, replace the traditional process of performing action first then examining working of process. Now a days, business organizations first understand the process and make intelligent business decisions. Historical data can be used to predict the happening of an event in future.

Individuals with prior knowledge and experience make decision by collecting, integrating and analysing data. Decision making is dynamic, contextual and personal/group activity. Artificial intelligence and machine learning technology reduce the effort to search patterns, identify relationships and patterns from historical data to influence performance in the business environment. A large amount of data is available on the social media, the main task is to find out the usable information and pattern.

Business analytics use data mining and prediction techniques for gathering, storing and analysing data to make better and strategic decisions, likelihood of an event occurrence, identify relationships and patterns, what is happening today and what will happen in future. Analytic tools and techniques include statistical, quantitative and mathematical models, finding information, decision making and visualization methods for improving business operations (Evans, 2013). Data collected from different sources for business intelligence and analytics is described by figure 1.

Data mining tools extract hidden and predictive information from large database. Data is collected from facts and figures as a collection of files. Several metrics are used to quantify the performance (Evans, 2013). Business analytics software include tools and applications for tracking, storing, visualizing,

Figure 1. Data Source for Business Analytics and Intelligence



EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

analysing, and modelling data for decision making process. Business analytics process improve business performance and determine strategies to achieve competitive advantages in sales, pricing, coupons and advertisement. Business intelligence users find out followers, todays trend, ideas and feelings of a people so that information provide business value.

Combining business intelligence and social media together helps in attracting target audience and cost reduction to the business firms via online advertisement and campaigns. Business intelligence system analysed real time data from social media. Various tools fetch data from online social media in easy and readable formats on the basis of certain input parameters. Business intelligence software retrieve, analyse, transform and report data. The process of analysing social network business data is described as:

- Data collection and processing
- Data modelling and information retrieval
- Analysis and prediction

Social media have various types of services and communications simultaneously taking place throughout the cyberspace. Social media attains new customers rapidly that has been previously a tough task. It creates a series of links for connecting customers to the companies or organizations. Social media analytics analyse comments and data related to product or brand to find out opinions, targeted followers and audience. Social media provides a platform for interlinking social internet with business process for the current and potential customers knowing their requirements, interest, problems and feedback.

Natural language processing algorithms based on social network analysis, data mining techniques and sentiment analysis filters the data on the basis of blogs. Influencing individuals for brand reputation and voice of targeted customer helps in deriving critical decisions to the business. Web community focuses on the real-time sentiments and opinions of a new product advertisement or campaign via messages or video sharing while they are released/launched across the globe. Business analytics software automates business process for an organizations to monitor, capture and analyse the huge amounts of data and optimize the process of strategic and tactical decision. Business analytics is used in several fields like as in managing customer relationships, financial and marketing activity, supply chain management, human resource planning, decision making in pricing etc. Business analytics is associated with profit, shareholders returns, understanding of data, competitiveness with other business firms, generating information reports. Business analytics use descriptive, predictive and prescriptive analytics methods to understand present and past data, analyzing past performance and optimization method.

Social business analytics access unstructured text data from social media communities, blogs, forums, online comments to analyse and integrating it to their organization data to deliver better results, profit and decision making process. Sentiment analysis optimize marketing campaigns, building customer and employee relationships, product services from social communities very fast. Social media and predictive analytics tools give better results in business from sales, development of product, marketing and financial operations. Most department stores clear their seasonal stock by reducing price and discount on the basis of historical data to maximize sale and profit. They change the scheme and discount offer time to time, it is decided by analyzing the previous data. Social business analytics provides opinions, preferences, new opportunities, hidden patterns and trends in the social media. Social business analytics transform business processes in several areas such as:

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

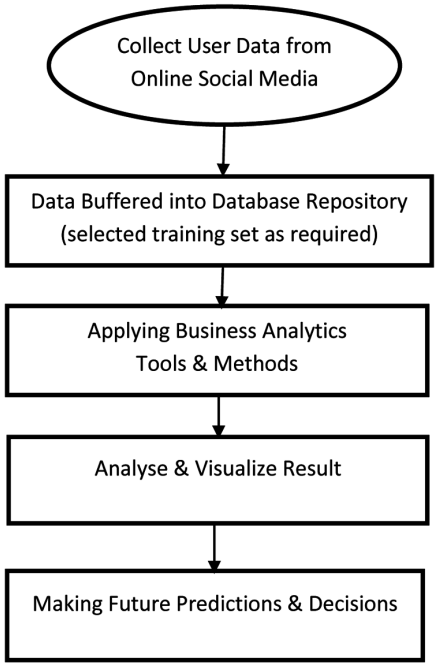
- **Marketing:** Social media provide information about campaigns details for future plans by Integrating and implementing end to end social media strategy.
- **Sales:** Social media develop promotional offers and discount to increase sale on the basis of user data.
- **Product Management:** Find out new consumers and their choice in the market.
- **Customer Service:** Helps in identifying real customer issues and resolving them before they become major problem to business.
- **Human Resources:** Identify potential customers and thoughts of people about company and product.

User data from different online social media is collected to analyse social conversation to build a model for prediction and recommendation. Self-social media network is created for collaboration and sharing important business information to the users. Business Analytics process is described by the figure 2.

1.4. Impact of Social Network on Business Application

Social media analytics provide various types of information such as sales marketing, customer and public relations, product development, effectiveness of promotional campaigns, customer needs, preferences, feedback and market trend data (Ruhi, 2014). Social media is a web based technology mechanism that transmit information to a large number of users quickly. It increase the number of people who visit the company website by mentioning the uniform resource locator (URL) in the social media web page. In other words, online social media directly connect customers with the business organizations.

Figure 2. Business Analytics Process



EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Social media reduce the budget to search and reveal target audience for online shopping etc. Now a days, business organization update product information through social media so that it is directly visible to their followers or users. Informal communication in the viral marketing promotes product, services and brands among social media users. The information propagation depends on the manners and user interaction and the type of relationship they share in the social graph. Diffusion mechanism increase the adoption rate of product or service. People often tend to use online social media for collaboration, communication and sharing information rapidly. Advertisements in social media about newly launched products easily attracts a large number of users or customers. Social media generates higher revenues, assisted with online feedback for better customer retention.

Social media network in the business perspective helps to find out answers for several queries such as which sections/regions are targeted for acquisition and growth, Who influences brand or product, emerging business related topics or themes, brand perception among users, brand comparison against rivals, knowing best social media channels for discussion/advertisement/ promotion. Social networking sites such as Facebook creating data centers around the globe to collect and process business related data of their users which can be used to assist in decision making particularly in marketing and brand management (Ruhi, 2014). It helps in identifying potential customers and new market prediction and forecasting outcome helps in growth opportunities of business to their customers. Social network affect business application in several areas, including:

- **Consumer Trends and Opinions:** Several API are used to aggregate and collect comments from online communities to find out keywords for gaining information about frequently purchased items on the basis of past or historical data.
- **Ratings:** On the basis of numerical value of product rating, this information is used for sentiment analysis purpose.
- **Desires for Improvements:** Reviews and comments about a particular product helps in improvements to be taken further. It provides a real evaluation of a product given by the interested groups of people.
- **Location and Density of Communities:** By knowing mass users and their geographical location helps companies to identify the areas where a product is to be launched first for their product popularity in short time period.
- **Degree of Involvement in the Product:** Consumer behaviour can be find out from small and detailed review feedback information given by the targeted consumers.

1.5. Social Network of Things

Social media data present on communities, blogs, forums and comments on social network sites provide business value to a great extent. By knowing the reviews about product or services from customers or employees, effective decision and action are taken for competitive advantage. Social business analytic tools fetch, measure and analyse social media and provide solution for the experts for taking decision. The higher correlation to customer, brand awareness, increase in sales and revenue find out the factors which attract public attention.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

1.6. Social Media Networking and Services

Social media is a tool for advertising, marketing, creating brand awareness, to find out new customers, innovation, customer service, problem resolution in the business to attract and engage their customers, employees and other stakeholders. There are several benefits and application of social networking services usage such as formal and informal education, learning, innovation, self-identity, building relationships, communities and participation.

1.6.1 Advantages

Various advantages associated with social media in context of business usage and applications, are enlisted as:

- **Feedback Analysis:** Business organizations get fair feedback to improve the quality of product from people across the globe.
- **Marketing:** Social media has become hub for marketing and branding product services with mobile and internet technology. All E-Commerce sites use this method for product advertisements and sale.
- **Connection With Customers:** Several E-Commerce and business firm created their own forum or web space for directly connecting customers or users providing latest offers and product information. A lot of customers have a registered account on their sites. Their feedback and review increase the popularity of product in the media.
- **Reduction in Overall Marketing Expenses:** Most of the social network sites are free, we can post create page or profile of our product on social network site so that it enables to identify peer groups or influencers in the network. Social media can capture target market segment through network effect in very less time with cheaper cost as compare to traditional advertising methods for a small business firms.
- **Professional Networking:** LinkedIn interconnects professionals throughout the world and acts as a job portal. Social media has become an important tool for recruiting top talent employee for desired profile. Professional people used online social network sites to increase their visibility, profile seen by others, telling about their company services and getting more clients etc.
- **Entertainment:** Individual joins a social network to get connected with his friends irrespective of geographical or cultural barriers.
- **Polls:** Opinions and polls help in decision making having for diverse topics.
- **Knowledge Pool:** Experts collect data based on their customer experience and feedback.
- **Education:** Educational institutes have existence on social networking sites mainly aiming at academics, extra-curricular activities, achievements, highlights etc.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

1.6.2. Disadvantages

Certain disadvantage of social media networking are in perspective of security and false personification, are detailed as following:

- **Security:** There are still some chances of committing online crimes or fraud activities using personal information of user present on the social media. Only the authorised or valid user can access the information and various security level should be implemented to stop hacking.
- **Online Harassment and Stalking:** On social networking sites, Personal information of user is easily available. There is a risk of misuse of information, posting humours, photo downloading and morphing.
- **Fake Identity:** Some people make their online profiles with fake information for making real users fool. It is not easy to determine whether the profile of any person is real or not, if you do not know personally.
- **Addiction:** People physically interact in the community but in online social media it is virtual and having addiction of using these sites.

2. SOCIAL NETWORK TOOLS IN BUSINESS PERSPECTIVE

Social network analysis tools used to identify, analyse, visualize and represent individuals and their relationships from various types of input data. Individuals are represented by nodes or vertices and their relationship is shown by links or edges in the social network graph (Kumar et al, 2016) Output data is further analysed and can be saved in external files.

2.1. Business Analytical Tools

Analysis tools explores network of small size to very large network such as family, team, disease transmission, internet, web link etc. These tools include mathematical and statistical methods to analyse the social network graph (Kosorukoff, 2011). Social network analysis, in business perspective, support various activities such as customer interaction, information analysis, marketing and business intelligence requirements.

2.1.1. NetMiner

NetMiner mainly used for visualization and analysis of large social network data to discover pattern and structure. It can be used for research and teaching social networks. Python programming script language used for transformation, analysis, statistics, and visualization of network (Kosorukoff, 2011). NetMiner data file format is .NMF. It Import/export data in various file formats such as .txt, .csv, .xls, .xlsx, .ntf, .dl, .da, .net, .vec, .clu, .per, .dat, etc.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

2.1.2. iPoint

iPoint aggregate news and topics with sentiment and demographics, monitor and analyse social media data from all levels. Analysed data can be viewed and managed from worldwide, state and local neighbourhood level.

2.1.3. Inflow

Network data can be entered from CSV files, different databases, spreadsheets, automated survey tools etc. and calculate various network metrics. InFlow attracts many business users due to its simplicity.

2.1.4. KeyHubs

Keyhubs is a simple online tool for informal networks, permitting business managers for mapping interactions in a business organization.

2.2. Network Visualization Tools

Network visualization offers an integrated interface with rich graphics to display results from experimental analysis in a more meaningful and interpretative way (Kosorukoff, 2011).

2.2.1. Sentinel Visualizer

Sentinel Visualizer is a Comprehensive network analysis and visualization tool that generates dynamic link chart, timeline and geospatial view for temporal analysis and individual relationship in social network. It has a multi-user knowledge base for storing analysed data efficiently.

2.2.2. NodeXL

NodeXL is an open source network analysis and visualization tool for Microsoft Excel. It imports data from various online social media such as Facebook, Twitter, Flickr, web hyperlinks, YouTube, Microsoft Exchange Server, Google+ etc. via application programming interface to collect, analyze and visualize network data (Kosorukoff, 2011). NodeXL contains library of network metrics parameters such as centrality, clustering coefficient, diameter, average path length, giant component etc. for both directed and undirected network (Kumar et al, 2016). Different community detection algorithms are applied to find out clusters in the social network. The network graph contains edge lists or adjacency matrices representation in various file formats. NodeXL also imports UCINet, GraphML files, Excel spreadsheets etc. data.

2.2.3. KXEN Social Network (KSN)

KXEN social network analysis extract, integrate and exploit social network attributes from database storage. It has several important features such as classification, regression, segmentation, time series, product recommendation, prediction, finding group of individuals with similar behaviour and pattern.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

2.2.4. ORA

ORA is an assessment and analysis tool for dynamic meta network consist of hundreds of social networks. It finds out dynamic network and trail metrics, cluster nodes, local pattern and change detection techniques from dynamic meta network. It examines how network changes with time. ORA can handle multimode, multiplex and multilevel networks and identify main influencing players and groups (Kosorukoff, 2011)

2.2.5. Sonamine

Sonamine is a scalable network and analyse millions of nodes and billions of edges. It is used for improving data mining prediction method for marketing. It retrieves the functioning of neighbouring nodes of the current user in a very less time period, improves social advertisement through clicks and speed up initial user adoption in the social network.

2.3. Social Media Analytical Tools

The social media analytics tools assess volume, sentiment and trends from online social media sources across the globe.

2.3.1. IBM Social Media Analytics Tool

IBM analytics contains users search items, feedback about product, brand, services, employee, partners, etc. data for a certain time period. Analytic results in charts and dashboards are easy to understand for a business organization. Information obtained from these tools can be used for marketing campaigns, enhancing reputation and market share, improving customer service and experience, product development, resolve problems, new opportunities etc.

2.3.2. IBM SPSS Predictive Analytics

Data from social media interactions is analysed for customer behaviour to attract new customers and boosting marketing campaigns. Social media and predictive abilities build advertisement and campaigns to a particular customer group through right channel delivering and accepting the offer at the right time. It predicts user desires and expectations in the future about a product.

2.3.3. IBM Cognos Business Intelligence

It provides dashboard, scorecard and report analysis, planning and accounting abilities on social media for achieving better business output in present and future time for an organization. All relevant stakeholders know what is happening on social media for decision making and customer satisfaction.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

2.3.4. IBM Connections

IBM Connections build co-operative social networks, share business process and respond to evolving opportunities from professional networks and communities with various applications. It connects organization and customers to provide exact business outcome. It reduces the guesswork in finding trends and decision making in the business process.

2.3.5. SAS

SAS is a statistical analysis tool for business intelligence, predictive analytics, data management and multivariate analysis for mining, altering, managing, retrieving data from a variety of sources (web, social media) to find out customer, predict their behaviour, manage and optimize communication.

2.3.6. Microstrategy

Microstrategy is a business intelligence tool for query, generating report, dashboard and scorecard to make decision.

2.4. Network Statistics

Network parameters are calculated from graph build by social network data set. Higher degree or central nodes (Hub Nodes) are important in social network analysis for diffusing information at a fast rate (Kumar et al, 2016). On deleting these nodes from graph, various sub graphs are generated (Kosorukoff, 2011) Let $l\left(i,j\right)$ is the shortest path from node $i to j$. Let the total number of nodes in a graph is N. Network metric parameters for a graph $G=\left(V,E\right)$ are defined below, where V and E represent nodes and edges respectively.

2.4.1. Diameter

The maximum distance between any two nodes in a graph.

$$Diameter = Maximum\, l\left(i,j\right) \tag{1}$$

2.4.2. Average Path Length

Average path length for a network graph is calculated as:

$$Average\, Path\, Length = \frac{\sum_{i\geq j} l\left(i,j\right)}{N\left(N-1\right)/2} \tag{2}$$

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

2.4.3. Centrality Measure

It defines the relative importance of a node in the network. It indicates how well they connect the network and to what extent they are central (Kosorukoff, 2011) Centrality is classified into degree, betweenness and closeness centrality.

2.4.4. Degree Centrality

Total number of nodes directly connected to a node is defined as degree centrality. In-degree and out-degree is defined for a directed graph. For an undirected graph, an edge acts as both in-degree and out-degree. For node i, degree centrality can be expressed as:

$$C_{D}\left(i\right)=\frac{Degree\left(i\right)}{N-1} \tag{3}$$

2.4.5. Closeness Centrality

It measures the degree to which a node is close to all other nodes in the network graph. For a node i, closeness centrality is defines as:

$$C_{C}\left(i\right)=\frac{N-1}{\sum_{i\neq j} l\left(i,j\right)} \tag{4}$$

2.4.6. Betweenness Centrality

It analyses the extent to which a node lies among rest of the nodes in the network graph. It determines importance of a node connectivity in the network structure. If the node is eradicated, it divide the network into sub networks. Let $P\left(i,j\right)$ is the total shortest paths that exist between node i and j; and $P_{k}\left(i,j\right)$ is the total shortest paths that exist between node i and j, including node k. Betweenness centrality is calculated as:

$$B_{k}\left(i,j\right)=\sum_{i\neq j,k\notin\left\{i,j\right\}}\frac{\frac{P_{k}\left(i,j\right)}{P\left(i,j\right)}}{\frac{\left(N-1\right)\left(N-2\right)}{2}} \tag{5}$$

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

2.4.7. Clustering Coefficient

It measures how neighbours of a node are linked to each other. Higher value of clustering coefficient represents well connected group. The value of clustering coefficient exist between 0 to 1. Clustering coefficient is defined as:

$$Cl\left(G\right) = \frac{3 \ ^{*}No.of\,triangles\,in\,the\,network}{No.of\,connected\,triples\,of\,nodes} \tag{6}$$

2.4.8. Density

It is the ratio of total number of edges present in network to number of edges for a complete graph.

$$Density = \frac{No.\ of\,edges\,present\,in\,the\,network\,graph}{N\left(N-1\right)/2} \tag{7}$$

2.4.9. Bridge

An edge which connects two or more different networks. Its end point lies in different components of graph.

