Table of Contents

Preface xx

Volume I

Section 1
Fundamental Concepts and Theories

Chapter 1
To Lend or Not to Lend: Exploring the Early Days of Peer-to-Peer Lending to Small Businesses 1
Traci L. Mach, Board of Governers of the Federal Reserve System, USA
Courtney M. Carter, Board of Governers of the Federal Reserve System, USA
Cailin R. Slattery, University of Virginia, USA

Chapter 2
Basic Types of Project Initiators: Contributor Relations in Platform-Based Online Crowdfunding 23
Javier Vidal-García, University of Valladolid, Spain
Marta Vidal, Complutense University of Madrid, Spain

Chapter 3
Crowdfunding and Slow Money: Challengers or Partners – A Field Perspective 38
Jung Aymeric, Sustainable Finance Geneva, Switzerland

Chapter 4
High-Growth SMEs: A Specific Research Object 48
Mohamed El Hakioui, Cadi Ayyad University, Morocco
Abdenbi Louitri, Cadi Ayyad University, Morocco

Chapter 5
Business Incubation in Malaysia: An Overview of Multimedia Super Corridor, Small and Medium Enterprises, and Incubators in Malaysia..... 61
Logaiswari Indiran, University Technology Malaysia, Malaysia
Zainab Khalifah, University Technology Malaysia, Malaysia
Kamariah Ismail, University Technology Malaysia, Malaysia
Santhi Ramanathan, Multimedia University, Malaysia

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Section 2
Development and Design Methodologies

Chapter 6
A Model to Reduce the Risk of Projects Guided by the Knowledge Management Process: Application on Industrial Services 86
Menaouer Brahami, National Polytechnic School of Oran, Algeria
Nada Matta, University of Technology of Troyes, France

Chapter 7
Design Methods for Decision Support Systems: A Perspective of Small Business B2C E-Commerce Environment 102
Madhury Khatun, Victoria University, Australia
Shah J Miah, Victoria University, Australia

Chapter 8
How to Launch a Successful Crowdfunding Campaign 119
Ronald Kleverlaan, CrowdfundingHub, The Netherlands

Chapter 9
A Risk Integration Framework for the Service-Oriented Enterprise 133
Eric Grandry, Luxembourg Institute of Science and Technology (LIST), Luxembourg
Christophe Feltus, Luxembourg Institute of Science and Technology (LIST), Luxembourg
Eric Dubois, Luxembourg Institute of Science and Technology (LIST), Luxembourg

Chapter 10
Social Media Strategies for Small and Medium Scale Enterprise in the Klang Valley Region of Malaysia 154
Donovan Chan, University of Malaya, Malaysia
Sameer Kumar, University of Malaya, Malaysia

Chapter 11
Metacognition of Organization Members as the Basis of Learning Strategy in Higher School 178
Irina Sergeyevna Yakimanskaya, Orenburg State University, Russia
Anna Mikhaylovna Molokostova, Moscow Humanitarian-Economical Institute, Russia
Milyausha Yakubovna Ibragimova, Kazan (Volga Region) Federal University, Russia

Chapter 12
Exploring the Determinants of Organizational Resilience in Islamic Banks: A Framework Development 196
Mohamed Mahmoud Abo Alrob, An-Najah National University, Palestine
Ayham A. M. Jaaron, An-Najah National University, Palestine

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Chapter 13
AHP-Driven Knowledge Leakage Risk Assessment Model: A Construct-Apply-Control Cycle Approach 218
Haley Wing Chi Tsang, The Hong Kong Polytechnic University, Hong Kong
Wing Bun Lee, The Hong Kong Polytechnic University, Hong Kong
Eric Tsui, The Hong Kong Polytechnic University, Hong Kong

Chapter 14
Towards a Hybrid MAS Organizational Model: Combining the ACMAS and OCMAS Viewpoints 238
Hosny Abbas, Assiut University, Egypt
Samir Shaheen, Cairo University, Egypt

Chapter 15
Can Social Dynamics Be Channeled from Offline to Online Communities? Commitment, Compliance, and Cooperation from Microfinance to Crowdfunding 275
Sharam Alijani, NEOMA Business School, France
Djamchid Assadi, Burgundy School of Business, France
Arvind Ashta, Burgundy School of Business, France

Chapter 16
Plan for Prevention of Risks of Corruption and Related Infractions: The Application of FMEA Methodology 293
Marisa Pinho, University of Aveiro, Portugal
Carlos Santos, University of Aveiro, Portugal

Chapter 17
Application of FMEA to Study the Risk Perception of SMEs Throughout the ERP Adoption Life Cycle 319
S. Vijayakumar Bharathi, Symbiosis International University (SIU), India
Kanchan Chandrayan, KPMG India Pvt. Ltd., India

Chapter 18
Towards a Framework to Improve IT Security and IT Risk Management in Small and Medium Enterprises 341
Stephan Mühe, University of Duisburg-Essen, Germany
Andreas Drechsler, Victoria University of Wellington, New Zealand

Chapter 19
Adoption of Online Marketing for Service SMEs with Multi-Criteria Decision-Making Approach 356
Lanndon Ocampo, University the Philippines Cebu, Philippines
Rosalin Merry Berdin Alarde, University of San Jose-Recoletos, Philippines
Dennis Anthony Kilongkilong, University of San Jose-Recoletos, Philippines
Antonio Esmero, University of San Jose-Recoletos, Philippines

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Section 3
Tools and Technologies

Chapter 20
Crowdfunding for Non-Profits: Opportunities and Challenges 376
Amir Manzoor, Bahria University, Pakistan

Chapter 21
Horizontal Crowdfunding Platforms: Socio-Economic Impact and Exogenous/Endogenous System of Rules 391
Tomaso Greco, Università degli Studi dell'Insubria, Italy

Chapter 22
Vertical and Community-Based Crowdfunding Platforms 404
Tomaso Greco, Università degli Studi dell'Insubria, Italy

Chapter 23
Crowdfunding as a Marketing Tool 419
Fabio Allegreni, Crowd Advisors, Italy

Chapter 24
The Diffusion of Voluntary ISO 26000 among SMEs: Evidence from Taiwan 436
Yen-Chun Wu, National Taiwan Normal University, Taiwan
Chih-Hung Yuan, National Sun Yat-sen University, Taiwan

Chapter 25
Human-Factor-Based Risk Management in the Healthcare to Improve Patient Safety 453
Barbara Streimelweger, University of Geneva, Switzerland
Katarzyna Wac, University of Geneva, Switzerland
Wolfgang Seiringer, Vienna University of Technology, Austria

Chapter 26
Insurance as an Optimization Tool for Risk Management in Small and Medium-Sized Enterprises 469
Katarina Ivančević, Law School of Union University Belgrade, Serbia

Chapter 27
Regression Analysis for Environmental Practices: Participation among Finnish SMEs 489
Nurul Aida Abdul Malek, University of Vaasa, Finland
Josu A. Takala, University of Vaasa, Finland

Chapter 28
Student Projects and Virtual Collaboration in IT Degrees: Incorporating Entrepreneurship into Study Programmes 505
Markus Helfert, Dublin City University, Ireland
Igor Lyutak, Ivano-Frankivsk National Technical University of Oil and Gas, Ukraine
Howard Duncan, Dublin City University, Ireland

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Chapter 29
Cloud Service Footprint (CSF): Utilizing Risk and Governance Directions to Characterize a Cloud Service 519
Mohammad Shalan, JEA, Jordan

Volume II

Chapter 30
Project Portfolio Management: Tool for Strategy Implementation in Non-Governmental Organizations 547
Beata Jałocha, Jagiellonian University, Poland
Ewa Bogacz-Wojtanowska, Jagiellonian University, Poland

Chapter 31
Risks Assessment using Fuzzy Petri Nets for ERP Extension in Small and Medium Enterprises 564
S. Vijayakumar Bharathi, Symbiosis International University (SIU), India
Dhanya Pramod, Symbiosis International University (SIU), India
Raman Ramakrishnan, Symbiosis International University (SIU), India

Chapter 32
Information Management for Network Transformation in Industrial Enterprises Associations: The Case of the Internationalization Process 589
Eric Costa, University of Porto, Portugal & INESC TEC, Portugal
António Lucas Soares, University of Porto, Portugal & INESC TEC, Portugal
Jorge Pinho de Sousa, University of Porto, Portugal & INESC TEC, Portugal
George Leal Jamil, Informações em Rede Consultoria e Treinamento Ltda, Brazil

Chapter 33
A New Maturity Model for Project Risk Management in the Automotive Industry 611
Jose Irizar, University of Gloucestershire, UK
Martin George Wynn, University of Gloucestershire, UK

Chapter 34
E-Commerce in Small and Medium Enterprises in Sri Lanka 634
Kennedy D Gunawardana, University of Sri Jayewardenepura,, Sri Lanka

Section 4
Utilization and Applications

Chapter 35
Addressing Risks in Global Software Development and Outsourcing: A Reflection of Practice 651
Brian J. Galli, Long Island University, USA

Chapter 36
Continuous Improvement Relationship to Risk Management: The Relationship Between Them 697
Brian J. Galli, Long Island University, USA

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Chapter 37
Internet Finance 713
Marta Vidal, Complutense University of Madrid, Spain
Javier Vidal-García, University of Valladolid, Spain
Stelios Bekiros, European University Institute, Italy

Chapter 38
Running Successful Crowdfunding Campaigns for Non-Profits 731
Amir Manzoor, Bahria University, Pakistan

Chapter 39
SMEs in Nigeria: Exploring Coopetition..... 744
Sola Oni, Pan-Atlantic University, Nigeria

Chapter 40
Effective Approaches in Higher Education Development: A Survey in Fundraising Best Practices 761
Andrew Aaron Shafer, Aquinas College, USA & North Park University, USA

Chapter 41
Relevance of Entrepreneurship in TVET..... 779
Charles O. Ogbaekirigwe, Federal University Ndufu-Alike, Nigeria
Ugochukwu Chinonso Okolie, Ebonyi State University, Nigeria

Chapter 42
Crowdfunding, Entrepreneurship, and Design Education: Case Study of a Campaign by Design Students from China 802
Zhou Ding, Nanjing University of the Arts, China
Jiang Jiabei, Nanjing University of the Arts, China

Chapter 43
Factors Comprising Effective Risk Communication, Decision-Making, and Measurement of IT and IA Risk 814
Ricardo Daza, University of Fairfax, USA
Kathleen M Hargiss, University of Fairfax, USA

Chapter 44
Determinants of Self-Employment Entry: Evidence from Portugal 834
Nadia Simoes, Instituto Universitário de Lisboa, Portugal
Sandrina B. Moreira, Instituto Politécnico de Setúbal, Portugal
Nuno Crespo, Instituto Universitário de Lisboa, Portugal

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Chapter 45
Building Entrepreneurial Networking Quality to Improve the Success of Innovation and Batik SMEs Performance 862
Elia Ardyan, Sekolah Tinggi Ilmu Ekonomi Surakarta, Indonesia
Ginanjar Rahmawan, Sekolah Tinggi Ilmu Ekonomi Surakarta, Indonesia
Sunarto Isstianto, Sekolah Tinggi Ilmu Ekonomi Surakarta, Indonesia

Chapter 46
The Relationship between Entrepreneurial Competencies, Competitive Intelligence, and Innovative Performance among SMEs from an Emerging Country: Competitive Intelligence in SMEs 884
Ainul Abdul-Mohsin, Universiti Sains Malaysia, Malaysia

Chapter 47
Exploring the Factors to Green IT Adoption of SMEs in the Philippines 907
Alexander A. Hernandez, College of Information Technology Education, Technological Institute of the Philippines, Philippines

Chapter 48
Real Estate Crowdfunding: 2015 and Beyond 927
Steven A. Cinelli, REMARQ, USA

Chapter 49
The Impacts of Trait Emotional Intelligence and Entrepreneurial Self-Efficacy on Perceived Behavioral Control Among Undergraduate Students 955
Teresa Torres-Coronas, Universitat Rovira i Virgili., Spain
María-Arántzazu Vidal-Blasco, Universitat Rovira i Virgili, Spain

Chapter 50
Entrepreneurship Development in Northeast Region of Romania 969
Alexandru Costin Cîrstea, Bucharest University of Economic Studies, Romania

Chapter 51
Maximising Value Through IT and Business Alignment: A Case of IT Governance Institutionalisation at a Thai Bank 978
Abrar Haider, University of South Australia, Australia
Sureerat Sae Tang, University of South Australia, Australia

Chapter 52
Information and Communication Technology for SMEs' Competitiveness 1006
Neeta Baporikar, Namibia University of Science and Technology, Namibia

Chapter 53
Optimizing Virtual Communities in Tourism to Facilitate Development of Small and Medium-Sized Enterprises 1023
Silvena Dencheva Yordanova, Varna University of Management, Bulgaria

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Chapter 54
Working Capital Financing by Banks in Small Enterprises: Problems and Challenges for Bangladesh 1042
Md. Mosharref Hossain, Bangladesh Institute of Bank Management (BIBM), Bangladesh & Universiti Utara Malaysia, Malaysia
Yusnidah Ibrahim, Universiti Utara Malaysia, Malaysia

Section 5
Organizational and Social Implications

Chapter 55

Preface

Organizations of all types are consistently working on new initiatives, product lines, or implementation of new workflows as a way to remain competitive in the modern business environment. To maintain a competitive edge against other businesses, companies must ensure the most effective strategies and procedures are in place. This is particularly critical in smaller business environments that have fewer resources.

Staying informed of the most up-to-date research trends and findings is of the utmost importance. That is why IGI Global is pleased to offer this three-volume reference collection that will shed light on critical issues related to start-ups and small and medium-sized enterprises by providing both broad and detailed perspectives on cutting-edge theories and developments. This reference is designed to act as a single reference source on conceptual, methodological, technical, and managerial issues, as well as provide insight into emerging trends and future opportunities within the business market.

Start-Ups and SMEs: Concepts, Methodologies, Tools, and Applications is organized into seven distinct sections that provide comprehensive coverage of important topics. The sections are:

1. Fundamental Concepts and Theories;
2. Development and Design Methodologies;
3. Tools and Technologies;
4. Utilization and Applications;
5. Organizational and Social Implications;
6. Managerial Impact; and
7. Critical Issues and Challenges.

The following paragraphs provide a summary of what to expect from this invaluable reference tool.

Section 1, "Fundamental Concepts and Theories," serves as a foundation for this extensive reference tool by addressing crucial theories essential to the understanding of start-ups and SMEs. Introducing the book is "To Lend or Not to Lend: Exploring the Early Days of Peer-to-Peer Lending to Small Businesses," by Profs. Traci L. Mach (Board of Governors of the Federal Reserve System, USA), Courtney M. Carter (Board of Governors of the Federal Reserve System, USA), and Cailin R. Slattery (University of Virginia, USA): a great foundation laying the groundwork for the basic concepts and theories that will be discussed throughout the rest of the book. Section 1 concludes and leads into the following portion of the book with a nice segue chapter, "Business Incubation in Malaysia: An Overview of Multimedia Super Corridor, Small and Medium Enterprises, and Incubators in Malaysia," by Profs. Logaiswari Indiran (University Technology Malaysia, Malaysia), Zainab Khalifah (University Technology Malaysia, Malaysia), Kamariah Ismail (University Technology Malaysia, Malaysia), and Santhi Ramanathan (Multimedia University, Malaysia).

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Section 2, "Development and Design Methodologies," presents in-depth coverage of the conceptual design and architecture of start-ups and SMEs. Opening the section is "A Model to Reduce the Risk of Projects Guided by the Knowledge Management Process: Application on Industrial Services," by Profs. Menaouer Brahami (Department of Computer Science, National Polytechnic School of Oran, Oran, Algeria) and Nada Matta (Laboratory ICD/TechCICO, University of Technology of Troyes, Troyes Cedex, France). Through case studies, this section lays excellent groundwork for later sections that will examine present and future applications for start-ups and SMEs. The section concludes with an excellent work by Profs. Lanndon Ocampo (University the Philippines Cebu, Philippines), Rosalin Merry Berdin Alarde (University of San Jose-Recoletos, Philippines), Dennis Anthony Kilongkilong (University of San Jose-Recoletos, Philippines), and Antonio Esmero (University of San Jose-Recoletos, Philippines), "Adoption of Online Marketing for Service SMEs With Multi-Criteria Decision-Making Approach."

Section 3, "Tools and Technologies," presents extensive coverage of the various emerging tools and technologies used within start-ups and SMEs. The first chapter, "Crowdfunding for Non-Profits: Opportunities and Challenges," by Prof. Amir Manzoor (Bahria University, Pakistan), lays a framework for the types of works that can be found in this section. The section concludes with "E-Commerce in Small and Medium Enterprises in Sri Lanka," by Prof. Kennedy D. Gunawardana (Department of Accounting, University of Sri Jayewardenepura, Nugegoda, Sri Lanka). Where Section 3 described specific tools and technologies at the disposal of practitioners, Section 4 describes the use and applications of the tools and frameworks discussed in previous sections.

Section 4, "Utilization and Applications," describes best practices and strategies utilized in the effective management and operations of start-ups and SMEs as well as insights on important applications. The first chapter in the section is "Addressing Risks in Global Software Development and Outsourcing: A Reflection of Practice," written by Prof. Brian J. Galli (Assistant Professor and Graduate Program Director, Master of Science in Engineering Management Industrial Engineering, Hofstra University, USA). This section includes the widest range of topics because it describes case studies, research, methodologies, frameworks, architectures, theory, analysis, and guides for implementation. The breadth of topics covered in this section is also reflected in the diversity of its authors, from countries all over the globe. The section concludes with "Working Capital Financing by Banks in Small Enterprises: Problems and Challenges for Bangladesh," by Profs. Md. Mosharref Hossain (Bangladesh Institute of Bank Management [BIBM], Bangladesh & Universiti Utara Malaysia, Malaysia) and Yusnidah Ibrahim (Universiti Utara Malaysia, Malaysia), a great transition chapter into the next section.

Section 5, "Organizational and Social Implications," includes chapters discussing the organizational and social impact of start-ups and SMEs. The section opens with "Risk Management Usage and Impact on Information Systems Project Success," by Profs. April H. Reed (Department of Management Information Systems, East Carolina University, Greenville, USA) and Mark Angolia (Department of Technology Systems, East Carolina University, Greenville, USA). This section focuses exclusively on how these technologies affect human lives, either through the way they interact with each other or through how they affect behavioral/workplace situations. The section concludes with "The Importance Role E-Collaboration Capability and Information System Maturity on Knowledge Sharing and SMEs Marketing Performance," by Profs. Elia Ardyan (Sekolah Tinggi Ilmu Ekonomi Surakarta, Central Java, Indonesia), Andri Nurtantiono (Sekolah Tinggi Ilmu Ekonomi Surakarta, Central Java, Indonesia), Budi Istiyanto (Sekolah Tinggi Ilmu Ekonomi Surakarta, Central Java, Indonesia), and Berta Bekti Retnawati (Soegijapranata Catholic University, Central Java, Indonesia).

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Section 6, "Managerial Impact," presents strategies and theories for the management of start-ups and SMEs as well as their impact on the success and performance of the business. The section begins with "IT Strategic Planning Through CSF Approach in Modern Organizations," by Prof. Neeta Baporikar (HP-GSB, Namibia University of Science and Technology, Namibia). This section serves as a vital resource for developers who want to utilize the latest research to bolster the capabilities and functionalities of their processes. The chapters in this section offer unmistakable value to managers looking to implement new strategies that work at larger bureaucratic levels. The section concludes with "Technological Change Perspective for ERP Implementation in Small and Medium Enterprises," by Profs. Jessy Nair (Faculty of Management Studies, PES University, Bangalore, India) and Aarthy Chellasamy (Faculty of Management Studies, PES University, Bangalore, India).

Section 7, "Critical Issues and Challenges," presents coverage of the current challenges start-ups and SMEs face and addresses their limitations in order to present solutions. The section begins with "Using Marketing to Implement a Strategic Plan: Reflection of Practiced Literature," by Prof. Brian J. Galli (Assistant Professor and Graduate Program Director, Master of Science in Engineering Management Industrial Engineering, Hofstra University, USA). Chapters in this section will explore theoretical approaches and offer alternatives to crucial questions on the subject of start-ups and SMEs. The section concludes with "The Role of Culture in IT Governance Five Focus Areas: A Literature Review," by Profs. Parisa Aasi (Stockholm University, Kista, Sweden), Lazar Rusu (Department of Computer Science and Systems Sciences, Stockholm University, Kista, Sweden), and Dragos Vieru (TELUQ University Montreal, Canada).

Although the primary organization of the contents in this multi-volume work is based on its seven sections, offering a progression of coverage of the important concepts, methodologies, technologies, applications, social issues, and emerging trends, the reader can also identify specific contents by utilizing the extensive indexing system listed at the end of each volume. As a comprehensive collection of research on the latest findings related to using technology to providing various services, *Start-Ups and SMEs: Concepts, Methodologies, Tools, and Applications* provides entrepreneurs, managers, executives, business professionals, researchers, administrators, academicians, students, and all audiences with a complete understanding of the development of applications and concepts in start-ups and SMEs. Given the vast number of issues concerning usage, failure, success, policies, strategies, and applications that contribute to the success of these businesses throughout the world, *Start-Ups and SMEs: Concepts, Methodologies, Tools, and Applications* addresses the demand for a resource that encompasses the most pertinent research in technologies being employed to globally bolster the knowledge and applications of small business.

Chapter 1
To Lend or Not to Lend:
Exploring the Early Days of Peer-to-Peer Lending to Small Businesses

Traci L. Mach
Board of Governers of the Federal Reserve System, USA

Courtney M. Carter
Board of Governers of the Federal Reserve System, USA

Cailin R. Slattery
University of Virginia, USA

ABSTRACT

The current paper examines loan-level data from Lending Club to look at peer-to-peer borrowing by small businesses. We begin by looking at characteristics of loan applications that were and were not funded and then take a more in-depth look at funded applications. Summary statistics show an increasing number of small business loan applications over time. Beginning in 2010—when consistent measures of loan purpose were recorded for all applications—loan applications for small businesses were on average less likely than loans for other purposes to have been funded. However, logistic regression results that control for the quality of the application show that, holding all else constant, applications for a loan for a small business were almost twice as likely to have been funded as loans for other purposes. Focusing on funded applications, we note that funded business loans were slightly larger on average than loans funded for other purposes but paid similar interest rates. However, relative to small business loans from traditional sources, peer-to-peer small business borrowers paid an interest rate that was about two times higher. Regression results that control for application quality show that peer-to-peer loans for small businesses were charged almost a percentage point interest rate premium over non-business loans. Logistic regression results that look at loan performance indicate that loans for small businesses were much more likely to be delinquent or charged off.

INTRODUCTION

As distrust and dissatisfaction with commercial banks grew during the recent financial crisis, there was large growth in nonstandard types of borrowing arrangements. One such arrangement that has seen substantial growth in the past five years is crowdfunding —peer-to-peer (P2P) lending, in particular. Crowdfunding arrangements involve groups of individuals, not institutions, providing funding. As the name suggests, P2P loans are generally personal loans. However, small business owners often intermingle their personal and business finances so as overall P2P lending grew, so too did P2P borrowing for small business purposes.

The current paper looks at the individual loan-level data from Lending Club, focusing on those loans that were used by small business owners for their businesses. While there are other players in the market, Lending Club is the largest player in the US peer-to-peer lending space. In addition Lending Club provides a uniquely detailed data set that allows us to look at both the applicants and loans in more detail than is possible for other peer-to-peer sites. We begin by looking at the characteristics of loan applications that did and did not get funded. While loan purpose is not one of the criteria taken into account when evaluating loan applications, we find that loans intended for small business purposes were more likely to be funded than loans for other purposes. We then look at the interest rate paid on those loans that did get funded. Again, while loan purpose is not taken into account in assessing the credit quality of the application, loans for business purposes paid nearly one percentage point higher interest rate than other loans, holding borrower characteristics constant. Finally, we look at the loan performance. Our results indicate that loans for small business purposes were more than two-and-a-half times more likely to perform poorly.

The rest of the paper is organized as follows. We begin with a short discussion of crowdfunding and how P2P lending fits into the general crowdfunding framework. Then we look at the small business credit market and examine where small businesses have traditionally gotten their credit and how that may have been more difficult over the recent period. We next take a closer look at the data from Lending Club. The final three sections present our econometric results and the last section concludes.

Crowdfunding

The term crowdfunding has come to represent a spectrum of activities. The underlying idea is that funding that one would typically have to borrow through a bank or other financial institution is gathered from a group of individuals, or "the crowd." This is not a new concept; rotating savings and credit associations (ROSCAs) operate under a similar premise and have been long used in developing countries and within minority communities in the US.[1] However, the growth of the internet has given the concept a boost, allowing for a much larger and diverse "crowd." There is no longer a need for the individuals in the group to live in close proximity to one another or to actually know each other; crowdfunding sites are proliferating.

Early adopters of the internet for crowdfunding essentially used their websites as fundraisers. In some instances the crowd receives nothing in return, donating the money out of a sense of altruism. This is the model of websites like Kiva and Crowdrise.[2] In other cases, the crowd is essentially pre-buying the good or service being produced. This is the model of websites such as Kickstarter where funders are often given a copy of the book or CD that is being produced.[3] In both models, borrowers do not pay interest to the crowd or specifically repay the funds.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

A second form of crowdfunding is equity crowdfunding as laid out in the JOBS Act of 2012 (White House, 2012). In such cases, rather than receiving interest and principal for their investment, investors receive equity in the business. Prior to the JOBS Act, it was illegal for private companies to publicly solicit investments. It is only recently that the SEC has finalized its ruling making equity crowdfunding legal for accredited borrowers (Rathbond & Mazorol, 2013). In an even more recent occurrence, the SEC has proposed rules to allow entrepreneurs to raise capital online with fewer restrictions on who can invest (Harrison, 2013).

The final piece of the crowdfunding pie is debt-based, so-called peer-to-peer (P2P) lending. In P2P lending, the individuals fund small portions of loans and receive their principal plus interest when the borrower repays the loan. The two largest P2P sites are Prosper and Lending Club. Prosper started in 2006 and Lending Club started about a year later.[4] Both websites use a credit score-based model for evaluating investment options. Applicants allow the evaluation of their credit to be translated into a letter grade and investors can then choose how much risk they wish to take on when funding a loan. As in traditional credit markets, higher risk translates into higher interest rates. P2P lending provides funding that might not be available elsewhere and rates are lower than for alternatives, such as payday loans.

Between 2006 and 2008 peer-to-peer lending grew steadily. It hit a snag in 2008 when the SEC determined that their loans should be classified as securities and, thus, regulated (Craven, 2008). This led both Prosper and Lending Club to put any new loans on hold until they properly registered with the SEC. Both organizations survived the reclassification and moved back onto a path of steady growth.

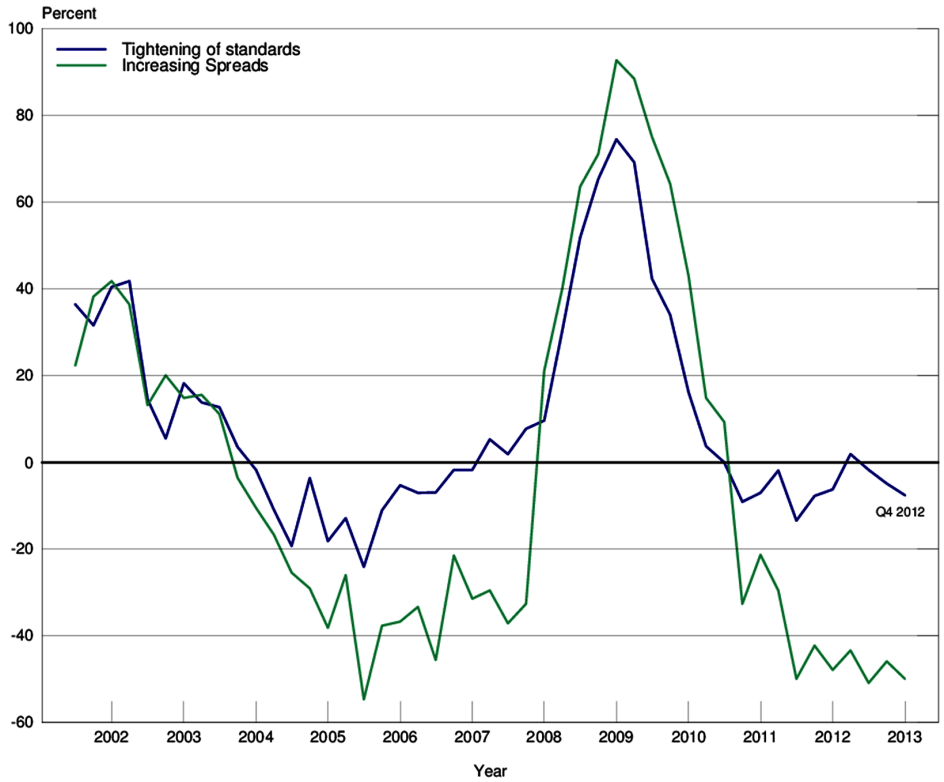
The steady increase in peer-to-peer lending suggests the potential for much more growth. Due to state laws and regulations, not all states allow investments and loans from Lending Club and Prosper. Currently, Lending Club loans are available to borrowers in all but six states while Prosper is available in all but three states. Investors face greater restrictions. Investors in only 29 states plus the District of Columbia are given access to Prosper. Investors in a slightly different set of 28 states have access to Lending Club.[5] If P2P lending were to become available throughout the rest of the U.S., investment dollars and P2P borrowing could grow substantially.

For a more detailed look at project initiator-contributor relationships and microfinance business models, please refer to the Garcia-Vidal and Assadi chapters in this book.

SMALL BUSINESS CREDIT

Traditionally, small businesses have been thought to face increased difficulties in accessing credit than do larger businesses. Lending to small businesses is generally considered to be riskier and more costly because small firms have higher failure rates and are more vulnerable to downturns in the economy. Lending to small businesses is further complicated by their informational opacity. Most do not have the detailed financial statements and rarely have publicly traded equity so obtaining reliable information on the creditworthiness of small businesses is difficult. Previous research has found that relationship lending provides a way of mitigating the information problem (Petersen & Rajan 1994, 1995; Berger & Udell 1995; Degryse & Cayseele 2000). Because commercial banks typically provide small businesses many products other than loans, commercial banks are able to use information gathered about the business over a longer term to their advantage in assessing the creditworthiness of small businesses. For these reasons, small businesses are thought to be relatively dependent on commercial banks for loans.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use



During the recent economic crisis (2007-2009), standards on business lending at commercial banks tightened substantially. These tighter credit conditions for small business lending by banks have eased notably since 2010. Results from the Federal Reserve Board's Senior Loan Officer Opinion Survey on Bank Lending Practices (Figure 1) indicate that lending standards for small borrowers tightened substantially in 2008 and 2009 but loosened in 2010 and 2011 (Federal Reserve Board, 2012). The net percentage of National Federation of Independent Business (NFIB) respondents reporting that credit had become more difficult to obtain, which had remained low by historical standards in the years prior to the financial crisis, rose in 2008 and reached its highest levels on record in 2009 (Figure 2) (Dunkelberg & Wade, 2012). Since then, it has retraced a good portion of its increases during the financial crisis, but still remains well above pre-recessionary levels.

Coincident with the tightening of standards on lending terms, there was also a large drop in commercial lending by banks (Figure 3). Some of the drop is likely a result of the higher standards, but some of it is also likely attributable to diminished demand from small businesses uncertain about their future. In addition, some of the decrease is likely due to deterioration in the financial conditions of many banks during this period.[6]

Figure 1. Net percent of domestic banks reporting a tightening of standards or terms on loans to small businesses

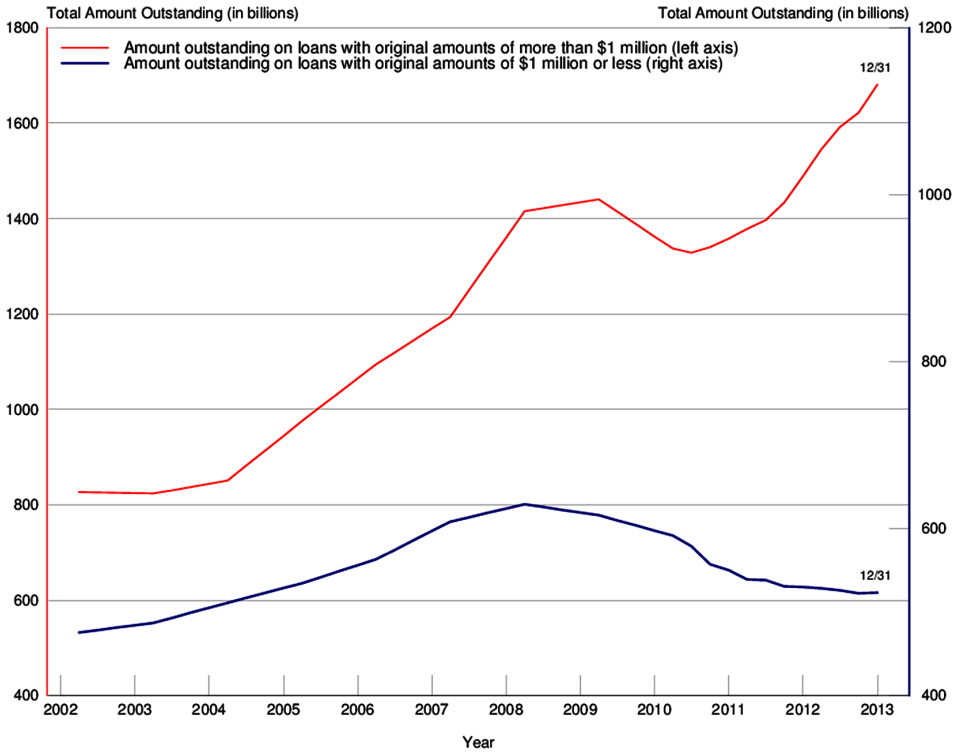
Figure 2. Net percent of firms reporting that credit was harder to get compared to 3 months ago
Source: National Federation of Independent Businesses (NFIB) Survey, Small Business Economic Trends Data http://www.nfib.com/research-foundation/surveys/small-business-economic-trends.
Note: This question is only asked of firms reporting that they regularly borrow; data are monthly; 3 month moving average is reported; not seasonally adjusted.



Small businesses get their credit from many different sources. Statistics from the 2003 Survey of Small Business Finances (SSBF) indicate that while commercial banks are an important source of finances for small businesses, they are not the only source (Table 1).[7] Nearly 60 percent of outstanding credit to small businesses in 2003 was provided by commercial banks, but finance companies provided over 15 percent, and other sources provided just under 10 percent. The median loan outstanding was $20,000, but this varied with the type of provider, ranging from the median $90,000 outstanding loan from mortgage companies to the median $8,000 outstanding loan from a brokerage or mutual company.

There are also differences in the amount and types of credit used according to the size of the firm. For example, the median loan for firms with fewer than 10 employees was less than $18,000 compared to $40,000 for larger firms. This was true across all different types of lenders. The share of outstanding credit provided by each type of lender was similar across firm size for most types of lenders. The exceptions to this were mortgage companies and other providers; nearly 11 percent of funds for small firms were from mortgage companies and about 5 percent of funds were from other sources compared to 2 percent and about 11 percent of funds, respectively, for larger firms.[8]

Given the downturn in the real estate market, the availability of home equity loans to finance the business may have become more difficult in the recent period. Table 2 provides additional insights into this question. In 2003, business owners reported using personal real estate to collateralize—at least in part—loans for their businesses a fair amount: 15.6 percent of total dollars outstanding and 11.0 percent of all loans used personal real estate as collateral. Among loans from mortgage companies, the shares

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 3. Amount outstanding on loans to businesses
Source: These data are constructed from special tabulations of the June 30, 2002 to September 30, 2012 Call Reports (Consolidated Reports of Condition and Income for U.S. Banks).
Note: Beginning March 2010, the data reporting frequency changed from annual to quarterly.

were even higher, with more than a quarter of outstanding dollars and nearly 60 percent of outstanding loans secured by personal real estate.

Overall, commercial bank lending to small businesses is down in the recent period; while much of this may be due to lack of demand, there is also evidence that traditional routes may have been difficult, especially for the smallest small businesses (Figure 4). Such firms often require small amounts of credit which may not be profitable for commercial banks to lend and may be turning to more alternative sources such as peer-to-peer lending. The impact of such a choice is not clear. Even though such loans may allow the firm to remain in business in the short term the high cost may not be sustainable in the long run.

DATA

The current paper is, to our knowledge, the first paper to examine the growing peer-to-peer borrowing among small businesses. In this paper we use data on individual loans and applications from the LendingClub.com website to examine more closely the characteristics of loans that get funded as well as the interest rate paid on those loans.[9] Lending Club makes their data available publicly. The data include borrower characteristics, loan status and payment information of loans that are funded, and details about all of the loan applications that were rejected. Our data set consists of more than 670,000 unfunded loan applications that do not meet the Lending Club underwriting criteria and just under 100,000 funded loans.

Note: This question is only asked of firms reporting that they regularly borrow; data are monthly; 3 month moving average is reported; not seasonally adjusted.

Both the number of loans and the average dollar amount of loans disbursed through Lending Club has grown tremendously since Lending Club's inception in 2007. Table 3 shows the volume of lending from mid-2007 through 2012. Total loans funded for small businesses grew from about $850,000 in 2007 to over $22 million in 2012. Loans for other purposes grew from just under $4 million in 2007 to nearly $700 million in 2012. The average loan size for small business loans started near $15,000 in 2007 and then fell slightly until 2010. In 2012, the average loan for small business was $16,200. On the other hand, non-business loans grew slowly from 2007 to 2012, from $3,600 to $13,400 for. The interest rate was sometimes higher and sometimes lower for small business loans than loans for other purposes, but they were generally within a percentage point of each other.

Over the entire time span, small business was the sixth most frequently cited loan purpose among funded loans, totaling 3.5 percent of all funded loans. Debt consolidation was the most common loan purpose, accounting for just over half of the total, credit card payoffs follow with about 17 percent, "other" was almost 8, home improvement/purchase is just over 6, and "major purchase" was 3.8 percent. The average amount funded for "other" or "major purchase" is not presented in the table because these categories can encompass a variety of things and is less informative.

Comparing small businesses loans to other popular loan purposes, the average amount funded and the interest rates across the groups were comparable, although loans for small businesses were a bit larger on average (Table 4).

Note: Statistics are calculated from LendingClub.com loan issue data through December 31, 2012. Year is based on the year the loan was issued.

Small business and non-business loans had roughly the same rate of rejection, with about 8 percent of all small business loans over the period being funded and about 12 percent of all non-business loans being funded (Table 5).[10] The rejection rates for small business loans were understated in 2007 - 2009 because it was not until mid-2009 that the rejected and funded loan data sets started to categorize loan purpose in the same way. In order to attempt to correct for this, every rejected entry with a loan description that included the word “business” was designated as a small business loan. Nonetheless, it is likely that many more small business loans than we are counting were rejected in those earlier years. The percent

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

funded in 2012 picked up in both small business and non-business loans, but only by 0.5 percent from 6.8 to 7.3 in terms of small businesses, where it has increased by almost 5 percent for non-businesses, from 9.5 to 14.2.

Figures 5 and 6 break down the number of applications and acceptance rates by state. Not surprisingly, the more populous states had more small business loan applications. However, they did not necessarily have the highest share of small business loan applications that were funded. For example, while Florida was home to more than 4,000 applications for small business loans, fewer than 300 of them were funded. It is interesting to note that funding rates were fairly high in some of the more rural states such as Mississippi and Tennessee, but this may be at least partially explained by the relatively low numbers of applications from these states.

Table 6 provides overall mean and median characteristics of applications according to whether or not the loan was funded. Only 12 percent of all loan applications received by Lending Club over this time period were funded. The applications that were funded were about $1,000 smaller on average than the unfunded requests. The fraction of applicants with less than a year's work experience was quite different in the funded and unfunded applications, with only 10 percent of funded applicants employed for less than a year versus 77 percent of the unfunded applicants. One also saw a sizeable difference in FICO scores, with funded applicants having an average FICO score of 706 versus 636.

NFIB statistics are calculated from monthly membership surveys done by the National Federation of Independent Business through the December 2012 survey.

As less traditional lending vehicles such as peer-to-peer lending are usually associated with higher interest rates, we are interested to see how the rates that small businesses receive through Lending Club loans differ from those that a small business may receive in a more formal lending setting. Figure 7 and Table 7 explore this by comparing the Lending Club small business lending rate with that reported by National Federation of Independent Business (NFIB) members. NFIB firms are split into two categories, the smallest firms – those with fewer than 10 employees – and larger small businesses, those having 10 or more employees. It is possible that small business owners who are seeking financing through an alternative lending vehicle, such as Lending Club, are less creditworthy and therefore unable to receive financing through a traditional lending institution, such as a commercial bank. As mentioned in the

Table 5. Denied and funded applications from Lending Club, by application year

	Non-Business Loans			Small Business Loans*		
Year	**Rejected**	**Funded**	**% Funded**	**Rejected**	**Funded**	**% Funded**
2007	5,298	630	10.63%	8	65	89.04%
2008	25,319	2,254	8.17%	450	124	21.60%

Table 7. Interest rate for Lending Club loan compared to other interest rates for NFIB members, by year

Year	LC Non-Business Loans	LC Small Business Loans	NFIB Firms with 10+ Employees	NFIB Firms with <10 Employees
2007	11.75	12.54	8.67	9.23
2008	12.07	11.95	6.92	7.74
2009	12.27	14.63	5.54	6.92
2010	11.97	12.45	5.55	6.77
2011	12.18	13.13	5.47	6.56
2012	13.65	13.39	5.29	6.09
Total	12.98	13.25	6.06	7.03

Note: Lending Club statistics are calculated from LendingClub.com loan issue data through December 31, 2012. Year is based on when the loan was issued.

previous section, assessing the creditworthiness of small businesses is difficult, particularly among the smallest businesses. For this reason we would expect that the rates for the smallest NFIB firms would be more comparable to the Lending Club small business rates. Although it is the case that the NFIB firms with fewer than 10 employees paid about a 0.5 to 1.5 percentage point higher rate than those with 10 or more employees, the NFIB reported rates were much lower than the Lending Club rates, with the smallest NFIB firms averaging about 7 percent over the period, and the Lending Club small businesses averaging over 5 percent more. Also, the NFIB firms did not experience the spike in late 2009 that the Lending Club small businesses did, which is evident in both the table and the figure.

Figure 7 tracks the mean interest rates on a monthly basis, and although there is volatility from month to month, the Lending Club small business rate fluctuated much more than the NFIB rate. This can be partially explained by the fact that there were fewer observations in the Lending Club data. Also, the NFIB rate has trended slightly downward since mid-2007, when the series began, ending with a 2012 mean rate that is about 3 percent lower than the 2007 mean. The Lending Club rate did not experience this decline, and the small business loan rate averaged about 0.9 percent higher in 2012 than 2007, and about 1.9 percent higher in 2012 than 2007 for non-business loans.[11]

FUNDED VS. UNFUNDED LOAN APPLICATIONS

Because some of the variables are analogous between the rejected loan applications and funded loans data sets we are able to do some regression analysis in order to discern some of the determinants of loans being funded, and if small business loan applications were more or less likely to be funded. We estimate a logistic regression, using the following variables:

$$Funded_{i\{0,1\}} = f(SmallBusiness_i, Amount_i, Employment_i, HPI_i, Fico_i, Year_i)$$

where *i* refers to the individual application. SmallBusiness is a dummy which equals 1 if the application was for a small business loan, and 0 if not. Amount is the amount of money requested in the application, in thousands of dollars, and Employment is a dummy indicating that the applicant had been employed less than a year at the time of application. HPI is the mean of the Corelogic house price index in the

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

state where the applicant resided, indexed such that 100=1, and averaged over the previous year. Fico is the Fico credit scores of the potential borrower at the time of application. Finally, Year represents the year of application, and we include state fixed effects. We estimate the model initially with all time periods. Because the identification of loan purpose is not consistent until 2010 and we are likely to underestimate the share of loans for small business purposes, we estimate the model again using only applications from 2010 forward. Despite the incomplete information in the early years, the results from both models are quite similar.

Table 8 presents our results from the model described above, displayed as odds ratios. When controlling for quality of the application, loans were about two times as likely to be funded when they were designated for small businesses. As expected, requesting greater amounts of money decreased the likelihood of a loan being funded; each additional $1,000 requested decreased the likelihood of funding by about 4 percent. Having worked less than a year decreased the likelihood by about 97 percent. Having a higher FICO score positively affected the likelihood of acceptance, with each additional point increasing the odds by about 2 percent. We also see a positive relationship between higher home prices and the likelihood of having one's application accepted.

INTEREST RATE PAID

Turning to funded loans, we estimate a linear regression on the interest rate paid on the loans.[12]

$$InterestRate_i = f(SmallBusiness_i, Amount_i, Employment_i, HPI_i, Fico_i, Year_i, Population_i, Income_i, Long_i, Home_i)$$

SmallBusiness, Amount, Employment, Fico, and Year are defined as in the previous model. HPI is the Corelogic house price index, averaged over the previous 12 months in the county where the applicant resided.[13] Long indicates that the loan agreement was for 60 rather than 36 months, and Home indicates that the borrower owned his/her own home at the time of the application.

Population and Income are the population, in thousands of people, and the per capita income, in thousands of dollars in the county where the borrower lived. These county level controls are gathered from data provided by the U.S. Bureau of Economic Analysis.[14] We also control for state level fixed-effects in the regression.

The results of this regression are displayed in Table 9. The results indicate that, all else equal, loans that were for small businesses were charged an interest rate nearly a full percentage point higher than loans for other purposes. Each additional $1,000 requested increased the interest rate by 0.14 percentage points. Having a higher FICO score negatively affected the interest rate paid by borrowers; for each additional FICO score point, the interest rate was 0.09 percentage points lower. The year with the highest interest rates, as seen in the descriptive statistics, was 2009. Relative to the omitted category of 2007, all the years had positive coefficients, or higher interest rates, but at over a 2 percentage point increase, 2009 was the highest. Living in a county with a higher per capita income slightly decreased the interest rate charged. There was no statistically significant relationship between either the county population or the local house price index on the interest rate charged.

LOAN PERFORMANCE

Our finding that loans for small businesses were charged a premium over other types of loans despite controlling for the credit quality of the borrower is interesting. In order to explain this finding, we investigate whether such loans perform differently than other types of loans. We estimate the following logistic regression:

$Delinq_i = f(SmallBusiness_i, Amount_i, Employment_i, HPI_i, Fico_i, Year_i, Population_i, Income_i, Long_i, Home_i)$

All covariates are as defined in the interest paid regression and the dependent variable is a dummy variable equal to one if the loan was charged off, in default, or 31 to 90 days delinquent.[15] In addition, the model included state fixed effects.

Results from estimation are in Table 10. The results indicate that after controlling for observable differences in the quality of the borrowers, loans for small businesses were more than 250 times more likely to perform poorly than loans for other purposes, which may give some insights into why such loans are charged a higher rate. The other covariates in the model behave as one would expect.

CONCLUSION

Peer-to-peer lending has grown substantially since its inception in 2007 and has shown no signs of slowing. To the contrary, Prosper, the largest competitor in the peer-to-peer space, recently received a $20 million equity injection and may considerably expand its lending in the very near future. In addition Lending Club received $125 million dollar investment led by Google (De la Merced, 2013). Shortly thereafter, Lending Club announced that they had plans to launch a separate platform to make small business loans (Shankland, 2013). Unlike the personal loans to business owners on the traditional Lending Club platform which are underwritten based on the characteristics of the owner, loans on the small business platform would be based on the characteristics of the firm. The other large difference that is likely to occur is an increase in the size of the loans available. While final details are not yet available, there is an expectation that loans as large as $250,000 may be available on the new platform.[16]

While a relatively small fraction of peer-to-peer lending in the US currently goes to businesses, one might expect this to grow rapidly with a platform dedicated to small business lending based on two factors. First, beginning in June 2013, community banks Titan Bank and Congressional Bank began purchasing loans through the Lending Club platform and Titan Bank started to offer personal loans to their customers through Lending Club (Zerucha, 2013). With nearly 7,000 community banks in the US, the potential for additional partnering with Lending Club as it expands into the small business space is substantial. The passage of the SEC crowdfunding rules will certainly expand the pool of individuals eligible to provide funding to small businesses but it is unclear what the overall impact will be on P2P lending.

Second, consider the experience in the UK. UK-based Funding Circle is a peer-to-peer platform dedicated solely to making loans between £5,000 and £1 million to small businesses for 6 months to 5 years. It was founded in August 2010; as of August 2013, it had already made loans to nearly 2,500 businesses totaling more than £135 million.[17] This information is particularly relevant now that Funding Circle has merged with Endurance Lending Network in the US and are providing loans to businesses in the United States (Eavis, 2013).

As small business owners are increasingly turning to this alternative source of money to fund their businesses, policy makers may wish to keep a close eye on both levels and terms of such lending. Because such loans require less paperwork than traditional loans, they may be considered relatively attractive. However, given the relatively higher rate paid on such loans, it may be in the best interest of the business owner to pursue more formal options. More research is required to understand the long-term impact of such loans on the longevity of the firm and more education to potential borrowers is likely in order.

Additional research into the types of businesses that are more likely to turn to peer-to-peer platforms rather than traditional funding sources would also be of interest. For instance, it would seem that peer-to-peer borrowing would be more likely among service firms that have fewer—if any—assets to offer as

KEY TERMS AND DEFINITIONS

Crowdfunding: The practice of funding a project or venture by raising monetary contributions from a large number of people, typically via the Internet.

JOBS Act: The Jumpstart Our Business Startups Act, or JOBS Act, is a law intended to encourage funding of United States small businesses by easing various securities regulations. It was signed into law by President Barack Obama on April 5, 2012.

Peer-to-Peer Lending: Peer-to-peer lending is the practice of lending money to unrelated individuals, or "peers," without going through a traditional financial intermediary such as a bank or other traditional financial institution. This lending takes place online on peer-to-peer lending companies' websites using various different lending platforms and credit checking tools.

Prosper Marketplace: A San Francisco, California-based company in the peer-to-peer lending industry. The company operates Prosper.com, a website where individuals can either invest in personal loans or request to borrow money.

Lending Club: A US peer-to-peer lending company, headquartered in San Francisco, California. Lending Club operates an online lending platform that enables borrowers to obtain a loan, and investors to purchase notes backed by payments made on loans. Lending Club is the world's largest peer-to-peer lending platform.

Alternative Finance: Alternative finance refers to financial channels and instruments that have emerged outside of the traditional finance system such as regulated banks and capital markets. Examples of alternative financing activities through 'online marketplaces' are reward-based crowdfunding, equity crowdfunding, peer-to-peer consumer and business lending, and invoice trading third party payment platforms.

ENDNOTES

1 A ROSCA is a group of individuals who meet at regular intervals; at each meeting, each member contributes a given sum of money which is then given to a single member at the end of the meeting. Meetings continue until all members have received the lump sum. See Ardener (1964) and Geertz (1962) for a historical perspective on ROSCAs.

2 For more information, see the individual websites of these companies, http://www.kiva.org/ and http://www.crowdrise.com/.

3 See http://www.kickstarter.com/.

4 See https://www.prosper.com/ and https://www.lendingclub.com/ for more information on the individual companies.

5 See http://www.prosper.com/help/investing/
http://www.prosper.com/help/borrowing/
http://blog.lendingclub.com/2011/06/10/is-lending-club-available-in-my-state/

6 Kiser, Prager, & Scott (2012) find that the distribution of banks' supervisory ratings shifted towards worse ratings between 2007 and 2010 and those ratings downgrades were associated with significantly lower rates of growth in small business lending over this period.

7 While somewhat dated, the data from the 2003 SSBF provide the most current enumeration of small business borrowing from all sources with dollar amounts. Mach and Wolken (2006) provide more information on the 2003 SSBF.

8 "Other" providers include: venture capital firms, small business investment companies, other business firms, family or other individuals, government agencies, suppliers, credit card processors, check clearing companies, factors, owners, retirement plans and consolidated institutions.

9 The data are publicly available at https://www.lendingclub.com/info/download-data.action and are continuously updated. The data used for analysis in this paper were downloaded on August 13, 2013; analysis is restricted to loans issued prior to December 31, 2012.

10 The total number of funded small business loans is slightly larger in Table 5 than in Table 3. This is because Table 3 is split by the year or issuance of the loan whereas Table 5 is by year of loan application. There is some lag between application and issuance.

11 There are several months in 2008 when there were no peer-to-peer loans for small business when Lending Club was coming into compliance with SEC regulations.

12 In doing our research, we noticed that interest rate downloaded on different days was not identical for a handful of observations. For the 21 observations that did not have the same value across the two time periods, we compared the rate paid and the credit grade of other loans issued at the same time and used the reported rate that mostly closely fit with other loans from that period. For example, one loan on the data downloaded in August 2013 had an interest rate of 6.00 percent; that same loan had an interest rate of 14.91 on the data downloaded in December 2012. Because the 14.91 rate was more in line with the other loans made at the same time with a D2 rating, we used the 14.91 interest rate in the analysis.

13 The location data for the denied loans is of much lower quality than for the funded loans. For the denied loans, the state is the finest level of geography that we are able to ascertain for most of the applications. For the funded loans, we are able to ascertain the county from the city and state for most loans. Thus, we use state-level controls in the logistic model, but county-level controls in the regression.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

[14] The data used is the "Local Area Personal Income accounts CA1-3" series, downloadable from http://www.bea.gov/regional/downloadzip.cfm.

[15] While we cut off applications at December 31, 2012, we pulled data on all these loans on August 14, 2013 to get updated performance data.

[16] Since the revision of this paper, Lending Club has both launched its small business platform and become a publicly traded company valued at $5 billion.

[17] Statistics were pulled from the Funding Circle page on August 7, 2013.

This research was previously published in Strategic Approaches to Successful Crowdfunding edited by Djamchid Assadi; pages 56-77, copyright year 2016 by Business Science Reference (an imprint of IGI Global).

Chapter 2
Basic Types of Project Initiators: Contributor Relations in Platform-Based Online Crowdfunding

Javier Vidal-García
University of Valladolid, Spain

Marta Vidal
Complutense University of Madrid, Spain

ABSTRACT

Crowdfunding has helped many businesses and projects to take off easily and is replacing the traditional methods of fundraising since more platforms are being created. Evaluation of the risk for both the borrower and the donor is important before investing or borrowing to ensure that the project is a success. Crowdfunding is changing the way that projects and startups get funded. Most of crowdfunding money is raised on reward-based platforms, although equity crowdfunding is growing quickly. It can be expected that crowdfunding will become more popular, with many crowdfunding new opportunities available, which will make not easy for potential investors to choose what to support. In this chapter, we introduce the reader to the basic types of project initiators-contributor relations in online crowdfunding. We review the current literature identifying the research questions relevant for our purpose. We subsequently conduct a research method of systematic review to identify the relevant papers that address those research questions.

INTRODUCTION

People have many business ideas and innovations that are usually delayed or crippled due to lack of funds. There are many ways of raising money towards a given venture in order to kick-start a project. If an individual does not have the necessary funds, one of the alternative ways to raise funds is through fund-raising platforms. The money raised through a fundraising may it be through donation or on debt and it should only be used to successfully start the targeted project. The money raised can be through donations, mainly reward-based, equity-based or credit-based, all of which have to give some form of compensation to the contributor (Outlaw, 2013, p. 5).

It is very difficult to maintain an adequate long and short term financial plan when there is a shortage of funds for any particular business or a new venture. Furthermore, the working capital management will need to have adequate funds in order to cover the short term expenses. It is also possible that the creditors can demand payment at any time for the goods delivered to the business by them and for that is necessary to maintain the working capital or adequacy of the funds. Fundraising can also help the business to maintain the effectiveness of the business on a long term basis and the example could be related to the purchase of a new machine (Steinberg et. al., 2012, p. 35)

A new startup needs some amount of funds in order to get the business started. In order to transform the entrepreneurial project into a reality, then it is necessary to have adequate cash to execute all such plans. Moreover, the fundraising will help the entrepreneur to develop the business model for the growth of the project and a successful business marketing plan (Damus, 2014, p. 32)

The technological advancement and the use of the Internet have raised a new platform for fundraising known as crowdfunding. Crowdfunding involves three parties: the project initiator or owner who needs funding, the contributor who is willing to give their money and the moderating organization that facilitates the engagement between the contributor and the initiator (Young, 2013, p. 33). Moderation can also be done through technology by the project initiator himself, using Web 2.0 and outside of platforms (see for example Gerber & Hui, 2013 for a definition including such practices). The platform involves entrepreneurs or potential business owners asking for funding for their projects from the "crowd" or users from all over the world who may be interested in supporting their cause or business. Crowdfunding allow individuals the possibility to develop into their business ideas, even if it is only with a small amount of money. Governments encourage crowdfunding due to its positive impact on the economy as a whole, as it creates new jobs and fosters the economic growth of countries.

This chapter seeks to introduce the reader to the basic types of project initiators-contributor relations in online crowdfunding. For this, we have reviewed the current literature identifying the research questions relevant for our purpose. We subsequently conduct a research method of systematic review to identify the relevant papers that address our research questions.

BACKGROUND

Although the name of crowdfunding and its use of the Internet are new concepts to the market and the population, it is usually mentioned that the construction of the Statue of Liberty's Pedestal took up the same idea. John Pulitzer, who was then a publisher, used his newspaper to rally up people donate money for the construction of the Pedestal, a project that later raised 100.000 dollars in six months. Pulitzer raised a fund and promised to print the identity of each donor, regardless of the amount of the donation. In August 1885, Pulitzer was finally able to announce that he had raised the final $100.000 for the statue's pedestal. The next year the Statue of Liberty, which had arrived from France packed in crates, was erected on top. (See Young, 2013 for more details). Crowdfunding is becoming hugely popular in many parts of the world and the Internet platforms that are being used for contributions are on the rise.

In 2013, Crowdfunding raised over 5.1 billion dollars to help people in various projects all over the world and the figure is projected to increase in the future with the new platforms becoming more popular (See Crowdfunding Industry Report from Research firm Massolution). The new law of the Jumpstart Our Business Startups (JOBS) by President Obama in 2012 introduced a regulatory framework. Most of it still has to be translated into active regulatory elements to this date, protecting donors to crowdfunding

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

projects and enabling businesses to use crowdfunding as a real source of funding. The Act enhanced the credibility of the platforms for crowdfunding while at the same time ensuring that the project owners or entrepreneurs had a viable and a good source of funding for their projects. Kickstarter and Indiegogo are some of the most popular platforms boasting of members in millions of all parts of the world, these websites have enough people to pool huge amounts of resources for the funding of their businesses. See Assadi in this book (In search of business models of crowdfunding) for a complete explanation of the business models of online crowdfunding websites.

The chapter starts describing the different types of crowdfunding and continues explaining the different types of relations between project initiators and contributor in online crowdfunding such as reward-based crowdfunding, equity-based crowdfunding, and credit-based crowdfunding.

MAIN FOCUS OF THE CHAPTER

1. Reward-Based Crowdfunding

The reward-based form of crowdfunding is the most popular type with most contributors and initiators preferring this method due to the security of their funds under this method (See Crowdfunding Industry Report from Research firm Massolution, 2014). In reward-based crowdfunding, the target amount has to be established first for the completion of the project (Steinberg, 2012, p. 97). Then, the person or organization sets up donation amounts with an attached incentive that is proportional to the amount donated for the project. This method is hugely popular for artists, movie directors and other projects that have an aesthetic or prestigious value to the donor. For instance, if an artist was looking for a donation to help with a tour of Europe, he may offer signing autographs to people that will contribute $500 and backstage preparation with the cost to people contributing $1,000. These incentives ensure that the enthusiasts and the music lovers are motivated to donate to the cause (Young, 2013, p. 79). One of the unique characteristics with this method is that if the set platform allows for the project owner to get the amount only after the targeted amount is reached, he/she cannot be awarded the amount collected in case the donors do not raise all amounts. The donors can therefore get their money back and they have the confidence of recovery of the raised amount as a result (Agrawal, Catalini, & Goldfard (2015))

One of the major benefits of reward-based crowdfunding is that it has low risks for the promoter or the company that is behind the campaign to raise funds or donated amounts. Once a company has raised the required amount for the project and they may have had the donations only with a special clause for the specific project they are able to avoid dealing with debts, credit implications or interest that is attached to the loans or government grants. The reward-based crowdfunding method offers the chance to completely avoid all these problems and start their business or project without any possibility of future shortcomings due to any changes in the plans or the success of the project. The reward-based method also runs on low cost with the project owners being offered a chance to showcase their projects for only a small fee of their total collection and there are no high costs of managing the platform. As opposed to raising money through other conventional methods, where a person could end-up incurring a lot of costs for setting up the funds, crowdfunding sets this up at only a small fee and the project is viewed and supported by millions from all over the world (Roebuck, 2011, p. 104). The reward-based method also offers the donors a chance to gain a personal connection with the project they have donated towards and the people they have funded.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Given the nature of their agreement or the incentives that have accompanied a specific project the donors get a chance to meet with their project initiators and owners in some of the project or are offered a form of memorabilia that offers them a personal connection to the projects. (Roebuck, 2011, p. 108).

One should examine the project and the rewards that they have offered the people in order to ensure that they feel attracted enough to the project to offer their funds. As much as the project owner has to assess the amount of money that they need for their project, it is equally important to draft the best reward that is irresistible for the targeted crowd. The reward is very important to the project since it is the attractive aspect of the project and the main reason why people are interested in investing. The company has also to ensure that the reward selected does not detrimentally affect the project since they may end up spending a lot of time to give their rewards infringing on the results of the targeted project. (Young, 2013, p. 85).

The experiences and rewards that companies set for the people need to be measured and evaluated for their practicality since they may cripple the success of the project in the long-run. It is therefore advisable to limit the premium awards to only few elite and people that have hugely contributed towards the project. Depending on the amount that the project needs to be successful the owner should come up with premium rewards that are set to mirror the amount that he/she wants to raise (Young, 2013, p. 90). This means that the rewards for small projects should not have high premium awards in comparison to the rewards for a huge project that needs a lot of money.

Drafting a good plan to help with selling the project to the people in the right way to attract potential investors is also critical in a reward-based method. The right plan should consist of the ways to market the project and also the right rewards to the donors who have contributed to the project. Prior planning ensures coming up with the best strategy for marketing and representing the project in addition to the project itself (Roebuck, 2011, p. 139). It is also advisable to hire professional marketers in the event that the project is large and requires a lot of resources to ensure that it gets the amount of funding to complete it successfully. Professional crowdfunding marketers are essential in guiding and ensuring that the company has captured the main attributes of their project and that it may be attractive to donors. Giving incisive information on the best rewards for a given project are also some of the factors that may help in directing and giving a project owner. Generating a buzz for the project leads to funding and therefore the project should generate the buzz that is achieved through personally promoting the product across multiple channels and trying to forge personal connections with people to rally them behind the cause (Roebuck, 2011, p. 141). The reward-based method is regularly used, especially due to the fact that the project owner does not have to incur any financial loss in the undertaking, apart from a small amount that they pay to the platform owners once it is fully financed. Table 1 shows the advantages and disadvantages of this type of crowdfunding.

The crowdfunding platforms such as Indiegogo, Kickstarter, RocketHub, and Eppela host many reward-based projects. Moreover, an individual can establish a project that incorporates a text, video, and reward perks that will be accessed by a backer when the money is pledged by them to the initiative. Therefore, it can be said that these platforms are available to fund new innovative projects. Kickstarter is the pioneer in reward-based crowdfunding online platforms, where over $1 billion has been raised to projects. The online platform Kickstarter is the most creative way to provide funding for the creative projects.

The platform Indiegogo is suitable for any kind of project. The most important fact is that it has attained more recognition worldwide and even more than Kickstarter. Initially, it used to fund theatre based projects, but then it expanded its development and made it open to almost any project.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Rockethub is another similar company that was originally meant for the artists, but later transformed to include the sciences and scientists' projects, especially after the launch of its SciFund Challenge (Roebuck, 2011, p. 32).

Eppela is a platform founded in 2011 in Italy (Tuscany) for projects in the fields of design, art and culture, technology, food, non-profit, sustainability, and social innovation. The platform mainly targets potential artists, writers, film makers, or designers. Eppela charges 5% of the sum raised to cover operating costs. 40% of projects posted on Eppela are successful, it has more than 90,000 registered users, a successful project raises an average of 6,500 euros. Some of the most successful projects of reward-based crowdfunding funded through Kickstarter include Coolest Cooler, a company started in 2014 and located in Portland (Coolest, 2014), which is the largest reward-based crowdfunding campaign to date. The project involves the design of a portable cooler, which include blended drinks and music. This project has received donations from 62,642 investors for a total of 13,285,226 dollars. Another successful project, and currently the most funded, is Pebble, which is a customizable watch, with many downloadable watchfaces and internet-connected applications. The company is headquartered in California, its watches can be purchased online at (Getpebble, 2015). Pebble can connect to iPhone and Android smartphones using Bluetooth, alerting customers with a vibration for incoming calls, emails and messages. The project was funded in 2012 and attracted 68,929 investors, raising a total of 10,266,845 dollars. Ouya is another prosperous project funded in 2012, it is a microconsole with its own version of the Android operating system. The console was released to the general public on June 2013, together with Ouya stores for applications and games designed for the Ouya platform, its products can also be purchased online. A total of 63,146 investors supported the project, which raised a total of 8,596,474 dollars. Another of the most funded project is Pono Music, funded in 2014 in San Francisco, California (Ponomusic, 2014), which is an audio player using high quality recordings sold through the PonoMusicstore. The project gained support from leading record labels such as Warner, Sony, and Universal, and has signed a full agreement with Warner. The company was fully funded in one day after launching its crowdfunding campaign, 18,220 people invested in the company raising 6,225,354 dollars.

2. The Equity-Based Crowdfunding

Equity-based crowdfunding is a form of crowdfunding where the contributors become part-owners of the company raising funds. Equity-based is not a popular form of crowdfunding since the majority of the projects are not huge companies that donors and people funding the projects can get a stake and own part of (Douw, 2012, p. 60). Most of the projects are by entrepreneurs who do not have shares that the investors can invest in. However, since the enactment of the Act in 2012 this form of crowdfunding has gained popularity with most people seeing it as an investment opportunity for the interested investors in lucrative projects that the investors deem to pick up and be beneficial in a near future. This is offered at

Table 1. Reward-based crowdfunding in balance

Advantages	Disadvantages
• Raising money for the project or business without selling off an equity stake in the business. • Getting hundreds or thousands of people committed to the success of the campaign.	• Once an individual has successfully raised money, he has got to ship whatever he is producing. • The dock is ticking and it is no surprise that many of the top crowdfunding projects are very late in getting delivered to donors.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

very low rates as compared to the market rate since the project owners will need to make their proposal and project attractive to the potential investors through their competitive prices and growth potential in the future (Douw, 2012, p. 60).

Equity-based form of crowdfunding is slowly catching up with the other methods of crowdfunding. It is, however, a safe and viable method to raise money for the company and beneficial for the donor if the company makes profits in the future and they gain from the dividends or distribution. Equity-based crowdfunding can also be used to create a venture finance market. Equity crowdfunding does not only involve the shares as the only forms of securities, but also debt notes, convertible notes, and hybrid forms of equity and debt (see Freedman & Nutting, 2015, p. 5). In addition, there are some forms of partnerships that qualify as securities in equity-based crowdfunding. One of the main attributes of equity-based crowdfunding in creating venture-based market is its ability to connect startup business and the medium businesses to the larger investor community. Equity-based crowdfunding offers a platform to reach out to the companies through a single advertisement on the web. It ensures that the information reaches out to interested potential buyers and sells the business to the investors (Mollick (2014)). The venture space is therefore in ensuring that the investors and the business people meet. In addition, the venture space ensures that people with similar businesses and ideas can interact and advise each other on the best practices and the best ways to improve the businesses. The venture space is not only useful in raising the funds, but also ideas and plans on the best ways to improve the business given that there are other members of the crowd with the same ideas. It can also lead to mergers and amalgamation of two or more different venture businesses since the equity-based crowdfunding targets the business people who are interested in increasing their venture capital either through shares or other securities. The equity-based finance structure has a pool of professional small and large businesses that need a regular appraisal either through funding or through further investments (Steinberg, 2012, p. 113). Economic growth is also a factor that is hugely influenced by the success of the equity-based crowdfunding, since the growth of business companies contribute to the economic growth of the country. Most governments all over the world are taking up the new platforms and legislations have already been passed to ensure that crowdfunding for businesses and individual projects help the larger financial community that is the whole country. The venture finance marketplace has therefore transformed the equity-based crowdfunding concept to rally the support of the government and security legislations since it has been viewed as a milestone and a new trend in the financial sector.

These platforms offer companies to obtain extra funding for their product without having to go through the normal bureaucratic procedures that tie up an Initial Public Offer or the sale agreements with the shareholders in a company. It is therefore a platform for buyers and sellers to meet as much it is a fundraising project since the donors stand to gain from their investment decisions (Dresner, 2014, p. 85). The Jumpstart Our Business Startups Act of 2012 has increased the number of people who are interested in investing in the projects as they are assured of getting a return on their investments. The process is similar to the reward-based method since one has to broadcast and market their project to many people in order to ensure that they get enough "crowd" to fully fund their projects. It is therefore essential that the company plans for the ways to sell the project and make it attractive to potential investors that invest in the company in the hope of getting returns on the investments in the form of dividends or distribution. Similar to reward-based crowdfunding sorting help from professionals, on crowdfunding under this method is also necessary since they need to generate enough buzz to ensure that their projects are funded. This implies a low risk as compared to get money through other channels such as debt financing since the shares are the tokens that are offered to the investors of the new project. In addition,

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

the costs are also relatively low since instead of going through the usual channels and processes that require a lot of resources the company generates the funds at a very low cost with the only requirement being the small fee (ranging from 7% to 12%) charged by the platform operators. Although the investors are offered a stake in the company, the amount of stocks that are offered for a given amount needs to be proportional to their contribution (Dresner, 2014, p. 57). It is important to note the purpose of the project to the company and the implications of offering new members a part of the company keeping in mind that it should be high enough to attract new investors but should be financially feasible to ensure that the company remains in a competitive position. Offering too many shares for a lower amount may result to problems in the company due to one project and as a result, it is advisable to ensure that the amount given is managed by the company and does not cause any problems in the long-run.

The investors, however, bear the risk of losing if the company does not do well in the projects that it has invested in. As opposed to the reward-based method where the donors do not expect rewards that have a monetary value, although reward-based campaigns offer products as rewards, in equity-based method the donors take the risk of losing the money if the project or the company fails in the market. The opposite is true if the company performs well, investors are likely to get return on their investments from the project. The owners of the project are also able to pool the funds that they could not have accessed due to their financial constraints easily and more efficiently (Lawton & Dan, 2013, p. 86). Table 2 shows the advantages and disadvantages of this type of crowdfunding.

There are several online platforms that facilitate equity-based crowdfunding. They are IPOVillage.com, Seedrs, Crowdcube, Earlyshares.com, and MicroVentures.com. Their details are shared below:

IPO Village is the platform that utilizes equity-based crowdfunding in order to provide retail investors with exclusive IPOs emulated by the allowance of Main Street investors to get an access to the stock that was for Wall Street elites.

Cedars is the FSA regulated platform in the UK. It provides services for investments in the startups that includes equity-based crowdfunding investments as well. This platform lets the individuals to look for rewarding, tangible, places to get their money invested.

Crowdcube is another way to provide money to the startups and expand the business through equity-based crowdfunding while providing the entrepreneurs with a great platform to get connected with the ordinary people and ultimately give a raise to the venture capital.

A sample of recently funded projects funded through Seedrs includes Chapel Down (Chapeldown, 2015), a Premier English sparkling wine and beer producer based in Kent, England, admitted to trading on the ISDX Growth Market. The Company raised £4,350,000 through an equity issue in 2013 when it was funded, supported mainly by large investors and institutions. The company has launched a new equity issue in 2014. The company has been admitted to trading on the ISDX Growth Market and it is the first listed company that has undertaken an equity crowdfunding campaign anywhere in the world. Seedrs is also an example of a leading company funded by equity crowdfunding, the company is an online, cross-border platform for investing in startups (Seedrs, 2015). It aims to provide the infrastructure for private investments in early-stage businesses. They are looking to process and administer angel and group transactions and to create products and structures to provide a range of investor types exposure to startups. The company was launched in 2012 and has raised £2,583,420 since then with an equity offer of 33% of the company. NearDesk is another example of successful equity-funded company, the company lets users rent desk and meeting space by the hour at different locations around the UK, it is based in London and its cards can be purchased through its website (Neardesk, 2015). Thus, customers only pay for the time they use, with a single monthly invoice. Cards are issued by NearDesk and by partners

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Table 2. Equity-based crowdfunding in balance

Advantages	Disadvantages
• By taking angel investing (individuals investing in startups) online, equity crowdfunding has opened up this type of investing to more and more people. There are very accomplished investors using these platforms whose contribution may add to the success of the business long term. • Equity crowdfunding allows raising money in a fast way on websites without the need to agree to fundraising commitments of venture capital companies. • It would also allow entrepreneurs more freedom to set their own commitments compared to selling publicly traded stocks. • Attracting hundreds of investors online also means gaining online popularity for a startup company.	• Not all entrepreneurs are comfortable posting their financial and business plans online for investors to see. Getting comfortable with equity crowdfunding means one must get comfortable with increased transparency into the business. • Equity crowdfunding might not be able to compete with the experience and expertise in business growth that venture capitalists could bring to startups. • As crowdfunding investors might have not much knowledge about the risks of online investment, it may be difficult for entrepreneurs to deal with investors' expectations. • Equity crowdfunding (by non-accredited investors) is not yet legal in the United States as it is prohibited by the Securities Act of 1933

who provide co-branded cards. The company has raised £1.000.012 in 2014 with an equity offering of 22% in its third round. Another company worth mentioning is Shareeight, an application available to download on the iPhone and iPad that aims to bring together all of the major brands and retailers in one place. Shareeight is a unique search method to reach the top 500 retail search terms in just three taps, the interface organizes the results into manageable chunks of 8. Shareeight aims to bring all the major stores together to benefit both customers and shops. So far, more than 80 retailers and over 8.000 brands have joined Shareeight. The company was founded in 2014, it is based in London and its applications can be downloaded from its website (Shareeight, 2015). They have had two rounds of financing, in the first one they raised £605.000, equivalent to the 16% of the company, and a second round raising $1,000,000 in just 24 hours.

3. Credit-Based Crowdfunding

Credit-based crowdfunding is a method where the donors to a specific project loan out money to the person in the hope of future repayment of the amount owed. This is the safest method of crowdfunding for the donors since in case the project owner defaults in payment of the advanced loans the platform is liable for the payment of the loan to the donor (Tomczak & Alexamder, 2013, p. 341). Under this method the borrowers submit an amount that they wish to be loaned and the donors interested in the specific project advance the borrower the amount with a promise of repayment at a future date. The platform acts as the intermediary and or surety for the borrower and the donor to ensure that the donor gets the amount back and facilitate the pooling of funds for the borrower. The borrowers find crowdfunding attractive since it has very low or no interest rates for the borrowers and they only have to incur a fee to process the funds by the platform and agree on a flexible payment plan to refund the amount forwarded. In the event that there is any interest to be charged on the amount of money borrowed the borrower sets the interest to be charged that they are comfortable and can guarantee a refund within the stipulated time period (Mollick, 2014). This makes the method attractive for the borrowers since they are not required to pay a minimum or set interest rate that is predetermined and as a result they can guarantee payment. The lenders on the other hand have to evaluate the project for its risks or benefits and potential and establish if they are willing to lend money at the interest rate set by the borrower. The arrangement is similar to that of a bank loans with the main difference being the predetermined interest rates. Whereas

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

in credit-based crowdfunding the borrower sets the interest rates, inviting donors to fund the project in a bank loan the borrower must agree to the terms set by the bank or the authorities involved (Althoff & Leskovec (2015)).

One of the main advantages is that the borrower does not have to give any form of collateral to the lender and they transact only in terms of good faith from the borrower and the donor of the project. The donor funds the borrower in the hope that they will repay the money not because they have a history of repaying or they have presented evidence to suggest that they are capable of repaying the money but only on faith they have on their project. This ensures that the platform eradicates many processes of loan funding and borrowing that would slow the timeline of acquiring a loan. Background checks run by the banks and also the examination of the presented information are a large part of the processing process making it tedious and time consuming. The process also rules out borrowing from poor and new business people that are looking for money to kick start their business and have no collateral or no history to guarantee payment of the amount that they have borrowed. Crowdfunding offers such people a chance to borrow even huge amounts of money without any form of guarantees and guarantors. Credit-based crowdfunding has been immense in eliminating the factors that hinder borrowing and lending since there are none in crowdfunding. The project and presentation of the ideas are the most important aspects of a project if one aims to be funded for a project accordingly. It is therefore advisable for one to lend both their time and resources in the presentation of the project to as many people as possible. Hiring professionals to market the product is necessary for a borrower that looks to get money for their project and within a specific timeline since the professionals are able to market the product to the potential lenders using the best techniques while also offering advice on aspects such as the interest rate that stands to attract investors in the market (Tomczak & Alexander, 2013, p. 350). Proper planning is also important for the borrower if they are to make the intended amount within the set timelines and be able to pay specific installments that they have set. Unlike the other two methods where awards are given to the people who invest in the project, the credit-based method requires an individual to have a well-structured plan on the mechanisms of payment. Table 3 shows the advantages and disadvantages of this type of crowdfunding.

Just like the above two crowdfunding platforms, there are several examples of online credit-based crowdfunding platforms. They are named as Funding Circle, Lending Club, Prosper, Zidisha and Index Ventures.

Funding Circle was developed with a big idea in order to revolutionize the outdated banking system and maintain a better deal for every individual. They have helped the businesses grow with thousands of loans along with the facilitation to let the investors prosper and stabilize the economy. It is the leading lender in the online marketplace which targets small business.

On the other hand, Lending Club got the status of an establishment as an alternative to the conventional banking system in that provides loans to the borrowers at a low interest rate and better returns to the investors. It is America's dominant online credit platform and has been pioneer in transforming the way the lending operates.

Index Ventures is the leading international capital firm with branches located in London, Geneva and San Francisco. They provide support to the companies and founders who look to become the Fortune 500 for the upcoming 50 years.

Credit-based crowdfunding present some interesting statistics, Funding Circle (Fundingcircle, 2015) reports that 34,322 British investors have lent to business through their website and a total of £417,602,420 have been lent to British businesses since 2010. An average investor achieves an average return after fees and bad debts of 7.6%. Lending Club (Lendingclub, 2015) is the world's leading online

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Table 3. Credit-based crowdfunding in balance

Advantages	Disadvantages
• Possibility of raising capital without giving away company's shares of capital. • Funds are disbursed as personal loans through internet without financial intermediation. • The fact that small sums are made to individual loans minimises losses.	• Less important contributor's involvement than in equity-based crowdfunding • No pre-sale/audience building element as in donation-based crowdfunding. • Funds are disbursed without collateral, with high risks involved.

credit marketplace, they have a simple credit marketplace, customers interested in a loan fill an application, the company examines the information, determines an interest rate and presents some offers to borrowers, then investors select loans in which to invest and can earn monthly returns. Lending Club has donated $6,205,366,548 in loans, and has paid $595,817,848 to investors. 83.17% of borrowers report using their loans to refinance existing loans or pay off their credit cards. The company has grown at more than 100% per year over the last few years. Prosper (Prosper, 2015) is America's first peer-to-peer lending marketplace, it has more than 2 million members and has funded more than $2,000,000,000 loans. Borrowers request loans between $2,000 and $35,000 and lenders invest from $25 in each loan listing selected, investors can see credit scores, rating and histories, as well as borrowers' personal loan descriptions, endorsements from friends, and community affiliations. The company reports an average return of 8.89% for investors. Zidisha (Zidisha, 2015) is the first online microlending community that matches lenders and borrowers, the company has raised $2,308,144 so far and has funded 8,127 projects, with a total of 9,504 lenders and 6,141 borrowers from 141 countries. Index ventures (Indexventures, 2015) is the oldest of the companies, founded 1996, they have funded 140 companies in 38 countries. The company has raised several venture funds, from Index Ventures I through VI; Index Growth 1 and 2; and a $200 million life sciences fund with the support of GlaxoSmithKline and Johnson & Johnson.

4. Donation-Based Crowdfunding

Donation-based crowdfunding is the last method available for funding new initiatives. In this method, funds are raised for an initiative of public interest, although there is no economic benefit to the community financing the initiative. One of the greatest challenges of social entrepreneurs today is accessing startup capital, that's why donation-based crowdfunding makes this method an interesting financing solution. One example of donation-based crowdfunding is the 2008 election campaign of President Obama, the campaign team collected more than $137 million by this method.

One of the risks in a crowdfunding initiative is targeting and unrealistic financing initiative, as crowdfunding platforms charge a larger percentage fee if the target is not met, failing to deliver on the project's promise will negatively affect the project's reputation. Thus, it is very important to engage the potential community into the project and design the project according to their interests. That's why advertising the campaign is an important part of the crowdfunding process, always keeping costs in mind, it is important to advertise the campaign through several channels and reaching the largest possible potential supporters. Most donations-based crowdfunding initiatives reward donors with something in exchange for their contribution. Typically this is some kind of perk, this is usually the most expensive part of the crowdfunding campaign. The most challenging part of the crowdfunding process is moving from the zero donation phase, as potential donors usually imitate what other supporters did, then a

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

potential donor might be not willing to give funding to a project when no money has been raised yet. Encouraging close friends and contacts to contribute in the initial stages of the campaign will be helpful. The Regional Studies Association (RSA) explains that the most critical zone is when the 10%-50% of the initiative has been funded, as most unsuccessful campaigns fail somewhere in this range. Thus, in order to take the initiative to reality it is essential to push the campaign after the launch with advertising and showing previous donations. In initiatives involving social entrepreneurship like the ones involving this type of crowdfunding it is more important to have the certainty that it is a feasible project, as a poor crowdfunding campaign could harm the reputation of the company and affect future initiatives to get funding. Another important issue to consider is that the amount raised can be affected by declined funds later on coming from credit cards, wrong donations, or fraud.

Not all of the main crowdfunding portals are suitable for social entrepreneurs. For example, Kickstarter is designed only for creative projects and is not aimed for social businesses or nonprofits. GoFundMe is the world's leading personal fundraising website, it is based in San Diego, California, and it was launched in 2010 (Gofundme, 2015). It has become the leading fundraising site for personal causes and life-events. It has raised $550 million from 8 million donors since inception. Some example websites that are usually employed by social business include: Indiegogo, which we already mentioned above, although the company was not created for social entrepreneurs it allows almost all donations-based initiatives. It has become a large network for social businesses and ONGs due to its flexibility and international recognition. Another platform for causes and charities is Crowdrise, which employs a specific system to advertise the charitable impact of social organizations. Rockethub jointly in partnership with A&E Project Start Up also offers donation-based crowdfunding services funding innovative projects for social entrepreneurs. Another portal which operates in a different way of the others listed above is Invested.in, this website offers the opportunity to social ventures to create its own crowdfunding community for donation-based fundraising. The platform argues that its procedure to raise money is simpler than other portals and its transaction fees are lower than the competition. Table 4 presents the advantages and disadvantages of this type of crowdfunding.

The most common examples of donation-based crowdfunding are projects involving some kind of community fundraising: improvement to schools, improvements to churches, financing for children school ground, or financing facilities for sports clubs. The initiatives that raised the largest amounts from the platform GoFundMe include "Saving Eliza" (SavingEliza, 2015), which is a campaign to save a 8 year old girl, who was diagnosed with a rare terminal genetic disease. The campaign has raised $1,758,500 from 32,794 people. Another campaign is "Bucks for Bauman", which helps a man injured in the Boston marathon attacks to pay for his medical bills, the campaign has raised $809,035 from 16,491 people. Also related to the Boston marathon attack is the "Celeste and Sydney Recovery Fund", which is a fund to recover both ladies physically and emotionally from the attack in Boston. The initiative has raised $794,934 from 11,271 people.

CONCLUSION

In conclusion, crowdfunding has helped many businesses and projects to take off easily and is replacing the traditional methods of fundraising since more platforms are being created. Evaluation of the risk for both the borrower and the donor is important before investing or borrowing to ensure that the project is a

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Table 4. Donation-based crowdfunding in balance

Advantages	Disadvantages
• There are usually no tax implications when receiving large sums of money in this kind of initiatives. • No need to give up partial ownership of the company (although in many cases of donation-based crowdfunding there is not a company involved). • Limited regulatory restrictions. • Donors are assured that their money is put to good use. • It provides a platform for many short-term and easy to measure social projects, which are initiated soon.	• The main disadvantage is that social entrepreneurs might be limited by the amount of money they raise, as this kind of initiative usually attract less money than other types of crowdfunding, the amount collected might not be enough for an ambitious initiative. • People are reluctant to support a project if they do not obtain a financial return on their donation, this should be taken into account in the initial plan. • Especially important for social projects is that the number of participants in these initiatives decreases in proportion to the likelihood of fraud. • Reward initiatives can be expensive. • It is difficult to differentiate a social project from others and get attention from the crowd given that barriers to entry are low.

success. The legislation of the Act has enabled the platforms to conduct business better and have a larger crowd since the donors have the backing of the government and the law while engaging in the business.

Crowdfunding is changing the way that projects and startups get funded. Most of crowdfunding money is raised on reward-based platforms, although equity crowdfunding is growing quickly. It can be expected that crowdfunding will become more popular, with many crowdfunding new opportunities available, which will make not easy for potential investors to choose what to support. A new business that seeks funds through the crowdfunding process comes out stronger as for the questions that has to answer and the scrutiny that it is put under, compared to convince a single angel investor. It is worth mentioning that because a startup does not obtain crowdfunding does not necessarily mean that the business is not viable. It might be that investors may not be on that platform or perhaps is not the right time. One of the biggest challenges ahead will be communicating efficiently and engaging with investors after successful funding. Investors will possibly be interested in the big numbers and updates instead of the news from daily operations. Investors will be more likely to reinvest if they are kept engaged and the company is looking after them. Creating a mutual interest might foster that investors act as ongoing mentors in the business.

It is widely believed that crowdfunding will democratize the investment market. The question remains if the sector will continue acting in a fair and trustworthy way in the future, or will make the same mistakes as banks during the financial crisis, in that case the sector can lose its credibility. In this sense, Crowdfunding research website TheCrowdCafe explained that there are no cases of fraud in the six main platforms monitored by them. Fraud means creating fake campaigns or companies. Although the number of fraud cases and scams in the crowdfunding industry has been recently growing, recent cases include: GoBe, Anonabox, Scribble or Holovision. Thus, investors should examine the project thoroughly before investing as the possibilities of fraud will increase in the near future as the industry grows.

Each type of crowdfunding has itws own advantages. Reward-based crowdfunding can raise money for the project or business without selling off an equity stake in the business, as well as getting hundreds or thousands of people committed to the success of the campaign. Equity-based crowdfunding attracts accomplished investors using these platforms whose contribution may add to the success of the business long term. It allows raising money in a fast way on websites without the need to agree to fundraising commitments of venture capital companies, and also allow entrepreneurs more freedom to set their own commitments compared to selling publicly traded stocks. Credit-based crowdfunding offers the possibility of raising capital without giving away company's shares of capital. Funds are disbursed as personal

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

loans through internet without financial intermediation, and the fact that small sums are made to individual loans minimises losses. Finally, Donation-based crowdfunding offers no tax implications when receiving large sums of money in this kind of initiatives, with no need to give up partial ownership of the company, limited regulatory restrictions, while donors are assured that their money is put to good use.

While in the US, companies using crowdfunding platforms have to disclose their finances to potential investors and regulators, in European equity crowdfunding platforms are still approaching important concerns like transparency for potential investors. American crowdfunding platforms typically look for financial projections of companies and examine their business plans. The lack of crowdfunding legislation in Europe is an important obstacle in the advancement of this way of financing. In Europe, small and medium companies represent 99% of businesses and 67% of all jobs. According to the European Central Bank, bank loans decreased sharply after 2008 by 29%. Crowdfunding is a possible solution for the problems of financing small and medium-sized companies, but the existing regulations prevent growth in this market. Furthermore, the lack of integration of European regulation limits crowdfunding to national borders, which means that operating in a small market will make more difficult for small companies to satisfy their capital requirement.

In Europe, there are 28 different legal crowdfunding frameworks for one market, this fragmentation is the key problem for crowdfunding growth. Cross-border transactions will face problems with this situation. Thus, many investors are excluded from investing in crowdfunding projects due to their location in the UE. Many countries are pushing the European Commission to create a pan-European regulatory framework to foster growth in the sector. This problem has been clearly recognized in the United States, with the Jumpstart Our Business Startups Act', or the 'JOBS Act', a uniform regulation for crowdfunding has been created. According to Masssolution Market Researcher, Europe will represent 26% of the crowdfunding total market. Only in 2012, the European market handled transaction for 925 million, while the American market for crowdfunding managed 16 billion dollars. Europe will not be able to follow the United States when it comes to crowdfunding until a uniform legislation is created (Bruntje & Gajda 2016).

Finally, it is worth mentioning that many crowdfunding proposals do not go through the crowdfunding platforms, many companies prefer to launch their crowdfunding campaigns through their websites. One example is Lockitron, which was rejected by Kickstarter. The company, which makes electronic door locks, launched a campaign on its website and raised more than $2,000,000 in 30 days.

KEY TERMS AND DEFINITIONS

Angel Investor: An investor who provides funding for small startups or entrepreneurs.

Credit-Based Crowdfunding: Credit-based crowdfunding is a method where the donors to a specific project loan out money to the person in the hope of future repayment of the amount owed.

Crowdfunding Platform: Internet platforms which enable companies to advertise over the internet and obtain investments from registered users in return.

Donation-Based Crowdfunding: In this method, funds are raised for an initiative of public interest, although there is no economic benefit to the community financing the initiative.

Equity-Based Crowdfunding: Equity-based crowdfunding is a form of crowdfunding where the contributors become part-owners of the company raising funds.

Jumpstart Our Business Startups (JOBS): A regulatory framework, protecting donors to crowdfunding projects and enabling businesses to use crowdfunding as a real source of funding.

Reward-Based Crowdfunding: In reward-based crowdfunding, the target amount has to be established first for the completion of the project. Then, the person or organization sets up donation amounts with an attached incentive that is proportional to the amount donated for the project.

Chapter 3
Crowdfunding and Slow Money: Challengers or Partners – A Field Perspective

Jung Aymeric
Sustainable Finance Geneva, Switzerland

ABSTRACT

Investment is always needed for new business or business development, and we are living with the emergence of new kinds of providers. Alongside banks, funds, or capital markets, efficient funding through people is doable on a larger scale than ever before, thanks in part to the Internet. Crowdfunding platforms and Slow Money are part of this bottom-up trend. In this chapter we compare crowdfunding and Slow Money and by analyzing how they attract people, we discuss their similarities and differences to respond to the research questions. The analysis might help identify potential synergies between the two non-conventional models, and heighten crowd-based solutions of fundraising. This article will identify their fundamentals. More importantly, we will investigate the spirit behind direct funding.

INTRODUCTION

The severe decline in finance for business has arguably been the most enduring dimension of the 2008 financial crisis. American and European banks, the conventional channels of funding for businesses, have abruptly decided to lend less, particularly to small and medium enterprises (SMEs), to reduce their exposure to worthless debt and risk. As a consequence, the normal supply of funds for smaller businesses and micro-enterprises has significantly declined even more in both nominal and real terms.

Small firms, unlike large firms, lack access to public institutional debt and equity capital markets, and therefore in crisis periods when credit sources tend to dry up, they are more likely to experience difficulties in obtaining external funding for working capital and investment than large firms. Banks pledge 40% of their resources to multinationals, 20% to derivatives, 13% to interbank loans and only 17% to the local economy (Mortier, 2013),

Gordon Mills and McCarthy (2014) report that American small enterprises were hit harder than large firms in terms of securing bank credit during the 2008 financial crisis. In the same vein, the European Central Bank (2014) notes that while access to finance is a major challenge for European SMEs in normal times, it was much more so during the financial crisis. Klein (2014) finds that limited access to bank credit in recent years has increased the pressure on SMEs, forcing them to scale back investment plans and production. He finds evidence that countries with a high prevalence of SMEs tended to recover more slowly from the global financial crisis than their peers, implying that the interaction of the economic structure and access to bank financing plays a critical role in episodes of economic recovery (Klein 2014).

The 2006-2008 crisis also revealed that governments, often affected by high levels of public debt, were unable to provide extensive funding. People consequently took initiative for both protesting ("Occupy Wall Street" in the United States, "Indignados" and "Podemos" in Spain, etc.) and leveraging their social ties to be part of the solution in the face of the financial problems.

One of their basic solutions consisted of bypassing the conventional institutions as intermediaries of collecting funds from one and lending them to others. Crowd-based initiatives used the power of people to unlock funds for small entrepreneurial and local projects. The idea was to link people who had extra capital to people who needed capital.

While the emerging community-based solutions had almost always existed, they experienced a renaissance after the financial crisis of 2008. Crowdfunding and Slow Money are from this strand. Both resort to people for supporting project initiators and entrepreneurs. The idea behind these new modes of funding is to offer people to invest in projects they relate to.

This chapter compares the two crowd-based solutions of crowdfunding and Slow Money. Crowdfunding is the process by which capital is raised for a project through pooling numerous and relatively small financial contributions or investments (Belt et al, 2012). The rationale is similar to any entrepreneurial project that is funded through conventional channels: profitability, or at least financial sustainability.

Slow Money is socially and proximity oriented. It encourages consumers to buy from and investors to support local businesses. Woody Tasch, founder and chairman of Slow Money, a nonprofit organization, criticizes the grow-big-and-go-global-fast mode of industrial and capitalist agriculture, and calls for a capitalism that restores biodiversity, soil health and the local economy (Tasch, 2009). Kurland et al. (2012) believe that Slow Money is part of the localisation movement with four priorities: independent ownership, local buying, local sourcing, and pragmatic partnering. They also identified other values such as responsibility to workers and the natural environment (Kurland et al. 2012).

The ultimate objective of this research is to identify similarities and differences between crowdfunding and Slow Money in financing small projects. Do they have the same mission? Are they challengers or partners?

COMPARATIVE ANALYSIS OF CROWDFUNDING AND SLOW MONEY

In this section, we compare crowdfunding and Slow Money in terms of rationale, networks (communities) of initiators and backers, and regulations.

For crowdfunding, the analysis is mainly based on relevant literature. For Slow Money, because of its relative newness, the review will mainly be based on the founding book of the movement, "Inquiries into the nature of Slow Money" (Tasch, 2009), some direct meetings with key people and the related websites through fifteen states in the United States and one in France.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Vision, Mission, and Foundation

Crowdfunding commonly means an open call for funding a project with small amounts of money from a large number of people via the Internet. Crowdfunding is generally based on credit, donations, equity or rewards and/or voting rights (material and natural recompenses) to support initiatives for specific purposes (Lambert & Schweinbacher 2010). There is no obligation in return for a donation.

Although donations and reward-based crowdfunding might seem close to the foundations of Slow Money, the difference is that the former mainly supports the contributor's favorite artist, product or sport event, while the latter is rather a local and community-based engagement. While crowdfunding can be considered a tool that is neutral by nature, Slow Money demonstrates a deliberate willingness to change the way businesses and investors operate. Slow Money is also limited to food-related projects.

Slow Money originated in Slow Food, which is an alternative to fast food and industrial farming. The movement started in Italy in the 1980s and progressively expanded worldwide, promoting regional producers and local biodiversity. Woody Tasch published (2009) an inspiring book called "Inquiries into the nature of Slow Money: Investing As If Food, Farms and Fertility Mattered". The Slow Money Alliance started in California in 2009 to support sustainable local food systems. Ashta (2014) describes Slow Money as a patient investment in the slow food sector as opposed to the high velocity of money, fast money products such as derivatives and securitization, and profit maximization (Ashta, 2014).

Slow Money seeks to promote a direct link between local entrepreneurs and investors for a wide array of local food actors such as farmers, distributors, processors and specialized Internet platforms instead of complicated securitizations and structured finance.

In Slow Money and reward-based crowdfunding, entrepreneurs offer rewards and products instead of reimbursement in cash. Both also provide technical assistance to collect money as well as legal support and frameworks for handling funds and rewards.

From a project initiator's vantage, the first benefit that comes to mind is that both crowdfunding and Slow Money provide an alternative source of funding and financing to conventional banks and financial institutions.

Consequently—and it can be a second benefit—project leaders can raise funds in a way that is consistent with their values and those of their backers. This community of values generally leads to long-term relationships beyond the moment of the financial transaction (Gerber, et al., 2013, p5).

Crowdfunding also garners attention and feedback (Belleflamme, 2010; Gerber et al., 2013) and logically allows measuring public interest for a product or a service. Slow Money organizations can provide advice and support, with value sharing operating through physical encounters as well as Slow Money supported websites and forums.

A process of crowdfunding can reach potential customers (Paykacheva, 2014) and actively involve them from the very beginning of the project. Interacting with backers and customers at various stages of product development increases chances of commercial success at a very low cost (Gorshkov 2011).

In so doing, project leaders receive validation and public recognition. Pre-marketing or pre-payment permits firms to launch products with a certain amount of revenue. When enthusiastic customers share their experiences, they attract new potential funders (Paykacheva, 2014, p12).

However, one should not forget that a campaign might also fail and damage its reputation with potential customers, crowdfunders and in particular traditional investors like banks or business angels. However, in cases of failure to reach the target funding, entrepreneurs can benefit from remarks and feedback to readapt their products' features to the market within a reasonable timeframe.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Communities

Crowdfunding and Slow Money resort to communities to raise funds. In both cases, entrepreneurs look for recognition and investors whose values align with their projects. Relationships are often built beyond the financial transaction. However, the affiliated communities are different.

The community of Slow Money already exists, and its members regularly interact. It is not an ad hoc community built around spontaneous projects. Slow Money is "mission money" that chiefly requires a positive impact on the ecosystem, local jobs, and indigenous foods within a pre-existing community.

Investors in Slow Money projects are not all professionals or accredited individuals but most of the time are part of a community that aims to initiate change and discover new solutions for a capitalist system perceived as having lost its fundamental values. Investments' maturities are between 2 to 7 years in most cases, with returns targeted around 3% to 5%. Accordingly, having a project linked to the community is compulsory for resorting to Slow Money. Slow Money induces more meaningful relationships than just interacting about the project.

A crowdfunding community does not exist a priori. Money is collected from individuals for different kinds of project, from supporting a social or communal cause to profit-oriented opportunities. In this perspective, investors might support projects that are useful for a community or the environment, but this is not a *non-sine* condition. In addition, crowdfunding is predominately happening on the Internet. A potential entrepreneur can prepare with a relative ease a message on a computer screen and send it to crowds. In a Slow Money process, physically meeting investors is a must.

Individuals spread the word about campaigns they support. They usually trust the experiences of their peers more than firms' ads (Paykacheva, 2014). The buzz that a crowdfunding platform creates might even attract traditional media such as radio, television and newspapers, which are interested in reporting about original ventures. Influential people within a network can disseminate the message even further and consequently attract more backers. In this vein, there are similarities between the functioning of crowdfunding platforms and e-commerce, which collects data about users and tracks their behaviors. Highly sophisticated algorithms then enable e-merchants not only to understand customers but also to impact their behaviors. Similarly, crowdfunding platforms gather data and generate traffic to lead visitors to different projects rather than any specific one.

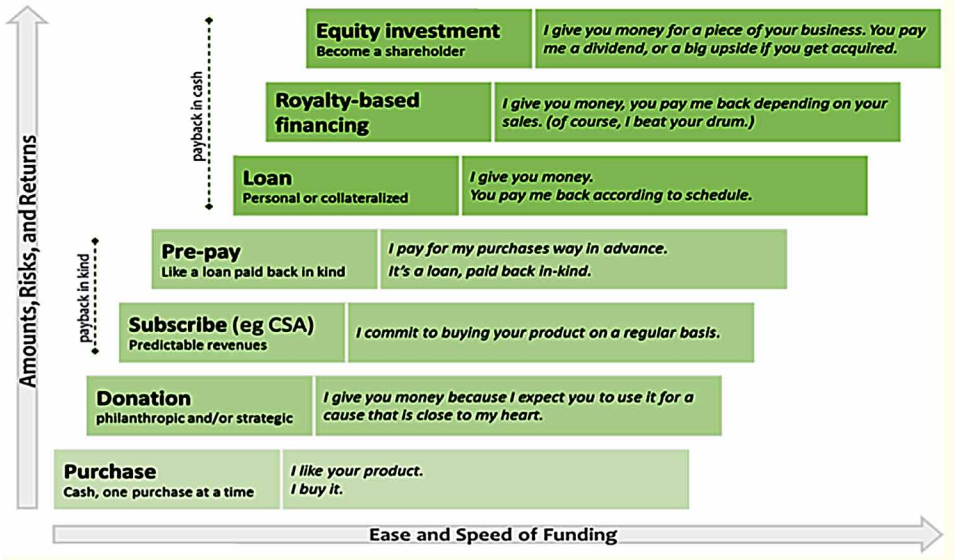
Traffic generation in a crowdfunding campaign aims to create ex-ante community on a platform around projects (Beier, and Wagner, 2014, p17). Larralde and Schweinbacher (2010) point out that efficient communication inside a network is an inherent component of any crowdfunding process. Unknown inhabitants of networks on crowdfunding platforms or through Facebook and Twitter pages might back initiators by disseminating the message and engaging more people (Hui, Gerber & Gergle, 2014).

This is not the case with Slow Money, which endorses specific community-related projects and supports face-to-face visits between entrepreneurs and investors. Investors look to support businesses that integrate and develop the related communities.

While crowdfunding platforms mainly use the Internet and online social media to link project leaders and contributors, Slow Money's infrastructure for linking initiators and investors is offline through local communities. Certainly, Slow Money members can also use the Internet and social media; however, their major channel continues to be offline local networks. Slow Money has developed a major internal website on which members can buy "beetcoins" against USD. These "beetcoins" are granted to a Slow Money entrepreneur during national gatherings once a year, but their value is marginal. For example in 2014, beetcoins were bought for $100k, but direct money invested by local communities reached $10 million.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Entrepreneurs might also be supported further and introduced to politicians and public institutions for developing their projects. For example, Business Alliance for a Living Local Economy (BALLE) in the US is a network of local entrepreneurs that aims to promote its members even more. They are part of the "localist" movement, with connections between entrepreneurs alongside the full value chain. All in all, Slow Money is a way of enacting community links rather than exploiting social ties for testing or selling products.



There are now progressively thematic crowdfunding platforms that raise funds for community and environmental projects. However, their orientations are optional rather than essential, as is the case of Slow Money.

Regulations

Regulation for raising funds are different in Slow Money and crowdfunding approaches. In a Slow Money campaign, contributors can invest or give one as much as they want—hundreds, thousands, or even millions dollars. Investors can support a food business with a pre-payment purchase at a time or through a regular commitment, donate, lend money, or directly invest (Hesse, 2012). There is no limitation to the amount that can be raised.

Such is not the case for crowdfunding in many countries. For example, in France, crowdfunding based on investment is limited to €1000 per crowdfunder and €1 million per project. In the same way, crowdfunding is limited by current regulations on the format of funding, most being considered donations, with some legal frameworks, such as in the United States, simply forbidding equity.

DISCUSSING DIFFERENCES AND SIMILARITIES BETWEEN CROWDFUNDING AND SLOW MONEY

According to Tables 1 and 2, which describe similarities and differences, crowdfunding and Slow Money are actually challengers, different and complementary.

They are challengers when they compete for the same investor's wallet to get direct funding outside of the banking system and conventional intermediaries.

They are different in two major areas, the management of relationships with supporting communities and the amount of money authorised by current regulations. While crowdfunding campaigns to build or to grow a community for financing (entrepreneurial) projects, Slow Money operates within an already existing community for developing local (food) production. The community is firstly interested by the impact of the project on the environment, local jobs and quality of food. Tools and legal forms used to bring the money from the community to the project are various and discussed at Slow Money in a second stage during the support process. It is slow because as an investment, the main purpose is to finance over the mid- and long-term. It is also Slow Money because it is a financing linked to the food. The community brings money to an entrepreneur with a project or a product linked to the local food system. His commerce and his product must take care of the ecological system and create local jobs for the community. The entrepreneur has proximity with investors and the investment is about the soil, the food, and the community. Mission related investment in a community that already exists is meaningful and is more than just interacting.

Slow Money by definition is patient capital and gives another chance to the entrepreneur even if he failed in raising the money needed. Indeed, through an internal study, half of the Slow Money investors explained that they will not stop their support even if the investment does not give the return expected or if there is a loss in capital. Patient capital is different from a support motivated by a buzz. Furthermore Slow Money as a brand is part of Slow Movements with Slow Food, but also Slow Media, Slow Science, Slow Travel, Citta Slow using Internet communication tools and social media.

A crowdfunding platform manages communities in another way, much more like social media do. To generate community dynamics, crowdfunding uses philanthropic wording and methods, in order for crowdfunders to at least have the feeling they share the same values and the same priorities as the entrepreneur (Gerber,et al., 2013). As highlighted by Paykacheva "this directly applies to Maslow's hierarchy of needs as one of the esteem needs, fulfilled by being accepted and valued by others" (2014,

Table 1. Similarities between crowdfunding and slow money

	Crowdfunding	Slow Money
Direct Funding	Through Internet, out of the banking system	Bypassing the conventional intermediaries
Empowered People	To link people with extra capital	Supporting projects inside a community
Technical Assistance	Through technology to communicate and get funds	Like business angels for business plans and networking
Donation	No obligation in return	Payments paid back with products
Relationships	Long-term relationships beyond financing	Networking in a community
Marketing and Feedback	Pre-marketing, pre-payment, and customer engagement	Providing advice and support through physical meetings and "tastings"

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

p8). This strict separation between the role devoted to the entrepreneur and the position of the community backing projects gives crowdfunders the possibility to follow a creative production or the launch of an innovative initiative, for a community or for the environment, without having to engage or interact at all outside of their pledge. This small scale individual commitment is the basis of crowdfunder engagement. Individual rewards outside of products ranging from ego satisfaction to a potential answer to concerns about the future through solutions they couldn't have developed alone or initiate. As requiring an individual involvement of members of the targeted population, crowdfunding benefits from the use of customer engagement techniques as "enthusiastic customers sharing their experiences attract new potential funders and later on, form a community" (Paykacheva, 2014, p12). In order to do so, crowdfunding platforms must fulfill all the criteria required for customers' engagement. They have to provide a memorable experience; to manage to stay in touch and to engage in regular communication to obtain customers' endorsement. (Paykacheva, 2014).

New technologies and e-commerce have changed customers' fidelity models, it is therefore necessary to create special relationships between prospective consumers and brands. Making people funding new products pertains to this new marketing approach. It gives the customer the feeling to be part of a project, which is better than just being a mere "ambassador" of a brand when using or wearing its products.

With crowdfunding, when it is a loan or an equity investment, it could be indeed in the spirit of local economy or community financing, but it could reveal itself as just an opportunity such as peer-to-peer lending. Crowdfunding could also be like making a long-term investment in a community through a platform such as supporting the creation of a video game. In both cases it could not be considered comparable to a Slow Money project.

They are also different with regard to donations and engagement. Crowdfunding platforms use donations as a way of financing, so it clearly shows the support from the crowdfunder to a project. It could be a donation with or without rewards. The funder likes the pitch, believes in it and supports the project with money. However it does not mean it is an answer to a concern, neither part of a solution, local or global. It could be a donation like a sponsor for a sport event, a travel or any other creation. It is funded by the collaborative and sharing economy but it is not necessary for the community. Without a food and social context, it will not be Slow Money.

They are complementary and can partner, when, for example, Slow Money members use the convenience offered by thematic crowdfunding platforms, promoting values such as sustainability, ecology, or local economy, to support their mission-oriented projects. Crowdfunding in many cases brings back solidarity in a time where we were used to see more and more individualism. It is true that crowdfunding participation or investment is mainly enacted sitting behind a screen through a website, but studies and

Table 2. Differences between crowdfunding and slow money

	Crowdfunding	**Slow Money**
Community	The community is built/ strengthened around the project	The community already exists
Mission	Agnostic projects	Only around food, for the soil and biodiversity
Proximity	No: any project, anywhere	Yes, for the local food system
Regulation	Yes, funding limited by people and by project	No limitation for qualified investors

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

the academic literature on crowdfunding show that it is not enough. Relying on an isolated act from an Internet user will not lead to a successful crowdfunding campaign. In a variety of contexts we can see now more and more thematic crowdfunding platform, raising funds, allowing for the "click and invest" action to be based on, and to generate an attention to, values. Such partnership projects with Slow Money are indeed already at work.

For example, the French crowdfunding platform Bluebees is dedicated to agro-ecological projects and already partnering with the French Slow Money organization.

Using Bluebees, French Slow Money members can raise more funds from small investors in a convenient way to the mutual benefit of both parties. However, the partnership is a trade-off for the time being because crowdfunding has some investment limits by investor (€1000) and by project (€1 million).

According to Marco Vangelisti, co-founder of Slow Money California, "With the arrival of crowdfunding, many bureaucratic hurdles for raising funds have been removed. For too long, raising capital in small businesses meant either being at the mercy of bank underwriter or a lengthy process with affluent angel investors, involving lawyers and a lot of paperwork"

CONCLUSION AND AVENUES FOR FURTHER RESEARCH

The objective of this paper was to analytically compare crowdfunding and Slow Money, which people resort to for funding small and local projects. We have found that these two solutions are challengers, different, and complementary.

We believe that crowdfunding and Slow Money can mirror each other's strengths for mutual benefits. Crowdfunding can learn community engagement from Slow Money projects, and the latter can learn scaling from crowdfunding. Benefiting from one another's values, methods and tools, crowdfunding and Slow Money could finally be the start of a new economic paradigm beyond short-term capitalism.

Slow Money brings people together and offers a part of the solution, a "soil economy instead of an oil economy". "The second principle is to slow down the velocity of money by de-complexing the financial transactions. By promoting a direct link between the entrepreneur and the financer, instead of complicated securitizations and structured finance, which clearly were not comprehensible even to bankers using these products in the pre-financial crisis stage.

The third principle questions the profit maximization and wealth maximization assumptions of the individual, leading to opportunism and transaction cost economics, and reaffirms the social nature of people and their nurturing relationship with their habitat." (Ashta 2014).

Indeed, this comparative analysis reveals a new spirit for entrepreneurs and the market economy that is emerging out of the financial crisis of 2008. We believe that crowdfunding and Slow Money have announced a new economic paradigm with new forms of investment. Both have also a human impact by redefining the nature of investment. Invest in what you want to support, in what you want to become a success and interact with the entrepreneurs. It is a human impact that we cannot see any more through electronic capital markets. They support entrepreneurs and provide funds when the banking system does not seem to finance small entrepreneurs sufficiently. They also aim to engage and link different economic agents around projects. With the Web 2.0 a crowdfunder becomes indeed an actor; he can initiate changes and make people aware about what he is doing, about what he supports, about what he likes. Any project will therefore benefit from the crowdfunder's network and influence. It is here where artificial and collective intelligence get combined.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

The people-based solutions for financing entrepreneurial and local purposes might be the starting point of a new model of economy, tentatively described as sharing, circular, or collaborative. Finally, we could see here a redefinition of the "smart money" concept beyond banking and capital markets. The driving force and common denominator of all these endeavors is the search for a balanced economic model.

KEY TERMS AND DEFINITIONS

Agroecology: An agricultural system having a whole approach to food, feed and production in a sustainable way and as an ecosystem.

Beetcoins: Electronic money used by Slow Money community in reference of the bitcoins.

Capital: Financial resources needed to fund and start an enterprise.

Collaborative Economy: An economy based on people sharing services instead of buying goods, often facilitated by Internet.

Community: A group where members share specific characteristics or values and have a common heritage.

Credit: A contractual agreement where a borrower receives funds engaging him to pay it back with interests.

Financial Crisis: A period where there is a panic and a lack of confidence leading to a drop in value of (financial) assets.

Impact Investing: Investing that aims to generate specific beneficial social or environmental effects in addition to financial gain.

Local Food System: A food system giving priority to local product and looking for autonomy.

Localist: People giving priority to products or people in the same locality, generally with less than 100 miles.

Chapter 4
High-Growth SMEs: A Specific Research Object

Mohamed El Hakioui
Cadi Ayyad University, Morocco

Abdenbi Louitri
Cadi Ayyad University, Morocco

ABSTRACT

This essay tries to highlight the economic importance of the high-growth SMEs phenomenon. In doing so, an attempt to define and specify this type of firms was conducted. From the authors' literature review it was found that there is no single definition of high-growth. Each researcher adopts a definition according to his research interests. Trying to discuss the economic importance of SMEs gazelles, analysis led to identify three main features of high-growth: high-growth persistence, the novelty and strategic voluntarism. These characteristics make the high-growth SMEs a specific research object.

INTRODUCTION

Since 1990s, a lot of researches are devoted to the study of the growth phenomenon (Birch & Medoff, 1994; Storey, 1994; Storey, 2011; Henrekson & Johansson, 2010; Moreno & Casillas, 2007; Davidsson & Delmar, 2006; Delmar et al., 2006). This tendency can be seen as the direct result of the important contribution of this phenomenon to the generation of new jobs and to the creation of the new value. Although the majority of companies suffer from absence or low rate of growth (Daunfeldt et al., 2012), a minority enjoys high potential of growth, and consequently, participate significantly to the job creation and to the creation of the new value. Indeed, 70% of increase in the rates of employment is allotted to high-growth companies (Birch & Medoff, 1994).

Strong growth, high-growth, gazelles, hyper-growth, etc., are all some terms that are used to describe these fascinating businesses. Despite the diversity of terms, the concept of growth remains ambiguous and poorly defined due to the lack of research and conceptualizations about it, hence the importance of this paper.

Several studies have emphasized the need to distinguish between the growth taken in its overall dimension and the high-growth as a particular phenomenon (Moreno & Casillas, 2007; Delmar et al., 2006). Companies with high-growth are regarded as particular entities quite different from other firms (Moreno & Casillas, 2007; Storey, 2011; Davidsson & Delmar, 2006). The specificity of the phenomenon requires suitable methodological approaches and new theoretical perspectives.

Various factors explain the craze of researchers to the study and analysis of SMEs growth determinants especially when it is a question of high-growth SMEs. Indeed, many authors admit today that SMEs are not anymore considered as the miniaturized replica of large firms (Shuman & Seeger, 1986). SMEs are particular organizations, very different from large companies. They are seen as true levers for the creation of jobs and wealth in economies. Albeit there is a consensus about the prevalence and the importance of SMEs in the global economies, the weight and the impact of high-growth SMEs compared to the high-growth large companies constitute a point of divergence between researchers.

This essay is inscribed in the course of specificity (Torres, 1997). At first, the specificity of SME compared to large companies, and then, the specificity of high-growth as a particular aspect of the firm growth phenomenon. In this vein, this document tries to discuss the following conceptual question: to what extent does SME constitute a specific and legitimate search object within the phenomenon of high-growth?

The big part of literature on high-growth firms is descriptive (Sheppard, 2010). It tries to draw up a portrait of this phenomenon by describing its characteristics of high-growth firms. The high-growth SMEs occupy a central place in this literature. This essay is divided into two main points. The first one seeks to clarify the concept of high-growth firms. The second try to sit the legitimacy of the high-growth SMEs as a specific and a relevant research subject.

HIGH-GROWTH SMES: DIVERSITY OF DEFINITIONS

Moreno and Casillas (2000) indicate that high-growth is identified through two main features. Firstly, the achievement of high-growth, and secondly, the concentration of this high-growth in a short period of time. This definition raises three central questions:

- From what level are we talking about high-growth?
- How can we measure this growth?
- On what interval of time do we have to make sure of the persistence of the high-growth to indicate a firm as gazelle?

Following a literature review, it was found that there is no single answer to these questions, and therefore no consensus on the definition of high-growth firms (Henrekson & Johansson, 2010; Moreno & Casillas, 2007). Several approaches can be considered to define the concept of high-growth. In this vein, present two methods to identify the high-growth companies. According to Daunfeldt et al. (2012), most of studies take as high-growth firm a proportion Y % having realized the strongest growth on that industry, very often (1%, 5% or 10%). Furthermore, these two authors added that some studies indicate by gazelles any company having realized a growth rate upper to a well determined rate.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Definitions of high-growth firms are marked by an aversion to biases relative to age and size of the firm. Indeed, it is generally accepted that the young or recently created firms grow faster to reach their critical size (Moreno & Casillas, 2000). It will be thus inappropriate to consider these businesses as gazelles insofar as their growth is natural and logical. In order to neutralize these biases, definitions of high-growth firms recommended variables of control. In this vein, Peterson and Ahmed (2008) specify that the simplest indicator of high-growth that one can easily interpret is the one implementing two criteria. The first criterion is the satisfaction of specific growth rate, then, the second condition is aiming at neutralizing the effects and the biases of some factors as size and age. By referring to Peterson and Ahmed (2008), these conditions are defined by convention based on the specific characteristics of the context of study.

In this sense, Birch and Medoff (1994) define the gazelle as any company having realized at least an annual turnover growth of 20% during an interval of time with a basic annual revenue above 100.000 $. For Storey (2011), gazelles are firms which carry out an annual turnover growth of at least 25% during a period of 4 years with a condition of 5-10 £ million as a turnover of the basic year, or a growth of at least 15% for firms whose turnover of the year under study is 10-100 £ million. The definition adopted by Barbero et al. (2011) says that these companies have an annual growth rate of at least 10% during 4 consecutive years. To circumvent the bias induced by age, Peterson and Ahmed (2008) indicate that the company must have at least 10 employees during the reference year. In the same vein, Eurostat-OECD Manual on Business Demography Statistics (2007) defines high-growth firms as: "All enterprises with average annualized growth greater than 20% per annum, over a three year period, and with ten or more employees at the beginning of the observation period. Growth is thus measured by the number of employees and by turnover" (p.61).

Peterson and Ahmed (2008) specify the contingency of growth firm implied by the disparity of contexts and business sectors under investigation. In fact, each context has its specificities that distinguish it from others. In this sense, definitions advocating a fixed growth rate do not take into account this reality. Trying to remedy this shortcoming, Moreno and Casillas (2007) propose to retain a growth rate of over than 100% of median sector activity.

The Eurostat-OECD definition (2007) and that of Petersen and Ahmad (2008) distinguish between the terms gazelle versus high-growth. In this line, gazelle must be devoted to young firms with less than five years. Besides, Cooney and Malinen (2004) suggest distinguishing between high-growth and fast growth in sparing the fast growth to denote the speed of growth in time while the high-growth depends on the sheer volume of this growth. Nevertheless, the majority of studies use these terms interchangeably.

Several indicators are used to study the firm growth. According to Delmar et al. (2006), assets, employment, part of market, production, profit and sales are the most used indicators of firm growth. They add that employment and turnover remain the most mobilized indicators. Delmar (2006) points out that this trend is mainly due to their ease of access and their uncontroversial utility. The turnover growth is an indicator of the creation of new value while the employment indicator reflects the dynamic of job creation. Moreover, unlike other indicators, turnover and employment are independent objective measurements. Delmar et al. (2006) state that other indicators suffer from deficiencies limiting their applicability to particular contexts.

In the same perspective, Hoy et al. (1992) underline that the turnover is the best indicator of growth. Barkham et al. (1996) add that turnover is the best revealing indicator of firm performance, and consequently, the most preferred by entrepreneurs. For Davidsson and Wiklund (2006), the process of growth is primarily stimulated by demand growth for products and/or services of the firm, employee increase

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

only comes last. Indeed, once an increase on the level of the demand for a product is identified, firms initially seek to respond by increasing their production and their turnover. In the second time, firms undertake organizational readjustments in order to adapt by investing in the required resources such as employees, machines, etc.

Following this line of thought, Delmar (2006) specifies that: demand is a proactive variable; turnover is the intermediate variable that highlighting the balance between demand and resources of the firm; finally, the adjustments of resources to adapt the firm to these changes. This author emphasizes the low volatility of this last dimension insofar as the leader often has interest to make sure of the stability and sustainability of the change before undertaking necessary investments. Nevertheless, the relation between turnover indicator and employee indicator is not obvious. Other alternatives are offered to the firm to increase its turnover without addition of new resources, by subcontracting or only by improving its efficiency and productivity (Davidsson & Wiklund, 2006; Delmar, 2006). However, Davidsson and Wiklund (2006) add that it is unlikely that other dimensions of growth can take place without having a growth of turnover. In short, the choice of the adequate indicator is conditioned by the interest of research.

Generally, two fundamental approaches are used to measure the firm growth between two different moments. The absolute growth estimates the brut variation of the indicator while relative growth analyzes the relative variation by dividing the absolute growth by the initial value of the indicator. The choice between the two approaches requires consideration of the size effects on the growth of firms. Indeed, the absolute growth tends to attribute the growth to large firms while relative growth privileges small firms.

Despite the fact that the calculation of the absolute growth did not make a big debate, several formulas are suggested to measure the relative growth of firms. Indeed, the impact of size on firm growth has expanded to the choice of the appropriate formula of calculation. Each formula impacts differently the theoretical development and the ensuing construction of models relative to firm growth (Delmar et al. 2006). Wiklund (1998) underlines that it's better to have all information on the growth in order to be able to study the change of size for every period. However, such information is very rare and incomplete. In most cases, collected information relates to only two distinct moments. So, growth is often studied as a variation between the current size and the size at the beginning of the study.

In the literature, we can identify three principal models to measure firm growth (Wiklund, 1998; Davidsson & Wiklund, 2006). The first model was used by Delmar (1997) in his doctoral work:

$$g = (St_1 - St_0)/St_0$$

with:
g is the rate of total growth of period
St_0 represents the initial size
St_1 represents the size of the company at the end of the period of study

This model is criticized because of its sensitivity to the initial size. As the temporal interval between T_0 and T_1 is often long, this model is able to privilege small companies (Wiklund, 1998; Davidsson & Wiklund, 2006). The second model, called Gibrat's law, admits a constant growth rate:

$$St1 = St_0 (1 + g)t_1\text{-}t_0$$

with:

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

g represents the annual growth rate

In spite of its low sensitivity, this formula remains inappropriate to long periods because of its exponential curve. The third model was mobilized by Wiklund (1998) in his doctoral work. He admits that growth is linear and that a volume of growth is made each year:

n=N

$$g = 1/N \sum (St_{n+1} - St_n) / St_N$$

with:

n=1
g represent the growth annual rate
N represents the number of years, n refers to years
St_n represents the size at each year
St_N represents the size at the end of period

This formula is similar to the first one. But, it has the advantage of allowing to neutralizing the size effect, in the sense that the denominator increases each year.

To conclude, the choice of the formula must take into account its form and its sensitivity to the size effect. Having regard to its linear shape and its low sensitivity to the size effect, the third formula seems the most appropriate to the study of high-growth (Wiklund, 1998; Davidsson & Wiklund, 2006).

THE HIGH-GROWTH SMES BETWEEN LEGITIMACY AND SPECIFICITY

Henrekson and Johansson (2010) distinguish two big debates having tried to characterize the firms that contribute significantly to the job creation. The first stream is trying to clarify if it is a set of newly created firms or a minority of high-growth firms that are responsible of the creation of the largest portion of jobs. This is what Davidsson and Delmar (2006) called the debate 'mice vs gazelles' or 'Flyers vs trundlers.' This debate is mainly due to the disparity of contexts studied and the diversity of methodologies adopted by researchers (Davidsson & Delmar, 2006). The second orientation examines the legitimacy of the SME as a real jobs creator.

Henrekson and Johansson (2010) point out that the contribution of newly created firms and high-growth SMEs to job creation is complementary. They add that the effect of high-growth SMEs tends to diminish over time. Thus, to achieve net job creation, industries require continuous entry of new firms. In this line, Delmar et al. (2006) state that high-growth is determined by the firm's age than by its size. According to their study, high-growth firms are younger. In contrast, Acs et al. (2008) indicate that high-growth firms, designated by 'high impact firms,' are not young, their average age is estimated at 25 years. Similarly, Mason and Brown (2010) point out that the majority of high-growth firms in Scotland are older. In this sense, Acs et al. (2008) specify that the impact of new firms on job creation is very significant for the year of entry, and then the growth rate weakens over time. Indeed, Hamilton (2011) note that age does not have considerable impact on firm growth as a result of the quick deterioration over time of the "Newness" effect.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Moreno and Casillas (2000) explain that the importance of high-growth young firms is essentially due to the process of search for a critical size. In another article, both authors (2007) have tried to explain this impact by referring to two main theories: the organizational learning theory and the entrepreneurial theory. Drawing on the theory of organizational learning, Jovanovic (1982) presents a model that emphasizes the ability of young company to achieve high-growth. The lack of experience gives to this kind of firms the flexibility required to attain high-growth. However, these firms have often a fluctuating rate of growth. On the other hand, older firms have quite precise objectives, well defined processes and a well-established structure. Thus, they know well how to maximize their efficiency and then present a weak variation of growth rate. In the other hand, the young firms are often seen, within entrepreneurship field, as responsible for the exploitation of unexploited opportunities through innovation, proactiveness and risk taking. That's what allows them to achieve a high rate of growth.

Derbyshire (2012) focuses on the emergence of the concept of high-growth firm as a new paradigm. The later that is still in a gestation step seems to be a good alternative to the young firm based paradigm in the orientation of countries' economic policy. Indeed, Shane (2009) has called into question the policy based on encouraging people to be entrepreneurs and on supporting newly established firms. He invites the decision makers to focus more on existing businesses with high-growth potential. It seems that Shane's recommendation finds its credibility in the high correlation between entrepreneurship and failure. This orientation was present in the Europe strategy report 2020 wherein the support of SMEs high-growth constitutes a central objective. This importance is also reflected in the research orientation of OECD that has conducted several studies in order to help governments to promote high-growth firms (OECD, 2010).

Being inspired by the evolutionary theory, Derbyshire (2012) underlines that strong competition, undergone by new firms at its beginning, impacts its future potential and its ability to become a high-growth firms. Derbyshire (2012) added that start-ups are challenging existing firms by encouraging them to strengthen their competitiveness, innovativeness and performance, thereby making them high-growth firms.

Henrekson and Johansson (2010) indicate that net job growth must be analyzed in the wider perspective of creative destruction by including churning and restructuring in a dynamic process of entry, expansion, decline and exit. They add that creative destruction process allows new efficient and expanding firms to reach the resources of the failing ones. Indeed, it appears that the weight of new businesses compared to high-growth firms is conditioned by the life cycle of the affiliate industry. Young industries are distinguished by low barriers to entry and plenty of opportunities to seize. This situation favors the introduction of new businesses. The large number of companies introduced increases the rate of contribution to the job creation.

In this sense, Henrekson and Johansson (2010) argue that the increase of introduction of new business is able to increase the chances to generate future business with sustained high-growth. As explain Hamilton (2011), the effect of 'newness' disappears over time, and therefore, its contribution to job creation deteriorates after the first year of their existence (Acs et al., 2008). As the industry get matured and entry barriers strengthened, the industry attractiveness decreases and therefore, the mortality of established companies increased and only a minority of existing firms show high-growth. In this line, it seems that the growth of young firms is natural in the sense that it is essential to reach the critical size to survive (Barkham et al., 1996).

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

As the industry gets matured, the high-growth due to the 'newness' effect disappears. Thus, high-growth is only maintained by the existing and high-performing firms called 'gazelles.' Julien (2002) points out that 50% of new SMEs do not exceed 5 years, and most survivors are growing relatively slowly. In this perspective, the majority of researchers adopt age control variables in order to erase the young firms whose high-growth is natural, transitory and does not reflect an exceptional phenomenon. Indeed, to achieve sustained growth, firms should lead a process marked by a strategic voluntarism.

Although authors consider the trajectory of high-growth as a result of a chance or luck, the number of gazelles in national economies shows the insufficiency of such justification (Chanut-Guieu & Tannery, 2009). In fact, even though the context can play a favorable role, the main engine of this trajectory emanates essentially from firms (Chanut-Guieu & Tannery, 2008; Julien et al., 2006).

Several researches admit that gazelles, which form according to the countries from 2% to 10% of permanent firms and generate from 40% to 60% of jobs created by expansion, are the true creators of jobs (Julien, 2002). However, recent studies indicate that high-growth is not a persistent phenomenon. The question of persistence has been the subject of a great debate that compromise the well-founded the high-growth firms as a new paradigm. In fact, high-growth is often a 'one-hit wonders' and most of firms will not meet again their high-growth rate (Parker, 2010; Hölzl, 2014, 2011; Gabrielsson et al., 2014; Daunfeldt et al., 2012).

A lot of studies (Birch, 1984; Storey, 1994; OECD, 1994, 2002) confirm that a minority of high-growth firms contribute significantly to the economic development. The high-growth firms stood out as key element of the nations' economic development. Thus, in the name of the national, local and regional competitiveness, several governments bustled to multiply these fascinating firms. The non-sustainable nature of high-growth calls into question the usefulness of public support for this phenomenon in the sense that it is able to amplify the turbulence of the economy without increasing sustained dynamic of firms and consequently the whole economy (Hölzl, 2014).

In their recent study, Gabrielsson et al. (2014) specify that in spite of the small proportion of firms whose high-growth rate persists in time (22% of their sample), future research must be focused on studying their characteristics. Furthermore, Hôlzl (2014) underlies a lack of study of the impact of various governmental policies on high-growth firms. Therefore, giving more attention to this kind of firm is able to develop a better understanding of 'sustainable high-growth entrepreneurship' and help to orient public action in this direction. In short, the phenomenon of high-growth finds all its pertinence in its persistence. This concern was reflected clearly in gazelles' definitions that attributing this quality to firms whose growth extends over a specific period of time (3 to 5 years or more). Such a perspective requires longitudinal studies instead of static studies often adopted to study this phenomenon.

The second orientation cited by Henrekson and Johansson (2010) found its roots in the economic debate analyzing the impact of the size on the firm growth. The Gibrat's law (1931), as the most knowing concept of this perspective (Moreno & Casillas, 2007; Delmar et al., 2006), states that the growth of firm is proportional to its size and that the magnitude of this growth is random. This debate has generated much empirical works without reaching consensus. Implicitly, the literature relating to SMEs is part of this great debate. In spite of contradictions in the results of empirical studies, the majority of researchers reject the Gibrat's law conclusions by allocating high-growth to SMEs than large firms (Moreno & Casillas, 2007).

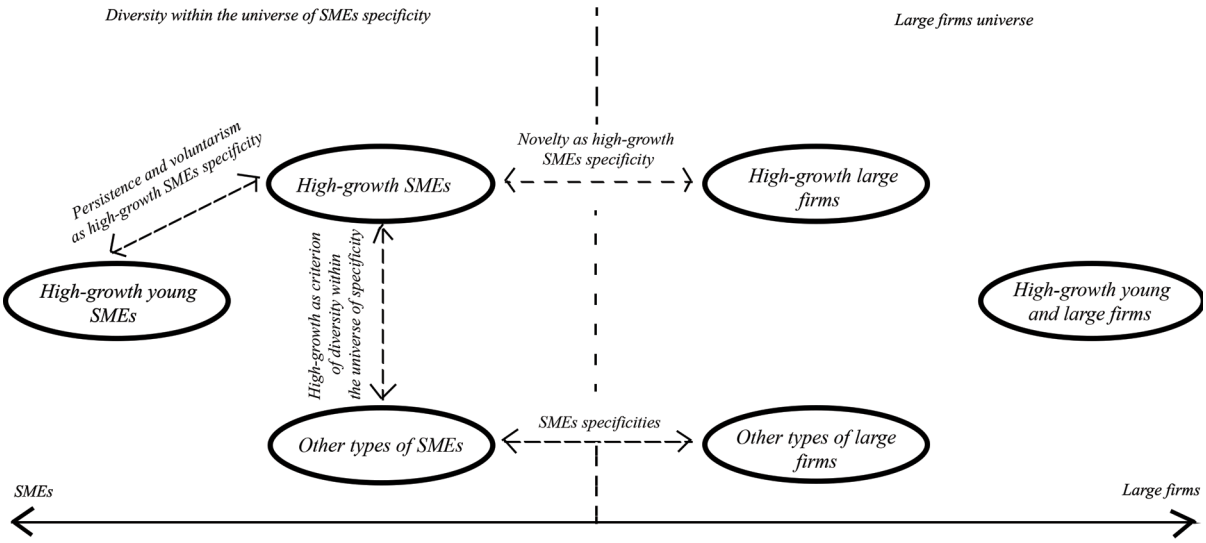
After three decades of research development in SMEs, it seems now that the majority of researchers recognize the predominant role of SMEs in job creation (Davidsson & Delmar, 2006; Birch, 1979; Story, 1994). In this line, several theories have succeeded to explain SMEs growth potential. Thus, for

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Penrose, growth of SMEs is the way to exploit the unexploited resources and capabilities. In fact, the indivisibility of their resources incites SMEs to grow. Other authors point out that SMEs seek to achieve critical mass that improves their competitiveness (Correa et al., 2003).

The review of literature on SMEs makes it possible to distinguish two main trends that have succeeded in time. The first stream tries to sit the legitimacy of SMEs specificity. According to it, the specificity of SMEs consists on its significant contribution to economic development. This specificity can be situated in a macro level often with an economic feature (value creation, new jobs, etc.). This movement took a run-up with the work of Birch (1979). Despite the criticism addressed to this perspective (Haltiwanger & Krizan, 1999), Birch initiative has opened the debate to sit the legitimacy of SMEs as a specific research object. The second stream can be understood as an extension of the first one. From managerial view, the second stream seeks to explain the secret of the SMEs potential by starting to talk about managerial characteristics of SMEs compared to large firms (Julien, 1994; Torres, 1997).

SMEs are now considered as specific organizations, very different from large firms. They are seen as real levers to create jobs and wealth. Although the SME is a more or less homogeneous field of research because of the sharing of some specificities, several currents specialized in the study of SMEs have succeeded to contradict this assumption of homogeneity. As noted Torres (1997), "because of the diversity of the SMEs field (SMEs- field), no generalization is possible and everything is a matter of context" (p. 25) [free translation]. This heterogeneity has made so difficult the development of a unique theory of SMEs. The current of synthesis is the result of reconciliation of specificity and diversity of the SMEs field. Thus, the conceptualization of this field has progressed to become a change of degree in the universe of specificity (Torres, 1997). Conscious of the conceptual and methodological implications of diversity, each research has more focused on a well-defined type of SME. The choice of the type depends largely on the nature of the research objectives.



Several researchers have developed operational typologies of SME in order to build groups approving certain homogeneity and where one can find similarities or average behaviors (Julien, 1994). In this perspective, high-growth SMEs constitute a type of the SMEs universe which deserves special attention from researchers (Birch & Medoff, 1994; Julien, 1994, 2002).

If high-growth strengthens the peculiarity of high-growth SMEs in the field of SMEs specificity, looking for its specificity compared to large high-growth firms can improve our understanding of this search object. In this vein, Schreyer (2000) confirms the major role of high-growth firms in net job creation. He specifies that the rate of high-growth SMEs is higher than that of large ones. High-growth large firms create more jobs only in an absolute term. Birch (1979) stressed that despite the importance of contribution of large firms in job creation, they generate few new jobs. According to the results stemming from the study of Davidsson and Delmar (2006), young and small firms, often operating in young and growing industries, are the real creators of new jobs. They often grow accordingly to an organic mode. These authors add that large firms, often in mature industries, experience a great change in total employment with negative net jobs creation. According to these two authors, the majority of jobs created by large firms are not new as a result of the growth by acquisition often adopted by large and old firms.

As shown in the Figure 1, it is clear that high-growth SMEs is positioned at the intersection of two major debates: young firms versus high-growth firms and SMEs versus large firms. The intersection of these two trends allows specifying the high-growth SMEs. It seems that the first characteristic of this type of business is the continuity of high-growth in time, at least three years. Indeed, the persistence of high-growth is an inevitable condition for the emergence of high-growth paradigm (Derbyshire, 2012). This first characteristic distinguishes it from the temporary high-growth trajectory of young firms. The

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 1. The high-growth SMEs between specificity and diversity

second specificity relates to the novelty of the economic contribution of high-growth SMEs. This novelty is manifested by creating new jobs, new value, etc. We believe that deepening these two main features is likely to lead to new promising perspectives.

CONCLUSION

At the end of this review, it appears that high-growth remains a controversial phenomenon. Several definitions have been developed with different measurement units, measurement indicators and formulas. Despite the diversity of researchers' views, the economic importance of high-growth SMEs is now indisputable. These fascinating firms do not cease to attract the attention of all economic actors.

Through this document we tried to sit the legitimacy of SMEs gazelle as specific research subject. At first, its specificity compared to young companies insofar as high-growth SMEs is voluntary and more persistent. Then, based on the current of diversity, high-growth of SMEs gazelles remains the notable specificity which differentiates it from the rest of the SMEs universe. Finally, based on the results of empirical studies on growth, we are able to specify the high-growth SMEs from the large ones. In fact, as a result of organic growth often adopted, high-growth SMEs are distinguished by the novelty of their contribution.

ABSTRACT

The purpose of this chapter is to present the importance and contribution of business incubation programmes to Small and Medium Enterprises in Malaysia. Chapter starts with a brief review of the history and transition of major economic policies in Malaysia as well as the government responses towards achieving the status of fully developed nation by the year 2020. The policy review includes the Laissez-faire Policy, New Economy Policy, National Development Plan, National Vision Policy, and New Economy Model which were set to achieve nation's rapid economic growth. This review leads the paper towards the exploration of the major drivers of current economic growth in Malaysia. This chapter identifies Multimedia Super Corridor as the most important initiative and a key driver to global Information Communications Technology development as well as the major contributor to Small and Medium Enterprises establishment in Malaysia. In addition, it outlines the significant contribution of Small and Medium Enterprises to the economic growth in Malaysia, and finally identifies business incubators as a support mechanism to accelerate the SMEs success, especially the start-up firms. This chapter provides knowledge to the researchers and practitioners on the linkages among Multimedia Super Corridor, Small and Medium Enterprises and incubators that align with the economic policy development. As a conclusion, the chapter discusses the challenges faced by the incubation programmes in Malaysia and thus, highlights the prominence of business incubators as a niche subject to be explored in depth, in terms of their growth and potentials in Malaysia.

INTRODUCTION

Malaysia has been making notable progress in economic development over the last century as the wave of globalisation expands across the world. Malaysia has achieved the major transformation of economic structure from being exporter of a primary commodity to an industrialized-based country. This transformation and accomplishments seems to be supported and guided by various economic policies implemented over the decades, namely, New Economy Policy (NEP), National Development Plan (NDP), National Vision Policy (NVP) and New Economy Model (NEM) which was introduced in 2010.

Vision 2020 was initiated in 1991 by Malaysia's former Prime Minister, Tun Dato' Seri Dr. Mahathir bin Mohamad, with an overriding objective which is to achieve a fully developed nation and achieve an industrialized level by the year of 2020, encompassing on the economic development, as well as focusing on other angles, including social, political, spiritual, psychological and cultural areas (Islam, 2010; Khan, Liew, & Ghazali, 2014; Vicziany & Puteh, 2004). There are nine strategic challenges outlined in Vision 2020 in order to transform Malaysia into a competitive, robust and dynamic country in the span of 30 years. Based on various strategies and initiatives, Multimedia Super Corridor (MSC) has been one of the prime project which aims Malaysia to get much insight on the development of Information Communications Technology (ICT) industry by providing a test-bed for global ICT landscape (Abdul Khalid, Gilbert, & Huq, 2012). To date, MSC has made a notable progress in ICT sectors and has been seen as a fundamental engine for becoming a fully industrialized nation by 2020.

A part from MSC, significance and development of Small and Medium Enterprises (SMEs) to the economy has been acknowledged (Husin & Ibrahim, 2014; Moorthy et al., 2012; Yeoh, 2014). In line with this, SMEs in Malaysia is recognized as the backbone for the economy development and thus paramount of SMEs business strategies were developed by government. However, the government is facing emerging challenges in shaping the future of SMEs, particularly during the start-up development phase. In order to overcome these challenges, the government has introduced the business incubators programme as an effective support mechanism to accelerate the development of SMEs (SMIDEC, 2007).

Said, Adham, & Abdullah (2012) has recently drawn attention to the paradox in MSC and incubators in Malaysia. However, the chapter will be more comprehensive if a broad range of dimension has taken into account. Therefore, this chapter aims to identify the linkages between MSC, SMEs, and incubators, align with the economic policy development, as well as conclude the importance of business incubators as a field to be explored more in Malaysia. This chapter is divided into four sections as follows. The first section presents the historical background of economy policies in Malaysia, including an overview of MSC Malaysia. The second section elaborates the SMEs contribution to economy followed by the third section that discusses the development of business incubators in Malaysia. Finally, the fourth section presents the challenges face in incubation programme in Malaysia, discussion and implication for future research.

TRANSFORMATION OF ECONOMIC STRUCTURE AND POLICY IN MALAYSIA

During the pre-independence, British colonialism tried to rebuild the export of primary commodity because Malaysia was highly dependent on the earning from exports of primary commodities; rubber, tin, timber and oil (Bekhet, 2013). Malaysia progressed impressively after it gained independence in 1957 in social and economic developments, where laissez-faire policy was pursued, with import-substituting

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

industrialization, agricultural diversification, and rural development program (Said et al., 2012). Government strategy was to continue with import substitution strategy in the 1960s under the First Malaysia Plan 1966-1970, as to have economic diversification, which indirectly could eliminate the total dependency on primary commodities (Gunto & Alias, 2013). However, the economic expansion during this period failed to balance the inequalities exist among ethnics, which became the turning point for the introduction of the New Economy Policy (NEP) in 1970, under Second Malaysia Plan 1971-1975 (Zainal Aznam Yusof & Bhattasali, 2008). The key objective of NEP (1971-1990) was to maintain national unity through two strategies; eradication of poverty among the entire population and restructuring the society with a view to eliminate the identification of race by economic function (Menon, 2009). Along with many essential strategies, the manufacturing industry boosting with momentum in global landscape, allowed the government to regulate two programmes, including second phase import-substitution industrialization programme, and followed by export orientation programme (Said et al., 2012; Gunto & Alias, 2013). Fortunately, Malaysia holds a predominant stand, depending mainly on the high price for its primary commodities in a global market, and managed to attract industrial foreign investors, which created opportunities in economic development.

However, in the mid of 1985-86, Malaysia could not avoid the impact of global economy crisis, where the demand for primary commodity decreased dramatically (Menon, 2009; Stafford, 1997), leading Malaysia to embark widely on the privatization policy that was believed to be a remedy for the issue. The introduction of privatization policy in 1983 has proceeded as one of the multipliers to economic prosperity and enabled Malaysia to premise on the notion of new technologies and expertise through various multilevel projects, including construction of North-South Highway, Kuala Lumpur Tower, and LRT. During that period, Malaysia has emphasized a shift away from labour driven economy (assembly type manufacturing) to investment-driven economy (medium-technology manufacturing) which cultivated the growth of new technology-based entrepreneurship culture in Malaysia (Berma, 2012). Together with this paradigm, the National Development Plan (NDP) for the duration of 1990 to 2000 was introduced to replace the NEP in order to put the creation of wealth ahead of redistributing it. It was presented in the perspective of Vision 2020, which was launched in February 1991, outlining the aim of Malaysia attaining a developed-nation status by the year 2020 (The Economic Planning Unit, 2006). Thus, the transition from medium-technology manufacturing to high-technology manufacturing was accorded a vital role during this period with the government commencing on productivity-driven economy as an engine of economic development. In addition to the aim of establishing an united, progressive, prosperous, developing and competitive nation, the NVP was introduced in 2001, as an extension of NDP (1991 – 2000) (Menon, 2008). In line with this, Malaysian government has established the knowledge and technology-based industries as well as regarded Information, Technology and Multimedia (IT) industries as efficient sources of economy prosperity.

As the effect of this curve, Malaysia has begun to focus on ICT industries as an engine to accelerate the competitive advantages in global economy. As such, with the aim to promote the new economy direction, Malaysia has introduced the MSC project, an idea urged by the former Prime Minister, Tun Dr Mahathir Mohammed, in 1996. The linkages between the MSC, export orientation, the roles of multinationals and country's productivity were then spelled out in the Seventh Malaysia Plan 1996-2000.

NEM was introduced in 2010 formulated by the country's National Economic Advisory Council (NEAC) with core principles to direct Malaysia towards a developed nation by the year 2020 with its population enjoying a high quality of life, besides a high level of income resulting from economic growth that is both inclusive and sustainable (National Economic Advisory Council, 2010). NEM consists of four

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

pillars, namely, 1Malaysia Plan, Government Transformation Programme (GTP), Economic Transformation Programme (ETP) and Tenth Malaysian Plan 2011–2015 (National Economy Advisory Counsil, 2010). Malaysia progressively continues with the Eleventh Malaysia Plan 2016 -2020 being the vital stage in the drive to achieve Vision 2020, with the theme "anchoring growth on people". In line with all the plans, policies and strategies to achieve the ultimate goal of Vision 2020, and SMEs are recognized as another major trust to economic development. SMEs are seen as an engine that will remodel Malaysia into high-income nation by the year of 2020 through knowledge-based economic approach (Abdullah & Shamsuddin, 2009; Moorthy et al., 2012; Yeoh, 2014).

MULTIMEDIA SUPER CORRIDOR (MSC) MALAYSIA

MSC as the Cluster Concept

Science parks have emerged all over the world as a mechanism to spur economic development and started to gain the impulse in the 1980's. The idea followed the steps of the successful Sillicon Valley in California, Route 128 in Massachusetts, Cambridge in the UK and the Research Park Triangle in North Carolina. Many other countries replicated the Science Park concept, including Russia, Brazil, Kuwait, China, Taiwan, India, and Israel (Ratinho & Henriques, 2010). Malaysia too, adopted science park concept and introduced MSC in 1996 (Ramasamy, Chakrabarty, & Cheah, 2004; Yigitcanla & Sarimin, 2015) that was launched officially on 27th June 1998 as a set forth to drive the county into a fully developed nation by the year of 2020 (The Economic Planning Unit, 2000). The MSC project comprises four main dimensions; (1) the development of IT and technology applications, (2) the development of IT firms, (3) the development of IT industries, and finally (4) the development of MSC region (Said et al., 2012).

MSC as a Transformation Mechanism to Knowledge-Based Economy

MSC was initiated by the Malaysian policy maker with the intention to switch the economic approach towards a knowledge-driven economy. This transformation on economic approach is incorporated in country's Third Outline Perspective Plan (OPP3, 2000-2010). It notably emphasized on the human capital development, research and development, infrastructure; science and technology, financing and equity. The emphasis believed to provide a foundation to achieve a rapid economic growth and sustain global competitiveness. The overall thrust is outlining the aim of Malaysia attaining developed nation status by the year 2020 (OPP3, 2001).

In line with this, Malaysia developed National IT Agenda (NITA), which aimed to formulate strategies and foster the utilization and development of IT, which is seen as the key to a dominant knowledge-based economy. It is followed closely by introduction of MSC in 1996 as the engine to accelerate economic development for the 21st century that has a vital signaling role as a global player in the application of ICT (Abdul Khalid, Gilbert, & Huq, 2014; Zainal Aznam Yusof & Bhattasali, 2008).

MSC as 'Multimedia Utopia': Infrastructure and Support Services

The MSC accounting a 50 x 50 km2 area, facilitated with basic telecommunication infrastructure, is a home for five emerging cybercities in the country, including Kuala Lumpur City Centre, Kuala Lumpur

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Tower, Cyberjaya, Technology Park Malaysia and Malaysian Technology Development Corporation- Universiti Putra Malaysia Incubator Centre (Ramasamy et al., 2004). The vision of the MSC was ultimately to foster an IT environment through the pursuance of two strategies namely; (1) attracting world leading IT companies to move their industries within the MSC region, conducting research while developing new products and technologies, exporting, and MSC acting as being a hub as well as a global test-bed for multimedia industries in Asia; and (2) encouraging the formulation as well as the development of Malaysian IT SMEs and transforming them into world-class companies (Mohan et al., 2004).

The MSC project, covering the duration of 20 years, was divided into three phases (Said et al., 2012). Phase 1 focuses to influence world first class companies to establish their operations in the region of MSC. This is parallel to the establishment of the two cyber cities; Putrajaya and Cyberjaya. Phase 2 emphasizes on providing a platform of borderless networking among the MSC and other clusters across the country. Phase 3 aims at stemming Malaysia for future growth; knowledge-based society, on the premise of MSC as host of cities which hold the key to the global information and technology.

Along with the development of MSC, the Multimedia Development Corporation (MDeC) was established in 1996 (Earlier known as MDC) and tasked to monitor the development as well as the achievement of the MSC (MSC, 2003). Apart from monitoring, MDeC provides differing level of services within the MSC region to ensure latest intelligent cities standards are applied such as managing the infrastructure incentives and other support service; funding and granting qualified companies, eliminating red tape assistance, facilitating services, overseas market accessing, assisting developing networks with other potential local partners and financiers, and enhancing technopreneurship nurturing programmes.

As part to pursue the strategies, MSC imposed the First Wave Flagship Application; e-government, multipurpose card, tele-health, and smart schools to facilitate unparalleled collaboration between local and international companies, and to set up business incubators centres as to stem the government's approach to support the formation and development of Malaysia IT SMEs. Besides that, in order to circumvent the MSC strategies to be hosting in technology in the country, MSC Malaysia 10 Bills of Guarantee (BoGs) was introduced where all the companies that are given title MSC-status, regardless local or foreign, are eligible for it. Some of the key elements of BoGs are the companies to be entitled to receive tax benefits, including those for their income and import duties, to employ unlimited foreign white-collar workers, to get a financing and flexible ownership option, and to utilize the government-contract business which is the so-called privilege of MSC companies (MSC Malaysia, 1998). All the MSC-status companies are classified into four main ICT focus cluster namely Information and Technology (Infotech), Creative Multimedia Cluster (CMC), Global Business Services (GBS), and Institutions of Higher Education and Incubators (IHLs and Incubators).

Growing recognition on MSC Malaysia is notable and is proven by the increasing number of companies that MSC Malaysia Status as depicted in Figure 1 (MDeC, 2014). In 2014, a number of 229 new companies were awarded MSC Malaysia status which accumulates a total of 3632 companies has received MSC Malaysia status. This accounted increment 7.0% from the previous year. It shows MSC programme managed to promote the growth of creation MSC-status companies.

While reviewing the data in details, Table 1 displays the number of companies awarded as MSC-status which are classified according to the technology cluster and the number of active companies out of it, in 2014. It is apparent that the effective cluster, Infotech has the highest rate as 71%, followed by CMC and GBS with 13% and 12% respectively. IHLs and Incubators falls at the lowest rate which is 4% (MDeC, 2014). However, it shows a positive indication in the implementation as 74.6% companies are active out of the total amount of companies awarded.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 1. MSC Malaysia status companies growth 2014
Source: MDeC (2014)

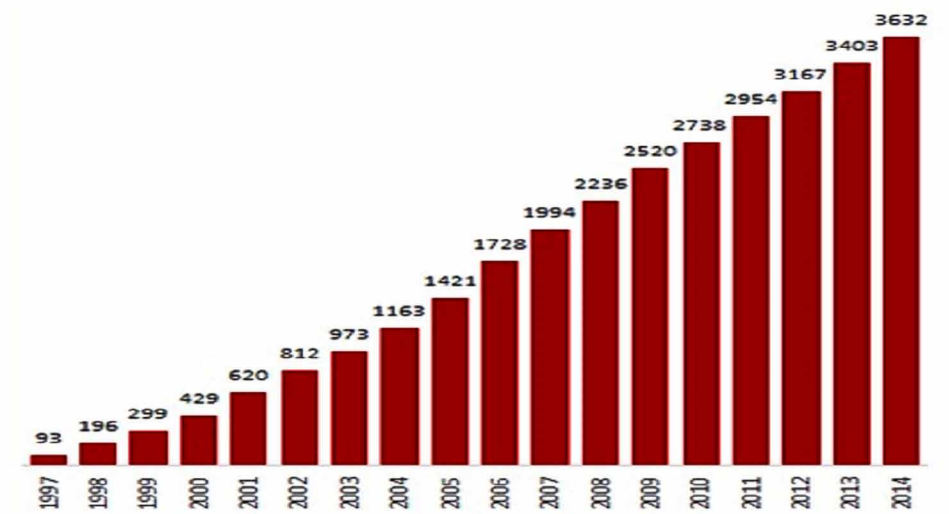

Table 1. MSC status companies awarded and active year 2014

Cluster	Number of Companies Awarded	Number of Companies Active
Creative Multimedia	436	334
IHLs & Incubators	125	111
InfoTech	2,665	1,920
Global Business Services	406	343
Total	**3,632**	**2,708**

Source: MDeC (2014)

Table 2. Number of employment from 2010-2014

Year	Number of Employment
2010	111,536
2011	119,138
2012	128,850
2013	138,071
2014	147,568

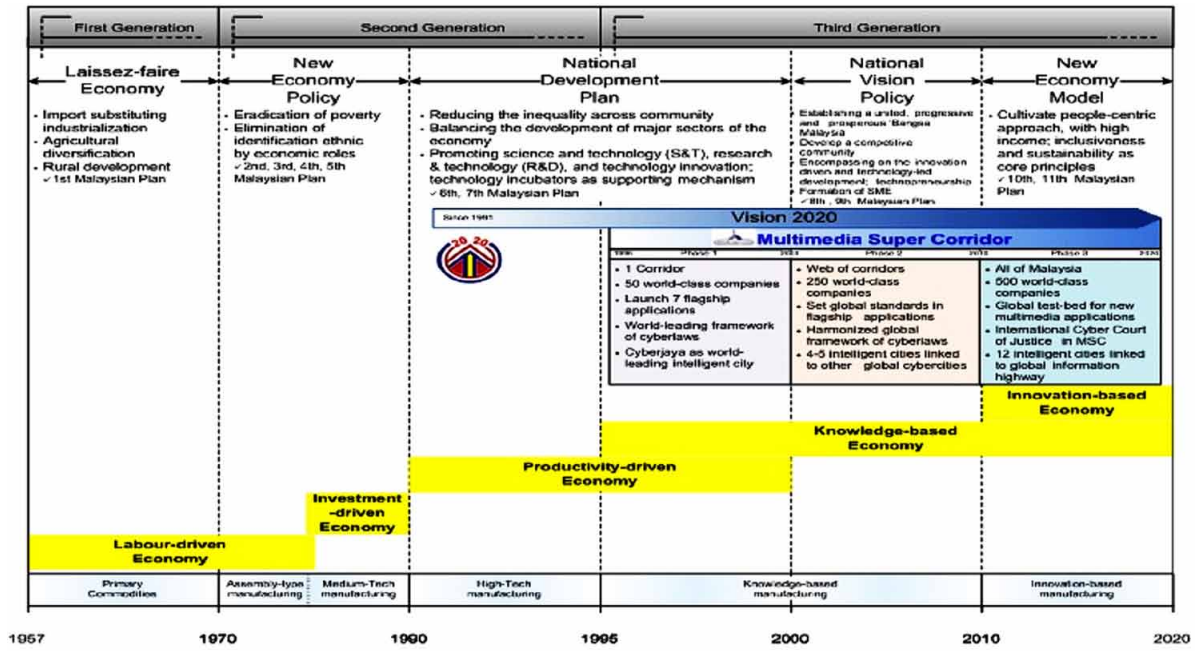
Source: MDeC (2014)

In tandem with this growth, MSC annual industry report (2014) presented data on the number of jobs created by MSC Malaysia-status companies from 2010 to 2014 which shows a marked increase from year to year (Table 2). An increment about 7%, which is from 138,041 in 2013, increase to 147,568 in 2014 indicating MSC Malaysia experiencing an expansion on the employment growth, and it is promoting to develop high-income community by 2020.