3. CONTEXT AWARENESS AND SOCIAL NETWORK OF THINGS

Context awareness is evolved from various application ranging from web and desktop application, mobile and pervasive computing to Internet of things (IOT) in last few years (Perera et al, 2014). The communication and interaction among users regarding various products and objects enables several applications in various smart domains to operate as Internet of things. With the increasing popularity of Internet and social media, colossal amount of data is generated from users' activities from social networking sites. User identity is identified by social network profile. In Internet of things, data collected from a large number of intelligent sensors is analysed and interpreted with the impact of context-awareness. The sensors and handheld electronic devices communicate to each other via internet without requiring too much human involvement at any instant of time and independent of their location. Various types of sensors (homogenous or heterogeneous) are interconnected to perform cross-disciplinary functionalities. Data from various sensor nodes is collected by the sink node and further it is transmitted to computational devices. Context is used for fusing sensor data to get novel information and knowledge with reference to situational awareness that surrounds the region of interest. Middleware technology is used to impart context awareness to Internet of things.

Worldwide interconnection of object such as sensors, actuators, RFIDs (Radio Frequency Identification) and smart applications forms the internet of informative resources (Perera eta l, 2014). Data collected from social media is analysed by various contextual reasoning and decision models such as decision tree, naive bayes classifier, hidden markov model, regression analysis, support vector machine,

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

k-nearest neighbours algorithm, neural network, fuzzy logic, supervised and unsupervised learning. Pre-processing methods are further applied to remove ambiguous and interpolate missing values.

The context information collected from various online social network sites aligned with context information collected by mobile and network-enabled devices, enhances applications for prediction, recommendation and personal assistance. These applications use location data, user preference and schedules, likes/dislikes and other information to apply the contextual essence.

3.1. Context

Context is an information which is used to describe the state of an entity for interaction between user and application. An entity can be person, place, software and application services, objects or any handheld electronic devices which significantly enable for interaction between user and application. Context information gets generated by processing the raw data gathered from group of intelligent sensors deployed in the region of interest (Perera eta l, 2014). The context types are described below:

- **Primary Context:** Information generated without using sensor data fusion method and existing context.
- **Secondary Context:** Information is computed from primary context and data retrieval operations.

3.2. Context-Aware Systems

Context-aware system uses context information to provide appropriate service and information to users on the basis of application specific task. These systems have presentation, execution and tagging features. The context information is presented to user on the basis of location and time. Some actions are taken dynamically on an automated basis with contextual information. Context data is tagged with multiple sensor data for processing (Perera et al, 2014b). Various charts, graphs and other visualization methods are used to present information in desired form.

Context awareness is classified into three levels including, personalisation, active and passive, depending user interactivity. Context lifecycle is divided into four phases that involves acquisition, modelling, reasoning and diffusion of context. The context awareness communication and computing play an important role in ubiquitous computing and Internet of things (IoT) systems, thereby creating an intelligent interaction (Perera et al, 2014). People and things are now connected with anything from anywhere at any time by the Internet of things (IoT) systems.

3.3. Applications Coupled With Context-Awareness

Normally in sensor-based applications, several sensor nodes are deployed in bulk around a certain geographical area to monitor and capture the description of environmental situation. The captured sensor data is further processed and fused to generate information that could be eventually used for decision making purposes (Perera et al, 2014) There exists certain intelligent sensor devices (for instance - Nest thermostat) that has ability to understand user behaviour and preferences over a particular time and control temperature efficiently. This can enable real-time remote monitoring of patients, thereby making eHealth intelligence a reality. All smart applications tend to make use of contextual data such as location, time and other surrounding detail to build an intelligent system. These systems are capable of

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

processing real-time data and approach with dynamic solution. Voice triggered IoT solutions can answer common questions by processing natural language and semantic technology. Users can easily interact with IoT based solutions through voice, gesture and touch screen method. Mostly, the centralized hubs are managed and controlled by smart phone, tablet and computers. The intermediate nodes exist between sensors/actuators and centralized node that assists in coordinating the operation intelligence.

Generally, IoT solutions are categorized into smart wearable, smart home, smart city, smart environment and smart enterprise. These IoT systems use information and communication technology to provide smart services. In smart home environment user can switch on their appliances apart from home. In the supply chain management system, SenseAware use context information such as location, temperature, humidity, pressure and other parameters for processing. Another such IoT based application is Mimo, a baby monitoring product that notifies parents about abnormal health conditions (Perera et al, 2014).

Internet of things is used in various applicable areas widely spanning over waste management, parking slot management, street lighting, fire safety, indoor localization, manufacturing process management, concrete structure, health monitoring, environmental monitoring, air quality monitor, smart farming, smart river management, weather monitor, smart home, smart cities, smart water, security automation systems etc.

3.4. Social Network of Things in Contextual Business Network

Social network is considered to be perhaps the richest source of variety of user information, including location coordinates, personal identity, addresses, preferences and user neighbourhood statistics. Online users interact with each other through social structure formed owing to capabilities and extensibilities of electronic gadgets, thereby forming social network of things. Owing to tremendous development in sensor & digital domain, the electronic devices are well-equipped with networking, computational, sensing and buffer capabilities.

A global network of interconnected objects represents an intelligent end to end system based on communication protocol stack. Social Internet of things add an essence of sociality and smartness to the manner electronic devices interact without intervention of humans. The network relationship and interactions among the electronic objects is similar as per social network services. The real-time requests for an event are made to extract facts from social profiles of the users with application of several natural language processing techniques. By analysing the user profile, an application send notification to mobile device having relevant services and objects, for further processing on contextual basis.

With the rapid development in networking infrastructure, systems can access application and services on demand anytime from anywhere, pervasively. The contextual information of an individual at a particular time is collected from heterogeneous data such as personal, applications, devices, entities and other networking components. On occurrence of a particular scenario, the aggregated outcome is published to social media and an event is triggered to a nearby location area in social Internet of things (SIoT). Certain components of the contextual information can be static as well as dynamic in nature (Moore et al, 2013).

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

4. DIFFUSION AND INFLUENCE IN BUSINESS

The diffusion of information, ideas, virus, disease, innovation, influence and cascading behaviour exist in social and information networks (Gomez-Rodriguez et al, 2010). Diffusion model mainly includes threshold, cascading and epidemic model. In threshold-based models, an individual who diffuse information or transmit it to their neighbours depends on the threshold value. Threshold value is chosen as per network structure and connections. In the cascading model, the nodes who already adopt the information or idea (activated node), influence or activate other nodes which are currently in inactive state (nodes which have no information) that are directly connected to them. This process stops when all nodes participate for active state in the network. Cascading process initially start from some source nodes on the basis of degree centrality or distance value. The tendency of a node to become active increases as most of its neighbour node are in active state (Kempe et al, 2003). A node becomes inactive to active state but active to inactive transition is not allowed. In the business perspective point of view, the brand promotion or advertisement will go in a single direction progressively.

An epidemic model describes propagation of infectious disease in a community network. In epidemic model, there are susceptible, infected and recovered state. The disease spreads in the community through some agents like as fungi, bacteria, virus etc. when a people comes in contact of a person which is infected, then there are chances of people which are connected to the infected one to become infectious. It will depend on immunity power of a person. Information like as news, rumours and innovation ideas in the social media network follows epidemic model for transmission of information from one node to other through some relationship between them. The spread of virus or malware in computer network also follows epidemic model. The network metrics parameter value affect the rate of information diffusion. Consumers adopt the behaviour of an early adopter if they are closely related or distance between them is less. Lesser distance nodes will diffuse information first and they will forward the information to their connected neighbours. A social network is an interaction graph of individuals that plays a major role in diffusion of information, idea and influence in the network.

Influence Maximization choose most potential individuals to diffuse information so that maximum number of users adopt the product, news or information in the network (Huiyuan et al, 2014) In the last few years, exponential increase in users of online social network site (Facebook, Twitter, GooglePlus etc.) provide a best platform for information diffusion and exchanging information (Huiyuan et al, 2014). Influence maximization in information diffusion process will depends on the seed set (initially chosen) nodes. Viral marketing, recommendation system and information diffusion process can be seen in many forms on online social network and follow social influence phenomena. The adoption of new ideas, technology and information is affected by the decision of their friends, colleagues, neighbours and word of mouth phenomena.

The network structure and information content jointly affect the path of diffusion process in the network. It predicts how rapidly an individual is aware about news or information will depends on strength and ties of communication media. Initially the diffusion process is fast and after some time it will become constant (follow S shape pattern). Information spread between individuals via behaviour, word of mouth effect, marketing, innovations and social groups in the industrial organisation. Different types of information diffuse in a different manner. The user creates and share information with each other for their mutual understanding. Spread of information is dependent on the degree or connection of an individual to others in the network. Highly or strongly connected nodes increase the possibility of accepting information as compare to loosely connected nodes.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Higher degree and clustering coefficient value in the network increase the number of adopted population or users to follow their behaviour or information who have already adopted the information, news and product. The network parameters identify influencers and predict the adoption probability of the users that have not adopted till now. A highly connected sub group in the network have a strong influence on its members. Innovation ideas are key factors for business growth. It enhances the competitiveness in the business environment. Without diffusion process, an innovation has no impact on business economy. The parameter that influence the business is the rate of diffusion and it is different for different products, news and information. It is affected by social, political and economic chrematistics. Diffusion predicts the rate and pattern of innovation adoption over time and space. It increases the productivity in the business process.

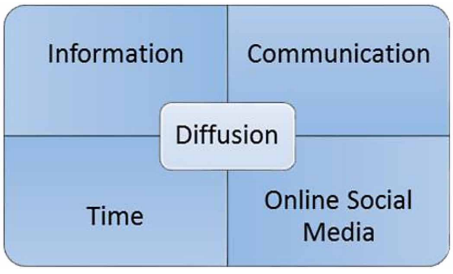
4.1. Diffusion in Social Network

Diffusion in the social network is the spread of information from one place to another. A social network is dynamically changing and continually evolving in nature. Such evolution is attached with the spread of information on top of the network. The network connection affects the diffusion of information. A node can adopt a new behaviour or technology, it will depend on how many neighbours an agent has (Degree), cost, threshold value and communication media. Individuals receive multiple types of information during communication in the social media. Diffusion in social network analysis is applied in many areas such as diffusion of innovations, health care, organizational studies, social media, trend prediction, business and marketing, community detection, content sharing, epidemic model. Innovation is generally considered as a progressive model, making communication a medium for adoption. At each time instant the number of users who adopt the innovation increases.

4.2. Influence of Diffusion in Online Social Media

Diffusion in online social media is a process that explains how, why, and at what rate new ideas, technological events, information or news propagate through certain mediums among individuals for a certain time period is given by figure 3. Information, communication medium, time, social system (media) are important parts of the diffusion process. The information spread from one node to another node through influence of external sources (Myers et al, 2012). The external influence process affects the information adoption process to some extent time to time. External influence increases the brand popularity in the business network.

Figure 3. Elements of Diffusion Process



EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Diffusion of information in online social media is affected by direct or indirect connections and by some external factors such as newspaper, television, radio etc. In the business perspective product popularity is also affected by its features, quality, price etc. and by other sources like as comparison with respect to competitors.

Online social network sites such as MySpace, Facebook influence the customer decision in the business environment and an organisation explores about their marketing strategy. Friends of individual have dense connection with each other i.e. average distance between individual to any other on this planet is six (Six degree of phenomenon). Highly connected members have strong influence on adoption as compared to sparsely connected members in the network.

4.2.1. Viral Marketing

Spread of information and ideas in online social network where individual act as the motivation for the others. It will predict the future popularity based on the early adopter and the connections between them. If we post any news/advertisement on any social media with initially on a central or highest degree node, then how much time it takes to become popular among the social media. Viral marketing is a technique for increasing brand awareness. People choices are also affected by decision of their friends, colleagues and neighbours.

Initially, viral marketing choose small number of influential members to convince other users to adopt new product. Adoption is increased to a great extent by advertisement and recommending product to their friends. Influence maximization problem finds out key individuals for maximizing spread of influence (Huiyuan et al, 2014). Online social networking sites attract mass number of people for influence maximizing in viral marketing strategy (Huiyuan et al, 2014). In viral marketing, people adopt particular behaviour or product without knowing the key influencers for adoption process (Gomez-Rodriquez, 2010). Strong communities in the network have more relevance for word of mouth effect.

4.2.2. Market Basket Analysis

While getting the relevant dataset of opinions or blogs from online social media and applying several preprocessing and mining techniques, we finally get the list of products that are purchased by the customer frequently/most of the times. Normally, there exists certain products, news and some kind or source of information that is highly associated with other one. Such commonness acts as the basis for this analysis so that we get the list of these associated items sorted by their value, rank or popularity.

4.3. Discovering Trends in Business

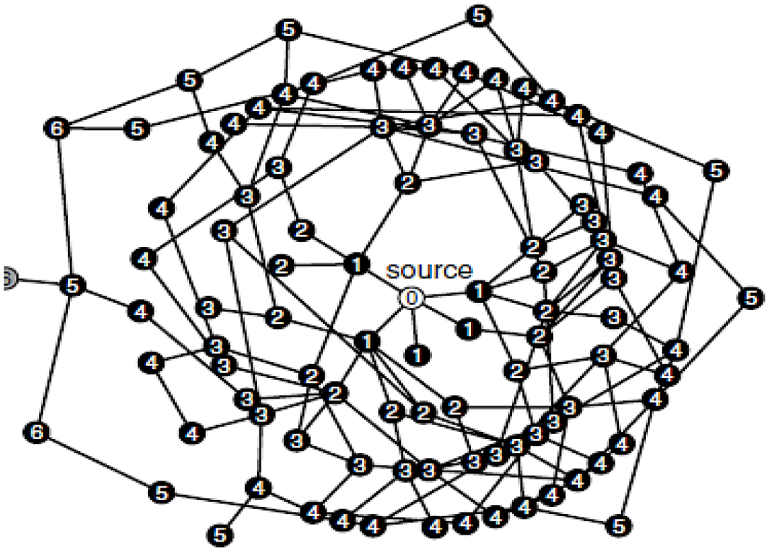
The mass media play an important role in spreading information from one vertex to another. In figure 4, vertex number represents the distance from source vertex and the connection between them.

Mass communication consists of two parts. In the first part, mass media nodes inform and influence initiator nodes. In the second part, initiator nodes influence potential adopters within their communities and so on. The second part of diffusion is important in spreading of information because it sees the high degree network connections. First, less number of people adopt an information/news/product, but after some time it increase exponentially, then it becomes constant (follows S shape pattern).

Some facts related to diffusion are:

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 4. Random Network with 100 Nodes



- Diffusion of information/news/product is fast in dense networks as compared to sparse networks
- Diffusion rate is low in an unconnected network
- Higher degree or central nodes are chosen to adopt innovation initially

Network parameters play important role in information propagation at each time instant. Diffusion model is used in prediction, forecasting in various areas in taking decision. Node with high degree and centrality act as a vast source of spreading information to their connected neighbours.

4.4. Business Strategy and Marketing Communication

Many business organization communicate to their customers through social media. Social media provides direct communication interface to connect customer and business organization. By knowing target audience profile factors such as age, likes, dislikes, interest, income etc. then it is easy to locate them on the social media. Social media strategy relies on type of content, frequency of posting and time at which content is posted. Social media advertisement increase the competition in business which is beneficial for the consumers.

Communication in social media helps companies to know their clients, services required by them, communicating to a larger group of community, sales and building reputation over the globe. Communication in marketing includes several mode such as advertisement, sales offer, publicity, direct and interactive marketing, word of mouth etc. social media is communication tool which exchange various types of information among users and customers in the business.

Social media include activities of interaction about companies brand and connecting firm to their target audience. Customer reviews about product or services helps companies to take corrective actions. The presence of huge number of people on the social media increase brand awareness and interaction among people. Social media is an easiest method for communicating and listening their customer requirements. Online social media have interactive communication with its target audience for spreading

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

short information message while increasing sales and adding new customers in the business. Business organizations increasing their network towards social media users.

Social media helps in managing consistency, sales, exposure, marketing expenditure, ranking, position and customers in the business. Individual is free to write any type of review on the internet, so negative review on social media also impacts the reputation and brand of the product. Social media provides a platform for receiving feedback about customer feeling to the product, ensuring companies to respond quickly from avoiding future problems. Now a days, companies post audio, video, image and other information related to their current and upcoming product on the social media for reducing the time of knowing features. Companies made various group of community of their user to know their behaviour and reviews. Fortune 500 companies are using online social media for advertisement and campaign. Companies communicate their customers directly, also customer can interact with other on the social media without knowing each other. An information is instantly updated on the social media and can be seen by a lot of people in a very less time.

5. CONCLUSION

To summarize, the chapter addresses the prevailing methods, new models, current trends and future projections of research in business social network. This would foster the understanding of formidable challenges confronted and expanding scope in developing business analytical standards. The chapter is designed with the aim to serve as the leading reference for those who seek broad knowledge with in-depth conceptualization on impact of networking in business perspective with social network of things.

Chapter 27
The Influence of Crowdsourcing Business Model Into Artificial Intelligence

Anna Szopa
Jagiellonian University, Poland

ABSTRACT

We observe situation in which human computation processes leverage the abilities of people via the Web to perform complex computation. In this context human intelligence is harnessed to solve computational problems that are beyond the scope of existing Artificial Intelligence (AI) algorithms. The aim of this paper is to achieve an in-depth understanding of the influence of crowdfunding business process into Artificial Intelligence and what kind of computational problems can be efficiently answered using human computation. Wisdom of crowd has been applied successfully to a range of tasks, from translating text and marking images, collecting information to building large databases and to solve problems that are difficult for machines to solve. Presented hybrid solutions will be considered as optimization- leveraging machine intelligence to help improve the accuracy and efficiency of algorithms.