MSC Cybercities and Cybercentre: Key Economic Focus Area

The essential strategy for promoting clustering approach in MSC region is by designating two categories; (i) MSC Malaysia Cybercity- self-centre intelligent city with the aim to build world-class business eco-system offering MSC 10 Bills of Guarantees (BoGs), (ii) MSC Malaysia Cybercentre which is a building

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use



with essential enabling environment, aiming purely to nurture, stimulate and promote the growth of ICT and ICT enabled industries, while offering partial BoGs.

MSC Malaysia Cybercity includes Technology Park Malaysia, Universiti Putra Malaysia-Malaysia Technology Development Corporation (UPM-MTDC), Kuala Lumpur City Centre-Cyberjaya, Kuala Lumpur Tower, and Kulim High Tech Park. While, MSC Malaysia Cybercentre includes Kuala Lumpur Sentral, Menara MSC Cyberport in Johor, Mid Valley City, Bangsar South City, and Melaka International Trade Centre.

As part of the strengthening the MSC strategies, there are four categories of entity eligible for MSC status, which are; (1) companies that use high level of multimedia and provide technology as well as knowledge transfer to Malaysia; (2) Institutions of Higher Learning (IHLs) or faculty of IHLs; (3) incubators that provide and share basic facilities and services, and (4) shared services and outsourcing that have to fulfil four major criteria, including headcount, export, location and investment. However, only IHLs and incubators are gaining flexibility on the location, where they are not restricted to be located in MSC cybercities or cybercentre, but still eligible for some benefits from BoGs.

Figure 2 exemplified an overview of all the national policies, even from first generation till the third generation, which consists of pre-independent laiisez-faire followed by the stages of economic approach; labor-driven economy, investment-driven economy, productivity-driven economy, innovation-based economy and finally knowledge-based economy. Along with this, snapshot of the development of economic policies includes NEP, NDP, NDV and finally NEM are clearly shown.

Figure 2. Malaysian economic development and MSC Malaysia milestone

SMALL MEDIUM ENTERPRISES (SMES) IN MALAYSIA; A KEY DRIVER TO ACCELERATE MSCS' OBJECTIVES

Definition of SMEs

There is a wide range definition of SME which differs within institutions, countries, and regions. SMEs in Malaysia classified all the enterprises by the total annual turnover and number of full-time employees (SMIDEC, 2007) that resemble most of the universal characteristics. A common definition of SMEs in Malaysia which was endorsed by National SME Development Council (NSDC) since 2005, has been adapted and practiced across all the institutions, organizations, agencies, as well as the ministries.

However, the structure of economy evolved rapid changes including economy, business trend, and other structural changes, has led NSDC to introduce new definition of SME that was effective from 1st of January, 2014 (Table 3). A clear shift is observed where NSDC focused on classifying all the enterprises into two categories, which are (1) manufacturing, including transformation of materials or components, from physical or chemical component into new products, and (2) services and others including primary agriculture, construction, as well as mining and quarrying (SME Corp. Malaysia, 2013).

SMEs in manufacturing sectors are defined as enterprises with full-time employees not exceeding 200 workers and sales turnover not exceeding RM50 millions. SMEs in services and other sectors should have full-time employees not exceeding 75 workers and sales turnover not exceeding RM 20 million. The definition is applied to all the ministries, agencies and financial institutions that are involved in SMEs development programmes. Table 3 shows a clear new definition of SMEs in Malaysia by size and operation (Gopal & Mohd Sulaiman, 2013).

Table 3. New definition of SMEs in Malaysia, effective from 1st of January, 2014

Category	Micro	Small	Medium
Manufacturing	Sales turnover of less than RM300,000 *OR* full-time employees less than 5	Sales turnover from RM300,000 to less than RM15 million *OR* full-time employees from 5 to less than 75	Sales turnover from RM15 million to not exceeding RM50 million *OR* full-time employees from 75 to not exceeding 200
Services and Other Sectors		Sales turnover from RM300,000 to less than RM3 million *OR* full-time employees from 5 to less than 30	Sales turnover from RM3 million to not exceeding RM20 million *OR* full-time employees from 30 to not exceeding 75

Contribution of SMEs to Economic Development

SMEs are recognized as the backbone to economic development in Malaysia and seen as major contributor to Gross Domestic Product (GDP), export and employment. In 2011, the number of 645,136 SMEs shows a significant establishment in the development of economy, which reached 97.3% of the total enterprises indicated the importance of SMEs to the development of economy (Table 4). According to Economic/SMEs Census (2011), SMEs contribute 32.5% of GDP, 57% of total employment, as well as 19% of total exports in 2011.

While, Table 5 presents the contribution of SMEs to GDP in Asia-Pacific region where SMEs are the key drivers for both developed and developing countries. Almost all the countries within the region are considering SME as the engine for their economy development. According to Asia-Pacific SME Statistic, Index 2015, the highest contributions of SMEs to GDP is at the range of 40 to 60% from China (60.0%), Australia (55.7%), Hong Kong (54.0%), Japan (53.0%), Singapore (50.0%), South Korea (47.0%), and lastly followed by Vietnam (40.0%). Even Malaysia is in average stage, which contributed 32.7% to GDP, and still considered a good achievement. Thus, recognizing the importance of SMEs' contribution, the government has highly focused to increase the contribution to 41 percent of GDP by the year of 2020 as compared the contribution of 30% in the year of 2010, and to prepare Malaysia into a developed nation by the year of 2020, as shown in Table 6 (Hafsah Hashim, 2013).

As SMEs have a significant contribution on the economic development across the world, many researchers have look into various angle in the context of SMEs success factors. For example, innovation policies in SMEs (Wonglimpiyarat & Jarunee, 2016), motivation of SMEs entrepreneurs (Soltanian, Zailani, Azmin, & Aziz, 2016), knowledge management (Yigitcanla & Sarimin, 2015), organizational and management activities (Agostini, 2016), business-based website (Ramayah, Ling, Taghizadeh, & Rahman, 2015), network (Ing. & Ing., 2016), human capital (Onkelinx, Manolova, & Edelman, 2016) and many more.

However, in the practical perspective, critical challenges and difficulties lies ahead, particularly during the start-up phase. The failure rate of SMEs in their early stage is high and need urgent attention in most countries (Ahmad, Wilson, and Kummerow, 2011; Rasmussen, Mosey, and Wright, 2014). Therefore, many prominent researchers across the world (Aerts, Matthyssens, and Vandenbempt, 2007;

Bergek and Norrman, 2008; Calza, Dezi, Schiavone, and Simoni, 2014; Hackett and Dilts, 2008; Mas-Verdú, Ribeiro-Soriano, and Roig-Tierno, 2015) have heightened the importance of business incubator programmes as key drivers to foster the development of start-up firms through job and wealth creation.

INCUBATOR AS A SUPPORT MECHANISM TO SMEs

Having the right environment is essential in ensuring the effective and efficient creation process of technology-based entrepreneurs. Research has shown that in order to encourage the formation of technology based entrepreneurs, business incubators are needed to act as catalysts (Abdul Khalid, Gilbert, & Huq, 2011; Rosa Caiazza, 2014; Wonglimpiyarat, 2016). Business incubators are generally seen as a politically attractive and widely accepted means of increasing the chances of survival for new business ventures (Dee, Livesey, Gill, & Minshall, 2011; European Commission, 2002; Lalkaka, 2003; Smilor,

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

1987; Tavoletti, 2013). They are also viewed incubator as one of the newest tool for promoting the growth and development of economic of a country (Al-Mubaraki & Busler, 2014; Mansano & Pereira, 2016; Marchis & Lecturer, 2011).

A systematic review was conducted on business incubation by Hackett & Dilts (2004). It was observed that most literatures agree that incubators-incubation represent a systematic method of providing business assistance to firms during the early-stages of their development. This assistance is provided with the aim of increasing firm survival rates (Mas-Verdú, Ribeiro-Soriano, & Roig-Tierno, 2015). It was also noted by earlier researcher, Allen & Rahman (1985) that while the universal purpose of a business incubator is to increase the chances of a firm surviving its formative years, the business incubator also adds value by maximizing the firms' growth potential (Rosa Caiazza, 2014).

Business incubators can be perceived to be a type of infrastructure geared to support and nurture the establishment and development of small enterprises (Bergek & Norrman, 2008; Brathwaite, 2016; European Union, 2014; Lesáková, 2012; Mas-Verdú et al., 2015; Peña, 2002). Incubators typically seek to provide a nurturing or a supportive environment by ensuring that start-up firms have access to the resources, services and assistance needed. These resources are more often than not a luxury that new ventures lack or cannot yet afford (Lee & Hunt, 2008; Trewartha et al., 2012).

Entrepreneurship in the United States thrives because of the prevalent culture of risk-taking, competitiveness, technical infrastructures, and venture capital (Adlesic & Slavec, 2012; Brathwaite, 2016; Chandra, 2009) practiced by the entrepreneurs. It must also be noted that in order to further foster the development of entrepreneurs, especially from the technology-based angle, the presence of business incubators are especially important economic development tools. A clear example of this is undoubtedly the Silicon Valley, which boasts of being the ultimate business cluster phenomenon. Results from a study conducted by Suzuki, Kim, & Bae (2002) which compared entrepreneurship in Japan and Silicon Valley showed that Japanese entrepreneurs and their counterparts from the Silicon Valley were different in four dimensions; which are motivation, risk and obstacles, growth factors and infrastructures.

In Korea and China, entrepreneurial activities are also enhanced by the emergence of science parks and incubators, which are mostly linked to universities (Lalkaka, 2002). According to Nam (2000), in Korea, the technological know-how and managerial skills could be regarded as a necessary but it is not sufficient condition to be successful ventures. As Sung, Gibson, & Kang (2003) explained that entrepreneurs in Korea have insightful evaluations about their resources and capacities as well as expectations towards the functions and features of science parks and incubators. However, it was also observed that the functions and features of science parks and incubators were generally not perceived to be a critical influence on business start-up firms or on the growth of new businesses. Contrarily, Chinese incubators not only helped to bridge the gap between government research and the marketplace, but also fostered entrepreneurial attitudes. Besides that, the incubation programs had also been effective in promoting continuous interaction and opportunities among the managers (Lalkaka, 2002).

Observations made in South East Asian countries have highlighted several initiatives which have been undertaken by various governments in order to nurture the development of entrepreneurs. Singapore's cultivation of technopreneurs as a social movement implies a fundamental shift in orientations, such as a higher concentration on innovation Foo & Foo (2000). The government has also conditioned favourable environments to encourage the blossoming of technopreneurship through the provision of a strong education system, infrastructure, and internet access. Studies have also shown a similar movement in Malaysia through the establishment of technology parks, MSC and incubators to nurture the start-up of

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

companies. An example of this is the SIRIM Malaysia incubator hub in Sepang which aims at assisting entrepreneurs develop innovative concepts, upgrade skills and enhance their knowledge (Yunos, 2002).

Bergek & Norrman (2008) highlighted four components which bring business incubators and incubation into the limelight, namely; 1) shared office space which is rented under more or less favourable conditions to incubatees, 2) a pool of shared support services to reduce overhead costs, 3) professional business support or advice and 4) internal and external network provision. Governments have the role of providing the necessary infrastructure for the MSC, developing the human resource pool, the setting up of incubators and research agencies and councils to support SME, MSC as well as economic development. In comparison with other developing countries, Malaysia can be seen to have initiated the most integrated efforts in terms of government policies development, provision of incentives and infrastructures to support the growth of SMEs.

However, one of the challenges faced by SMEs during the start-up phase is the capability to utilize all the facilities provided by the government. One effort made by the government to reduce this problem is the increased running of programmes and policy regimes. It is hoped that through the delivery of these initiatives, SMEs will be able to enjoy further development and an escalated success rate. Six categories have been identified (SMIDEC, 2007), namely:

1. Programs on capacity building and human capital development,
2. Programs on technology development,
3. Programs on market access,
4. Programs on advisory services,
5. Programs on promotion and outreach, and
6. Programs on incubator centers and SME Industrial Sites.

Malaysia is not foreign to the concept of 'business incubators', as the nation has seen the adoption of this concept in the economy since the early 1990s. The number of business incubators has been on the rise since then, and as of 2009, it was noted that there were 110 incubators in Malaysia (Association of Business Incubation AABI; 2009), and 2000 incubating companies, as is depicted in Table 7. Although Malaysia currently ranks in the mid-range levels among the 14 listed companies, the statistics are still indicative of the positive future prospects of incubation development in Malaysia.

THE NUMBER OF BUSINESS INCUBATORS AND INCUBATEES IN MALAYSIA

According to SME Corp report (2012), although there are 126 incubation centres in Malaysia, only 103 of these centres are currently active. It was also recorded that 23 of these centres are in the pre-stage status at various incubation centres (Table 8). Key information highlighted in the table with regards to the 103 active incubators indicated that there are 988 incubatee companies residing in these active incubators, and that more than 50% of these companies have already developed commercial products and are generating revenue. Less than half (43%) are actual pre seed and start-ups, with a very negligible number of virtual incubatees (3%). These figures represent a ratio of 10 incubatees to 1 incubator, which is slightly less than the average ratio of 17 incubatees to 1 incubator as was highlighted by a study conducted by infoDev in 2009. The same study found China to have the highest incubatee to incubator ratio, which

stood at 67:1, while Australia was observed to have the slightest ratio at 2:1. Japan and Taiwan both have a ratio of 13 incubatees to 1 incubator, placing both countries just above Malaysia (SME Corp, 2012).

There are two ways of categorising incubation centres in Malaysia, which is either by the type of incubator or according to its industry sector focus.

- **Type:** The incubator can be of technology, business, jobs/skills and virtual (Figure 3), and
- **Sector Focus:** Agriculture, craft, manufacturing and services (Figure 4).

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

The following two figures provide a more detailed description of these categories.

EVOLUTION OF INCUBATION MODEL

Incubation models have undergone several evolution movements over the years and can be classified into different generations based on the period of change, as is highlighted in Figure 5 (Abdul Khalid et al., 2014). 1st generation incubation models entail incubation centres that focus solely on providing real

(Adapted from SME Corp, 2012 and Abdul Khalid et al., 2014)

estate services and some shared physical facilities. On the other hand, 2nd generation incubation centres provide specific advisory services that are mainly based on the particular specialisation of the incubation centre. Support from the management at this stage is generally on request. 3rd generation incubation centres marked a significant change in terms of services, as these centres extended their services by providing business support (mentoring, coaching, business advisory), marketing support (market access, network, marketing services) and facilitation for access to funding sources such as grants, project financing, loans, venture capital, and investors. Currently, incubation models are at the 4th generation phase, and the services delivered by at this phase include greater support and add internalisation value of their clients' business, seeking access to global funding, international alliances, and international markets.

CHALLENGES OF BUSINESS INCUBATORS IN MALAYSIA

It is clear that SMEs are acknowledge in literature as one of the most potential drivers of the Malaysia's economy as they are significant contributor in terms of capabilities for creating employment, contributions to gross domestic product (GDP) and exports (Ahmad et al., 2011; Bakar, Mahmood, & Ismail, 2015; Isa, Aziz, & Razak, 2011; Muhammad Wasin Jan Khan & Dr Muhammad Khalique, 2014; Ramayah et al., 2015; Sharif, 2014; Tock & Rohaizat Baharun, 2013). Thus, business incubators programmes are seen to shed light to the SMEs by providing a nurturing business environment to accelerate the development of start-up firms.

After realizing the importance of business incubation programmes, tremendous support has been given by the government. Yet, according to Mohd Saffar (2007), SME Corp (2012), and Jamil et al. (2016) there are many challenges faced in the process of incubation as:

- Lack of skilled staff to coach and monitor the incubatees,
- Weak underlying processes in incubators,
- Lack of managerial skills among the managers operating incubators,

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

- No standard definition and concept of business incubation modeled in Malaysia,
- Incubation programmes are parked in various ministries,
- Majority of incubators are funded by federal government, and
- Bureaucratic complexities in some of the processes.

Report from SME Corp (2012) has outlined realistic indication of Malaysia incubation scenario that 68% of business incubators in Malaysia are in first and second generation, accounted for 20% and 48% respectively. These generation incubation programmes adapt traditional landlord-tenant models (low-cost real estate), and provide basic incubation supports (office space and shared office facilities). The report also identified that 29% of business incubators are in third generation, while only 3% ended in the fourth generation. Both third and fourth generation incubators have updated their supports portfolio by offering business support services particularly coaching and mentoring, assisting the incubatees with technological upgrade, professionals, providing international market and network access, as well as providing essential support from local and global funds. This statistic infers that human, structural and network capital element need to be given attention, which will result in upgrading the level of the majority business incubators from the first and second generation to the third and fourth generation in the near future.

DISCUSSION AND FUTURE RESEARCH

Despite all the strategies and development in business incubators, little evidence on theoretical challenges was identified in Malaysia. Even developments in economics have highlighted the significance of business incubator programmes across the world, yet far too little attention has been paid on the business incubators-incubation research in Malaysia. This chapter is highlighting some of the literature research, from a range of period from 2000 to 2015 which has been conducted in both conceptual and research in Malaysia as shown in Table 9. The update clearly indicates a remarkable shortage of research in Malaysia. Thereby, this chapter suggests future researchers to explore and identify the success factors and performance of business incubator programmes which can be exploited in Malaysia particularly. It is very important for future research to close the gap by looking into the unexplored dimension. Based on the few studies conducted in business incubation, the following challenges were highlighted:

- What is the standardization of the incubation process? (Lee & Hunt, 2008),
- What is the best practise of an incubator? (Bergek & Norrman, 2008),
- What are the enabling factors for strategic management of business incubator? (Somsuk & Laosirihongthong, 2014), and
- How do business incubators use their intellectual capital? (Calza et al., 2014).

Thus, one way to explore the challenges faced by incubators in Malaysia would be exploring on the influence of intellectual capital to the performance of incubatees, as Malaysia is moving toward knowledge based economy. As intellectual capital is the major source of knowledge, Calza et al., (2014) had proposed a theoretical model to analyze the intellectual capital of new generation business incubators, where it encompasses three dimensions; human, structural and relational capital.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Abdul Khalid et al. (2014)	The Way Forward For Business Incubation Process in ICT Incubators in Malaysia

Therefore, moving forward, and in line with SME Masterplan 2012-2020, this chapter would like to highlight the gaps in business incubators research in Malaysia. This chapter clearly shows the urgency to carry out studies to identify the factors which influence the performance of business incubations in Malaysia, in the context of effectiveness of business incubators either during the phase of pre, during or post incubation.

CONCLUSION

As part of the journey in realizing Vision 2020, MSC and SMEs have played a vital role in contributing to the economic growth. Realizing this, government has formulated and multiplied strategies and action plan to drive together the promoting of the economic growth. Taken together, the study encompass the role of business incubators as an accelerator to start-up firms, and simultaneously in line with the objectives of SME Masterplan 2012-2020 to generate greater impact to SMEs development.

This chapter reviewed the significance of MSC and SMEs in the Malaysian economy; the small but important steps taken to facilitate more effective approaches to business incubation as well as a general typology of business incubators in Malaysia. As the government is the leading stakeholder of the incubation centres and their ecosystem in the country, this is a timely moment for the nation to take key steps to regulate the incubation industry into a single governance system, with a keen focus on nurturing the incubatees and increasing their chances of survival. Undeniably, there are many drawbacks in

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

the Malaysian incubation industry such as the fact that most of the incubation centres in Malaysia are either federal or state owned, the loose interpretation of the term incubator in Malaysia, the trend of most incubation centres in the country being placed at either 2nd or 1st generation stages, equity funding by incubation centres that is not prevalent, human capital issues especially in terms of incubation managerial skills, structural capital as well as issues with innovation. These limitations indicate that there are still many steps which must be taken by Malaysia in order to successfully achieve the status that the nations hopes to attain within the incubation industry in the near future, encompassing on the intellectual capital context of business incubation.

KEY TERMS AND DEFINITIONS

Business Incubation: A dynamic, interactive, and innovative process which stimulates and accelerates the discovery, validation, application of new ideas towards development and commercialization of tangible and intangible products in the market.

Business Incubator: An innovative system which is designed to accelerate the development and success of start-up firms by providing a broad range of resources and business services. Business incubators are primarily defined by nature of the incubator's promoters, their objectives, the types of projects and services, the financial model and the environment in which the incubator operates.

Economic Policy: The actions that governments take in the economic field.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Incubatee: Firms that have been registered under an incubator and had been in operation for a period of time.

Multimedia Super Corridor (MSC): MSC Malaysia is Malaysia's national ICT initiative designed to attract world-class technology companies while grooming the local ICT industry.

Small and Medium Enterprise (SME): SME definition covers all sectors, namely services, manufacturing, agriculture, construction and mining & quarrying bases on sales turnover and number of full-time employees.

Chapter 6
A Model to Reduce the Risk of Projects Guided by the Knowledge Management Process: Application on Industrial Services

Menaouer Brahami
National Polytechnic School of Oran, Algeria

Nada Matta
University of Technology of Troyes, France

ABSTRACT

Knowledge plays a key role in the information revolution. Major challenges are to select the information from numerous sources and transform it into useful knowledge. In this context and in an economy strongly focused on the "Knowledge", take the turn of knowledge management becomes a strategic issue for the survival of organizations. However, the research in knowledge management focuses mainly on the creation, capitalization, and knowledge transfer process. Researchers are centered on the establishment of the knowledge management process in companies, but little about interaction between the knowledge management process and the risk management process. In this article, the authors propose a new model to reduce the risk of projects guided by the knowledge management process represented by the GAMETH method. They apply their approach to ammonia industry presented by the FERTIAL (Algerian-Spanish company).

INTRODUCTION

Very many companies use the risk management for developing their activity (construction, computer science, ecology, industrial, pharmaceutical, health, etc.). Among the different research themes addressed in the literature, the risk reduction of projects remains one of the most studied together other important works on detection, evaluation, estimation, solutions and tools to be implemented. However, it appears that appropriation (learning) and experience (know-how) are effective ways to prevent risks.

Such knowledge acquired in the past should be managed to allow more effective risk management: one role of knowledge management. The latter is a way of systematic management of tacit knowledge and explicit knowledge. Indeed, its purpose is to retain, to transmit and to develop knowledge in order to:

- Improve the skills management,
- Promote innovation and creativity
- Support decision making.
- Increase productivity

In sum, risk management and knowledge management are two different fields that become more and more important for companies dealing in a global and multicultural environment.

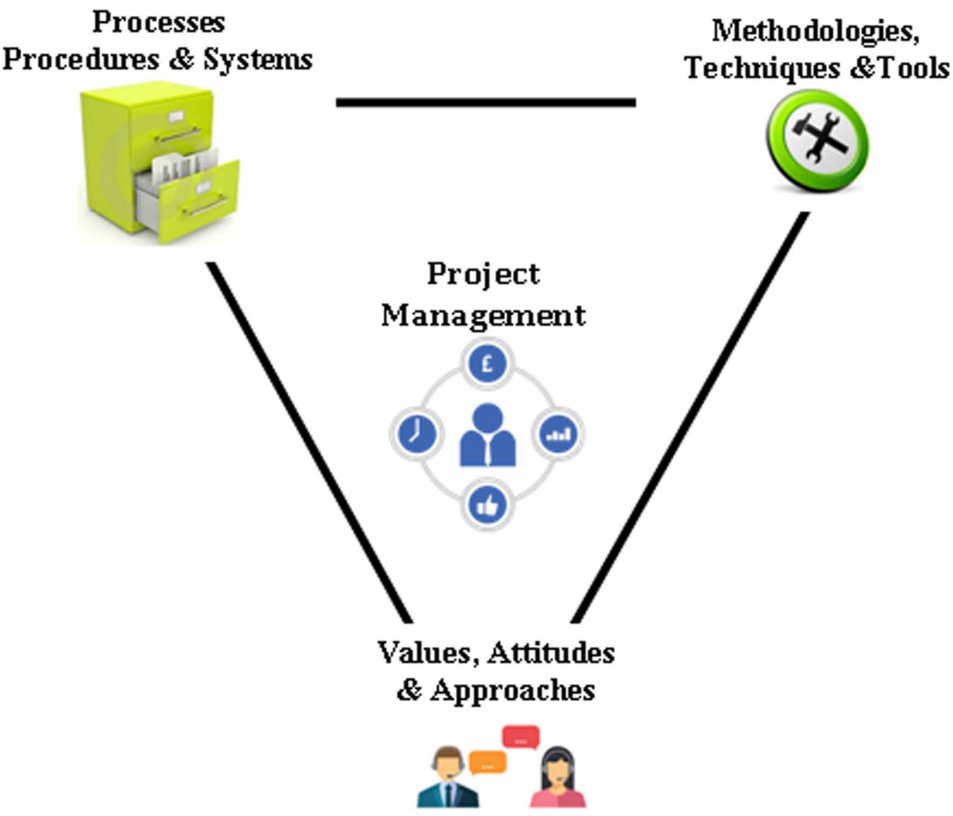
In the first part, we present the main concepts that are used in our paper regarding to context and elements of the project, the theoretical concepts of risk management process, and knowledge management process. In the second part, we present our model to reduce the risk of projects guided by the knowledge management process by using the GAMETH method (Grundstein, 2012; Brahami et al., 2015). Thus, we refer to the knowledge stakeholders, their tasks, and the results of their problem-solving activities as knowledge resources.

THEORETICAL FRAMING

This section deals with the main concepts that are employed in this paper regarding to context and elements of risk projects.

Context and Elements of the Projects

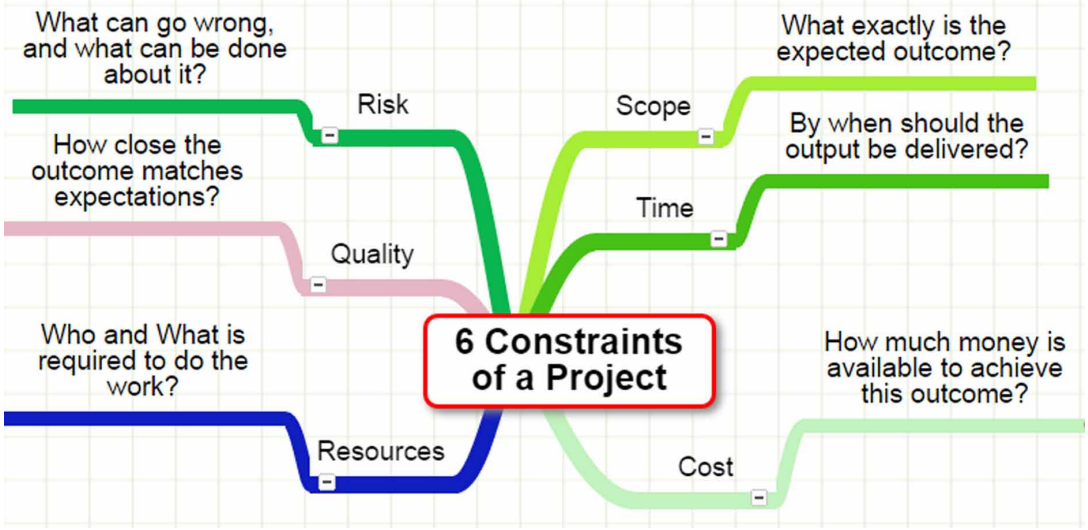
In the literature of management and according to (Morley, 2003), the term project corresponds to the situation in which one finds oneself when we shall reach a goal with the means with ad hoc and in a given time frame. According to (Marciniak & Rowe, 2008), a project is defined as a specific action, new, with a limited duration, which structures methodically and progressively a given reality to come. In addition, the project is a complex system of stakeholders, means and actions, with the purpose to provide a response to a demand or a need. For Giard (Giard, 2004), the project is indicated as a specific approach that allows structuring methodically and progressively a reality to come. Also, a project is defined and implemented to elaborate a response as required by user or customer and it implies an objective and actions to be undertaken via concept data resources (Reina et al., 2012).



EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

At the conclusion of these three definitions, we find that the word project is highly bound to objective terms, means and time. The diagram below, adapted from (Briner et al., 1993), represents the fact that the realization of a project is influenced by organization policy, by some external constraints and by individuals' needs in the environment as well as within the organization. Consequently, these factors should be considered throughout the life cycle of project (see Figure 1).

In addition to its different elements, the project evolves in a particular context which confers the specific characteristics. According to Newcombe (Newcombe, 2000), this context is composed of the organizational structure of the enterprise, the direct environment of the project and the general environment of the enterprise. For Giard (Giard, 2004), the organizational structure of the enterprise determines the organization of the project because it affects the roles and tasks of the actors. The direct environment of the project "users, project team, and management type" influences the objectives and progress of the project. The general environment (competition, sector of activity, etc.) legitimates, regulates and / or strengthens the project.



The project, its elements and its context are managed by the project leader. An abundant literature defines the project management. The project management is first presented like applying tools and technologies on resources for the accomplishment of a single task, complex possessing of the constraints of time, cost and quality. Other author specifies that the project management has the role to address these challenges by putting in place an organization and a planning of the all the activities aimed at ensuring the achievement of project objectives (quality, cost, time), performing their monitoring, anticipate the risks

Figure 1. The project management triangle

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 2. The heuristic map of the constraints of a project

and the changes to be implemented, deciding and communicating (Emblemsvåg, 2010). The synergy of project management and knowledge management concepts creates a sturdy knowledge-based framework that enables sharing of project knowledge and lessons learned, and promote the cross-pollination of ideas (Kevin & Evaristob, 2006). This knowledge is hopefully fed through the other areas of the organization, such as engineering, research and development, and product development, so as to improve the products and services of the organization (Kevin & Evaristob, 2006) (see Figure 2).

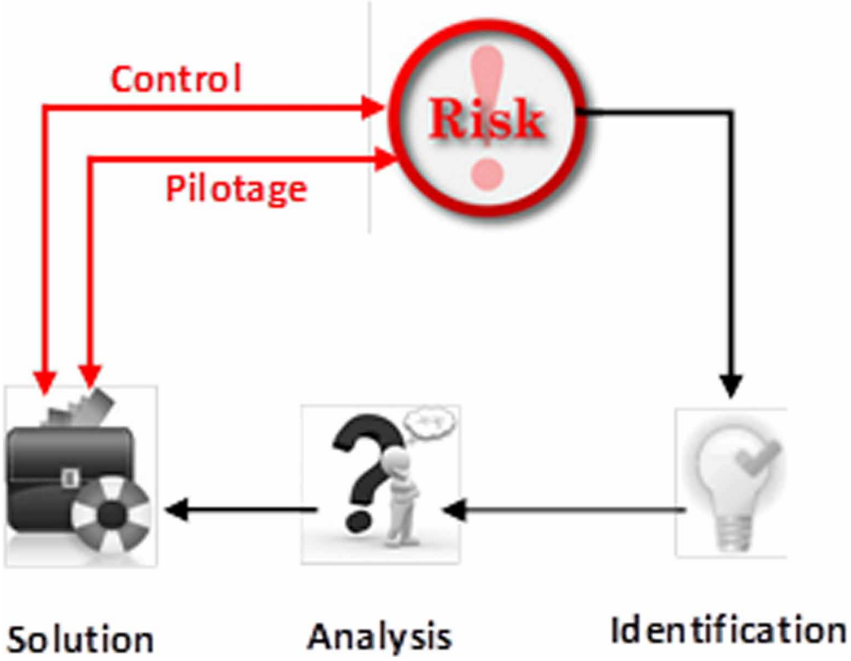
Finally, some describe the project management like a process of organization, of planning and of coordination of means (Barker & Cole, 2007) rather than a process of control and of monitoring of the tasks. Although these knowledge areas are all equally important from a project manager's point of view, in practice a project manager might determine the key areas which will have the greatest impact on the outcome of the project.

All projects are not of successfully. By way of example, we can cite the studies of the Standish Group published in the "Chaos report" but which only relate information system projects. The latest public release of 2009 date and is given below (Morley, 2003).

Risk Management Process

The projects failures lead us to treat the existing risks preventing projects to arrive to their end or else to meet their initial specifications. For this, the need for risk management in projects is unquestionable. Almost all norms, quality models and standards of project management claim that risk management is essential. With the diverse interpretations of risk, the domain of the risk management becomes even more complex with different organizations and entities defining it in different expressions. Related to ISO 31000 defines it as a set of coordinated activities implemented in order to direct and control an organization with regard to risk. In fact, the risk management is a continuous process that will trigger further deliberation as soon as a fact is added to the knowledge base, which makes the situation risky. According to Bradley (Bradley, 2011) risk management embodies an organizational culture of prudent

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use



risk-taking within an agency. It is the process of identifying, assessing and responding to risks, and communicating the outcomes of these processes to the appropriate parties in a timely manner. For (Rachna & Shahid, 2013), the risk management process is a holistic approach includes the external and internal risks to be addressed in the corporate strategy in integration with corporate culture prevalent in the company. Moreover, he outlines a standardized approach to the identification, analysis, evaluation, treatment, communication and monitoring of risk. According (Pender, 2001), the risks management is present in all the systems of the model presented above: strategic, technical, social, structural, and the project management. The project manager must then seek to reduce them, and if he/she can't reduce them, he/she shall monitor their evolution. He set up in this optic a risk management. This risk management is a principal component of the project management. According to (Corvellec, 2009), risk management can be embedded in the daily management activities that typify the operational mode of the firm without explicitly referring to risk, but still addressing in a complete and effective manner the risk issues of the organization. For (Emblemsvåg, 2010), the risk management is required to take into account the past problems leading to complications, present challenges and predominant inclinations which impede the project's successful implementation. For (Berg, 2010), risk management is an activity which integrates recognition of risk, risk assessment, developing strategies to manage it, and mitigation of risk using managerial resources. Some traditional risk managements are focused on risks stemming from physical or legal causes (e.g. natural disasters or fires, accidents, death). In supply chain domain and according to (Borgman & Rachan, 2009), the risk management in supply chain operations is clearly of significant interest to production companies, intermediaries and consumers. Furthermore, it does not equate to disaster response only. Rather, it means keeping an increasingly complex process moving efficiently at the lowest total cost and without compromising the quality of the product or customer satisfaction. Moreover, an attempt was made by (Gupta et al., 2014) to bring out a schema for analyzing supply chain risks faced by the firm and develop a risk management action framework that would serve as a guide for practitioners to identify the level at which their firms are operating and the strategies they need to employ to combat or prevent supply chain risks. According to the authors, the data is collected by means of an online as well as an event survey from logistics managers of various supply chain firms.

Generally, the setup of a risk management process varies between different types of standards; some include the risk management process in the risk management framework and does not separate them (Hopkin, 2012). A risk management process aims to give the structure of how the organization should control risks, and independently of which standard's way of presenting the process that is used, most of the existing models gives the same basic work structure (Hopkin, 2012). According to (Zuo & Hu, 2009), a full cycle of risk management includes risk identification, risk analysis and risk mitigation. Effective risk management is to (1) identify any potential risks that an organization faces (including cyberattacks from external malicious hackers, internal human errors, and system failures); (2) assess the levels of threats to the organization's assets, and (3) develop strategies and approaches to mitigating risks. Likewise, risk management process is defined as a concatenation of five (05) steps (see Figure 3):

- **Risk Identification:** Attempts to establish threats (risks) to the project. Its goal is to anticipate what can go wrong in the project. The identified risks in previous similar projects can help the software engineer in that task. Risk identification is critical to efficient management of risks on construction projects;
- **Risk Analysis:** Concerns analyzing the identified risks, estimating their probability and occurrence impact (exposure degree);

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 3. The risk management process (Emblemsvåg, 2010)

- **Risk Assessment:** Aims to rank the identified risks and to establish priorities. The goal is to allocate resources only for the most important risks, without managing risks with low probability and low impact;
- **Action Planning:** Concerns planning mitigation and contingency actions for the managed risks (those of higher priority). Mitigation actions aim to reduce probability or impact of a risk before it occurs. Contingency actions assume that mitigation efforts have failed, and are to be executed when a risk occurs;
- **Risk Monitoring:** As the project initiates and proceeds, managed risks should be monitored. Risks' exposure degrees could change, new risks could appear, or anticipated risks could be no more relevant. It is necessary to control managed risks, to identify new risks, and to accomplish the necessary actions and evaluate the effectiveness of them.

For to be reduced, the risk must first be identified it this is the first step. For the known risk, the analysis phase that follows consists in finding the causes of this risk and to evaluate its consequences. The project team then searches the possible solutions to reduce it and sets up the one which seems the most effective. This setting up of the solution is piloted and regularly monitored in order to check that it matches well to the expectations of the team that shall make changes if necessary.

In this context, very few articles attempt to combine knowledge management and risk management. Furthermore, managing organizational knowledge about risks is important to improve the accomplishment of this activity, and to allow organizational learning about risk management. In this way, many experts agree that "an organization can't manage its risk today without managing its knowledge". In addition, (Rodriguez & Edwards, 2014) have examined possible relationships between knowledge management constructs related to knowledge sharing, and two risk management concepts: perceived quality of risk

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

control and perceived value of enterprise risk management. (Trkman & Desouza, 2012) also use the phrase "knowledge risk management" to refer to the risks associated with knowledge management, for example that too much sharing of knowledge can adversely impact competitive advantage. They categorize these knowledge risks, and examine how these risks affect knowledge transfer. In closing, (Benoit et al., 2011) have proposed a measure of risk exposure for knowledge management system use. This measure enables knowledge managers to assess the level of risk supported by their organization and to take the appropriate action to manage their risk exposure.

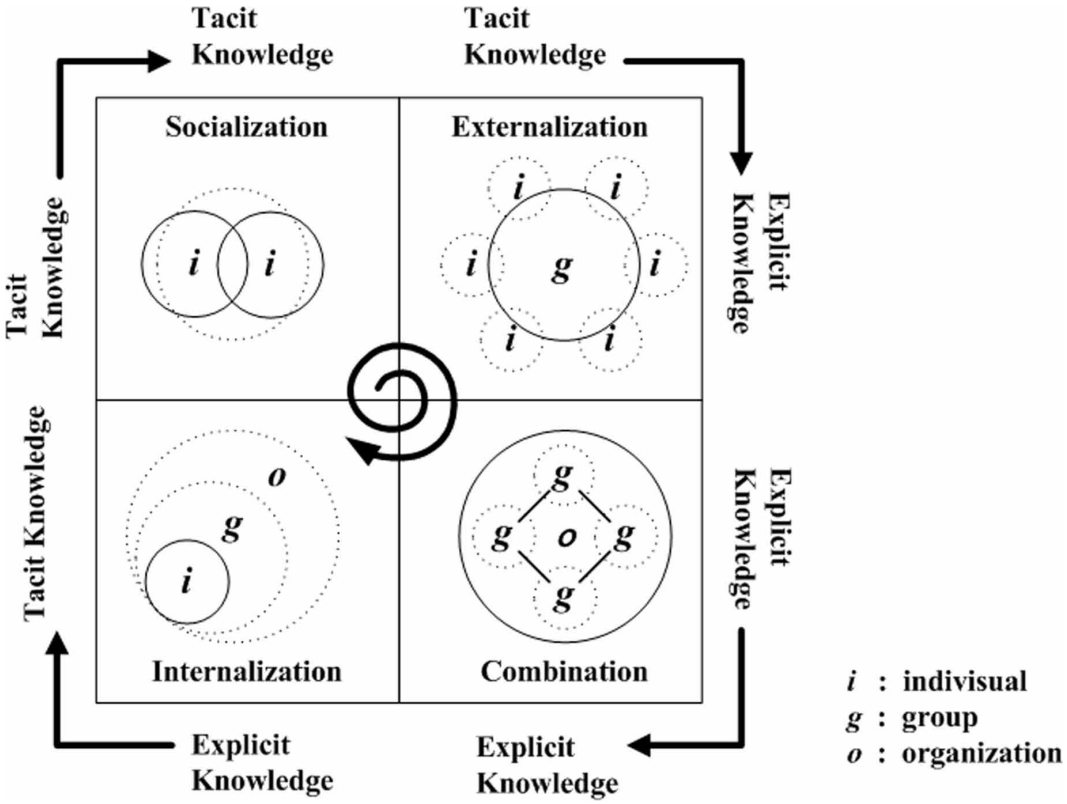
Finally, the Knowledge Management processes as well have turned out to become a strategic resource for the organizations. The knowledge management can have a great influence on reducing organizations' risks (Rachna & Shahid, 2013). However, using the knowledge management processes to improve the application of the risk management processes is a recent and significant research area. In spite of its importance, this area of research has not been addressed intensively up to now. A company cannot manage its risks effectively if it cannot manage its knowledge, many projects failed due to lack of knowledge among the project team members or lack of knowledge sharing during project progress (Rachna & Shahid, 2013).

Knowledge Management Process

Before understanding how knowledge management allows reducing the risks in the projects, we find out its own characteristics.

In the literature, we find several definitions of knowledge management. For this, we are focused in our paper about a few definitions. According to (Kusumawardhani & Markeset, 2015), knowledge management is an organized planning, coordination and control of organizational activities and resources to effectively capture, distribute, and use knowledge. For (Haapalainen & Pusa, 2012), knowledge management includes several processes, e.g., knowledge creation, knowledge storing, sharing, and using knowledge. When these processes run smoothly, an organization can confirm that information is available for users whenever needed. This is essential for organizations that sell knowledge based services. Moreover, (Barclay & Murray, 2004) defines the knowledge management as being "as a process of identification, formalization, disseminating and use of knowledge in order to promote creativity and innovation in companies". According to (Matta et al., 2000), Knowledge capitalization in an organization has as objectives to promote the growth, the transmission and the preservation of knowledge in this organization. According to (Grundstein, 2012), capitalizing on company's knowledge means considering certain knowledge used and produced by the company as a storehouse of riches and drawing from these riches interest that contributes to increasing the company's capital. In fact, the knowledge management is a way to answer the problem of capitalizing on the company's knowledge. This problem can be considered as a multi facet problem solving approach which is described by Grundstein as follows:(Locate, Preserve, Enhance, Actualize, and Manage) (Grundstein, 2012). For (Barthès & Grundstein,1996), knowledge management consists of capturing and representing knowledge of the company, facilitating its access, sharing and re-use. This very complex problem can be approached by several points of view: socio-organizational, economic, financial, technical, human and legal (Grundstein, 2012). Additionally, (Alavi & Leidner, 2001), identified the KM processes: creation, storage and retrieval, transfer and application of knowledge. These processes are looking for creating value from intangible assets: human capital, structural capital, intellectual capital, customer or relationship capital. For (Nonaka & Takeuchi, 1995), knowledge management systems are guided to capture, create, store, organize and disseminate

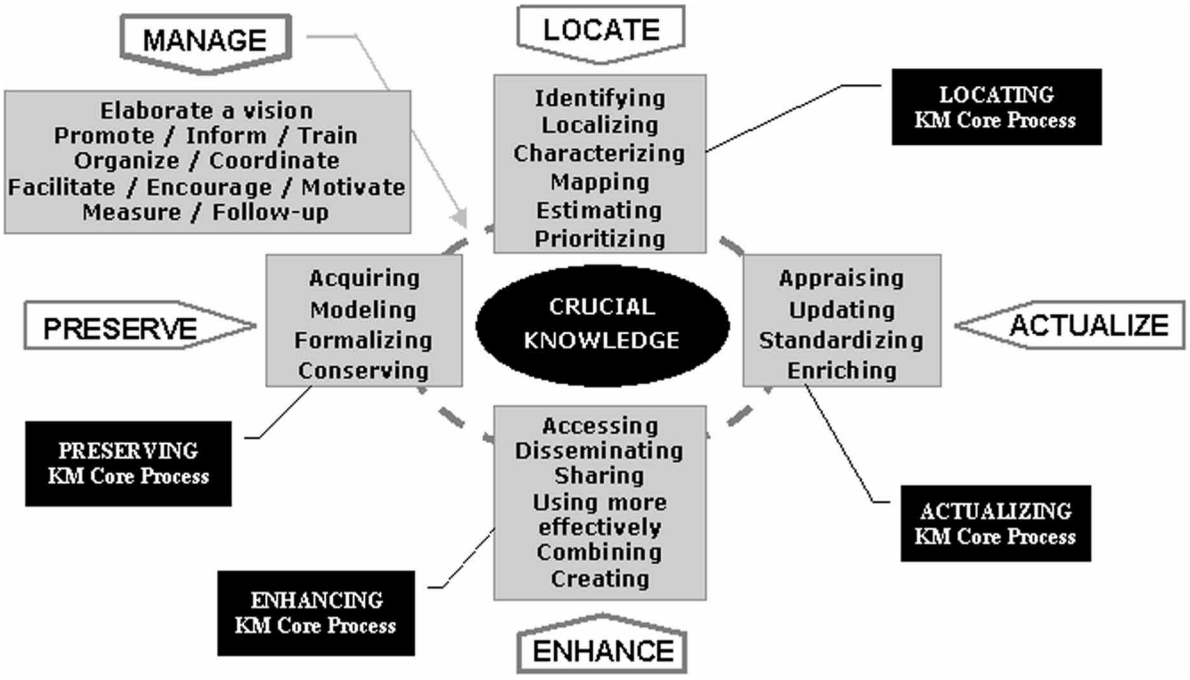
EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use



organizational knowledge. This process takes into account the transformation and the evolution of tacit to explicit knowledge (O'Leary, 1998) and of individual to collective knowledge. Tacit knowledge is represented by experience, beliefs and technical skills accumulated in the people's minds. Explicit knowledge is the knowledge expressed in documents, data and other codified forms (Reina et al., 2012). The interactions and movements from tacit and explicit knowledge to tacit and explicit knowledge on the individual and organizational level generate the knowledge creation in an organization (Nonaka & Takeuchi, 1995). The dynamic is expressed through the processes in Figure. 4 (see Figure 4).

It can carry both theoretical knowledge and know-how of the company. It requires the management of company knowledge resources to facilitate their access and their re-use (Pender, 2001).

Moreover, we can find in the literature different proposals of life cycle used to realize knowledge management (such as GAMETH, MASK, KALAM, BKMDM, REX, KOD, etc.). In our paper, we adopted the knowledge management life-cycle proposed by (Grundstein, 2012), where, according to him, "in any operation of knowledge capitalization, it is important to identify the strategic knowledge to be capitalized".



For our purpose, the knowledge capitalization cycle was chosen as the most appropriate because of its generalizing point of view. This cycle summarizes the knowledge capitalization tasks in four major steps: detection, preservation, capitalization, sharing and actualization of strategic knowledge, each of them declined by several detailed tasks (Brahami et al., 2015; Haapalainen & Pusa, 2012). These steps also reflect requirements for our objective, i.e. the development of a model to reduce project risks and a decision support system for FERTIAL Company of the Oran city in Algeria (see Figure 5).

Figure 4. A Model of Dynamic Organizational Knowledge Creation (Nonaka & Takeuchi, 1995)

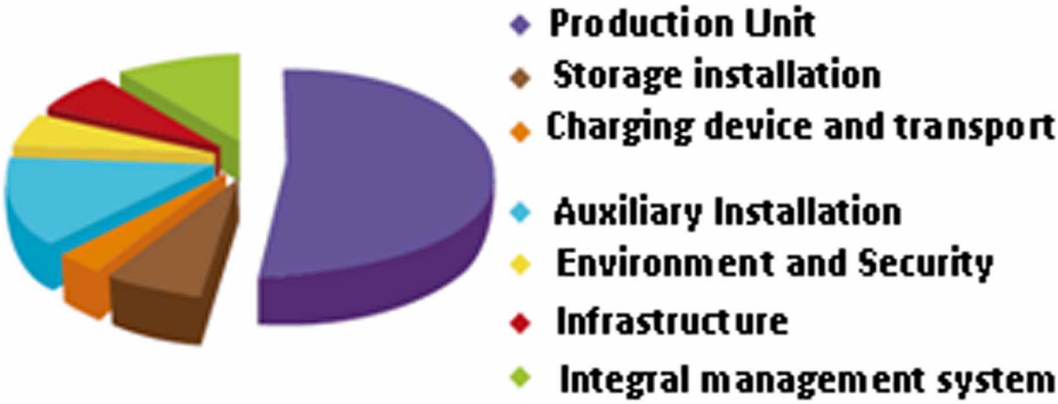
Figure 5. The generic Knowledge Management Processes (GAMETH method) (Grundstein, 2012)

THE MODEL TO REDUCE THE RISK OF PROJECTS GUIDED BY THE KNOWLEDGE MANAGEMENT PROCESS



The capitalization gathers the processes allowing of valorize the knowledge "acquired": the return of experiments on reducing risks, capitalization around the finding solutions to improve the teamwork, use of tools for modeling, and the planning within the FERTIAL (National Fleuron of the petrochemical industry) Company.

FERTIAL (National Fleuron of the petrochemical industry), Company of Fertilizer of Algeria, is a company resulting from a partnership concluded in August 2005 between the Algerian Group ASMIDAL and the Spanish group GrupoVillar Mir. Also, it is composed of five major divisions specialized in numerous activities related especially the manufacture of fertilizers and agricultural fertilizers. Indeed, the security is a key factor in the Industrial Policy and Human Resources, as well as staff training, quality and respect for the environment. The company is committed to create a healthy and safe environment by implementing a security policy compliant with legislation and performance improvement. Therefore, the most important goal of the FERTIAL Company is to achieve zero accidents and ensure industrial safety of the surrounding communities by proposing an approach of knowledge capitalization in the trades' and its exploitation in the projects. These projects were intended for the renovation and modernization of industrial facilities to improve their capacity, the acquisition of new digital control system, to the environment and security, etc. (see Figure 6).

The knowledge management process can reduce the risk of projects. In fact, as we are going see through the Figure 5, the different phases of risk management correspond to the operational chain of the knowledge management process.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 6. Destination of investment projects in FERTIAL Company

During the Identification Phase, the project team puts in common all the knowledge related to sources of the risk and searches for the presence of these sources at all levels of the project. For that, we are also interested in this study to identify the sources of risks for people, property, and work at the level of FERTIAL group especially the complex Fertilizers Production. The table below recapitulates the identification of these risk sources (see Table 1).

This knowledge was accumulated during previous learning and from experiments of past projects. The acquisition of such knowledge that corresponds to the step of preserving (acquiring) the knowledge management core process is carried out using different means: learning, the experiments return, and the knowledge transfer between the actors of the project team. Moreover, we have used others project risk identification techniques including:

- **Brainstorming Sessions with Staff or External Stakeholders:** This brainstorming process is likely to highlight a large number of risks of differing importance. As a result, it is necessary to score the risks in terms of the likelihood of the risk being realized, the impact the risk would have on the achievement of projects objectives and the quality of the mechanisms in place to control (manage) the risk. This enables the relative importance of each risk to be assessed and ranked.
- **Use the Documentation and Existing Project Management Tools:** Project design tools (functional analysis, Pert (critical path key step), and budget);

Table 1. The different types of resources threatened by Risks in FARTIAL Company

Management, Skills	■ Membership resignation of the project team. ■ Departures of consultants or experts, (Death, Injury, and illness of an expert). ■ Go to another company – project. ■ Stress, exhaustion.
Technologies / Materials / Middle	■ Pollution in terms of environment (hygiene, waste management). ■ Accident in terms of health, ■ Gas leak ■ Incendie, Explosion
Identifying the stakeholders (i.e., who is involved or affected).	■ Past events, ■ Future developments.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

- **Check-lists or pre-established surveys** covering the different areas of the project (Environment and Safety).
- **Working from the problems encountered from previous projects** (Post-mortem, expert advice, and experiences Returns).

In the concrete case of a project, we have clarified some contextual information's: for example, which are users formed, what are the signatories and recipients of mail and what are the participants in the meetings...

However, these methods and tools each have their own limitations. For that, we find ourselves important to use them jointly in order to obtain a most exhaustive identification of the projects risk. This stock of knowledge feeds the discussions which occur during of the identification phase.

During the Phase of Risk Analysis, the knowledge acquired in the past relating to the evaluation and estimation methods and the risk measurement are put to contribution. The solution for reducing and / or controlling the risk arises from the analysis developed just before. Through knowledge detained by team, its trade's actors can more or less predict the consequences entailed by the solution establishment.

Furthermore, the method chosen for the risk analysis that we used combines the possible consequences or impact of an event (management, skills, environment, technologies, and health) with the likelihood of these events which occurring. The result is a 'level of risk' (see Figure 7).

Subsequently, the type of analysis that we used is qualitative (i.e. based on a "simplified" evaluation) that takes into account the severity and probability parameters according to the following four levels (see Table 2).

Also, we performed a mapping "Occurrence probability/ gravity." This mapping allows determining the nature of the risk treatment measures to be implemented depending on the type of risk (preventive measures for risk probability, measure of protection for gravity risks, avoidance or suppression, and priority by treatment, etc.).

Figure 7. Characteristics of Risks

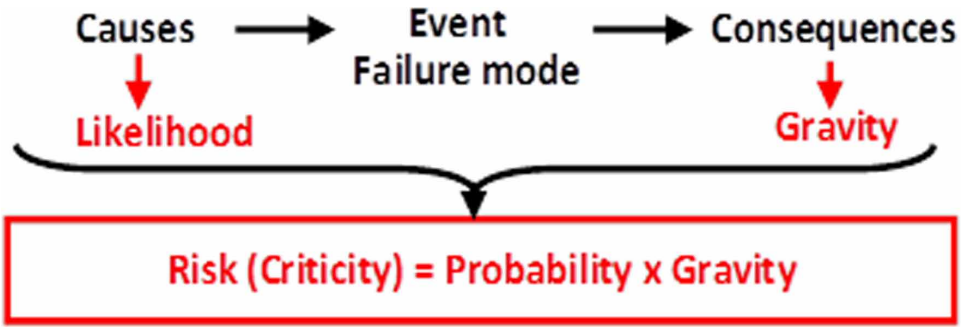


Table 2. Index of risk criticality

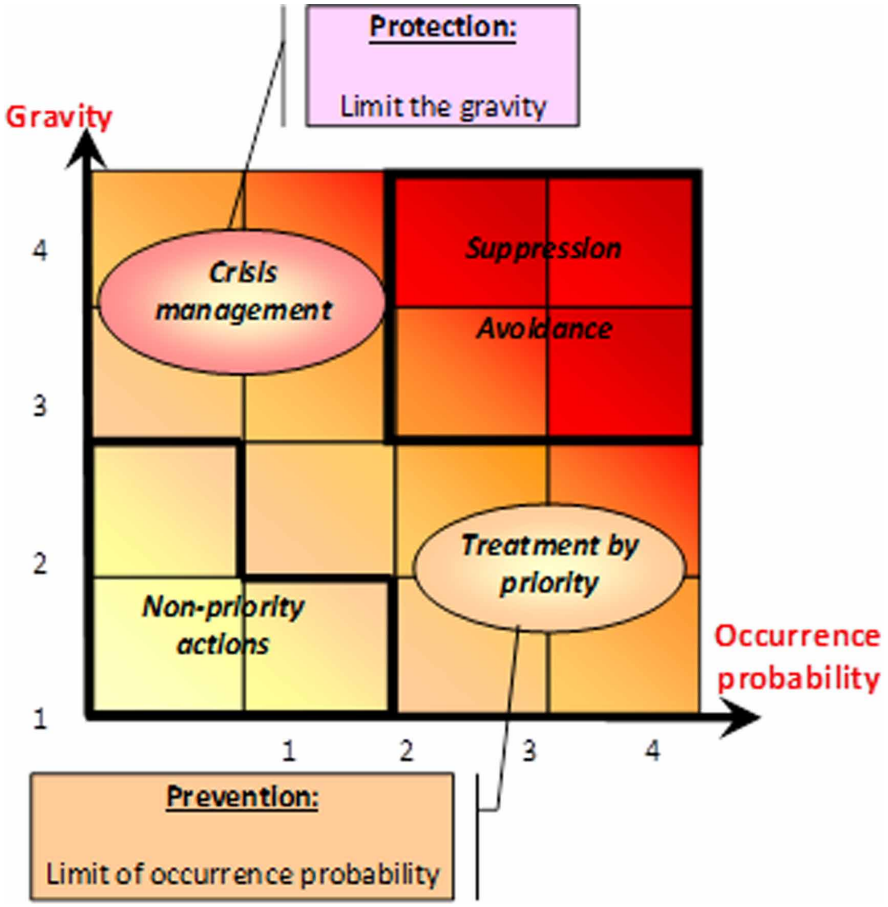
1	Null
2	Low
3	Medium
4	High

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

It allows arbitrating the risk treatment with high probability of occurrence and strengthens protective measures for risks with high gravity (see Figure 8).

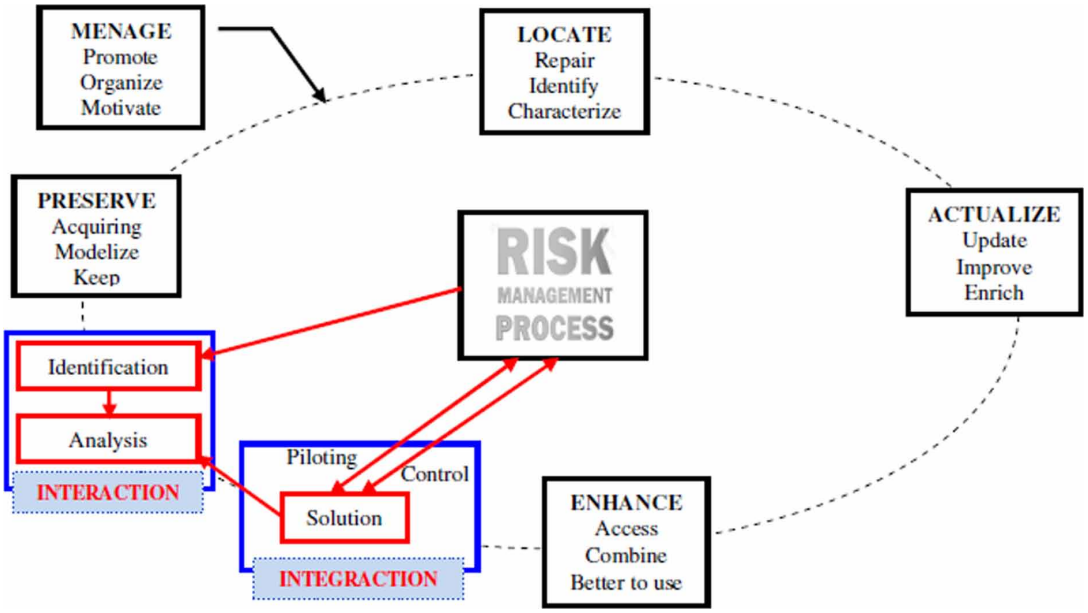
The choice of preventive actions to engage is performed by comparing the costs of implementing them with the consequences costs of the risk, taking into account their occurrence probability.



Thus, the steps of identification and analysis constitutes the Interaction Phase of our model that we have integrated into the GAMETH method (Grundstein, 2012) after the preserving phase (see Figure 9).

Moreover, the establishment of the solution is piloted and controlled by the project manager (leader) with the aid the effect evaluation of the solution of the risk, for example by using of monitoring balanced scorecard which contains (control efficiency, control cost, and monitoring of action plans) or by dialoguing with concerned trades' actors.

Likewise, we can through this mapping to launch a regular activity to risk monitoring. The latter allows following the evolution of the risk appearance probability (stable, on the rise, on the drop) to control the relevance of preventive actions engaged and eventually to correct the planned arrangements.



The interaction between the solution and the two managerial skills (piloting and control) is similar to the Integration Phase of knowledge management process (see Figure 9). Indeed, the implementation of the solution is akin to an action process which is tested and regulated by the control and piloting of the project manager.

Figure 8. The mapping "Occurrence probability/ gravity"

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 9. Integration of the Knowledge Management Process (GAMETH method) in the Risk Management Process

This control and this piloting pulls out a more or less thorough evaluation of the effects of the solution envisaged and this evaluation serves as the basis for knowledge creating, the third step (Enhancing KM core Process) of the GAMETH Method. Evaluation of the solution consists in comparing the results obtained to desired results (effectively). This difference, positive or negative, between real results and contemplated results, allows the team (managers and trades' actors) to make self-criticism of the solution and to define thus the advantages and disadvantages of the solution developed to accumulate knowledge.

After updating, enriching, and appraising of the knowledge management process by the new knowledge (the fourth phase "Actualizing" of GAMETH process), this new knowledge is managed in a project memory (Matta et al., 2000) for that the knowledge management process can reduce the risks, follow-up the risks, and elaboration a vision of the future projects (the fifth phase "Manage" of the GAMETH process).

The knowledge management cycle is thus sealed off. The new knowledge accumulated over of the risk management is memorized and ready to be disseminated to the future of project teams. The risk management will be more effective because the phases of identification, of analysis, and setting up the solution will benefit from the experience of past projects. The introduction of knowledge management thus allows reduce directly the risks. However, it also influences indirectly risk sources:

- **The Responsiveness Lack:** This is organized by the establishing of the alert system; information processing systems by exception which enable quickly identify the risks that can arise, and the procedures aiming at reducing these risks. In other, the responsiveness is improved by the detection, identification and rapid risk analysis.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

- **The Cognitive Biases:** For (Zindel et al., 2014), the cognitive biases are cognitive processes which generate errors of appreciation and interpretation of the information at the individual level. Moreover, the cognitive processes serve to reduce and combine mentally of the information quantities. From sharing its process, knowledge management reduces the cognitive biases due to interactions between the team members.

CONCLUSION

We can summarize the contributions of knowledge management to reduce the risks in the following way:

- The knowledge management allows evolving the cognitive processes of the various project actors.
- The knowledge management favors the knowledge acquisition at the level the risks by making explicit the tacit knowledge of the different actors on the risks, retaining such knowledge and transferring them.

However, it must be noted that the use of the knowledge management to reduce the risk is only relevant if an assessment and an experience feedback of projects is performed by all project actors. Indeed, it was only at this time that the knowledge about the risks can extend thanks to the measurement of deviations between what that was expected of the project and the real results, by analyzing these deviations and by fixing this analysis in the knowledge base.

It does must also not lose sight of the fact that the knowledge management takes an interest in the environment that surrounded the project, because, the solutions applied to reduce the risks may be different according to the project environment.

Finally, we are currently working with our collaborator of FERTIAL Company to put our approach and its stages, including the risk monitoring plan and the knowledge capitalization, in practice, in a project to increase production capacity of ammonia and fertilizers.

Chapter 7
Design Methods for Decision Support Systems:
A Perspective of Small Business B2C E-Commerce Environment

Madhury Khatun
Victoria University, Australia

Shah J Miah
Victoria University, Australia

ABSTRACT

This article reviews methods to the development of a decision support system (DSS) solution for small business owners/managers. The main objective of designing the DSS artefact is to support the strategic decision-making for achieving competitive advantages in the business-to-consumer (B2C) e-commerce environment. Many researchers in the DSS domain utilised various methods to design of information systems (IS) artefact, mostly intended for large businesses. Researchers have paid much attention to the business environment as a knowledge source for DSS design and development for the small business strategic decision support needs. User-centred design (UCD) principles were adopted for DSS development. Prior a novel DSS development, multiple case studies were carried out for understanding the user needs and system requirements. Also, knowledge was sourced from the external business environment via the analysis of small business website features against their overseas competitors. The findings suggested developing a DSS solution for small business needs.

INTRODUCTION

The analysis and design of decision support systems (DSS) is a multifaceted activity that points toward exploiting of suitable methodologies for modelling decision processes (Brandas, 2011). This article describes various system development approaches to select suitable method(s) for a small business DSS artefact design. The novel DSS is targeted to enhance small business owner/manager strategic decision-

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

making capabilities. The idea is to provide an option to managers with appropriate knowledge to update competitive features on their websites within the business-to-consumer (B2C) e-commerce dynamic environment. DSS is the area of information system (IS) discipline focused on systems that support and improve managerial decision-making (Arnott & Pervan, 2012).

One of the vital roles of a manager in an organisation involves in making most profitable decisions within the business environment and implementing them for the productive business outcome. Making a productive decision is relatively a hard task for small business managers in the dynamic business environment (Power, 2010). Predominantly, decision making may difficult for small businesses in the B2C e-commerce environment, where millions of consumers have the opportunity to direct dealings with companies on their websites and can evaluate products and services until choosing one site (Haag & Cummings, 2009).

This changing environment influences both problems and opportunities for managers. Thus, managers as decision-makers require analysing problems in such environment (Hall, 2008). Moreover, global products and services are produced and delivered to customers in a technologically sophisticated electronic trading environment where markets change rapidly, and consumer demands are high (Power, Sharda & Kulkarni, 2007). Thus, the business processes are complex and competitive oriented (Alalwan, 2013). B2C e-commerce highly visible, as it directly interacts with more than several millions of consumers through websites (Haag & Cummings, 2009). Therefore, appropriate decisions and actions are required by the decision makers in such environment (Hall, 2008).

The majority of Australian small businesses in the B2C sector have been experiencing significant issues in running their online businesses successfully that were recognised through multiple case studies before a novel DSS solution development. In this environment, effective decision-making could be impossible without the use of appropriate technical support that can assist selecting competitive features on small business websites. The adoption of competitive website features would help a small business to reach potential customers to increase sell online. These discussions suggest designing a purpose-specific DSS solution artefact that is essential for owners/managers in making the strategic decision in such environment. The research objective of this study is:

What are the most appropriate methods for developing the novel DSS solution artefact for the small business strategic needs?

This article is organised as follows. First, it discusses the practical problems, DSS requirements, and method used for requirement analysis. Then, it discusses various DSS development approaches to identify the appropriate methods for small business DSS development, and finally, presents a conclusion.

PRACTICAL PROBLEM CONTEXT AND DSS REQUIREMENT ANALYSIS

DSS research has been established as a well-recognised tradition in IS research field. Its dedication is promised to improving decision-making process and practice through the application of appropriate technologies (Miah & McKay, 2016). DSS is significant for this study as it usually focuses on the effectiveness (such as decision) rather than efficiency (such as search & measurement) in helping decision-making processes (Eom, 2007). In small business context, it can assist owners/managers in improving their strategic decision-making process and capabilities using a novel DSS solution artefact because a

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

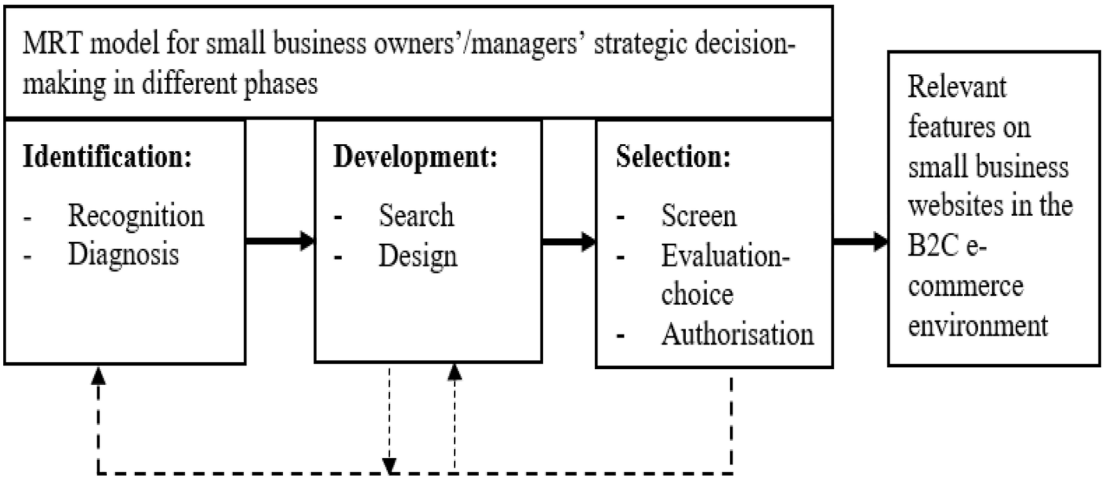
DSS mainly helps human decision-making processes that are integrated into the organisational context and known as the new application domain (Angehrn & Jelassi, 1994). A DSS is also a comprehensive tool in IS discipline that can assist to improve decision-making processes in an organisation (Alyoubi, 2015). Decision-making is a process of choosing among alternative courses of action for attaining an organisational goal (Tariq & Rafi, 2012).

General benefits of DSS are to assist better decision-making process at various phases within the business environment and to assist decision makers in making better decisions (Pick, 2008). The vital role of the DSS is to support all phases of the decision-making process (Sprague & Carlson, 1982). Sometimes, a DSS does not provide better decisions, but the decision process can be improved, for instance, decision makers might be achieved their goals with less effort within a time frame, and in some cases requiring the better documentation, thus, decision process improvements may provide improved decisions (Pick, 2008). The next section describes user issues, needs and analysis methods on DSS requirements.

DSS REQUIREMENT ANALYSIS METHODS

This research is evolutionary, exploratory and centred on the practical problem and real business context, such as focused on the small business online system and strategic decision-making issues in the B2C e-commerce environment. Thus, prior to DSS solution development, multiple case studies were carried out with small business owners/managers from the online retail sector in Australia. The intention was to identify business internal issues and system requirements and recognise how owners/managers can address their problems strategically in such environment to make their websites interactive. This method was considered as the investigation and analysis of internal environment of small businesses and related factors. Summary of findings from case studies is discussed and analysed using the MRT (Mintzberg, Raisinghani & Theoret, 1976) model in the conceptual DSS solution framework as shown in Figure 1.

This study also carried out the web content analysis to identify issues of the small business existing e-commerce system, such as to determine the adoption levels of small business website features against those of their overseas competitors. The process is termed as the system analysis and requirements for a novel DSS development for the small business in the B2C e-commerce environment. This method can also be characterised the investigation and analysis of external organisational environment of small businesses and one of the significant external factors. The external factor was considered the overseas competitor who sell to Australia through their websites.



This study adopted constructivist research philosophy and the overall approach to research design for this study was qualitative and the strategy of enquiry by employing case study method with multiple cases. Constructivist research provides practical guidelines for understanding a context with various perspectives and diversities and generates theories. The constructivist research approach often combines with interpretivism and is typically seen as an approach to qualitative research (Creswell, 2013).

In the context of small business owners/managers strategic decision-making processes and making improved decisions, a conceptual DSS framework is constructed theoretical basis and based on the MRT model for strategic decision-making. This model is shown in Figure 1.

This model has been well-known in the strategic management literature. Many influential factors are associated with decision-making processes that are also part of the MRT model, and one of the factors is environmental forces. Another factor related to decision process is comprehension cycles to understand and process information and this factor also addressed by this model (Power, 2009).

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 1. A conceptual DSS framework

This study considered the B2C e-commerce environment and associated internal and external factors that force to retail industry changes. This study also processed the information in different cycles to understand the small business problems, needs, and DSS requirements. These activities were involved in information processing through multiple case studies and analysis of small business website features. Finally, owners/managers participated in processing information using the functional DSS artefact prototype and evaluating it to test the usability and efficiency of the prototype.

MRT model consists of three phases: identification, development and selection phases for management strategic decision-making processes in the business environment. The findings from case studies have been discussed and analysed using the phases of MRT model in the conceptual DSS framework to determine how small business owners/managers have been accomplished their strategic decisions at different phases in the B2C e-commerce environment, particularly in the selection of competitive features on their websites. These phases are described in the following sections.

Identification Phase

This phase comprises two routines: recognition and diagnosis. The recognition routine initiates the decision-making process by recognising problems and opportunities for organisations within the business environment. In the problem recognition routine, this study found that all owners/managers had awareness and knowledge regarding online shopping problem in Australia. However, the majority had lack competencies and knowledge to address their problems. In the opportunity recognition routine stage, although the majority expressed their external opportunities to increase sales via websites, however, their strategies were inconsistent to accomplish such opportunity.

In the 'diagnosis routine,' further information is required for decision makers to define and clarify the previously recognised problem or opportunity. In the small business perspective, additional information is crucial for owners/managers in strategic decision-making in the B2C e-commerce environment to clarify and address the challenges that they have been experiencing in such context. A strategic decision focuses on analysing or assessment in both the internal and external business environments and associated factors (De Wit & Meyer, 2010; Mintzberg et al., 1976), also involves in qualitative judgments,

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

using intuition and finally making rules or decisions (Bonczek, Holsapple & Whinston, 2014). However, many owners/managers lack awareness and analytical knowledge about internal and external business environment and associated environmental factors. Mainly, this inadequacy was showing in the B2C e-commerce environment. The analytical knowledge and its acquisition from the business environment are essential for improving business performance and remain competitive in the online business environment. Knowledge acquisition also associates with knowledge sources whether it can find internally or externally (Oliver, 2008).

Internal Factors and Requirement Analysis

Characteristically, internal environmental analysis involves recognising strategic factors crucial to the success of an organisation. This analysis also determines the importance of each of these factors, identifies the strengths and weaknesses of the organisation against each of these factors, and finally, preparing a strategic advantage profile for the organisation and comparing it with profiles of successful competitors in the industry (Srivastava & Verma, 2012).

Small business internal factors were considered to analyse and identify the real problem. These factors include owners/managers as system users' issue about strategic decision-making competencies in the B2C e-commerce environment, and the problem remains on their existing system related to adoption level of website features. Additional internal factors considered in this study including owner/manager knowledge and awareness about the business environment and associated factors (e.g., competitors). Moreover, how they can use their skills and knowledge for making the effective decision (e.g., significant internal factor) in the selection of relevant features on their websites. This study also considered internal strengths of small businesses and how they used them to maximise opportunities, and how they address their internal issues efficiently in the B2C e-commerce environment.

Although majority small businesses had a greater range of products as their internal resources, only one company had a strategy to provide relevant information on its website through which consumer interactions can be maximised. The majority small business internal weakness was lack skills to use advanced technology, and their strategies were unlike to counter this weakness. The most significant internal issue was the lack of understanding and analytical knowledge about the business environment. While the majority of owners/managers believed that their opportunity is to increase sales via websites, their strategies were irrelevant to exploit such opportunity. In the perspective of external threat analysis, the most were known their external threat as competitors, but they had lack strategies to address such risk. Moreover, many were not attentive and interested in overseas competitors who sell to Australia. Only a few were concentrated on local competitors.

In the concept of owner/manager strategic decision-making competencies (critical internal factor) that this study was considered to analyse how do they select relevant features on their websites in the dynamic B2C e-commerce environment. This study found that the majority businesses had lack own strategies to choose and maintain competitive functional features on their sites. Most relied on web designers or consultants who are the secondary decision makers. Even, nearly all businesses had lack awareness about the adoption level features of their overseas competitor websites through they sell to Australia. The most of them had lack awareness and knowledge what features are available on their sites. Most owners/managers were occupied with everyday business operations and had no time for research and development. Likewise, Buxton and Walton (2014) recognised that small businesses might find it challenging to collect market research data, due to limited time.

External Factors and Requirement Analysis

In the context of analysing the external business environment and associated factors, researchers were considered some factors including new technologies, customers, suppliers, the economy, competitions and government policies (Thierauf, 1988; Pedersen & Sudzina, 2012; Rosenblatt, 2014). This study looked at small businesses who have to deal with overseas competitors, a significant external factor, and who can compete via their websites through the Internet.

From the B2C e-commerce perspective, the online environment must be attractive, with adequate features so the consumers can choose, perform, and enjoy their shopping experience (Abdallah & Jaleel, 2015; Bilgihan & Bujisic, 2015). One of the significant challenges that small business owners/managers have been facing in forming strategies for creating their e-commerce website effective that found through case studies. The lack of strategy formation is centred on the selection and implementation of competitive features on their websites. This study does concern about the analysis of the external business environment and associated factors. Thus, it carried out an investigation at what extent small businesses adopted features on their websites against those of their overseas competitors. The study found that significantly lower of adoption levels of Information, Communication, Transaction, and Distribution related relevant features on their websites than those of their overseas competitors who sell to Australia. The results are presented in Figure 2.

Practical issues discussed above acknowledge to design and development of a novel DSS solution artefact. The DSS can assist in enhancing owners/managers strategic decision-making competencies to select and implement more competitive features on their websites in the B2C e-commerce environment and ultimately can maximise their sales online.

Figure 2. Problem finding through web content analysis

	Information	Communication	Transaction	Distribution	Overall
Domestic	56%	26%	21%	3%	26%
Overseas	81%	72%	89%	45%	72%

Development Phase

The development phase of MRT model involves a set of activities that generate one or more solutions. This phase has two routines. First is the 'search routine' that aims at finding ready-made solutions. Second is the 'design routine' that seeks to develop new solutions or modify ready-made ones. In this phase, owner/managers can formulate or develop a decisions model, set the criterion for the choice, and search for alternatives. This study noticed that small business owners/managers had lack knowledge about the business environment that is significant for making strategic decisions to achieve organisational goals. Strategic decisions made by owners/managers were irrelevant to address the problems and opportunities. This study also found that many owners/managers are predominantly busy, and they had no time to participate, response and engaged in research and development activities.

Consequently, this study was initiated to design and development of a novel DSS with the involvement of small business owners/managers. Given that, this study was adopted the user-centred design environment (UCDE) method, as developed by Miah et al. (2014) for the overall DSS design and development, as well as evaluation of the artefact with the involvement of owners/managers as end-users.

Selection Phase

Mintzberg et al. (1976) suggested that the selection phase of MRT model as shown in the conceptual DSS framework is typically a multi-stage iterative process of decision-making. Three routines emerged from this phase: screen, evaluation-choice, and authorisation. The selection phase starts with a screening routine, which is activated to eliminate any impractical alternatives. Next, the best choice is selected, through a process of analysis, in the evaluation-choice routine. Finally, the decision goes through the authorisation routine. This activity involves an authorised decision-maker for making the strategic decision that relates to the selection of competitive website features. Competitive features for small business websites were categorised based on the business information, communication, transaction, and distribution (ICDT) provisions within the B2C e-commerce context by adopting Angehrn's (1997) ICDT model. This ICDT categories website features were recommended by Burgess (2016) for Australian small business. These website features are presented in Table 1 of the Appendix. A prototype method was used for the novel DSS solution development and evaluation. A prototype is a smaller-scale representation or working model of the user's requirements, or a system development method in information system research (Haag & Cummings, 2009).

Consequently, these activities were involved assimilating knowledge through analysing the external and internal business environment and related factors of small business organisations in the B2C e-commerce environment and system requirement activities. Evolving from the development phase of MRT model, next section discusses the system development approaches for the novel DSS solution design and development.

DSS DEVELOPMENT APPROACHES

Many approaches have been created for system development in the IS research. The most frequently used method is the system development life cycle (SDLC) (Kroenke, Bunker & Wilson, 2014). The SDLC approach involves a long-term focused with many stages (Turban, 2007), and with a large project

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

(Kroenke et al., 2014). The small business strategic decision-making problem context in the dynamic B2C e-commerce environment, SDLC was unsuitable for the novel DSS design and development because this method is used for the massive project and the process taking a long time. Evolutionary prototyping method was suitable for the small business solution design and development. The evolutionary development considers set of causes, which can be forces or factors that motivate users to the DSS adaptation process, and leads to evolution. Causal factors can be originated from the business environment and can be cognatic factors to the decision maker (Arnott, 2004) that the current study was centred. The evolutionary prototyping is based on the user-centred system design and development principles (Gulliksen et al., 2005). A prototype is also appropriate approach because a prototype is a smaller-scale working model of the user's requirements, or a system development method in information system research (Haag & Cummings, 2009). The next section discusses the evolutionary prototyping system development approach.

Evolutionary Prototyping System Development Approach

As asserted by Chen and Lee (2003), the objective of cognitive decision support is to help managers in their decision making from human cognitive aspects, for instance, thinking, being familiar with the environment, understanding and predicting, and fully reusing their experience. Among these aspects, decision makers' situation awareness and mental models are considered to be two vital requirements for decision making, predominantly in the ill-structured and dynamic decision situations with uncertainties, and time limit. These researchers also identified that decision making is becoming increasingly difficult in the contemporary business environment where a cognitive style or a mental model plays a significant role that assists a decision maker for understanding business environments and ill-structured problems. Therefore, situation awareness by managers about the business environment is becoming a critical factor to make a productive decision (Niu, Lu & Zhang, 2009). Moreover, "Cognitive styles are also known as knowledge representation technique of human mental models that have received wide research attention in DSS researchers…" (Niu et al., 2009, p. 42). The term cognition comprises general processes by which particular information is attended, transformed, stored, and retrieved (Rogers, O'Brien & Fisk, 2013).

A typical example of cognatic causes of DSS evaluation is when managers learn more about the decision task by using the system and interacting with a system analyst. They also think of new system requirements through the conversation with another manager or can come from a consultant if the consultant is a domain expert rather than an information system expert. Also, attending conferences, seminars and training courses could provide a cognitive cause of DSS evolution. These interactions and participation influence managers in thinking about the DSS. Finally, the decision task may lead to ideas that cause evolutionary changes to the system (Arnott, 2004).

In the small business context, many owners/managers have no interactions with system analysts and other managers, as the majority small businesses are owner-operated, and an owner is the primary decision-maker. Owners/managers are busy at most of the time, therefore, have no time and resources for attending conferences, seminars and training courses, in addition to research and development. Thus, this study initiated to develop a user-friendly DSS to assist owners/managers to improve their decision-making competencies in the B2C e-commerce environment where most of them have no skills in using advanced technology, who are the primary users of the system.

The main advantage of evolutionary system development approach is that phases of this method are related to the quick prototype systems that are fully functional (Kroenke et al., 2014). Evolutionary prototyping is a special case of iterative prototypes in which the prototype evolves into part or all of

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

the final system (Beaudouin-Lafon & Mackay, 2003). Evolutionary system development is an iterative process using the user-centred development (UCD) approach, which allows continuous iterations with users (Seffah, Gulliksen & Desmarais, 2005). These authors also recommended that design solutions need to be evaluated by users before they are made final. An iteration should contain a proper analysis of the user needs and the context of use, a design phase with suggestions for modifications and a redesign following the assessment results. An iteration could be as short as half an hour, as long as it contains all three steps of design, evaluation, and redesign.

This study was chosen evolutionary prototyping approach through updating the small business website features against those of their overseas competitors that originate from the analysis of external business environmental factors (Figure 2). This study also investigated owners/managers' cognatic causal factors through multiple case studies to analysed internal issues and needs. This investigation represents the evidence of initial requirement of system development with the interactions of system users and the researcher (as a domain expert). The small business owners/managers again involved in the evaluation phase of the novel DSS prototype development using focus group method. These activities are aligned with UCD principles with user (owner/manager) direct contributions to initial system requirements phase and the final evaluation phase of the novel DSS development.

Using UCD Principles for Small Business Novel DSS Design, Development and Evaluation

Although DSS has been commonly a successful concept that has been implemented in several forms over the last decades (Arnott & Dodson, 2008). Many researchers found that they did not always bring a practical outcome for their target users (Arnott & Pervan, 2014; Arnott & Pervan, 2012, Arnott & Dodson, 2008; Hosack, Hall, Paradice, & Courtney, 2012). Researchers found that the many failures of DSS project due to unfit design methods and the lack of user involvement in the design process (Nelson, 2007; Dwivedi et al., 2015). Also, the lack understanding their reality in the design process that creates inequality between the end user and designer motivations, and incompetent implementation methods (Arnott & Dodson, 2008; Arnott & Pervan, 2012). UCD principles adopted for the small business DSS development are discussed in this section.

The method of DSS design and development has traditionally established the importance of the decision, the system, or the support part of the systems (Courbon, 1996). In such concepts, various methods have been proposed for DSS design and development including decision-centred design, system-centred design, support-centred design, and UCD. The decision-centred design focuses on the portfolio management. The system-centred design comes from the software engineering field and is viewed as a model-based and data-based system (data and model combination). In the context of the support-centred design, the paradigm suggests early implementation and testing of the system to provide necessary support to users. Finally, in the UCD method, the main principles include beginning with a significant decision problem, using a short life cycle, evolving the system with multiple cycles and evaluating constantly. Moreover, the UCD approach ensures not only decision-making tasks but also considers the decision-makers' involvement in the decision-making process (Zarate, 2013).

UCD is also considered as a sociotechnical approach, which is guided by philosophies. There is no specific methods or processes are required for the design. The idea is to attempt the design using knowledge and willing to utilise social and cognitive analysis of human activities (Baek, Cagiltay, Boling, & Frick, 2008). UCD, besides, focused on cognatic causal factors to the decision maker. Cognatic style

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

referred as the knowledge representation technique of human mental model also regarded as the situation awareness by managers about the business environment. Thus, the analysis of business environment is a critical factor to make a productive decision (Niu et al., 2009) that present study was also centred. Knowledge representation suggests the requirement of knowledge formalising in a symbolic form, and to find a symbolic expression that can be interpreted (Klein & Methlie, 1995).

There were various dimensions of user-centredness in the UCD literature. According to Gulliksen et al. (2005), UCD is based on following fundamental principles. These include user focus, active user involvement, evolutionary system development, simple design representations, prototyping, evaluate use in context, explicit and conscious design activities, a professional attitude, usability champion, holistic design, process customisation, and a user-centred approach. Likewise, an analysis of literature by Iivari and Iivari (2011) enabled four dimensions of user-centredness in the UCD literature: UCD as the user focus; UCD as user work-centeredness; UCD as user involvement; and UCD as system personalisation.

UCD as user work-centredness focuses on the relationship between people, technology, work requirements and organisational constraints in work settings, where people are with a set of skills and shared practices based on their experience of working with others. UCD as system personalisation focuses on the diversity of users use the system (Iivari & Iivari, 2011). These two dimensions were unsuitable for small business DSS development because the majority businesses are owner-operated, and they have lack skills of using advanced technology.

The UCD as 'user-focus' and 'user involvements' were appropriate for small business DSS development for the following reasons. This form of UCD places the person at the centre, and emphasis on the number of users use the system. Thus, when the system has one or only a few users, it is reasonably easy to detect them and to match the system according to their needs (Iivari & Iivari, 2011). This form of UCD is also "…focusing on cognitive factors (such as perception, memory, learning, problem-solving, etc.,) as they come into play during people's interactions with the interface…" (Shahar, GorenBar, Boaz, & Tahan, 2006, p. 119). This UCD is also to take every individual user's capabilities into consideration and fully satisfy his or her needs related to the system to be developed (Iivari & Iivari, 2011). These researchers also found in the early literature, where most studies viewed UCD as user involvement is an integral part of UCD method for DSS design and development. Many researchers also suggested for DSS development with the engagement of industry and decision makers (Arnott, 2006; Arnott & Pervan, 2012; Hosack et al., 2012). In IS design, user involvement is expected to lead to more accurate user requirements, features that meet the user needs, a greater acceptance of the system, and enhanced ease of use (Mao, Vredenburg, Smith, & Carey, 2005). A researcher also concluded that success in DSS design is associated with user involvement, which can be effective for appropriate method selection (Courbon, 1996). Therefore, in the UCD method, users' support and involvement are significant in developing products to match their requirements (Miah, 2004), where an appropriate set of web features were suggested for accessibility by students in the higher education sector.

Consequently, the engagement of small business owners/managers' was vital in the initial phase of the DSS design and development and the final stage of DSS evaluation. For problem identifications and system requirements, initially, case studies and web content analysis were conducted. The owner/manager understanding, knowledge, and analytical skills about the business environment and associated environmental factors were investigated through multiple case studies. These activities represented the investigation of the situation awareness (SA) and mental model (Niu et al., 2009) of decision makers that

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

are required for the successful system design and development related to their business needs. Finally, the involvement of owners/managers was vital for evaluating the DSS prototype for confirming its usability and usefulness to end-users.

Supported on the above discussions, also for small business decision support requirements, the UCD as user-focused and involvements were suitable methods for DSS design, development and evaluation by employing the evolutionary prototyping approach of the direct participation of small business owners/managers as primary users.

CONCLUSION

This article reviewed DSS design methods in the theoretical concept of the novel DSS development and evaluation. Various system development approaches were discussed in this article aim of selecting suitable method(s) for the novel DSS artefact development and evaluation. The article also discussed real issues of small businesses within the B2C e-commerce environment using the MRT model in the conceptual DSS framework. Problems were identified through web content analysis and multiple case studies. These activities were considered as problem identification and system requirements analysis prior a novel DSS development. The significant issues were identified as the lack of realisation of their business strategies, and skills to use advanced technology for the improvement of strategic decision-making competencies in their business needs. The findings from case studies also produced the problem definitions related to many owners/managers' inadequate knowledge about internal and external business environment and associated factors that are significant for meeting the strategic decision-making requirements. These issues recognise a clear need for designing a context-specific practical DSS solution.

Many approaches have been employed for system development in the IS research. The most commonly used method is the SDLC. The small business strategic decision-making problem context in the dynamic B2C e-commerce environment, SDLC was unsuitable for the system design and development because this method is used for the vast project and the process is taken a long time. The evolutionary prototyping approach was suitable for the small business solution design and development because the evolutionary development considers set of causes, which are forces or factors that motivate users to the DSS adaptation process. Causal factors can be originated from the business environment or can be cognatic causal factors to the decision maker and involved user-centred DSS design and development. A prototype was an appropriate method because it is a smaller-scale system development working model in IS research that was selected for the small business DSS development.

The novel DSS was designed, developed and evaluated primarily adopting the UCD principles, focusing on user-specific needs. In such concept, involvements of small business owners/managers were vital for the artefact design, development, and evaluation through the evolutionary prototyping approach that this study was adopted. The study contribution goes to the field of DSS research as the objective of this research is to enhance the current theory and practices relevant to the knowledge-based personal DSS design. Personal DSS is defined as a small scale IS development for a manager or a small number of independent users to support their decision-making tasks (Arnott, 2008).

APPENDIX

Table 1. ICDT model-based website feature categories

ICDT Model-Based Website Feature Categories in B2C E-Commerce Environment	
Information (I)-Based Website Features	**Subcategory of Features**
Contact details	Business name, email address, location with map, telephone and fax numbers
Business information	Product and service descriptions, static product reviews, product catalogue, policies and mission statements, company and employee background, privacy policy, customer testimonials, business images and videos, print order form
Added value	Frequently asked questions (FAQ), product use instructions, financial calculator
Communication (C)-Based Website Features	
Contact the business	Email form, email order form, customer enquiry form, and sign up for newsletter form
Reviews	Customer posting reviews direct to website
Social networking	Bulletin board, blogs, etc.
Transaction (T)-Based Website Features	
Online database	Real-time catalogue, online ordering, automatically record customer preferences
Payment	Real-time credit card payment, Internet banking, online voucher redemption, PayPal
Distribution (D)-Based Website Features	
Web-based distributions	Online download of digital goods or contents, software
E-services	Online digital product delivery information, online physical product tracking information

Chapter 8
How to Launch a Successful Crowdfunding Campaign

Ronald Kleverlaan
CrowdfundingHub, The Netherlands

ABSTRACT

This chapter provides insights into the important characteristics of a successful crowdfunding campaign. It starts with providing the fundamentals of crowdfunding and shows the reasons why it is important to find the right target groups and communities for a campaign. It describes in details the Return on Involvement model, what the funders want in return for their support. In the second part the additional results of crowdfunding are discussed, such as market research, marketing, brand loyalty and the possibility to use crowdfunding to raise additional funding. The last part of this chapter will focus on the background of setting up and running a successful campaign.

INTRODUCTION

Why are some campaigns very successful and do they raise millions of euros and have other campaigns huge problems to get their first investors? What are the secret ingredients of a successful campaign? In the chapter will we look into the do's and don'ts of launching a campaign. This will involve a good planning and preparation, finding the right community that will fund, creating a good pitch and finding the rewards that will convince people to support a campaigns.

CROWDFUNDING = COMMUNITY FUNDING

The investors in a crowdfunding campaign are not an anonymous crowd of people that will automatically find a crowdfunding campaign and will support a campaign they find online and like. The majority of the funders are people that know the entrepreneur of project in advance, or get introduced at the campaign by someone who knows the. Therefore, it is important for a successful crowdfunding campaign to think about the communities that will be interested in the campaign and find out how to reach them.

Find Your Communities

Every person and every organization has access to communities. Sometimes these are their own clients that are able to support the financing needs of the company, but it can also be business partners, current stakeholders of the organization, people from your own village or sport club up to friends & family and employees.

When the potential communities are identified, it is important to find the best way to reach out to them. Some communities are already grouped and can be easily reached through social media or on weekly/monthly regular meetings, but for other people it can be more difficult to contact them. For all of them it is important to identify some of the strongest connections in these networks. You can contact them in a later stage and try to convince them to help you promote your campaign in the community you are both part of.

Return on Involvement (ROI)

The strength of crowdfunding is the trust people have in the entrepreneurs running the campaign. They will not just financially support a campaign, but want to get involved in the process of making the project or company a success. This involvement is very important for all people supporting a crowdfunding campaign. But what do they want in return? What is the Return on Involvement of their participation in a crowdfunding campaign.

While launching the crowdfunding campaign it is very important to focus on the potential donors/investors and their expectations. The investors are strongly connected and involved in the projects they support, but the return they are interested in is very different. Some of them are interested in a social return, some want to have a material return (products/services) and some are more interested to support crowdfunding campaigns to have a financial return.

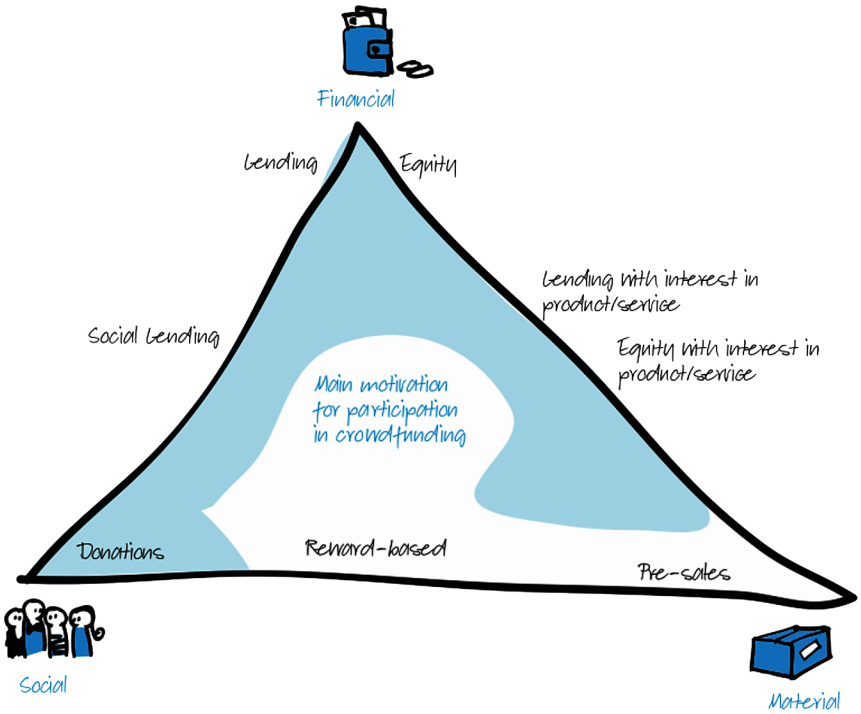
For campaigners it is very important to know your community and your community members and know what kind of return they are interested in and define returns bases on these expectations.

Social Return

People who are interested in a social return, only want to be recognized as donors and want to have a good feeling about the cause they supported. These kind of campaigns are normally launched by non-profit organizations that are able to focus on project based fundraising. These are typically the donation-based campaigns that are in line with the other type of fundraising activities of NGOs. This can be successful for some campaigns, but the average donation is rather small. In the fundraising world it is commonly know that providing tangible and unique reward to major donors, helps attracting higher amount of donations. This can also be applied to crowdfunding by offering small rewards in return.

When a project owner is offering small rewards, valued (much) lower than the price the crowdfunders are paying, this is called reward-based crowdfunding. These are campaigns where the project owner is offering for example a meet-and-greet with an artist or a VIP-dinner with the founders of a company or a public figure that will costs the project owner not much, but is worth a lot for the crowdfunders. For project owners it is important to look for people and companies in their network that are able to provide these products or services for them for free or for a large discount.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use



The main advantage of this strategy is that the average donation of a donation will be 3-4x higher than for average donations. In Europe the average donations are around 15-20 euro. In reward-based campaigns the average donation is 60-80 euro (see Figure 1).

Project-Based Fundraising for Non-Profits

For a lot of non-profits this is very interesting, because it will give them the opportunity to upgrade their current donors. Typically NGOs use an one-to-many (mass) mailing strategy to reach a lot of small donors for donations without a reward and they have a one-to-one strategy with unique, tailored rewards to a attract a few major donors. There are a lot of small donors who are willing to support the organization with larger amounts of money if they are also able to receive some (small) rewards and are very interested to support specific projects of their choice. NGOs can use this, but one requirement would be that they are able to focus on project based fundraising.

The main difference for most NGOs will be that they have to move from fundraising for their brand, to fundraising for individual projects. This has a lot of impact on their organizations, because they have to work with earmark money that can only be used for the projects they are raising fund for and their organizations should be able to describe and provide the programs that are in need for funding in advance. This sounds logical for crowdfunding, but al lot of NGOs are not used working like this. They raise funds and based on the amount of money they raised, they will later decide which projects will get funded.

Figure 1.

Material Return

If a project owner is providing a reward that is valued at the same price of the amount of money that is provided, or is even worth more, we talk about pre-sales. Legally it is not really pre-dales, because in most cases the funder will provide money and finances the project that will give him ultimately (if everything goes as expected) a product or service in return. Therefore, it is not a a100% guarantee that the funder will gets its product, but because of reputation risks and possibilities for follow-up crowdfunding and continues support in his own communities, the entrepreneur will do everything what is possible to make sure he will deliver a good product or service in return.

This type of crowdfunding is mostly used by entrepreneurs, inventors and creatives who have an idea, and sometimes even a prototype, and need to have funding to create the first batch of their products. By pre-selling their products they get an immediate cash-flow which they can use to invest in creating these products.

An additional reason to use this type of crowdfunding is that it is a great way to do market research and find out of the entrepreneur is able to reach its potential market and if the potential clients are willing to pay for the product. This is the ultimate way of market research. It will not ask people about their intentions to buy a certain product, but let them vote with their wallet.

The risk in this type of crowdfunding is that the entrepreneur will need all the money to produce and distribute the rewards to his investors. After the products are produced and delivered he has made his first sales, but most likely will not have made a lot of profit. Therefore, this can be used very well for entrepreneurs to kickstart a business, but the company will need to get additional finance for further growth. This can also be done by crowdfunding or traditional finance. One of the additional benefits of having done a successful crowdfunding campaign is that attracting extra financing is easier when financers will see that you were able to attract a number of investors or customer in earlier campaigns.

Financial Return

The last type of return that can be offered is a financial return. This is called Crowd Investing of Crowd Financing. When funders are interested to support the entrepreneur and his idea, but don't want to give him a donation, or don't need the product or service that will be made, a financial incentive can be used to attract them. There are a number of financial offerings that can be made, and most of them are only limited by the possibilities of the regulations in the country. Because providing a financial return will in fact mean that the entrepreneur will offer an investment opportunity, the local regulators will have specific rules applied on Crowd Investing.

In general, there are two types of Crowd Investing that can be used by entrepreneurs that want to offer a financial return to their investors: Loan-based crowdfunding and Equity-based crowdfunding.

Loan-Based Crowdfunding

Offering Loan-based crowdfunding is the most popular way of Crowd Investing, especially in non-Anglo-Saxon countries, because this is most familiar with traditional bank loans. Instead of getting a loan from 1 bank, the entrepreneur will attract the loan from a group of funders. Normally a crowdfunding platform will act as a middle-man and collects the money, closes the deal and facilitates the interest payments to the funders. The exact terms of the loan (duration, interest, etc.) are unique per country and/or platform, but offer in most cases more flexibility than the standard loan models of banks.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Equity-Based Crowdfunding

While offering a loan is the most popular option for traditional SMEs, for (fast-growing) startups or companies that need to have more equity capital, they can sell a part of the shares in their company to (small) investors. These can be business angels, but also individual investors who are interested to support the company and are willing to take the risk to invest in equity capital, but will also benefit from the capital gain if a company is successful.

There are typically two different ways the investment can be structured. The first one is that all investors will get direct shares in the company that is looking for an investment. The advantage for the funders is that they have a (small) say in the company and will have legal rights to attend shareholder meetings and vote. The disadvantage for the companies is that this is very difficult to manage and that all board decisions and shareholder meetings will be difficult to arrange. The second option is to use a Special Purpose Vehicle (SPV) that will represent all shareholders. This way all shareholders are grouped in one legal entity that has the total number of shares of all the investors. These investors will still have the benefits of capital gain and dividends, but will not have a direct vote individually. This structure is mostly interesting for small investors that are interested to participate in these companies, but are not interested in the (monthly) shareholder meeting and direct interaction and communication with the founders.

Social Lending

A special way of providing the right rewards for potential investors is social lending. These are loans that are provided to the entrepreneur with a very low interest rate, sometimes even 0%. This is interesting for people who want to support an initiative or entrepreneur and don't want to get a high interest rate, but are not willing to give the money as a donation.

This can be used by causes that are lending money the entrepreneurs in developing countries, such as Kiva. People can lend small ($25) or larger amounts of money through Kiva to Micro Finance Institutes (MFIs) that will distribute it to local entrepreneurs who need to repay the loans. With an almost 99% repayment rate most funders will get their initial loan back, so they can lend it to another entrepreneur.

Another great example is using it to finance the installation for renewable energy for a local school or sports club. The people connected to the school of club will provide the money that is needed to finance the installation of the system. From that moment the school or club has a lower energy bill and is able to start repaying the funders without (or a very low) interest. After a number of years the organization will have structural lower cost and can invest that money in education and sport equipment.

Lending/Equity with Material Return

Because investor feel really connected with a project, it can be a good idea to provide a product or service from the company they funded as part of the repayment. It can be a good idea to offer a product as interest payment. This way the funders feel even more connected with the company they supported, but it can also be beneficial for the funders and the entrepreneurs. The entrepreneur doesn't have to pay cash as interest payment but can provide the products or services it is producing already. Their cost prize is normally lower than the sales prize, so for them it is cheaper to offer that as a return, or they can be very generous and offer more than a funder normally would expect. This would be interesting for the funder.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

An example would be an entrepreneur who starts his own local brewery. He will use crowdfunding to get a loan from people in his network. Instead of paying them 5% interest every year, he will send them a box of beer. The market value of this box is for example equal to a 7% interest payment, but the cost prize to produce it is lower than 5%. This will be beneficial for the entrepreneur and the crowdfunder and has the additional benefits that the crowdfunder will feel much more connected with the company and therefore will be interested to help promoting the company or even buy additional beers.

Dunbar's Rule and Funding Target

Robert Dunbar suggested a maximum number of 150 people a person is able to create and maintain stable social connections (ranging from 100-250). Surprisingly enough this is also the average amount of people that join an average crowdfunding campaign. While preparing you crowdfunding campaign it is important to think about this to calculate the maximum amount of money you are able to attract. For example, at Kickstarter, one of the largest and most well-known reward-based crowdfunding platforms in the US, 85% of all the campaigns raise less than $20,000.

Every campaign is different and every project owner or group of project owners has different successes in their campaigns, but based on the average donation levels in your country, you can use Dunbar's Rule to make a calculation of the average amount of money you are able to attract and therefore to set the right goal in your campaign.

In Western European countries the average donation is for example 20 euro. Based on Dunbar's rule you will able to attract on average 3,000 euro per project owner. For a group of 3 people this can go up to 10,000 euro, although their will most likely be some overlap in these networks.

For reward-based crowdfunding this can be 3-4x more, because the average funding will be between 60-80 euro. This will result in 10-12,000 euro for an individual project owner up to 30,000 euro for a group of 3 project owners.

The highest funding goals can be reached by Crowd investing. On average funders will invest 500-1000 euro in a company, whereby it is normally much more difficult to attract investors in equity than in loans. An average campaign can, based on Dunbar's rule, raise 75,000-150,000 euro. A team of 3 people can raise on average 200,000-400,000 euro.

All of these examples are based on a good pitch, a good project and a team with a good reputation and no guarantee for a success. There are also always examples of projects and campaigns that are raising much higher amounts of funding, for example with reward-based campaigns that go viral, but the above calculations are based on averages.

CROWDFUNDING IS MORE THAN MONEY

While preparing a crowdfunding campaign, it is important to think in advance about the additional benefits you can get out of it. A crowdfunding campaign is a marketing campaign that includes raising funds. The community that will support the campaign will be interested in the end result. Therefore, they are interested to support on more levels then just donating money during the campaign. The campaign is also a good test of the ability to reach the potential end users of the product and convince them to buy it.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Market Research

Crowdfunding can be used as a great tool for market research. When an entrepreneur wants to launch a new product the traditional way is to invest in developing and building the product, start a marketing campaign and try selling it. This can take months or even years before you can really find out if people are interested and if you invested your time and money in the right product.

Another option would be to create a proto-type or describe your concept in a crowdfunding campaign and ask people at the start if they are interested in buying the product in advance already. This way you can find out if you can reach the potential customers and if they can be convinced in buying the product. If nobody will support the project, then nobody is interested or the entrepreneur is not able to find his potential market. In both cases it would be useful not to further invest in the project, or adjust it in advance. This way the risk for the entrepreneur is reduced.

By applying this concept to more products, the entrepreneur will in an early stage know about products that people are interested in and continue investing in these products.

Marketing

Because a crowdfunding campaign is also a marketing campaign, it is important to look into the potential of using crowdfunding for marketing.

During the campaign there will be a lot of communication from the team to promote the crowdfunding campaign. Because the campaign has a clear start and end, all the marketing efforts will be bundled in a short period of time. The first supporters and the ambassadors of the campaign will also help in promoting it by spreading the word in their own network during the campaign. There will also be a possibility for free publicity of local (or even national) media willing to write about a successful campaign.

After the campaign is finished there is a strong network of ambassadors. They will be interested to help promoting the results of the campaign. If used wisely, these can be used as part of the marketing department of the organization.

Brand Loyalty

People who feel more connected to a brand, are more willing to support the brand, also when things go less good. It is important that they have a strong connection and this can be realized by making a strong connection with the projects and keep them informed about the progress.

People who invested in a company through loans or equity feel themselves (partly) owner of the company. They will think twice before they will buy at a competitor.

Access to Additional Finance

Because crowdfunding is a good market research tool, a successful crowdfunding campaign will make it much easier to attract additional finance from investors, grant from governments and loans from a bank.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

When a company can show they have already raised funding from hundreds or thousands of people, it shows an investor that there is an interesting market potential. It will also show the investor that this entrepreneur is able to sell the products. One of the most important success factors for a new business. For a lot of business angels, crowdfunding is therefore an important tool to find and pre-select the companies they are willing to invest in.

For a government providing grants to projects, it is useful to see if the general public is supporting them already and perhaps even they have funded a part of the project already. It can even be used as a pre-selecting tool in a competition for grants.

Depending on the type of financing raised, it can make it much easier to attract additional financing from a bank. Money invested in equity or junior loans make it easier for banks to lend additional money.

STRATEGIC CHOICES OF A CAMPAIGN

Crowdfunding Experts

Running a crowdfunding campaign for the first time is very time-consuming and it can be very useful to hire professional experts for support. These experts can help you preparing your campaign, but also advise on the legal and fiscal consequences of crowdfunding and help you to select the right platform for your project of start.

When choosing a crowdfunding expert for support, it is important to check in advance how much experience this person or organization has. Because this is a new industry and there are no certifications for professional or certified crowdfunding professionals yet, a lot of marketing and financial experts are promoting themselves as crowdfunding experts.

Based on the type of financing by crowdfunding an entrepreneur is looking for, a different type of advisor need to be selected. For a donation, reward or pre-sales campaign, it is important to find a campaigner who is able to setup a strong marketing and communication campaign. The background of these advisor are mostly in fundraising, marketing or community management. For investment campaigns, either loans or equity, such a campaign advisor is also necessary, but the focus will more be on the financial part of your proposal. You will need to have a financial advisor who can help you with the financial part of your business plan and can create a good overview of your cash-flow for the next years.

Separately a tax advisor need to be consulted in advance to know how to structure your campaign regarding VAT and afterwards for tax filings.

DIY Crowdfunding or Using an Existing Platform

Most people will use a crowdfunding platform to publish and promote their crowdfunding project. This has a lot of advances and it makes your life much easier, because you don't have to build a website yourself and you know that the legal and fiscal elements are taken care of. A well-known crowdfunding platform can also create an additional level of trust to your potential donors/investors. The downside is that you have to pay some fees for putting your project on their platform and success fees when reaching your goal Depending on the size of your campaign and the type of crowdfunding you want to use this can go up to 5-10% of the amount of money you are raising.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

If you are expecting to raise a lot of money it can be useful to build your own crowdfunding campaign website for it. This is normally interesting while raising 100.000 euro or more, but this depends on the country where you are based and what type of crowdfunding you are using. In general investment based crowdfunding (lending/equity) is much more expensive to setup, and sometimes illegal to do it yourself, then donation-based crowdfunding or reward-based crowdfunding. Other reasons to start your own crowdfunding campaign site are that you can brand your crowdfunding campaign site much more in your own look-and-feel and you have 100% control over the contact details of the people that donated to your campaign, because normally they will be stored in the database of the crowdfunding platform. Especially with companies that have a very strong community of people that know them, or if you want to use crowdfunding often for different projects, it can be very interesting to do it yourself.

THE PLANNING OF A CAMPAIGN

The more time and energy spend on the preparation of a Crowdfunding campaign, the more successful it will be. A crowdfunding campaign is a marketing campaign, so a campaign need to be planned thoroughly and you need to know the target audience you want to reach to maximize the results. Because a good crowdfunding campaign costs a lot of time and resources it is important to know the additional benefits of a crowdfunding campaign to get the most out of it.

Pre-Campaigning

Before starting a campaign, it is very useful for an entrepreneur to take a look at other campaigns to find out what other successful and less successful campaigns in their country have done before. It will give inspiration and insight for the campaign. If possible it would be very beneficial to meet with the founders of these campaigns to hear their side of the story. In most cases much more happened then can be seen from a campaign site. You can contact them directly or go to local crowdfunding events where entrepreneurs tell about their experiences in the campaign. In a lot of cities these events are organized by banks, accountancy firms or by independent organizations such as a Chamber of Commerce or CrowdfundingHub.

In this phase it is also useful to focus on the goal of your project and prepare your pitch. What is the main goal and why do people want to support you? What will be the outcome of the project for you and your investors? Talk with people about the plan and the campaign. Don't be afraid someone will steal your idea. Most people will offer you their help and these are already your first ambassadors for your campaign later.

You will also need a team of people who will support you. You shouldn't do crowdfunding alone. When people are very enthusiastic you can ask them to become part of your crowdfunding team. You will need to have ambassadors promoting your project, but also people helping you in your (social) marketing activities, organizing events, etc.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Preparation of a Campaign

When the decision is made to start a campaign, the most important part of the campaign will start: the preparation phase. The biggest mistakes are made in this phase. Mostly because of underestimation of the process and not preparing for all the additional values of crowdfunding.

Storytelling

An important part of Crowdfunding is to convince people in your (extended) network and outsiders who don't now the entrepreneur and the project before, to support the idea. Therefore, the entrepreneur should be able to explain clearly the reasons why this project should start, what will be done with the money that is being invested and what the investors will get for it in return. It is important to make the message very clear and powerful.

The best way to convince people is by storytelling. Build a story about why it is important for you, the community or society that this needs to be done and why you and your team would be the best to realize it, whether it is a new company, a small local community project or a new product you'd like to create. This message should be written down and recorded on video, so it can easily be distributed.

For recording a video, the passion of the entrepreneur is very important. People like to give to other people who are passionate about their projects. Make also sure the video is short (max 2-3 minutes) to keep the attention of the viewer and show you key message in the beginning of the video.

Identify Your Target Group

The next step would be to identify your target groups. Who are the people in your own network or external network who would potential be interested to support the project? These can be different groups with other expectations and therefore it is important to adjust the marketing message for the different target groups.

Some groups of people are closely related to you and you have a strong personal relation with them (family, friends), some have more a business relationship with the entrepreneur (customers, business partners, LinkedIn contacts) and some have looser connection, because they are part of the same (local) communities or social media network.

For the campaign it is important to identify these potential networks in advance and make sure that the right networks will be approached on the right moment. It is important to first start with the people who know you personally and who you can approach with a personal appeal (1-to-1) and later use one-to-many communication for people who you don't have a very strong personal connection, but will still know you. In the last phase you will use mass communication to approach the large communities about your campaign. For details about this planning, see the "campaigning" paragraph below.

Rewards

People have different motivations of supporting a crowdfunding campaign. As discussed earlier in the chapter on Return on Involvement there will be different expectations for the people what they will get in return. Especially for reward-based crowdfunding it is important to be creative in finding interesting rewards. Not only will this increase the number of people supporting the project, it will even motivate them to spend more on the campaign.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

The first rewards can be found within the project itself. If the result of the campaign will be a product or service, then this can be given back as a reward. To make it special it is possible to create "first-editions" of the project or add special features to the product that will not be available for the retail edition. These can also be VIP services for cultural/creative projects.

The second type of rewards are rewards from the entrepreneur or the team. This starts with small personal thank you messages to a diner with the founders or unique services the entrepreneur can give from his/her own background. These can also be other products of the company, or activities like a product tour through a factory, research lab or company.

A third type of rewards can be found at companies closely related to the campaign. Companies and people who like to support the campaign, they can also donate some of their own products and services as a possible reward to offer in the crowdfunding campaign, instead of supporting the campaign with money.

Planning Communication

Because a campaign is very intense, it is very important to prepare a lot of work and activities already in advance. You can plan a lot of (speaking) events, publications in advance and of course it is important that the flyers will are ready in time. Something most people don't think about is that it is also possible to prepare a lot of the social media communication and emails that will be send to people who are interested and as a thank you to people who invested in the campaign. When these texts are written a bit in advance, the entrepreneur will not only write nicer and better messages, he also will have more time to think about the possible follow up actions that can be done by the investors. A simple message on social media will be shared by the funder within his/her own network, if you make it really personal, perhaps even with an personal image or video. And an email with a simple description how your funder can help you to spread this message will stimulate him to forward your email to a number of friends and show them your campaign.

In the months before the campaign you will gather all the people in your community and find the best way to communicate with them. Try to reach out to them far in advance of your real campaign and inform them you are working on a new product/service and want them to get involved. Build up mailing lists, online (Facebook) groups or other platforms that give you the opportunity to easily interact with your community.

Pre-Campaigning

A few weeks before your campaign starts it is important to test your final pitch. You should reach out to the inner circle in your community, the people that know you best, and test your final pitch and ask them directly if they will support your campaign. If they do, you ask them for how much they will support you and what rewards they would like. This way you can not only test your pitch and rewards, but this is also a good test about the possible funding goal you are able to reach.

This test will show the capabilities of the entrepreneur to reach out within his/her own network and the ability to convince people to support him. It will also show how much they are willing to invest. Because a large part of the funding and support of first-time campaigners will come from their own inner-crowd, this is a good prediction of the total amount of fund that can be raised. Before the start of the campaign, the entrepreneur should have at least 20-30% of the amount pledged by people from his own network. If this is (much) lower, the funding goal should be lowered, because it would otherwise be very difficult to reach that goal.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

One of the additional requests for these investors is that they will fund the campaign at the start. This way the campaign will have a good start.

Campaigning

It is very important for the first people to invest at the start of the campaign. When they do this, it will give a boost to the campaign and from the start it has a more positive vibe. This is very important, because most people are risk-averse and will not join a campaign or project when they are one of the first. They want to join when they see it is already a success and they want to become part of that success.

Therefore, it is also very important to build up the campaign in 3 phases. Because the strength of crowdfunding is community funding, you should also embrace the strength of the community to support the campaign. At the start of the campaign the communication should be focus on the Inner Crowd. These are the people that know the founder best and can be reached individually. After these people are connected it is important to reach out the rest of the community of the founder. This can be done my mass e-mailings, communication by social media or newsletters. Only in the last phase people will be reached by mass media, traditional newspapers and support of other networks.

Inner Crowd

In the Inner Crowd are the people that can be reached personally. The more personal and intense these connections are, the more successful they are. The most successful communication methods here are physical meetings or phone calls. The conversion rate here is very high, because it is much harder to say no to a personal friend who is reaching out for support in this phase. Because this is a very time consuming effort, his should only be done by people that are well known, but because it is so successful, every campaigner should do this by at least 10 people to get the first funding.

The next step would be to approach people personally with an individual and tailored message, but contact them online. This can be done by a personal email or DM messages through social media. Spend enough time on every message to make it tailor-made for the recipient. The more personal approach, the higher the conversion rate is. A follow-up call is of course also very useful.

For all these steps it is important to keep an overview of the people you contacted, how much they committed and if they indeed contributed already in your campaign. A lot of people are really willing to support you, but because of a lot of different reasons and a busy life, they tend to forget it. Because the campaign is only running for a small amount of time, it is important to do follow-up calls or send them an email if you notice they didn't contribute yet.

Therefore, a daily check on the people that donated is very important. This will also give you the possibility to reach out to the people that contributed and thank them for their support. If you do this through social media, they will also reply on it and help you spread the message of your campaign to a larger audience.

Own Community

When you've reached out in the first phase to the people you know best and contacted them personally, it is time to move to the next phase and use mass marketing to reach the people in your network that still know you, but the connection is not strong enough to send them a personal update (or your network is too big to reach out to all of them personally).

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

At this moment your campaign is running for a number of days and because of the support of the people in the pre-campaigning phase and the support from you inner crowd, you already have a good start in your campaign. When people that know you and hear about your campaign from your mass emailing or the communication you send to them through social media, they notice that you have a successful start of your campaign and therefore they are much more willing to join.

External Communities

After you have reached out to the people you know, you can start to find people who don't know you yet, but would be potential funders of your campaign. The best way to do this is to identify the characteristics of the people that would be most interested to support you. In most cases these are the people in the networks and communities that are closely linked to your cause, such as sustainability or specific niche groups interested in a specific sport, activities, pets or hobby's.

Before starting the campaign, it is important to identified these networks already and contacted them about your plans. This way it is easier for you to contact them during your campaign and you can show them some real progress and success. They will be able to spread your message in their own (social media) network, but will also be interested to publish an interview in their internal newsletter of magazine.

At this moment you will also plan your speeches and presentations at external events. Contact far in advance the organizers of events you know take place during your campaign and are interested for your target audience. The conversion rate at these events is not very high, but in most cases it will generate a few more funders, but at least a lot of extra fans. These fans can be beneficial in a later stage of your company. In most cases it will also connect you to other people you never were in contact with before and who can help you to introduce you by other investors, potential clients, partners or employees.

This is also the right moment to publish your story in newspapers and other mass media. Most entrepreneurs send their press release to as many blogs, newspapers and tv stations as possible, but the success rate us normally very low. And even if it is successful, it will not help the campaign. The reason for this is that in general media is not interested to hear about your ideas. They want to publish successes. Therefore, it is better to contact them later, when you show some success and your reached your first milestone already. For your potential funders who have never heard about you before is it also important to show them how successful you are and that a lot of other people already funded you. People are not interested to be the first funder when nobody else is supporting you. But when they see that it is a success and already a few hundred people participate, they follow the rest much easier.

End Sprint

The last days of your campaign will be very hectic, but if you use them wisely it can provide you with a lot of extra funding. A lot of people are lazy, also in supporting you. They really want to support the campaign, but they waited because they were busy doing other things. Now it will pay off if you kept records of the people that were interested. Send them an urgent last-minute email telling them that they only have x days left and tell them exactly when the campaign will close and thisis their last chance to join. Make it as easy as possible with a direct link to your payment page, perhaps even pre-selected the amount of money and/or reward they told you they were interested in.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

This is also the moment to send a last reminder to your current funders about the end of the campaign and ask them to think about upgrading their funding and asking all of them to ask 1 or 2 friends to join the campaign.

This will normally give a boost in the last phase in your campaign that will help you to reach finally the target or will even give you a large boost for over-funding.

Post-Campaigning

Directly after your campaign finished, send a thank you message to all your funders and congratulate them with the success you made together. Continue building the relationship with your (new) community. These people are very strong connecting to your goal and are willing to help you in the next phases also. Keep them close. Make sure you update them in the next months and years about the progress of your company, because they made it possible.

When you offered rewards, now it is time to start distributing them to your funders. Group your funders in categories, so you can update them on the individual rewards they will get and give them, if possible, a good estimation when they can expect their rewards. If you can send them already, do as quickly as possible. If they pre-financed some product or service that first need to be created, give you funders a clear planning when they can expect it. And keep your promise! If anything goes wrong and you expect a delay in delivering your reward, be open and transparent about it. The worse thing to do is not tell any of your funders about it. If you are transparent and open about it, they will understand in most cases.

Next Steps

After finishing a campaign, this is not the end. This is the start of the preparation if the next campaign(s). Companies can use serial-crowdfunding and start new campaigns in different phases of the growth if their company. They can start with an equity campaign to raise some seed-funding, pre-sell their first products and services by reward-based crowdfunding and lend money through crowd lending when they are in need for some growth capital and don't want to give away additional equity.

Companies using this concept on a structural level will also transform into a CrowdBusiness business model, where they not only use their network to raise funding in one or more campaigns, but also involve their community in marketing activities, crowdsourcing for new innovations and will even move into co-operative models where their investors will become owner of the organizations.

This research was previously published in Crowdfunding for Sustainable Entrepreneurship and Innovation edited by Walter Vassallo; pages 224-237, copyright year 2017 by Business Science Reference (an imprint of IGI Global).

Chapter 9
A Risk Integration Framework for the Service-Oriented Enterprise

Eric Grandry
Luxembourg Institute of Science and Technology (LIST), Luxembourg

Christophe Feltus
Luxembourg Institute of Science and Technology (LIST), Luxembourg

Eric Dubois
Luxembourg Institute of Science and Technology (LIST), Luxembourg

ABSTRACT

Enterprise architecture management provides the mechanism for governing enterprise transformations required by changes in the environment. In this article, the authors focus on changes that result from the analysis of information system risks and of their impacts on the services delivered by the enterprise. The authors present how the concepts of an information system risks management domain can be integrated into the ArchiMate enterprise architecture modelling language. This article approaches the conceptual integration in two design cycles: first, this article will consider information security risks, and then the authors generalize to information system risks. Additionally, the authors illustrate the application of the proposed approach and demonstrate the benefits of the integrated model through the handling of a case study, first in the domain of information security, and then in the domain of information privacy. The generalized risk-oriented EA model leads to a risk integration framework for the service-oriented enterprise.

INTRODUCTION

To remain competitive in the growing services' economy, enterprises have to transform themselves in business service-oriented enterprises. Business services are delivered by service system defined as "a configuration of people, processes, technology and shared information connected through a value proposition with the aim of a dynamic co-creation of value through the participation in the exchanges with customers and external/internal service systems" (Spohrer, Maglio, Bailey, & Gruhl, 2009).

The value proposition of a service system can be refined into a number of requirements qualifying the expected characteristics of the provided business service. Today, many business services are information intensive, and the achievement of those requirements heavily depends on the properties of the supporting Information System (IS). Our research investigates this type of requirements, and more specifically those associated with information security and privacy: the "security goals" and "privacy goals" according to the usual requirements engineering terminology (Elahi & Yu, 2007). The sources for these goals are customers' needs but also the many regulations and norms the enterprise has to comply with. The occurrence of security and privacy breaches may result in deviations (misalignments) between the goals of the enterprise and the supporting IS. There are many other goals associated with the IS, like accountability, non-repudiation, auditability, trustworthiness (Cherdantseva & Hilton, 2013), which need to be addressed uniformly.

Given the strong dependency of the business service on the supporting IS, the alignment of the deployed IS with the business service system is a key issue, also from a security and privacy perspective. The purpose of Enterprise Architecture Management (EAM) is to align an enterprise to its requirements and business goals, and specifically to the goals associated with the business services. EAM helps to design and guarantee a coherent enterprise's organizational structure, business processes, and infrastructure (Lankhorst, 2013) through a set of models.

The solutions to overcome the misalignments are more and more complex and it is not either technically feasible or economically sustainable for an enterprise to solve all potential breaches. Risk Management (RM) is a central process managing the effect of uncertainty on the business goals and is largely used to balance the often-conflicting constraints in information security engineering (NIST SP 800-60). It also becomes the response to the increased concern of personal data protection.

The first objective of the paper is to report about our contribution (Grandry, Feltus, & Dubois, 2013) to the design of a security risk-oriented Enterprise Architecture (EA) model. The core of the framework relies on the integration of Information System Security Risk Management (ISSRM – Dubois, Heymans, Mayer, & Matulevičius, 2010) concepts into EAM constructs from a service system perspective. It also addresses the model representation of risk analysis, leveraging the ArchiMate modelling language (The Open Group, 2016), which has been purposely designed for supporting EAM, and inherently supports the service-oriented enterprise.

The second objective of the paper is to generalize the model to manage the risks on any goals of the information system supporting the delivery of business services, not restricted only to the security goals. This generalised model is validated with a specialisation addressing the privacy goals of the business service. The integration of these additional concerns opens the door to the management of the interactions amongst risks: a control mitigating a security risk can indeed cause risks to breach privacy objectives.

The paper is structured as follows. In the next section, the research methodology is exposed, giving insights on the process followed to elaborate the artefacts. Afterwards, we provide background knowledge regarding ISSRM and ArchiMate EA Modelling language. Then, we describe the initial extended

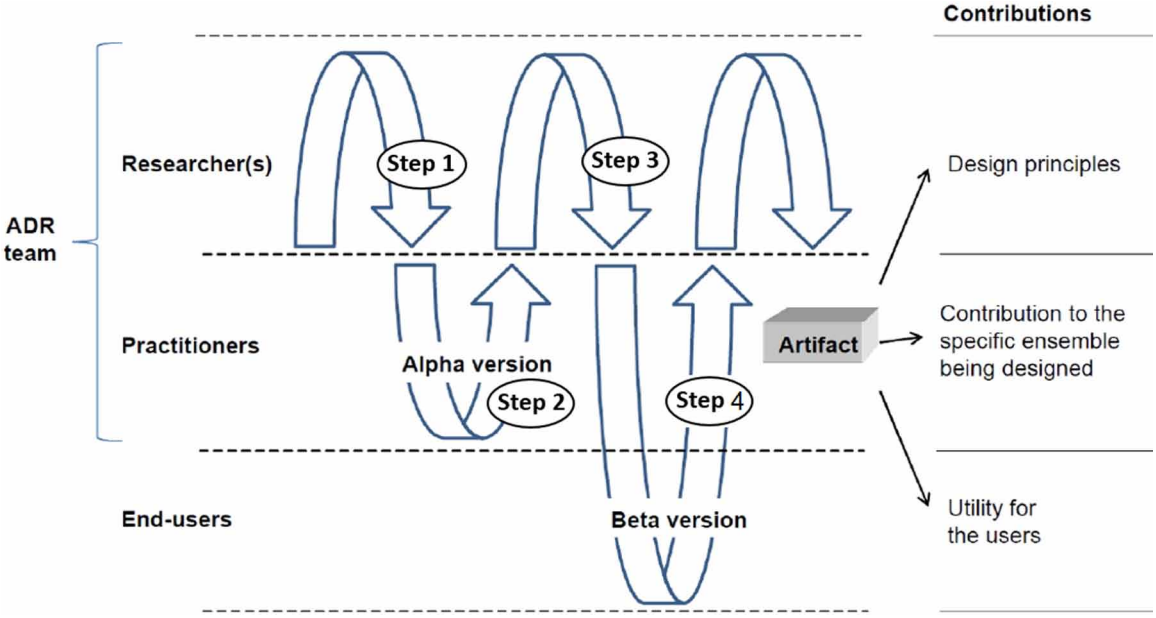
EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

EAM, as a mapping between the ISSRM and ArchiMate metamodel, which is illustrated with a case study. The conceptual integration is generalized and illustrated to information system risks, including information privacy in the next two sections, where privacy risks and information security risks are combined, introducing the concern of risk interaction. We finally review related work and conclude with future perspectives.

RESEARCH METHODOLOGY

According to Hevner, March, & Park (2004), the design science paradigm seeks to extend the boundaries of human and organisation capability by creating new and innovative artefacts, and the authors further maps their defined artefact to the four artefacts proposed in the research framework from March & Smith (1995), i.e.: construct, model, method and instantiation. This framework prescribes four research activities: build and evaluate, and theorise and justify. The first two refer to design sciences activities, whereas, the latter two concern the natural science activities.

Our development of a metamodel integrating the concepts of both ISSRM and EAM is a research that is in the scope of Design Science Research. We focus on the build activity (i.e., integration of the risk management and the enterprise architecture into an integrated model) and evaluate activity (i.e., validation of the metamodel through case studies).



In practice, we note the build and evaluate design activities are preceded, in most design science research methods, by an activity of problem discovering (e.g., Peffers, Tuunanen, Rothenberger, & Chatterjee, 2008[1]). Given that our artefact is motivated by real problem and relies on the knowledge of the field, we need to involve practitioners and end-users all along the artefact building activity. Therefore, we have applied the design research method proposed by Sein, Henfridsson, Purao, Rossi, & Lindgren (2011): the Action Design Research method has for objective to strengthen the connections between the practitioners (the risk experts selected to participate to the metamodel elaboration) and the researchers by combining the building, intervention and evaluation (BIE) activities. Given that the elaboration of our artefact strongly relates to IS, we apply an IT-Dominant BIE Generic Schema[2] (Figure 1).

When applied to our research, at step 1, we (researchers) have proposed leveraging EA models to enhance the ISSRM (Dubois et al., 2010). At step 2, security experts (the practitioners) from the telecommunication services, designed a first model integrating information security risks and EA description in participative workshops (Mayer, Aubert, Cholez, & Grandry, 2013). At step 3, the researchers formalised the ISSRM and EAM integration in ArchiMate (Grandry et al., 2013). At step 4, the metamodel was both implemented in a supporting tool (TISRIM - Mayer & Aubert, 2014) distributed to the end-users, and further experimented with end-users from the healthcare services, in participative workshops (Schwartz, Grandry, Aubert, Watrinet & Cholez, 2015). It was also used in support to a master thesis in information security risk management (Tovstukha, 2014). Step 5 integrates the feedback from these experimentations and starts a new design cycle with a generalization of the artefact by extending the scope of risk from information security objectives to information system objectives, including privacy (Feltus, Grandry, Kupper, Colin, 2017).

According to March & Smith (1995), the evaluation of a designed artefact must use precise evaluation criteria. Provided that the goal of our research is to support end-users with a useful metamodel supporting risk management, the validation criteria is the usability of the metamodel, defined in ISO

Figure 1. IT-Dominant BIE generic schema

25010 (SQuaRE) by the sub-characteristics of (1) understandability - determines the ease of which the [artefact] can be understood, (2) learnability - learning effort for different users and (3) operability - ability of the [artefact] to be easily operated by a given user in a given environment.

BACKGROUND KNOWLEDGE

In this section, we introduce the two main sources of knowledge for our research, namely a conceptual security risk model and the ArchiMate EA modelling language.

Information Security Risk Management

ISSRM is paramount because it helps companies to adopt cost-effective security measures: security threats are so numerous that it is impossible to act on all of them as (1) every technological security solution has a cost, and (2) companies have limited resources. Hence, companies want to make sure that they adopt only solutions for which the Return On Security Investment (ROSI) is positive. This is done by comparing the cost of a solution with the risk of not deploying it.

In a previous research, the different concepts of ISSRM and their relationships have been formalized under the form of a domain model, i.e. a conceptual model depicting the studied domain (Mayer, 2009; Dubois et al., 2010).

The ISSRM domain model is organized in three groups of concepts:

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

- Asset-related concepts describe the assets and the goals which guarantee the security of the assets; according to the IS theory, the IS supports the Business System and the assets are specialized as business assets and IS assets (aka Supporting Assets, Resources), and the IS assets support the business assets.
- Risk-related concepts present the risk itself as composed of a potential event together with its impact on the enterprise's asset (whether business or IS); in the domain of security, the feared event is itself defined as a threat exploiting vulnerabilities of the IS assets.
- Risk treatment-related concepts describe what decisions, requirements and controls should be defined and implemented in order to mitigate possible risks.

In this paper, we use the concept of Security Goal, which merges the Security Criterion and Security Objective defined in the initial ISSRM (Dubois et al., 2010).

We have experimented the ISSRM in various projects (Mayer et al., 2013, Goettelmann, Mayer & Godart, 2014; Mayer, Grandry, Feltus & Goettelmann, 2015) and demonstrated that it is neutral with respect to the types of business, the industries and sectors. Later in this paper, we will discuss its specialization with respect to the service industry.

In these projects, we also identified that the design of the asset model is a key activity to get the value out of the ISSRM: identifying the business and the IS assets, as well as their links is the main challenge when applied in the context of real enterprises.

EAML and ArchiMate

The Open Group proposes ArchiMate as a standard Enterprise Architecture Modelling Language (EAML), which provides the capability to represent an enterprise in a uniform way, according to the multiple stakeholders' viewpoints, across business, IS and IT architecture layers (Lankhorst, 2013). Although it has not been specifically developed for the service system domain, ArchiMate introduces constructs supporting the concept of service as an abstraction of the behaviour exposed by a system (The Open Group, 2016). In enterprise engineering, an enterprise is viewed as a complex designed system, and a service-oriented enterprise can therefore be considered as a set of services exposed to the enterprise's environment.

ArchiMate 3.0 organizes the representation of the enterprise along several abstraction layers: strategic, business, application, technology and physical. The layers conform to strict dependencies going from upper layer (strategy) to bottom layer (physical). There are no dependencies permitted the other way round.

The modelling pattern of ArchiMate revolves around the concept of service: a service both abstracts a behaviour (that realizes the service) and is a part of a behaviour (composed of services). The pattern is instantiated in each abstraction layer of the core framework, contextualized with the relevant concepts of that layer: business service, application service and technology service.

The Motivation extension was introduced in the version 2.0 of ArchiMate and is reinforced in version 3.0: besides the what (passive structure), who (active structure) and how (behaviour), the motivation supports the why dimension. The motivation is relevant in each abstraction layers of the full ArchiMate framework and allows tracing the rationale behind the elements of the architecture. A motivational element is related to a core element of the architecture through the concepts of requirement, value and meaning. A requirement is realized/influenced by a (set of) core structure/behaviour elements of the architecture (except stakeholder), which is associated with a value or a meaning.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

INFORMATION SECURITY RISK INTEGRATION

Our initial research (Grandry et al., 2013) had the objective of conceptually integrating the domains of ISSRM and EAM through the Enterprise Model Integration (EMI) approach (Kühn, Bayer, Junginger, & Karagiannis, 2003; Karagiannis & Kühn, 2002), which consists mainly in resolving semantic heterogeneity through concept mapping and integration rules (Zivkovic, Kühn & Karagiannis, 2007). A concept mapping introduces a correspondence between at least one concept of each of the source model. The major correspondences are: Equivalence, Relation and Non-Relation. A relation between two concepts can be a generalization (and reversely specialization), a composition, an aggregation, an association, a classification. While the concept mapping addresses what is integrated, the integration rules address how the integration is actually performed, depending on the defined mapping. Equivalent concepts are integrated through an alignment rule (merge, mapping, abstraction), while related concepts are integrated through a connection rule (generalization, aggregation, composition, association, classification).

Asset

The ISSRM distinguishes between the business assets and the IS assets. Security risk management end-users usually classify business processes, information, skills and capabilities as business assets. Accordingly, the EAM concepts of Business Process, Business Object, Business Actor and Business Role are all business assets: information, business processes and skills are leveraged for the service-oriented enterprise to deliver its value through the business service. The Business Service encapsulates these business assets and abstracts the value they bring to the enterprise.

The concept of IS Asset in ISSRM abstracts a component of the IS that support the business asset. It is very close to the EAM domain that considers that elements of the application layer realize (or are used by) the elements of the business layer. Application and technology services are the major abstractions of the application and technology layers. They are however not sufficient in the mapping of the IS Asset in terms of risk management: the vulnerabilities are indeed not the characteristics of the packaged set of resources (which the service abstracts), but of the actual components that the service is made of, i.e. of the structural elements of the technology architecture.

Risk

A Security Goal represents an intention of securing the business assets in order to increase the value of the associated business service. For example, the confidentiality of the information manipulated by the business service increases the value of the service when it is relevant for the business. Although it could be tempting associating the Security Goal with a goal in terms of EAM, it is important to remind that risk management defines the Security Goal as an indicator to assess the significance of the risks: a security goal is not an end-state to be achieved per se, but rather a driver that indicates a direction of change. We therefore map the Security Goal to the concept of Driver in terms of EAM (a Security Goal is-a Driver), and the concept of Risk to the concept of Assessment (a Risk is-a Assessment). The mapping of the relation between Security Goal and Business Asset requires additional concepts to be considered: ArchiMate does not support direct relation between Driver (Security Goal) and the elements of the busi-

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

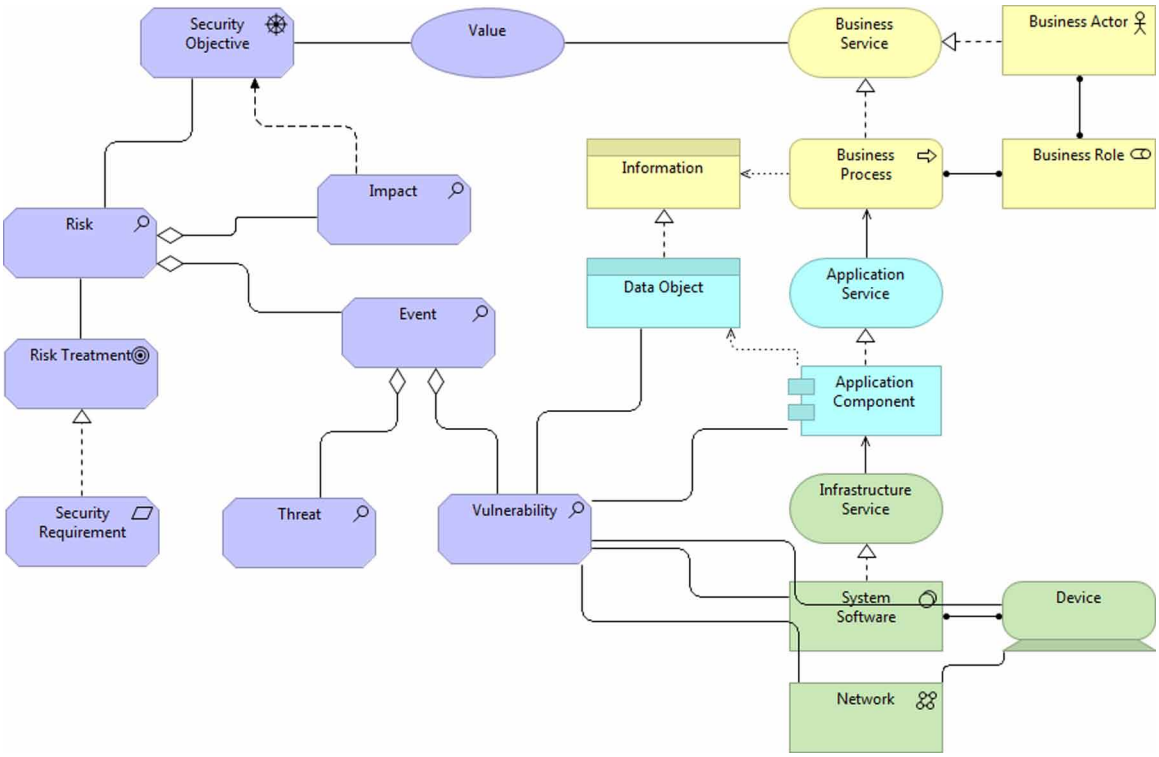
ness layer (Business Asset). However, a Driver influences the Value of a Business Service: the Security Goal associated with a Business Asset influences the value of the Business Service encapsulating these assets, e.g. the confidentiality of the information manipulated by the business service increases the value of the business service. Given this mapping of concepts, security risk management can be expressed in the following way: a risk is the outcome of the analysis made on the intention to secure business elements of the enterprise in order to increase the value of the associated business service.

The components of the Risk (Event and Impact) are also modelled with the concept of Assessment and the composition relation (an Assessment composed of other Assessments), as they are the results of the risk analysis. The same approach is applied to map the Threat and the Vulnerability.

Finally, we propose modelling the chain of impacts in ArchiMate with a composition of impacts. It should be noted that the final element of a chain of impact might negatively influence another driver than the one that initiated the risk assessment, and even a non-security driver. For instance, the 'Reputation of the Enterprise' is a strategic driver that is not a security goal. It is however negatively influenced by the impact 'loss of reputation' associated with the security risk 'identification theft' associated with the security goal 'Guarantee integrity of information'. It is therefore very relevant to integrate the analysis of security risks as a strategic activity of the enterprise, and not perform it in a silo.

Risk Treatment

The Risk Treatment is the decision of how to treat the Risk: retention, reduction, transfer, avoidance. It is mapped to the EAM concept of Goal: the Goal (Risk Treatment) addresses the Assessment (Risk) of the Driver (Security Goal). The Security Requirement is introduced when the Risk Treatment decision is to reduce the risk. The Security Requirement is modelled with the EAM concept of Requirement: they are the means to reach the end, i.e. to realize the Goal. Finally, the Control as the abstraction of the solution that implements the Security Requirement is mapped to a (set of) Core Elements of the architecture: the realization relation between Requirement and Core Element is used to trace the rationale behind the elements of the solution. The solution to a security requirement can be realized by elements of the business layer, application layer and/or infrastructure layer. When multiple solutions can be envisaged, the enterprise architecture models represent a support to decision-making, potentially based on an ROSI analysis.



Integrated Metamodel

Besides mapping the concepts of ISSRM to ArchiMate, we also represent at this stage the risk concepts (concrete syntax) with the existing ArchiMate notation: a Security Goal is a Driver, and reuses the Driver symbol as representation. The resulting integrated metamodel is illustrated in figure 2, in the ArchiMate notation.

There are two channels of exchange between the risk model (left side) and the architecture model (right side): on one hand, the IS architecture is a source of vulnerabilities that might be exploited by threats; on the other hand, the resulting risk impacts the value of the business service the architecture supports.

Figure 2. ISSRM in relation with EAM

CASE STUDY SECURITY – @RCHIMED

The metamodel integration is illustrated with a lab case study, @rchimed[3], which is a reference case study for the EBIOS risk analysis method (DCSSI, 2004) defined by the French Ministry of Defense. First, we present the context and the existing enterprise architecture of @rchimed: we identify the assets of the enterprise and we elaborate a standard ArchiMate EA model that highlights the connections between the business and the IS assets; then we model the security risk perspective of the system.

@rchimed Architecture

@rchimed is an AEC company specialized in the design of blueprints for the building of new factories and offices. To that end, @rchimed provides services related to the analysis of building stability and estimations of the costs. The reputation of the enterprise is a very important factor to win market shares in a competitive market. @rchimed's strategy is based on two drivers: on one hand improving the reputation of the company, and on the other hand reducing the costs to remain competitive.

The business service "studies elaboration", which value relies on the accuracy of the delivered artifact, is part of the @rchimed service offering, and is realized by three processes performed by the @rchimed experts, namely: the visualization elaboration, the structures calculation and the technical plans

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

elaboration. These processes generate two business objects: the building structure calculations and the structural parameters. The structures calculation process is supported by the calculation service which is itself realized by the Structure Management Software. This application is accessed by the experts through the parameters setting interface and generates the calculations on files, listings and USB supports.

The relevant @archimed architecture is described in figure 3, using the standard ArchiMate language.

Security Risk Management

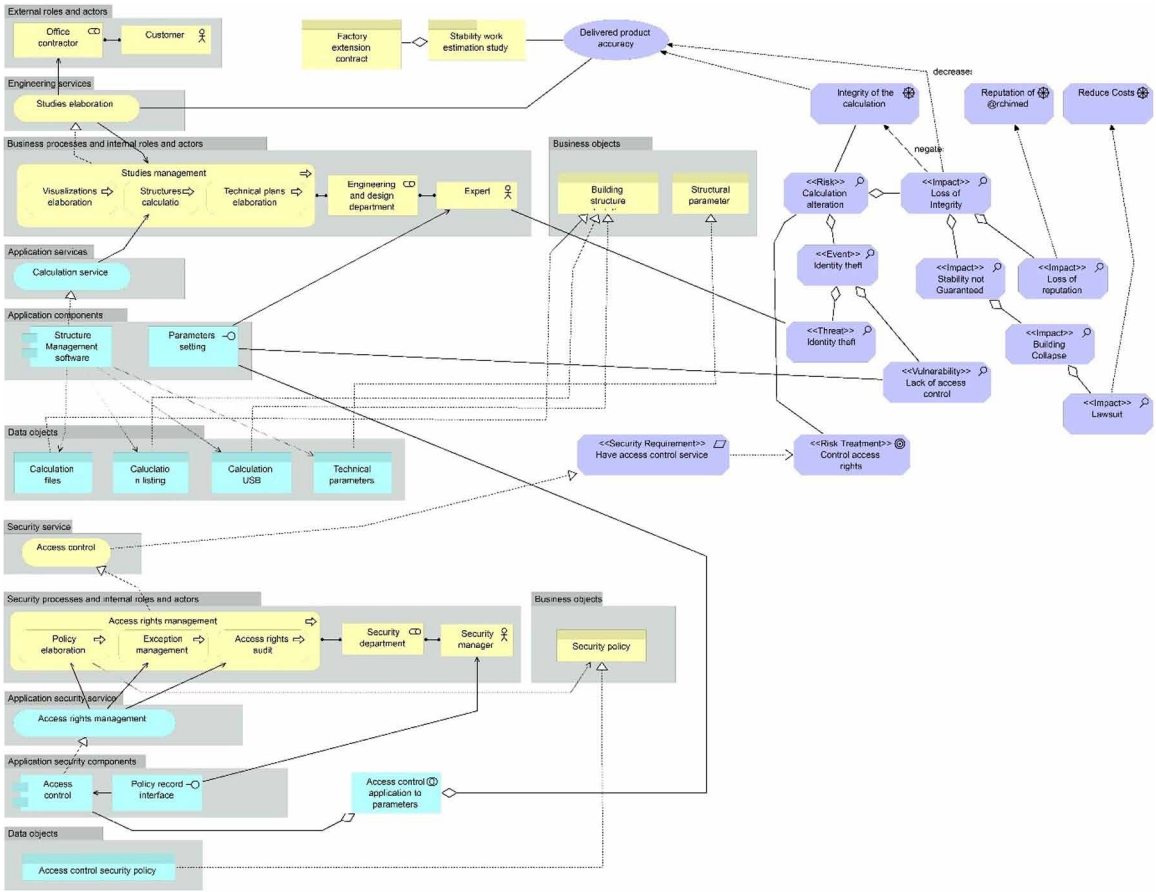
A classical risk analysis is deployed, which consists of 3 steps (according to ISO/IEC 27005, 2008): identification of the context and security goals, analysis of the risks and definition of the risks treatment.

Context and Security Goals

Given the value of the studies elaboration business service, @archimed has a strong requirement on the integrity of the calculation, which is strategically more important than its availability and confidentiality. The security goal integrity of calculation is modeled as a driver positively influencing the value of the business service studies elaboration.

Risk Analysis

A calculation alteration represents a breach of the integrity of the service. A lack of access control on the information system (vulnerability) can be exploited to thieve identity (threat) and cause a calculation alteration risk (risk), which negatively impacts (loss of integrity) the security goal, and decreases the value of the business service. A loss of integrity might be the initial node of a chain of negative impact, leading to a loss of reputation, but also to an instable building, a collapse of the building and lawsuits. It also negatively impacts the strategic goals of the company through a loss of reputation and new costs induced by the lawsuits. This risk analysis is modelled in figure 3 according the proposed extended EAM.



Risk Treatment

Although @rchimed is looking for cost reduction, the impacts of a calculation alteration are high and the company decides to mitigate the risk through the deployment of an access right management system. This control reduces the vulnerability to identify theft.

The risk treatment is modelled with a goal, influencing the value of confidentiality/integrity of the parameter settings interface. This goal is realized by the security requirement to have an access right control service. This service is realized by three security processes, namely: the policy elaboration, the exception management and the access rights audit, which are assigned to the security department and use the access right management application service. This latter is realized by an access control application that read the access control security policy data object and collaborates with the parameters setting interface to control the user's access rights.

Figure 3. @rchimed security risk model

Discussion

The case study demonstrates the usability of the integrated metamodel to capture the results of a risk analysis. However, the language does not allow relating the assessment concept to the core concepts with stronger relation than the association. Thereby, it prevents from strongly typing the relation between the vulnerability (and threat) concepts with the core EAM concepts.

The metamodel improves the security risk management activity by addressing the challenge of designing the asset model. The simplistic ISSRM asset model is replaced with the EA model, which captures the actual dependencies amongst assets, and better reflects the complexity of the enterprise IS thanks to the richer description both in terms of elements and in terms of relations. Moreover, the asset model design relies on the body of knowledge of EA, and more specifically modelling techniques.

The metamodel emphasises the service-oriented enterprise as the primary object of risk management: the business asset of the enterprise is the business service, and the risks are prioritised and mitigated according their effect on the value of the associated business services.

The metamodel was experimented in several collaborative projects with industrial partners: telecommunication services (Mayer et al., 2013), healthcare services (Schwartz et al., 2015). It is the underlying model of the TISRIM tool (Mayer & Aubert, 2014), deployed to support information security risk assess-

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

ment in various industries. It is also used as a reference model in a master in Information Security run by the LIST, and in a master thesis addressing the integration of mal-activities diagrams in EA (Tovstukha, 2014). The constructs of the model were therefore validated by both the practitioners (security risk experts participating to the model elaboration) and by end-users (security risk experts not part of the model elaboration) as being understandable and learnable. However, from an operability perspective, information security risk analysis usually relies on knowledge bases containing a considerable amount of risk entries: graphically representing the security risk elements of the model is therefore seen as a cumbersome task without any added-value. The actual value of the model resides in the conceptual integration rather than in the reuse of a graphical modelling language.

GENERALIZING THE INTEGRATION OF RM AND EAM

Based on the first integration of EAM and Information Security Risk Management, we consider extending the conceptual integration to any goal and related risk associated with the information system supporting the delivery of business services. The specific example of privacy risk is used to illustrate the argumentation.

Information System Objectives and Risks

An information security risk is a risk concerned with the security objectives of the information system. Security is often used as a placeholder for any objective associated with the information system: the reference model of information assurance and security (RMIAS – Cherdantseva & Hilton, 2013) defines security objectives as including the usual confidentiality, integrity and availability objectives (the CIA triad), but also accountability, auditability, trustworthiness, non-repudiation and privacy. The model acknowledges that countermeasures (i.e. controls) of different nature are deployed to protect the information according to the set of (security) objectives: organisational, human-oriented, technical and legal countermeasures are combined to meet the objectives on the IS. The NIST (Brooks, Brooks, Garcia et al., 2017) distinguishes privacy from security: it defines the domain of information security as the concerns arising from unauthorised system behaviour, and the domain of information privacy as the concerns arising from by-product of authorised processing of personally identifiable information (PII). The overlap area of security and privacy domains is concerned with the security of PII, i.e. the unauthorised processing of PII. We first generalize this approach and consider that many objectives are targeting the IS, and not only security and privacy: any IS property contributing to the value of the business service is in our scope.

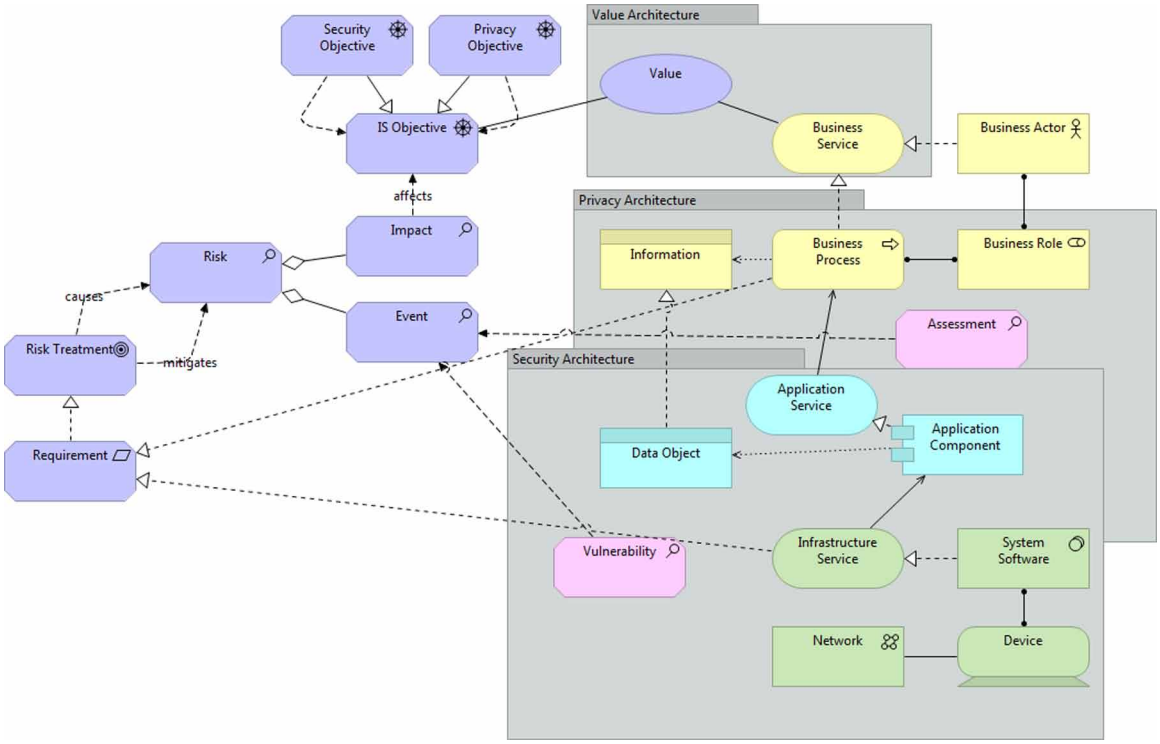
The NIST leverages risk management to integrate privacy concerns in the engineering process and designed three privacy objectives (equivalent to CIA in security) to enable system's engineers to build IS capable of implementing the organisation's privacy goals and support the management of privacy risks: Predictability (the enabling of reliable assumptions by individuals, owners, and operators about personal information and its processing by an information system), Manageability (providing the capability for granular administration of personal information including alteration, deletion, and selective disclosure), and Disassociability (enabling the processing of personal information or events without association to individuals or devices beyond the operational requirements of the system).

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Extending its proven information security risk framework, the CNIL (CNIL, 2012) is also developing a Privacy Risk Management models and considers that a privacy risk is composed of a feared event (impacting the privacy of data subject, such as the unavailability of legal processes, or the illegitimate access to personal data), and the threats that make it possible. Threats exploit vulnerabilities of the IS and allow the feared event to happen. The NIST on the other hand considers that threats and vulnerabilities fail to capture the essence of many privacy problems for individuals: the adverse outcome can indeed arise from the operations of the system itself, regardless of external event and in the absence of technical vulnerability.

Integrating RM and EAM

Besides addressing specific objectives and supporting the engineering of information systems in silos (security engineering, privacy engineering), risk management also provides a common language to address the risks associated with the combined objectives of the information system: we argue that assessing the risks associated with any property of the IS contributing to the value of the business service is relevant and that these risks needs to be uniformly managed. Risk Management is an instrument to prioritise issues, support trade-offs and decision making across the several objectives associated with the information system, and contributing to the value of the service-oriented enterprise. This leads us to extend the scope of our integration, from the specificities of information security to any other goal associated with the information system. We validate this generalized metamodel by instantiating the concepts in another critical domain, the privacy.



The elaboration of the generalized metamodel brings a major change in our security risk model, which is reflected in the generalized model: the concepts of vulnerability and threat cannot be generalized as the components of the potential event. We therefore remove them from the risk model and integrate them in the so-called information security architecture: they are indeed relevant concepts supporting the identification of the risk associated with the security architecture of the system. We apply this pattern for each relevant property of the IS, and consider that the view concerned with that specific property is responsible for identifying the relevant risk. A privacy architecture therefore needs to be designed, which will support the identification of privacy risks, and each relevant property of the IS requires the development of the associated architecture. This modification solves the weakness identified in Tovstukha (2014) as it is now possible to define mal-activity diagram as the relevant security architecture integrated in the EA.