INTRODUCTION

Progress in information, communication and multimedia technologies and the increasing expansion and use of the internet, are generating gradual innovation in diverse areas, leading to the creation of new business processes. The innovation process is currently undergoing significant change in many industries, it very visible in Information Technology (IT) sector. Recent developments in technologies and the usage of Artificial Intelligence techniques make the IT more intelligent and provide higher-level services to its users. Therefore, building an appropriate infrastructure for intelligent agents to run around the IT performing complex actions for their users is the biggest challenge for organizations of the future (Hendler, 2001). An enormous potential exists in rich collaboration between humans and computers. Countless open computer science problems remaining in Artificial Intelligence, can be readily solved by

humans with the usage of their creativity, planning abilities, visual processing, and verbal tasks (Quinn & Bederson, 2011).

The new computer world has created a virtual collective intelligence- helped large groups of people connect and collaborate. According to Von Hippel a large number of users of a given technology comes up with most innovative ideas (Von Hippel, 2005). A decentralized, disorganized group of people, thinking independently can use "crowd intelligence" to make judgments and solve problems that would be very difficult to make using only one person (Surowiecki, 2005). Crowdsourcing business model have had important impact into AI it has been applied to a range of tasks such as: collecting information, translating texts, annotating images, building complex software. While traditionally these tasks have been small and could be completed employees, organizations are now starting to crowdsource larger, more complex tasks to experts in their respective fields. Presented combination of crowd and computers offers another point in the tradeoff space where solutions are faster than individual human efforts due to diversity and network effects of human participation (Long Tran-Thanh, 2014).

The strategy of combining computers and humans by delegating parts of the problem to the crowd is conducted via the internet, in this process a computer system having global knowledge of the problem to be solved requests the crowd to resolve it then proposed results are usually checked and aggregated by the computer system in presented process humans help computers to do computer-type projects. Finally, group of these participating humans later became the first professional programmers (Malone et.al., 2009)

In most advance processes of artificial intelligence (AI) crowd builds large databases of common sense facts. That's possible due to the fact humans acquire a great deal of common sense knowledge. Large databases of spread humans' knowledge collect information into knowledge bases and ontologies using data mining. Presented process influences of recent innovations in the competitiveness of organizations (Zaidan & Callison-Burch, 2011).

Background

The idea of humans and computers collaboration was implemented in 1960 in the article, "Man-Computer Symbiosis," (Licklider, 1960). However recently field of human computation is being advanced by researchers who explore human intelligence to solve computational problems that are beyond the scope of existing Artificial Intelligence (AI) algorithms (Michelucci, 2011; Bederson, 2010; Brachman et.al, 2011; Quinn, 2011). According to researchers from University of Maryland Alexander J. Quinn and Benjamin B. Bederson human computation is related to, but not synonymous with terms such as collective intelligence, crowdsourcing, and social computing. The term human computation was primarily used in philosophy and psychology literature, as well as more recently in the context of computer science theory. And it refers to a set of operators in addition to traditional computation. Lav von and Ahn emphasize role of humans and define the process as "…a paradigm for utilizing human processing power to solve problems that computers cannot yet solve … the idea of using human effort to perform tasks that computers cannot yet perform" (Law & von Ahn, 2009). Chandrasekar, Chi, Chickering, Ipeirotis, Mason, Provost and Tam take under consideration tasks that are completed, defining human computation as "…a new research area that studies the process of channeling the vast internet population to perform tasks or provide data towards solving difficult problems that no known efficient computer algorithms can yet solve" (Chandrasekar et.al., 2009). Quinn and Bederson underline collaboration "A computational process that involves humans in certain steps … systems of computers and large numbers of humans that work together in order to solve problems that could not be solved by either computers

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

or humans alone" (Quinn & Bederson, 2009). And Law highlights complexity of the process "…a new area of research that studies how to build systems, such as simple casual games, to collect annotations from human users" (Law et.al., 2009). Most comprehensive definition of human computation present Brachman, Cohen, and Dietterich defining it as "intelligent systems that organize humans to carry out the process of computation—whether it be performing the basic operations (or units of computation), taking charge of the control process itself (e.g., decide what operations to execute next or when to halt the program), or even synthesizing the program itself (e.g., by creating new operations and specifying how they are ordered)" According to authors still many problems are simple for humans to solve, but complicated for even the most sophisticated computer algorithms. Those problems are mainly referring to Artificial Intelligence (AI) and include perceptual tasks such as object recognition, classification, natural language analysis- language translation, sentiment analysis and complex cognitive tasks including planning, analyzing and reasoning. Presented process stands new opportunities for artificial intelligence leveraging the human computation systems, tackling problems that neither humans nor machines alone can resolve where crucial role plays collective intelligence (Brachman et. al., 2008). According to Levy knowledge communities voluntary and temporary, create collective intelligence, he claims that "thinking community search, inscribe, connect, consult, explore … Not only does the cosmopedia make available to the collective intellect all of the pertinent knowledge available to it at a given moment, but it also serves as a site of collective discussion, negotiation, and development. Unanswered questions will create tension within cosmopedic space, indicating regions where invention and innovation are required" (Levy, 1977).

Crowdsourcing Business Model

The term crowdsourcing, was first used in a Wired magazine article by Jeff Howe (Hove, 2006) and the subject of his book (Hove, 2008), and it was derived from outsourcing. Howe defines crowdsourcing as: "the act of taking a job traditionally performed by a designated agent (usually an employee) and outsourcing it to an undefined, generally large group of people in the form of an open call." (Hove, 2008). The transformation of the customer from a passive client into a highly active one who wants to participate in all production and development process. The term is also defined also as "the outsourcing of tasks to the general Internet public" (Kleemann et al.2008), "describes a new web-based business model" (Brabham, 2008). In recent years, a wide range of organizations, have turned to a new emerging labour market to achieve their operating objectives. Using the internet, they announce request to a global audience this so-called crowdsourcing promises considerable flexibility, as it quickly connects employers and workers. The development of crowdsourcing has been leveraged for working with people in a larger geographic scope, as well as task demands for accomplishing human intelligence tasks (Doan et.al, 2011).

According to Brabham crowdsourcing harnesses the creative solutions of a distributed network of individuals through open call for proposals. He points out that the public can help design products, produce memorable commercials and images, and that it outperforms the industry faster and cheaper than ever (Brabham, 2008). It includes customers, considered as "co-workers", and various stakeholders who are not employees of the organization, in the production process (Rieder & Voß, 2010). Crowdsourcing processes includes four dimensions: pre-selection of contributors, accessibility of peer contributions, aggregation of contributions, and remuneration for contributions. The classification scheme focuses exclusively on an organizational perspective and on the mechanisms available to these organizations (Geiger et.al, 2011)

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Hove in his publication "Why the power of the crowd is driving the future of business" classifies the applications of crowdsourcing as (Howe, 2009):

1. Collective intelligence when people solve problems and provide new insights and ideas.
2. Crowd creation when people create various types of content and share it with others.
3. Crowd voting when people give their opinion and ratings on ideas, products, or services, as well as evaluate information.
4. Crowdfunding when people raise money for investment, donations, or for micro-lending of funds.

Crowdsourcing process is very broad and includes everything from the design of a product or process, creating content, product development, solving problems, advertising, quality monitoring, etc. (Howe, 2006; Brabham, 2008; Kleemann et al., 2008). Crowdfunding has developed mainly through the expansion of social networks, which has allowed labor to be outsourced to the public with very diverse kinds of remuneration and motivation mechanisms for contributions. (Corney et al., 2009). Crowdsourcing business model is related to a few concepts that may be used to render similar concepts, including: open source, open innovation, user innovation, and co-creation. Open source software allows users to freely access, use, modify and redistribute software products and their source code under a public license (Howe, 2006). The idea of open innovation assumes that companies should use external ideas to create innovations, share risks, and improve productivity and competitiveness. Chesbrough indicates several methods for importing external ideas: consulting, employing focus groups, conducting joint design sessions and using other collaboration methods that were in use for decades to facilitate open innovation (Chesbrough, 2011). The last concept- co-creation describes a joint effort of producers and consumers aiming at developing new products or services and significates working collaboratively with a group of people with specialized skills or talents to come out with new ideas (Ramaswamy, 2000).

There is no doubt that crowdsourcing business model is a phenomenon involving the use of volunteers to accomplish complex tasks however it has couple drawbacks that should be taken under consideration in context of Artificial Intelligence. The first problem that may occur is the lack of contributors. Crowdsourcing business model relies on voluntary participation and benefits from network externalities and reaching of essential crowd workers not always is guaranteed. Second issue is the knowledge correctness- the model is relevant in fields where knowledge is highly codified - as it is in case of artificial knowledge The third problem that can occur while implementing crowdsourcing model is the statement formulation. When addressing a request to the crowd, the firm seeks to obtain a number or candidate solutions to its problem. If the request to the crowd is wrong defined, the process is very likely to lead to non-satisfactory contributions as result feedback cannot be implemented (Teece, Pisano, 1994). As stated above the problem and requested definitions should be major concerns for companies that implement crowdsourcing business model.

THE IMPORTANCE OF CROWDSOURCING BUSINESS MODEL FOR ARTIFICIAL INTELLIGENCE

The potential of intelligent machines associated with human minds, such as learning and problem solving cannot be conceived without the participation of people. In this sense, the source of competitive advantage of artificial intelligence can be found in crowd wisdom- where knowledge is the principal feature.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

A growing number of businesses implementing Artificial Intelligence projects crowdsource work on large-scale that require many hours of activity by experts in a particular field. In this context expert crowdsourcing is used for the creation and development of large software applications. Accordin to Long Tran-Thanh, Sebastian Stein, Alex Rogers and Nicholas R. Jennings researchers who investigate the problem of expert crowdsourcing we can observe growing popularity of this approach. According to their data in 2013 oDesk platform had 2.5 million registered workers, while Freelancer had 6.7 million. Presented expert crowdsourcing instead of doing small units of work rises new challenges (Tran-Thanh, 2011).

Crowdsourcing business model enables knowledge creation, sharing and learning (Shiffman, 2008), therefore is able to facilitate central problems of artificial intelligence that include (Luger, Stubblefield, 2004):

1. **Deduction, Reasoning, Problem Solving:** Developed algorithms that imitate reasoning that humans use when they make logical deductions,
2. **Knowledge Representation:** The problems that are expected to solve require extensive knowledge about the world,
3. **Planning:** Intelligent machines should be able to set goals and achieve them. Therefore, need a way to project the future and be able to make choices that maximize the of the available choices,
4. **Learning:** Studying of computer algorithms that improve automatically through experience,
5. **Natural Language Processing:** The ability to read and understand the languages that humans speak. A sufficiently powerful natural language processing system enables natural language user interfaces and the acquisition of knowledge directly from human,
6. **Social Intelligence:** Recognizing, interpretation, processing and stimulation of human affects. The machines interpret the emotional state of humans and adapt its behavior to them, giving an appropriate response for those emotions,
7. **Creativity:** Addressed theoretically (from a philosophical and psychological perspective) and practically (via specific implementations of systems that generate outputs that are considered creative),
8. **General Intelligence:** Combining all the skills presented above.

Artificial intelligence is associated with a great number of problems however those stated above can and even should be solved with the usage of crowdsourcing business model. Fits of all because AI requires human knowledge from the fields of computer science, mathematics, psychology, linguistics, philosophy, neuroscience and artificial psychology (Russell, Stuart, Norvig, 2003) and crowdsourcing is associated with board knowledge. In addition, creates environment where the knowledge is complex expanding and located in networks rather than individual activities (Kodama, 2005). Presented concept o is essential since it makes information more meaningful to crowd by making it more understandable to machines (Feigenbaum et al., 2007). Furthermore, possessing information from crowd intelligent machines read, understand, interrelate, and can manipulate data. Gathered information is essential for adapting and personalizing products, or services. The concept means a radical transformation with critical changes in the technology itself (Garrigos et al., 2011). Such collaboration with crowd represent a flexible source of information and knowledge. Strategically, the most important change in presented relation is the importance of meaning in the new environment. It stands essential tool for finding out what customers are demanding, discovering technological trends, innovations and expert opinions. Furthermore, crowd-

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

sourcing in presented model promotes innovations "drives all of society and corporations to work faster, create and manage more interdependencies, and operate on global markets" (Kalpic, Bernus, 2006).

Practical Aspect of Crowdfunding Business Model and Its Impact into Artificial Intelligence Algorithms

To outline practical aspect of crowdfunding business model and its impact into Artificial Intelligence algorithms this part will present three platforms Amazon's Mechanical Turk that supports the large-scale distribution of micro-tasks to human workers, Ushahidi which provides software for collecting information from the public, mainly during crisis situations, and Zooniverse that hosts a range of large citizen science projects.

Amazon's Mechanical Turk

Amazon's Mechanical Turk is a platform dedicated to create annotated data for natural language processing application including human-mediated translations, editing rates (HTER) and creation multiple reference translations- humans perform manual evaluations of machine translation quality using the web service. Tasks dedicated to humans at the moment cannot be completed by computers and include from data extraction from images, filtering adult content, audio transcription, filtering adult content, moderating blog comments to providing feedback on relevance of results for a search query (Huang et.al, 2010). Mechanical Turk mechanism consists of two types of players: requester and workers- the independent contractors. The jobs offered on Mechanical Turk refer to Human Intelligence Tasks (HITs). Amazon's Mechanical Turk, online labors are paid small sums of money to complete tasks (Winter, Siddharth, 2012).

Presented platform stands an inexpensive way of gathering human judgments and annotations for a wide variety of tasks- which can be utilized to ensure translation quality. According to Chris Callison-Burch from Center for Language and Speech Processing, Johns Hopkins University Baltimore by combining the judgments of many non-experts the system can achieve the equivalent quality of experts. According to the researcher, the platform is very useful for a wide variety of machine translated tasks like: word creation, verifying the accuracy of documents especially sentence alignments, performing non-simulated active learning experiments for statistical machine translation, and even collecting training data for low resource languages (Callison-Burch, 2009). Rion Snow, Brendan O'Connor, Daniel Jurafsky, and Andrew Y. Ng. investigating certain tasks including word sense disambiguation, word similarity, textual entailment, and temporal ordering of events, observed that a correlation between non-expert and expert annotators can be achieved by combining the judgments of multiple non-experts, example by voting (Snow et.al., 2008). To provide high quality services Amazon's Mechanical Turk provides special mechanisms that include option of rejecting the work of individual employee and blocking from doing future work for a requester. Requesters can require a particular set of qualifications, such as sufficient accuracy on a small test set or a minimum percentage of previously accepted submissions. Furthermore, requesters can design custom qualification tests that must be completed before working on a particular project. To secure employees the platform established a Firefox plug in called Turkopticon that provides ratings of how good the requesters are in terms of communicating with workers, being generous, and paying (Amazon Mechanical Turk).

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Ushahidi

Ushahidi stands an open source crisis-mapping application, and is being used for humanitarian purposes around the world. Ushahidi supports and trains community based organizations to engage with local governments. The key component of Ushahidi is the ability to use mobile phones as a means of sending crisis incidents and receiving updates. The platform, Crowdmap, is amongst the first Web 3.0 technologies using both mechanical and human means to order information and present it in a layered mode. The platform specializes at turning small parts of data into information by using mapping. Ushahidi is an open source technology, which is linked to detailed reports, including the level of validity or authentication. In this process collected information can be view online by anyone. The platform exploits new forms of encoding, which in turn afford new outcomes and have material impacts. Human vision can compare small and large-scale structures at the same time, deal with layers and separations and intuitively find patterns. The platform has its qualification system- the information is verified before plotting on the map - decision makers don't receive unproven crowdsourced or web based information. Then checked information is visualized. Open modification of the system allows for multiple types of visualizations of this data (Ushahidi).

Zooniverse

Zooniverse is a research platform in a range of subjects from astronomy to zoology where human-based analysis still exceeds that of machine intelligence). Zooniverse stands a cluster of projects that source volunteer contributors to analyze and interpret huge datasets that are too complex to interpret using computer algorithms (Zooniverse). The platform engages workers without having a specialist knowledge or background in science to complete sufficiently simple tasks (Silvertown, 2009). Zooniverse projects invite the crowd to participate in genuine data analysis at a scale that researchers cannot accomplish. The whole process consists of two teams: the first the core team of developers and data scientists (has headquarters at Oxford University and the Adler Planetarium) the second crowd workers that implement the most rudimentary algorithms for functionality (Smith et.al, 2009). Crowd workers are shown how to perform required analysis via a tutorial to be able to identify, classify, mark, and label them as researchers would do. Research data is shown to the crowd in the form of images, audio and video via one of the Zooniverse websites (Simpson et.al, 2014).

CONCLUSION

This paper has attempted to analyze the influence of crowdsourcing business model into Artificial Intelligence, and the development of human-computer interaction. The study examined literature and describes the transformation of technologies, and the new business model emerging in the new context of Artificial Intelligence. The chapter also stressed the importance not only of the technology, but of the essential use of crowdsourcing and the management of cooperation. The principle for human computation is that given conditions, an unprecedented number of human workers can be mobilized to solve problems that are difficult for machines to solve. However, since human computers are still more costly than machines, hybrid solutions, involving both human and machine intelligence, may advance future human computation systems. The crowdsourcing of people in artificial intelligence processes has proven to be a technique

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

capable of making a valuable contribution. The crowd combination of intuition with abilities in pattern recognition and analysis can outstrip the performance of sophisticated automatic systems. Furthermore, presented process evaluates and is becoming very popular presented above Zooniverse platform have collected more than 300 million data analyses from over 1 million volunteers providing rich datasets for not only the individuals working to produce research from their projects but also the machine learning and computer vision research communities the platform is evolving into a system capable of integrating human and machine intelligence in a live environment. Author is aware that this chapter is merely a first step in analyzing the impact of crowdsourcing on artificial intelligence and recognizes the limits of this exploratory analysis and the fact that all of these transformations require further analysis. For instance, future research should concentrate on the impact specific functions, or the most appropriate skills for developing. In addition, the work can open up new possibilities for the use of crowdsourcing business model by all types of organization, and considers this to be a crucial step toward the success of crowdsourcing business model by effectively utilizing the collaborative intelligence of internal and external stakeholders, as well as the general public.

KEY TERMS AND DEFINITIONS

Artificial Intelligence: Intelligence exhibited by machines. In computer science, an ideal "intelligent" machine is a flexible rational agent that perceives its environment and takes actions that maximize its chance of success at some goal.

Collective Intelligence: Shared or group intelligence that emerges from the collaboration, collective efforts, and competition of many individuals and appears in consensus decision making.

Crowdsourcing: Process of obtaining needed services, ideas, or content by soliciting contributions from a large group of people, especially an online community.

Human Computation: A computer science technique in which a machine performs its function by outsourcing certain steps to humans, usually as microwork. This approach uses differences in abilities and alternative costs between humans and computer agents to achieve symbiotic human-computer interaction.

Innovation: As the application of better solutions that meet new requirements, unarticulated needs, or existing market needs. This is accomplished through more-effective products, processes, services, technologies, or business models that are readily available to markets, governments and society.

This research was previously published in Strategic Imperatives and Core Competencies in the Era of Robotics and Artificial Intelligence edited by Roman Batko and Anna Szopa, pages 15-28, copyright year 2017 by Business Science Reference (an imprint of IGI Global).

Chapter 28
Experiences in Social Innovation:
A Platform for Ethics Through a School of Engineering Studies

Domingo Alfonso Martín Sánchez
Universidad Politécnica de Madrid, Spain

Ana García Laso
Universidad Politécnica de Madrid, Spain

ABSTRACT

Convergence is an opportunity to determine the possibility to train students in social skills, assuming that our universities provide valuable training in specific technical and professional skills. This study presents the strategy followed in the Mines and Energy Engineering School of the Polytechnic University of Madrid (UPM from its name in Spanish) to enhance social learning through a program based on the assembly of training practices on Mentoring, Service Learning and social consciousness (Ethics and values in engineering). In this article we discuss about social motivation through social collaboration with qualified entities in the Spanish social landscape such as Tomillo Foundation, Congregation Mary Immaculate as well as looking to a future collaboration with the Ana Bella Foundation.

INTRODUCTION

In 2006, thanks to a truly innovative initiative within the Spanish university, the Directorate of the School of Mines and Energy (ETSIME) of the Polytechnic University of Madrid (UPM), decides to introduce a supplemental education in order to promote discussion and debate on the ethics and values that should integrate technical and professional education across the engineering curricula taught at ETSIME.

The Unit for Social Entrepreneurship, Ethics and Values in Engineering (UESEVI from its name in Spanish), introduced the methodology of learning service in an effort to fulfill the purposes for which the university was created for: to grow and transform the man by science and knowledge, in order to pre-

Copyright © 2019, IGI Global. Copying or distributing in print or electronic forms without written permission of IGI Global is prohibited.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

pare a technical, scientific and human professional. The underlying assumption was that to get involved in technical content, the critical understanding of reality is required. Critical intelligence involves the perception of its reason for being.

In the Spanish context, the university in the field of engineering, projects a very technical applied learning, which should integrate ethics to get more complete and desirable results. In an engineering school in which results and practical solutions are looked for, ethics and values must follow the same path.

Service learning is a tool to combine the three aspects of teaching and practical humanistic theoretical concepts such as ethics, values and those derived from them.

Since then, this new process has been interesting, full of aspects and following various initiatives (subjects, external projects and mentoring). Not without difficulties, but with a positive evolutionary development that has shaped the thematic agenda of the training courses. In 2011 this process has been analyzed and summarized (Muñoz, Flor, García Laso & Martín, 2011, in a collective publication: *Participation and Scientific Culture in an international context* (Diaz & Muñoz, 2011).

In the following the social project of the Mines and Energy Engineering School of the Polytechnic University of Madrid is presented through the development of each one of the branches into which is divided. This project has been recognized with 6 European Credit Transfer and Accumulation System (ECTS) credits for educational activities.

Since specific skills are set out in the curricula designed and verified by "Agencia Nacional de Evaluación de la Calidad y Acreditación (ANECA)" – the Spanish National Agency involve in the quality evaluation of universitary curricula-, we considered that these 6 credits could overcome the difficulty of incorporating social skills in the teaching of engineering. We assume that those social skills go beyond the topics integrating the degree or the specific branch studies, and therefore we were trying to train students in a range of skills and values that could enable them to act as citizens committed to the others, and that they would project into the commons scenario of their professions (Environment and Society).

The design allows students to participate in a continuous or discontinuous manner in the process as we have designed it to facilitate their incorporation to one part or to the whole of the process. As the first step the students are integrated into the mentor project as mentees, arising the possibility that they can act as mentors from the second year on as mentors and obtain recognition of 2 credits ECTS (Mentor Project).

On the other hand, the students can take the training activity on Ethics in Science and Engineering for any year, activity that is recognized with 2 ECTS credits. It is advisable to have the Mentor Project completed. Finally, the students have the possibility to conduct formative activity included within the general catalog of the UPM: "Towards Social Entrepreneurship: Practice Learning Service" where they can develop the practice of this type of abilities. The advisable path would be to study the activity after have taken Ethics in Science. The latter activity also give the recognition of 2 ECTS credits.

CONTEXT

The main objective of this project is to provide engineering students with training in applied ethical criteria. This implies a complete training in the values that would transmit to them the need to adhere to ethical and good practice codes in all their activities, and that includes the creation of social values inherent to any of their actions.

The factors that emerge as determinants of this positive evolution are as follows:

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

1. Introduction of an intergenerational component in the management team that has remained reduced in size but significantly motivated for the successful development of the project.
2. Students' collective mobilization, from direct personal action of the youngest members of the management team (employees or fellows). This mobilization has been translated into an increase in enrollment.
3. Two strategic decisions made by the School Management at a critical time for the survival of the project. These decisions were made in close collaboration with the teaching team responsible for the subjects.

The first relates to the integration of concepts and skills contained in the teaching of ethics, as the incorporation of Social Entrepreneurship and Social Innovation as topics in the program. This initiative is rooted in a self-assessment of the skills provided, including the reactions and opinions of students. In these opinions, those scholars studying the Ethics and Values in engineering issues demanded more practical guidance in this education.

The second decision concerns the inclusion within the social project of the School the Mentor project in order to present a complete offer for the students who have shown interest on these issues. This was performed taking advantage of the incorporation of the EEES.

4. The constant search for interdisciplinarity and cooperation as the main idea of the relationship with external agents mobilized in processes of social innovation.
5. The commitment to acquire our own framework with ethical dimensions and dynamics as a result of a process of research and self-reflection from studies on the relationship between science, technology and society. Throughout this process has shaped a program that offered a synthesis of theory and practice, integrating approaches from the humanities and social sciences with those emanating from the scientific and technological activity and its impact on socio-economic development.

As was covered in detail in the article already cited (Muñoz et al., 2011), the program analyzes the historical contexts in which ethics has been developed as part of moral philosophy to the implementation of combined professional ethics (deontologies), applied as codes of conduct, evolving to practical approaches and a vision exploring cases and problems.

By means of the synthesis and assembly processes we moved into the field of applied ethics. To support the selection and development of these cases, research programs on the philosophy of science policy and the theoretical and practical analysis of the management of scientific knowledge were used, relying on the fact that have been areas of interest along the last two decades, for the components of our institutional collaborator, the Research Unit in Scientific Culture of CIEMAT (1ICC) (Muñoz, 2004; Muñoz & Luján, 2009; Muñoz, A., 2011; Muñoz, Moreno & Luján, 2012; Muñoz A., 2013; Muñoz & Todt, 2013).

6. The specific options designed for the teaching of ethics were: to train the engineering students as responsible and values-rich human beings advocating for reaching this objective on a "consequentialist ethics" supported by the basic principle of responsibility and moved by concerns about the debate in the fields of energy, natural resources, environment, and their relationships with society and respect to economic impacts. Educational programs have been organized around two

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

large spaces: REMAS space [resources, energy, environment and society] and REMARÉ space [resources, energy, environment, and economic impact].

Within the REMAS space the following topics have been addressed: the theoretical basis and framework for introductory reference, the relationship between ethics, energy and environment, environmental awareness, climate change and sustainability impact, risks: communication and the precautionary principle (Beck, 1992). In the transition to the REMARÉ space the concept of governance has been dealt with. In the REMARÉ space the themes of social development (social entrepreneurship, corporate social responsibility, social economy, base of the pyramid and inclusive business) have been addressed. The training activity on Learning Service (APS) is the practical experience that seeks to value the cohesion and cooperation of social factors such as strategic socio economic impact and empathy, solidarity and social commitment as representative values.

DESCRIPTION

The principal methodology of these activities involves lectures, seminars or workshops, practical lessons, tutorials, study and group work, group practice and projects.

Social Entrepreneurship (GEM, 2012; Harding, 2004; Jonas, 1985; Mair & Noboa, 2003; Manfredi, 2005; Social Innovation, 2007; Thompson & Doherty, 2006)

Three key factors have contributed to the 2012-2013 course program. First of all, experiences accumulated over five years of course teaching, its evaluation, and its evolution with subsequent lessons. Second, concern for the profound economic and social crisis - the Great Recession in nomenclature generally applied by economists- that led to UESEVI director to critically explore the economic policies and strategies that were behind those policies, while the critical exploration was inspired in the application of the scientific method and, with the aim of contrasting, reviewing these decisions against the foundations of evolutionary biology from the contents of the publications, articles and books, from a set of economists and political scientists (Stiglitz, 2011; Stiglitz 2012; Borrell & Missé, 2011; Ekaizer, 2012; Hessel, 2011; VV.AA., 2012; Judt, 2011) who have questioned those policies from economic perspectives and theories (see Muñoz, 2013, a).

It also has very positively valued the Service Learning as the most significant practical formula, comprehensive and less polluted that constitute the rapidly expanding field of social innovation. Last but not least the introduction into social content methodology for both Bologna and students of the old teaching programs in helping their peers through mentoring project.

As a result of this exercise, the education has been remodeled. The part corresponding to the theoretical framework, needed to combine consequentialist ethics choosing Principlist contributions and this has led to the development of a Decalogue of paradoxes and contradictions that has been called “the never Decalogue” (has published a summary of this framework in the web of the education league, Muñoz, 2013, b). Meanwhile, REMAS space has focused on presentations on environment and society.

The study of the environment as a social problem has been approached. A methodological approach has been adopted. In this sense, the exhibition is structured around the phases of a research design:

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

definition of the research problem with the formulation of a working hypothesis, method, result analysis and conclusion. Finally there has been a brief review of the study of values from a social psychology perspective, specifically analyzing the environment as a value.

We have also studied global risks and its evaluation. Its content is structured in two parts: a theoretical introduction and a practical part. In the theoretical part the concept of risk as a function of the different domains in which is used (technical, media, academics) was explained. The key points in assessing and managing risk and the characteristics common to all global risks. In the practical part of the assessment report on global risks in the next decade presented by the World Economic Forum in 2013 was replicated. To do this, students answered questionnaires about global geopolitical risk-governance, economy and environment.

As can be seen the focus has been placed on the social dimensions of the issues and the approach that takes into account the perceptions and engagement strategies with practical and methodological emphasis. This approach was supplemented by an analytical discussion of the Precautionary Principle.

As previously noted the issue of governance has been discussed in depth to establish the connection between the spaces: REMAS and REMARÉ. In the latter the treatment of subjects has been more critical on the issues of Corporate Social Responsibility and the Bottom of the Pyramid (treated tangentially in several presentations and discussions) while emphasis has been put on conferences and talks about Social Entrepreneurship and Creativity and Innovation under a humanistic view (H2i Institute): These classes have been aimed to prepare students for the presentation of social innovation projects that are the culmination of the ESEVI teachings (Social Entrepreneurship, Ethics and Values in Engineering).

The planning proposal in three modules is depicted in Table 1.

The Learning by Service

The Service Learning course is established as an educational activity and appears in the general catalog of the University. The students coming from old study plans -which means 1.5 credits, and students coming from Bologna plan have 2 recognized credits, named ECTS in Spanish. It is classified as a partnership activity that is taught in the second semester of the course, and although be independent, is presented as a practical extension of the subject of Ethics and Values above mentioned.

Although it is written for the two coexisting plans studies plans, they have a continuous assessment requirement. Compliance and participation in class and a high level of student engagement is required.

Learner seeks from the student a clear willingness to participate in social activities. Entrepreneurship interest and social integration are requested. No academic profile from the student is requested, which allows us to accept students of any specialty of engineering.

The objectives of this course are to practically integrate values through the implementation of a technical project, developing attitudes as participation and support.

The proposed program is divided into three modules which distribution is shown in Table 2.

Although the action is generally performed after the training process, in our case, we performed a variant of the APS technique: developing fieldwork before the training process along with the Tomillo Foundation and another project after the training process focused on the design of an action with immigrants seeking work as domestic workers under the support of the Mary Immaculate Congregation.

	Presentation of work	Emilio Muñoz/Domingo Martín/Ana García Laso	UESEVI	April, 1

Mentor Project

In the general plan of social skills training in our center, integration within the mentor project is the first step. This project has the objectives of improving the academic integration of new students, improving efficiency in the acquisition of learning outcomes by students and reduced absenteeism and abandonment. We could also define specific objectives of our center where we focus on the processes of reception and guidance, organization of training process of developing training mentors students through a process of Coaching. In this way, we get to promote the values of commitment, personal / social responsibility and respect for everyone involved in the learning process.

Table 2. Service learning course planning

MODULES		PROFESSORSHIP	AFFILIATON	SCHOOL ATTENDANCE
MODULE 1: PREPARACIÓN				
Step 1: PREPARATION OF DRAFT	• Experience Thyme Foundation • Analyze how the group is • Determine socially necessary service • Establish learning linked to the service	Domingo A. Martín Emilio Muñoz Ana García Laso	UPM	April, 8
Step 2: ESTABLISHMENT OF SOCIAL RELATIONS FIRMS	• Raising the demand and reach agreement • Visit the project participants (C / Ríos Rosas 35-37)	Domingo A. Martín Emilio Muñoz Ana García Laso	UPM/RMI	April, 9
MODULE 2: REALIZACIÓN		**PROFESSORSHIP**	**AFFILIATON**	**SCHOOL ATTENDANCE**
Step 3: PLANNING	• Interview with the project participants • Diagnose the problem • Reflect on the lessons learned from the preparation	Domingo A. Martín Emilio Muñoz Ana García Laso	UPM/RMI	April, 22
Step 4: PREPARATION	• Organize the work to be carried out • Prepare the necessary materials for implementation	Domingo A. Martín Emilio Muñoz Ana García Laso	UPM	April, 23
Step 5: IMPLEMENTATION	• Students in this course will teach the training courses for the participants.	Domingo A. Martín Emilio Muñoz Ana García Laso Javier Maroto	UPM	April, 29 April, 30
MODULE 3: EVALUACIÓN		**PROFESSORSHIP**	**AFFILIATON**	**SCHOOL ATTENDANCE**
Step 6: CLOSE	• Evaluation of the work group (how we have felt) • Delivery of Diploma participants • Small holding in the cafeteria of the School of Mines	Domingo A. Martín Emilio Muñoz Ana García Laso Leticia Abad Javier Maroto	UPM/RMI	(undefined)

The dedication that mentors students have to take the project has been set to 70 hours, of which the main points are training for 38 hours and mentoring for 14 hours, leaving 20 hours to coaching and recruiting students.

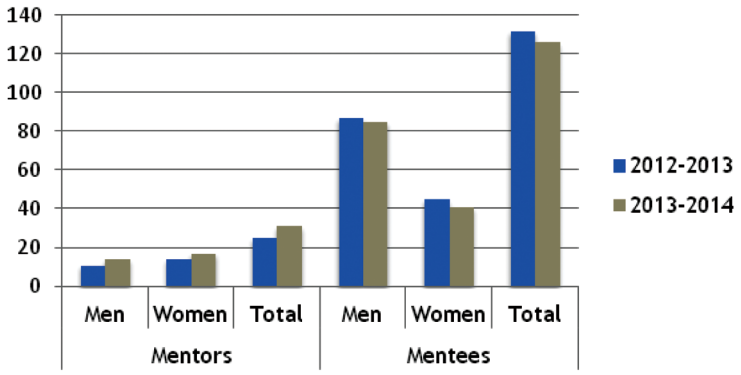
RESULTS

In general, one can conclude that the satisfaction rate of the proposed activities that forms the center social offer is very well accepted by the educational community. This is reflected in DOCENTIA-UPM surveys conducted by students and satisfaction surveys conducted in some of the projects. In all cases and considering the maximum satisfaction level as 5, the surveys indicate that we are around 4.3.

If we analyze the impact and sustainability of each of the proposals, they all have a guaranteed continuity since participation is important in all cases. As an example serves the development of the mentor project, which has evolutionated from 70 to 150 mented students in the last edition, plus 40 mentor alumni from the 1200 available in the center (See Figure 1).

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 1. Number of mentors and mentees



Although this project is specially designed for the curriculum within the EEES, there is a direct relationship between students of both plans, existing cooperation between them (one third of students from earlier plans, compared to two thirds of undergraduate students). This cooperation may also be extended between professors teaching in one curriculum or both at once. In addition there is a direct cooperation between faculty teachers, assistant students and teaching staff from centers others than the UPMs, as it is the case of Tomillo Foundation. In the latter case, the cooperation tool is the social skills teaching.

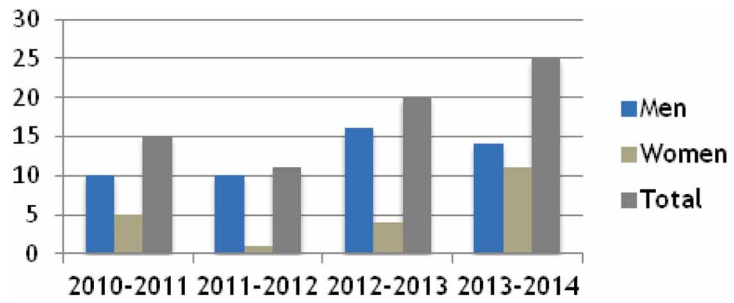
Thus, the UESEVI is developing a contacts network that promote inter-center cooperation among those involved in any of these projects are included: CIEMAT, H2ii, itdUPM, Master in Technology for Human Development, Ana Bella Foundation, Gómez Pardo Foundation, La Caixa, Ashoka…

It's also important to mention the center staff integration in the project from 4 to12 members, 2 "Personal de Administración y Servicios (PAS)", - Administration and Service- and 10 "Personal Docente e Investigador (PDI)", - Teaching and Research- .