The resulting integrated model is depicted in figure 4:

- Security objective is generalized in objective, and specialized in privacy objective and security objective: it is defined as a property of the information system that has an impact on the value of the business service.
- Threat and vulnerability are abstracted away and moved to the security architecture, part of the enterprise architecture
- Requirement generalizes the realization of risk treatment; the requirements are realized by controls, which are elements of the architecture: security controls are included in the security architecture, while privacy controls are included in the privacy architecture
- Objectives are not independent of each other's, and an influence relationship captures the dependency amongst them. Events also relate to each other's

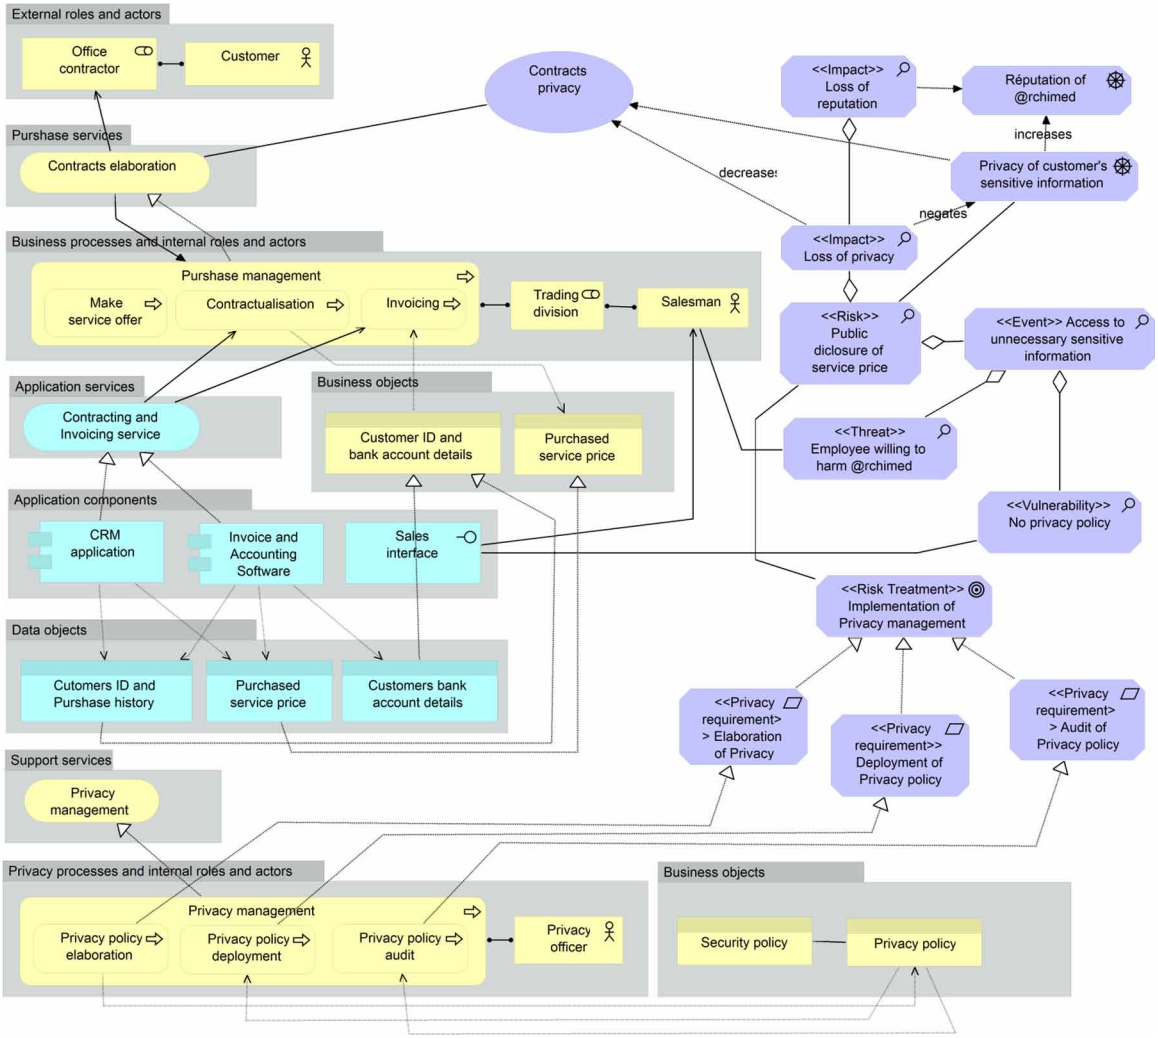
EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 4. Generalized integrated model

The risk and EA models are joined through the following concepts: (1) the Risk/Event abstracts the result of the assessment of potential event's occurrence, considering the various properties of the IS; (2) the Value abstracts the effect of the risk on the business service; (3) the Requirements abstract the intention to change the IS as a consequence of the Risk Treatment.

The risk is now promoted as the common concept for abstracting any potential event having uncertain outcomes on any objective associated with a business service, and the generalized metamodel becomes a risk integration framework for service-oriented enterprises.

CASE STUDY PRIVACY – @RCHIMED



This case study illustrates how the extended metamodel supports the management of the privacy and how it supports the combination of the security and privacy objectives. The associated model is depicted in figure 5.

Privacy Concerns at @rchimed

The case study addresses the management of the privacy associated to the contracts elaboration, realized by three processes performed by the @rchimed trading service, namely make service elaboration, contractualisation and invoicing. These processes exploit and generate sensitive information: the customer

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 5. @rchimed privacy risk model

ID and bank accounts details and the purchased service price. Amongst these processes, contractualisation and invoicing are supported by the contracting and invoicing application service, which is realized by the Customer Relationship Management (CRM) application, and invoice and accounting software. These applications are accessed by the salesmen through the sales interface, and they use and generate the customer ID, the purchase history and the purchase price which are types of business objects.

The value of this business service depends on the privacy management: the contracts elaboration business service is the business asset and the CRM application, the invoice and accounting software and the sales interface are supporting IS assets.

Privacy Risk Management

The management of the privacy risk is performed in 3 successive steps: definition of the context and privacy goals, analysis of the risks and definition of the risks treatment.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Context and Privacy Goals

@rchimed identifies that it is highly valuable to guarantee the management of the privacy, especially for the Contract Elaboration business service: Guarantying the privacy of customer's sensitive information is modeled as a driver positively influencing the value of the business service.

Risk Analysis

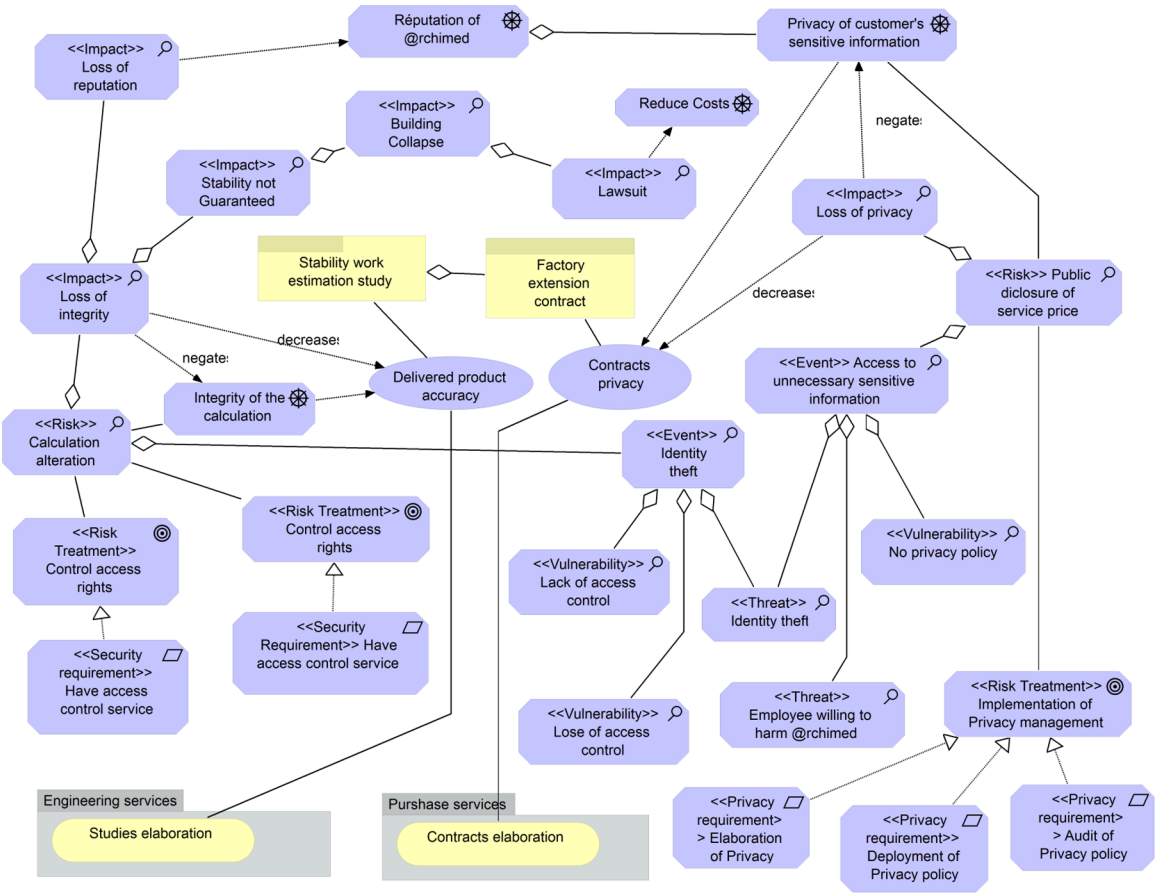
A public disclosure of the price of the service causes a breach of privacy when using the service, which can be induced by the access to unnecessary sensitive information due to a lack of privacy policy in the company. The risk (public disclosure of price) is composed of the potential causing event (access to unnecessary information) and impact (loss of personal data protection) affecting the privacy objective associated with the business service, and therefore negatively influencing the value of the business service. Moreover, this breach of protection of sensitive customer information also negatively impacts the reputation of the company, and therefore negatively influences the strategic goal of @rchimed.

Risk Treatment

The risk reduction is achieved with the deployment of privacy management processes, dealing with specific rules regarding the processing of sensitive customer data.

This risk treatment is modelled with a goal, realized by three requirements: the elaboration, the deployment and the audit of privacy policy. These requirements are realized by the privacy management service, which is operated with three privacy-related processes: the policy elaboration (that generates the privacy policies business object), the privacy policy deployment and the privacy policy audit. The privacy policy clearly states that only necessary information is collected and processed, reducing the risk associated with the access to unnecessary sensitive information.

Discussion



As the threat and vulnerabilities are abstracted away from the risk model, there is a need to design the right security architecture that supports the identification of the security risks, and the privacy architecture that supports the identification of the privacy risks. The case study adopted the previously applied threat-vulnerability approach inherited from security architecture body of knowledge, but other models could be developed and integrated.

Although the value becomes the integration concept for abstracting the effect (either positive or negative) of the risks on the business service, ArchiMate weakly defines the value concept, and does not provide any guideline and/or model to describe it. A specific view of the enterprise should be designed to capture the (relative) value of the enterprise assets (the value architecture).

The integrated risk model also acknowledges that a potential event might impact various objectives associated with the value of a Business Service, possibly in diverging directions. It implies that trade-off analysis will be required when considering multiple objectives, such as illustrated in figure 6.

Figure 6. Security and privacy risk interactions

RELATED WORKS

As stated in Dubois et al. (2010), the introduction of a model-based approach for ISSRM is motivated by an efficiency improvement of the ISSRM process, and by the enhancement of the product resulting of the process. Existing information security risk approaches are already based on model, such as UML profile CORAS (Mass Soldal, Solhaug, & Stølen, 2011), and extension of the i* framework (Elahi, Yu, & Zannone, 2010; Matulevičius, Mouratidis, Mayer, Dubois, & Heymans, 2012). However, theses languages lack from a crosscutting viewpoint relating all three conceptual areas of risk management together- assets, risks and risk treatments. EAM provides a better answer by acknowledging that an enterprise is a system that requires modelling from multiple perspectives and at different levels of abstraction.

Integrating security risk with multiple perspectives of the enterprise is addressed by other researchers: Goldstein & Frank (2016) use a proprietary modelling language framework (MEMO) and extend its set of Domain Specific Modelling Language (DSML) to support the management of IT security. To do so, they had to extend the meta-modelling language itself to support the concept of security concern. Our approach differs conceptually as we are not prescriptive on how the assessment of the risk (the method) should be performed for each domain, but on how each assessment's results are combined to

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

a risk common language. Our integration model can therefore also be viewed as an integration framework for assessment methods. Moreover, as we use a standard EA modelling language (ArchiMate), we also benefit from the product offering around the language and do not force the end-users to adopt any specific modelling environment. Finally, our integrated model does not directly depend on any specific modelling technology: it could be realized on Eclipse technology (EMF), by extending an existing tool (such as Archi), but also on more flexible model technology such as JSMF (Sottet & Biri, 2016).

Leveraging EAM to defragment the identification of risks and to manage them in a holistic way was also proposed in Barateiro, Antunes, & Borbinha (2012): EA description is used to model complex business system at the desired level of abstraction, and to cover the views of the enterprise relevant to assess and manage the different kinds of risks. The approach however focuses on the process integration between RM and EA activities, and relies on the development of a specific xml-based risk language (Risk-DL).

Szwed & Skrzynski (2014) demonstrate the value of ArchiMate as a mean to model the added value tree which is the core of their information security risk assessment method. We are covering the full risk model with ArchiMate, model the risk identification, impacts and treatments.

Tovstukha (2014) is using our proposed mapping for designing the asset model in ArchiMate, which is then transformed to mal-activity diagram (MAD) to perform the security risk analysis and identification of controls. This work is now seen as complementary to our research, and particularly aligns well with our proposal for risk integration framework: the MAD is a security view of the enterprise, generating potential events to be integrated in our risk model.

From an industry standard perspective, integrating security risks management and enterprise architecture is also specified by The Open Group ArchiMate forum (Band, Engelsman, Feltus, Paredes, Hietala et al., 2015): the proposed extension uses ArchiMate concepts AS-IS to model risk/security aspects, to elaborate risk/security-specific specializations (stereotypes/profiles) and to define new concepts. We participated to this standard development and leveraged the first results of our research (Grandry et al., 2013). We now address in this research the risk associated with other objectives of the information systems, and expect to also play a role in the adoption of related open standards.

CONCLUSION AND FUTURE WORK

In this paper, we have proposed an integration of ISRM and EAM in the form of an integrated metamodel. The value of this integration was illustrated with case studies in information security and information privacy domains: enterprise architecture description better supports the identification of business and IS assets, as the complex relationships amongst them are maintained; the extension to any IS concern clarifies the integrated model as a risk integration framework for the service-oriented enterprise, centred on two unifying concepts: the risk and the value.

The unifying concept across the assets of the enterprise is the Value in our integrated metamodel. We expect to leverage this concept to unify other perspectives of the service enterprise, and manage other risks of the enterprise, especially those not directly associated with the information system: Reputation, Legal and Financial risks are very relevant to be addressed together with the operational risks (and especially the information system risks). As soon as the required perspectives on the enterprise are designed, which capture these specific concerns, we can expect to better manage the interactions amongst these risks through the unifying lens of our integrated metamodel.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

The integrated metamodel does not only serve as the basis for a potential new language extension to ArchiMate, it also drives the management of the various parts of the model, in the way it is prescribed by megamodelling theory: a megamodel is a special kind of model, composed of models, which provides the holistic view on all the models of the system (Barbero, Jouault, & Bézivin, 2008). Megamodel has been demonstrated as an instrument for system management and we plan to leverage it as an instrument to manage complex enterprises. We are actually developing such as model management platform, enabling the collection of the different parts of the integrated metamodel expressed in various languages: ArchiMate for the Enterprise Architecture model, Excel for catalogues of risks, threats and vulnerabilities (Sottet & Biri, 2016).

Risk management is not only used to estimate the uncertainty and support sound decision-making and priorities setting in management of the enterprise, but also as an instrument to regulate the ecosystem. The Council of Europe formally adopted in May 2016 the Network and Information System Security Directive (NIS, 2013), laying down the measures to achieve a high common level of security of networks and information systems so as to improve the functioning of the internal market. Risk Management plays a central in managing the security of interconnected systems in this Directive, which scope of applicability is very broad, as operators of essential services include any company whose operations is critical to any of the following industries: energy, transport, banking, financial market infrastructures, health sector (public and private), digital infrastructure.

In the domain of privacy and personal data protection, risk management is also emerging as the standard instrument to adapt existing systems and engineer future systems. In April 2016, the European Parliament adopted the long awaited General Data Protection Regulation (GDPR, 2014), laying down rules relating to the protection of individuals with regard to the processing of personal data and rules relating to the free movement of personal data. It specifically requires a Data Protection Impact Analysis (DPIA, PIA) to be performed as soon as personal data are processed, and the Section 3 of Article 33 states that "the assessment shall contain […] an assessment of the risks to the rights and freedoms of data subjects, the measures envisaged to address the risks, safeguards, security measures and mechanisms to ensure the protection of personal data and to demonstrate compliance with this Regulation".

We plan deploying our metamodel to actually manage the compliance with regulatory requirements, and especially across regulations.

Chapter 10
Social Media Strategies for Small and Medium Scale Enterprise in the Klang Valley Region of Malaysia

Donovan Chan
University of Malaya, Malaysia

Sameer Kumar
University of Malaya, Malaysia

ABSTRACT

Despite the current widespread adoption and use of social media as a marketing tool, very little empirical research focusing on local small and medium-sized enterprises (SMEs) is available. This study examines the usage of social media by small and medium-sized enterprises (SMEs) in Malaysia. The study assesses the impacts of age, educational attainment, and industry characteristics to the utilization, perceived benefits and barriers of SMEs. Results of the study indicate that social media is used by most SMEs for customer acquisition and its benefits are developing new business opportunities, reduced cost of advertising, 24 hours accessibility and decreased travelling time. The results however indicate that there is a lack of allocation of resources mainly in staffing and training when adopting the social media. Results also indicate that manager's age and educational attainment had significant impacts on social media strategies. The results did not reveal any evidence of different industry sectors relevance towards social media strategies. Implications for research are discussed.

INTRODUCTION

Background of the Study

In this modern era, most people spend some time of their day accessing one or even several social media networks. It is possible to say that an individual would find his day incomplete if his daily routine did not involve logging into Facebook, Instagram, Twitter and many others that are freely available. With the dawn of mobile technology, many online sites have become mobile friendly, thus further deepening our involvement in social media. Social media is an essential and necessary tool in this generation, as it has become the recent trend and preferred Internet application.

Social media does not only play a significant part for large organizations, but is also becoming increasingly important for small and medium-sized enterprises (SMEs). Researches in Germany noted that 47% of all companies use social media (Meske & Stieglitz, 2013). SMEs stand to gain a great deal by utilizing easy-to-use and easy-to-implement social media applications (Zeiller & Schauer, 2011). Furthermore, it has become less difficult and less expensive to adopt social media applications due to its wide availability and advancement in technology. As social media has become widely used by more and more SMEs, it could assist to "level the playing ground" with large competitors. (Kim, Lee, & Lee, 2011). Nevertheless, many small businesses still struggle to use social media as most of them still lack the knowledge on how to use them appropriately.

Problem Statement

As SMEs are a vital element of all economies representing 99.2% of total business establishments in the Malaysia, they are of high social and economic importance (Malaysian Business Advisory 2015). Nonetheless, SMEs are often left behind when compared to large firms in the adoption of modern technologies.

In this regard, this paper intends to discover the adoption and goals behind SMEs for using social media applications as well as to what extent are social media practices being used by SMEs specifically for marketing activities. In particular, it is important to identify social media's perceived benefits and factors behind the unwillingness of SMEs to adopt social media as marketing tool.

Research Objectives

Social Media is a relatively a new media. Studies into the commercial use of social media thus far have almost entirely been about large organizations. Although there has been increased press coverage of the use of social media by SMEs, these have primarily focused on a specific SME segment. It is therefore warranted for new research in comparing the use of social media by SMEs in different industries within Malaysia to provide a good foundation for further research in the future.

The research main objectives for this research are:

1. To investigate the adoption, goals, and social media practices, particularly the usage of social media platforms as a marketing tool in SMEs.
2. To investigate perceived added values and barriers of adoption of social media and its effectiveness as a marketing tool.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Research Questions

Based on the objectives, the main study argues that the demographic profile of an SME affects their marketing strategy. To do so, the study attempts to answer the following main research questions:

1. What are the social media usage habits and what benefits do SMEs get from using Social Media?
2. What are the barriers that SMEs perceived in using Social Media?
3. Do SMEs prioritize Social Media via the resources that they allocate to it?

Significance of the Study

This primary investigation intends to provide a deeper perspective on the uses of social media by small businesses based on characteristics (age/ education level/ industry) of owners/managers, the extent of dependency on social media and whether appropriate social media practices are being followed to when adopting this new technology. Current studies are limited and are mostly based on big companies. Till date, there is still a void on research regarding the use of social media by small businesses.

Next, the research aims at getting a deeper understanding on the main perceived values gained by small businesses using social media versus the barriers of its adoption. Lastly, this research is done in the two most booming industries of small businesses in Malaysia and a cross comparison analysis can be done to summarize the results across industries.

Scope and Limitations of the Study

The scope of this research is small businesses that only use social media as a marketing tool for their marketing activities.

Similar to other studies, this research also has several limitations. Firstly, this research focuses only on the main casual social media platforms such as Facebook, Twitter, Instagram and blogs. The social media application YouTube was not included in the research, as YouTube is not widely used by Malaysian SMEs as a marketing tool in acquiring new customers.

Next, the limitation for this study was that it targeted only two industries and specifically in the Klang Valley Region of Malaysia. According to the Malaysian Ministry of Domestic Trade, Cooperatives and Consumer Affairs as cited by the Malaysian Business Advisory 2015, Food and Beverage is the leading industry in Malaysia amounting to 36% of SME franchises. The Apparel and Accessory industry has recently witnessed a rising interest in the sector by more and more entrepreneurs accounting for about 11% of the Malaysian franchise industry. The research focuses only on the two most prominent industries accounting to 47% of SMEs in Malaysia to facilitate a smoother data collection procedure.

Operational Definitions

Consistent with prior studies in this area, the following terms will be defined as follows:

1. **Web 2.0/Social Media:** Anderson (2007) describes Web 2.0 or social media as a group of technologies that have become deeply connected contributing to a more socially linked web where everybody is capable off adding and editing content.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

2. **Small and Medium Entrepreneurships (SMEs):** The National SME Development Council (NSDC) Malaysia (2013) defines SMEs in two categories. Manufacturing: Sales turnover not exceeding RM50 million OR full-time employees not exceeding 200 workers and Services and other sectors: Sales turnover not exceeding RM20 million OR full-time employees not exceeding 75 workers.
3. **Marketing Activities:** The activity, set of institutions, and processes for creating, communicating, delivering, and exchanging offerings that have value for customers, clients, partners, and society at large. (American Marketing Association, 2013).

LITERATURE REVIEW

Social Media and Businesses

Web 2.0 or social media can be described as a group of technologies that have become deeply connected contributing to a more socially linked web where everybody is capable off adding and editing content (Anderson 2007). The introduction of SixDegrees.com in 1997 sparked a social media revolution leading to the development of key sites such as MySpace and Facebook in 2003 and by 2008 it had become a worldwide phenomenon (Boyd & Ellison, 2008). The acceptance and practice of social media has grown swiftly among its users and gain much media attention but academic literature on it still lags behind.

The term "social media" means Internet-based applications that help individuals to connect and share resources and information with one another (Lindsay, 2011). Social media was initially meant to be a medium where friends could connect, communicate and share but has also been implemented as a tool for businesses (Bughin & Manyika, 2007). As social media becomes synonymous in today's modern society, the trends for it are ever changing, improving and updating to meet the demands of its users. It is difficult to define which technologies are "social media" and which are not (Alavi et.al, 2014). New advanced technologies with inventive features are constantly being introduced and are often confusing to differentiate the many variations of social media technologies available.

More and more businesses these days are shifting towards social networks in order to aid their business procedures such as marketing, customer relations' management and business networking both inside and outside the company (Kim et al, 2010). This is particularly important to small businesses or companies that have a partial or if not all of their operations in direct contact with social media. Small business owners and managers are now realizing the inevitability of being swift to adapt and change according to the technologies or stand the chance of being outdated.

Prior industry reports have shown that in 2014, 92% of small business owners seem to indicate that social media is crucial to their business (Stelzner & Stelzner, 2014). This figure had risen from 86% in 2013 whereby businesses are repositioning the investments from traditional marketing approaches to social media and other incoming strategies in advertising (Stelzner & Stelzner, 2014). Since 2013, a constant trend regarding image and video sharing has emerged compare to text-based content. Image focused social media such as Instagram, Pinterest, Tumblr and Snapchat have been on the rise but are still not a major competitor to Facebook which has a solid loyal user base (Demers, 2014). Active daily users on Facebook have increased by 8% in 2014, whereas mobile daily active users almost double that amount, an increase of 15% in the same year (Katz, 2014).

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

One main problem that arises though is that SMEs frequently struggle to implement this new technology because of the lack of knowledge, funds and technical expertise compared with bigger rival companies (Harris et al, 2008). With the expansion of the Internet and social media, SMEs are now given a chance to overcome these problems. The Internet has greatly lowered down the marketing costs against traditional approaches. (Harris et al, 2008). Businesses are now able to leverage of each other's connections to advertise their products, services and brands (Harris & Rae, 2009).

Challenges and Opportunities for Social Media

As with every new kind of technology being used, challenges to social media are unavoidable. Researchers have listed several challenges concerning social media. Among these challenges include the sharing of content among users or content communities and blogs (Kaplan & Henlein, 2010). These content communities can make or break any small businesses as information is spread from one user to another at rapid proportions. Any dissatisfied or disappointed clients may choose to engross in social media for complaining in the form of disapproval websites or blogs (Ward & Ostrom, 2006).

In the business arena, there is a change in tendency to opt for personalization against other businesses. While technological advancements make the world more connected, consumers seem to resist being homogenized and therefore making marketing even more localized and personalized (Dan, 2014). Big companies will now have to rethink the way they do marketing as smaller companies mainly SMEs are giving stiffer competition due to the level playing field thanks to social media.

Utilizing social media as a means for marketing or business may not be as direct as it seems. Small business owners are hesitant to get involved in social media and some even struggle with the idea of social media being used for their businesses. Most of the misconceptions regarding social media often come from the lack of knowledge on its uses and benefits to the business. Nevertheless, there is still a chance for business owners to obtain social media through free platforms that are widely available on the Internet. The most important thing for small businesses to remember about social media, is that whatever content they have it needs to be in which ever platform they decide is right for them (Nenni,2014).

Carr (2003) is one of many researchers to lead the way by questioning the value gained from investments in IT, and there is substantial literature examining the relationship between IT investments and a company's performance. Similarly, other studies focused on the "use of technology" and discovered IT payoffs can be found and measured (Devaraj & Kohli 2003). They additionally recommend cross-sectional studies with large samples in order to generalize results across different industries (Devaraj and Kohli, 2003).

A review of the literature shown above, describes the usage of social media in SMEs in general. It highlights the importance of social media platforms for marketing activities of businesses. The research paper therefore attempts to contribute through an operational model adapted from (Wamba & Carter, 2014) in Section 3 to get broader insights by analyzing the characteristics of SMEs and the use of social media.

RESEARCH METHODOLOGY

The main intent of the current study is to examine social media strategies among SMEs in Malaysia mainly in the food and beverage and apparel and accessory industry. This study particularly focused on how SMEs in Malaysia adopt and use social media, specifically for their promotion activities and marketing tasks.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Operational Framework

Three approaches had been referred to in the development of the framework of this study. The first approach was adapted from an empirical study conducted on "Social Media Tools adoption" by Wamba and Carter (2014). According to Wamba and Carter (2014) social media adoption by SMEs can be measured by manager/owner characteristics (e.g., age, and education) of the said SME. Secondly, the conceptual model of Derham, Cragg, and Morish (2011) focused on the SMEs goals and values derived from the use of social media. Finally, several aspects of the survey had been referred from a study of online marketing survey conducted by an American professor Edward Boches from Boston University (Boches, 2012).

Through the adoption of this framework, the researcher seeks to investigate the demographic characteristics of SME owners/managers in Malaysia and the values derived by SMEs from social media. To date, there are actually very limited studies on social media and SMEs in Malaysia and no single research adopting this framework specifically in the Malaysian context has been found. Therefore, this paper aims to fill the gap in the literature by providing a detailed analysis for Malaysian SME owners/managers and social media.

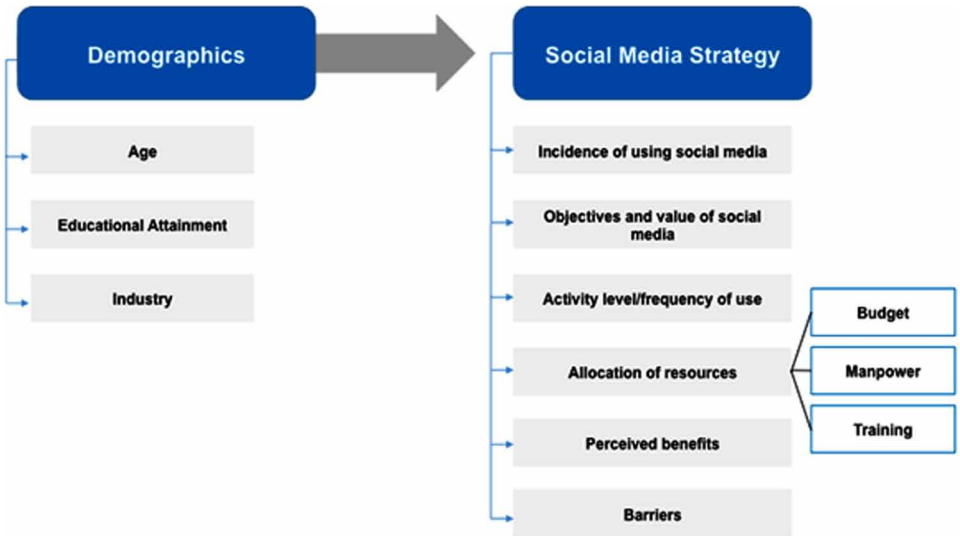

Figure 1 shows a framework adopting and combining all of these concepts.

Sampling and Data Collection

A quantitative research methodology was used to answer the research questions in Section 1. The implementation of a quantitative method permitted for the gathering of measurable data on SMEs and to examine the relationships between SMEs and their social media practices.

The questionnaire method or technique employed is to establish the current standing of a phenomenon (Powell & Conway, 2004). The researcher referred and adapted the questionnaire from previous study done (Edward Boches, 2012). Questions used were multiple choice, which is simple, effective

Figure 1. Operational framework of SME demographics and their social media strategies

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

and easy to complete by the respondents. The population of relevance was SME owners or managers in the Klang Valley. The questionnaire was distributed to 150 SMEs in either the food and beverage or the apparel and accessory industry.

The survey was conducted in GM Klang, a shopping complex that rented out 400 places exclusively for SMEs to conduct their businesses. The survey was conducted from July 15th to 31st July 2015. Each survey required approximately 5-10 minutes to complete. A copy of the detailed survey is contained in Appendix 1.

The survey consists of three sections. The first section comprises of questions related to the demographics attributes of the respondents (age, education attainment, industry). Section two of the survey covers questions that address social media strategies of SMEs with regards to their demographic attributes. Finally, the third section covers the perceived benefits and barriers for SMES in using social media.

Data Analysis

Data analysis of the present study consists solely of quantitative data analysis. The researcher implemented an online web survey application "Typeform" to aid in the gathering, storage and analysis of the data. The researcher had chosen this particular online application due to its simple layout and support of mobile phone interactivity compared with other online surveys.

Subsequently, descriptive statistics were used to examine the data manually. Descriptive statistics are techniques of getting characteristics or summary indicators from the raw data collected from the survey. Descriptive statistics are provided for both the independent variable from the first section of the survey consisting of percentage graphs and pie charts for the categorical (e.g., age, education attainment, industry) and multiple responses from section two (e.g., incidence of using social media) and section three (perceived benefit and barriers).

This section has described the research approach taken in the current study. The quantitative (questionnaire) employed is described in detailed including the advantages and disadvantages of the approach. The next section contains a presentation of the quantitative results of the current study.

RESEARCH RESULT

This section presents the descriptive analysis of the survey. It includes frequencies and percentages for the categorical and multiple responses. It provides findings from 144 out of 150 respondents. The analysis indicated that 6 out of the 150 of the respondents' data had been corrupted and was not applicable

Demographics and Total Responses

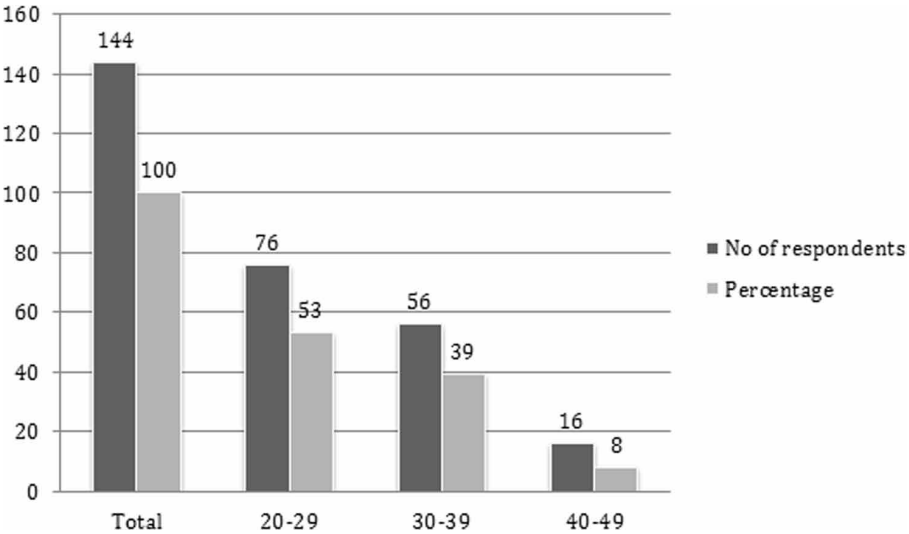
This section aims to provide the relevant demographic background parameters of the respondents (e.g., age, educational attainment, industry) and discuss the overall responses of this study.

Figure 2 shows the percentages of the age groups of the owners or managers of the SMEs.

Individuals above the age of 50 are not found in the population. A possible explanation of this could be that, these individuals grasp of current technologies are limited and prefer to delegate the tasks of handling social media to the younger generation. The age group 20-29 had the most number of respondents totaling 53% (n= 76). The second age group 30-39 comprised of 39% (n=56) of the respondents while the age group 40-49 accounted for 8% (n= 16).

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 2. Age group of respondents



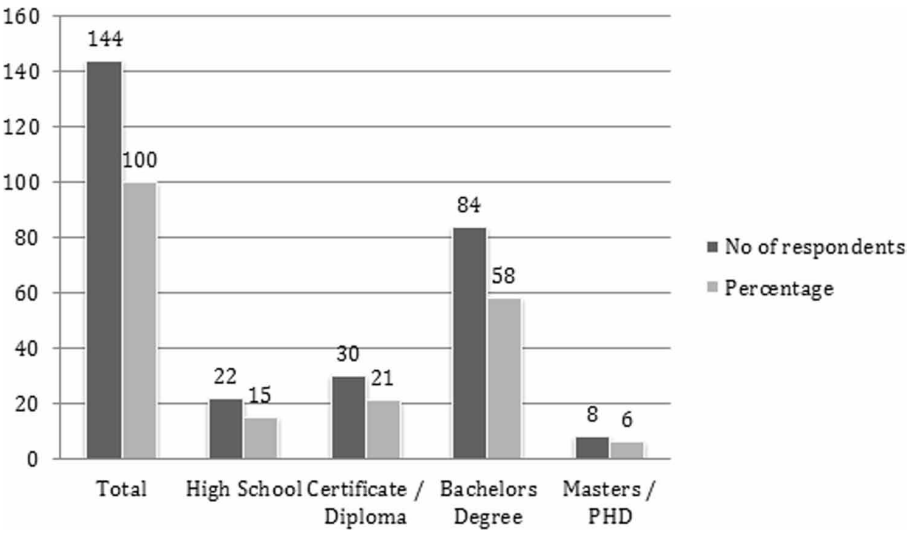


Figure 3 illustrates the educational attainment of the owners or managers of the SMEs in the survey.

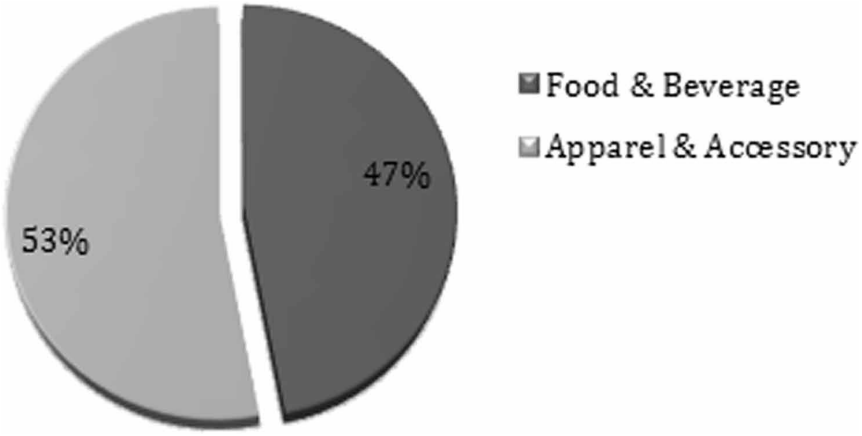

Educational attainment is classified into four clusters, which are, high school, certificate or diploma, Bachelor's degree, and Masters Degree or PHD. Out of the survey conducted, the majority of respondents had a Bachelor's Degree qualification amounting to 58% (n=84). The second highest was the Certificate and Diploma level accounting to 21% (n=30) respondents while 15% (n=22) of the respondents had basic high school education and 6% (n=8) had either a Masters Degree or PHD qualification. The industries of SMEs are depicted in Figure 4.

Figure 3. Educational attainment of respondents

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

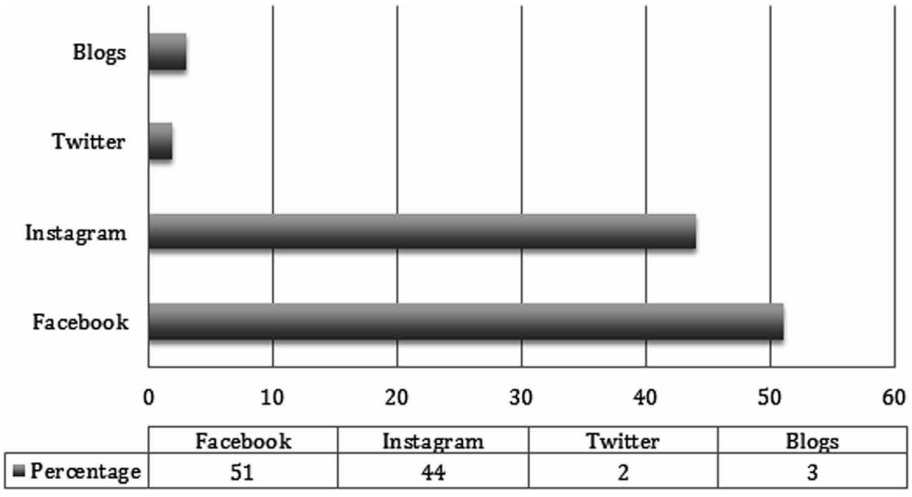

Figure 4. Industry of respondents

Two industries of SMEs were covered in this study namely the food and beverage industry as well as the apparel and accessory industry. Respondents from the apparel and accessory industry amounted to 53% whereas the remaining 47% were from the food and beverage industry. It is possible to say that both industries are currently thriving in the Malaysian economic scene, as the distributions of SMEs are almost similar

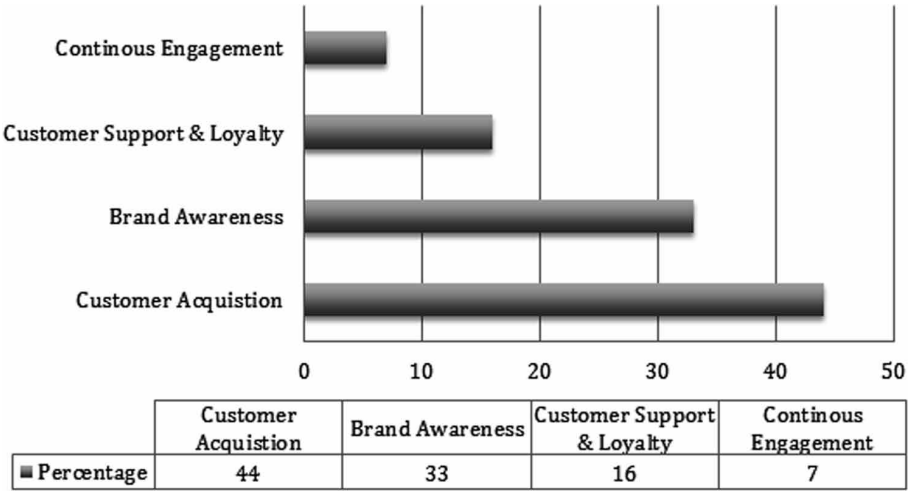
On the incidences of SMEs using social media, 92% of owners and managers claim that social media is incorporated into the SMEs marketing strategy while only 8% do not associate social media as part of their marketing strategies. Facebook ranked the top most used social media by SMEs with 51% of respondents using this platform while Instagram is the next choice of totaling 44% of the replies. Twitter and Blogs usage remain relatively low with only 2% and 3%. Youtube was not included, as SMEs in the survey did not use this social media application for their marketing activities. Figure 5 depicts this.

Figure 5. Social media platform usage by SMES

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

The primary objectives of using social media by SMEs in the Klang Valley tend to vary according to the individual goals of the respective owners and managers as seen in Figure 6.

The number one objective for SMEs in using social media is customer acquisition with 44%. Brand awareness is also an important objective with 33% of businesses ranking this as their end goal. Customer support and loyalty is third with 16% and only 7% of businesses use social media as a means of continuous engagement with customers. It can be implied that most businesses see social media as an advocate to help acquire more customers and in gaining customer awareness on their business



Following the objectives, the research also sought to identify the values of content that SMEs provide their customers through the use of social media. Respondents were given the option of selecting more than one value for this question. Figure 7 displays the result findings.

Out of the total responses, 88% of businesses chose "promote products and offers" while 72% of businesses "deliver updates" to their customers via social media platforms. SMEs are also actively interacting with their customers via social media as "respond to requests" is chosen by 63% of the respondents. The options of "add value to the content" and "provide utility/solve problems" were of lower interests with only 32% and 22% of respondents selecting this as values provided to customers.

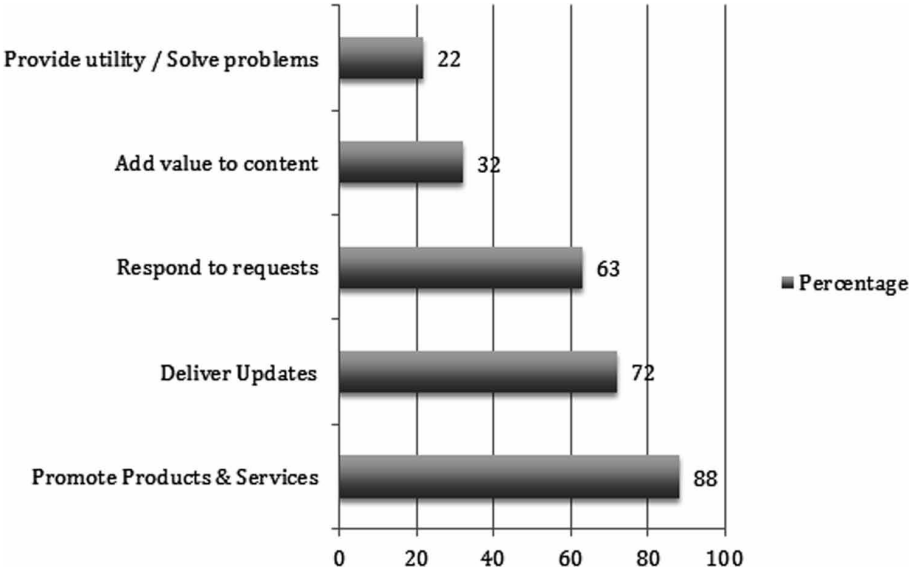
Next, the research prompted respondents on the activity level or frequency of use of social media. A total of 46% of SMEs spend an average of one to two hours daily on social media related activities, 37% dedicated more than four hours, and 17% use three to four hours of their day doing online sales via social media. On uploading new social media content, 50% of SMEs create new media on a daily basis, whereas 33% do it weekly. 15% of SMEs have monthly updates and 2% who claim to update content yearly. Figure 8 and Figure 9 show this.

The next step was to discover the resources that these businesses allocated for the social media platform. On the question of allocation of budget for social media marketing activities (e.g. Facebook ads, Instagram reviews, etc.) only 26% of respondents answered that they had a monthly marketing budget set aside for social media. Those respondents who had answered this question quoted a range of RM300 to RM500 per month. From this it is possible to assume that most SMEs choose social media as a marketing tool due to its "free publicity" nature. Another question on resources was whether SMEs had a

Figure 6. Objectives of social media

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 7. Values of social media



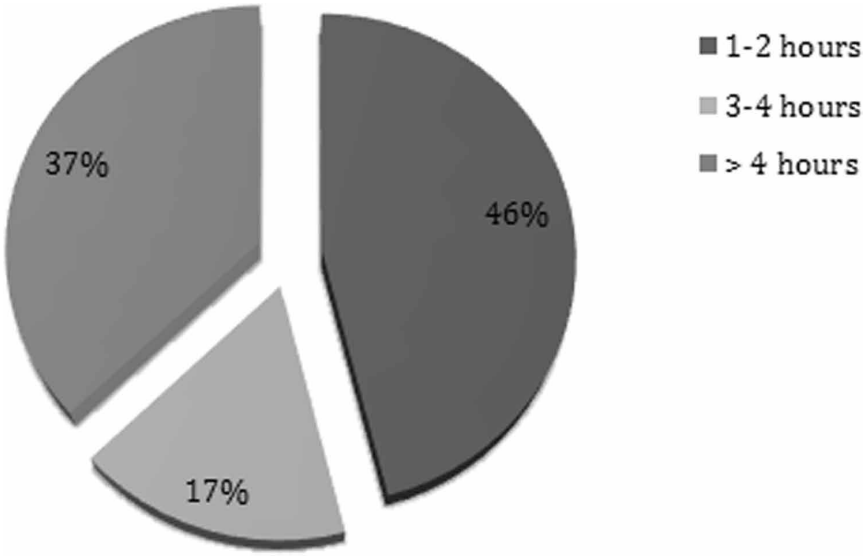


Figure 8. Daily use of social media

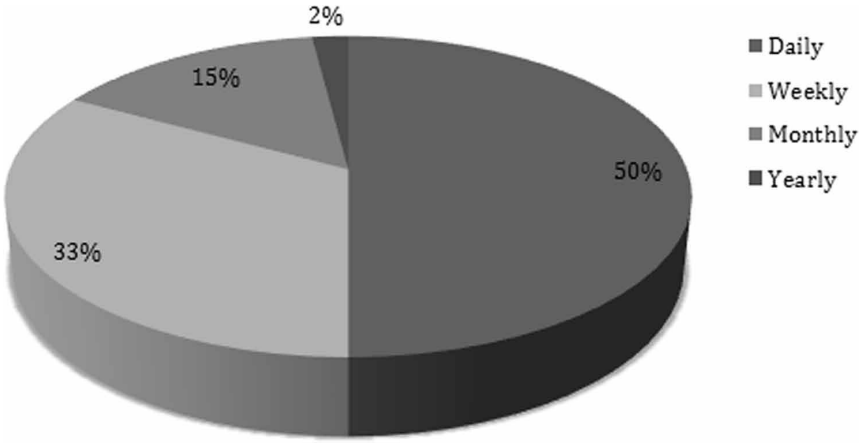

designated staff to handle their social media marketing, to which only 28% of the respondents had a dedicated employee in the company assigned to this function. In the case of social media training provided to staff; only 12% of SMEs provided some sort of guidance on social media marketing to the employees.

In the final section of the research, the perceived benefits and barriers on the adoption social media by SMEs was studied. Perceived benefits by SMEs were divided into four sections, namely, market development, efficiency in sales and promotions, ease of accessibility, and cost reduction. In market and development, the benefits ranked as chosen by respondents were; - 1) "developing new business oppor-

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 9. Updating the content

tunities" (57%), 2) "providing better service to customers" (28%) and 3) "enhancing company image" (15%). For efficiency in sales and promotions, the benefits ranked as chosen by respondents were; - 1) "reduced cost of advertising" (51%), 2) "providing more effective promotions" (25%), and 3) "online sales and operations" (24%). As for ease and accessibility, benefits ranked as chosen by respondents were; - 1) "24 hours accessibility" (56%), 2) "ease of access to potential customers" (37%), and 3) "low communication cost" (7%). As for cost reduction 81% of respondents chose "decrease in travelling" over 19% of respondents opting for "savings in phone bills" as the benefit. Figure 10, Figure 11, Figure 12 and Figure 13 illustrate the data according to the sections.

Lastly, the barriers of SMEs in the adoption of social media are discussed. Among the four difficulties, the biggest difficulty for SMEs is due to the lack of knowledge and expertise of staff on social media marketing with 38% of businesses stating this as their main problem. Staffs of these SMEs are usually of basic education qualifications and the outsourcing of menial jobs to foreign workers here in Malaysia maybe why this happens. Second is the uncertainty of whether or how can social media help the business with 32% of respondents selecting this as a barrier. From this, it can be presumed that although businesses use these technologies, they are unable to quantify or trust in social media strategies. The third highest ranked barrier was that social media required a big investment in time as chosen by 26% of respondents. Generally, most business managers or owners were more focused on daily operations linked directly to sales and profits. There is a small percentage of 4% of SME owners and managers that believe social media is not important for their business. These owners or managers may still prefer to do their marketing via traditional means of advertising. Figure 14 illustrates this.

Social Media Strategies by Age

In the first comparison analysis, the research aims to relate the (age of manager/owner) with the social media strategies employed by the SMEs. The three age groups of managers or owners covered in the survey are 20-29 years, 30-39 years, and 40-49 years.

For incidences of using social media, on the question of incorporating social media strategies in the SMEs marketing plans, managers from age group 20-29 recorded the highest amount. Managers in the

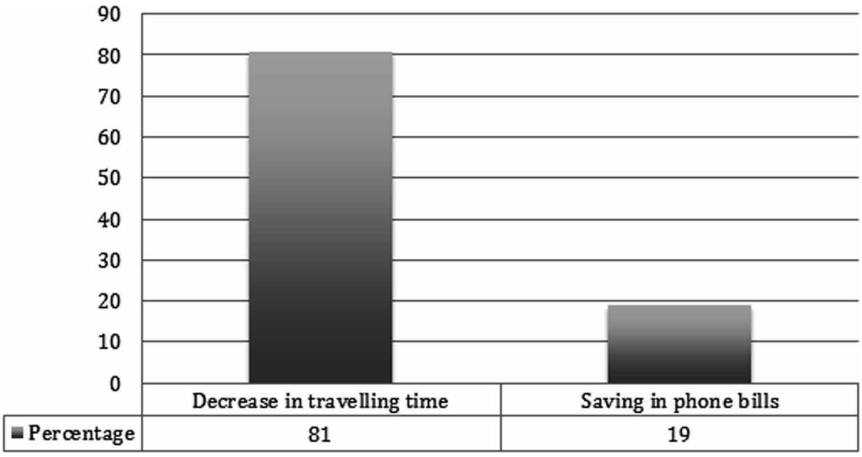
Figure 13. Benefits: cost reduction



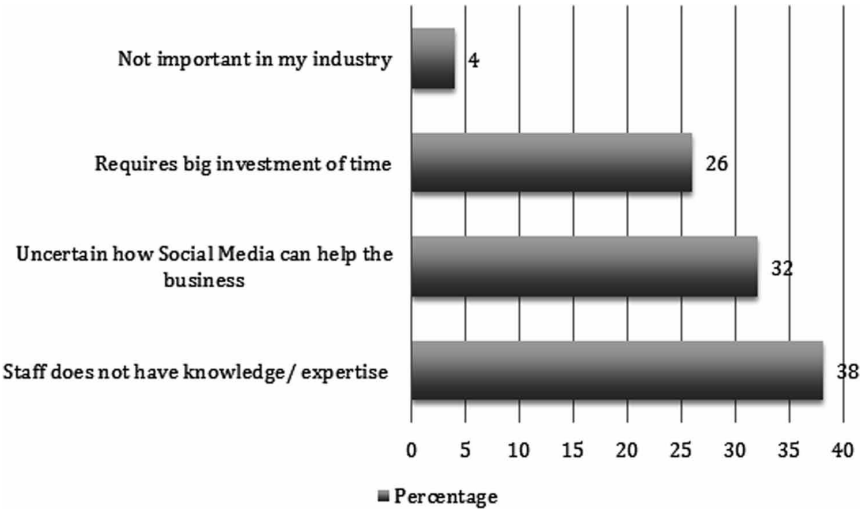


Figure 14. Barriers in adopting Social media

age group 30-39 also had social media incorporated into their marketing strategies at a lower percentage. The lowest percentage was from the age group 40-49. The results further strengthen reports of (Damanpour & Schneider, 2009) in that; older managers tend to be more accustomed to their routine and favor traditional forms of marketing. As for younger managers in both the lower age groups, it is clear that an element of social media is embedded from the very beginning and is one of the core marketing strategies.

The next comparison was the types of social media platforms that were adopted by the SMEs according to the manager or owner age level. Facebook remained the number one choice for all age groups. The adoption of this platform however was at different levels.. As with previous research (Wamba & Carter, 2014), Facebook is still the most used platform due to its widespread adoption and amount of users on the application, hence it is typical that this is the first go to for any SME adopting social media as a

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

marketing tool. The current on-going trend or latest application that ranked second in being adopted by SMEs as conducted in the survey is Instagram. One plausible explanation for this is that Instagram uses online mobile photo or video sharing where marketers are able to promote their products.

The next comparison was the objectives and value of content based on age group of managers or owners of SMEs. Younger managers seem to be motivated towards brand awareness. For managers in the older age groups the emphasis was towards customer acquisition. Customer acquisition is preferred among older managers due to its direct correlation with profits whereas younger managers goals could be to foster better consciousness among customers as a means to separating themselves from competitors. Promoting products and offers is reflected to be most important value of content for all SMEs regardless of the age group of the managers or owner's. The importance of marketing products for SMEs remains the same for all levels of managers or owners in the hope of influencing consumers to purchase their products or service.

Following that, the activity level or frequency of use of social media was conducted. Respondents in the age group 20-29 spend the highest amount of time, committing more than four hours daily on social media marketing activities. In the age group 30-39 and 40-49, respondents were less active on social media averaging one to two hours per day. The amount of time spent on social media decreases proportionally as the managers or owners' age increases. The advent of mobile devices such as hand phones and handheld computers may support this data. As younger managers are more technology savvy hence the usage of social media is much more when compared to their older counterparts.

Subsequently, a comparison was done on the allocation of resources of SMEs. Majority of managers took on the responsibility of handling social media activities with the exception of older managers whereby the task of social media was delegated to a younger supervisor or family member in the business. Trainings for staff on social media were also very low across all age groups. It can be said that although the usage of social media is high among SMEs, the requirement for structured ways of using social media is not enforced because most SMEs do not allow staff to handle social media marketing activities.

Lastly, a comparison on perceived benefits and barriers to the adoption of social media by SMEs according to the age was examined. In Market Development, the most looked-for benefit was that of "developing new business opportunities". This benefit is more sought by older managers compared younger managers, the percentage was much lower. The cause of this is that managers in this age group also prioritized "providing better service to customers" as the main benefit. The second sub category was Efficiency in Sales and Promotions. Younger managers were of the same requirements whereby "reduced cost of advertising" was the most chosen benefit. Older managers however cited "online sales and operations" as their chosen benefit. In newer SMEs with lower capitals, social media provides an excellent way to promote the business without much cost (Harris et al, 2008). As for more experienced managers, the ambition is to use this new technology to help improve current processes and transform it into a digital form. The third benefit category was Ease of Accessibility. Among the benefits in this category, managers or owners had all selected the same benefit, which was "24 hours accessibility". As with the use of online technologies for marketing activities, most SMEs found it more convenient as they are able to access the business and potential customers at any time fitting to them. Businesses are no longer tied to the standard operating hours but are available to customers 24-7. The last benefit category was on Cost Reduction. Results for this category was similar to that of the previous one, in that all the different age groups of managers or owners had chosen the same benefit, which was "decrease in travel time". The percentages showed an increase in the amount of managers, as the age groups get older. One reason behind this could be the value of time for business owners. Established owners tend to have multiple businesses and social media helps reduce the hassle of travelling long distances for business dealings.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Finally, the research intended to understand on the different barriers by SMEs in adopting social media according to the age level of managers. Younger managers said the main barrier they faced in adopting social media was "social media marketing requires a big investment in time". Middle-aged managers noted that barriers for adoption of social media would be that "staff is unfamiliar or lacks technical skills". Older managers said the main obstacle would be "uncertain whether or how social media marketing can help the business". Through the comments, it is clear that not every individual views the adoption of social media the same. For younger managers who are more confident on using social media and tend to handle social media marketing activities themselves, the worry is that too much time is required and they will be unable to perform other tasks related to marketing. On the other hand, middle-aged managers tend to lean towards the competency of staff, as most managers may want to delegate the job of social media to their employees. Older managers however, are still used to the traditional forms of marketing.

Social Media Strategies by Education Attainment

In the second comparison analysis, the research examined the (education attainment of manager/owner) with the social media strategies employed by the SMEs. Education attainments in the survey have been classified into two groups, which are Basic Education (High School and Certificate/Diploma) and Higher Education (Bachelors Degree, Masters Degree and PhD).

For incidences of using social media, on the question of integrating social media strategies in the SMEs marketing plans, both groups of managers noted that social media strategies were incorporated into their marketing plans. The next comparison was the types of social media platforms that were adopted by the SMEs with managers from different education levels. In the basic education group, Facebook was the most widely adopted. But for the higher education group, Facebook and Instagram shared the same amount of adoption.

The next comparison was the objectives and value of content based on education attainment of managers or owners of SMEs. Managers in the basic education levels are driven by sales. For managers in the higher education group, the objectives are far less outward as customer acquisition and brand awareness are both deemed equally important. Managers with higher education may be exposed to business strategies and understand the importance of creating brand awareness for long-term profits. As for the value of content, both groups irrespective of the educational attainment had selected "promoting products and offers". In the business industry, all SMEs adopt the fundamental marketing strategy to promote products and services to customers and influence them to make purchases.

Subsequently, the activity level or frequency of use of social media by SMEs based on the different educational groups was analyzed. Managers in both the groups spent one to two hours daily on social media marketing activities. In creating new social media content, both education updated news daily. In terms of activity level and frequency, no difference is noted.

With regards to staffing, it is noted that managers or owners of different educational attainments still opted to handle social media marketing activities themselves. Trainings for staff on social media were also very low across both education groups.

Finally, a comparison on perceived benefits and barriers to the adoption of social media by SMEs according to the educational level was studied. In Market Development, the most looked-for benefit was "developing new business opportunities".. The second sub category was Efficiency in Sales and Promotions. Out of the two education groups, "reduced cost of advertising" was the most selected benefit. Social media is viewed as a cheaper alternative for promotion and publicity when compared to traditional forms of

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

advertising (e.g. newspapers or brochures). The third benefit category was Ease of Accessibility. The benefit of "24 hours accessibility" was the number one criteria selected by both groups. Both groups agree that through social media, the businesses are able to run more efficiently and owners may access the platform at any time. The last benefit category was on Cost Reduction. Both groups selected "decrease in travel time".

Finally, the research intended to understand the barriers by SMEs in adopting social media according to the different educational level groups. In both groups, "staff is unfamiliar or lacks technical skills to use social media marketing" is deemed to be the biggest obstacle. This highlights the general view of managers concerning staff competency or lack of it in managing and using social media marketing strategies.

Social Media Strategies by Industry

For the third comparison analysis, the research intended to observe the (difference in industries) with the social media strategies employed by the SMEs. The two separate groups studied in the survey were the Food and beverage industry and the apparel and accessory industry.

For incidences of using social media, on the subject of incorporating social media strategies in the SMEs marketing plans, both groups of managers noted that social media strategies were incorporated into their marketing plans. Across industries, social media is a core component in the marketing strategies of SMEs. The next comparison was the types of social media platforms that were adopted by the SMEs. Facebook ranked the most used social media platform in the two different industries.

The next comparison was the objectives and value of content based on the different industries of SMEs. The most selected objective across both industries was customer acquisition. For the value of content, "promoting products and offers", had been chosen by both industries. The percentages for the apparel and accessory industry are slightly higher possibly due to the heavy reliance of social media to sell the continuous range of products to customers.

After that, the activity level or frequency of use of social media by SMEs based on the different industries was conducted. Respondents in the food and beverage industry spent one to two hours of the day on social media marketing activities. SMEs in the apparel and accessory industry however spent more time on social media marketing activities committing up to four hours daily. In creating new social media content, both industries uploaded new content on a daily basis. The average daily time spent on social media is higher in the apparel and accessory industry probably due to SMEs having to promote various goods across the product range to customers.

Next, a comparison was done on the allocation of resources of SMEs by industries. The research indicated that in both the industries, managers or owners of SMEs chose to handle social media themselves. Trainings for staff on social media were also minimal in both industries. In both industries, it is noted that there is low levels of training provided to staff as most managers or owners chose to carry the task of managing the marketing activities themselves.

Finally, a comparison on perceived benefits and barriers to the adoption of social media by SMEs in different industries was studied. In Market Development, the most wanted benefit was that of "developing new business opportunities". The second sub category was Efficiency in Sales and Promotions. Both industries agreed that "reduced cost of advertising" was the most sought benefit. The third benefit category was Ease of Accessibility. The benefit of "24 hours accessibility" was the number one criteria chosen from both groups. The last benefit category was on Cost Reduction. The results of percentages were nearly the same with both industries selecting "decrease in travel time" as the benefit. In this the difference in industry does not affect the outcome of the perceived benefits.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Lastly, the research intended to understand on the different barriers by SMEs in adopting social media according to the industries. In both groups, "staff is unfamiliar or lacks technical skills to use social media marketing" is deemed to be the major difficulty for SMEs to adopt social media. In the same way, barriers for adoption of social media by SMEs are the same.

Based on the results, it can be stated that successful adoption of social media practices, perceived benefits and barriers depends on the manager's age and educational level. The final section will provide the conclusion and recommendations of the study.

SUMMARY AND CONCLUSION

The study aimed to identify SMEs use of social media, their social media practices and the perceived benefits and barriers in adopting social media for marketing strategies.

In the operational model, the manager/owner characteristics (age / educational attainment) and different industries of SMEs lead to social media practices as well as perceived benefits and barriers. The research shows that use of social media has provided value for SMEs in the incorporated marketing strategies. The results of this study indicate that Facebook still holds it place as the most used social media platform by businesses in the Klang Valley region of Malaysia. However, new social media platforms such as Instagram are gaining popularity among the businesses.

The research results also indicate that the main objective of using social media strategies by SMEs is for customer acquisition but brand awareness is becoming more significant as SMEs learn to understand its importance. Besides that, the research findings highlight promoting products, delivering updates and responding to requests as the main values of content for SMEs in using social media. In terms of activity level or frequency of use, the research results point out that SMEs are indeed active on using social media as a marketing tool, spending a few hours and updating content daily

Surprisingly, the research results discovered a major flaw in the adoption of social media strategies by SMEs. Though usage of social media strategies was high, almost all of the SMEs did not emphasize on the allocation of resources to this tool. Budgets were not divulged and very few SMEs had a dedicated staff to handle the social media marketing. Besides that, there was very minimal training provided to staff on how to handle social media marketing activities.

Out of the four categories of benefits, the research results show that social media marketing helps SMEs in developing new business opportunities, reduces the cost of advertising, is accessible 24 hours and decreases travelling time. The research results also indicate that the major barrier for SMEs in adopting social media is that staff are unfamiliar or lack technical knowledge on social media marketing.

In comparison of the different attributes of SMEs, the research results indicate that managers or owners age level and educational attainment have a major impact on the adoption of social media as a marketing tool. The research results indicate that younger managers are more flexible and open to new ideas and tools and are more likely to incorporate social media into marketing strategies than older managers. Younger managers also spend more time utilizing social media as a marketing tool compared to older managers, a finding consistent to previous literature. The research results illustrate the difference in perceived benefits and barriers of social media marketing strategies amongst managers of different age groups. In addition to that, the research results also imply that a manager or owner's educational

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

attainment has a positive affect on the use of new technologies by the SMEs. Managers with higher educational backgrounds are more supportive of using new technologies (e.g the use of Instagram) as compared to managers with basic education. Finally, in comparing different industries, the research result did not exhibit any significance in the adoption of social media by SMEs.

Implications for Research

The increasing acceptance of social media for marketing activities makes adoption very attractive for SMEs. Firms can now use social media to foster interactions with existing and new customers and to enhance sales and operations of businesses. In many cases, they can improve customer acquisition and create brand awareness by providing constant product updates and receive feedback from customers

The research has significance in that it identifies the main objectives, practices, benefits and barriers of social media by SMEs. Although research on use of social media is rising, there are currently few studies on use of social media by SMEs. Available literature on local businesses are limited and focused on larger corporations or individual companies. This study is an attempt to highlight the social media practices as well as explore the factors that significantly affect social media as a marketing tool among SMEs.

Implications for Practice

The results indicate that there is a notable relationship between the manager's age and adoption of social media. Younger managers are more probable to adopt social media strategies. SMEs should therefore consider developing young managers as this could positively influence the direction of the business to adopt social media marketing strategies. Larger companies have management trainee programs designed to groom fresh graduates for managerial positions. SMEs could gain by emulating such programs. More importantly SMEs should consider allocating more resources to the use of social media. Trainings with consultants or online advertising companies should be provided to staff as to overcome the barriers of adopting social media. SMEs could also apply "best practices" based on the trainings to better benefit from social media.

Limitations and Suggestions for Future Research

There are several limitations with this study. Similar to other survey based projects, there is a risk of bias. Sometimes, respondents may provide answers deemed to be desirable instead of reporting the normal practice. In this research, quantitative data was obtained from 150 respondents in the Klang Valley due to time constraint and limited financial resources. Future research could include qualitative data for better understanding and analysis. To broaden the coverage of the research different industries and a wider location across Malaysia can be explored further. For future research direction, analysis regarding the effectiveness of social media in leveraging competition by small businesses against big companies can provide a better insight and understanding towards this study.

KEY TERMS AND DEFINITIONS

Facebook: As defined by Derham, Cragg and Morish (2011), Facebook is one of the main platforms for social commerce that allows firms to harness social capital by tapping into the tremendous word-of-mouth potential of its active users.

Innovation: The Oxford Handbook of Innovation Management (2013) describes innovation as an essential means by which organisations survive and thrive.

Manager's Characteristics: A critical role of managers (age, education, and gender) in influencing behaviours in a wide variety of domains (Damanpour & Schneider, 2009).

Marketing Activities: The activity, set of institutions, and processes for creating, communicating, delivering, and exchanging offerings that have value for customers, clients, partners, and society at large. (American Marketing Association, 2013).

Small and Medium Entreprises (SMEs): The National SME Development Council (NSDC) Malaysia (2013) defines SMEs in two categories. Manufacturing: Sales turnover not exceeding RM50 million OR full-time employees not exceeding 200 workers and Services and other sectors: Sales turnover not exceeding RM20 million OR full-time employees not exceeding 75 workers.

Social Media Tools: Online platforms that provide improved communication and collaboration between the firm and its stakeholders (e.g., customers, suppliers, business partners). (Wamba & Carter, 2014).

Web 2.0: Anderson (2007) describes Web 2.0 or social media as a group of technologies that have become deeply connected contributing to a more socially linked web where everybody is capable off adding and editing content.

This research was previously published in the Handbook of Research on Small and Medium Enterprises in Developing Countries edited by T. Ramayah, Syed Abidur Rahman, Noor Hazlina Ahmad, and Hasliza Abdul Halim; pages 377-400, copyright year 2017 by Business Science Reference (an imprint of IGI Global).

APPENDIX: QUESTIONNAIRE

Section 1

1. What is your age group?
    a. 20-29
    b. 30-39
    c. 40-49
    d. 50 and above
2. What is your highest level of education?
    a. High School
    b. Certificate / Diploma
    c. Bachelor's Degree
    d. Masters Degree/ PHD
3. What industry are you currently in?
    a. Food/Beverage
    b. Apparel/Accessories

Section 2

4. Is social media incorporated in your marketing plans?
    a. Yes
    b. No
5. Based on the list, what social media do you use?
    a. Facebook
    b. Instagram
    c. Twitter
    d. Blogs
6. Please indicate how focused your marketing is on the following platforms.

Box 1.

	Not at all focused	Somewhat focused	Very focused
Facebook			
Instagram			
Twitter			
Blogs			

7. What are your primary objectives of using social media?
    a. Customer Acquisition
    b. Brand Awareness
    c. Ongoing Engagement

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

   d. Customer Support and Loyalty
8. How do you measure success?
   a. Number of Fans/followers/Likes
   b. Number of Comments
   c. Number of Retweets
   d. Referrals
9. What is your daily time commitment for social media?
   a. 0 hours
   b. 1-2 hours
   c. 3-4 hours
   d. More then 4 hours
10. How often do you create new social media content?
   a. Daily
   b. Weekly
   c. Monthly
   d. Yearly
   e. Never
11. What is the value of your content? (Select all that apply)
   a. Deliver updates
   b. Promote products and offers
   c. Add value to the content
   d. Respond to requests
   e. Provide utility/solve problems
12. Do you have a dedicated employee/personnel specifically handling social media activities?
   a. Yes
   b. No
   c. I handle the social media activities myself
13. Do you have any social media training to your employees?
   a. Yes
   b. No
14. Do you have a social media-marketing budget?
   a. Yes. (Please specify amount. RM_____)
   b. No

Section 3

15. What benefits do you think are the most important in using social media for your business?
   a. Market Development.
      i. Developing new business opportunities
      ii. Enhancing company image
      iii. Providing better service to customers
   b. Efficiency in Sales and Promotion.
      i. Online Sales and Operations

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

   ii. Reduced cost of advertising
   iii. Providing more effective promotions
c. Easy of Accessibility.
   i. Low communication cost
   ii. 24h accessibility
   iii. Ease of access to potential customers
d. Cost Reduction.
   i. Decrease in travel time
   ii. Savings in phone bills

16. What are the barriers for you to adopt social media marketing for your business?
   a. Social Media Marketing is not important in my industry.
   b. Uncertain whether or how can social media marketing help the business.
   c. Social Media Marketing requires a big investment in time.
   d. Staff is not familiar with social media marketing.
   e. Staff does not have technical skills to use social media marketing.

Chapter 11
Metacognition of Organization Members as the Basis of Learning Strategy in Higher School

Irina Sergeyevna Yakimanskaya
Orenburg State University, Russia

Anna Mikhaylovna Molokostova
Moscow Humanitarian-Economical Institute, Russia

Milyausha Yakubovna Ibragimova
Kazan (Volga Region) Federal University, Russia

ABSTRACT

The concept of metacognition is used to study knowledge of knowledge, and mainly in cognitive psychology. According to the content; metacognition is an intelligent process related to memory, reflection and motivation. The problem, we research, concerns the fact that the content and the mismatch of employees views can lead to non-constructive activity that violates the effectiveness of an organization as a whole. The outcome of this study is a model that describe the characteristics of the organization through determination of the metacognitive skills of employees at different levels. The model takes into account the emotional colouring, different levels of metacognition inconsistency, characteristic of the organization effectiveness and various inconsistencies of metacognitions.

INTRODUCTION

The theory of metacognition is currently one of the most studied topics of empirical research in cognitive psychology. Since the emergence of research interest in this field, a number of experiments has been made dealing with mechanisms that people use to overcome decision-making difficulties and form their perceptions of the surrounding world. Modern psychology has various approaches in defining

metacognition: J. Flavell [1979], who introduced this term, meant a special cognitive process aimed at understanding one's own cognitive activity or, in other words, "mental activity aimed at understanding the thinking process". This is the definition followed by this article's authors. J. Flavell distinguished three main components of metacognition: planning, monitoring, and regulation. W. Schneider and K. Lockl (2002), M. E. Marinez (2006), K. Ray, M. C. Smith (2010), B. White (2005) associate metacognition with a wide range of psychological phenomena such as motivation, critical thinking, and meta-memory. G. Schraw, K. J. Crippen, K. Hartley (2006) mentions the possibility of applying metacognition as an indicator of learning activities; these authors also note the possibility of viewing metacognition as an indicator of a higher school graduate's realization as a specialist in an organization. The authors view a graduate's metacognition as a component of planning which includes knowledge of the organization (their image of the relations between "myself", "organization", and "society"; metaphor of the organization; knowledge of its structure, size, hierarchy, resources, information ties, motivational system and mission), monitoring of the thinking process (which includes the images of the organization's current and desired states) and regulation of their own behavior in the organization on this basis. It should be noted that research on metacognition in education is being done relatively often; for instance, there is a differentiation of metacognitive skills and metacognitive knowledge. G. Schraw, K. J. Crippen, K. Hartley (2006) write that knowledge is the complex of a student's views on the relations between their own personality traits and a problem's properties and possible solutions – as part of an academic situation for a student and as part of a specific organization for its member. Metacognitive skills provide regulation and control of learning activities [Schneider, Lockl, 2002], in the case of the authors' research – control of a higher school graduate's activity in an organization. For example, the results by S. Gómez-Haro, J. Aragón-Correa, E. Cordón-Pozo (2011) show that organization members react to the perception of context rather than to the organization's objective characteristics. It should be noted that the authors did not find a research dedicated to the specifics of metacognition formation in higher school graduate students as members of organizations, even though such information would make it easier for them to start a professional experience and build a career in an organization. Thus, the problems raised by this research dedicated to the study of metacognition formation sources in organization members appear to be relevant and in high demand in the context of application in higher schools. The authors take into account the institutional approach in the implementation of this study, referring to the interaction of specific aspects of an organization (structure, size, hierarchy, resources, information ties, motivational system and mission) and its members' characteristics (position etc.) in the formation of metacognition. The institutional approach is considered by the authors to have a top priority in the interaction of organization leaders with higher school graduates. In addition, it is also the basis for the work of higher school educators on securing the graduates' entrance into the professional sphere. The authors' research uses the theory of strategic choice for the analysis of metacognition (in their regulative aspect) and characteristics of organizations that hire higher school graduates.

The aim of this chapter is to examine the relationship between (1) perceived aspects of an organization and (2) objective positions of its members and of the organization as a whole (official position, age, size, territory, and sector). Due to a large volume of research, the authors had to confine this work to the official position, but other characteristics are planned to be studied as well. The relationship under research appeared on a quantitative level; the authors' opinion is that it is two-way, so non-parametric criteria of differences between groups were used for the analysis.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

The article's structure is as follows: in the first section, the authors present the theoretical basis of the research and hypotheses. The second section is a description and justification of research methods. The third section presents the results of the analysis and discussion in the context of the objectives set and the hypotheses suggested. The conclusion lists the main findings and limitations along with suggestions for further research.

THE THEORY AND HYPOTHESES OF THE RESEARCH

Modern psychology provides various definitions of metacognition. J. Flavell [1979], who introduced this term, meant a special cognitive process aimed at understanding one's own cognitive activity or, in other words, "mental activity aimed at understanding the thinking process". If learning is taking place without understanding the cognition process, the knowledge is passive and has a lower efficiency. Metacognition is viewed as control and management of low-level thinking (operations) by a higher level of thinking [Broadbent, 1977].

J. Flavell was the first to attempt to identify elements of metacognition. He built a cognitive model or regulation made up of: 1) metacognitive knowledge; 2) metacognitive experience; 3) cognitive goals or objectives; and 4) cognitive strategies. By monitoring their thinking, people receive information about their state of knowledge or cognitive strategies, while control is used to regulate their thinking [Flavell, 1979].

Next it would be appropriate to highlight the subject of metacognition with regard to organizations. Organizational psychology has various structures and models for describing organizations. Managing an organization in any culture, economic and political conditions is always associated with the definition of objectives and characteristics of the organization. Naturally, a question arises regarding the assessment of the structure's correspondence to stated goals and objectives of the organization in the employees' eyes. To evaluate the success of a chosen structure, the optimality of coordination processes is usually analyzed, and to assess its adequacy, various characteristics of the staff are considered. We should focus on studying an organization's structure and role in efficiency management as covered in the works with the latest research on organizations [Argyris, 2004; Warner, 2001].

Any organizational structure is stable enough and is able to reproduce the patterns of management and interaction. Explicit or hidden rules produced by the structure are unambiguously related to an organization's stability and preservation. One could say that an organization's structure is a mechanism of reproducing business relations. The structure, in its turn, manages communication processes. Clear communication reduces the uncertainty of a work's conditions and criteria; it allows to make decisions timely and share responsibility for real achievements and failures. In an effective communication system, the organization's goals, objectives and standards are legalized, which makes them understandable for the employees [Mintzberg, Quinn, & Ghoshal, 2001; Yakimanskaya 2013].

In the classic organization theories, the conscious acceptance of goals by the employees and the realization of a particular type of strategy are recognized as key factors of organizational success. A common assumption in the modern theory of organizations is that a goal or strategy defines the organization's characteristics. At the same time, the primary task of the leaders to explain the goals and mission and to inspire the staff is emphasized [Muczynski, 2004].