Analyzing other activities we see that both APS and the subject of Ethics and Values in Engineering also significantly increases the number of participants, from 12 to more than 20 students in both cases compared to previous years (See Figure 2 and Figure 3).

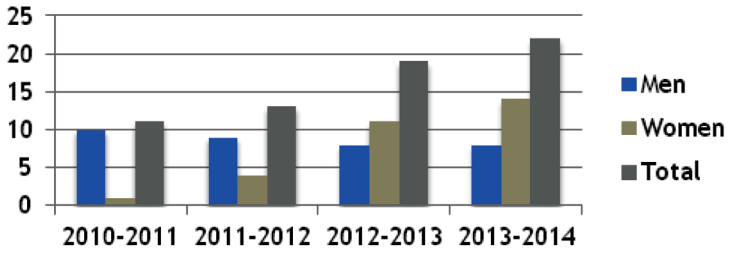
The main result is the observed decrease in the rate of abandonment. There is a continued interest in the project once the credit scheme program ends. A percentage of participating students continue being involved in the project-related distribution within its redesign for the next year, which may or may not benefit them, by generating a transmission platform. The student participates actively in the proposed

Figure 2. Number of participants: Course ethic and values



EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 3. Number of participants: Service learning course



improvements, which require the team to work on the reality of both the student and the recipient of the service. Involved students focus their proposals to generate more common spaces and long term relationships.

Social Entrepreneurship

The academic year 2012-2013, the students have presented two projects related to social entrepreneurship activities in relation to improve the functioning of the School of Mines and Energy where they are carrying out their studies, approach that agreed with one of the requirements that we ask such as to endorse the project. Both projects achieved and reflected the content and skills that were proposed in the theoretical part of the course, proving once again that its participants are the real protagonists. Being on the "front lines" of the School, they have been able to offer quality proposals, demonstrating its ability to reply when they are allowed to give their opinion.

Projects were submitted to the Centre Management who evaluated the proposals directed to improve the Centre and thereby giving rise to a debate in both cases.

A summary of the two papers are hereby presented.

Recycling Project

Through a survey given to all staff asking about the Center's needs, sensitivities and needs that the center is lacking concerning recycling were detected. The project consists of an analysis of the values that are taught in the subject (Ecology, Social Responsibility and Cooperation), design and implementation of a survey and finding funding for the proposed project. Illustratively we present Figure 4.

Photocopiers Management

The project arises from the lack of awareness that first course students have about the photocopiers system in the center and the need to improve this service.

We start with an analysis of the population of students in first courses by designing individual interviews with the information technology staff (responsible for managing the service) and students. As a conclusion it was observed that it is necessary to adapt the service to new technologies that students are familiar with as it is wireless networks and automatic coin. Besides the values that they want to work remembering Responsibility, Commitment and Respect which are the most that can be adjusted to this project. Economic study shows that the cost of this improvement would include a 2900 € / year

Service Learning (Ryan, 1995; Westbrook, 1991)

Service learning is a method of attaching learning with social commitment. (Batlle, 2013)

Service-learning is an educational approach that combines learning and community service in a single well-articulated project where participants learn to work on real needs of the environment in order to improve it. (Centre d'Aprenentatge Promoter Servei, 2013)

The training activity towards social entrepreneurship: Practice Learning Service has completed its third edition this course. Like the rest of the activities of the UESEVI, his approach has evolved after the experience of previous years, the view of the participants and the current socio-economic situation.

What began as a pilot exercise, it is becoming a more complex and motivator "in crescendo" course. Its complexity should not cause panic, because it lies mainly in the fact of incorporating new players every year, on the other hand, is a sign of the success of the program.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Specifically this year two alternatives ended together in a final closure act.

The Antonio Orozco center, that is part of the Tomillo Foundation, offered in November to perform the practical part with them. We had a problem with the dates, as the course of UESEVI was meant to begin in May, however, since it was the first organization with which we participate, we did not want to miss the opportunity. Our students begin "the cart before the horse", i.e., the practical part would be done first and then attend to the lectures, something that APS purists disagreed with. Yet we went forward. The practices consisted perform electrical inspections in some houses and facilities in the neighborhood of Carabanchel. Engineering students successfully escorted Antonio Orozco center students, PCPI in Electricity during their inspections, taking on work and social reality.

Moreover, in May, we had the opportunity to offer a computer course to a group of immigrant women from a center near the School of Mines and Energy (Mary Immaculate Congregation). This option, where students that performed their practical lessons with the Tomillo Foundation had to attend to, ended up as a second option for everyone. I.e., students who had already participated, explaining to their colleagues what they knew from experience, teaching that service learning means and why they had to take the subject. Of course, after preparing courses for new participants, all decided to continue to the end.

Thus, what began as a problem of methodology and schedule ended up being an advantage when approaching students and convey a sense of the course.

Mentor Project

This is the third edition of the Project. The first one started at the academic year 2010-2011. The organizative structure has four levels. First year students or mentees, superior courses or mentors that are taught about social competences and perform the service, tutors or lecturers who advise mentees. The technical coordinator or project manager (see Table 3).

The primary means of dissemination were social media to recruit mentors and personalized information for the mentees. In Table 3, we present the information from the leaflet used to attract mentees.

The mentors learning is performed through the seminars that deal with the following contents: Emotional Intelligence, Social Skills, Communication Skills, Team management and coaching process through an agreement signed with the European School of Coaching.

Table 3. Number of mentors and mentees, gender division

	Minas Mentor Project (2 ECTS)

CONCLUSION

Technology, in connection with scientific progress, is the main force that produces changes in humanity. Engineers develop this technology in the field of industry, agriculture and fisheries, leading implicitly to the generation of economic, social and environmental impacts on the exercise of their profession, not always impacting positively on the sustainability resources and environmental quality, with effects on air, water and land and the socio economy of the affected population.

The need that arises to develop a program to enter the ethical dimensions in the training of engineers is based on the consequences of handling any technology if it is not done taking into account certain criteria. This need is made more evident every day from the time that the major innovators, companies are moving to adopt the concept of Corporate Social Responsibility.

The engineering student, the main protagonist of the immediate future development, has certain limitations when integrating in his/her professional activities these ethical criteria given the weakness of their formal /technical training on these topics.

There have been a series of experiences in the framework of an educational program on Ethics and Values in Engineering, which reveal interesting aspects to a broad vision of social innovation, trying to advance their understanding and applications. This practice is beginning to generate a change in culture that speaks of collaboration, which fails to consider only the particular interests to work on a common project that promotes the free and voluntary commitment, and work efficiency. Encouraging education in this sense, intended to form a partnership with open eyes, can begin to respond to reality, to value their own talents, and face their own challenges.

Service Learning Initiative seeks quality technical training that is acquired through formal teaching, through the return to society of the benefit of learned knowledge. Landing on this tool makes sense from two perspectives: the first is the search for realization of the ethical teaching through real actions, the second awakening a critical spirit that allows students to start walking towards that path of involvement with society expressing Social Entrepreneurship.

The UPM students who have chosen to participate in this experience have achieved through their efforts several goals by becoming human beings who should be: versatile, able to work in multidisciplinary teams as well as to develop the business in a place of work delocalized (University and partner organizations), and to assume different roles in a same project. Moreover, the students live their responsibilities directly by joining a team in order to finish the job on time, feel the satisfaction of having provided a service, but also feel the frustration of not getting a goal; in sum they are learning by doing social interactions. At the same time, they develop the ability to react to unforeseen events, internalize the culture of error and take the surprise factor of working with and for the others.

The activities proposed from UESEVI allow social and collaborative learning, enable the development of both technical and transversal competencies, and involve learning throughout life, because they introduce reality into the classroom and take the classroom to reality. The mobility of the educational process as students for developing their work where the need is, as well as the development of an entrepreneurial spirit in the increasingly important field of social innovation are other targets. In short, from the training we are giving the students the opportunity to live cases as those they will encounter in their working lives. The result is to form them for professional careers, with the advantage of gaining experience of mistakes done in the course of “successes” and “failures” experiences.

All the process addresses to join forces, to a job well done, because humans processing capacity should not be limited to what we do at some point in a given time, i.e., the demands of the new titles

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

should force us to share experiences and to design curricula which converge to hybridize specific and transversal skills (including social skills). In the future, the University should be seen as a "living laboratory of sustainability."

ACKNOWLEDGMENT

We are indebted to all the persons and organizations mentioned in the text by their support. We thank Belén Flor, Emilia Lopera, Ana Muñoz van den Eynde and Emilio Muñoz for their contributions in the teaching experiences described in the text and to EM for his help in the preparation of the text.

Chapter 29
Improving Accessibility Through VGI and Crowdsourcing

Igor Gomes Cruz
Federal University of Campina Grande, Brazil

Claudio Campelo
Federal University of Campina Grande, Brazil

ABSTRACT

Accessibility is an important element in the life of those who have certain limitations, such as the physically disabled and visually impaired people. However, one of the greatest challenges for this group is to find paths and areas adapted to their limitations while performing their daily activities, since not all environments they explore have these characteristics. Volunteered Geographic Information (VGI) and the crowdsourcing technique appear to be quite useful to develop solutions to overcome these challenges, since these techniques are naturally cheap as they rely on human sensors as the main agent of information delivery. In this chapter, we discuss how these techniques can help mitigate accessibility problems and present some existing research and applications in the field.

INTRODUCTION

According to the World Health Organization, "more than a billion people in the world today experience disability. These people generally have poorer health, lower education achievements, fewer economic opportunities and higher rates of poverty. This is largely due to the barriers they face in their everyday lives, rather than their disability. Disability is not only a public health issue, but also a human rights and development issue."

Urban mobility can be defined as the people's capacity to move around the city, to live and to interact with the space. This ability can be strongly affected by architectonic obstacles which represent a physical impediment to the exercise of citizenship by people with special needs, such as disabled elderly people. (Mirri, Prandi & Salomoni, 2016)

The term accessibility has various definitions and it can be understood as a medium to obtain barrier-free environments which affect the usability or the utilization of services associated to these areas, depending

on the context in which it is employed. Inside this group, we can highlight the environmental accessibility which refers to how accessible a place is to a group of people. This kind of accessibility describes the relation person-environment, in which the abilities of a person are opposed to the environmental properties for a given place. The environmental accessibility extends to a large group of users, which includes children, elders, people walking with baby carriages or with heavy luggage, among others. It basically has the goal of equality. (Laakso, 2014)

It is clear that human navigation is a quite complex activity, essential to people in environments which require movement. It is a process which involves the association of many locomotion components, discovery of paths/routes, vision (responsible for the capture of static and dynamic information of the environment) and the locomotion medium (on foot, cars, motorcycles, wheelchairs, among others). Thus, for someone with visual impairment or movement disability, the navigation in unknown environments becomes a hard task. This happens due to the specific necessities of each individual. Consequently, many disabled people deprive themselves from exploring unknown environments because of these problems and of the risk they can offer to their security and health. (Vanclooster, Weghe & Maeyer, 2016; Brock, Truillet, Oriola, Picard & Jouffrais, 2012; Coughlan & Shen, 2013; Schmitz, Becker, Blessing & Großmann, 2011; Santos, Forest, Dutra & Almeida, 2012; Neis, 2014)

Thus, environmental accessibility has a fundamental role for those who have some kind of special need, as these individuals have many difficulties when trying to move around public environments, since such places sometimes are not adequately adapted to users with some disability, whether it is physical or visual. People with disabilities should be in constant interaction with their sociocultural medium. Although the construction of accessible places is a goal in current society, urban areas, specifically the ones for pedestrians, are often inadequate for locomotion of the elderly and disabled, since these users have greater and more remarkable needs when it comes to accessibility. Therefore, these environments still represent one of the most real examples of the difficulty of locomotion felt by people with disabilities. Thus, geospatial data play an important role in offering help in choosing the best routes according to the population needs.

However, another barrier which hinders people's independent locomotion is the lack of information about the urban environment and its accessibility. The maintenance of up-to-date databases is considerably costly, thus the availability of information about urban accessibility has been traditionally limited for many urban centers. Consequently, traditional approaches based on databases (e.g., maintained by government authorities) have appeared to be not sufficiently effective in the field, thus lowering the chances of becoming a social inclusion medium (Mirri, Prandi & Salomoni, 2016).

In order to assist the users with special needs, a geospatial database must contain the maximum amount of information on the characteristics which affect the accessibility, since the pedestrians locomotion mediums are extremely large and suffer constant changes in their structure. Thus, crowdsourcing, social media and Volunteered Geographical Information (VGI) offer a great potential to the collection of data at pedestrian level. The OpenStreetMap – OSM (www.openstreetmap.org) is one of the most representative examples of dynamic maps. It is a voluntary project offering the users an online map, which grows with the help of non-official sensors, i.e., amateurs which contribute daily with information updates. (Qin, Aburizaiza, R. Rice, Paez & M. Rice, 2015; Laakso, 2014; Antoniou & Skopeliti, 2015; Basiouka, Potsiou & Bakogiannis, 2015)

The mapping of dynamic geographical phenomena is a hard task, due to the frequency of changes they are subject to. In urban areas, for instance, pedestrian walkways and the transportation infrastructure

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

are among the ones which suffer the most with frequent changes, since they are affected by obstacles in sidewalks, construction detours, among others. For individuals with vision and mobility disabilities, changes in pedestrian walkways (even temporary) may cause various problems, due to the necessity of route change, inconvenience and the risks posed to their safety and health. Thereby, the updated mapping of these areas becomes something essential. Nevertheless, remote sensing and automatic characteristics extraction, in this scenario, are not a realistic approach, due to the cost and the requirement of frequent updates. Hence, a different approach is needed. Thereby, VGI, which is based in a new form of participative mapping and in the use of crowdsourcing, has been successfully applied to the mapping of such phenomena. (Brock et al., 2012; Wen, 2013)

It is generally accepted that maps offer significant help in activities like orientation, mobility and support to streets and buildings locations, as well as the estimate of the directions and distances between points. A great number of people with visual impairment use technology to perform tasks in their daily life. The increasing use of computers, smartphones and tablets can offer efficient forms of interaction, transforming these devices into valuable tools to offer users an intuitive interface, dedicated to improve their visualization and mobility. As a result, mobile platforms are rapidly evolving, aiming the development of supporting technologies. Recently, various smartphone apps were developed with the goal of helping disabled people. Such tools, although promising, still have proven incapable of offering some detailed information about the location of the user, such as precise orientation with respect to a pedestrian crossing, current status of signaling lights, barriers and surface inclination. (Coughlan & Shen, 2013; Koukourikos & Papadopoulos, 2015; Laakso, 2014; Prandi et al., 2014)

In the recent years, it could be noticed a constant effort to the development of applications capable of detecting such problems, making VGI a potential solution. Maps based on OSM arose with a variety of purposes, such as skiing, walking or public transportation. In addition, applications and projects like OpenRouteService and Open TripPlanner demonstrate VGI can represent a reliable source to the development of pedestrian routing and navigation software solutions applied to disabled users. (Laakso, 2014)

Moreover, we are witnessing the emergence of a new era of online geographic tools like Google Maps, Google Earth NASA World Wind, OpenStreetMap, among others, which have attracted an immense number of users. For example, in the five largest European economies, 50% of users access online maps through their personal computers, and 35% through mobile phones daily. However, not all people can have access to this type of information due to its graphical nature. Some groups of users, such as the visual impaired, are examples of it. (Calle-Jimenez & Luján-Mora, 2015)

This chapter discusses the importance of Volunteered Geographic Information applied to accessibility, demonstrating the efficacy of this phenomenon in the reduction of mobility problems, providing essential information in the context of physically and visually disabled people. In addition, the chapter presents a literature review, comparing and highlighting the strengths and weaknesses of existing research using VGI and crowdsourcing to mitigate accessibility issues for those user groups.

The next section introduces some relevant background concepts and discusses the motivations for development of VGI and crowdsourcing systems to physically disabled and visually impaired people. Then the following section describes how VGI and crowdsourcing phenomenon can help reduce the locomotion difficulties of disabled people. Then the next section highlights current researches and innovative accessible applications based on VGI and crowdsourcing to assist disabled people in their navigation activities. Finally, the last section concludes de chapter and points to future directions.

BACKGROUND AND MOTIVATION

This section presents some of the motivations for the development of solutions using crowdsourcing and VGI aiming to mitigate accessibility issues encountered by physical and visually impaired.

Physically Disabled People

According to World Report on Disability (2011), "Disability is part of the human condition. Almost everyone will be temporarily or permanently impaired at some point in life, and those who survive to old age will experience increasing difficulties in functioning. Most extended families have a disabled member, and many non-disabled people take responsibility for supporting and caring for their relatives and friends with disabilities" (p. 3).

According to World Health Organization (WHO), disability is a generic term, which encompasses activity limitation (difficulty in the execution of a task or action), participation restriction (problems caused to an individual when getting involved in daily life situations) and other disabilities in general. It can be represented as a problem in the body function or structure. (World Health Organization, n.d.b.).

Physical disability is characterized by complete or partial alterations which can affect one or more segments of human body, compromising its physical functions. People with such limitations have difficulties when performing their daily activities, like moving from one place to another; and therefore, many times, depend on other people for the execution of those. (Silva et al., 2015)

This limitation hinders the execution of simpler tasks. Frequently, the basic activity of moving becomes arduous, depending on other people's help to their execution. Wheelchair users, for instance, have a multitude of problems when trying to move through external environments. A simple deformation on the sidewalks surface can offer risks to the health of these individuals, resulting in accidents. However, construction companies do not frequently follow these rules and many environments are built in a way which does not offer the proper accessibility to the physically disabled people, preventing the utilization and locomotion through these places by this group of users.

Thus, the utilization of human sensors, in this context, can be extremely useful. Applications can, through the VGI techniques and crowdsourcing, offer information about the environments, presenting those who possess the proper alterations to accommodate the physically disabled people or relating the problems found in the attended places. So, as one identifies any type of problem in the environments used, one can insert information in the systems, about what type of inadequacy was found, like tight corridors, inexistence of accessible restrooms, inadequate surface elevations, among others. The utilization of the traditional mediums of acquisition of geographical information in this kind of situation is unfeasible due to the cost needed to update the data in a timely manner to the provision of correct information to the users.

Blind People

An individual characterized as blind has either the total loss of the visual capacity or only the loss of light perception. The one identified as having low or reduced vision, presents a reduction in the visual capacity, only being able to detect masses, colors, shapes, having limitations in long sight, and only having the possibility of identifying objects when they are close. One also presents difficulty to notice

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

visual aspects such as: disproportional features in space, tridimensional representations, composed shapes, depth, movement, objects or materials over similar backgrounds, objects with low light and distinctive details in the forms and inside the figures. The individuals with this kind of disability, in spite of having great capacity of adaptation through other senses, still present some limitations like, for instance, the limitation of the communication capacity, considering that the process of communication consists of receiving, processing and transmitting written and or body information; and the capacity of locomotion, since, for example, individuals which are visually impaired use other senses to move in safety. (Brock et al., 2012; Coughlan & Shen, 2013; Favretto, Carvalho & Canini, 2008; Martinez-Sala, Losilla, Sánchez-Aarnoutse & García-Haro, 2015; Liao, Rakauskas & Rayankula, 2011)

Human beings gather information about the world through multiple sensorial channels (touch, audition and vision) and share them to enhance their comprehension of the world. Over many years, cartographers developed symbolic methods for encoding and communication in order to make spatial information available graphically. However, those strategies are being strongly studied with respect to their form and function, since, generally, the conclusion of these cartographic processes depends mainly on the vision as a medium of interaction. Nevertheless, some people, like the visually impaired, do not have the required visual acuity to the creation, use and comprehension of the traditional maps. Then, as an alternative for this group of users, several professionals of this area developed methods to adapt or substitute the presented information visually through other sensorial domains. (Rice et al., 2013)

The constant growth of the utilization of the technology and mobile applications increases the access to information available in the web, including geographical information. Nonetheless, for people with visual impairment, this interaction is hard when the maps are not accessible. Not all people have access to this kind of information through their devices due to the graphical nature of this geographical data. Visually impaired people, for instance, can have problems when trying to make use of this kind of application. (Calle-Jimenez & Luján-Mora, 2015)

Individuals with this type of disability, despite having great capacity of adaptation through other senses, still present some limitations, like the safe locomotion. Human navigation is a behavior which depends mainly on the vision, since it is through it the individuals capture a great amount of the information around them. Therefore, for a person with visual impairment, the locomotion becomes very hard. These individuals face great challenges when trying to move around external or internal environments due to the complexity of the environment around them and the presence of obstacles in their path (Koester, Lunt & Stiefelhagen, 2016).

Therefore, many of the visually impaired people desire to have the freedom and safety to explore the great variety of existent environments, just like the ones without this disability do. For this purpose, various types of studies are being developed to help the mobility of this group of people. Allied with the mobile technology, present in people's daily life, navigation apps based on maps and routing offer significant help in matters like orientation, mobility and location support, as well as the estimate of the directions and distances. Thus, a great number of people with visual impairment use these technologies to help their locomotion. However, this kind of people usually finds great obstacles to the access of spatial information, since the interaction with this type of application is performed mainly through the vision.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Accessibility Issues (Problems Related to Accessible Environments or People With Disabilities)

According to the United Nations (2007), "Accessibility is about giving equal access to everyone. Without being able to access the facilities and services found in the community, persons with disabilities will never be fully included. In most societies, however, there are innumerable obstacles and barriers that hinder persons with disabilities. These include such things as stairs, lack of information in accessible formats such as Braille and sign language, and community services provided in a form which persons with disabilities are not able to understand. Although some of the more costly accessibility provisions in the Convention can be implemented progressively, there are a number of low-cost, low-tech accessibility solutions that would have immediate benefits".

According to ABNT NBR 9050 (ABNT, 2015), accessibility is defined as the "possibility and reach, perception and understanding condition for utilization, with security and autonomy, of housing spaces, urban equipments, edifications, transportation, information and communication, including their systems and technologies, as well as other services and installations open to the public, of public or private collective use, in both urban and rural areas, by a person with disability or reduced mobility".

Therefore, accessibility is fundamental in all environments of collective usage. In order to be considered accessible, an environment must offer conditions to come and go with independence, comfort and safety whether the displacement is horizontal or vertical, with or without stairs, corridors, ramps and elevators, or any other medium, being properly signaled, if necessary, by plates, signs and any essential information. Thus, the presence of any kind of obstacle which can hamper this capacity is considered an architectonic barrier. (Silva et al., 2015)

Human mobility is related to various factors such as age, health, and/or social and economic status, and is directly related to the development of the cities, since all human actions involve movement around the space. Thus, locomotion difficulties can impact in a variety of areas, such as: economic, social, and even environmental. The equalization of the possibility of locomotion for various publics means making the social functions of the cities accessible to all. Nevertheless, urban locomotion is directed to assume that perfect mobility is something guaranteed, since motorization becomes more and more universal around the world. Thus, all exceptions to this rule tend to be treated as deviations, relating with social groups which are currently in disadvantage. The accessibility is, therefore, the way to make the urban space and city mobility socially just. In this sense, accessibility can support the sustainable urban development. (Abitante & Lima, 2014; Taylor & Józefowicz, 2012)

Accessibility is connected to both mobility factors and the physical environment, and must enable the displacement of the individual with plain safety. Thus, the possibility of locomotion is a fundamental aspect of the human being, whether disabled or not, directly related to sensations, perceptions, social history, social, economic, cultural and environmental contexts, among others. Consequently, accessibility offers access to all services, according to the necessities presented by people, at all levels of attention. Hence, the more individuals stay in environments which restrict their mobility and accessibility, the greater will be the difficulty for them to reach a plain and autonomous life. (Amaral et al., 2012; Taylor & Józefowicz, 2012)

One of the main challenges faced by people with disabilities is represented by the various problems of accessibility which can be found in the streets or in the development of their daily lives involving locomotion. Flooding, holes in the streets, objects inconveniently discarded in the streets, among others, are some of the questions which bring discomfort to all citizens, in addition to creating locomotion

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

barriers to the disabled. The problem is not just the structure of the locomotion mediums, which affects where and how people move, but mainly the lack of mechanisms to determine the accessible areas of an environment. (Cardonha, Gallo & Avegliano, 2013; Hara, Le & Froehlich, 2013)

The US Department of Transportation and the US Access Board, for instance, describe some of the problems which hamper the accessibility of pedestrians, including: the lack of well-connected paths to destinations like schools, problems in the streets surfaces - blocked temporarily (by a vehicle, for instance) or permanently (light poles); hard crossing of tight streets and sidewalks with less than 60 inches (hampering the locomotion of wheelchair users) (Hara et al., 2013). Therefore, it can be noticed that accessibility is a fundamental factor in the life of the disabled people, once those need specificities in the execution of their activities.

Besides, the utilization of geographical information is currently becoming more and more important in society. Maps can help various people in their daily needs, such as children coming back from school, women avoiding unsafe areas at night, parents pushing baby carriages, among others. Nonetheless, the major part of this kind of information is inaccessible to the users with visual disability, once the interaction with these applications is performed mainly by vision, and usually made available through interactive maps. In addition, this group of users needs the knowledge of several characteristics of the environment in order to move safely and adequately, as sidewalk accessibility, points of interest, among others. However, this is not offered with efficiency by the current geographical data providers, due to the high costs and slowness in the collection of this type of information using only the traditional mediums. (Mirri et al., 2016; Kaklanis, Votis & Tzovaras, 2013a; Kaklanis, Votis & Tzovaras, 2013b; Prandi, Soave, Devigili, Amicis & Astyakopoulos, 2014)

HOW CAN VGI AND CROWDSOURCING MITIGATE ACCESSIBILITY BARRIERS?

One of the great difficulties to the production of accessible applications is the lack of details about the locomotion environment of the disabled public, such as the infrastructure of the pedestrian walkways, fixed and transitory obstacles, among others. These characteristics are important, since their presence can prevent or hamper the locomotion of this public in the place or even cause accidents, posing risks to the individual health.

If the information about areas used by pedestrians were reliable and complete, it would be possible to increase the number of pedestrians and the amount of physical activity performed by people in general. Thus, environments could become more accessible, offering the users the required information for the provision of accessible routes and about barriers and objects which hamper locomotion. (Laakso, 2014)

Therefore, crowdsourcing has recently received great attention, due to its capacity of providing with efficiency data and geographical synthesis. This technique has proven to be a new resource to make information more accessible, excluding precision gaps and gathering intellectual power of human beings. Due to its efficiency, it has obtained great interest from researchers from a variety of fields, starting from more specific to broader fields, even reaching the context of social media, demonstrating its importance and potential.

Along with that, during the last decade, the emergence of VGI offered an alternative to the provision of spatial data. The mechanisms used for acquisition and the nature of VGI can provide competitive advantages over official data, such as: the knowledge of the place, the update frequency, cost reduction

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

to data acquisition and maintenance, temporal relevance, social and community engagement, among others. These benefits are intrinsically related to the participation of the public in the GIScience community and demonstrate crowdsourcing can serve as an essential technique in computational projects with geotechnological objectives, due to its association with the community, the final users and its real world application. Thus, these characteristics have drawn attention of both researchers and private sector institutions. This kind of information can enrich, complement or update datasets, products, or become the only source of such data. (Antoniou & Skopeliti, 2015; Rice et al., 2013)

Besides that, the advance and participation of technologies such as Global Positioning System (GPS), Internet, geospatial communication, mobile and wireless communication, automatic sound recognition and image recognition can offer alternatives to the development of solutions which can assist the sensorial capacity of disabled people, helping their displacement, security and health. However, even with the whole potential presented, these technologies are not well used in the field of accessibility, ignoring important factors like the special needs of each individual, environmental characteristics, among others (Mostafavi, 2015; Takagi et al., 2013)

Then, the union of all those characteristics makes the VGI approach a suitable alternative to be used in environments in which the frequency of changes in space is very high, which is the case with the environments used by pedestrians, generating great opportunities in the research field.

VGI and Crowdsourcing to Improve Accessibility

According to World Report on Disability (2011, p. XI), "Across the world, people with disabilities have poorer health outcomes, lower education achievements, less economic participation and higher rates of poverty than people without disabilities. This is partly because people with disabilities experience barriers in accessing services that many of us have long taken for granted, including health, education, employment, and transport as well as information. These difficulties are exacerbated in less advantaged communities".

Currently, much research is being developed to analyze the feasibility of the usage of human sensors and/or crowdsourcing to provide accessibility to visually and physically disabled people. In this field, therefore, it is worth mentioning some studies which have the objective to provide accessible maps with relevant geographical information for the disabled people and others which aim at providing accessible routes based on the users' limitations.

Some applications whose objective is to help the user in its navigation can be highlighted in the context of the physically disabled people. This can be done through the presentation of maps capable of exhibiting information directed specifically to this group. These can be locals and areas (restaurants, stores, boulevards, among others) which present adaptations to the perfect utilization by the physically disabled person, whether through restrooms, routes or any adaptation which enables the accessibility. Such information is obtained through the participation of the users in the system, informing the places which present the satisfactory adaptations and also the problems in this context.

Yet in this group, the creation of applications and research which work with the categorization and presentation of adapted routes using crowdsourcing has currently grown, for instance: studies on the collection, processing and presentation of the more viable routes for this public, considering their limitations. Thus, a map capable of generating accessible routes based on the specificities of the user and environment characteristics is commonly used.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

With respect to the visually impaired people, a great amount of studies have emerged to facilitate the access and provision of information originating from maps through alternative mediums other than the visual channel (e.g., audio, vibration, among others). These individuals face daily a multitude of problems. The simple activity of crossing a busy street becomes something extremely hard due to their special needs. Therefore, the provision of geographical information capable of presenting which places have the required adaptations for the usage of this public (e.g., audible street signals or tactile paving) becomes essential.

Finally, as for the physically disabled people, some applications also emerged with the goal of generating the best routes (most accessible) to the user with some visual limitation. In this context, the main goal is to propose, considering the user's needs, the routes which have less obstacles, which can be: holes in the streets, steep slopes, trees, or any kind of change in the environment, whether it is fixed or transitory, capable of posing any risk to the health of the disabled person.

For the development of such applications, increasing efforts have been directed to use VGI and/or crowdsourcing as the origin of the information, whether for updating any internal information in a map of the application or to calculate accessible routes to the users with the described special needs, among other purposes.

ACCESSIBLE APPLICATIONS AND RESEARCHES

Any person, in order to develop some activities, necessarily has to get around from one place to another. But when this action is performed by the disabled people, the mobility is impaired due to their special needs. Locomotion for disabled individuals is a complex task, since they require tools adapted to their needs or some help of other people to facilitate their mobility. Moreover, if the environment has obstacles, this task becomes even more difficult, since these can block the passage of those with some disability or even offer them health risks. A wheelchair user, for example, requires unhindered passages that enable their navigation with the wheelchair. Therefore, steep slopes and narrow corridors can prevent the passage of these persons in certain environments. In the case of visually impaired people, the situation is also critical, because these individuals generally cannot get a detailed description of the environment around them, making it impossible for them to detect barriers, mainly transient, like potholes, slopes or any kind of obstacle in locomotion surfaces. Thus, these can easily suffer accidents.

Short-lived obstacles, such as obstructions on sidewalks, detours caused by construction and damaged surfaces are unpredictable and, therefore, considerably difficult to be detected in traditional mapping systems (Qin et al., 2015). The detection and rapid geographical location of transient obstacles can be of great help for the visually impaired (Rice et al., 2013). For that reason, alternative means should be developed to fill that gap. Some of the alternatives proposed by researchers aimed at solving this problem are described below.

Jayakody, Murray and Herrmann (2015) propose a model to help visually impaired people in indoor environments they are not yet familiar with, such as universities, hotels, houses and restaurants. Users usually use white canes, GPS navigation devices and guide dogs to assist them in these tasks. However, these instruments and animals do not provide sufficient information for the visually impaired to properly navigate in indoor spaces. The authors propose a mechanism for collecting useful information on locomotion areas and obstacles in internal environments (e.g., wash room, lift lobby, stair case, walls

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

and doors), based on a mobile application that works with a set of sensors; and on information extracted from the web about Points of Interest (POI). Moreover, they propose a method of automatic labeling/tagging maps with semantic information on internal environments (e.g., room names, room description) to assist visually impaired navigation. This participatory methodology allows users to contribute with information on indoor environments in a collaborative way through their mobile devices. The use of cameras and internal sensors of the devices can increase the reliability of semantic information added to a crowdsourcing database.

Rice et al. (2013) propose a crowdsourcing system that consists of a base map and information on barriers and hazards environments. Such information may be represented in the form of events, such as those related to construction activities. The information is collected through crowdsourcing combined with Ambient Geographic Information (AGI) acquired from geosocial networks and by traditional means, that is, from government, state or municipal entities. Obtained data are geotagged using a method based on a gazetteer, filtered, labeled and evaluated in terms of quality. Finally, relevant information on obstacles hazardous sites is presented on a hybrid system.

Rice et al. (2013) argue that local construction activities, such as fencing across walkways, are usually mapped by authoritative entities. On the other hand, more transient obstacles, such as the temporary delivery of bulk construction materials onto a public right-of-way, are not mapped by these entities because of their temporary nature. Thus, through crowdsourcing, they gather information about those transient events and combine them with the authoritative reports. Although the authors propose a useful method of capturing obstacles which combine various techniques, no effort has been directed to acquire VGI information directly from the users. Furthermore, since the proposed system aims at supporting accessibility, it could be further improved by including a routing component to avoid obstacles and could provide an accessible interface to be used by their target audience.

In order to facilitate the identification of accessible environments for disabled people and wheelchair users, maps containing useful information for this public can be developed. One of the best and fastest ways to do this is to use the community knowledge. For instance, Wheelmap (http://wheelmap.org) is an online map based on VGI, available for web and mobile platforms that has the function of helping disabled people. This application can identify a variety of different environments such as gas stations, restaurants, banks, churches, medical centers, department stores, among others. Each environment is associated with a level of accessibility identified by anyone who wants to contribute. Available levels are “wheelchair-accessible”, “limited accessibility”, “not wheelchair-accessible” and “unknown”. In addition, the user can search for locations based on different categories (e.g., tourism, shopping and food) and contribute by adding new places, editing place information (e.g., name, address) and by uploading photos of entrances. Users can easily add information about accessibility through an online application or a mobile application. It is an essential application for wheelchair users, since it facilitates the identification of places with affordable accommodation and avoids unpleasant experiences.

In the field of accessible maps, the research by Calle-Jiménez and Luján-Mora (2015) can be highlighted. The authors present an alternative solution to improve the accessibility of geographic maps using VGI and Scalable Vector Graphics Tiny (SVG Tiny - www.w3.org/TR/SVGTiny12/). The proposed application allows the users to interact with the system by adding accessibility information and other descriptions of elements that make up the map, such as the presence of ramps, escalators and parking lots available. Using this tool, users can select a map element and a window appears so that they can add accessibility information about that element or location using SVG Tiny code. Since SVG is a textual representation of a map, it helps the development of accessible maps through the use of text readers.

Kaklanis et al. (2013a, 2013c) present the "Open Touch / Sound Maps", a multimodal interactive map that replaces the visual information by alternative formats. The tool is a mobile application for Android operating system, which is aimed at improving accessibility of interactive maps for visually impaired users. Multimodal interaction is given by sound effects, Text-To-Speech (TTS) and vibration feedback, which allows access to OpenStreetMap data for the visually impaired and blind people. This application, unlike others previously described, does not implement the techniques of crowdsourcing or VGI directly. Rather, it relies on data from OSM, which is a comprehensive platform based on these techniques. Thus the intention of the authors is not the production of information from the collaboration of the community, but the availability of information to your target public (visually impaired people). This application enables the retrieval and the tactile exploration of any area of the map through a mobile device running Android, with the help of sound effects and messages generated by the TTS.