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

It has to be admitted that researchers do not restrict themselves to proclaiming the priority of goals over contextual characteristics; attention is also paid to searching models and means of effective staff management and organization management. A special mention should go to the approach originated in the works of F. Selznic (1984) and A. Etzioni (2001).

At various points of teamwork one or another factor requires study and managerial work on explanation and coordination of positions. Attention to the points of agreement allows to prevent malfunctioning in the organization and to localize social risks and conflicts in good time [Molokostova, 2013; Yakimanskaya, 2014].

In the early 20th century, Roger Paul Lawrence and Jay William Lorsch proposed a model called "complex organizations". According to the authors, each unit works with a separate part of the environment and applies specific methods, algorithm and communications. This division inevitably leads to the formation of three large and relatively autonomous organizational substructures: development department, sales department, and production department. Consequently, a problem of building interactions and resolving conflicts between the departments arises. The more complicated and diverse the organization's activities are, the more difficult communication and interaction between the departments become. The difficulties are eliminated by introducing integration groups of employees or by the addition of integration and communication functions to their responsibilities. From a behavioral point of view, conflicts are successfully resolved by leaders who are prepared to handle problems and are willing to use negotiations, and not just allow one side to force the other to carry out the decisions on their elimination [Rubin, Pruit, Kim Hye Sung, 2003; Warner, 2001]. In this case, conflicts are not defused but rather aggravated, but with timely and competent management they do not become destructive.

The search for predictors that would allow to anticipate and control the difficulties of the future development periods of an organization in the communication process is an objective of empirical research, but at the same time it requires a theoretical understanding [Molokostova, 2013].

An organization is more directly influenced by market demand, competition, laws and their amendments, etc. than it is thought and perceived to be by the members of the organization. We consider it appropriate to specify the three abstract components of social systems important for our work: roles, norms and organizational culture [Muczynski, 2004].

All these aspects depend on the organization's kind of activity and on the characteristics of employees who constitute it. The formation of loyalty is determined by how the goals and environment of the organization are accepted in an employee's personal meaning [Adizes, 2008].

How does the law of conservation of an organization work in times of crisis? Naturally, the first to notice the existence of the crisis are top managers, as the need for change is evident for the leaders. Middle managers are involved in the solution of specific tasks and do not think so big. Line managers develop the feelings of incomprehension and personal dissatisfaction with what is happening, the feeling of pressure from the management. Resistance becomes a major obstacle to the changes planned by the "tops" [Yakimanskaya, 2014]. Evaluation of the organization's current situation by line managers is a key factor since the effectiveness of change and control of social risks depend on their personal position and loyalty to the organization, on the extent to which they are ready to act in the conditions and times difficult for the organization.

According to a research by E. Miller and E. Menzies, many ways of working are primarily aimed at maintaining a relatively comfortable emotional state, so performing work tasks consumes significantly less energy, which is not conducive to effective work (Miller, 2001). The most effective option is con-

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

sidered to be a combination of high demands with the support of the leader. Thus, an internal knowledge of the organization as a dangerous environment is formed, and any changes may lead to a greater harm to the employees [Lazarus, 2003; Fernham 2014].

Taking responsibility for the implementation of imminent modifications or rejecting activity is determined by how much value and personal meaning the organization has for the employees [Lupina-Wegener, Drzensky, Ullrich, & Van Dick, 2014].

Basing on the characteristics of the organizational environment cited above that give reasons for assessment and prediction of its future state and effectiveness, the authors identified the parameters or sets of characteristics of an organization that constitute the metacognition of its members; they are informative for a research of the real difficulties faced by both management and employees.

One more work seems interesting to us since it has to do with finding the key factors of an organization and developing effective communication between employees of different departments performing both administrative and executive functions. This is a work by James David Thompson who says that organizations are open multi-component systems operating in a situation of high uncertainty [Thompson, 1956].

The interpretation of modern organizations as complex systems is based on distinguishing therein two professional groups, or two types of units with opposing goals, nature of conditions and functioning principles: the technical core producing the main product, and service departments. These substructures perform different functions and are subject to unfavorable environmental conditions to different degrees.

Consequently, the work on developing effective interaction between employees with different functions in the organization is associated by the majority of researchers with the establishment of a clear communicative system enabling to receive and impart information, to understand the goals and objectives, and to take part in important decisions. To study real organizations, it is important to understand at what stage of development they are [Adizes, 2008].

According to the authors' opinion, the significant points of organization members' metacognition in Russian organizational psychology most often include the following ones with respect to the organization: its size and structure, hierarchy, goals, resources, types of resources, information ties system, reward system, corporate ethics, its message to the world, and its mission [Bogdanov, 1989; Kabashov, 2011].

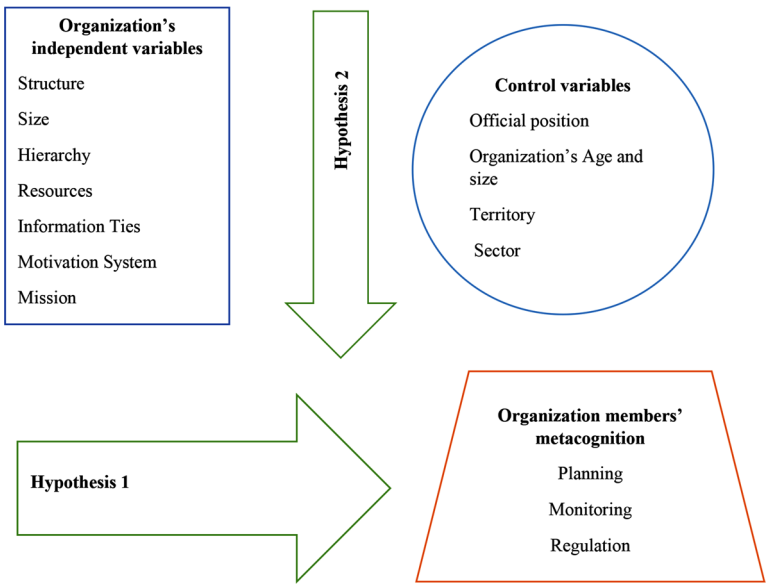
Let us consider some factors that are directly relevant to the goals and objectives of this research.

The indicator of the organization's size and structure reflects its most common parameters as viewed by its members and allows to keep the correspondence of the company's goals and aims and its objective characteristics up to date. The indicator of the organization's hierarchy shows how well-developed and well-known the relations of subordination and superiority are to its members, how clearly the power is distributed and whether the declared objectives of the organization agree with the objectives of its management. The indicator of the organization's resources and their types makes it possible to reflect the availability of the organization's sources of development for its members, to give a characteristic of the organization's overall potential, a scenario of its development. The indicator of information ties system in the organization reflects the internal and external state of the information field. This mainly refers to the streams of information that exist within the organization and are aimed at the coordination of teamwork through timely exchange of data and relevant information. The indicator of the system of rewards and sanctions in the organization and corporate ethics allow to determine the general condition of the members' motivation, to identify the piled-up discontent and difficulties in the system of "superiority–subordination" and develop common directions of incentives for the employees. The message to the world is reflected in the organization members' views of its mission, role in society and, in particular, of its value for themselves and other people.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

From this perspective, the authors decided on two hypotheses (Figure 1):

Hypothesis 1: The perception of the organization's characteristics which are independent variables can be used by its members in the process of formation of images, i.e. metacognition.
Hypothesis 2: Metacognition of organization members differ in connection with their position.



Thus, in times of crisis and instability, activity and metacognition of employees can both contribute to and hinder the success and reliability of an organization. The employees, being the only ones who fulfill the organization's goals and objectives, may have different positions according to their degree of loyalty, involvement, approval, etc. The decisive role here is played by the attitude that the top management, which solves the organization's problems in different ways, accords to their employees [Borkowski, Carr, & Pressely, 1987].

DESCRIPTION AND JUSTIFICATION OF THE RESEARCH METHODS

This research was conducted in several stages as the problem of building a complete picture of metacognition at various levels of the organization had to be solved as follows:

- A research on the image of the organization's characteristics in its members differing by their position as the basis of metacognition formation (to test hypothesis 2). In this research, the authors considered only a few important characteristics of the organization as viewed of its members: its structure and size, resources, hierarchy, communication and information streams, motivation system.

Figure 1.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

- A research on the employees' views on the real and desired state of the organization. Employees of various departments and positions were asked to describe the current state of the organization and its desired state. The discrepancy of the two images made it possible not only to understand what actions should be taken to improve the efficiency of the system, but also to draw conclusions on how the employees' views are formed.
- An analysis of the views on the relations between "myself", "organization", and "society"; a metaphor of the organization by its members. This side of metacognition allowed judging not only the direct but also indirect components of the views on the organization.

The aim of this research is to study the relationship between (1) the perceived aspects of the organization and (2) the objective positions of its members and of the organization as a whole (official position, age, size, territory, and sector). Due to a large volume of research, the authors had to confine to the official position, but other characteristics are planned to be studied as well.

A complete picture of an organization's condition consists of a comparison of inconsistencies witnessing the absence of coordination not only in the understanding of the organization's objectives and structure, but also in communication and teamwork. The employees' knowledge of the organizational system and metacognition are determined by the organization's characteristics and by personal traits and perceptions of individual employees. Describing the elements of knowledge of the organization requires identifying the organization's key factors determining the general views of the employees.

We have consistently carried out the following tasks:

- A theoretical description of a complicated notion of metacognition as a system of employees' views on the organization;
- An empirical research on metacognition peculiarities in members on various levels of the organization;
- A comparison of metacognition in members of a specific organization;
- Creating a description model of organizational environment conditions that would allow diagnosing it and using for teaching higher school students.
- A research on the image of the organization's characteristics in its members differing by their position.

Due to the research's approximate, preliminary nature, the authors decided to make the sampling as wide as possible, so the study was conducted in 3 organizations of various orientations: educational, productive, and social. The samplings consisted of top and middle managers and workers; 15 randomly selected members of different positions were surveyed in each organization (50% males and 50% females, balanced by age, average 35-40 years). A total of 45 subjects participated at this stage.

The authors used the structured interview technique; its topics were the organization's characteristics and their discussion. Groups based on formal structure were formed (top and middle managers, subordinates); interview questions were developed; protocoling and deciphering the data was conducted followed by summarizing the results.

To comply with the ethical requirements increasing the reliability of the information received, it was important to create in the groups as much free space communication as possible; it gave the participants an opportunity to share their ideas and express their views on emotionally-charged issues.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

- A research on the employees' views on the real and desired state of the organization.

Employees of various departments and positions were asked to describe the current state of the organization and its desired state. The discrepancy of the two images made it possible not only to understand what actions should be taken to improve the efficiency of the system, but also to draw conclusions on how the employees' views are formed.

The comparison of parameter values for the real and desired states of the organization shed light on what the organization should strive for according to the staff. In the context of metacognition content construction, it was important not only to detect the discrepancies but to confirm that they are crucial elements of organizational knowledge and make an integral picture formed within the organization.

The diagnostics of the organization's condition was carried out by studying the employees' attitudes and perceptions of the organizational system through formalized interviews. For this purpose, we modified M. Zilberman's questionnaire containing 40 questions which we grouped by five factors: organization's achievements, social involvement, feedback, employee loyalty, and ability to change [Zilberman, 2007].

The basis for the research was a commercial organization – a small business going through a period of growth. The request for research was submitted by the organization's owner and is caused by the necessity of change in society and economics during the crisis.

The research involved 75% of the organization's staff who had work experience from several months to 5 years. Employees of different positions answered the consultant's questions; all the answers were protocoled. At this stage, 22 employees took part in the research: 9 top managers and 13 line managers. Since personal perception was under focus in this case, the definition of organization was given first – so that the subject of study is the same for all employees. Then primary assessments and relationship measures of individual parameters for the real picture and the expected organization were calculated in the entire set of responses. The general directions of the results' description and analysis are as follows:

- Identifying lowest and highest parameter values for real and desired state of the organization;
- Identifying the biggest discrepancies between the real and desired states;
- Making the pictures of real and desired organizations.

To confirm the statistical reliability of the differences and discrepancies under study in the estimates of the same sampling, the authors used Wilcoxon's signed rank test.

- The analysis of the views on the relations between "myself", "organization", and "society"; a metaphor of the organization by its members.

The authors undertook a qualitative study using the proposed and piloted projective techniques including the semantic psycho-geometric test and the "Postcards" test.

The authors believe that characterizing the intra-organizational environment and highlighting the areas of particular tension and social risks recreates an overall picture of knowledge or metacognition of the employees. These subjective phenomena are not easy to objectify since the employees, fearing pressure from the management, try not to show their negative perception of what is happening in the organization.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

The authors are convinced that such emotionally-charged issues as the attitude to the organization, management and hierarchy, and one's own role in this system require the utmost discretion and respect for psychological safety requirements. Direct questions do not allow making a reliable picture of cognition; moreover, the use of implicit research methods allows weakening the cognitive control encouraging socially desirable answers.

Firstly, the authors conducted preliminary interviews with the participants of business processes in the organization and defined the stimulus materials. Then we picked up a group of organization members of various positions most typical by age, working experience, and status and invited them for the research after taking informed consent to participate in the experiment. Then, after processing the obtained data, the authors discussed them at the organization meeting.

The group that took part in the research included 2 subgroups: top managers (8 people) and line managers (8 people), 50% males and 50% females of 30-40 years of age.

The authors used the following projective methods:

- Semantic psycho-geometric test (S. Dellinger's test modified by us). The employees were offered a set of figures of various sizes and shapes. The group members were asked to relate the figures and the concepts of "myself", "organization", and "society". To do that, they were asked to choose a shape (triangle, square, circle of a large, medium and small size) associated with the concepts above and to color it. Then the selected pieces were placed on a standard sheet of paper and outlined; within the shapes the group members wrote their associations. The concepts of "myself", "organization", and "society" were chosen to describe the views on the organization's state in the outer and inner spaces: environment space and personality space. The participants of our study showed a distinctive projection of the characteristics and state of the intra-organizational environment. The analysis of the psychosemantic geometric test was carried out according to standard categories. The experts were 3 practicing psychologists with 5 to 10 years of experience. To analyze the relations of the used concepts, we used spatial categories: size, shape, and location.
- The method of selection of postcards associated with the organization's productive environment. The stimulus material was a random set of postcards with little story-telling content. The participants were asked to present their vision of the organization and try to find at least three images in the postcards associated with this image. To analyze the selected images, the experts used the categories of "Color" and "Content of the image".

THE ANALYSIS' RESULTS AND DISCUSSION

The research showed that metacognition of organization members of different positions do not match in various aspects, sometimes completely contradicting each other.

Concerning *the organization's structure and size* it may be noted that occurrence frequencies of responses are different in the groups ($\chi^2 = 3.5000$, i.e. group differences are significant). For example, the prevailing response in the top managers' group is "structure is not clear", while in middle managers it is "weak structure". This is quite an indicative response since senior management is closest to the means of structural development and change. This response may be indicative of its inefficiency and encourage to seek the causes of the current situation. The small number of responses concerning the power and accordance with the structure in both groups indicates unanimity in the negative assessment

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

of the current structure. It is worth noting that top managers note the growth of the organization, while in middle managers' group it is not observed. Most likely, the plans and prospects of organization's development initiated by the senior management are not known to other categories of employees, so it is possible to conclude that the organization's dynamics are not present in the metacognitive picture of mid-level employees.

We found out that the magnitude of shifts in estimates changed slightly. It was required to specify the direction of shifts whether the changes were positive for the most of the estimated characteristic responses. We made sure that the value of shifts varies from 10-38% as a result of mathematical processing. The received results show that in 81 cases values of estimates of desirable condition of the organization were smaller than values of estimates of real condition of the organization. In 539 cases the values of desired state of the organization were greater than the values of real state estimates. It is noted that equal count of values of real and desirable state of the organization was established 300 times. The significance value $p = 0, 000$ indicates a statistically significant difference between estimates of real and desirable state of the organization according to the answers of the employees.

We believe that the assessment of real state of the organization reveals the emotional aspects of knowledge about the organization as desirable state is always colored positive.

Most of employees appreciate highly such parameters of the organization as achievements relating to the product and services, the loyalty of employees and the implementation of changes in the organization. Probably, it is possible to draw a conclusion on a positive sign of emotional relationship.

The social involvement of the organization, feedback condition, loyalty of employees and capability to changes in the organization are estimated moderately as having a tendency to higher values. Probably, according to these characteristics it is also reasonable to conclude that they are assessed emotionally positively.

Tolerant attitude of the organization to employees, who used new techniques and methods of work and failed, received the lowest values. The degree of freedom in which the organization allows the employee to take the risk of mistake in the performance of professional duties is also quite low assessed, but this estimate is in the zone of moderate assessments.

There is a contradiction that loyalty of employees according to the characteristic of understanding of the purposes is highly appreciated. It is estimated moderately by the degree of freedom in what the organization allows the employee to take the risk of mistake in case of accomplishment of the professional obligations. These estimates can demonstrate a tough control of actions and negative attitude to independence of employees which reduces their effectiveness, but makes goals and objectives of the organization more clear in general. This contradiction finds interrelation significant for the creation of metacognition model; it is the current control and constant feedback which is replaced with punishment according to employees. So, negative emotional conditions show that there is the fixing of knowledge of the organization; the information flow is interrupted by anxiety and expectation of danger. The expected social risk distorts the perception of real situation, reducing the productivity of the employee at the stage of cognitive processing.

The direct involvement in resolving social contradictions which is performed by the organization in addition to its core business is also evaluated low. Therefore, the organization is relatively isolated from society in representations of employees. We believe that group identification and group boundaries are shown in this fact. So, the essential characteristic of opposition of the organization to interests and attempt to be protected from social problems of bigger scale is revealed.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Confirmation of negative emotional perception of communication system is quite low estimates of feedback in the organization that, in fact, confirms the distortion of knowledge about the organization and processes according to the answers of the majority of employees.

It is possible to conclude that lack of reliable and safe feedback breaks cognitive control; metacognitive ideas of the organization are distorted in lack of complete and non-evaluative information by the organization's management. Emotional aspects of perception of organizational conditions by employees and the organizational environment at the intrapersonal level of metacognitive complex were studied by us from the standpoint of content of the relations.

Analyzing the views on the relations between "myself", "organization", "society", and the organization's metaphors by its members, the main tendencies characteristic of group members have been found, such as a positive attitude to the concepts of "myself", "organization", and "society" tending to an upward bias. There is an indicative priority of the categories of "domination", "submission", and "no contact" with regard to the concepts under study.

We undertook a qualitative study using the projective techniques proposed and approved by us, in particular, the semantic psycho-geometric test and «The postcards» test.

We consider that the characteristic of the intra-organizational environment, allocation of zones of special intensity, social source of risks emergence recreate full picture of knowledge or metacognitive ideas of employees of the organization, allowing to identify the emotional aspect of this knowledge. It is hard to objectify such subjective phenomena as employees do not aim to find the negative perception of the events in the organization, being afraid of an assessment and pressure of management.

We are convinced that such emotionally charged issues as the relation to the organization, management and hierarchy in this system require the maximum discretion and compliance with the requirements of the psychological safety. Direct questions do not allow allocating a reliable picture of the knowledge; moreover, the use of implicit learning methods allows weakening the cognitive control, acting in the direction of socially desirable answers.

First, we conducted primary interviews with participants of business processes in the organization and defined stimulus materials. Then we picked up a group of the most typical on age, seniority, status position, members of the organization of the different levels and invited them for research after taking the informed consent to participate in the experiment. Then, after the processing of the data, we conducted their presentation at the meeting of the organization.

The group participating in research included 2 subgroups of heads (tops) of the organization (8 people) and line managers (8 people).

So, we used the following projective methods:

1. Semantic psycho-geometric test (the test of Dellinger S. modified by us). The set of figures of different size and form was offered to employees. The group used in the choice of the perception as «I», «organization», «society» of the relationship between the figure and the concepts. For this purpose it was offered to them to choose a figure which is associated with the above-stated concepts and paint it. Then, the chosen figures were placed on a standard sheet of paper and were outlined, participants of group designated inside their associations.
2. The method of selection of postcards with the association on the production environment of the organization. The accidental set of the postcards which are not loaded with plots and events acted as stimulus material, participants were asked to present their vision of the organization and try to find at least three images on the postcards that are associated with this image. We assumed that

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

distinctions in emotional perception of the organizational characteristics of leaders of different level complete the realized ideas of the organization and specify how the metacognitive complex is created at the intrapersonal level. The main tendencies peculiar to members of group, such as the positive attitude towards the concepts as «I», «organization», «society» with a tendency to overestimate are observed. The obvious priority of the categories «domination» and «submission», «there is no contact» in the ratio of the studied concepts is indicative.

Probably, these results indicate the existence of the deep conflict which is one of risks of safety in the organization, connected with a contradiction of directions on domination over people around – submission to people around. The lack of contact with itself, the organization and the society is combined with the adaptive position of the line managers who are not inclined to take the initiative and activity. The emotional attitude reveals the impossibility of full cooperation and manifestations of independence in their actions.

In accordance with the task to understand how knowledge of employees of different levels is developed, we compared the elections of the figures on two groups of managers. For confirmation of reliability of distinctions in perception of oneself, organizations and society we carried out statistical analysis of the obtained data with the help of criterion of chi-square. At the level of tendencies it is possible to say that the senior and line managers give various answers finding the attitude towards the specified concepts. The most similar answers are received concerning the concept «society». Most likely, it is necessary to say that society is the sphere, the least dependent from respondents, having an insignificant resource, weak connection with values and needs. It is possible to conclude that knowledge about the organization is separated or isolated, poorly connected with processes on the scale of society or the country. Managers of both levels perceive real and actual processes and conditions of the organization, not including it in a wide social context. Probably, it is possible to draw a conclusion on a neutral emotional condition in relation to society.

The senior and linear managers give the most various answers concerning the concept «I», there are fewer distinctions concerning the concept «organization». The differences may be indicative of the importance of their role and the perception of oneself as a leader. Line managers found lower activity and leadership aspirations, feel less self-importance and the ability to influence what the events happening in the organization. The organization is perceived as poorly manageable, the interaction is performed in the form of control and domination or isolation and avoidance. The cooperation and contact are not shown concerning both groups of leaders.

It is also possible to find interesting results in features of the choice of images on postcards by members of groups. The color and black-and-white pictures are selected very unequally that can be connected with the conflict which is characterized by a high saturation of an emotional component and a lack of the realized opportunities for the analysis of the created situation of the organization.

Most examinees most often chose postcards with the image of people, buildings and landscapes on content. Most likely, this choice is also indirect evidence of the importance of relations and contacts with other people and can confirm the desire to avoid interpersonal conflicts. The appeal to neutral and emotionally positive material happens in connection with unconscious desire to reduce an involvement into conflict communication and rivalry, to reach balance and tranquility.

Organization members spoke in interview about the negative non-equilibrium conditions increasing over time. Psychological pressure may be one of the basic social risks menacing to safety of intra-organizational environment; it leads to a decrease in the efficiency and reliability of the organization

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

functioning in a result of reducing of loyalty and positive motivation of employees. It is evident that the formation of metacognition of employees is determined by steady domination of the top management; and, it is possible to speak about pressure and stress which distort the perception of the organization of both cognitive and regulatory processes. Further, the distorted picture of the events in the organization «manages» the activities of employees, forcing them to defend themselves and save efforts for self-preservation.

Thus, Hypothesis 1 put forward by the authors (the perception of the organization's characteristics which are independent variables can be used by its members in the process of formation of images, i.e. metacognition) proved true. In the process of experiment, organization members indeed showed their views on it, voiced their opinions of its certain aspects and expressed their attitude to them.

Hypothesis 2 (metacognition of organization members differ in connection with their position) was also confirmed in the research: it was found that there are significant differences in knowledge of the organization (structure, size, hierarchy, etc.), views on one's self in the organization ("myself" – "organization" – "society") and its dynamics (real and desired state) in its members: top managers and line managers.

CONCLUSION

The aim of this research was to study the relationship between (1) the perceived aspects of the organization and (2) the objective positions of its members and of the organization as a whole (official position, age, size, territory, and sector). To achieve this aim, the authors used J. Flavell's model (Flavell J.H. 1979) defining metacognition as a special cognitive process aimed at understanding one's own cognitive activity or, in other words, "mental activity aimed at understanding the thinking process". This is the definition followed by this article's authors. J. Flavell distinguished three main components of metacognition: planning, monitoring, and regulation.

This work has an approximate, preliminary nature, so it tends to take into account qualitative rather than quantitative characteristics of the subject being analyzed. The analysis of three Russian small and middle business companies showed some important aspects of an organization as viewed by its members: structure, size, resources, hierarchy, communication and information streams, motivation system. Their content varies among organization members of different positions, which allows drawing conclusions concerning the risks of instability for the organizational system and processes violating the coordinated functioning of the organization, so formation of such metacognition in higher school students will be useful for them and for the organizations where they plan to work. There are metacognition differences in terms of monitoring, or views on the organization's real and desired state forming a multidirectional activity of organization members related to their official position. Formation of this kind of knowledge is also important for students in terms of their career in an organization.

The results of this research can be useful for those who study metacognition in developing markets and institutional environment in the context of using the results to teach high school students, especially in Russia. The theoretical contribution of this work is related to developing and testing a model of relations between perceived aspects of an organization and objective positions of its members and the organization as a whole that can be used in developing training courses for higher school students. In terms of practical importance of the research results, the authors' opinion is that the assessment of

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

importance of Russian institutional environment organization members can be useful for entrepreneurs in forming a more humane, person-centered environment in higher school and in various fields of graduates' further activities.

The obtained results should be considered in the context of limitations of the research. Firstly, it refers to the sampling, which only includes three types of organizations from one Russian city. This does not allow the authors to extend the findings to all Russian organizations and beyond the Russian Federation. Russia has its own cultural, political, and social climate, and our model can be applied with changes in the variables included in the study. The directions of future research can include the study of relations between views on an organization and its age, location, sector, profitability etc. The authors believe that this information will allow to specify the content of programs for students. Secondly, because of the complexity of data collection in Russian organizations, only a restricted group of their members were interviewed in each case, which may have led to common method bias [Tang, Hull, 2012; Podsakoff et al., 2003]. That is why we, following recommendations [Podsakoff et al., 2003], took measures to control the possibility of this bias. The authors explained the test subjects before they participated in the survey that it would be anonymous, only the general results will be published, and nothing personal would be brought to knowledge of other participants of the research. In addition, we placed different versions of the same themes in different parts of the interview, and if there was a discrepancy between the responses, we withdrew this unit from the analysis. Thirdly, our research focuses on the regulatory environment, which is especially important in Russia.

ACKNOWLEDGMENT

The research reported in this chapter was conducted with support from the project number 16-16-56005 funded by the Russian Foundation for Humanities.

KEY TERMS AND DEFINITIONS

Cognitive Control: A psychological mechanism denoting person's assessment of the current situation to the choice of activity strategy.

Cognitive Style: Includes characteristic of the person's metacognitive regulation of intellectual activity: narrowness - breadth of scanning the visible field; field dependence - field independence; impulsivity - reflexivity; narrow - wide range of equivalence and orientation characteristics within the subjective time [Kholodnaya, 1997].

Complex Organizations: A term for analysis of joint activity of all departments and organizational environment, applying specific methods, the algorithm and communication [W. Loursch].

Emotional Aspects of Metacognition: The predictors of current state and perception of organization and its processes.

Higher School: A general name for the higher education institutions and postgraduate education.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Metacognition: The complex structure of the human thinking, which occurs from a position of motives and needs of the individual attitudes in the formation of a strategy to achieve or overcome existing difficulties.

Organizational Structure: A term denoting a stable device and the hierarchy of the company.

Social Risks: The interpersonal factors interrupting safety and productivity of whole company and individual activity without direct physical threats. Significant metacognition points of members more often are defined as follows: the size and the structure of the organization, the hierarchy in the organization, its goals, the organization resources, types of resources, the system of information communications in the organization, the remuneration system in the organization, corporate ethics, the message of the organization to the world, the mission of the company [Bogdanov, 1989; Kabashov, 2011].

The Study of Organizations in the Higher School: The process of students' education through the understanding of goals and sustainability of an organization, which leads to the necessity of constant studying, taking responsibility for decision-making and arrangement of one's own study process in an active way. The understanding and the description of the displacement effect in grades and differences in perception of the separate character features of an organization is useful in the education process of the Higher School students. The reason fo that is that their metacognitive abilities get targets that are more precise and reduce the adjustment time to the new conditions of the organization, where they come as young professionals.

Chapter 12
Exploring the Determinants of Organizational Resilience in Islamic Banks: A Framework Development

Mohamed Mahmoud Abo Alrob
An-Najah National University, Palestine

Ayham A. M. Jaaron
An-Najah National University, Palestine

ABSTRACT

Resilience has been viewed as the critical component behind Islamic banking organizations' ability to respond and compete during crisis. However, there seems to be scarcity of empirical attempts to explore the determinants of stronger resilience in Islamic banking organizations. This article is an attempt to develop a managerial framework of Islamic banking organizations that identifies these determinants of improved resilience. Two case studies were conducted in two Islamic banks in Palestine. Data were collected via semi-structured interviews, observations, and archival documents, followed by the use of the Resilience Benchmark Tool (RBT). Cross-case analysis of the results shows that organizational resilience in banking organizations is characterized by two dimensional determinants for improving organizational resilience; planning and adaptive capacity along with a set of ten resilience enhancing factors. The article demonstrates important dynamics of how resilient capabilities can be incorporated into the managerial models of banking organizations during turmoil.

1. INTRODUCTION

Generally speaking, turbulent events that can affect organizational performance take many forms, such as the 2004 Indian Ocean Tsunami, the 2010 Haiti and Chile Earthquakes and the recent global financial crisis. Natural disasters, pandemic disease, economic recession, system failures and human errors can all pose both a potentially unpredictable and severe threat to the continuity of an organization's operation.

Therefore, the concept of resilience has been reaching increasing prominence both within academia and industry over recent years (Bhamra et al., 2011). The Concept of resilience is grounded in the roots of ecology and social psychology and has expanded to address various areas including organizations, industrial safety, supply chain management, infrastructure development, crisis, and disaster management. Although the context and meaning of resilience may vary across disciplines, the fundamental principle of resilience remains the same (De Florio, 2015). Resilience relates to the capacity of a system to absorb discontinuities and disturbances, such as natural disasters and other potential crises, and retain essential system structures, processes and feedbacks (Adger et al., 2005). As highlighted by several authors (Seville et al., 2006; Crichton et al., 2009; Gibson and Tarrant, 2010; Lengnick-Hall et al., 2011), through the cultivation of resilience within a system, it may be possible to not only overcome potential disruptions but transcend these events and develop towards a more robust system.

Banking organizations, similar to other organizations, are subject to a diverse and ever-changing environment. The threats that turbulent environment possess can vary in both severity and frequency and may originate internally or externally to banks. An event in one area of the environment can often have disastrous effects on these organizations (Juttner, 2005). The recent global financial crisis has been described as the worst in history. It has adversely affected the global banking organizations performance and profitability. Researchers argued that the major cause of this crisis is financial imbalances. Nevertheless, there is no full agreement about the origin of these financial imbalances. As a result, several banks collapsed and many others were bailed out by their governments. Other large banks, such as Royal Bank of Scotland and Citibank, have survived this crisis but suffered tremendous losses (Acharya and Schnabl, 2010). Conversely, during the financial crisis, researchers and financial reporters witnessed an unprecedented better cumulative profitability and performance of Islamic banking organizations than conventional banks.

Islamic Banks and Conventional Banks have similar roles. They manage all types of risks such as liquidity risk, operational risk and others. The main difference between them is that Islamic Banks operate in accordance with the rules of Islamic principles. The aim of Islamic Banks is not only the creation of maximum returns on capital but also the achievement of socio-economic goals of the Islamic region, such as full-employment, high economic growth rate, equitable distribution of wealth and income, socio-economic justice (Ouerghi, 2014). Central to Islamic financial system adopted by Islamic Banks is the fact that banks are not allowed to benefit from lending money or receiving money from customers. This means that earning interest is strictly prohibited as a method of creating profit. Instead, Islamic Banks can create profit by adopting the principles of trading through selling approved commodities and services to its customers. Therefore, Islamic Banks are expected to trade in Islamic Law-compliant investments using the money deposited by customers, and then profits are shared by the two parties (Hassan and Mervyn, 2007). There are three main schemes that can contribute to the profits gained by Islamic Banks; a) buying a commodity or goods for a customer then leasing it back to them (i.e. Ijara), b) selling a commodity or goods that are owned by the bank to its customer based on mutually negotiated margin (i.e. Murabaha), c) and creating a joint venture where the customer and the bank contribute to a capital for specific project or operation with an agreement about shares and returns for each party (i.e. Musharaka) (Ouerghi, 2014). However, in order to achieve socio-economic justice, Islamic Banks are required to comply with the Islamic law of *Zakat* inherited in Islam*;* a mechanism for the redistribution of wealth in the Islamic society. The amount of *Zakat* is 2.5 percent on assets held for a complete year. The most important purpose of *Zakat* is to reduce differences in the Islamic society by enabling the poor/needy to have a normal and decent life (Hassan and Mervyn, 2007).

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

There are several studies on comparison of efficiency between Conventional Banks and Islamic Banks, but few studies are focused on exploring the factors enabling Islamic Banks to respond to disturbances in crisis periods (Dridi and Hasan, 2010; Boukhris and Nabi, 2013). Previous research has proposed conceptual models that illustrate how organizations respond to discontinuities (Staw et al., 1981), it has also identified human, operational and financial resources, and other factors necessary for organizations to achieve resilience (Bennis and Thomas, 2002; Worline et al., 2002; Hamel and Valikangas, 2003; Sheffi and Rice, 2005). Resilience, in this sense, is a multidimensional and multifaceted concept (Ponomarov and Holcomb, 2009), as it resides in both individual and organizational levels (Bhamra et al., 2011). The interaction between the individual resilience and organizational resilience is quite similar to the interaction between the systems and subsystems (Lengnick-Hall et al., 2011). Therefore, the research question sought to be answered in this paper is as follows:

RQ: What are the determinants for improved Islamic banking organizations' resilience over conventional banks?

Bhamra et al. (2011) and Jaaron and Backhouse (2014) have explained that literature is lacking empirical methods such as case studies on how organizations, including Islamic Banks, can achieve resilience. To close this gap, two independent case studies are presented in this paper. The case studies were conducted in two Islamic Banks operating in Palestine. The results of this research suggest that Islamic Banks can perform better than conventional banks during turbulent events due to availability of two dimensional determinants for improved organizational resilience; adaptive capacity dimension and planning dimension. The adaptive capacity dimension has been found associated with minimization of silos, internal resources, staff engagement and involvement, information and knowledge, leadership, decision-making, and situation monitoring and reporting, whereas the dimension of planning has been found to be associated with planning strategies, stress testing plans, proactive posture, external resources, and recovery priorities. The paper is focused on developing a resilience enhancement framework, for Islamic banking organizations, where resilience determinants are identified.

The paper is structured into eight sections. In the next two sections, the concepts and dimensions of organizational resilience are presented. Then, an account is provided in section four on achieving organizational resilience in organizations based on a review of existing literature. Next, Islamic Banks are characterized and compared with Conventional Banks in section five. The research methodology, including research sites, is then presented in section six. Finally, in the seventh and eights sections, results are presented and conclusions discussed.

2. CONCEPTUALIZING ORGANIZATIONAL RESILIENCE

The term resilience is used in a wide variety of fields that include ecology (Walker et al., 2002), metallurgy (Callister, 2003), individual and organizational psychology (Barnett and Pratt, 2000; Powley, 2009), supply chain management (Sheffi, 2005), strategic management (Hamel and Valikangas, 2003) and safety engineering (Hollnagel et al., 2006). Although the context of the term may change, across all of these fields the concept of resilience is closely related with the capability and ability of an element to return to a stable state after a disruption (De Florio, 2015). This is similar the definition of resilience from an engineering perspective, where it is defined as "the tendency of a material to return to its original

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

shape after the removal of a stress that has produced elastic strain" (Merriam-Webster Dictionary, 2007). Nevertheless, when the notion of resilience is applied to organizations, this definition does not drastically change. Organizational resilience is, therefore, related to both the individual and organizational responses to turbulence and discontinuities that allow organizations to return to their stable operational modes after turmoil (Bhamra et al., 2011). In this sense, Jaaron and Backhouse (2014) define organizational resilience as the ability of an organization to adapt to the conditions and changes available in the surrounding environment based on its ability to absorb environmental variability. The business environment is constantly changing. Managing change to adapt to an uncertain future is a challenge that requires resilience. While it is not possible to foretell the future, the organizations can equip themselves to adapt to the turbulence ahead, so resilience may be the key to sustainability (Hart and Milstein, 1999, Hamel and Valikangas, 2003, Moore and Manring, 2009). Organization's must strive and continually adapt in order to sustain competitiveness and remain viable within uncertain environments. Through turbulent economic, social and environmental periods, organizations will experience disruptions and discontinuities. The concept of resilience within organizations may offer a potential framework to overcome these disruptions and discontinuities, and allow for organizational development (Bhamra et al., 2011). Resilience, in this sense, is perceived as a dynamic capability of the organization that must be linked with surrounding environmental conditions (De Florio, 2014a). The study of organizations from a disaster perspective includes an array of literature examining why they fail, which is mainly drawn from the analysis of major accidents (Choo, 2008; Paté-Cornell, 1993; Sheaffer et al., 1998), as well as several studies proposing models of crisis causation and management (Hwang and Lichtenthal, 2000; Pearson and Mitroff, 1993; Pearson and Clair, 1998; Shrivastava et al., 1988; Smith, 1990; Turner, 1976). Less attention is given to what makes organizations succeed despite disaster. According to De Florio et al. (2014b), no organizational solutions have so far been introduced to be activated in preparation, during, and after crisis that can tap on the abilities of the social capital of the organization. However, organizational resilience literature is beginning to fill this gap and to focus on the characteristics of employees in organizations that survive and thrive (Corey and Deitch, 2011; Kendra and Wachtendorf, 2003; Seville et al., 2008). Concepts have also emerged that provide a sociotechnical systems view of organizations such as high reliability organization theory (Bierly and Spender, 1995; Bourrier, 2011; Roberts, 1990), and normal accident theory (Perrow, 1999), which also explore elements linked to resilience. As shown by a variety of authors (Dooley, 1997; Comfort et al., 2001; Dalziell and McManus, 2004; Vogus and Sutcliffe, 2007; Pettus et al., 2009) within an ever changing environment capable of significant turbulence, a system is required to change and adapt in response to environmental fluctuations in order to sustain function and retain advantage. Without this change in the face of adversity, systems will follow a primarily recovery based approach which may introduce maladaptive cycles of development. Instead, a resilience approach in the face of perturbation is suggested to enable the adaption to new risk environments and circumstances (Bhamra et al., 2011). Within the context of organizations, resilience relies upon processes, structures, and practices that promote competencies, restore efficacy, and promote growth and development. Through this, resilience provides organizations with the dynamic capabilities to mediate and overcome major disruptions (Vogus and Sutcliffe, 2007).

In this paper, the definition of organizational resilience adopted is "a function of an organization's situation awareness, identification and management of keystone vulnerabilities and adaptive capacity in a complex, dynamic and interconnected environment" (McManus, 2008). Resilience thereby strongly relates to the adaptive capabilities that enable an organization to respond to change effectively while enduring minimal discontinuity. Organizational resilience depends on the capability of an organization

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

to restore efficacy after a disruption. However, within complex environments often organizations have limited capacity to anticipate every challenge and discontinuity that could possibly occur (Sutcliffe and Vogus, 2003). As identified by Shaluf and Said (2003), disruptive events also stand to temporarily overwhelm the response capacity of affected systems through both natural and man-made events. These events can vary in both severity and magnitude, causing extensive damage, economic loss, disruption, injury or in severe instances loss of life. As such, there has been a growing amount of evidence from several large-scale incidents over the past decade that have highlighted the need to develop organizational and infrastructural systems capable of adapting and overcoming complex disruptive events.

The literature on resilience suggests that there is a need for constant, proactive and ever quicker approaches to change (Bolton, 2004), before the case for change turns out to be urgently inevitable (Hamel and Valikangas, 2003). In effect, resilience is an organization's level of preparedness to change by rapidly redeploying and reconfiguring its technical and organizational resource base, thus enabling a quick response to unpredictable changes within its operating environment (Sine and Davidm, 2003). Consequently, it is agreed that resilience is a distinctive organizational capability (Stoltz, 2004; Barton and Christianson, 2006; Bergman et al., 2006) that is underpinned by an organization's ability to change timely, rapidly and easily (Vickers and Kouzmin, 2001). However, in most organizations, change is still problematic; studies have shown that two out of three change initiatives fail (Sirkin et al., 2005). As such, there is an urgent need to understand the dimensions of organizational resilience that are considered a prerequisite for organizational preparedness to changes, and also to understand organizational structures where these dimensions can prosper to enhance resilience. These are highlighted in the next two section of this paper.

3. DIMENSIONS OF ORGANIZATIONAL RESILIENCE

In pursue of researchers to understand the dimensions of resilience, Mallak (1998) developed six factors as metrics of resilience, these are goal directed solution seeking, avoidance or skepticism, critical understanding, role dependence, source resilience, and access to resources. Subsequently, Somers (2009) developed the organizational resilience potential scale (ORPS), where he used Mallak's (1998) six metrics of resilience in addition to measures of decision structure and centralization, connectivity, continuity planning, and agency accreditation. While both studies of Mallak (1998) and Somers (2009) represent significant theoretical contributions, neither of them was developed using a random sample and therefore cannot be used as the sole base for a robust resilience measurement tool. However, De Florio (2014a) asserted that due to the dynamic nature of resilience, it cannot be measured in absolute terms and that a number of indicators need to be taken into consideration in this process. According to author, these indicators include, first, the behaviors that system parts, such as the parts of an organization, are able to perform. Second, characteristics of individuals and the social system they are located in. Third, the organizational structures and the degree of control and centralization they employ. Similarly, McManus et al. (2008) proposed a definition of organizational resilience as "a function of an organization's overall situation awareness, management of keystone vulnerabilities and adaptive capacity in a complex, dynamic and interconnected environment." Through this definition, authors developed a model where relative overall resilience (ROR) is composed of three factors (situation awareness, management of keystone vulnerabilities, and adaptive capacity) and also introduced 15 indicators of organizational resilience,

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

five for each factor (McManus et al., 2008). The ROR model has been found to be a comprehensive tool covering all dimensions of organizational resilience identified in literature. Therefore, the ROR provides a good context for this current type of research. The three factors of the ROR models are explained below.

3.1. Situation Awareness

The term situation awareness was first used in connection with the military, where pilots are required to understand, assimilate, and act on large volumes of information to perform their roles (Endsley, 1995). Endsley et al. (2003) define situation awareness as "being aware of what is happening around you and understanding what that information means to you now and in the future." They go on to note that the term is usually applied to operational situations. One example of this is the application by Masys (2005) to airline operation and safety, which suggests that situation awareness is distributed across teams, groups, and organizations, as well as human and machine agents. Masys (2005) draws on Stout and Salas (1998) and argues that situation awareness "should be regarded as an essential requirement for competent performance in dynamic environments, with inaccurate and incomplete situation awareness often leading to dangerous and life-threatening consequences." Crichton et al. (2005) echo this when they discuss incident command skills in the oil industry. They argue that situation awareness is a vital command skill in a crisis because the first step in decision making is to evaluate the situation. Roth et al. (2006) discuss the importance of shared situation awareness as an informal cooperative strategy between workers which occurs within the organization's culture.

3.2. Management of Keystone Vulnerabilites

Turner (1978) made the first theoretical analysis of organizational vulnerability to technological disasters, emphasizing the role of organizational norms and values. Several authors have also focused on identifying organizational vulnerabilities that have contributed to organizational losses or failure during and after disasters using case study and survey research. Kroll et al. (1990) identify organizational size as vulnerability when they discuss how small businesses suffered more severe losses during and after the Loma Prieta earthquake. Durkin (1984) and Alesch and Holly (1998) identify pre-disaster economic health as a vulnerability during and after the 1984 Coalinga earthquake and the 1994 Northridge earthquake. Alesch and Holly (1998) also identify the owners' entrepreneurial skills, or lack of, and the effect of the disaster on demand for the organization's products or services as vulnerabilities. McManus et al. (2008) discuss what qualifies a particular vulnerability as keystone vulnerability and note other uses of the term keystone: ecological and architectural. They go on to define keystone vulnerabilities as "components in the organizational system, which by their loss or impairment have the potential to cause exceptional effects throughout the system" (McManus et al., 2008).

3.3. Adaptive Capacity

An organization's ability to adapt is at the heart of its ability to display resilient characteristics. Kendra and Wachtendorf (2001) argued that the idea of resilience as adaptive behavior is increasingly being applied to the business environment to help explain how organizations manage the balance between stability and change. Starr et al. (2003) discussed the importance of adaptation and suggest that adaptive capacity is also linked to an organization's competitiveness. Kendra and Wachtendorf (2003) noted that organizations

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

displayed "adaptive behavior that was not dependent on either specific physical facilities or specific technological systems." Here they described how organizations drew on their culture and the capabilities of their staff, as opposed to their structures and technology, to develop adaptive responses to emerging situations. An organization's adaptive capacity then, is their ability to continuously design and develop solutions to match or exceed the needs of their environment as changes in that environment emerge.

4. ACHIEVING ORGANIZATIONAL RESILIENCE

Building a resilient organization can provide high levels of competitive advantage (Lee et al., 2013). Stephenson et al. (2010) have explained that organizations can struggle to allocate resources to building resilience, given the difficulty of demonstrating progress or success, particularly during times of crises. This is partly because resilience building programs need to compete for resources against profit-driven activities for which there are metrics to evaluate whether they have produced financial growth or not (Kay, 2010). Lengnick-Hall et al. (2011) has emphasized that building organizational resilience is possible as it is embedded in a set of individual level attributes and organisational level processes. In congruence to this, Jaaron and Backhouse (2014) have explained that organisational resilience can be achieved by having an organic structure in the organisation where individual employees are supported to build high level of affective commitment towards their organization. Meyer et al. (1998) demonstrated that during times of instability and crises, affective commitment can activate organisational resilience as it emanates from the organization's individual employees located within team, by efficiently reconfiguring organizational resources to respond to threats. Various behavioural characteristics have, therefore, been linked with achieving organizational resilience (Limnios et al., 2014). However, Stephenson et al. (2010) asserts that organizational resilience is more than individual capabilities and social interactions that are usually difficult to measure, and that a direct link to financial measures is particularly important to support and enhance organizational resilience. This view is also shared by Farooq and Zaheer (2015) in their study of organizational resilience in Islamic Banks. They found that better financial performance of Islamic Banks during economic crisis, accompanied by supportive leadership and both cultural and religious values, explained in the next section, has brought about more resources spending on business operations to deal with the economic crisis. They also added that Conventional Banks lack some cultural and religious values, found in Islamic Banks, which are essential for enhancing resilience. It is as stated by Bhamra et al. (2011) and Giezen (2013) that the efficient employment of organizational resilience is mainly driven by the development of a resilience culture, within a prosperous business values, where leaders are supportive and employees are working within teams (Oppong et al., 2014). It would seem more logical, then, that achieving resilient organizations requires financial stability and cultural readiness before resources can be spent on building internal operations that enhance organizational adaptability and take advantage in the face of discontinuities (McManus, 2008).

5. ISLAMIC BANKS VS. CONVENTIONAL BANKS

As it was mentioned earlier, business arrangements and contracts in Islamic Banks are based on the concept of prohibiting the use of interest or usury (Riba). Islamic banking system appeared in the 1970's by the establishment of the Dubai Islamic Bank (DIB) in the United Arab Emirates, followed by the

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Islamic Development Bank (IDB) in Jeddah, Saudi Arabia. Islamic banking is based on different business law: Profit and Loss Sharing (PLS) principle, fix charges established forehand, no interest, and lender-borrower collaboration. Chapra (2008) stated that debt selling and derivatives are the main causes of the financial crisis. The author also explained the difference between Islamic Banks and Conventional Banks in the way they deal with risk-taking. In the Conventional Banks, risk is transferred to them by depositors which receive guaranteed and predetermined rate of return of their investment. However, in the Islamic Banks, profit and losses are shared, the return for the investors are not guaranteed and depend on the banks performance. Another point of divergence between the two types of banks is the risk transfer. In Conventional Banks borrowers pay interest independently of the return of their investment. So, Conventional Banks transfer the risk through credit default swaps or securitization, financing is debt-based. However, in Islamic Banks, there are two main uses of sources that have been explained earlier: Musharaka (Equity participation) and Mudharaba (Trustee finance). In the Musharaka contract, both banks and investors contribute to the capital of project and share possible profit or losses according to their shareholding capital. In the Mudharaba contrast, Islamic Banks provide the required capital for a project, the investor contributes expertise, labor and management of the firm in this case, only profit is shared by the bank and investor, losses are supported by the banks (Ouerghi, 2014). Few studies conduct a comparative analysis on Islamic Banks and Conventional Banks performance during and after the global crisis. Dridi and Hasan (2010) analyzed the impact of the global crisis on profitability, credit growth, asset growth and external rating, on the sample of 120 Islamic and conventional banks. Their results support the better performance of Islamic Banks during the economic crisis.

6. RESEARCH METHODOLOGY

In order to empirically explore the determinants of organizational resilience in Islamic banking organizations, two case studies were conducted in two Islamic Banks in Palestine. Case studies have the advantage of being able to answer questions like ‘what’, ‘how’ and ‘why’ (Yin, 2009). Also, case studies typically use any and all types of methods for collecting and analyzing research data such as interviews, questionnaires, archives, and observations (Hamel, Dufour, and Fortin, 1993).

The mixed methods design (Tashakkori and Teddlie, 1998) is used in this research as the technique for conducting the research process. Further, cross-case analysis was used to search for common factors and themes. Both quantitative and qualitative data were collected in the two case studies simultaneously. Four main sources of qualitative and quantitative data have been employed; these are observations, semi-structured interviews, questionnaires, and documents (Bryman and Bell, 2007). Overall, 12 semi-structured interviews were conducted to identify availability of resilience capabilities and to initially explore main determinants for enhanced organizational resilience in these banks. Interviewees from both case studies were asked questions such as ‘What sort of hazards/problems/events the bank is facing or do you think this bank is exposed to?’, ‘What do you think the consequences of these events would be on the bank?’, ‘how well can you manage these events and what level of control do you think the bank has over this?’, ‘what level of business interruption insurance or external aid is available to the bank?’, ‘how suitable is this for the expected range of hazards and their consequences on the bank?’, ‘what does, or should, an emergency management plan look like for the bank?’, ‘what level of emergency management exercises does the bank engage in? how frequently? what are the principle barriers to participation in such exercises?’. Interviews were tape recorded and transcribed in preparation for data analysis. Observations

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

and notes were recorded to supplement the data collected through interviews. In fact, observations and documents collection captured things that escaped the interviewees' awareness during interviews. Furthermore, the Resilience Benchmark Tool (RBT) (ResOrgs, 2013); developed by the Resilient Organizations research program at the University of Canterbury and the University of Auckland in New Zealand was implemented. The RBT was used to; firstly, confirm availability of resilience capabilities in the two case study organizations, and secondly to scrutinize the main determinants of resilience capability identified via interviews. The tool consists of thirteen indicators to measure the three interdependent attributes of organizational resilience: Leadership and Culture, Networks and Change Ready. It is a tool for improving the organization understanding of its resilience capabilities and performance. In addition to this, the tool allows the organization to benchmark other organizations within the same sector thus, providing the organization with a self-analysis of resilience strengths and weaknesses in order to enhance their overall organizational resilience. The two research sites of the case studies are presented below, and data sources used in the two case studies are summarized in Table 1.

6.1. Research Sites

The estimated market share for the Islamic banks in Palestine is approximately 8% of the net assets of the Palestinian banking sector and approximately 9% of the total direct funding and customer deposits. Knowing that the share of the global Islamic banking industry exceeded 25% means that there is great opportunity in front of the Islamic banking industry in Palestine to expand its market share. In this research inquiry, two Islamic Banks have been studied. The banks details, as well as those of the participants, are kept anonymous and the banks will be denoted as 'Bank A' and 'Bank B' throughout this paper.

"Bank A" is one of the local leading banks in Palestine. It was established in 1995 as a public limited company, in 1997 the bank got the license from Palestinian Monetary Authority (PMA) to undertake banking business in accordance with the provisions of Islamic Sharia. In 2005, the bank signed an agreement with Cairo Amman Bank to purchase his net assets in Islamic transactions branch. While at the beginning of 2010, the bank singed another agreement with Al-Aqsa Islamic Bank to purchase its banking portfolio. At the time of the research, "Bank A" operates from its main branch in Ramallah along with

Table 1. Source of case study data

Bank	No. of Interviews	Interviewees' Roles	RBT	Observations	Documents
Bank A	7	• Member of board of directors • Regional manager • Risk management manager • Internal audit manager • Financial manager • Human resource manager • Branch manager	Circulated among 7 senior managers	Covered all aspects of planning and risk management activities	Various sources of publications and governmental and internal reports
Banks B	5	• Risk management manager • Internal audit manager • Financial manager • Human resource manager • Al-Bireh branch manager	Circulated among 5 senior managers	Covered all aspects of planning and risk management activities	Various sources of publications and governmental and internal reports

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

another seventeen branches distributed allover West-Bank and Gaza Strip. The bank has a total of 397 employees comprised of 48 regional managerial staff, 81 managerial staff, and 268 customer service staff.

"Bank B" is the first Islamic banking company operating in Palestine. It was established in 1995 as a public limited company. At the begging of 1996 the bank got the license from Palestinian Monetary Authority (PMA) to undertake banking business in accordance with the provisions of Islamic Sharia. At the time of the research, "Bank B" operates from its main branch in Al-Bireh city along with another nine branches distributed allover West-Bank and Gaza Strip. The bank has a total of 264 employees comprised of 142 executive management staff, 122 customer service staff.

7. DATA ANALYSIS AND RESULTS

Once each single-case was conducted thoroughly, the cross-case analysis was carried out at two different levels. Firstly, qualitative data analysis, including thematic analysis of interviews, observations and documents were completed. Secondly, the quantitative data generated from the use of RBT (ResOrgs, 2013) was analyzed to measure the three interdependent attributes of organizational resilience: Leadership and Culture, Networks and Change Ready to confirm initial findings from qualitative data analysis. The aim of multiple case analyses is to search for similarities and differences and to expand the understanding of similarities and differences across cases (Miles and Huberman, 1994). The results from the thematic analysis of qualitative data were directly compared with results from the quantitative methods of the two cases. The process started by transcribing and studying the interviews, the 'thematic analysis' approach (Taylor and Bogdan, 1984; Attride-Stirling, 2001) was employed to analyze the data following Bryman and Bell's (2007) considerations in coding in order to achieve the analysis themes; these are illustrated in the following stages:

1. General theoretical topics were identified by reading the interview transcripts and revising the research question;
2. General theoretical topics helped in generating a coding framework for the interview transcripts. This is a set of topics carefully selected to reflect what has been said in interviews (Attride-Stirling, 2001);
3. After identifying the coding framework it was possible to divide the interview transcripts into meaningful parts, and every part was given a code that belongs to a pre-defined topic;
4. At this stage it is necessary to revise interview transcripts to find codes with similar topics. Similar topics are clustered around larger central themes that were used later for interpretation.

Table 2 illustrates the coding framework devised and the central themes found.

7.1. Theme 1: Risk Management Activities

With this theme aimed at identifying the foundations for the risk management significance to the Islamic banks as a methodology to enhance the overall organizational resilience. The prevalent feeling among interviewees was that their risk management tools were vital for their readiness for any unexpected disruptions or events, and that provided them with a sense of organizational proactive posture. The interviewees identified that their improved risk management capabilities were due to delegation of decision

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Table 2. Thematic analysis

Codes	Issues Discussed	Basic Theme	Central Theme
• Hazards found • Consequences • Manage risk	• Sort of hazards the bank is facing or do you think this bank is exposed to • Consequences of these hazards • Management of these hazards and the level of control over it	• Justifying risk management • Decision Making • Readiness and Proactive posture	Risk management activities
• Knowledge • Empowerment • Systems	• Staff roles, responsibilities and training • Staff make business decisions • Systems and procedures documentation and implementation	• Staff information • Leveraging knowledge • Situation Awareness • Internal resources	Internal capacity building
• Strategy • Planning	• Strategic, business continuity, stress testing, emergency planning • Integration of plans and monitoring and evaluation of polices and plans	• Role of planning • Stress testing plans • Planning strategies • Identifying, assessment and controlling role	Planning strategies
• Leadership • Commitment • Communication	• Decision making during times of crisis • Senior management support to the risk management activities • Staff empowerment and rewarding system • Upwards and downwards communication and effectiveness of communication channels	• Leadership • Staff engagement • Breaking silos	Leadership and staff engagement

making authority to most highly qualified personnel in the organization. The adapted risk management concept and its related activities have been developing since the establishment of the two banks and still improving; intensive monitoring and evaluation for stress testing plans and business continuity plans are practiced at a constant base, gradual employee empowerment to use their knowledge in novel ways to solve new and existing problems was encouraged. On the other hand, most interviewees pointed out the importance of the compliance and internal audit department in risk management activities for improving organizational resilience.

7.2. Theme 2: Internal Capacity Building

Interviewees pointed out the importance of information and knowledge for human resource development especially in the field of risk management. It was clarified that equipping employees with the full situational understanding, skills and access to information, and specialized training that enables them to perform risk management activities effectively was another pillar for their perceived organizational resilience capabilities. They also pointed out that critical information is stored in a number of formats and locations and the staff has access to this information in addition to having access to experts' opinions when needed. They also emphasized on the importance of job rotation concepts and roles sharing between employees; so that qualified personnel will always be available to fill key experts' roles in times of their absences. The results also showed that the two case study banks adopted a rewarding scheme for rewarding those employees who think outside the box.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

7.3. Theme 3: Planning Strategies

The interviewees pointed out the importance of strategic plan, business continuity plans and stress testing plans in enhancing the overall resilience capabilities and practices in the two banks. They also empathize on the importance of development of a risk management strategy to be aligned with the bank strategy. On the other hand, the interviewees were satisfied with the current monitoring and evaluation mechanism for following-up and updating the plans. Moreover, the interviews pointed out the importance of identifying all hazards in their departments by undertaking a risk assessment on a specific task/activity periodically. The two banks to some extent practiced looking for hazards that have the potential to harm people, systems being used, work environment and/or work processes adopted. Due to this, several risks are visible and their occurrence is reduced as reasonably as possible.

7.4. Theme 4: Leadership and Staff Engagement

Majority of senior managers were directly involved as a member in risk management committee other senior management were involved from the earliest stages. Interviewees insisted that staff engagement at operational levels and senior management support was vital for resilience enhancement. When risk management was first introduced in the banks, head office senior management and other departmental managers were provided with qualitative evidences on how potentially the risk management concepts are beneficial to their bank. Interviewees revealed that difficulty in quantifying the impact of risk management, at the beginning, was a source of threat to risk management implementation at all levels. However, the two banks used successful case studies to convince their top management of these benefits. Furthermore, interviewees emphasized that open channels of communication between departments and branches is essential for information sharing and thus better response to unexpected events.

7.5. Resilience Benchmark Tool Analysis

The statistical analysis of the data collected via the RBT (ResOrgs, 213) showed that the average level of organizational resilience for Bank A and Bank B was very good with an overall average of 4.0 and 3.93 respectively. Despite that, none of the two banks were found to be outstanding in all attributes, showing that there is room for improvement for the two banks. Figure 1 shows that the attribute with the highest value and greatest similarity between the two banks is in leadership and culture at an average of 4.21. The change ready attribute also reflected in a small difference between the two banks at an average of 3.98. The lowest value for the two banks was in network attribute at an average of 3.7. Table 3 shows the scores of the thirteen indicators at both research sites for these three attributes.

The differences between the two banks lie in the comparison of the 13 resilience indicators shown in Table 3. Although the same pattern of scores has been detected in the two research sites, the indicators with the greatest similarity between the two banks are mostly in the indicators of Leadership and Staff Engagement in the “Leadership and Culture” attribute, and Internal Resources indicator in the “Network” attribute. Also, Planning Strategies indicator in the “Change Ready” attribute. However, the largest differences were relatively noticed in Decision Making indicator of “Leadership and Culture” attribute, Leveraging Knowledge indicator in “Networks” attribute, and Unity of Purpose and Stress Testing Plans in “Change Ready” attribute. Figure 2 shows a comparison of the thirteen resilience indicators in the two research sites.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 1. Comparison of the three resilience attributes for "Bank A" and "Bank B"

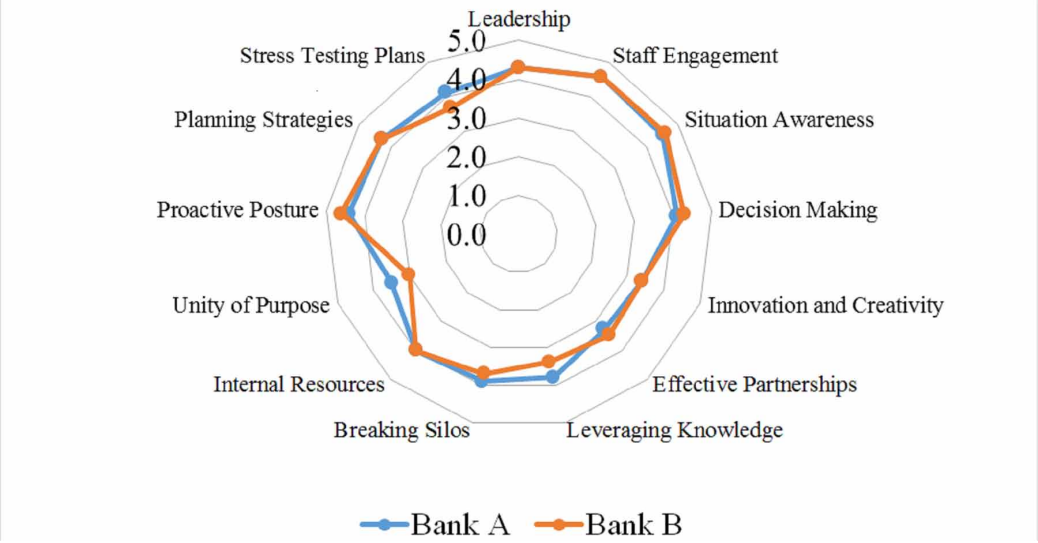

Table 3. Results of RBT at research sites

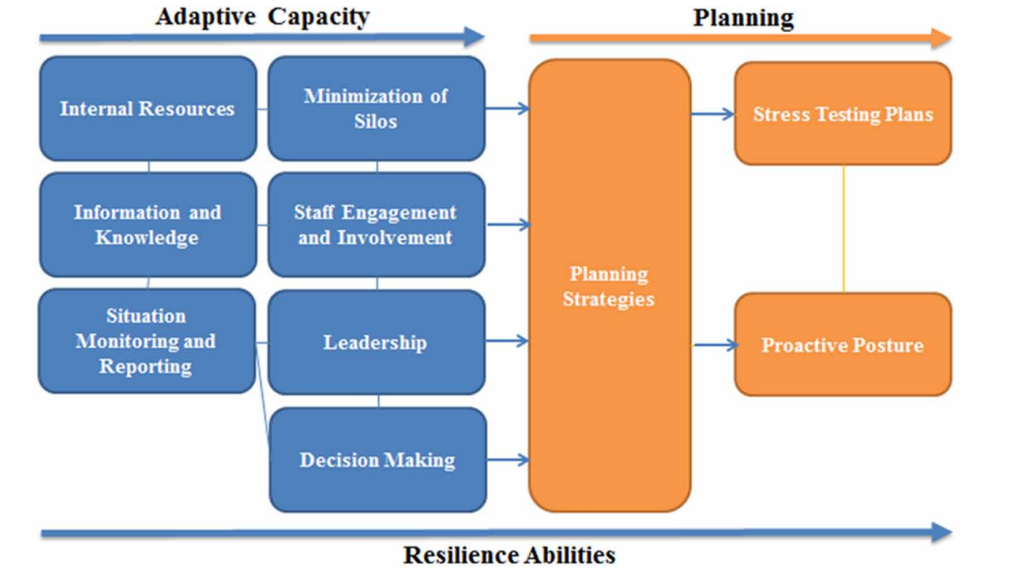
Attribute	Indicator	Bank A	Bank B	Mean	Supported
Leadership and Culture Attribute	Leadership	4.3	4.3	4.3	Yes
	Staff Engagement	4.6	4.6	4.6	Yes
	Situation Awareness	4.5	4.6	4.5	Yes
	Decision Making	4.1	4.3	4.2	Yes
	Innovation and Creativity	3.4	3.4	3.4	No
Leadership and Culture Attribute Overall Mean		4.18	4.24	4.21	
Networks Attribute	Effective Partnerships	3.3	3.5	3.4	No
	Leveraging Knowledge	3.8	3.4	3.6	Yes
	Breaking Silos	3.9	3.7	3.8	Yes
	Internal Resources	4.0	4.0	4.0	Yes
Networks Attribute Overall Mean		3.75	3.65	3.7	
Change Ready Attribute	Unity of Purpose	3.5	3.0	3.2	No
	Proactive Posture	4.4	4.6	4.5	Yes
	Planning Strategies	4.3	4.3	4.3	Yes
	Stress Testing Plans	4.1	3.7	3.9	Yes
Change Ready attribute Overall Mean		4.07	3.90	3.98	
Overall Mean		4.0	3.93		

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 2. Comparison of the thirteen resilience Indicators between "Bank A" and "Bank B"



However, results show that out of the thirteen indicators measured by the RBT only ten indicators were supported by interviews results as the main determinants for improved resilience capabilities in the two Islamic Banks studied. These are the indicators of leadership, staff engagement, situation awareness, decision making, leveraging knowledge, breaking silos, internal resources, proactive posture, planning strategies, and stress testing plans. While the remaining three indicators of innovation and creativity, effective partnerships, and unity of purpose where not supported by the interviews results. This explains why these three indictors scored the lowest values in the RBT as shown in Table 3.

8. DISCUSSION AND CONCLUSION

In this exploratory study, an attempt has been made to investigate the availability of resilience capabilities in Islamic Banks, and to identify the major determinants of this resilience capability. The study demonstrated an important dynamics of how resilient capabilities can be achieved in Islamic Banking organizations. A managerial framework, where resilience capabilities determinants have been incorporated, is shown in Figure 3 below. The framework has been constructed to operationalize resilience as a function of adaptive capacity and planning dimensions. Based on the result of both interviews and RBT, there are ten indicators for organizational resilience for Islamic banking organizations. The first set of determinants is minimization of silos, internal resources, staff engagement and involvement, information and knowledge, leadership, decision-making, and situation monitoring and reporting. These represent the adaptive capacity dimension. While the remaining five determinants are planning strategies, stress testing plans, proactive posture, external resources, and recovery priorities. These represent the planning dimension. This framework represents congruence with the work of McManus (2007). He presented a Relative Overall Resilience (ROR) model consisted of three dimensions; situation awareness, management of keystone vulnerabilities and adaptive capacity with fifteen different indicators.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 3. Managerial Framework showing determinants for enhancing organizational resilience in Islamic banking organizations

The results show that the two Islamic banks included in the study possess relatively high levels of resilience capabilities. However, there seems to be room for resilience improvement for the two banks. As a smaller country, Palestine is regularly exposed to business threats with changing markets, supply chain issues and staffing challenges. The country is to some extent vulnerable to natural disasters such as bad weather conditions and constant political instabilities. Islamic banks in this environment keenly consider the importance of organizational risk management for business as a driver for surviving a crisis and even thrive. The result of the two case studies showed that risk management introduction and maturity to the Islamic banks is a step in the right direction to enhance the organizational resilience of these banks. Further, human resources capacity building through leveraging staff knowledge levels and information sharing was vital for sustaining relatively high level of resilience capabilities. In addition, the results supports the notion that a well-integrated action plans and strategies can enhance the overall organizational resilience from two perspectives; supporting the new concept of organizational resilience and harmonizing the development and evaluation of plans and strategies. Another dimension where resilience capabilities availability in Islamic Banks was supported is the senior management engagement in risk management activities. Furthermore, results have proved that staff empowerment by their immediate top management was very essential for employees to use their latent skills and innovation to solve and adapt to unexpected disruptions. This explains why the two case study banks included in this research showed an excellent resilience score in leadership, staff engagement and situation awareness indicators. On the other hand, leveraging knowledge and breaking silos indicators resulted in a fair resilience score, while proactive posture, decision making, internal resources, planning strategies, stress testing plans indicators scored a good resilience result.

The analysis of the results showed that the indicators of leadership, staff engagement, and internal resources have the same resilience benchmark average. This is due to the fact that the Palestinian banks should be committed to PMA obligations and instructions regarding the risk management procedures,

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

practices and activities including the procedures for managing their internal resources and the implementation of Basel II accords. In addition to that, PMA conducted several training workshops for the risk management team in "Bank A" and "Bank B" so that they have a mutual information and knowledge backgrounds. Furthermore, the two banks implemented the same risk management system; they have interchanged seven senior managers so they almost share the same experience and culture.

Moreover, analysis of the results at both case studies suggested that in order to enhance the organizational resilience the Islamic banks should embrace the concepts of "Leveraging knowledge" necessary for learning organizations. A learning organization is the organization that acquires knowledge and innovates fast enough to survive and thrive in a rapidly changing environment. Change management is a systematic approach to dealing with change, both from the perspective of an organization and on the individual level. Engaged and involved employees are emotionally invested in the whole organization, they believe in what they are doing and are dedicated to their peers, their supervisors and their organization. When done right, engagement and involvement is a powerful mixture, and the power is contained within the concept of discretionary effort, increased levels of employee engagement and involvement correlate with higher knowledge acquisition and profit generation, productivity, while decreasing absenteeism, and turnover.

This research has the limitation of providing attempts to only explore the dynamic of organizational resilience in Palestinian Islamic banks. Future research is needed to explore the dynamics of organizational resilience in Islamic banks in other countries and regions. As such, future research directions should explore and compare the enabling conditions and determinants of organizational resilience between countries and regions. In addition, further research is required to investigate how the implementation of Basel III: A global regulatory framework for more resilient banks and banking systems impact the resilience of Islamic banking organizations. Furthermore, it is proposed that future research directions focuses on exploring the enablers of organizations to go beyond resilience by discovering how to tap employees commitment and develop the capacity to learn at all levels. It is as Senge (1990) said "Learning organizations are possible because at heart we all love to learn. Through learning we re-create ourselves and are able to do something we were never able to do earlier. Through learning we re-perceive the world and our relationship to it. Through learning we extend our capacity to create, to be part of the generative process of life". Therefore, further research is needed to look at how organizational resilience can help Islamic banking organizations to build internal capabilities and processes to enhance the learning process of understanding the business environment to become better performers.

Chapter 13
AHP-Driven Knowledge Leakage Risk Assessment Model: A Construct-Apply-Control Cycle Approach

Haley Wing Chi Tsang

Eric Tsui
The Hong Kong Polytechnic University, Hong Kong

ABSTRACT

Intellectual Capital (IC) is becoming more widely understood by the academic and business communities, especially its important role in value creation of an organization. However, few people are aware that IC, if not managed properly, may also pose threats, sometime serious, to an organization. Knowledge leakage from an organization, for example, may come about when an experienced employee leaves for another job. Knowledge leakage is pervasive throughout an organization but is seldom noticed until the consequence is felt. This intellectual capital risk has to be systematically and effectively identified, assessed and controlled in the whole value chain of an organization. An AHP (Analytic Hierarchy Process) based multi-dimensional decision making and assessment model is developed to determine knowledge leakage risk in an organization.

INTRODUCTION

In the globalized knowledge-intensive, technology-driven economy, the importance of knowledge to any sector in society or business has never been so critical. Intellectual capital (IC), a term often used interchangeably with knowledge assets, refers to the knowledge, skills and experiences of employees, and the

knowledge embedded in business processes, management practice, company culture, client relationships etc. of an organization. Edvinsson (1997) stated that IC was knowledge that could be transformed into values (products or services) to generate revenues for an organization. For a long time since the term was coined, IC has been classified into three categories: human capital, structural capital and relational capital (Edvinsson & Kivikas, 2007). IC has also received growing attention by the public and business people, and a fair amount of research efforts by academics. The focus up to now has been on the value creation side of IC. This is expected. However, the downside of IC, or IC risks, is not on the radar of many professionals, including researchers, despite its potential disastrous impact on an organization in some instances of IC risks occurring in real life. IC risks include, for example, employee turnover (experienced staff leaving the organization) (Harvey & Lusch, 1999; Parise, Cross, & Davenport, 2006) and reputation damage (product safety has serious problems) (Harvey & Lusch, 1999).

Among the typical IC risks in an organizations, knowledge leakage risk is by far one of the most pervasive and it can occur in different business functions or processes. By definition, knowledge leakage refers to the loss of knowledge to a third party which is owned by and resident in an organization for internal use only (Frishammar, Ericsson, & Patel, 2015). Knowledge leakage can take many forms and bring many disadvantages to an organization. For example, an organization may have developed a very effective sales/marketing software to streamline the sales process and reporting which is of great help in increasing the productivity of sales staff. If the design of the software is leaked to a competitor, the 'secret' of success may be replicated in a short time in the competitor's systems to enable it to enjoy the same benefits offered by the software. The organization's competitive advantage may be seriously affected, making the resulting costs of knowledge leakage quite obvious (DeLong, 2004). This example showed that the downside of knowledge leakage can threaten the survival of even a large corporation, but research in this type of common IC risk is still insignificant (Parker, 2012). In an attempt to fill this research gap, this study proposes a knowledge leakage assessment model driven by the Analytic Hierarchy Process (AHP). In the following sections, the building components of the model, methodology, benefits and examples of applying the model in the business world are discussed.

RISK ASSESSMENT AND ANALYTICAL HIERARCHY PROCESS

In enterprise risk management, there are a number of frameworks in use today and COSO (Committee of Sponsoring Organizations of the Treadway Commission) (Curtis & Carey, 2012) is the most widely adopted by organizations. Typically, risk management involves identifying, prioritizing, responding to, assessing, monitoring and reporting risks. The risks may include physical risks like fire and earthquake and financial risks like interest rate instability and payment default. However, there is also an important category of risks not specifically addressed by these common frameworks but related to IC of organizations which must be effectively managed to ensure competitiveness and sustainability. These risks, arising from IC not properly managed, are called IC risks. Examples are: knowledge leakage, intellectual property (IP) loss and employee turnover. In this paper, the focus is on risk assessment component of a framework as applied to one of the most important IC risks - knowledge leakage. As for risk assessment, it refers to activities carried out in establishing assessment criteria and scope, determining likelihood and impact of risks, and prioritizing them (Hallikas, Karvonen, Pulkkinen, Virolainen, &Tuominen, 2004). Common frameworks like COSO (Curtis & Carey, 2012) and CAS (Casualty Actuarial Society)

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

(Casualty Actuarial Society, 2013) have similar risk assessment methodology. The determination of the level of risk is important in risk management, including IC risk management. According to Zhi (1995) and Williams (1993), risk is expressed mathematically as:

$$R = P \times I$$

where R is the level of risk, P is the probability for the risk to occur and I is the impact of the risk.

In the usual risk management of an organization, the management process consists of a number of sequential steps: identification, prioritization, aversion, mitigation, assessment, monitoring, reporting and review (Hallikas, Karvonen, Pulkkinen, Virolainen, & Tuominen, 2004). In this study, the focus is on the assessment step which is roughly at the middle of the process. In this step, the performance of the preceding steps is measured. The assessment results then become input to the following steps which depend on such inputs and other information to achieve the objectives of monitoring and review, for example. Therefore, a study of risk assessment will yield a high ROI (Return on Investment) and improve the whole risk management process significantly. However, the assessment of IC risks has been mainly qualitative and done on individual risks often in isolation from each other. What is lacking is unified empirical assessment not only at individual risk level but also at functional and organizational levels to obtain better overall management. To fill this gap, the current study will deal with the organization-wide empirical assessment of IC risks. Thus a common IC risk, knowledge leakage, which can occur in many functions, departments or projects, is chosen for the study. To carry out the empirical assessment of an IC risk with an organization-wide characteristic, Analytic Hierarchy Process (AHP) was selected. The suitability of AHP in this project would be explained as follows. The chosen knowledge leakage risk has many kinds and can occur in different functions at different management levels and their relationships would best be described by a hierarchy, as explained in the later section on knowledge leakage hierarchy construction. Since AHP is hierarchy-based, both are compatible and AHP can be applied to this hierarchy to assess risks.

In practice, AHP starts first with the construction of a hierarchy of criteria relevant to the context of the decision to be made. In this project, the criteria became the different kinds of knowledge leakage risks, the context was the knowledge leakage situation in an organization and the decision making was about finding the relative risk impacts. Then pair-wise comparison of two criteria in terms of relative importance is done before an algorithm is deployed to determine the weighting of each criterion (Partovi, Burton, & Banerjee, 1990). The weightings calculated make AHP especially useful in multi-criteria decision making and are thus similarly used in the assessment of knowledge leakage risks hierarchy, as shown in the sections below.

Going back in history, AHP was a process developed by Saaty (1977) for multi-criteria decision making. It was used for prioritization of tasks or allocation of resources (Saaty, 2008). Since then, AHP has been applied in various business areas, for example, in risk assessment, project risk assessment (Mustafa & Al-Bahar, 1991) and overseas construction project risk assessment (Zhi, 1995). Scholars have also used AHP to weigh the knowledge assets of a company (Carlucci & Schiuma, 2007); to select the best set of knowledge management (KM) tools (Grimaldi & Rippa, 2011); to evaluate KM strategies (Wu & Lee, 2007) and to explore KM enablers (Jandaghi, Jandaghi, Irani, Mousavi, & Davoodavabi, 2014). Other industries include supplier selection (Handfield, Walton, Sroufe, & Melnyk, 2002), weapon system evaluation (Cheng & Mon, 1994) and site selection (Saaty, 2008). Finally, organization examples

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

are: Department of Defence in the U.S., British Airways and Federal Financial Institutions Examination Council (Saaty, 2008). The great number of varied applications of AHP since its inception shows that it is a strong, proven analytic tool with a wide range of usability. The AHP in knowledge leakage risk assessment represents only one of the recent novel research efforts.