For the visually impaired, there is a need to identify routes that offer less risk to the user's health (routes that have fewer or less dangerous obstacles). As this user group has disabilities in an aspect of great importance to locomotion (the vision), they have to overcome this difficulty through the use of other senses. Thus, applications aimed at suggesting routes for the visually impaired must provide an essential feature: an accessible interface, which provides to individuals forms of usability which consider their needs. We now present some studies that aim at providing navigation features through accessible interfaces.

Zeng and Weber (2015) discuss the difficulty that the visually impaired have in navigating in an external environment and in finding access ports (entrances) to the unknown internal areas such as entrances of shopping malls, hotels and shops. One of the factors that cause this difficulty is the spatial complexity around the entrances of these locations (e.g., presence of trash cans, stairs and alternative corridors). From this, the authors propose the Coach system, a tool that unites crowdsourcing technology, location-based services and vibration effects and audio outputs in a mobile application. This research assumes that the currently available wayfinding systems by mobile devices cannot function properly near entrances because of GPS signal loss. Thus, the authors use information on environmental accessibility, like difference of textures in a way, and crowdsourcing information to help visually impaired people located in environments around the entrances and help them on the routes to these.

This research uses the crowdsourcing technique in two user groups. A group is formed by people who have normal vision and are volunteers who contribute information about environmental accessibility. This group is responsible for providing, through their mobile devices, structured information (presence of automatic doors, attached stairs or tactile paving) on a particular location. The other group is made up of visually impaired people who receive, on their mobile devices, the information provided by the first group to support navigation. This group is responsible for sharing their experiences providing unstructured information (text or audio recordings) about their experiences and the accessibility of a given environment. [Zeng& Weber, 2015]

Zeng and Weber (2015) offer a fairly complete system covering obstacle detection, accessible interface, generating routes and a component that the user guide to their destinations. In addition, the authors use the crowdsourcing technique both to get information from people who have no disability as for the experiences of the visually impaired. However, it is a very specific application intended only for providing a navigation system for detecting access to internal room doors. The way the crowdsourcing technique was used (accessibility information from user disabled and non-disabled) could be extended to navigations applications in outdoor and indoor environments.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Prandi et al. (2014) present the mPASS application (mobile Pervasive Sensing Social Accessibility). It is a system which aims to assist in the navigation of people with disabilities, by collecting data on urban accessibility and providing accessible paths and maps to citizens. The application uses experts, sensors and techniques of crowdsourcing and crowdsensing to obtain data. These techniques are responsible for detecting the accessible features of the environment and to adapt the routes to the limitations and preferences of each user. The authors introduce the term Accessibility Points of Interest (aPOI), which represents the presence or absence of a barrier. Thus, the users can share, through the mobile tool, their experiences in finding different aPOI and categorizing them according to the level of accessibility. From this, the system is able to generate routes based on the users profile and the categorization of aPOI provided by the users. Moreover, aiming at providing useful visual information, the mPASS can also capture multimedia information, such as pictures and videos. The mPass provide for disabled people a way to avoid environments unsuitable for their limitations, as steep and uneven surfaces. Through the application, users can prioritize paths that have ramps and accessible features. The system can avoid paths that have obstacles and risky crossings.

Table 1 compares the researches discussed above by identifying a set of desired features for an application aimed at improving accessibility for physically and visually impaired people. We believe that an ideal application should include all the features shown on the Table 1. Physically and visually impaired people suffer from the presence of obstacles in the environments they navigate, both indoor and outdoor environments. A feature to automatically detect barriers would be extremely useful, such as those based on movement patterns or by image analysis. However, unfortunately, envisioned solutions still have many drawbacks, such as those related to computational costs, financial problems or privacy. For example, movement pattern analysis depends on the continuous collection of the user's location (through the device's GPS), leading to excessive consumption of device's battery and to privacy concerns. Solutions

based on computer vision to detect barriers from web pictures, for example, are not yet sufficiently accurate and are still costly. In this context, VGI-based techniques appear as suitable alternatives to identify barriers, even though this is not an automatic detection approach.

As users have different levels of limitation, there is a need for the development of a mobile client application equipped with a multimodal interaction interface. Moreover, the generation of routes avoiding obstacles would be an essential feature in these applications. As the automatic routing may contain errors, the VGI technique could help in this context, that is, the system could record the route of users, evaluate them as the presence of barriers and make them available in the system for use of the community. Audio and video messages about the environment could also be shared among users, aiming to provide information on a location in question for new users in that area. Finally, especially for visually impaired users, navigation functionality based on sound messages would be extremely useful. Users with this limitation need alternative ways to get located in relation to physical environment components. This can be easily implemented through the accessibility features available on mobile devices (e.g., Talkback present on the Android platform).

AN ACCESSIBLE PLATAFORM BASED ON VGI AND CROWDSOURCING

A research aimed at providing accessible outdoor navigation for visually impaired people is being conducted in our labs. We have developed a platform based on VGI and crowdsourcing to provide obstacle detection, recognition of users' environments, routing avoiding barriers and guided navigation. The solution comprises a mobile app equipped with an accessible interface which produces vibratory effects and sound messages.

The platform consists of four components, as shown in Figure 1. The map server retrieves information from the OSM service. The Talkback (accessibility service available on Android devices) provides the

Figure 1. The VGI-based platform

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

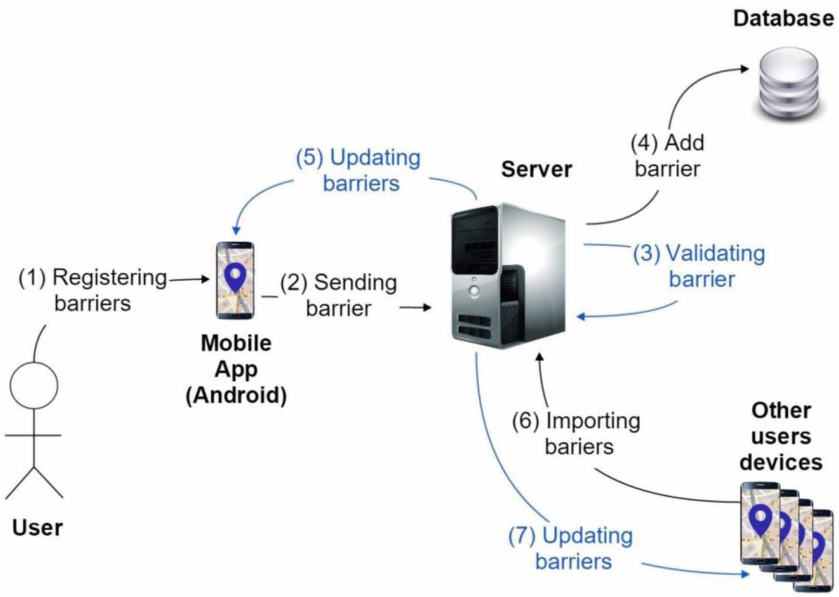
audio messages. The server is designed to receive, process and store information reported by the users. Finally, the client application (Mobile App) provides information to the end users and provide features to collect volunteered information.

Figure 2 describes the process to report and visualize barriers in the platform. The numbers shown on the picture represent the order of actions within the process. First a user reports the barrier on the server using the mobile application, specifying its type (among several types available, e.g., public phones, elevation, tree) and its dangerous level. The server registers the barrier report in the database and performs validations on the data. Then barrier information is made available on the platform so that other users can view it on their own devices.

The accessible interface of the mobile app explores a variety of tactile gestures capable of running on Android devices was developed. The tool recognizes different touch commands (double-click, single click, drag fingers) and associates each of them a kind of action. For example, the double click command focuses the map at the selected location, facilitating the exploration and recognition of areas outside the initial focus; the movement of dragging fingers returns auditory messages containing the names of selected locations (e.g., streets, avenues). The output information or instructions for users are available through sound effects and audio messages.

In order to provide greater comfort for the visually impaired, when the application starts, the map is centered on the current position of the user. This is intended to facilitate navigation and identification of the individual's position in relation to other map elements due to their needs. Such elements include Points of Interest (POI), obtained from a set of external services. As the barriers represent a great danger for the visually impaired, the proposed solution provides participatory means of identifying barriers, both fixed and temporary. Beyond providing information about elements on the user environment, the tool is able to warn the users about barriers during their navigation.

Figure 2. Collecting and using barriers information



EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Among the main challenges in providing such a VGI service is the development of algorithms to perform validations and analysis on the reported data. In our research, significant efforts have been made in this direction. Several data quality issues must be considered in this task, since the location of a certain barrier differs considerably among different user reports. Moreover, the inaccuracy of information collected by users' GPS sensors adds significant challenges to the process, because the expected accuracy for this kind of information (i.e., barriers to be avoided by visually impaired) is much higher than in other location-based services.

CONCLUSION AND FUTURE DIRECTIONS

Physically and visually impaired people face serious locomotion difficulties in the various environments that are part of their daily activities. Often, small details such as trees, narrow hallways, small holes and slopes in surfaces can influence the locomotion, causing discomfort and offering danger to the health of these individuals. These people need effective solutions that can solve these problems, since mobility is essential to the development of the day-today tasks of any person. Therefore, it is clear that there is a great need for resources that can assist the navigation of this group of people; solutions that can indicate which environments are adapted to the needs of the individuals and the best paths to get to their destinations, considering the specificities of each disabled person.

However, one of the great difficulties in developing software to help disabled people in their navigation is to obtain detailed information about the environment, since many cities and countries do not have up-to-date databases that provide useful information on their physical space. Moreover, environments which have such information do not usually include certain details that are sometimes crucial for these people's navigation (e.g., trees, poles, holes and surface unevenness). These obstacles (fixed or transient) can strongly influence the movement of people with special needs, offering danger to their health and safety. Thus, the use of VGI and crowdsourcing techniques in applications for this purpose has been considerably efficient due to the volunteered methodology of data acquisition, low cost of the process and update speed.

Nevertheless, systems based on VGI or crowdsourcing have major challenges to be built, such as those related to the reliability of the data entered into the system, usually by thousands or millions of users who insert information several times a day. According to Coleman (2013), one of the main difficulties encountered in developing systems that have VGI as the basis is how to assess the credibility of the users and the quality of their contributions. However, methods of analyzing reputation, adapted for the kind of systems discussed in this chapter, have not yet been sufficiently developed.

Another problem still encountered in the development of VGI applications is the community participation (Chow, 2013; Qin et al., 2015). This is an essential feature in the application maintenance, since it depends on the users' motivation to keep inserting and updating data. Some application discussed in this chapter, such as those for help navigation avoiding barriers, face particular problems related to the users' motivation, since the number of reports for a barrier decreases considerably when the information is already available on the system. That is, the users will not report a barrier if the system is already aware of it. However, the system needs as much information (i.e., user reports) as possible to increase accuracy and to deal with temporary barriers. Thus, considerable efforts should be made to develop suitable methods of providing society awareness and user motivation in this kind of systems.

KEY TERMS AND DEFINITIONS

Accessibility: Ability to provide the inclusion of disabled people in the participation of any activity.

Barrier: Object that offers danger or discomfort to an individual and that is located in their path.

Disability: It is an intellectual, cognitive, sensory, mental or developmental impairment of an individual.

Location-Based Service: Software-level service that handles location-based data.

Mobility Impairment: Physical impairment that impairs an individual's mobility ability. Persons affected by mobility impairment often use assertive devices such as wheelchairs and artificial limbs to obtain mobility.

Multimodal Map: Map that enables interaction through other senses beyond vision.

Short-Lived Obstacles: Obstacles that disappear with the passage of time (for example, trash and stones).

Visual Impairment: Visual impairment that, even with the best optical correction, partially (between 40 and 60%) or totally compromises the vision.

Chapter 30
Designing Effective Crowdsourcing Systems for the Healthcare Industry

Kabir Sen
Lamar University, USA

Kaushik Ghosh
Lamar University, USA

ABSTRACT

This article describes how healthcare faces many challenges. Among them is the inability of patients to seek and receive treatment based on their preferences. Patients characteristically pursue solutions to their medical problems that suit their individual needs. However, care providers and other stakeholders including healthcare insurance providers seem to 'limit' patients' ability to access affordable and quality healthcare. Discourse in prior research has indicated that the use of crowdsourcing may provide patients access to treatments that can solve their medical problems. This article is an extension of extant research that describes the main challenges facing healthcare. It advances current research by presenting ideas through which these challenges can be mitigated. The core ideas proposed encompass the elements of crowdsourcing systems that will include participation of individuals in the crowd without any bias, enable knowledge sharing among all members of the crowd, and provide opportunities for testing the solutions proposed by the crowd.

INTRODUCTION

Worldwide, healthcare remains a challenge in numerous aspects – quality of care, high costs of care, patient access to care. Crowdsourcing has been suggested as a way to solve healthcare problems (Ghosh and Sen, 2015; Kamajian, 2015), especially when the disease is uncommon and remedies are not readily available (Ghosh and Sen, 2016; Sen and Ghosh, 2018).

Many have defined healthcare as a unique problem (McCartney et al., 2013)– customers or patients have the most 'stakes'; however, the least power and control to make decisions and choices regarding

their care. For example, in the United States people often have to select a physician (care provider) based on their health insurance providers' recommendations, rather than having the choice to suit their own health needs and preferences. Similarly, during most times, treatment plans are dictated by the care provider's convenience rather than the patient's preferences. Crowdsourcing may help alleviate these issues (Blohm et al., 2013; Budescu and Chen, 2015; Ghosh & Sen, 2018; Prpic et al., 2015; Ranard et al., 2014; Xu et al., 2016). When a patient crowdsources their health problem, the inputs from the crowd may not 'bear' the bias of stakeholders (such as physicians, insurance providers, pharmaceutical companies), thus providing the 'latitude' to patients to make choices that suit their personal preferences and choices. In recent times, crowdsourcing has been typically used to generate ideas to solve medical problems (McCartney 2013), as illustrated with the advent of platforms such as CrowdMed, a crowdsourcing system that engages the crowd to find solutions to rare medical cases.

The healthcare industry faces different types of problems. These have been classified as (1) Known Known (2) Known Unknown (3) Unknown Unknown (4) Unknown Knowns (For more details on these classifications, please refer Ghosh and Sen, 2016). However, each of the four types of healthcare problems has its own challenges based on the different types of obstacles to solving the problem. This paper attempts to classify these problems and provides suggestions for an effective healthcare system that has helpful solutions.

THE FOUR HEALTHCARE CHALLENGES

The *"Known Known"* Problems: In spite of a solution to a medical problem existing in certain parts of the world, the answer does not appear to be "generalizable". Sometimes, the opposition to generalizability can come from ignorance based on superstition or beliefs that do not emanate from scientific evidence. On other occasions, the resistance may come from groups that have a vested interest in maintaining the status quo. This could occur when a particular company or sector of the industry will see their sales or profits decline if more globally efficient medical solutions emerge.

The effective antidote to these problems are:

1. Increasing the population of voters within the crowdsourcing system that alleviates the impact of block voting by vested interests (Surowiecki et al., 2007). This can be done by designing crowdsourcing systems that attract maximum number of interested individuals. The crowdsourcing system should promote participation to maximize the involvement of the crowd. Mechanisms within the system should enable individuals to participate without restrictions. There should not be any filter as to which individuals or entities may or may not participate. The crowdsourcing system should be equipped with internal procedures that can organize, filter, and integrate crowd contributions.
2. Having rigorous entry requirements into the crowdsourcing systems that rule out a disproportionate impact of voting blocks. Once the crowd containing individuals from varied backgrounds provides inputs on the type of disease by specifying the name, symptoms, diagnosis, and prognosis, a crowd voting mechanism can be applied where input from the crowd is aggregated.
3. Incorporating rules in the crowdsourcing system that include an equitable representation of the total population of the crowd. Hence, algorithms within the crowdsourcing system should be present to operationalize equitable representation by assigning equal weights to inputs coming from all sources, irrespective of their affiliation, background, and subject-matter expertise.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

The above solutions reflect attempts to prevent the "true" median of the wisdom of crowds being displaced because of poor selection, a disproportionate influence of different parties with vested interest. Thus, the solutions attempt to arrive at the "true" median of the crowd's wisdom.

The "Known Unknown" Problems: In these cases, a large group of interested entities are all working towards the same goal but are not necessarily collaborating in the most efficient way. One of the reasons might be that elements of the crowd may have loyalties to their original organizations (affiliations). This could prevent critical nuggets of information from being shared across the entire population of the crowd primarily due to the fact that individuals participating in the crowd would have their own agenda to 'push.'

In order to prevent this, the crowd must be designed to foster interaction across its different elements. Thus, before the main task is given to the crowd, a series of starter "mini" exercises could be given to different groups within it. These groups should be designed so that they incorporate individuals from different organizations. Over time, a sense of trust across the individuals forming the crowd is expected to develop as they work together on the mini tasks. This may enable knowledge to be effectively shared.

A challenge for these "known unknown" problems is that the nature of critical knowledge, that is essential for the cure, is not known in advance. A broad-based crowdsourcing system efficiently sharing information can over time recognize the nuanced detail of knowledge that is crucial to solving these problems. Effective interaction between the individuals forming the crowd is an important element of the crowd functioning efficiently.

According to Sen and Ghosh (2018), one way to solve known unknown problems is to request the participating crowd to propose solutions that meet certain conditions (a) whether the solution, once applied to an individual patient can be verified for its effectiveness (b) if any patient has had a encouraging experience after receiving the treatment, and (c) whether the solution is merely an opioid analgesic or does it actually treat the disease.

The "Unknown Unknown" Problems: These require the incorporation of rules that the crowd must adhere to when faced with a new challenge. Often, a new drug or diet or methodology creates a "buzz" that makes one overlook its deficiencies. These problems might be exacerbated with the impact of publicity and public relations expenditures (such as advertising). In such situations, an effective crowd should be given the task of formulating rules that judges the new treatment based on principles that adhere to proven medical practice. Effective functioning of the crowd again depends on all elements working together. Here, the best solution will include the results of medical tests that have been incorporated based on the advice of the crowd.