KNOWLEDGE LEAKAGE RISK HIERARCHY

In any organization, knowledge is embedded in employees, business processes, systems, databases, marketing campaigns, design documents, patents, products, services and so on. During normal business activities, knowledge, sensitive or insensitive, public or confidential, is used to carry out daily tasks. It is probable that some or significant portion of the knowledge, intended for internal use only, may be exposed to external parties because of errors unintentionally or business necessities unavoidably (Ahmad, Bosua, & Scheepers, 2014). The worst happens when highly sensitive proprietary knowledge is in the hands of competitors or parties hostile to the organizations, causing potentially great damage like loss of competitive advantage (Frishammar et al., 2015). The above incidents are knowledge leakage and the undesirable effects are referred to as the negative side of knowledge leakage. On the other hand, there is the opposite side to knowledge leakage too. When knowledge is intentionally leaked or lost to selected outside parties beyond information sharing or business collaboration needs to achieve something advantageous to the organization, for example, better collaboration or business relationship, such benefits are known as the positive side of knowledge leakage (Jiang, Li, Gao, Bao, & Jiang, 2013; Mohamed et al., 2007). Normally, in the course of business, knowledge leakage is predominantly negative. Therefore, though both the positive and negative sides of knowledge leakage are under-researched (Mohamed et al., 2007), much more attention to the latter side is required (Frishammar et al., 2015) and the present study belongs to the latter.

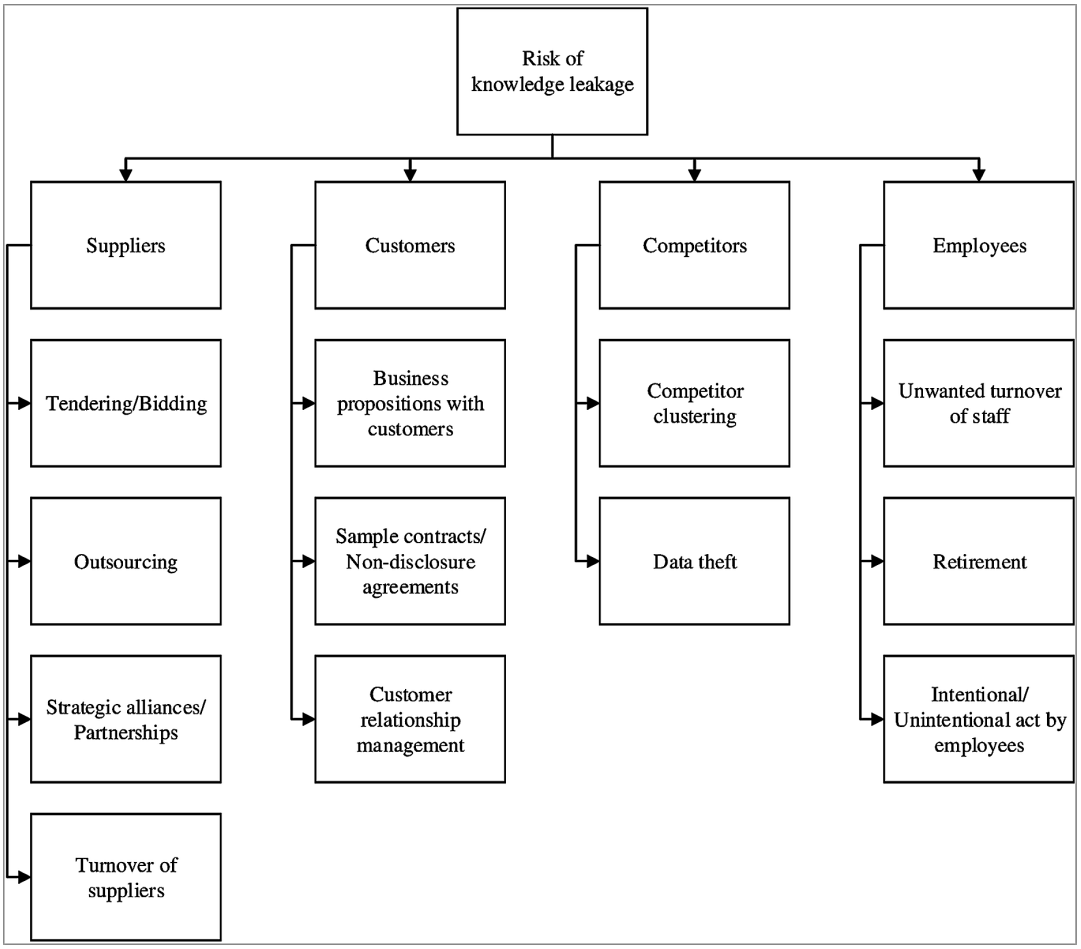
In nature, knowledge leakage risks have characteristics distinct from other common enterprise risks. Knowledge leakage can occur at any time in any place in an organization. Business processes, product designs and trade secrets may suffer from knowledge leakage from time to time. It is the pervasiveness of knowledge leakage which makes it different from other common risks such as stock price risks, payment default risks and country risks, which may be dealt with by some specific departments only. Knowledge leakage risks, because they can occur in many different functions, are rather being addressed by employees in many departments or groups. Then within a department, for example, marketing, there are also different kinds of knowledge leakage in areas like product sales data, promotional strategies, major customers list and pricing strategies. Going further, another sub-departmental level of knowledge leakage is possible. Considering the situation as a whole, a hierarchy becomes a natural choice to depict their relationships. Furthermore, as there are many properties common to different kinds of knowledge leakage, a multi-level hierarchy and its sub-hierarchies help group similar knowledge leakage risks together for more uniform and effective risk management at different levels of the hierarchy. It also follows that risk assessment can be done at different levels, depending on the needs.

In the proposed model, a similar knowledge leakage hierarchy of an organization is used in the risk assessment. To do this, a simple hierarchy is constructed first by making use of the key knowledge leakage drivers and a subset of sub-drivers extracted from the corresponding full set of a larger scope appeared in a study by Mohamed et al. (2007). The purpose is to illustrate some of the steps, factors and considerations involved in the construction process and therefore, only general business and risk knowledge of

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

a typical organization of today is used here to arrive at several common sub-drivers examples for each key driver. This hierarchy is also developed to illustrate how AHP can be applied in the assessment of knowledge leakage as in the later sections. The description and explanation is not intended to modify or replace any of the original arguments presented. In practice, the key staff of the organization will take part in the process as well. It details the factors and considerations involved in building this three-level hierarchy. The top level is the 'Risk of knowledge leakage' with four children (key drivers) at the level below being respectively 'Suppliers', 'Customers', 'Competitors' and 'Employees', from left to right in the figure. Each has several sub-drivers at the next lower level (third level). Refer to Figure 1 for all the elements of the hierarchy.

The 'Supplier' key driver is at the leftmost of the second level. In any business, suppliers of products or services are essential. However, during the course of conducting business transactions with them, knowledge leakage can happen. For example, in the purchase or tendering process, an organization provides specifications for products/services to be purchased from suppliers, which at least indirectly lets the suppliers know some part of the future sales plan or future products in design/manufacture, when such information is generally regarded as trade secrets. In another instance, the organization may outsource internal IT services to an outsourcing provider, and the risk of leakage of sensitive business information to suppliers is high and must be managed properly. In an organization which relies on an excellent supply chain to produce products, it has excellent relationships with suppliers, and if necessary, may transfer proprietary knowledge/skills to them so that their product/services can meet the requirements of the supply chain. These suppliers effectively become business partners. However, this situation makes the relationship with them riskier than with ordinary suppliers because more specialized proprietary knowledge is released to a third party who may pass it to the organization's competitors especially when these suppliers cease doing business with the organization and turn to its competitors instead. The stakes are high with such supplier partnerships for the organization. The four sources of knowledge leakage identified become four sub-drivers of the key driver 'Supplier': 'Tendering/Bidding', 'Outsourcing', 'Strategic alliances/Partnerships' and 'Turnover of suppliers'.



The second key driver is 'Customers'. Customers, a critically important asset of an organization, can be a driver for knowledge leakage. During the sales process, presentations and proposals are made to sell proposed solutions to a potential/existing customer business problem. These proposed solutions are the output of applying the knowledge of the organization to a sales situation and might be leaked. The potential/existing customers may take the ideas in the proposed solution and develop them further for their own purposes. Similar kinds of leakage occur in sample contracts or non-disclosure agreements. At another sales step, customer relationship building, a sales manager may reluctantly or unintentionally disclose some sensitive business information to a customer when being asked in order to make the customer satisfied. In light of these considerations, four sub-drivers under 'Customer' are identified: 'Business propositions with customers', 'Sample contracts/non-disclosure agreements' and 'Customer relationship management'.Besides 'Customers', 'Competitors' can become a key driver of knowledge leakage as well. It is very common in many industries for participants in the same industry, who are competitors, to attend trade shows, exhibitions, seminars, workshops, meetings or conferences together. During these occasions, they share news, trends and developments or exchange information. If participants do not take sufficient precautionary measures, it is easy for them to disclose unintentionally some confidential company business information to other participants who are competitors, and will take advantage of this unintentional knowledge leakage. At other times, there are people who are very

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

knowledgeable in computer security and attempt to access the database of their competitors to gain unauthorized copy of trade secret information. These considerations give rise to two sub-drivers for 'Competitors': 'Competitor clustering' and 'Data theft.'

The last key driver of knowledge leakage is 'Employees'. People are regarded as the most important asset in an organization because any successful running of a business depends greatly on the knowledge, skills and experience of its employees. Therefore, if employees leave an organization, very often this also means loss of knowledge as far as the organization is concerned. An organization would try to minimise the loss of key staff and their associated knowledge to avoid the undesirable effects on the organization's daily operation and growth. At the same time, an organization must get prepared for the retirement of staff so that the knowledge and skills of retired staff can be transferred to other employees in a timely and orderly manner. In other situations, some employee may leak company information to people outside the organization unintentionally or by mistake, or intentionally for benefits, because of dissatisfaction with the organization or other factors. Proper employee training in data security measures and ethics may reduce such knowledge leakage. What have been considered leads to three sub-drivers identified for 'Employees': 'Unwanted turnover', 'Retirement' and 'Intentional/unintentional act by employees'.

Figure 1. The knowledge leakage risk hierarchy adapted from Mohamed et al. (2007)

KNOWLEDGE LEAKAGE RISK ASSESSMENT MODEL

In the model proposed in this paper, AHP plays two important roles. The first role is to make use of AHP algorithms to create the weighting matrix for a given hierarchy. The second is to multiply the matrix with necessary risk impact and probability data from real-life risk practice to obtain the risk score, which reflects the result of the current risk controls adopted. Therefore, there are two cycles in the model as shown in Figure 2, corresponding to the two roles.

In the first cycle, shown on the left in the figure, is the sub-cycle and is known as the hierarchy cycle. The knowledge leakage hierarchy is constructed according to the current business context. Then pair-wise comparison is performed for each pair of risks in the hierarchy according to AHP, producing the weighting matrix for all the concerned risks. Usually the hierarchy and pair-wise comparison remain stable over a relatively long period of time. However, if the business context changes in the future, the hierarchy is updated or the pair-wise comparisons are done all over again to produce an updated weighting matrix for use in AHP. Therefore, there is the step at the bottom of the cycle for this. The second cycle, shown on the right in the figure, is the main cycle and is known as the control cycle. It makes use of the weighting matrix, which is the common part of the two cycles, to compute the risk score of the hierarchy based on the current risk impact and probability data. Risk control is carried out in this cycle with the use of the weightings for task prioritization and other risk control measures like risk mitigation. As soon as the risk controls or changes in business context affect the impact or probability of a risk, such data are updated and then combined with the weighting matrix to produce a new risk score for evaluation and monitoring. Usually, as time progresses, this cycle repeats itself as often as required, depending on the changes in risks or business context. Therefore, these parts are much more active and dynamic than the other parts in the left cycle and assume a greater role in the model. It explains why the right cycle is the main cycle whereas the left is the sub-cycle. As can be seen in Figure 2, AHP is driving the two cycles, making the elements and actions depicted by the model interact in constant motion in the context of the bigger Construct (Hierarchy) – Apply (AHP) – Control (Risk) cycle.

METHODOLOGY OF THE MODEL

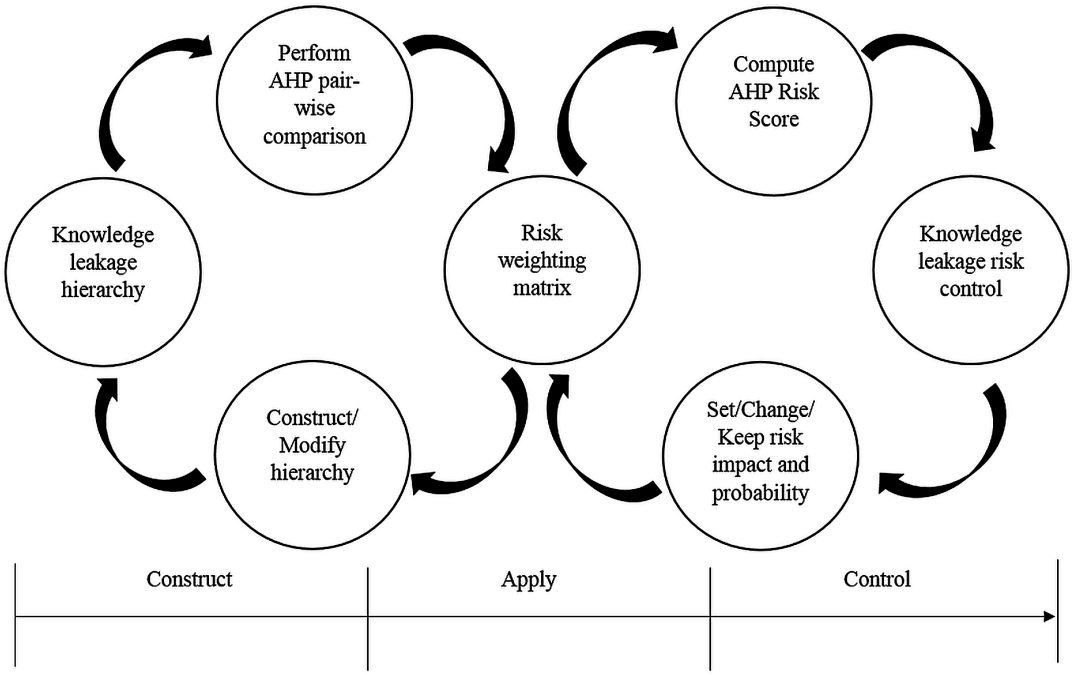
The methodology of the model involves a process of three phases during which AHP is applied to the knowledge leakage risk hierarchy constructed, as shown in Figure 3. The first phase is the construction of a hierarchy for the knowledge leakage risks of an organization while the second and third phases are the assessment of the knowledge leakage risks in the hierarchy using AHP.

Phase 1: Construction of a Hierarchy of Knowledge Leakage Risk

In this phase, a hierarchy of knowledge leakage risks of an organization is constructed based on studies carried out for the organization. The number of levels and the kinds of leakage risks to be dealt with are identified to reflect the business context, the nature of risks and the depth of assessment. The procedures involved are best explained with an example. Refer to the section on ‘Knowledge Leakage Risk Hierarchy’ for details.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 2. The knowledge leakage risk assessment model



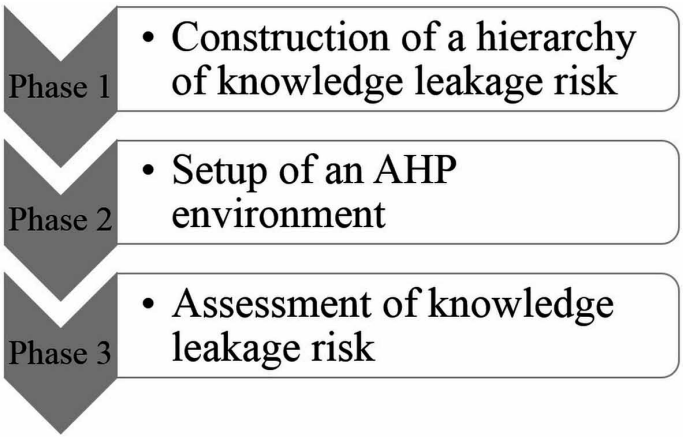


Figure 3. The 3 phases in the methodology

Phase 2: Setup of an AHP Environment

AHP is applied to the knowledge leakage hierarchy to assess the knowledge leakage risk. To do this, risks are measured in terms of their importance to the organization, and a weighting factor is assigned to a risk accordingly. The greater the importance is, the higher the weighting is. Starting with the four key drivers of knowledge leakage risks, a pair-wise comparison is performed for each driver with each of the other three drivers using Saaty's scale (Saaty, 2008) for pairwise comparison as in Table l. In this

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

section, a hypothetical organization is used and the data chosen reflects business parameters close to real world organizations. To illustrate, referring to the second, third and fourth entry in the first row in Table 2 (the first entry is for self-comparison), the importance of knowledge leakage through suppliers is considered as three times more than that through customers, three times less than that through competitors and seven times less than that through employees. The same comparison procedure is then applied to the set of sub-drivers of each of the key drivers and the results are given in Table 3 to 6.

Table 1. Scale for pair-wise comparison by Saaty (2008)

Intensity of Importance	Definition	Explanation
1	Equal importance	Two activities contribute equally to the objective
3	Moderate importance	Experience and judgement slightly favour one activity over another
5	Strong importance	Experience and judgement strongly favour one activity over another
7	Very strong or demonstrated importance	An activity is favoured very strongly over another; its dominance demonstrated in practice
9	Extreme importance	The evidence favouring one activity over another is of the highest possible order of affirmation
2,4,6,8	Intermediate values	
Reciprocals of above	If activity *i* has one of the above non-zero numbers assigned to it when compared with activity *j*, then *j* has the reciprocal value when compared with *i*	

Table 2. Pair-wise comparison matrix for the four main drivers of knowledge leakage

Main drivers	Suppliers	Customers	Competitors	Employees
Suppliers	1/1	3/1	1/3	1/7
Customers	1/3	1/1	1/5	1/7
Competitors	3/1	5/1	1/1	1/5
Employees	7/1	7/1	5/1	1/1

Table 3. Pair-wise comparison matrix for sub-drivers under 'Suppliers'

Sub-drivers	Tendering/ Bidding	Outsourcing	Strategic alliances/ Partnerships	Turnover of suppliers
Tendering/Bidding	1/1	1/3	1/9	1/5
Outsourcing	3/1	1/1	1/7	1/3
Strategic alliances/ Partnerships	9/1	7/1	1/1	3/1
Turnover of suppliers	5/1	3/1	1/3	1/1

Table 4. Pair-wise comparison matrix for sub-drivers under 'Customers'

Sub-drivers	Business propositions with customers	Sample contracts/ Non-disclosure agreements	Customer relationship management
Business propositions with customers	1/1	1/1	5/1
Sample contracts/ Non-disclosure agreements	1/1	1/1	5/1
Customer relationship management	1/5	1/5	1/1

Table 5. Pair-wise comparison matrix for sub-drivers under 'Competitors'

Sub-drivers	Competitor clustering	Data theft
Competitor clustering	1/1	1/9
Data theft	9/1	1/1

Table 6. Pair-wise comparison matrix for sub-drivers under 'Employees'

Sub-drivers	Unwanted turnover	Retirement	Intentional/ unintentional act by employees
Unwanted turnover	1/1	3/1	1/4
Retirement	1/3	1/1	1/9
Intentional/unintentional act by employees	4/1	9/1	1/1

Following AHP procedures, the elements C_{ij} in each pair-wise comparison matrix A, as below, are translated into absolute values (weightings) with a consistency ratio (CR) for each set of matrix.

$$A = \begin{pmatrix} C_{11} & \cdots & C_{1j} \\ \vdots & \ddots & \vdots \\ C_{i1} & \cdots & C_{ij} \end{pmatrix}$$

The consistency ratio is calculated as below:

$$A\omega = \lambda_{max}\omega$$

where ω is the principal Eigen vector of the matrix.

$$CR = \frac{CI}{RI}$$

$$CI = \frac{\lambda_{max} - n}{n - 1}$$

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Table 7. Sample Random consistency index RI as in Patil and Kant (2014)

Size (n)	1	2	3	4	5	6	7	8
RI	0	0	0.52	0.89	1.11	1.25	1.35	1.40

where *CI* is the consistency index and *RI* is the random consistency index in Table 7 and *n* is the

A web-based AHP software application developed by Dr. Klaus D. Goepel (http://bpmsg.com/academic/ahp.php) was selected to perform the AHP calculations to obtain the required weightings. There are a number of professional commercial software packages available for AHP (Al-Harbi, 2001; Alidi, 1996), e.g. Expert Choice, Criterium. Dr. Klaus D. Goepel's version was chosen because its features and capabilities are sufficient to support the non-complex AHP processing needs of this paper to illustrate the use of AHP in the knowledge leakage context, making the commercial grade software with sophisticated features unnecessary. Furthermore, the chosen is free and easy to use over the web with no local software installation required.

The weightings of the four key drivers and the consistency ratio are presented in Table 8. Subsequently, for each of the sub-driver pair-wise comparison matrices, the final weightings w'_{ij} are obtained by multiplying the weighting w_i *(i = 1,…,D)* of the respective main driver d_i *(i = 1,…,D)* with the initial weighting w_{ij} *(i = 1,…,D ; j = 1,…,S)* of the respective sub-driver s_{ij} *(i = 1,…D ; j = 1,…,S)* as below:

$$w'_{ij} = w_i \times w_{ij}$$

where w_i is the weighting of the main driver d_i and w_{ij} is the initial weighting of the sub driver s_{ij}

In this way, the final weightings of each sub driver are normalized with:

$$\sum_{j=1}^{s} w'_{ij} \leq 1, i = 1, \ldots, D$$

For example, the final weighting w'_{ij} for 'Tendering/Bidding= 0.0048 is obtained by multiplying the weighting of 'Suppliers' = 0.097 by the initial weighting of 'Tendering/Bidding' = 0.049. The final weightings with the consistency ratios are presented in Table 9. All the consistency ratios are less than 0.1, indicating that the results are sufficiently accurate (Partovi et al., 1990).

Table 8. The weightings/prioritised ratings for the four main drivers

	Suppliers	Customers	Competitors	Employees	CR
w_i	0.097	0.051	0.209	0.643	0.088

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Table 9. The initial and final weightings/prioritised ratings for the sub-drivers

Sub-drivers	w_{ij}				w'_{ij}	CR
	Suppliers	Customers	Competitors	Employees		
Tendering/Bidding	0.049	-	-	-	0.005	0.032
Outsourcing	0.101	-	-	-	0.010	
Strategic alliances/partnerships	0.607	-	-	-	0.059	
Turnover of suppliers	0.243	-	-	-	0.024	
Business propositions with customers	-	0.455	-	-	0.023	0.000
Sample contracts/Non-disclosure agreement	-	0.455	-	-	0.023	
Customer relationship management	-	0.091	-	-	0.005	
Competitors clustering	-	-	0.100	-	0.021	0.000
Data theft	-	-	0.900	-	0.188	
Unwanted turnover	-	-	-	0.200	0.129	0.010
Retirement	-	-	-	0.073	0.047	
Intentional/unintentional act by employees	-	-	-	0.727	0.467	

Phase 3: Assessment of Knowledge Leakage Risk

The impact and probability are then assessed for each sub driver after risk control actions have been performed. The more effective the risk control measures are, the more risk these measures can control and the less risk remains. The impact scale is a 1-10 scale, with 1 as the least impact and 10 as the most severe impact, while the probability scale is a 1-10 scale with 1 as the least possible and 10 as the most possible. The final risk score is capped at 100 and is calculated as:

$$Score = \sum_{j=1}^{S} w'_{ij} \times I_{ij} \times P_{ij}, i = 1,...,D$$

where w'_{ij} is the final weighting of the sub-driver s_{ij}, I_{ij} is the impact score of the sub-driver s_{ij} and P_{ij} is the probability score of the sub-driver s_{ij}

As illustrated in Table 10, the final risk score for the hypothetical organization is 33.8. The risk score can be used as an indicator of the level of risk in the organization as well as for monitoring the effectiveness of risk control measures taken. Basically, the higher the final risk score (the closer it is to 100), the higher the risk of knowledge leakage in the organization.

DISCUSSION

As can be seen in the model and methodology sections, the assessment of the knowledge leakage risks of the whole organization is facilitated with the application of AHP in the risk management process. The weightings help the prioritization of risks, or in better allocation of resources to tackle the knowledge risk. The two cycles, the hierarchy cycle and the control cycle, operate inter-dependently and co-opera-

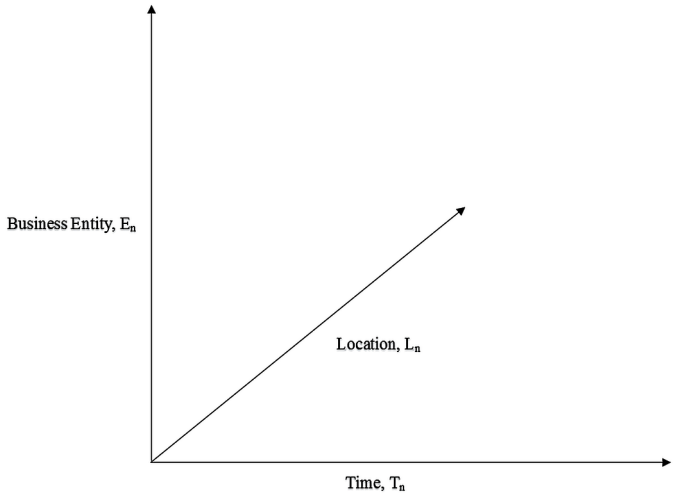
EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Table 10. Risk scores for sub drivers

Risk of Knowledge Leakage	Weighting w'_{ij}	Impact I_{ij}	Probability P_{ij}	Risk Score
Tendering/Bidding	0.005	3	7	0.100
Outsourcing	0.010	3	7	0.206
Strategic alliances/partnerships	0.059	7	4	1.649
Turnover of suppliers	0.024	5	2	0.236
Business propositions with customers	0.023	3	5	0.348
Sample contracts/Non-disclosure agreements	0.023	6	3	0.418
Customer relationship management	0.005	5	5	0.116
Competitors clustering	0.021	7	4	0.585
Data theft	0.188	9	2	3.386
Unwanted turnover	0.129	7	6	5.401
Retirement	0.047	8	7	2.629
Intentional/unintentional act by employees	0.467	8	5	18.698
Total				**33.8**

tively, though assuming different roles and fulfilling different needs in knowledge leakage assessment. The end result is that a risk score can be obtained as often as the business context demands for more effective assessment and quicker response across business entities or across different time periods in an organization, large or small. Though the risk score has to be interpreted together with other business performance indicators, it is still usable in monitoring. It indicates how AHP drives better risk management of knowledge leakage.

In fact, the hierarchy in the example can be replaced by another knowledge leakage hierarchy to suit a new business demand, where the top level becomes Sales/Marketing, Customer Service, Inventory Operations, Hardware Support, Software Support, Manufacturing and R&D, for example. Below the top level, each top level element is furthered composed of a number of knowledge leakage sub-risks specific to the top-level element. Almost immediately, another Construct-Apply-Control cycle can be carried out to assess the knowledge leakage risks from another perspective. This shows the flexibility of the present approach. To develop a usable hierarchy requires the cooperation of internal managerial staff and external specialists, where applicable. The hierarchy construction process can make use of the Delphi method (Sun, Srivastava, & Mock, 2006), a managed procedure to brainstorm alternatives and choose the different options available. One added benefit of the hierarchy construction process is that it enables the managing staff concerned to think systematically of the knowledge leakage risk they face every day without ever having a chance or time to think them through in a more organized way in order to discover what they do not already know or ignore most of the time. The knowledge leakage risks will be better attended to and managed.



EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Application I: Applying the Model across Organizational Structure

Except for small organizations, there are usually more than one business entities inside the same organization. In addition to constructing the knowledge leakage hierarchy for the whole, known as the main hierarchy, individual hierarchies, known as sub-hierarchies, can also be constructed for different business entities, and an independent AHP can be done for risk control of a particular entity. In other words, depending on the business needs, the model can be used for any structural or functional part of the whole organization as long as it makes business sense, from the corporate risk management perspective. In fact, the model can be deployed as one of the management tools for a specialized project of a definite duration. As a result of this flexibility, more cost-effective and detailed risk assessments can be carried out to meet current or anticipated needs.

To implement this flexibility in practice, there are three main directions for applying the model across different business entities, as shown by the three axes in Figure 4. First, for the x-axis, the axis of time, if the hierarchy and weightings are the same or stable over a period of time, a line graph constructed along this axis can show the risk score trend of the same business entity for different times. For the y-axis, the axis of business entity, if a number of business entities in the same organization location (e.g. a plant) are of similar business nature (e.g. product groups with each working on a different product in the same manufacturing campus) and thus share the same hierarchy and same weighting matrix, a line graph can be drawn along this axis to show the variation of risk scores for different entities in the same time period. Then for the z-axis, or the axis of business location, if a business entity of the same nature (e.g. web page design project group) exists in different business locations (e.g different districts in the same city or different cities in the same country) and they share the same hierarchy and weighting matrix, a line graph drawn along the z-axis can show the risk scores of entities in the same period in different locations for risk control results comparison. For a multi-national company with subsidiaries around the world operating in the same business and sharing the same management structure and practice, the AHP can be applied to offer tangible data for monitoring and comparison of the same or different business entities over time or space.

Figure 4. Risk Scores comparison along time, business entity and location axes

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Application II: Using the Model in Credit Risk Analysis

The AHP-driven knowledge leakage risk assessment model can be used in an organization to manage the concerned risk. At the same time, external parties can also take advantage of the usefulness of this model and one of them is the credit risk analyst of a financial institution which lends money to companies for running their businesses. At present, the credit risk analyst adopts the established practice for the credit risk assessment of loan applicants by mainly making use of the financial reports (Iazzolino, Migliano, & Gregorace, 2013). However, any knowledge leakage can potentially affect the competitive advantage significantly, putting its earning capacity in doubt. Therefore, it is advisable to include knowledge leakage risk assessment in the credit risk analysis of the applicant.

The financial institution can ask the applicant to submit knowledge leakage risk control reports which show their objectives, planning and review of what they have done in this domain of risk management. Further, the analyst can visit the applicant's office and hold meetings/interviews with the concerned staff to have on-site information gathering and observation. If the applicant uses the AHP-driven model, the analyst can do a better job in credit risk analysis in several ways. First, the risk hierarchy constructed for the model enables the applicant to have a critical systematic analysis and review of the current knowledge leakage risks faced. This action results in better planning and prioritization for the leakage risks to increase the ability to eliminate or reduce losses, especially those affecting the repayment of loans. Thus the hierarchy work provides documented evidence to support what the applicant claims in the loan repayment schedules. The quality of the documents at least reflects to a certain extent how well the applicant manages the risk.

Second, the weighting matrix, as a product of applying AHP to the hierarchy show the relative importance of the leakage risks in the applicant portfolio of the knowledge leakage risks. Detailed study by a credit risk analyst may reveal useful information, notably about the company's risk distribution but also the most important risks being faced, which may affect the organization's earnings in the future.

Third, the risk score, a numeric figure provided by the model, is very useful. The figure, when combined with other risk-related information, will inform the analyst about the quality of risk management in the organization. As this data can be provided regularly, like other financial data, the risk score can be used for the monitoring of risk management performance by comparing the figures in different periods.

Finally, this important numeric risk score can be fed into the credit risk analysis system of the lending company as part of the regular input data, making it a strong candidate to be one of the independent variable with the potential to enhance the credit risk analysis results. Earlier work by Iazzolino et al. (2013) showed that the use of intellectual capital related data (knowledge leakage is in this category) can benefit credit risk analysis. Further modelling work on the credit risk analysis software is required to realise this perceived advantage of the model.

LIMITATIONS AND FUTURE RESEARCH

The application of AHP to knowledge leakage risks of an organization is a novel approach conceptually and the empirical results after assessing a hierarchy of risks instead of individual risks are not commonly found in existing AHP applications nor in other risks assessment methods which are largely qualitative. The novel approach comes with limitations which are anticipated however. First, if the hierarchy consists of many kinds of knowledge leakage risks, to do all the pair-wise comparisons becomes a lengthy and

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

cumbersome process (Belton, 1986), making some comparisons not be done accurately. This undesirable situation may occur especially when the model deals with a large hierarchy or a hierarchy which changes its structure and components quite frequently. More fundamentally, it may be argued that the translation of assessor understanding, perception or evaluation in the pair-wise comparisons into numbers may be inaccurate though the assessor may think otherwise (Deng, 1999). Associated with this translation concern and as it is usual the case with other empirical methods which rely on the assignment of numbers to a set of related qualitative measurements, the analysis results (the risk scores in the assessment model) can be difficult to interpret for practical use. This limitation is magnified when the risk scores of the same hierarchy are compared for two or more different periods and then interpreted.

In view of the above, more research needs be done to address them. One probable route to take is to use a fuzzy scale in the model to overcome the undesirable uncertainty or inaccuracy associated with pair-wise comparisons (Mikhailov & Tsvetinov, 2004). Also, efforts should be made in finding other empirical methods to augment the AHP in the model so that the new numeric results can be interpreted on stronger theoretical grounds. Finally, as with any novel theoretical considerations, the proposed model should be put to test in small or large organizations in order to get field feedback from practitioners as well and increase the model's strength. Since both the positive and negative sides of knowledge leakage risk are under-researched (Mohamed et al., 2007), testing the model for the positive side can be one of the next logical steps of future work.

CONCLUSION

How AHP can be applied to the knowledge leakage hierarchy constructed for an organization in the risk assessment cycle is demonstrated and how the AHP-generated weighting matrix can be used in risk control effectiveness comparison and monitoring across time and business entities at various levels of the organization locations is also discussed. Such work done and demonstrated in this paper is built on strong, solid theoretical and risk management grounds with significant implications.

It is the nature of knowledge leakage that it can occur in any business entity and any point in the value chain, implying that there are quite many kinds of knowledge leakage faced by an organization. This makes using a hierarchy to visualize them and show their inter-relationships, either functionally or structurally, a logical first step to take in any risk control effort of knowledge leakage. Therefore, hierarchy-based AHP and the knowledge leakage hierarchy come naturally together in determining the weightings of risks in the hierarchy. It is easy to understand and do the pair-wise comparisons across the risks at the higher level horizontally and across those risks one level immediately below vertically. The readily available AHP software in the public domain then creates the important weighting matrix for the hierarchy, giving at a glance a total picture of the relative importance of all knowledge leakage risks of the whole organization. This indicates the power of AHP combined with the organizational leakage hierarchy.

Conceptually, AHP has been developed for a long time and is theoretically a sound solid methodology in multi-criteria decision making and a hierarchy of knowledge leakage risks is also a theoretically sound representation of knowledge leakage risks in business because it reflects the nature of such risks in an the real world. From a theoretical standpoint, the application of AHP to knowledge leakage is valid and similar to many past usage examples of AHP much mentioned in the literature. What is unique is

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

that this paper argues the conceptual combination of the two theoretical approaches and put forward the theoretical construct-apply-control approach in the risk assessment literature. Notably, it is the first time when the AHP theory is deployed to a new area of IC risks with revealing results when IC risk itself up to now is an under-researched topic for many years (Mohamed et al., 2007; Frishammar et al., 2015).

From the standpoint of management practice, the total organizational picture of knowledge leakages not only helps the allocation and prioritization of resources to combat leakages but also serves to monitor the risk control effectiveness across time or business entities, all being critical components in any risk management. The flexibility and robustness of AHP in knowledge leakage control become evident and crucial when IC, IC risks and knowledge leakage risks may change quickly, and new or emerging ones may come in great numbers without any pre-warning in the globalized knowledge-intensive economy. When even primitive tools let alone empirical ones of any sort are difficult to find in a research field as new as IC risk, the ease of using AHP makes it an attractive, effective tool to use in the initial control set up and following mitigation and monitoring to meet the fast changing uncharted IC risk waters. Compared against many existing risk management frameworks or systems, a systematic empirical means of risks assessment across time or business entities in an organization provided by the paper's model is conspicuously absent in them.

As said above, an AHP-driven risk assessment model is well-suited to knowledge leakage, as well as IC risks in general. The model can be further refined and developed to enlarge its scope of applicability and has the potential to use with other innovative empirical tools to provide risk assessment measures not seen at present in any risk management systems. As what it is now and will continue for some considerable time in the future, the robustness of this AHP model will make it a growing contributor in the empirical IC risk landscape and enterprise risk management landscape as well.

ACKNOWLEDGMENT

The authors would like to thank the Research Committee and the Department of Industrial and Systems Engineering of The Hong Kong Polytechnic University for the financial support of the research study (Account Code: RU8Q) and two anonymous reviewers for their valuable feedback.

Chapter 14
Towards a Hybrid MAS Organizational Model: Combining the ACMAS and OCMAS Viewpoints

Hosny Abbas
Assiut University, Egypt

Samir Shaheen
Cairo University, Egypt

ABSTRACT

The organizational aspects are currently getting a great attention within the multi-agent systems (MAS) community. The motivation towards this trend is finding a way to handle the increasing complexity and distribution of modern agent-based applications using higher order abstractions such as agent organizations. It is a transition from concerning the micro level (individual agents) to concerning the macro level (the whole system) to handle complexity. A large number of MAS organizational models can be found in MAS literature. Some of them adopt the ACMAS (Agent-Centered MAS) viewpoint and others adopt the OCMAS (Organizational-Centered MAS) viewpoint. Each of the ACMAS and OCMAS viewpoints has its advantages and disadvantages; therefore, combining them into a hybrid model is expected to give us the chance to take benefit of their advantages and avoid their disadvantages. This chapter presents our recent work towards the conceptual design of a hybrid MAS organizational model that combines both of the ACMAS and OCMAS viewpoints.

INTRODUCTION

Multi-Agent Systems (MAS) are currently widely adopted for modeling, designing, and developing a diversity of real-world application domains. The design concepts behind agents are vital in the globalization context as globalization refers to an inherently distributed world both from geographical and information processing perspectives. What distinguishes the agent-based approach from traditional

approaches is its unique ability to handle simultaneously many challenges of future and even present real-world applications especially those applications which are highly distributed and their working environments are highly dynamic and uncertain. MAS are considered as a promising engineering (i.e., architectural) style for developing adaptive software systems able to handle the continuous increase in their complexity as a result of their open, heterogeneous, and continuous evolution nature. They model the system as distributed autonomous agents cooperate together to achieve system goals. There are two viewpoints of MAS engineering, the first one is the agent-centered MAS (ACMAS) in which the focus is given to individual agents. With this viewpoint, the designer concerns the local behaviors of agents and also their interactions without concerning the global structure of the system. The global required function of the system is supposed to emerge as a result of the lower level individual agent interactions in a bottom-up way. The key problems of the ACMAS viewpoint are mainly related to the unpredictability and uncertainty of agents' behaviors and interactions. Because the whole is more than the sum of its parts (Upton et al., 2014), this approach can lead to undesirable emergent behaviors that may impact system performance, as a result, this approach might be not suitable to design and engineer complex multi-agent systems.

The second viewpoint of MAS engineering is what is called organization-centered MAS (OCMAS) in which the structure of the system is given a bigger attention through the explicit abstraction of agent organization. With that approach, the designer designs the entire organization and coordination patterns on the one hand, and the agents' local behaviors on the other hand. It is considered as a top-down approach because the organization abstraction imposes some rules or norms used by agents to coordinate their local behaviors and interactions with other agents.

Although the MAS paradigm is successfully adopted for the development of many applications either industrial or any other real-life domains, but their adoption for developing large-scale applications that contain a very large number of agents is currently facing many challenges. The reason is that the current practice of MAS in industrial environments tends to be limited to individual agents and static small face-to-face groups of agents that operate as closed systems, which comprise a small number of agents' types and a small number of agents in general (Odell, 2003). This approach is not adequate for modeling and designing complex, open, heterogeneous, and highly distributed systems, where agents must be able to reorganize towards the most appropriate organizations to adapt unpredictable environment changes within MAS. Types of reorganization can be seen from two different levels. The individual agents level (the micro level) where an agent changes its behaviors and interactions with other agents to adapt the dynamic changes of its environment. And the organizational level (the macro-level) where the whole system changes its structure by adding or removing agents. Abbas et al. (Abbas, 2015a; Abbas, 2015b) provided a comprehensive overview about MAS organization including its motivations, paradigms, models, and other related concepts such as self-organization and emergence. The key conclusion of the authors' overview is that in MAS literature there are a large number of organizational models proposed to enable dynamic reorganization within MAS. The large number of present MAS organizational models indicates that concerning the organizational aspects within MAS is currently a very active and interesting research area. Also, it indicates that till now there is no a fit-to-all organizational model that can be used for engineering all possible application domains. To our best knowledge there is not any proposed model for enabling dynamic reorganization within large-scale and ultra-large-scale MAS. Although some of them are claimed to be adequate for developing open MAS but their proof-of-concept case studies are small-scale applications. We are convinced that still there is a need for a new MAS organizational

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

model that can be used to model a wide range of real-life applications including large-scale industrial environments such as smart grids and SCADA networks (Abbas, 2014). Generality is the main feature that we are looking for in the design of the new model, that generality includes not only the diversity of real-life applications which can be modeled and designed based on the new organizational model but also the applications with different scales (small, medium, and large).

Regarding the two MAS engineering viewpoints (ACMAS and OCMAS), the new model should provide the adequate framework for adopting both viewpoints in contrast to present models which concern only one viewpoint, the ACMAS or OCMAS and therefore each of these models provides the advantages of the adopted viewpoint and lacks the advantages of the other one. In this chapter, it is intended to design a novel MAS organizational model that is tailored to the development of adaptive large-scale and highly distributed agent-based applications. The new organizational model should be a general model, in the sense that it should simultaneously concern the important MAS perspectives and characteristics that have not been tackled or have been partially tackled by current MAS organizational models. These perspectives are: Generality, the integration of the ACMAS and OCMAS viewpoints, transparency (the application domain independency), static and dynamic aspects of the system, autonomy, heterogeneity, mobility, and security. These important perspectives and characteristics are highlighted and defined in the following section, and then our journey to design the new hybrid MAS organizational model will start in easy to follow steps.

The remaining of this chapter is organized as follows. The second section is dedicated to highlight the required characteristics of the new MAS organizational model. The third section presents the design methodology of the new model, the adopted methodology comprises seven easy to follow and understand steps. The fourth provides a hint on how to implement the change in the proposed organizational model. The fifth section provides a general discussion and highlights future trends regarding to the maturity of the proposed organizational model. The sixth section provides a way to implement the change in the proposed model. Finally, the seventh section concludes the chapter and highlights the next work intentions.

THE CHARACTERISTICS OF THE NEW MODEL

This section highlights the important characteristics that a new MAS organizational model should have. The combination of these characteristics in one model is expected to make it more appropriate for engineering a wide range of real-life applications specially the future large-scale and complex highly distributed applications.

Generality

One of the key problems with the present MAS organizational models is their specialization, as when proposed they were dedicated to specific application domains and hadn't been applied to other domains. That is why there are a large number of organizational models in MAS literature, each one was proposed for specific application. A general MAS organizational model is still required to be adopted with different application domains based on common organizational constructs and abstractions.

Further, scale is an important dimension of generality; to our best knowledge till now there is not any MAS organizational model that can be used to design small, large, and ultra-large-scale systems with one MAS framework. Modern Real-life systems are continuously increasing in scale and distribution,

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

one of the important truths in our universe is that all things (seen and unseen) are connected. Therefore, the new organizational model should be prepared to handle the dramatic increase in scale, complexity, and physical distribution of the future highly networked applications.

Hybrid Approach

Each of the MAS engineering approaches: ACMAS and OCMAS, has advantages and disadvantages (Abbas, 2015b). For instance, with the ACMAS viewpoint, the system has the advantage of giving better performance because agents are able to quickly adapt to environmental changes that would otherwise require permission from an organization (Jensen, 2013). Further, the ACMAS viewpoint is more efficient and effective for small-scale closed MAS, where there is a little number of agents than the OCMAS viewpoint for the same application. From the other hand, the ACMAS approach can complicate the system-to-be because the individual agents can act unexpectedly, i.e., how can we ensure that the system will converge towards a specified state and not continuously adapt and change. Also, an ACMAS requires complex intelligent agents because agents will be the engines of the system and accordingly will have dual responsibility: functional and organizational, and off course that will make the agents more complex.

On the other hand, the OCMAS viewpoint allows the designer to focus on what the system goals are, without considering how the goals should be fulfilled. The OCMAS are modeled with a higher level of abstraction, so the conceptual gap between real world and models is reduced (Garcia, 2008). Further, the OCMAS approach makes it possible to create the structure of the system without specifying details about the implementation. Also, this kind of systems offers facilities to implement open systems and heterogeneous member participation. However, the OCMAS approach may reduce agents' autonomy, and their degree of intelligence. Compared to the ACMAS approach, the OCMAS approach often results in lower performance because of the dynamic reorganization process overhead.

Therefore, it seems a good idea to merge both approaches in one model and taking the advantages of both of them and also compensating the disadvantages of each one with the advantages of the other. Thus, the new MAS organizational model should adopt a hybrid approach combining both of the AC-MAS and OCAMS viewpoints trying to take benefit of their advantages and avoid their disadvantages.

Transparency (Domain Independency)

The application domain independency necessitates transparency. The system higher level adaptation behaviors should be transparent from the lower level individual agents. Individual agents should find the help when they need without knowing the source of that help. This philosophy is aligned with the ACMAS viewpoint where agents aren't aware of the existence of the organizational system behaviors.

In distributed systems, such as MAS, the consistency of the system is maintained using predefined access architectures and protocols, which are designed depending on the semantics of each type of entity. These distribution strategies can't be modified by the individuals, who are limited to use the default design. Transparency of the adaptation behaviors allows us to modify the organizational rules and schemes without making any change in the functionality of the lower level agents. Most of the current MAS organizational models adopt explicitly the concept of agent roles (remember that a role is an abstract description of a functional activity), and this strategy makes the organizational model tightly coupled with the application domain. It had better make the relation between the organizational model

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

and the application domain loosely coupled so that the organizational model can be easily used to model any application domain (generality). Therefore, the new MAS organizational model should be domain-independent by realizing the adaptation transparency relative to the individual agents.

The Static and Dynamic Aspects

A static system is a system in which there is no change, like the solar system. A static MAS is often completely engineered in design time and mostly every behavior in the system is predefined, system components are also predefined and their interactions are known in advance. These systems although are stable and have better performance, but they are not robust enough to survive against unexpected situations such as the crash of one or more system components. Also, they aren't flexible (i.e., can't adapt their environment dynamic changes).

In contrast, a dynamic system is a system that is constantly changing, like the human body system. It is designed to be robust by possessing the ability to adapt environment changes or other types of perturbations. The increasing complexity, heterogeneity, and openness of modern and future real-world applications make the predefined behaviors in design time not adequate because it will be very difficult or impossible for the designer to expect every behavior or situation in the system-to-be. Therefore, a method to make the system able to dynamically change (regardless of the type of change) to handle new situations will be a requirement for these systems.

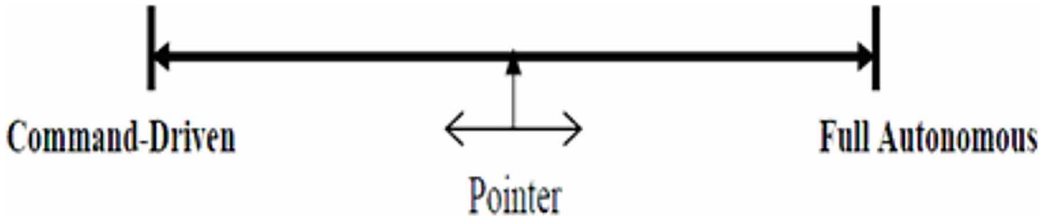
Therefore, the organizational model should adopt a hybrid approach regarding to the static and dynamic perspectives, to take advantage of the stability provided by the static perspective and also to take advantage of the robustness/flexibility provided by the dynamic perspective.

Autonomy

Autonomy was and still the main concept behind agents and multi-agent systems. Autonomy can be defined as the state of existing or acting separately from others. Thus, an autonomous agent is a software entity able to decide for itself independently without direct commands from other entities. Full autonomy is not a preferred agent characteristic in MAS research, and we can only find a type of full autonomy with humans (although controlled by the society) because they have perfect and rational minds, but agents (software or hardware) designed for specific missions in certain application domains and the requirement of safety imposes some constraints on their autonomy. Designed organization, where agents give up some degree of self-motivation and autonomy can be the appropriate choice, because it can serve as a kind of 'tuning' of the agent's autonomy. Figure 1 presents a possible spectrum of agent autonomy. As shown in the figure, the lowest autonomy level (the extreme left side) is when the agent is designed to be command-driven, where every action it does is selected by the operator. These types of systems are similar to open loop control in control theory (Doyle, 1992), where the operator is responsible of the control process state and he must observe the process and must enter the suitable setpoints to keep the process in stable conditions. Although it is a safe approach because it depends on a perfect agent like human but it is not flexible, not efficient, and not reliable. In time-critical control processes, a rapid action is required to adapt the unexpected situations. In this case, closed loop control with feedback is the appropriate system; according to an optimized predefined mathematical model it changes the output according to the input change in suitable time automatically without human intervention. Typical example of this system is the PID controller.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

A full autonomous system is presented in the autonomy spectrum shown in Figure 1 in the extreme right side, where the agents do plan and decide for their actions by themselves. The agent organizations can be represented in the figure by a pointer used to select the adequate agents' autonomy level. Agent organizations can tune (statically or dynamically) agents' autonomy levels using rules, norms, and specific constraints. Therefore, the new organizational model should be able to statically and dynamically tune agents' autonomy according to the context and system objectives.



Heterogeneity

Heterogeneity signifies diversity. The Internet is an example of a heterogeneous system full of different types of systems, components, networks, data, devices, protocols, etc. The emerging information technology paradigms and concepts such as Cyber Physical Systems, Cloud Computing, Internet-of-Things, etc, represent a clear evidence of the emerging worldwide trend towards heterogeneity. For instance, the Cloud Computing Business Framework (CCBF) was proposed to help business organizations in achieving good Cloud design, deployment and services (Chang, Walters, & Wills, 2013). CCBF provides the framework needed for linking both computing and businesses, and provides insights into how challenges can be resolved in the business context with improvements in efficiency, profitability, and customer satisfaction. It is a dynamic framework that identifies the organizational needs and then designs Cloud systems, applications or services based on user requirements. It deploys, migrates and supports services using Cloud strategies, technologies and resources. That imposes new requirements on software engineering to actively concern heterogeneity of modern systems. The Agent-Oriented Software Engineering (AOSE) is not an exception; it should assume that agents (human, software, or physical) are heterogeneous, have different architectures, communication languages, and situated in heterogeneous environments with different types of resources. Thus, the new MAS organizational model should concern the heterogeneity of its components and their interactions.

Mobility

Although mobility is considered as an optional characteristic of agents, but rapidly evolving network and computer technology, coupled with the exponential growth of the services and information available on the Internet, will soon bring us to the point where hundreds of millions of people will have fast, pervasive access to a phenomenal amount of information, through desktop machines at work, school and home, through televisions, phones, pagers, and car dashboards, from anywhere and everywhere.

Figure 1. Agent autonomy spectrum

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Mobile code, and in particular Mobile Agents, will be an essential tool for allowing such access. Mobile agents have many benefits such as providing improvements in latency and bandwidth of client-server applications and reducing vulnerability to network disconnection (Singh, 2012; Lange, 1999). Unfortunately, mobile agents are not getting the same amount of attention like other MAS disciplines. The logical speculation and prediction tell that mobile agents will be given a great focus in future applications especially with the ultra-large-scale applications, which are expected to dominate the computer science research in just the next few years (Kotz, 1999). Thus, the new MAS organizational model should provide the required efficient and flexible infrastructure for mobile agents' functionality.

Security

Security is an important issue for large-scale systems especially if the Internet is their communication medium. It is required to support MAS organizational models with security techniques. Security can be realized using two approaches. The first approach adopts hard security techniques such as encryption, authentication, or firewalls which are traditionally and increasingly used for securing users' data and systems information (Chang, & Ramachandran, 2016; Chang, Kuo, & Ramachandran 2016). The second security approach relies on soft security methods such as trust and reputation based techniques, which are seen to be more adequate for distributed systems and specially MAS. Therefore, the new organizational model should adopt effective security approaches and techniques that combine both security approaches especially if it is assumed that agents are mobile and can to move between agents' organizations.

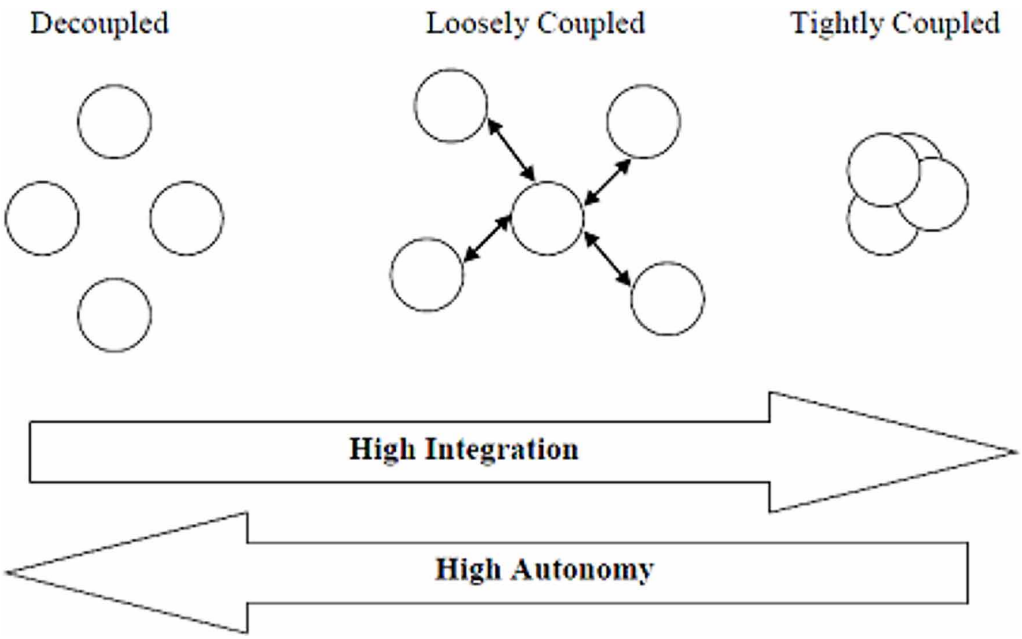
THE MODEL DESIGN METHODOLOGY

The design methodology of the required MAS organizational model comprises seven steps; each of them concerns a different perspective of the new organizational model.

Step 1: Identifying the Key Solution

This initial design step is dedicated to find the key solution to the problem. The realization of the mentioned characteristics (generality, dynamicity, autonomy, security, etc) of the new MAS organizational model can be achieved by adopting the loose coupling paradigm. In computing and systems design a loosely coupled system is one in which each of its components has, or makes use of, little or no knowledge of the definitions of other separate components. Figure 2 provides a discrete spectrum of systems coupling. Moving from left to right, the first class is decoupled (or isolated) components where each component possesses a high degree of autonomy and as a result can be run in isolation from other components, but in this case the integration of these components is low and even complex to be realized.

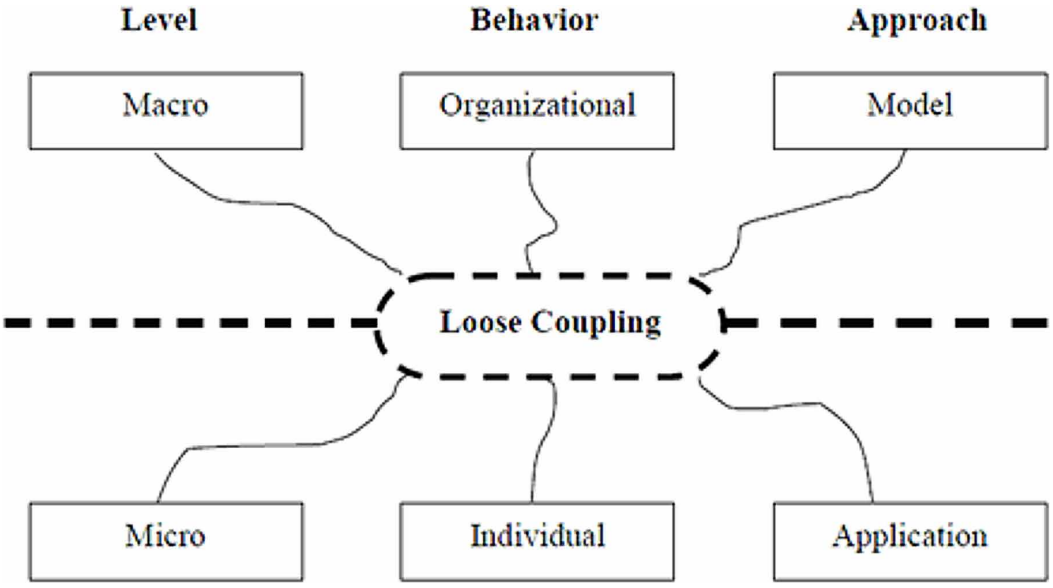
The next class is loosely coupled components where system components still have autonomy (although less than the decoupled class) and can interact together to achieve a common system goal, also in this class system components can be integrated to form one whole system and they follow the general system rules as needed. The final class is the tightly coupled components with high capability to be integrated with the price of low component autonomy.



EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

We believe that with the adoption of the loose coupling approach, it could be possible to realize the required characteristics of the new MAS organizational model, Figure 3 demonstrates this belief. The loose coupling paradigm can be used to form light relationships between the collective level and the individual level from three perspectives: abstraction, behavior, and approach. The abstraction perspective concerns the relationship between the micro and the macro views of the complex system. The behavior perspective concerns the individual agents' behaviors and the whole system organizational behaviors. Further, the approach perspective concerns the transparency between the new model and the application domain. The problem now is how to realize the loose coupling paradigm between these perspectives.

There are many ways to realize loose coupling paradigm within MAS:



- **Modularity:** The degree to which a system's components may be separated and recombined. In industrial design, modularity refers to an engineering technique that builds larger systems by combining smaller subsystems;
- **Implicit Agents' Roles:** Different from related MAS organizational models (i.e., AGR, and MOISE) which used the role organizational construct explicitly (this technique is a pure OCMAS approach and contradicts with the ACMAS approach), the new model should use the role concept implicitly so that no organizational constraints on the individual agents are predefined;
- **Service Orientation:** A design paradigm for computer software in the form of services. The principles of service-orientation design stress the separation of concerns in the software. Applying service-orientation results in units of software partitioned into operational capabilities, each designed to solve an individual concern. These units are described as services;

Figure 2. Classes of systems coupling

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

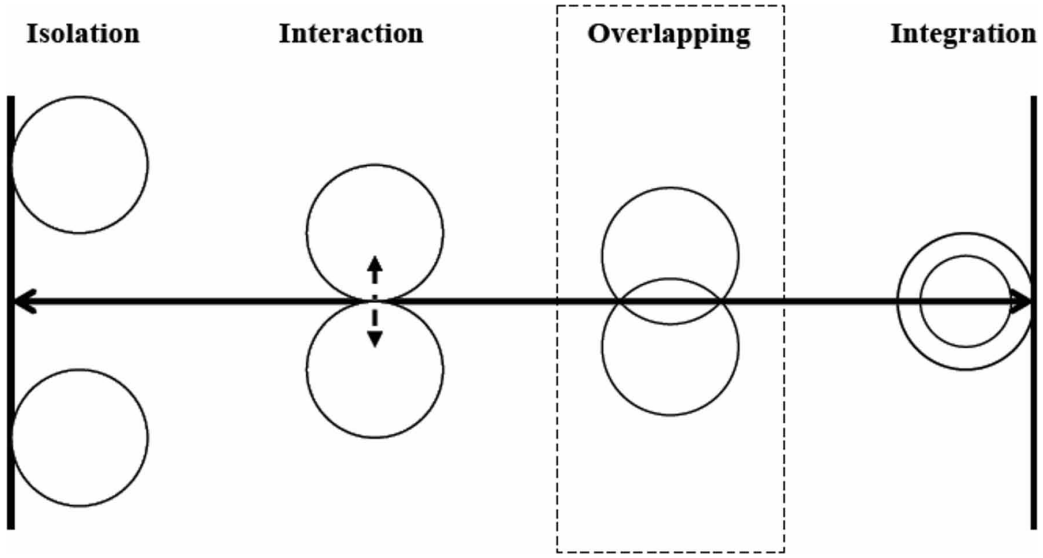
Figure 3. Loose coupling as a solution

- **Separation of Concerns:** A design principle for separating a system into distinct sections, such that each section addresses a separate concern. The value of separation of concerns is simplifying development and maintenance of computer applications;
- **Asynchronous Communication:** The exchange of messages, such as among the hosts on a network or devices in a computer, by reading and responding as schedules permit rather than according to some clock that is synchronized for both the sender and receiver or in real time. It is usually used to describe communications in which data can be transmitted intermittently rather than in a steady stream;
- **Indirect Communication (i.e., blackboard):** Communication through a shared space (blackboard) instead of direct message exchange.

In the design of the new MAS organizational model, the above-mentioned techniques for realizing the loose coupling paradigm will be used to make the new model more general and transparent for designing diversity of modern real-life agent-based systems. The next design steps continue the design process of the new MAS organizational model based on the loose coupling paradigm and its popular techniques.

Step 2: Spectrum of Entities Relationships

Step 2 presented in this subsection concerns the investigation of the relationships among real-world entities and identifies what can be called the key relationship, which can be exploited to engineer and design complex adaptive MAS to obtain its full power. We consider this step as the most important one because it gives us the core idea and theory of the new MAS organizational model. The relationships between real-world entities can be classified into four main classes aligned horizontally from left to right forming a spectrum contains four classes of entities relationships, as shown in Figure 4 and described as follows:



EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

- **Isolation:** Class in which entities are isolated from each other and have no any type of interaction (decoupled components);
- **Interaction:** Class in which entities interact together to achieve their own goals or a global common goal (the interaction can be logical by message passing or physical actions);
- **Overlapping:** Class in which higher order entities (i.e., groups of agents) coincide partly so they can save communication overhead and share or exchange resources, activity, or information;
- **Integration:** Class in which entities coincide completely together to become one.

The Isolation class (the extreme left end) can't fit with our modern world, where everything is connected to everything and complex, distributed activities and rapid progress are its dominant characteristics. Therefore, it is not a feasible or a preferred type of the entities relationships. The Integration class (the extreme right end) is not always the case in real world and to some extent it contradicts with the concept of autonomy because it is not logical to say that everything is contained inside another thing. The Interaction class is familiar in our real world, for instance, humans' interaction where there is a common language between two or more humans enables them to transfer their internal states, information, desires, etc., to each other. Also, by possessing the ability to interact, humans are able to coordinate to achieve shared goals.

From the other hand, the interaction class is individual-directed and doesn't reflect the structural level of the whole society. The Overlapping class contains systems where higher order entities such as human groups have some shared activities. For instance, consider two human groups each of them contain a number of humans and there are some humans who are members of both groups in the same time, so that they have the ability to interact with the members of the two groups. Thus, it is possible to say that the interaction class is implicitly included in the overlapping class, but it is not only concerning individual interactions (intra) but also concerning group interactions (inter).

Figure 4. Spectrum of entities relationships

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Step 3: Why is Overlapping the Adequate Relationship?

Table 1 provides a comparison between the entities' relationships classes; they are assessed according to their support to important characteristics such as autonomy, heterogeneity, modularity, application feasibility, and generality. The isolation class can be considered as the passive class, it lacks any features except heterogeneity. Conceptually it represents the components with the highest autonomy degree, but practically, it is not the case because it includes passive components that have no control even to change themselves and have no capability to interact with other components in the same system.

The application feasibility of the isolation class is very low because the main trend of our modern and future real-world is concerning communication and interaction and in which everything is connected to everything. Further, this class doesn't support modularity (the degree to which system components can be separated and recombined). The reason is related to the assumed missing connection between things which results in the missing sense of the word; system components are separated but never combined, as a result this class is not feasible to model real world applications. Finally, this class cannot be used to describe every pattern found in our real world, so it is not general. The interaction class supports all the characteristics except generality. Further, it is not a general scheme in our real world because some real-world paradigms and patterns are not reflected in this class, as an example, sharing of objects is not reflected in this class. This class can be considered as an enhanced view of the isolation class. The integration class is feasible enough to be adopted for some real-world applications (especially those problems which have a recursive nature) but it is not general enough to model all types of them. The overlapping class is the intermediate class; it implicitly contains the strengths of the other classes. The important attribute of this class is its generality because it can be used to model every pattern in our real world and even in the whole universe. To explain, it is said that our world is a small village; other people said that it is a global village, in the sense that the incidents in one part of the world affect the other part of the world. In fact, some of the incidents affect the whole world whereas some of them are long lasting in the same environment such as the atomic bomb dropped on Hiroshima in Japan by the Americans, still has its effect in that environment till now.

For the purpose of this research we imagine our world as a framework for countries overlapping, no country can live isolated from the rest of the world, each country imports and exports goods and even cultures. Also, each country has an embassy in each of other world's countries (this is a type of overlapping behavior). That leads us to conclude that our world survives based on its countries overlapping relationships. If you meditate the nature, the world, and the whole universe you will discover that the overlapping paradigm is widely exist. For instance, a human business organization contains many overlapping activities among its sectors. Also, the Internet is full of overlapping behaviors and activities (i.e., overlapping networks).

Table 1. Comparison between the classes of entities relationships

	Autonomy	Heterogeneity	Modularity	Feasibility	Generality
Isolation	High	High	Low	Low	Low
Interaction	High	High	High	High	Low
Integration	Low	Low	High	High	Low
Overlapping	High	High	High	High	High

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Further, space is discovered to contain many overlap patterns (i.e. parallel universes). Modeling real world applications using approaches and models that match or at least similar to those applications, nature will guarantee the understanding of their complex behaviors and evolution and that will facilitate their engineering. Therefore, it will be a good idea to design the new MAS organizational model based on the overlapping relationships among similar higher order entities (i.e. universes, worlds, and organizations of agents), these entities should be the first-class concepts in the proposed organizational model, which can be described as the dynamic organizational model for agent organizations (or higher order entities in general) overlapping.

Step 4: Who can Overlap within MAS?

This section tries to deeply investigate the overlap concept and answers the question of: who can overlap within MAS? The overlap concept means sharing of something and agents are the lowest abstraction entities in MAS so they are rigid and compact entities that can't overlap. Agents can only interact together to achieve some local or global goals (see Figure 5-a). On the other hand, organizations of agents (i.e., groups of agents) can overlap and share individual agents, as shown in Figure 5-b. Let's denote agents as (A_1, A_2… A_n) and denote organizations as (O_1, O_2… O_m). Also, let's denote an agent A_i that belongs to an organization O_j as $A_{j.i}$. In Figure 5-b, O_1 overlapped with organization O_2 and agent $A_{2.2}$ that belongs to O_2 is the shared object between the two organizations.

The proposed MAS organizational model (we named it NOSHAPE as will be shown later) assumes three levels of higher order abstractions (Universes, worlds, and organizations). Agents are the target of the overlapping relationships between these abstractions; they are the lowest shared objects. The overlapping process dynamically reshapes the complex MAS for agents to interact. In other words, it structurally prepares the working environment for agents to interact. This implicitly means that agents are supposed to belong to organizations, it is not allowed for an agent to be located independently outside of any organization. In other words, for two agents to interact they must belong to the same organization. Further, the overlap of organizations necessitates the overlap of their worlds and the overlap of worlds necessitates the overlap of their universes. All the entities used in the proposed organizational model are presented in Table 2, and Figure 6 provides the abstract view of the proposed organizational model.

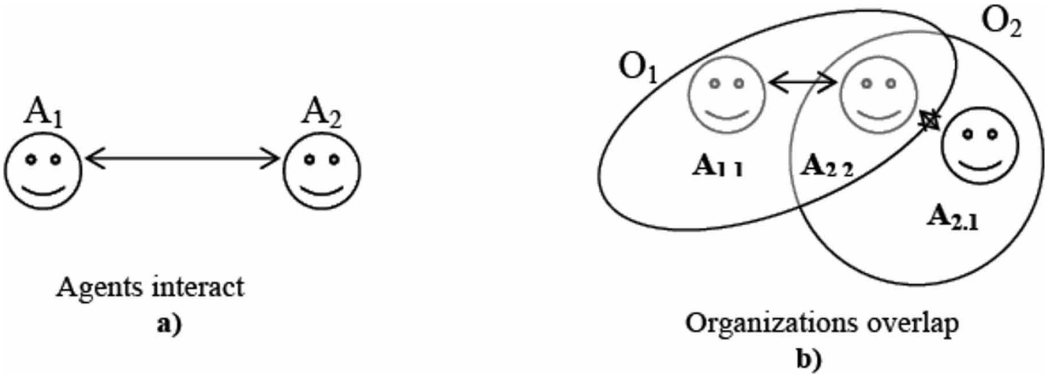
In the proposed NOSHAPE MAS organizational model, a MAS is considered as a collection of organizations (an organization can be seen as a group of agents) are able to overlap with each other to share or exchange dynamic agents. Based on the real-world application size, the MAS that engineered based on the proposed NOSHAPE model (let's call them NOSHAPE MAS) can be classified as follows:

- **Ultra-Large-Scale MAS:** Multi-Universe, Multi-World, Multi-Organization (MMM) multi-agent systems;
- **Very-Large-Scale MAS:** One-Universe, Multi-World, Multi-Organization (OMM) multi-agent systems;
- **Large-Scale MAS:** One-Universe, One-World, Multi-Organizations (OOM) multi-agent systems.

Before providing more complex overlapping examples, let us design a general denotation for entities naming. Table 3 provides a general denotation of the NOSHAPE entities. The first row in the table represents the complex case, where all the NOSHAPE higher order entities exist. It is the case, where there are Multiple-Universe, Multiple-World, and Multiple-Organization in the system-to-be. We abbreviated

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 5. Agents only interact but organizations can overlap



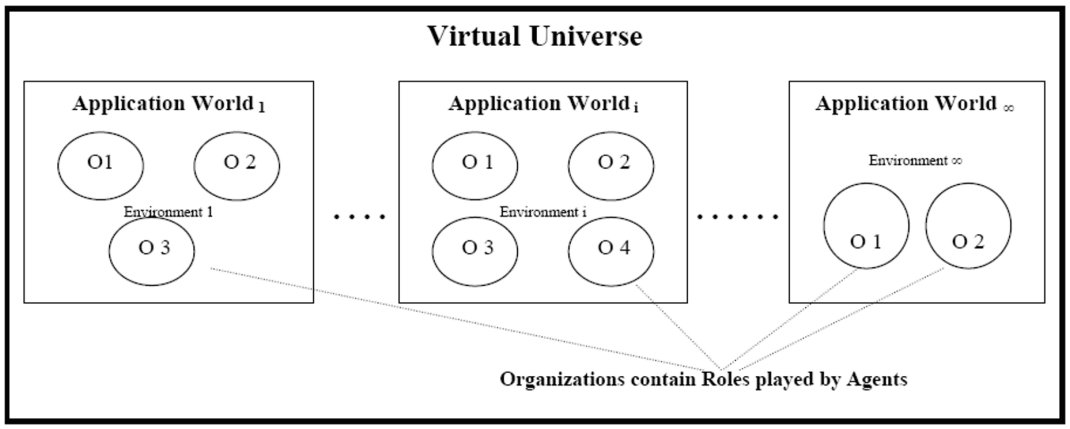


Table 2. Entities modeled in the new proposed organizational model

Abstraction Level	Description	Concrete Example
Universe	The collection of all virtual worlds	Internet
World	A collection of organizations	Web Application
Organization	A collection of Roles	Workspace
Roles	Abstract citizens of organizations	Agents Types
Agents	Actual citizens of organizations	Agent 1, Agent 2,

Figure 6. Abstract view of a virtual universe such as the Internet

this case as (MMM). The second row in Table 3 represents the case of one-universe, multi-world, and multi-organization applications (abbreviated as OMM). And the third row represents the one-universe, one-world, and multi-organization applications (abbreviated as OOM). These three cases are actually the OCMAS face of the proposed NOSHAPE model. The last row in the table represents the case where there are no any NOSHAPE higher level entities and it is the case where only the ACMAS viewpoint is adopted, in this case the considered application is not a NOSHAPE one but it is a traditional MAS

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Table 3. NOSHAPE denotation

	Universe (U)	World (W)	Organization (O)	Agent (A)	
MMM	U_u	$W_{u.w}$	$O_{u.w.o}$	$A_{u.w.o.a}$	OCMAS
OMM	--	W_w	$O_{w.o}$	$A_{w.o.a}$	
OOM	--	--	O_o	$A_{o.a}$	
OOO	--	--	--	A_a	ACMAS

*Where: u, w, o, a =0, 1, 2, 3, 4…

that concerns only the individual agent interactions and behaviors without explicitly concerning the organizational level. We abbreviated it as (OOO) for one-universe, one-world, and one-organization. Note that for the overlapping to take place, there must be two or more of similar higher order entities (i.e., two organizations).

Now after demonstrating the general structure of the proposed NOSHAPE MAS organizational model, let us see two more complex examples. Like the NOSHAPE organizations which can dynamically overlap and share individual agents, other higher order entities such as worlds of organizations can overlap together too, but in this case, it is logical and more adequate to let them share complete organizations. An illustrative example is shown in Figure 7, which presents two worlds W_1 and W_2 live in one universe U_0 and each of them contains a number of organizations that themselves contain agents. Because there is only one universe in the system, we omitted the universe subscript, see Table 3. As shown in the figure, the world W_1 overlapped with the world W_2 and accordingly W_1 shares organization $O_{2.3}$ which belongs to W_2. Also, in the organizational level, it is clear that organization $O_{1.2}$ which belongs to world W_1 overlapped with organization $O_{2.3}$ which belongs to W_2 and the shared objects (agents) are only $A_{2.3.1}$. Inside W_2, $O_{2.2}$ overlapped with organization $O_{2.1}$ sharing agent $A_{2.1.1}$. It must be pointed out here that the condition for two agent organizations belonging to two different worlds to overlap is that their worlds must overlap first. Let us denote an organization O_1 belongs to W_1 as $O_{1.1}$, and similarly lets denote an agent A_1 belongs to an organization O_1 which itself belongs to a world W_1 as $A_{1.1.1}$ (as demonstrated in Table 3). Therefore, the agent system shown in Figure 7 is a MAS of the type OMM and contains one universe (U_0). So, it can be symbolically represented as follows.

The MAS = $\{U_0\}$ where:

$$U_0 = \{W_{0.1}, W_{0.2}\} = \{W_1, W_2\}$$

because there is only one universe (U_0) the universe subscript is omitted:

$$W_1 = \{O_{1.1}, O_{1.2}\}$$

$$O_{1.1} = \{A_{1.1.1}, A_{1.1.2}\}$$

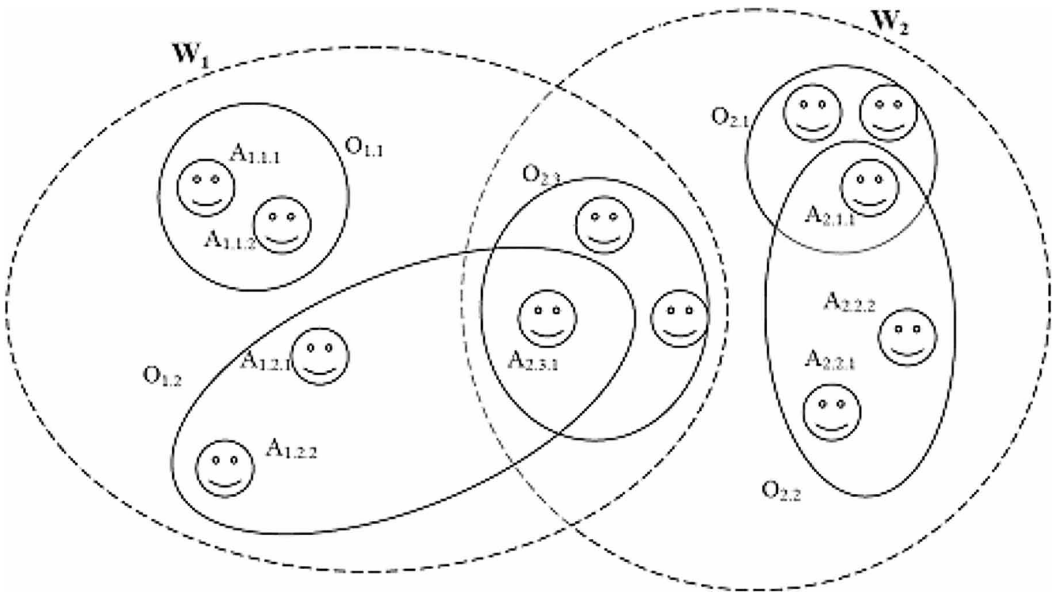
$$O_{1.2} = \{A_{1.2.1}, A_{1.2.2}\}$$

$$W_2 = \{O_{2.1}, O_{2.2}, O_{2.3}\}$$

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

$O_{2.1} = \{A_{2.1.1}, A_{2.1.2}, A_{2.1.3}\}$

$O_{2.2} = \{A_{2.2.1}, A_{2.2.2}\}$



$O_{2.3} = \{A_{2.3.1}, A_{2.3.2}, A_{2.3.3}\}$

That is the current system structure and the overlapping relationships can be represented as follows:

- W_1 overlapped with W_2; or
- W_2 overlapped by W_1;
- $O_{1.2}$ overlapped with $O_{2.1}$; or
- $O_{2.1}$ overlapped by $O_{1.2}$;
- $O_{2.2}$ overlapped with $O_{2.1}$; or
- $O_{2.1}$ overlapped by $O_{2.2}$.