The "Unknown Knowns" Problems: These involves a total lack of global knowledge of a problem which is known only to a small segment of the population. Sometimes, as in the case of indigenous or 'homegrown' medicine, there is a dearth of understanding of both the principles on which the treatment is based as well as ignorance about the combination of natural ingredients used for the cure. In other instances, there is a "hit" or "miss" quality about the efficacy of a new drug. The problem in many cases is exacerbated as the incidence of the infrequent failures might be known to only a handful of unfortunate patients.

The "Unknown Known" Problems: These can be solved by establishing protocols that call for a methodical collection of all evidence surrounding a new cure or drug. These include the exact composition of ingredients used, an accurate medical description of the affected patient. Step by step, the collection of data should be aggregated to a level when a group of experts from different fields can decipher the global evidence to offer an explanation for a cure's success or failure. The whole process will necessarily be long drawn as in these instances crowdsourcing must not only deal with an extremely uneven

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

distribution of knowledge, but also the likely incidence of idiosyncratic knowledge. The crowdsourcing service should therefore solicit experts not only from different fields, but also have a screening procedure that weeds out individuals who might have prejudices against medical traditions alien to their own.

Further, the efficacy of the medical solution relies on conducting standard laboratory tests and direct inputs from the patient (Sen and Ghosh, 2018). When analyzing the solution offered by a crowdsourcing system to the unknown known problems, the determination of where the solution falls in the continuum (of success and failure) must be based on results provided by technical evidence and the patient's response to the treatment.

DISCUSSION

All four problems described in this article present diverse challenges. There is no "one size" fits all answer to solve the complex nature of these problems. All require collaborations between experts from different medical traditions who work over time to establish procedures that depend on scientific tests as well as feedback from actual customers/patients. There is a strong reliance on how diverse the crowd is and knowledge sharing effectiveness of the crowd to find the appropriate solution. In many instances, either because of ignorance or vested interests, there could be hindrances towards an operative solution. However, the crowdsourcing system should establish procedures and mechanisms to enable unbiased participation and the creation of a knowledge base which in due course will provide strong evidence that pushes towards the best possible solution.

Chapter 31
Strengths and Limitations of Social Media Analytics Tools

Dražena Gašpar
University of Mostar, Bosnia and Herzegovina

Mirela Mabić
University of Mostar, Bosnia and Herzegovina

ABSTRACT

The aim of this chapter is to research and present strengths and limitations of social media analytics tools used in the financial sector. Emphasis is on the business point of view that sees the social media analytics as a collection of tools that transform semi-structured and unstructured social data into noteworthy business insight. There are two main aspects of social media analytics: the technology aspect which covers identifying, extracting, and analyzing social media data using sophisticated tools and techniques; and the business aspect which interprets the data findings and aligns them with business goals. Namely, it is simply not enough to have a social media analytics tool; the tool should be strategically aligned to support existing business goals. The chapter offers a framework for easier adoption and implementation of these tools in the financial sector.

INTRODUCTION

Social media analytics is a relatively new, but fast-growing, field. The term appeared in 2009, and since then it has become a buzz word used to describe the practice of gathering data from social networks and blogs to analyze them and make business decisions. Businesses view the chance to use the vast amounts of data produced by social media users to increase brand loyalty, generate leads, drive traffic, and more. Very soon, social media analytics has become successful in finding:Which customers use social media to comment about brand or a new product launch; which posted contents on social media resonate better with customers; which social media conversations about company, product, or services are positive, negative, or neutral; who are the most influential social media followers, fans, or friends; which social media nodesare influential; which social media platforms are generating the most traffic; which keywords and terms are trending.

The early implementations of social media analytics were related to marketing and brand management. Namely, consumer and brand discussions became the basis that enabled marketers and brand managers to create value from social media analytics.

The financial sector did not stay immune to the explosive growth of social media. Whether financial institutions like it or not, their customers have discussed their reputations and brands within social networks. However, as a highly regulated industry, the financial sector was slower in the implementation of social media analytics. The first adopters of social media analytics in finance were small private hedge funds. The growth of discussion around capital markets, equities, macroeconomic indicators, and breaking news was the basis that enabled the creation of value by social analytics for financial services. Since 2013, the implementation of social media analytics in the financial sector has evolved significantly regarding structure, depth, and breadth.

The massive use of social media analytics could not be possible without different software tools that support it. The early software tools enabled companies to monitor, listen, and measure their social media efforts. Nevertheless, the market for social media analytics tools has grown rapidly. Indeed, since 2012 it had started to consolidate when large IT providers entered the market with significant acquisitions of smaller, independent companies.

Social media analytics tools are becoming a huge business and can be divided into two broad categories: comprehensive platforms and specific solutions focused on one particular feature, like social monitoring, sentiment analysis, community responsiveness, content analysis, competitive benchmarking, and similar.

The financial sector started with social media monitoring, slowly changing focus on applying advanced social media analytics to create scores, signals, and other derived data from social media. Now, the implementation of social media analytics tools in the finance sector is oriented to the integration of social data, calculation of sentiment index, and use of text analysis as a part of risk assessment. Through intelligent use of social media analytics tools, the financial institutions can ensure enormous values for themselves. Applying these tools to the social data (tweets, blogs, posts, etc.) enable financial institutions to derive customer intelligence, understand the need for specific services or products, develop adequate marketing strategies, and transform customer relationship management into social customer relationship management.

However, besides huge potential benefits offered by social media analytics, some challenges remain. One of the big issues is a lack of standards and methods for mining social data, especially non-Cashtag data. Despite all social media potential, organizations that have implemented social media analytics tools still state complexity and lack of tangible return on investment (ROI) as a big challenge. The main question is how to make effective use of collected social media data. Also, as highly regulated organizations, financial institutions have to ensure that their implementation of social media analytics is in compliance with existing regulations and guidance.

The practical implementation shows that just using of social media analytics software is not enough, that organizations have to consider individuals in the process of analysis and interpretation of collected data. Since software tools are still in the process of maturing, organizations need to understand the limitations and risk that come with investing in these tools.

Financial organizations need to evaluate different software tools to find solutions that fit with their business goals. The concerns that can successfully implement social media analytics tools and integrate them with their business will stand to reap advantage, information, and returns. It is simply not enough to have a social media analytics tool; the tool should be strategically aligned to support existing business goals.

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Most of the financial institutions are discovering the challenges of social media analytics, and many are not sure how to proceed. The purpose of this chapter is to provide a clear analysis of the social media analytics tools used in the financial sector, to research their strengths and limitations, and to offer a framework for easier adoption and implementation of these tools in the financial sector.

BACKGROUND

Social media analytics is a relatively new and fast-developing discipline. The Merriam-Webster Collegiate Dictionary added the term *social media* in its dictionary in 2011and stated that this phrase was first used in 2004. The dictionary defines social media as "forms of electronic communication (as Web sites for social networking and microblogging) through which users create online communities to share information, ideas, personal messages, and other content (as videos)" (Merriam-Webster, 2016). Social media offer completely new and different possibilities for organizations that seek two-way communication with their customers. Social media promise real engagement where organizations also see a new way of binding their customers, new revenue opportunities, and lower costs. Nonetheless, if organizations want to achieve these benefits, in order to manage and understand customer interactions they need different methods when engaging in social media; in addition, entities have to change and adapt more quickly (Petrocelli, 2013). In order to ensure quick adaptability, today's organizations need adequate IT support, e.g. platforms that can help both of them to design, publish, and manage social media campaigns and to perform social media analytics for a deeper understanding of customers. According to Gartner (2016), the terms "social media analytics comprise monitoring, analyzing, measuring and interpreting digital interactions and relationships of people, subjects, concepts and content" (p. 1).

Based on an analysis of 27 research papers on social media analytics in the period 2008-2013, Holsapple, Hsiao, and Pakath (2014) proposed an integrated definition of business social media analytics:

Business social media analytics refers to all activities related to gathering relevant social media data, analyzing the gathered data, and disseminating findings as appropriate to support business activities such as intelligence gathering, insight generation, sense making, problem recognition/opportunity detection, problem solution/opportunity exploitation, and/or decision making undertaken in response to sensed business needs. (p. 3706)

This definition is a good starting point for further research related to social media analytics for the following reasons: first, it clearly motivates why a business should choose to apply social media analytics; second, it supports evidence-based decision making; third, it includes both external and internal environments.

Brand awareness and image are the main drivers that force organizations to start using social media. Namely, an organization's engagement in social media can improve a brand name in many ways: by providing customer education, positioning its own business as a source of expertise, giving information about the organization's philanthropic and activities in community, and providing location-specific updates that affect service availability to customers, including closings and changes in opening hours due to weather conditions (Hansche & Chen, 2014).It is not surprising that companies operating in retail and consumer goods sectors are those that are most active on social media. Facebook lists (Facebook,

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

2016) the following brands with the most fans: Coca-Cola, YouTube, Red Bull, Nike Football, Oreo, PlayStation, Converse All Stars, Starbucks Cofee, and Pepsi.

Social media analytics has come into the limelight of the wide area of analytics as a result of the application of appropriate analytics capabilities to social media (and, as such, user-generated) content, in order to achieve specific goals (Holsapple, Hsiao, & Pakath, 2014). The development of effective and efficient social media analytics techniques appears important in collecting, monitoring, and analyzing social media data and in extracting useful patterns and intelligence from them (He, Wu, Yan, Akula & Shen, 2015). Recent social media analytics researchesare oriented towards sentiment analysis, insight mining, trend analysis, topic modeling, influence analysis and visual analytics. They are more oriented towards *listening* of available user-generated content, and acting upon it (Holsapple, Hsiao, & Pakath, 2014).

Although the Facebook fans' top ten list does not include any financial institution, it does not mean that financial institutions are not present on social media. Table 1 shows the first 10 of 100 banks listed according to Facebook fans (Financial Brand, 2015).

In the financial sector, social data analytics were initially adopted by a small band of hedge funds and high-frequency traders (HFTs)–mostly private (Greenfield, 2014). However, social media have become more attractive to financial institutions after their regulators published official guidelines on the subject, requiring that financial institutions include these guidelines in their risk management programs. The Federal Financial Institutions Examination Council (FFIEC) Guidance came into force in December 2013; it applies to all financial institutions that are regulated by the federal banking agencies. Since when this document was issued, the FFIEC has urged state banking regulators to adopt it for the financial institutions they oversee (Hansche & Chen, 2014).

The second crucial factor that makes it possible for financial discussions to take place on social media is the adoption of the *Cashtag*. Cashtagging is when a discussion is associated with tradable equities by attaching a "$TICKER(s)" tag to content. StockTwits started with this practice in 2008, but it was formally adopted by Twitter in July 2012. There has been an immense increase of Cashtagged discussions in the last years. In comparison with periods from 2011 to 2014, Cashtagged conversations on Twitter about Russell 1000 securities increased over 550%, reaching million of messages per quarter (Greenfield, 2014).

Table 1. The first ten banks according to Facebook fans (Financial Brand, 2015)

No.	Name	Country	Facebook Likes	New Likes in the Third Quarter of 2015
1	ICICI	India	4,016,863	376,091
2	State Bank of India	India	3,851,046	988,811
3	Capital One	USA	3,701,221	201,324
4	GT Bank	Nigeria	3,432,842	399,577
5	Axis	India	3,132,153	44,663
6	Chase	USA	2,917,989	206,060
7	BofA	USA	2,274,439	85,800
8	HDFC	India	2,269,837	12,646
9	Yes	India	2,248,226	97,595
10	CIMB	Malaysia	1,342,010	37,694

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

The research shows that the financial sector was slower in the adoption of social media (Greenfield, 2014). Although many financial professionals resorted to their own Twitter accounts to follow breaking news or to share articles, real data analytics use cases were still rare.

Nevertheless, as consumer and brand discussions were the breaking point for adoption of social media analytics by marketers and brand managers, the growing discussion about capital markets, macroeconomic indicators, the foreign exchange market, and financial news are the breaking point for higher adoption of social media in the financial sector.

Recent research related to the *large bank content analysis* reviewed and analyzed every Facebook post and Tweet during the first quarter of 2016 (Golesworthy, 2016). The results of content posted on social platforms by financial institutions show that the highest ranked content list is held by sponsorship news –events, teams, and activities sponsored by bank, whilenews on bank philanthropic activitiesand advice (i.e., content related to customer education) are at the third and fourth place respectively (Golesworthy, 2016).

Although essential, content creation is only one element of social media adoption. There have been two schools of thought on the best social-media based financial market evaluation methodologies. The first focuses on evaluating the volumes of social media messages, search engine queries, and Wikipedia hits and edits. The second methodology focuses on endeavors to be ahead of trends in financial markets through the quantitative evaluation of the content of social media messages, known as sentiment analysis (Zheludev, Smith & Aste, 2014).

Social media analytics tools are evolving further, both general and those specialized for financial institutions. This chapter proposes a general framework for the adoption of social media and social media analytics tools in the financial sector.

THE SOCIAL MEDIA ANALYTICS PROCESS

Since the beginnings of the use of Web 2.0 technologies in general, especially of social media or Web 2.0 applications that allow live interaction, the number of users has increased significantly. Nowadays, crowds of people use social media, whether only to browse the posted contents or to actively participate, post contents, share, like, comment, etc. Besides, the amount of contentsbeing operated on a daily basis is almost unimaginable. If we sum how much each user Facebook daily use Facebook, it turns out that approximately one billion Facebook's active users spend circa 20,000 years online every single day. If it is calculated for Twitter, it turns out that circa 140 million active Twitter users send out more than 340 million tweets, has over 4 billion views per day. (Fan & Gordon, 2014).

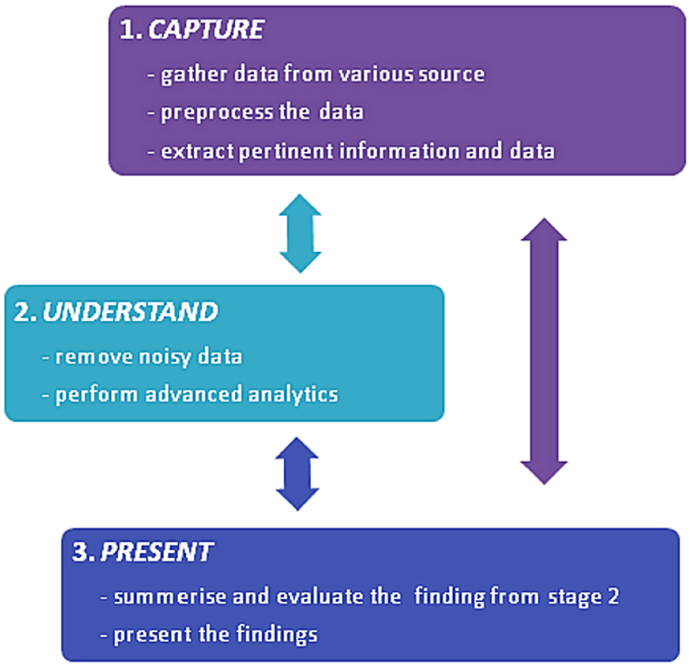
Exactly for these reasons (i.e., a tremendous amount of users, contents, and activities), activities and contents, on social media need to be monitored and analyzed.

Like any other research process, the analysis of activities on social media involves a number of tasks linked to the process. As Fan and Gordon (2014) stated, the process of social media analysis involves three basic stages: *Capture*, *Understand,* and *Present* (Figure 1).

The first stage, stage *Capture* involves the analysis of available sources and collection of relevant data on various social media platforms, both on currently widely popular social networks, as Facebook, Twitter, LinkedIn, YouTube, and Google+, and on various blogs, forums, wikis, and similar tools. These activities can run a company or can hire someone else. Since the goal is to satisfy all company's needs related to data and information, the result of this stage is an enormously large amount of data. In order

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 1. Stages of social media analytics process (Fan & Gordon, 2014)
Source: Fan & Gordon, 2014



to prepare a data set for the *Understand* stage, various preprocessing steps may be performed, including data modeling, data/record linking of data from different sources, stemming, part of speech tagging, feature extraction, and other syntactic and semantic operations that support analysis (Fan & Gordon, 2014).

Certainly, not all collected data are always usable, therefore what inevitably follows is the *Understand* stage, which is intended to identify only what is important, reject the "junk", and create a set of quantifiable and meaningful data and information. This process uses different techniques: rule-based text classifiers, sophisticated classifiers trained on labeled data, various statistical methods and other techniques derived from text and data mining, natural language processing, machine translation, and network analysis (Fan & Gordon, 2014).

The *Present* stage is a logical extension to the U*nderstand* stage. The results from different analytics in the *Understand* stage will be summarized, evaluated, and shown to users in an easily comprehensible format. Therefore, this stage uses different methods to visualize the results, especially dashboard tools that provide customized views for all types of users. They help make sense of large volumes of information, including patterns that are more apparent to people than machines (Fan & Gordon, 2014).

Upon examination of the basic characteristics of each stage, it is easy to conclude that the *Understand* stage is the keyphase because it creates an information base for making business decisions. Naturally, also the other two stages are crucial, but applying wrong methods in the *Understand* stage, or in the data cleaning and manipulation stage, may result in wrong conclusions and decisions.

What is important for the social media analytics process is the property of iterativeness. Namely, after one cycle the process is necessarily repeated because social media is a "live community" that grows every day. The results obtained from one cycle of social media analysis (passing through these three stages) are only a general clue for further activities, not a strong base for the adoption of long-term plans and

EBSCOhost - printed on 2/8/2023 5:57 PM via . All use subject to https://www.ebsco.com/terms-of-use

strategies. The social media analytics process does not function as a classical life cycle that is "blamed" the most of not having a way back to thecompletion of one stage and shift to another stage.

Also, an important feature is the fact that the stages are connected and intertwined; they overlap, complement, and enrich each other. Therefore, it is impossible to isolate the stages fully or to distinguish where one ends and another begins. For example, the result of the *Understand* stage "helps" the *Capture* stage. By understanding and analyzing the collected data, it is visualized what is desired to be achieved during the analysis of data from social media, and that is the starting point for the data collection and retrieval stage. If it is found that the results obtained in stage *Present* are not adequate and interesting or do not have a satisfactory level of prediction, it is necessary to go back to the previous stage (*Understand* and *Capture)* and make some corrections (check incoming data, check the adequacy of selected methods, tune the parameters, and so on.)