In this example, we consider an organization as a workspace inside a larger application modeled as a NOSHAPE world (i.e., application world). An application world can be considered as a large-scale distributed agent-based system. Assume that this application world is a web-based application in the sense that it works through the Internet. Then, what about the Internet itself, is it possible to imagine it as a very large entity comprises a very large number of application worlds like the one presented in Figure 7? Let's call this type of very or ultra-large-scale entities as NOSHAPE Universes. Thus, a NOSHAPE universe is a higher order entity contains worlds each of them contains a set of organizations. The presented example comprises three universes: U_0, U_1, and U_2. The universe U_1 is overlapped with the universe U_0 and the shared object is world $W_{0.1}$. This higher level universal overlap is a necessary condition for the overlap of worlds $W_{1.0}$ and $W_{0.1}$ which belongs to universes U_1 and U_0 respectively. Also, the overlap

Figure 7. Worlds of organizations can also overlap

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

of $W_{1.0}$ and $W_{0.1}$ is a necessary condition for the overlap of organizations $O_{1.0.3}$ and $O_{0.1.2}$. Agents, which are the target shared objects, are not shown in the figure of the sake of simplicity. Therefore, the agent system shown in Figure 8 is a MAS of type MMM and contains three universes (U_0, U_1, U_2). It can be symbolically represented as follows.

The MAS = $\{U_0, U_1, U_2\}$, where:

$U_0 = \{W_{0.0}, W_{0.1}\}$

$W_{0.0} = \{O_{0.0.0}, O_{0.0.1}, O_{0.0.2}, O_{0.0.3}\}$

$W_{0.1} = \{O_{0.1.0}, O_{0.1.1}, O_{0.1.2}, O_{0.1.3}, O_{0.1.4}\}$

$U_1 = \{W_{1.0}\}$

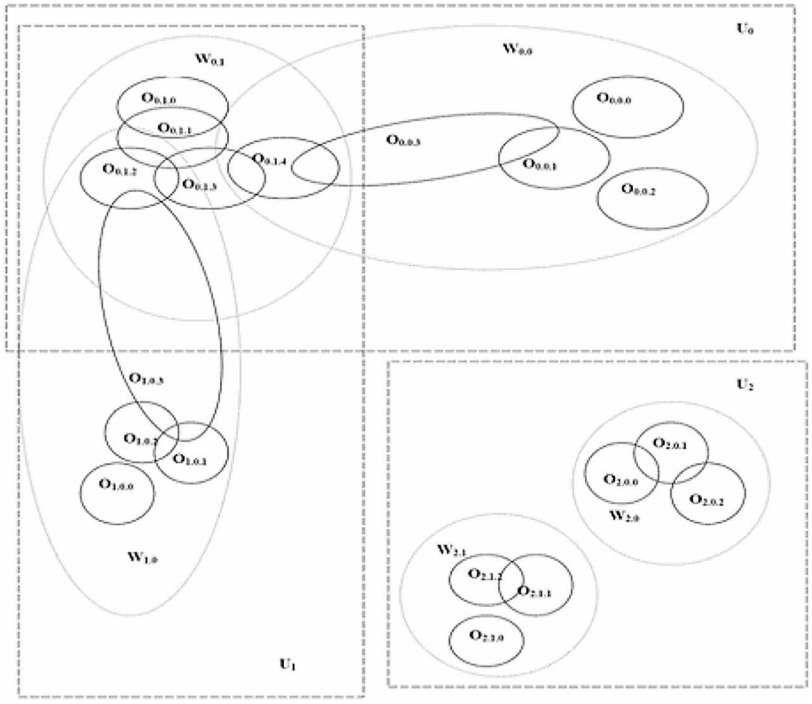
$W_{1.0} = \{O_{1.0.0}, O_{1.0.1}, O_{1.0.2}, O_{1.0.3}\}$

$U_2 = \{W_{2.0}, W_{2.1}\}$

$W_{2.0} = \{O_{2.0.0}, O_{2.0.1}, O_{2.0.2}\}$

$W_{2.1} = \{O_{2.1.0}, O_{2.1.1}, O_{2.1.2}\}$

Note that in this very complex example no subscripts are omitted. The overlapping relationships can be represented as follows:



- U_1 overlapped with U_0; or
- U_0 overlapped by U_1;
- $W_{0.0}$ overlapped with $W_{0.1}$; or
- $W_{0.1}$ overlapped by $W_{0.0}$;
- $W_{1.0}$ overlapped with $W_{0.1}$; or
- $W_{0.1}$ overlapped by $W_{1.0}$;
- $O_{0.0.1}$ overlapped with $O_{0.0.3}$; or
- $O_{0.0.3}$ overlapped by $O_{0.0.1}$;
- $O_{0.0.3}$ overlapped with $O_{0.1.4}$; or
- $O_{0.1.4}$ overlapped by $O_{0.0.3}$;

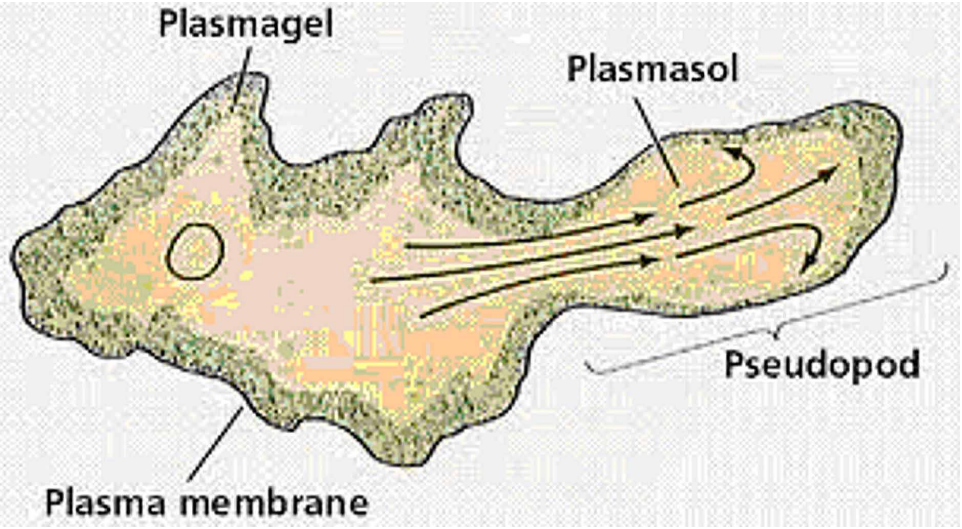
Step 5: Biomimicry (Inspiration)

This section tries to find an answer to the question of: how to dynamically overlap? We are looking for a way to enable a higher order MAS entity (i.e., agent organization) to dynamically (in run-tine) overlap with other agent organizations to adapt the environment dynamic changes. It is possible to specify the overlap relationships between agent organizations in design-time (statically) but this approach will not achieve the required system adaptivity. The dynamic overlap mechanism adopted within the proposed model is

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 8. Universes of Worlds of Organizations of Agents can also overlap

bio-inspired! We called the proposed organizational model as NOSHAPE (No Shape), as we inspired it from Amoeba which is a unicellular organism that doesn't have a definite shape. Cells are the building blocks for all life forms. Unicellular means that Amoebas have only one cell for their entire body. The inside of an amoeba is a jellylike fluid called cytoplasm. Bits of food and other materials float around in the protoplasm. For us, the important part of an Amoeba is the Pseudopod (pronounced as "sudopod"). The Pseudopod is used to help the Amoeba to move, and also to eat. It is a part of the Amoeba's body that it can stretch out and pull itself with. Or, to eat, Amoeba stretches out the Pseudopod, surrounds a piece of food, and pulls it into the rest of the Amoeba's body as shown in Figure 9. Moreover, Amoeba reproduces (makes more Amoebas) by a process called binary fission, this means that one Amoeba can split in half making two identical new Amoebas. Also, Amoeba is social and in case of starvation it aggregates with other Amoebas forming slugs. Slugs are a multi-celled organism able to travel rapidly and efficiently from place to place where it can find food. The proposed NOSHAPE MAS organizational model imitates the Amoeba structural and functional behaviors creating an organization (or any higher order entity) that can be seen as an artificial amoeba. Therefore, the NOSHAPE organizational dynamic behaviors inspired from Amoeba can be described as follows:



- **Expand:** In case an organization finds a need to overlap with another organization in the world, it should expand first to the required organization then it asks the required one to overlap with her;
- **Overlap:** After the initiator organization succeeds to expand to the destination organization, it executes the overlap structural behavior to overlap with the destination organization to share some or all of its dynamic roles (agents);

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

- **Partition:** After the overlapping relationship between two organizations is established, the overlapped (the responder or destination) organization may decide to partition (split) itself into two parts, one part contains the shared subjects and the other contains the remaining of the overlapped organization, the decision to partition is a local decision of the overlapped (Destination) organization;
- **Merge:** After the partition process takes place, the emerged orphan partition should be merged with the overlapping (the initiator) organization;
- **Shrink:** The overlapping organization may decide to shrink to its home space either after the partition process takes place or after the required joint activity finished. If the shrink process is preceded by a partition process then the agents contained in the emerged partition (now merged with the overlapping organization) will be automatically moved to the overlapping organization home space (as they are supposed to be mobile agents);
- **Home:** When triggered the overlapping organization repeals its overlapping relationships with other organizations and shrinks itself from all other spaces to its home space;
- **Retire:** The organization can be retired (separated from the system) by the system administrator for many reasons (i.e. for maintenance).

The reason to decompose the organization dynamic structural behavior into some discrete micro behaviors is to break down the problem into simple steps that are easier to conceive, understand, program, maintain, and control. But it is possible to bypass most of these structural behaviors and only use three of them, Overlap/Home/Retire, but in this case the organizations are supposed to share the dynamic roles (agents) without exchanging them.

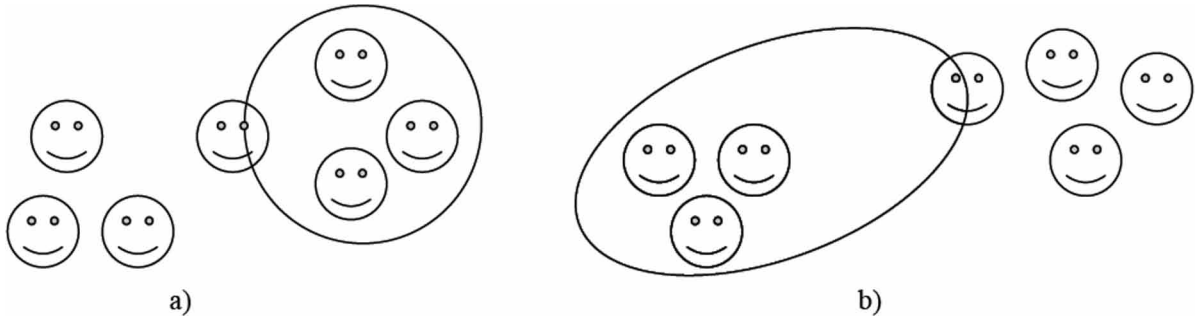
Figure 9. Amoeba stretches out to move

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Step 6: The Overlap Mechanism

This section answers the questions of when to overlap. Figure 10 demonstrates the possible agent-organization relationships, as shown in Figure 10-a, an individual agent searches for a suitable organization and asks to join it to achieve its own goals. But in Figure 10-b the situation is reversed, an organization searches for an agent to give it a role to play inside it and the result will be achieving the organization goals. The proposed organizational model adopts the later technique shown in Figure 10-b. We argue that this technique is better because the organization has more global view than individual agents so letting the organization selects the suitable agent is a feasible and effective way to achieve the organization goals. The overlap relationships can be specified by the designer in design time and used in run-time without change until the MAS terminates, but this approach is not adequate for open and complex application domains which are required to be adaptive able to change dynamically (in run-time) according to the context. Inspired from Amoeba, a higher order entity such as an organization should be able to change its overlap relationships as a result of the activities of its internal agents. As shown in Figure 11, which represents an application world consists of two organizations and an organization initiated an overlap relationship with the other one. Let's call the organization which initiates the overlap process as the overlapping organization, and the organization which responds to the overlap request as the overlapped organization. The example presented in Figure 11 considers the case when the overlap process modeled as two steps Home/Overlap.

Figure 10. Types of agent-organization relationships



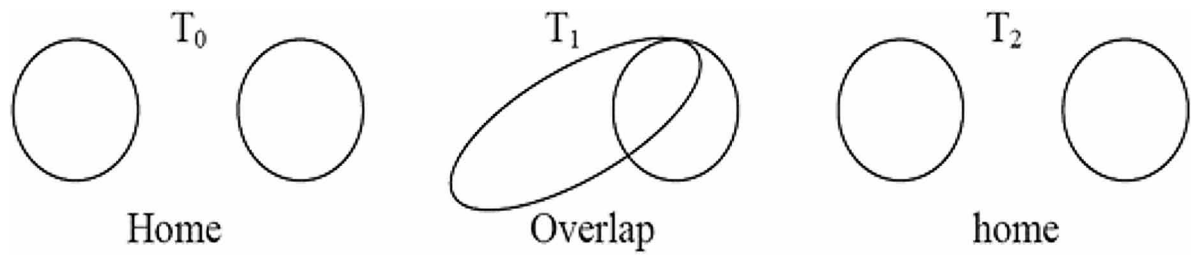


Figure 11. An organization dynamically overlaps with another one

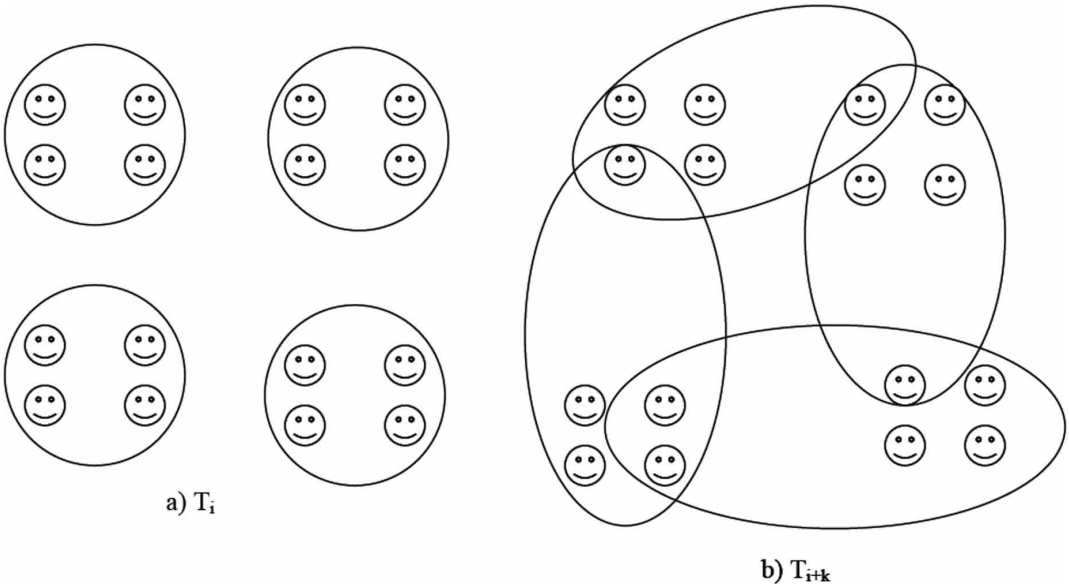
EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Another more complex example is shown in Figure 12 in which an application world comprises four organizations each contains a number of individual agents. The system starts at the initial time (T_i) with no inter-organization relationships but as time goes and at T_{i+k}, the system structure has been changed and the overlapping relationships have been established among system organizations as a result of each organization lower level interactions and/or environment changes. The overlap process is initiated by an organization according to the activity of its internal agents. The organization does this to satisfy the requirements of its internal agents to be able to satisfy the global organization goals. It is assumed that the agents inside an organization can easily find each other and interact together without the need for higher level adaptation (i.e., through a local yellow page service). But in case an agent can't find another agent that provides a certain service to interact with, it has to trigger the need for an overlap process to let the organization globally finds the required agent. Based on the above discussion, we are going to propose the internal structure of a NOSHAPE organization. Figure 13 presents the anatomy of a NOSHAPE organization, the figure illustrates the organization contents gradually from higher abstraction level (left) to the lower one (right). As shown in the figure, the organization is divided into two parts; the first one is the static part which contains static roles which are responsible of the management of the organization structure. An example of a static role is the global supervisor (GS) which can be considered as the organization structure controller; it concerns the inter-organization interactions and manages the overlap and the other dynamic behaviors relative to other organizations. The second part of a NOSHAPE organization is the dynamic part which contains dynamic roles (agents), which are responsible of the application domain functional activities. Dynamic roles (agents) can have many types (depending on the application domain); to free the global supervisor from caring directly about functional dynamic agents, it's possible to assign a local supervisor (LS) to each type of dynamic roles. The responsibilities of the local supervisor could be, (1) creating the required dynamic agents and configuring them, (2) monitoring the dynamic agents health/performance and applying dynamic load balancing algorithms on dynamic agents, (3) recreating dead dynamic agents and reconfiguring them, (4) receiving triggers from dynamic agents and bypass them to the global supervisor (the organization controller), (5) assigning new added environment resources to dynamic agents.

The two parts of the organization interact together through triggers such as Trigger-Required-Joint-Activity (TRJA), Trigger-Finished-Joint-Activity (TFJA) and so on, (as will be demonstrated later). Figure 13.c shows that the organization dynamic part contains many dynamic agents (DAs) with different types and each type is supervised by a local supervisor (LS). The figure also shows two other components, the Agent Management System (AMS) and the Directory Facilitator (DF). Each organization is assumed to contain these two important services. The AMS has the responsibility of creating agents, removing agents, naming of agents, etc, it provides the white page service inside the organization. The DF provides the yellow page service inside an organization where the system agents advertise their services to enable other agents to find them. Figure 14 illustrates how the adaptation triggers exchanged between the functional activity level (agents) and the organizational level (organization). What we need to emphasize here is that the global dynamic reorganization is excited by the organization internal functional activities (dynamic roles activities) in a bottom-up top-down way as shown in Figure 15, this happens endogenously without external intervention and this complies with the requirements of self-organization. As shown in the figure, it is not necessary to pursue the whole stack of dynamic reorganization as it could be sufficient to satisfy the organization functional activity with one, two, or (the worst case) with three (higher level) dynamic reorganization processes. For instance, if the two organizations are situated in the same world then inter-organization reorganization is enough. But if they are situated in two different

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 12. Overlapping of organizations of agents



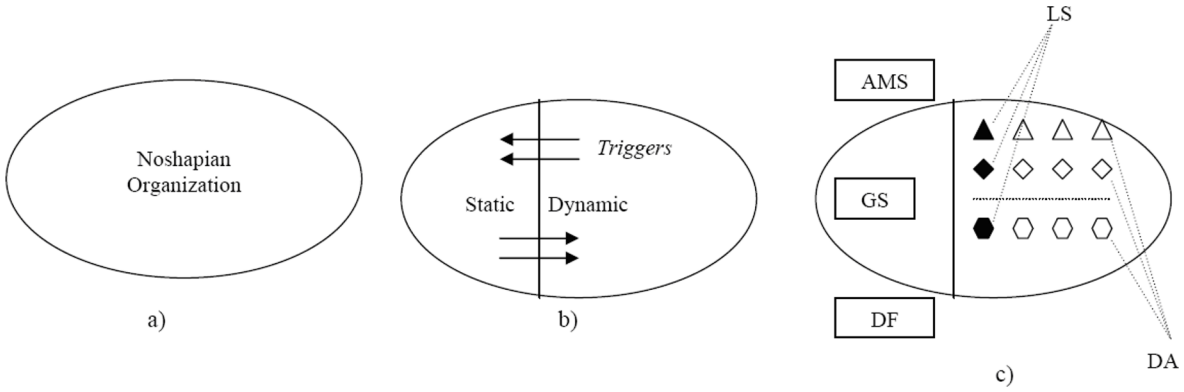


Figure 13. The anatomy of a NOSHAPE organization

worlds in the same universe then inter-organization reorganization is required which itself requires inter-world reorganization before it can be executed (suppose that the two worlds are not already overlapped). Furthermore, if the two worlds are situated in different universes, then inter-organization reorganization is required which itself requires inter-world reorganization which itself requires inter-universe reorganization to be executed (also suppose there are no already established overlapping relationships among similar entities). This means that there are a set of preconditions for each higher order entity dynamic reorganization (dynamic behavior) to be executed as will be shown in the next section.

Step 7: The Computational Modeling

The philosophy of the proposed NOSHAPE organizational model is to consider the agent organization as an explicit and static entity that has a set of dynamic structural behaviors. In other words, the agent organization is something tangible and has a personality, it comes to existence when the system starts and continues to exist until the system terminates. Moreover, new organizations can dynamically join the system in run-time. Thus, an agent organization is similar to an agent; it's autonomous, reactive, proactive, and social. The NOSHAPE organizational model tries to integrate both of the organizational perspectives: the static and the dynamic perspectives for the sake of stability, flexibility, and robustness. This section tackles the proposed NOSHAPE model computationally; the next subsection provides the general meta-model of NOSHAPE.

NOSHAPE Meta-Model

Figure 16 shows the NOSHAPE Meta-Model (its basic class diagram) in UML (OMG, 2015). That vision of a real-world application as a framework for entities (i.e., organizations) overlapping in addition to the Amoeba inspired me the basic ideas of the NOSHAPE dynamic organizational model, which can be considered as a starting point of a new OCMAS research direction concerns the overlapping of MAS higher order entities producing what can be called as NOSHAPE MAS. What can be read from the NOSHAPE Meta-Model shown in Figure 16, can be summarized in text as follow:

1. The NOSHAPE organizational model assumes three higher levels of abstraction, the universe level which comprises an infinite number of worlds, the world level which comprises an infinite number of organizations, and the organization level which comprises an infinite number of roles (static or dynamic) played by agents;
2. Entities in the same abstraction level (i.e. organizations) can overlap together to share their lower level entities;
3. Each higher order entity possesses a number of dynamic structural behaviors forming the inter-entity (i.e. inter-organization, inter-world, and inter-universe) relationships; examples of such structural behaviors are Expand, Overlap, and Shrink, etc.;
4. Each higher order entity is situated in a local environment and also can share remote entities environments (i.e., can access remote resources) through the overlapping concept;
5. An organization contains roles which played by agents. The NOSHAPE model assumes two types of roles, static roles which concern the structural aspects of the organization, and dynamic roles which concern the functional aspects (domain specific);
6. Static roles are specific to each organization as they monitor continuously and manage the current structural context of the organization. Static roles cannot be shared, cannot be exchanged, and cannot be moved, example of organization static roles is the Global Supervisory (GS) role which can be considered as the structural controller of the organization;
7. On the other hand, the organization dynamic roles can be shared, exchanged, and moved from one organization to another. Further, the dynamic roles handle the domain specific tasks; they embody the actual capabilities and abilities of the organization. The dynamic roles are dynamic in the sense that they can be dynamically created; removed, configured, etc. example of dynamic roles is the Worker Agents (WAs) for executing domain specific tasks inside organizations;

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

8. The dynamic roles fire functional Triggers and send them to static roles to translate these triggers to structural behaviors to satisfy dynamic roles needs and requirements by finding particular remote dynamic roles to interact with;
9. Entities structural dynamic behaviors can be realized as interaction protocols between these entities. Structural interactions are pursued by the organization static roles;
10. Each organization has an environment contains a set of resources such as databases, legacy systems, etc. Resources are the non-agent entities; they are used or consumed by dynamic roles to pursue the organization functional activities;
11. It is important to know that, static roles are not considered as the representatives of an organization to the outside world, they only concern restructuring or reorganizing of the system so local dynamic roles can find remote dynamic agents to directly interact with to be able to accomplish their assigned functions. This viewpoint is compatible with the separation of concerns principle which is a familiar principle in software engineering.

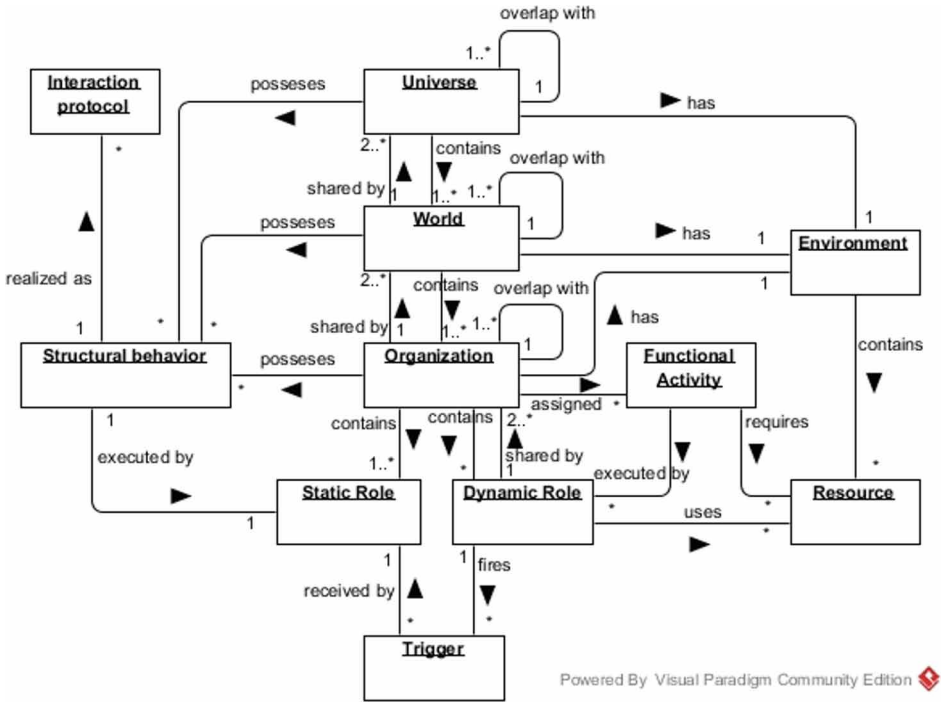
Representation

This subsection tries to propose a notation to represent the NOSHAPE MAS. Two types of notation artifacts are proposed, Venn diagrams and line graphs. Venn diagram is adequate for representing the overlapping relationships between organizations situated inside one world. However, if the number of organizations is large using Venn diagrams will be very complex. On the other hand, line graphs are simple, clear, and scalable, so they can be used to represent the overlapping relationships within complex NOSHAPE MAS. Figure 17 shows an example of a world comprises four organizations (A, B, C, D) initially separated from each other (Time 0) but as time goes the overlapping relationships among them are dynamically established (Time i). So, every point of time we look at the system we may find different established overlapping relationships. Figure 18 shows the same example but this time in line graph. The advantage of Venn diagrams is that they can be used to represent not only the overlapping relationships among organizations but also the other relationships such as Expand, Shrink, etc, can be visually represented in contrast to line graphs which can only be used to represent the overlapping relationships between organizations. According to the graph theory terminology (McKee, 1999), the line graph can be considered as the intersection graph of the Venn diagram which represents the organizations overlapping relationships.

The NOSHAPE model can be considered as a dynamic MAS organizational model for higher order entities (i.e., organizations) overlapping. The goal of the overlapping among organizations is to share their dynamic roles (agents). Figure 19 provides an example scenario in a world comprises two organizations (A, B). Initially the world is in its state 0 in which each organization is situated in its home space (a in the figure). As a consequence of organization, A working environment change, organization A decided to overlap with organization B, so A executed the action Expand to reach organization B (this may be implemented using an appropriate interaction protocol) (see b in the figure). Then A asks B to overlap with her and A specifies the range of agents required for the overlap. If B accepted the overlapping request from A, the overlapping process starts and the required activity (the reason of the overlap) takes place for a period of time (c in the figure). After the required activity of overlapping finish, A and B negotiate to terminate the overlapping and this negotiation may result in a partitioning process to take place to organization B, because A finds that it needs some of B's dynamic roles (agents) and B finds

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 16. The NOSHAPE complete meta-model



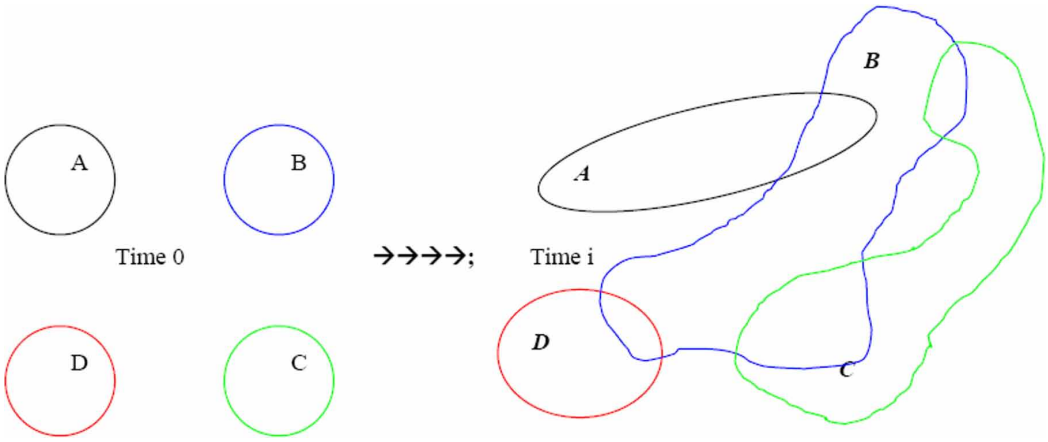


Figure 17. Vein graph showing the dynamic organizations overlapping

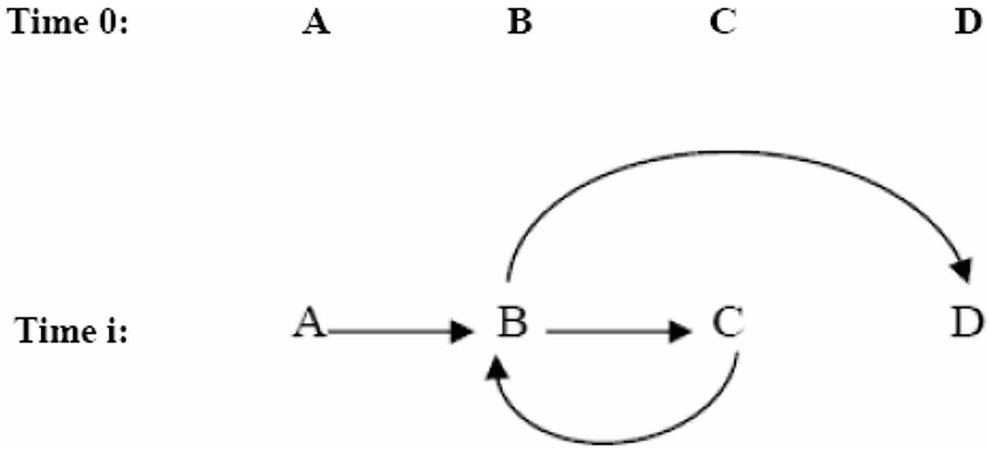
that it doesn't need these resources for a while (d in the figure) the partition process followed by a merge process to merge the B's emerged partition with A. Then A decides to shrink to its home space as the overlapping with B is terminated and it starts a shrink process (e in the figure).

The Shrink process includes moving the partitioned dynamic roles (agents) from B's home space to A's home space (mobile agents). Finally, organizations A and B return to their final states where each one is completely situated in its own home space (f in the figure) as shown now A becomes bigger as it contains more agents, its own agents and some of B's agents. As shown in the figure, starting from

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 18. One-dimension line graph as another representation of the example in Figure 17



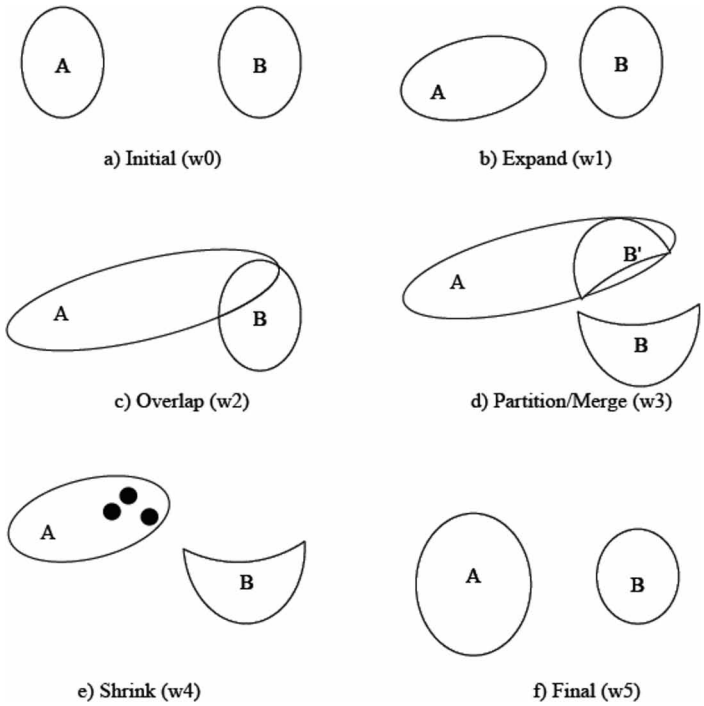


Figure 19. NOSHAPE organizations dynamic behaviors (ordered steps)

the initial world state (w0) we have five other possible worlds (w1-w5), the transition among those possible worlds happens sequentially in the forward direction. In another scenario, w3 and w4 may not happen, in this case the overlapping between organization A and B will persist until the required activity of organization A ends, in this case A will shrink to its home position (w5) without any change in its contents and structure unless there is a need for new structure changes according to its local home space environment. If there is no any change in A's local home space we might expect that (w5) will

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

be equivalent to (w0). Note that by (wi where i>=0) we mean the world (w) state over time and not a different world in the universe. Note that we will use the word world to mean both one of the infinite number of worlds in a universe, and at other times to mean an individual world state over time (possible world), they will be distinguished according to the context.

Formal Representation

This section is dedicated to semi-formally representing the proposed NOSHAPE organizational model. The higher order entities that a NOSHAPE MAS might compose of can be arranged as follows from top to down:

Universe* --> World* --> Organization* --> Roles*

Therefore, a definition of each on these concepts can be stated as follows:

Definition 1: A Universe is a higher order entity comprises an infinite set of worlds have the ability to overlap together according to their internal activity.

Definition 2: A World is a higher order entity comprises an infinite set of organizations have the ability to overlap together according to their internal activity.

Definition 3: An organization is a higher order entity comprises two types of roles, static roles and dynamic roles. Static roles concern the structural (organizational) behaviors of the organization and dynamic roles concern the organization functional activity.

Definition 4: Static roles are the organization roles that concern its structural dynamic behaviors. They are static in the sense that they are fixed and have a long-term behavior. They cannot be shared, moved or removed. They are the roles responsible of executing the organization structural behaviors relative to other organizations.

Definition 5: Dynamic roles are the real engines of an organization. They are responsible of executing the functional activities of an organization by interacting locally together or remotely with other foreign dynamic roles.

Definition 6: Agents are the real citizens of a NOSHAPE organization. They play roles (static or dynamic) inside the organization and interact together to achieve their objectives and the organization objectives.

Definition 7: A NOSHAPE MAS is a system of one or more universes, each contains one or more worlds, each contains two or more organizations, and each contains a set of static roles and a set of dynamic roles.

Although the intended plan for the proposed NOSHAPE model for MAS dynamic reorganization is to make it more general by addressing real world applications with a wide range of scale (MMM, OMM, and OOM) but this chapter concerns only the OOM NOSHAPE MAS which is the case of One Universe-One World-Multi-Organization MAS or the case of large-scale MAS-based applications. This means that we will ignore the abstraction concepts higher in order than organizations (specifically universes and worlds, which will be left as a future work). Formal specifications are mathematically based techniques whose purposes are to help with the implementation of systems and software. They are used to describe a system, to analyze its behavior, and to aid in its design by verifying key properties of interest through

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

rigorous and effective reasoning tools. Formal models force us to make assumptions plain, and admit a rigorous examination of what predictions the model does and does not make (K. Konolige, 1986). These specifications are formal in the sense that they have syntax, their semantics fall within one domain, and they are able to be used to infer useful information (Wikipedia, 2015). Fisher (Fisher, 2005) pointed out that many advocate the use of formal logic as a way to represent the behavior of both individuals and organizations, since it provides an unambiguous notation whereby logics can be designed for many scenarios and where formal properties of logical descriptions are well understood. In particular, choosing the appropriate logic provides a level of abstraction close to the key concepts of the software. In this chapter, we will not provide a complete formal model for the proposed NOSHAPE MAS organizational model; this issue will be left as a future work too. Instead, we will provide a semi-formal simple model to make the NOSHAPE model clear and easy to understand. Therefore, we are going to propose a symbolism to semi-formally explain and describe the NOSHAPE model. The proposed symbolism is shown in Table 4.

As shown in the table, we assigned a name and a symbol (operator) to each NOSHAPE dynamic structural behavior; each symbol can be used as a behavioral operation or as a predicate, for instance the dynamic behavior Expand, can be formalized as follows:

Name: Expand
Operator: »
Behavior example: A » B, which means that organization A executes the behavior Expand to organization B as a necessary step prior to the execution of the behavior Overlap with B.
Predicate example: »(A, B), which asks does organization A overlapped with organization B or not, the answer will be True or False. The negate of the predicate is, ¬»(A, B). Moreover, the » operator can be used as a unary operator (only in predicates) i.e. »A asks if A is expanded currently to any other organizations.

Table 4. Symbolism for NOSHAPE organizations dynamic behaviors

Operator	Name	Example	Description	Preconditions
→	FTI	beh1→beh2→→beh3	Finite Time Interval Between behaviors.	
»	Expand	A, B: Organizations A » B	Organization A expands itself to Organization B	¬»(A, B) ∧ ¬₪(A, B)
«	Shrink	A, B: Organizations A « B	Organization A shrinks itself from organization B	»(A, B) ∨ ₪(A, B)
₪	Overlap	A, B: Organizations A ₪ B	Organization A overlaps with organization B	»(A, B) ∧ ¬₪(A, B)
∞	Partition	A, B: Organizations B':= B ∞ A	Organization B partitions relative to organization A	₪(A, B)
Θ	Merge	A, B: Organizations A Θ B'	The partitioned part of organization B merged with organization A	∞(B, A) ∧ B' ⊂ B
¤	Home	A: Organization ¤ A	Organization A is in home space (position)	¬»A ∧ ¬«A ∧ ¬₪A ∧ ¬∞A ∧ ¬ΘA
®	Retire	B: Organization ® B	Organization B retired and isolated from the system	¤B
NOB	NOB	NOB	No operation behavior when a transition between two states happens as a result of time flow.	True

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Preconditions: Describe the necessary preconditions that must be satisfied in the current world state to execute the dynamic behavior Expand which are: ¬»(A, B) ∧ ¬₪(A, B), this means that organization A is not already expanded to organization B and organization A is not already overlapped with organization B. The other behaviors can be treated in the same way.

The question now is how to implement those organizational (structural) dynamic behaviors? A possible way to do that is by modeling them as interaction protocols (IP). Therefore, we will have to design an interaction protocol for modeling each of the NOSHAPE structural behaviors such as:

Expand/Overlap/Partition/Merge/Shrink/Home/Retire

An interaction protocol defines the possible sequences of messages that interacting agents must follow in order to achieve their goals (Paurobally, 2003). Each interaction protocol has an initiator and a responder and is associated with a Trigger Condition (TC) which represents a need to pursuing a particular dynamic behavior (interaction protocol). This sequence can be expressed as the following formula:

$$\text{Current State} \rightarrow TC \rightarrow B \rightarrow \text{Next State} \rightarrow \ldots\ldots \quad (1.0)$$

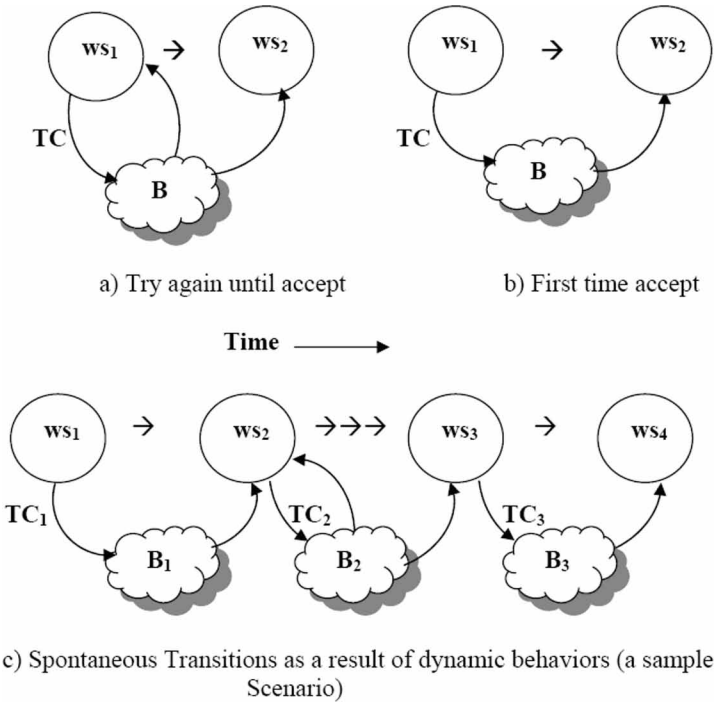
where, Current State represents the current world state including the current organization relationships with other organizations. The Next State represents the expected world state after executing the dynamic behavior *B* as a response to the trigger condition *TC*. The Next State might be a transition to a new world state or maintaining the current world state, the former case is when the responder organization accepts the pursuing of the dynamic behavior and the later case is when it refuses to pursuing it (as it is an autonomous entity and has control on its behaviors), in the later case the initiator organization might wait for a period of time then it could try to initiate the dynamic behavior again. A sequence of organization dynamic behaviors and activities form what can be called as a scenario. Figure 20 provides sample scenarios to illustrate the effect of the NOSHAPE dynamic behaviors in different cases, for instance a triggered dynamic behavior might fail to be pursued so the initiator should keep trying to pursue the dynamic behavior until it is satisfied (the responder entity accepts to pursue the behavior) as shown in (a) in the figure. Another case is when the responder entity accepts to pursue the dynamic behavior from the first time (b in the figure). (c) in the figure shows a sequence of transitions between possible worlds starting from world state (ws_1), as shown the transition from ws_1 to ws_2 and from ws_3 to ws_4 satisfied from the first time, but the transition from ws_2 to ws_3 failed firstly then satisfied in another attempt and so it needed more time to be satisfied as indicated by (→→→). Following formula (1.0), we can represent the scenario in Figure 20.c in text form as follows:

$$ws_1 \rightarrow TC_1 \rightarrow B_1 \rightarrow ws_2 \rightarrow TC2 \rightarrow B_2 \rightarrow ws_3 \rightarrow TC_3 \rightarrow B_3 \rightarrow ws_4$$

A Trigger Condition (TC) is the conjunction of the organization structural state and the organization functional activity state. Organization structure state describes the current shape of the organization including its overlapping and other relationships with other organizations. The organization functional activity state describes the current domain specific activity. Let TRJA, TFJA, and TSJA be defined as follows for two organizations A and B:

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

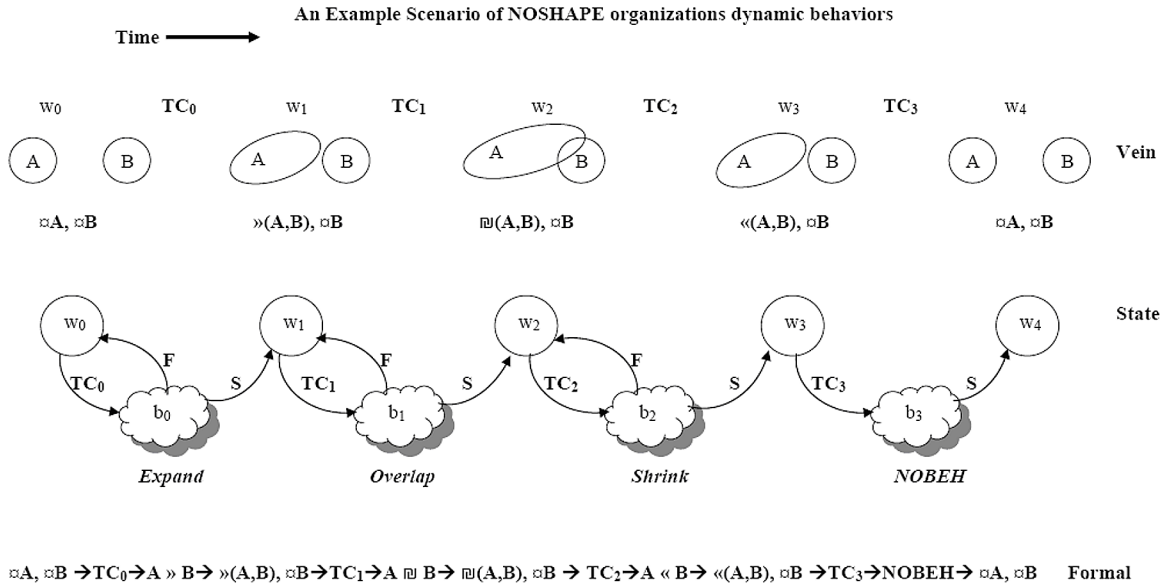
TRJA= Triger_Required_Joint_Activity (A, B)



TFJA = Triger_Finished_Joint_Activity (A, B)

TSJA=Trigger_Start_Joint_Activity (A, B)

These are the basic trigger conditions that can be used in conjunctions with other predicates to build complex ones. Other trigger conditions can be designed as required. Figure 21 shows an example scenario for a world containing two organizations A and B. The figure is divided into three parts; the top one illustrates the possible world states using Vein diagrams augmented by a formal description of the world state using the proposed symbolism shown in Table 3. The second part (middle) in the figure shows the transitions among world states as a result of pursuing the organizational dynamic behaviors (the world states modeled as circles, the dynamic behaviors as clouds, and the transitions as directed arrows labeled with the trigger of the transition. Finally, the bottom part shows the semi-formal representation of this scenario using formula (1.0). The example scenario shown in Figure 21 illustrates only the agents sharing within a NOSHAPE MAS, and it doesn't contain the dynamic behaviors Partition and Merge which are used when agents exchange is required.



As we decided to realize the NOSHAPE dynamic behaviors as interaction protocols, each interaction protocol might be created by the aggregation of primitive speech act per-formatives. We drew from Huget et al. (Huget, 2001), who proposed a semi-formal specification language dedicated to interaction protocols. Also, he proposed a protocol description language based on the combination of components

Figure 20. Dynamic behaviors cause transitions between possible worlds; (WS: World State, TC: Trigger Condition, B: Behavior)

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 21. An example Scenario 1 illustrates roles sharing in NOSHAPE

called micro-protocols corresponding to sets of per-formatives which represent pieces of an interaction and he call this language CPDL (Communication Protocol Description Language) in order to combine these micro-protocols into whole interaction protocols. We extended this language with the proposed symbolism (see Table 3) to describe NOSHAPE dynamic behaviors. According to Huget a CPDL well-formed formula looks like (see Figure 22), where:

- α denotes the state the agent is in prior to firing the formula;
- β denotes the state it will arrive in once the formula has been fired;
- {b ∈ B}* represents the guard of a formula. Such a guard is a conjunction of first-order predicates that needs to be evaluated to true in order for the formula to be used;
- B is the set of the agent's beliefs;
- The loop predicate aims at handling loops within a formula. Its argument is a conjunction of predicates. It loops on the set of micro-protocols involved in the formula while it evaluates to true.

Therefore, the scenario presented in Figure 21 can be represented semi-formally using the CPDL language as follows (where, TRJA, TFJA, and TSJA are the sample trigger conditions defined before):

1. ¤A∧ ¤B, TRJA(A, B) ∧ ¬»(A, B) ∧ ¬₪(A, B), loop (¬»(A, B)) → A » B, »(A, B) ∧ ¤B
2. »(A, B), TRJA(A, B) ∧ »(A, B) ∧ ¬₪(A, B), loop (¬₪(A, B)) → A ₪ B, ₪(A, B) ∧ ¤B
3. ₪(A, B) ∧ ¤B, ₪(A, B) ∧ TSJA(A, B) ∧ TFJA(A, B), loop (¬₪(A, B)) → A » B, ¬₪(A, B) ∧ »(A, B) ∧ ¤B
4. ¬₪(A, B) ∧ »(A, B) ∧ ¤B, ¬TSJA(A, B) ∧ TFJA(A, B) ∧ ¬¤A, loop (¬¤A) → A « B, ¤A∧ ¤B

Figure 22. CPDL well-formed formula

$$\alpha, \{b \in \mathcal{B}\}^*, loop(\bigwedge p_i) \mapsto \text{micro-protocol}^*, \beta$$

The modeling of the NOSHAPE dynamic behaviors as micro-protocols by the aggregation of a number of FIPA per-formatives (FIPA, 2002) can be modeled as follows (where O_1 and O_2 are two NOSHAPE organizations), as shown in Figure 23. The other NOSHAPE structural behaviors (i.e., Overlap, Shrink, Partition, Merge, etc.) can be modeled in a similar way. Note that the NOSHAPE dynamic behaviors or interaction protocols are executed by the organization global supervisory (GS). On the other hand, organization domain-specific interactions and behaviors interactions can be analyzed and designed using a familiar AOSE methodology such as Gaia methodology. That is because this chapter concerns only the conceptual view of NOSHAPE and abstracting away from the detailed design and implementation issues (execution algorithms).

DISCUSSION AND FUTURE TRENDS

The complexity, large scale, and physical distribution of future real-life applications impose new requirements and demands on the approached used for their development. The software development methods need to be evolved to cover the new demands and requirements. The Manifesto for Agile Software Development (ASD) published in 2001, is considered as an important step towards realizing that goal (Larson, & Chang, 2016). The ASD manifesto focuses on the individuals and interactions over processes and tools and provides the adequate methods for developing future real-life applications. MAS are not an exception, and new approaches, models, and techniques need to be proposed to guarantee the continuity of their adoption in future. This chapter provides a novel approach for dynamically reorganizing MAS.

Figure 23. Modeling NOSHAPE organizational behaviors as interaction protocols

Name: Expand
Behavior: $O_1 \gg O_2$
Semantics of the parameters:
O_1: Sender
O_2: Receiver
S: O_1's Required Services
A: O_2's Responsible Agents
Definition:
Request (O_1, O_2, S).inform (O_2, O_1, A) | refuse (O_2, O_1)
CPDL: $\square O_1 \wedge \square O_2$, $TRJA(O_1,O_2) \wedge \neg\gg(O_1, O_2) \wedge \neg\wp(O_1, O_2)$, $loop(\neg\gg(O_1, O_2)) \rightarrow O_1 \gg O_2$, $\gg(O_1,O_2) \wedge \square O_2$
Semantics: organization O_1 needs to expand to organization O_2

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

The proposed NOSHAPE model considers a multi-agent system as a system composed of two abstraction levels: micro and macro. The micro level is represented by the individual agents and the macro level is represented by higher order abstraction (modeling) entities such as agent organizations, worlds, and universes. The loose coupling paradigm enables to decouple the two levels for the sake of generality and transparency and also enables the adoption of both MAS engineering viewpoints: ACMAS and OCMAS. Thus, the NOSHAPE model adopts a hybrid approach for modeling agent-based systems. To realize this hybrid approach and in contrast to present MAS organizational models such as AGR (Ferber, 2004) and MOISE (Hannoun, 2000), MACODO (Weyns, 2010), NOSHAPE uses the role concept implicitly without predefined patterns of interactions and activities. This approach enables the developer of the MAS to follow the ACMAS viewpoint under the umbrella of the OCMAS viewpoint.

Further, the NOSHAPE model can be considered as a coordination model for agents' interactions within MAS. It transforms the lower level agents' activities into triggers then into global structural changes. In other words, according to the organization lower level agents' activities, some global inter-organizational interactions emerge. The lower level agents can be designed to be unaware of the global system structure or the globally emerged interactions. That is compiled with the ACMAS viewpoint in which system organization is an emergent phenomenon results from individual agents' interactions.

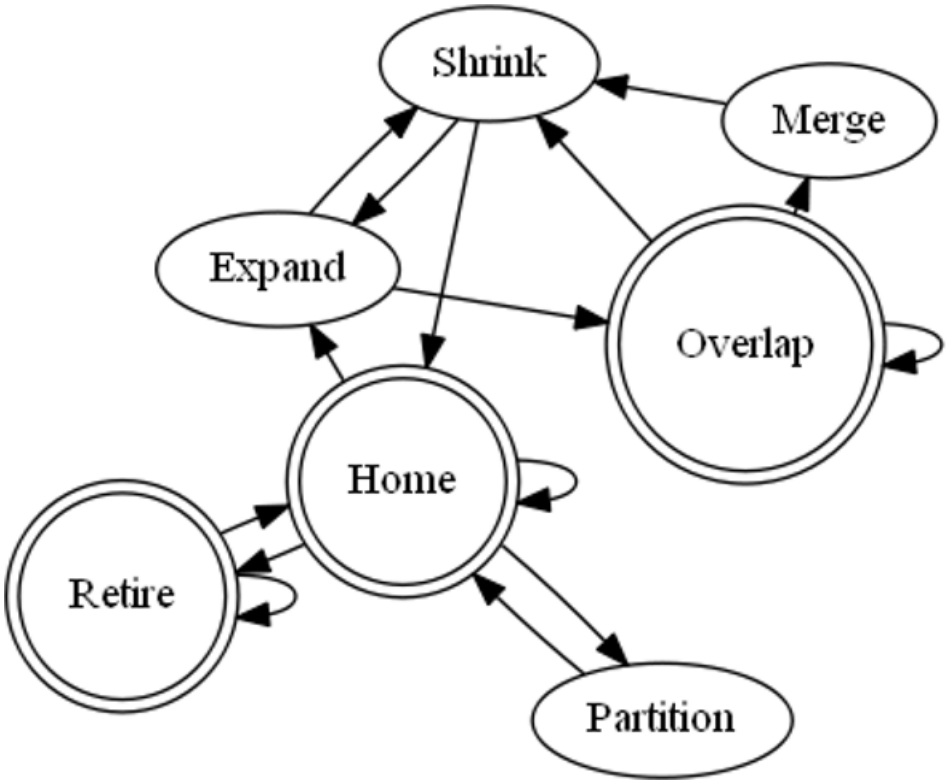
Also, NOSHAPE decouples the behaviors of individual agents from the organizational behaviors so that individual agents concentrate on their functional goals without caring about the organizational aspects (the familiar separation-of-concerns principle). Further, NOSHAPE decouples the considered application from the organizational model. In other words, most of current organizational models use the role concept for the developer to abstractly design the system agents before implementing them and this is a key characteristic of the OCMAS viewpoint and it makes the applications highly dependent on the organizational model, this approach prevents those applications which are adequate to be developed based on the ACMAS viewpoint from being realized.

The NOSHAPE model tries also to combine the static and dynamic behaviors in the system-to-be. Firstly, the designer designs the system with the OCMAS viewpoint in his mind and takes advantage of this approach in decomposing the global system goals into a set of autonomous cooperative organizations (i.e., groups) able to overlap together to share and exchange their roles (agents). Also, the explicit use of the organization abstraction helps reducing the overall interactions and as a result decreasing system complexity. From the other side, the organizational level has no direct control on the individual agents; it just prepares the adequate context for them to pursue their functional goals (in run-time). The system structure and organization can be dynamically changed to adapt environment changes and individual agents' interactions.

The proposed NOSHAPE model provides a way for individual agents to find suitable foreign (remote) agents to interact with to achieve their goals. The autonomy of individual agents can be defined as required by the designer; the proposed model doesn't impose strict or tight rules or constraints on individual agents. It just helps them to achieve their functional goals in a transparent way, all what is required from the individual agents is to discover the non-cooperation situations (i.e., missing services) and fire triggers to static roles, then they can go ahead doing other functionalities until the non-cooperation situation resolved as a result of the adaptive behavior (structural change) of the higher order entities.

Because the importance of mobile agents dramatically increases with time, the NOSHAPE model assumes that the dynamic agents located in a NOSHAPE organization can move from their organization to another one under the precondition that their organizations are overlapped together. If we succeed to

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use



make the overlap operation secure by using trust and reputation based security techniques in addition to other hard security approaches and techniques, agents' mobility can be a very powerful way to reduce systems complexity and efficiency.

IMPLEMENTATION PERSPECTIVE

Figure 24 shows how the organization dynamic structural behaviors (relative to another organization) can be modeled and implemented as a non-terminating Finite State Machine (FSM).

The figure represents the reference FSM adopted for realizing the proposed model. The figure also shows the transitions between the structural states (Home, Expand, Overlap, Partition, Merge, Shrink, and Retire). The transitions between structural states are being fired by the internal exchange of triggers inside the organization between the structural (static) and functional (dynamic) parts. Also note that the Retire state is triggered by the system administrator (i.e., for maintenance). Note that the reference machine presented in Figure 24 will be instantiated inside the organization GS agent for each other organization included in its address book. In this sense, each FSM can be considered as the model of the organization state relative to a particular acquaintance organization. It is supposed that the FSM runs continuously as long as the organization it is hosted by is in the online state (not in the Retire state which represents the offline state). The transitions between the FSM states are functions of the current

Figure 24. Implementing the structural changes as states in a FSM

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

world state and the current active triggers inside the organizations. Moreover, the proposed reference FSM contains seven states, four of them are transient or intermediate and three are attractors. The four transients are {Expand, Shrink, partition, Merge}, they are intermediates. From the other hand, the three attractor states are {Home, Retire, and Overlap}; they can stay running for long time depending on the active triggers. Again, a NOSHAPE organization is supposed to have one FSM of this type for each organization included in its address book.

CONCLUSION

This chapter presents our recent research efforts to conceptually and informally design a hybrid MAS organizational model that combines both of the ACMAS and OCMAS viewpoints. Combining these two viewpoints is the source of novelty that we are looking for relative to present MAS organizational models which adopt only one viewpoint for modeling and designing MAS. By combining the ACMAS and OCMAS viewpoints, the proposed NOSHAPE organizational model provides a general organizational model compared to present models. Our mission is not finished yet and still there are many aspects and perspectives need to be tackled for increasing the maturity and popularity of the NOSHAPE. Our future research activity will focus on the applicability of NOSHAPE for developing different types of real-life applications (industrial or non-industrial) and also the adoption of NOSHAPE for coordinating mobile agents because of the expected importance of them within future large-scale and complex real-life applications.

This chapter described conceptually the proposed NOSHAPE MAS organizational model. The future work will be tailored to providing an operational (implementation-directed) view of the NOSHAPE model. Also, it is intended to provide more applications of the NOSHAPE model within industrial and non-industrial domains. Further, it is intended to use the NOSHAPE model as a coordination model for mobile agents within real-life applications. Still, it is required to propose a trust-based security approach for NOSHAPE MAS. And also, it is intended to propose a development methodology for developing MAS based on the proposed NOSHAPE organizational model using FIPA-compliant platforms.

Chapter 15
Can Social Dynamics Be Channeled from Offline to Online Communities?
Commitment, Compliance, and Cooperation from Microfinance to Crowdfunding

Sharam Alijani
NEOMA Business School, France

Djamchid Assadi
Burgundy School of Business, France

Arvind Ashta
Burgundy School of Business, France

ABSTRACT

As alternative source of financing, microfinance and crowdfunding organizations are increasingly relying on commitment, compliance and cooperation among individuals, groups, and communities. In considering the extraordinary growth of the market for microfunding and microlending in recent years, this article aims to investigate a number of important questions. Can the conventional rule of social collateral applied to group lending be replicated in online crowdfunding? What are the institutional, social and organizational requirements in order to transpose the social collateral model of solidarity and responsibility to heterogeneous online crowdfunding and microlending platforms? What would be the implications for borrowers and lenders in terms of group compliance, collaboration and cooperation? By highlighting the differences and similarities between microfinance and crowdfunding structures, the article seeks to provide a broad comparative framework for analyzing different patterns of behavior in communities, organizations and networks that engage in crowdfunding and microlending activities.

INTRODUCTION

Three types of reasons have been suggested to explain the state of being unbanked: lack of basic and financial literacy; high level of transaction costs to provide, monitor, and support lending activities; and the poor's inability to provide collateral to reduce risks related to information asymmetries (Armendàriz & Morduch, 2005). Considering the small size of the loans, conventional banks simply do not think it is worth the risk or the high cost of appraising the loan (Akula, 2010). In addition, the inability of the poor to provide financial collateral leads to their exclusion not only from most economic activities, but restrain their integration in social groups. The majority of unbanked populations are located in underdeveloped countries (Chaia et al., 2009).

Microfinance institutions platforms curate and organize the financial sourcing and inclusion by designing control mechanisms and reinforcing conformity rules. Microfinance provides credit to entrepreneurs and business owners who lack access to traditional banking services due to the absence of financial collateral. By strengthening social ties among individuals, microfinance institutions (MFIs) leverage social (groupal) collateral to replace conventional asset-based collaterals. For doing so, MFIs reinforce group conformity rules within social arena. The Grameen Bank in Bangladesh (Yunus, 2003) demonstrated how engaging social groups could deal with the unbanked problem. The key contribution of Muhammed Yunus was to overcome the asset-based collateral barrier by encouraging members to support each other for the financial risks associated with individual loans. Members' commitment toward peers reduces the cost of carrying out economic transactions and oversight.

With the expansion of information technologies, individuals explored the possibilities of transmitting offline opportunities online. Crowdfunding, like microfinance, relies on the willingness and commitment of groups, rules of compliance among individuals to encourage cooperation within social networks and interest groups for addressing the investment needs of those who have limited access to financial collateral. Crowdfunding carries out via online platforms different forms of financing including credit, donation, equity, and reward. While, crowdfunders may be viewed as lenders and investors who provide financial backup to a wide array of borrowers, yet the question remains whether the rules of traditional group lending and social collateral can be applied to the online crowdfunders? Can the innovative principle of social lending, its managerial practices and organizational dynamics be transposed to the virtual world of Internet?

The transposition from offline to online is not evident because members in offline group know each other while those in online groups have no previous acquaintance (Boxenbaum & Battilana, 2005). It should be noted that conventional social groups and internet-based groups are formed differently. In the case of conventional offline groups, members generally share cultural codes, comply by common rules and behave with a greater degree of homogeneity and predictability. In the case of the internet-constituted groups and online communities, individuals come together from different social and economic horizons, engage in virtual interactions without knowing each other personally, but showing the desire to engage in mutually beneficial economic and social ventures.

In this perspective, we distinguish between "Ex-Ante" communities, who host individuals who are born and grown in the community, and "Ex-Post" communities that coalesce purposefully and operate on the Internet platform. We seek to shed further light on the importance of social ties and the pivotal role of networks in diffusing and translating the economic and social missions of the groups and crowds. Placed

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

within the context of social networks that amplify social interactions, we investigate the collaborative and cooperative nature of group members and crowds who comply with the norms, rules and practices of microlending and crowdfunding. The organization and the functioning of communities is affected by networks' configuration and members' ability to comply with pre-designated goals and common objectives. Consequently, understanding the dynamism of social collateral is crucial not only as a solution to the problem of the unbanked, economically poor and marginalized populations, but also as a source of inspiration for the fast growing social and peer-to-peer lending activities on the Internet. We believe that group pressure and compliance in the case of offline conventional groups can be equally applied to online microlending and crowdfunding.

We begin by reviewing the literature related to peers' pressure, conformity rules and compliance dynamic. A particular emphasis is placed on the nature of social ties and social embeddedness that shape social relationships. By comparing microfinance and crowdfunding, we will explore individual and crowd engagement in both offline and online contexts. Social lending cases within different socio-economic and cultural contexts will highlight the pivotal role of communities of interest and networks in accelerating social interactions. Our findings on offline and online group lending will be presented in the final section of this paper along with a discussion of theoretical underpinnings and managerial implications. In conclusion we will make suggestions for future research.

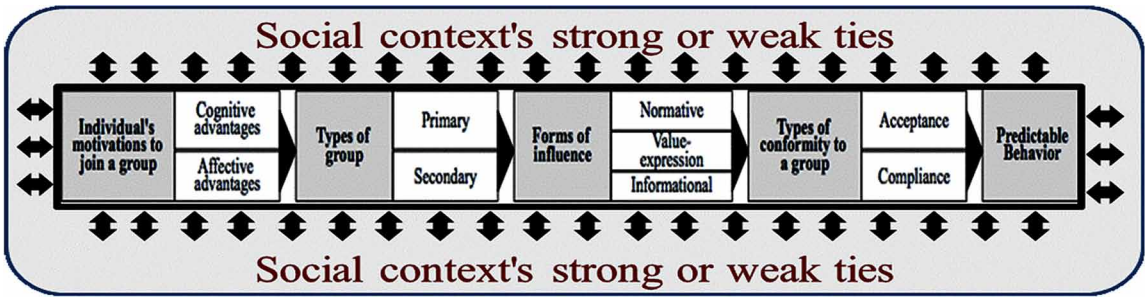
CONFORMITY AND COMPLIANCE: A LITERATURE REVIEW

It is important to explore the concept of group conformity in order to identify the determinants and dynamism of the social influence - changing one's perceptions, opinions, and behaviors in response to real or imagined pressure from others. A vast corpus in social studies, in particular sociology and psychology has scrutinized the concept of group, its different forms, constituents and internal dynamism. Here we emphasize on reference groups, identified as influential persons or group of people who are referred to as a standard or frame by members and exert influence on members' attitudes and behaviors. Primary reference groups are to be distinguished from the secondary ones. The former is an intimate social aggregation with face-to-face interaction where members exhibit similarities in belief and behavior (Witt & Bruce, 1972) while the latter is a less influential on thought and behavior (War & Reingen, 1990). The reference groups are believed to be either formal or informal. Formal groups are characterized by defined, often written, rules and a known list of members and requirements for membership. Informal groups are less structured and based mainly on friendship and interest. Though their norms can be stringent, they seldom appear in writing, the effect on behavior can be strong if individuals are motivated by social acceptance. Reputation is a mechanism to secure good conduct and often prevents cheating even where formal enforcement does not exist (Klein, 1997).

The desire of an individual to fit with a reference group leads to conformity - defined as changing one's perceptions, opinions, or behaviors in response to real or imagined pressure from others. It can be realized by acceptance and compliance. Conformity by acceptance occurs when an individual actually changes his or her beliefs, values and actions in the direction of a group norm. It presumably occurs when the rewards exceed its costs (Homans, 1961). Conformity by compliance may result from acting upon the request or wishes of a group without accepting all its beliefs or behaviors. Obedience is an extreme case of compliance where the individual follows the orders of an authority.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

But, why would individuals decide to comply with community rules at the expense of their own freedom? In most cases, conformity to peers' rules and norms respond to a greater need to satisfy one's cognitive, affective and conative goals. Individuals try to minimize rejection by conforming to group norms (Asch, 1951; Venkatesan, 1966; Ross et al., 1976).



Reference groups stimulate compliance and influence on individual behaviors and decisions in three different ways: normative, value-expressive and informational. Normative influence occurs when individuals have to alter their behaviors or beliefs to meet the expectations of a particular group. Value-expressive influence occurs when individuals subjectively associate with people who are admired and respected. Informational influence occurs when people who have difficulty assessing objects and events accept insights and comments by members of a group (Calder & Burnkrant, 1977) as credible and needed evidence about reality (Burnkrant & Alain, 1975).

Assadi & Ashta (2014) indicate how groups create predictable behavior. However, based on the preceding discussion on social network, we can see that social ties influence the predictable behavior in different stages: they may influence the individual's motivation to join a group, the type of group, the forms of influence as well as types of conformity to a group. Figure 1 therefore extends their model of the sociological analysis of group influence on individual behavior and provides our conceptual framework of group-individual interactions.

Two conditions must be present for people to comply: The influencing agent should have the ability to reward or punish for (non) compliance; and, the ability to monitor the compliance or failure to comply. If the person privately accepts the influence, the agent's ability to reward or punish the person and to maintain surveillance is unnecessary because the behavior is internalized, and consistent with the person's private beliefs. Group members conform more when working for a common goal rather than individual goals, presumably because they believe that deviance on their part will be punished more severely.

In the marketing literature, many authors have considered the role of conformity among consumers as a key driver in brand/user relationships (Escalas and Bettman 2005, Muniz Jr and O'Guinn, 2001). More recently, escapism has been opposed to conformity and it is posited that some consumers may become brand loyal because of their motivation to break away (escaping) in contrast to others who do so because of their motivation to conform (conforming) (Labrecque et al., 2011). Xia et al. (2012) underline the positive impacts on product attitudes and purchase decisions in two ways: directly by conformity with peers and indirectly by reinforcing product involvement. Martin and Johnson (2008) suggest a theoretical framework of ethical conformity for firms by considering the role of normative expectations held by societal constituents.

Figure 1. How groups create predictable behavior

GROUP COMPLIANCE WITHIN SOCIAL NETWORKS

Group compliance influences the process of change and innovation initiated by individuals who belong to a community or operate within a social network. The Actor-Network Theory (ANT) (Callon et al. 1986; Callon, 2001; Law & Hassard, 1999; Latour, 2005) provides a useful tool for analyzing the nature and extent of actors' involvement in creating and designing a variety of social events. Ideas and systems such as social collateral and crowdfunding platforms constitute the 'relational materiality' of such events. Each event entails its distinct translation process, showing how a powerful idea can transform agents' action into one that can develop its own agency. In the case of social collateral, borrowers and lenders have been brought to engage in novel forms of cooperation, requiring the need to conform to new social realities. It should be noted that the ANT early roots go back to ethnographic studies that focused on scientific creation within science laboratories (Callon, 1986; Latour, 1987; Law 1987; Law & Hassard, 1999; Latour, 2005).

Actor-network theory seeks to explicate how networks can strengthen "informal affinities" beyond the institutionalized ties in offices, factories, hamlets and parishes. As such, ANT expounds the translation process [as opposed to Granovetter's idea of diffusion] of ideas according to which social events emanate from and are shaped by social relations. The translation process highlights the importance of social interactions and the role of networks in creating and reinforcing social bonds and raising community awareness. Networks coalesce around purposeful missions and as such, help to explore and exploit market opportunities, diffuse knowledge and reinforce social capital. A significant research corpus has highlighted the importance of social capital and its link to social institutions and economic outcome (Putnam at al. 1993; Fukuyama, 1995; Portes, 1998). Family and community networks affect an individual's access to credit institutions. In a longitudinal study on credit access and social networks in Indonesia, Okten & Osili (2004) show that family and community networks have a larger impact on credit awareness of new credit institutions than the established credit sources. This is the case of crowdfunding and microfinance communities who build social ties with the objective of funding socially valuable and economically viable projects. In the absence of appropriate socioeconomic contexts and actor's motivations, networks cannot sustain long-term goals. Group coalitions operate within complex inter-personalized networks that reflect the multiplicity of individual and community goals and objectives (Scott, 2000; Freeman, 2004; Van Dijk, 2006, Castells & Cardoso, 2006).

The study of the patterns of interactions and power relations provides further insight as how individuals and communities are brought to cooperate and (co)evolve. Yunus's collateralization mechanism of group pressure has been instrumental in deepening and broadening group and peer-to-peer interactions. By foregoing the (tangible) social collateral required by the traditional banking system, the Grameen Bank provided a more innovative collateralization mechanism through group lending. Yunus realized that the commitment and cooperation at the bottom of the social pyramid can lower the default risk, and consequently reduce the transaction cost of lending to the poor. As a social innovator, Yunus realized that the use of social collateral can curate and transform social ties to enhance trust at the bottom of the social pyramid and help create and sustain human capital. Similarly, the primary benefit of crowdfunding consists of reinforcing social endowments that emanate from empowered crowds. Network trust is measured by mapping the degree of reciprocity, (a)symmetry, bridge and transitivity and clusterability among actors that operate in a network (Granovetter, 1973, 1974).

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

While ANT is primarily concerned with sociotechnical controversies, it can shed light on the process of social embeddedness resulting from group creativity, collaboration and cooperation in a variety of social phenomena, including microlending and crowdfunding. The rise of information and communication technologies and the 2.0 Web have had a direct bearing on social networks as the direct and indirect relationships (e.g. diads, triads, subgroups, …) that result from their development. The use of the Internet as a general purpose technology has enabled lenders and borrowers to share knowledge and diffuse information by building and exploring social ties among within different social groups. Weak ties can be immensely powerful in fostering relations between individuals and organizations embedded in social networks (Granovetter, 1973, 1974). Weak ties can potentially accelerate the innovation process by providing access to untapped sources of economic wealth. In contrast, access to capital and financial sources may not lead to enhanced organizational and firm performance if owners of capital cannot engage in business and social innovation (Bradley et al., 2012). This point is corroborated by empirical research that highlights the fact that strong social ties do not necessarily improve the chances of loan repayment (Abbink et al., 2006). Microlending and crowdfunding networks are likely to provide mutual incentives to peers who engage in social and economic ventures.

When comparing offline microfinance and online crowdfunding models, one should pay attention to the mechanisms by which group members engage in an array of socially innovative and economically sustainable ventures. Examples provided by participative finance and social collateral should be viewed as social translation mechanisms that enable actors and networks to accelerate the process of social change.

As structured networks and independent actors, crowds and social groups provide an interesting field study in comprehending and transposing the social network analysis and actor-network dynamics. The transition from offline microfinance communities to online crowdfunding platforms where agents and communities interact, orchestrate, curate and influence the decision-making process is of paramount importance in understanding the transposition conundrum. Microfinance institutions and crowdfunding platforms are brought to diffuse and translate knowledge and collective learning by engaging actors and networks with or without a pre-existing business context (Boxenbaum & Battilana, 2005). While those involved in offline transactions know and trust each other due to earlier acquaintances, those who engage in online transactions constitute weak social ties that may or may not gain further momentum. Individuals, social communities and interest groups act differently depending on the way they apprehend norms, codes and rules of an existing game. Communities with deep acquaintance (e.g. families and business partners) share cultural codes and rules whereas social groups with weak ties must devise new norms and common rules. Any innovation attempt at organizational, social, micro or macro level has a direct bearing on the actors and networks who affect, in turn, the innovation dynamics. It is therefore important to investigate the origin, process, outcome of innovation triggered by individuals, crowds and networks.

As we have previously mentioned one should distinguish in the case of social collateral between ‘ex-ante’ condition defined as born and grown communities and ‘ex-poste’ condition resulting from intentionally created communities. The study of offline and online microfinance institutions and crowdfunding platforms provide the opportunity to review the impact of peers, groups and communities on compliance and conformity rules. Microfinance and crowdfunding activities unfold over different levels of the social pyramid and represent different dimensions of the social innovation. It may not be easy to grasp the confusing dictum of social actors since there are too many of them who emerge and disappear within any given network. Yet, microfinance and crowdfunding networks provide a particularly useful

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

framework for studying and analyzing the (co)evolution of social actors and actants (e.g. entrepreneurs, microfinance institutions, nonhuman factors such as online platforms) who are capable of (co)constructing socially innovative and economically sustainable projects.

COMPLIANCE AND COOPERATION SCHEMES IN SOCIAL LENDING

To avoid aversions and moral hazard, institutional lenders often avoid borrowers with no records or collateral. Now, social collateral may provide a solution to this problem. But how can a group function as a social collateral? And why should its members comply?

To provide insights, we adopt the inductive method of case study for comprehension (Stake, 1995) and responses to the questions such as "how and why" rather than "what" or "how should" (Yin, 1994). For a recent example of application of such an inductive study, see Amit and Zott (2002). Our review of literature provided us with a structured observation guide of factors of compliance to analyze cases such as rotating savings and credit (ROSCA), solidarity group lending and cooperatives. We then look at online lending website Kiva (non-lucrative) and Zopa (lucrative) to see which features of group pressure are being adopted.

In a social lending process, members of a group guarantee each other's loans in absence of financial collateral. Social lending groups reduce the lender's credit risk at least for three reasons. In social lending groups, future credit extensions depend on reimbursement of the current loan. In other words, if anyone misses a payment, no one else in the group could receive a loan. As a result, it is in the interest of each member to be grouped with reliable team mates rather than with risky ones (Ghatak, 1999). In addition, members have all interest to monitor each-others' projects and settlement behaviors to ensure the sustainability of the group (Armendáriz de Aghion, 1999). Finally, borrowers don't want to "lose face" amongst their community by falling behind on payments. They even sometimes turn to loan sharks or family to find additional funds to ensure reimbursements. In this way adverse selection problem is mitigated and default risks are reduced (Armendàriz and Morduch, 2005).

Muhammad Yunus (2003) considered that the threat of the whole group not getting a loan was enough to instigate others in the group to put pressure and to pay for the defaulting member. According to the Grameen Bank's lending model, borrowers organize themselves into groups of five, for example. Two members receive their loans. If they honor installments on time, new loans are followed four or six weeks later to two other members, and so on. But if any member of group defaults on a loan, then all members are denied access to future credit. Any borrower who defaults is visible to the entire community and this circumstance imposes a sense of shame which represents a strong disincentive especially in small rural communities. In an alternate perspective, each member has a responsibility to the group and it is this social responsibility of the individual that is being exploited in the microfinance social innovation. Moreover, group work and weekly installments give the customer and the MFI (microfinance institution) the added benefit of discovering the problem early. Finally, customers are often expected – prior to loan provision – to deposit a small amount of money in a reserve fund that is used in case of credit default.

In Bolivia, lending groups are comprised of self-selected communities of 20 to 40 members who typically include families and friends and operate within a distinct geographic zone. MFI loans are conditioned by financial collateral that covers personal belongings and a request for regular loan repayment. The members are responsible collectively and the failure to meet the repayment terms will result in member exclusion (Vik, 2010).

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

An experimental study in South Africa and in Armenia (Cassar et al., 2007) researched whether it was the social relational aspect of group lending (ties, social exclusion), the information aspect (selection based on private information) or the control aspect (joint-liability contract) that was more important in determining superior group performance. It was found, in both countries, that group members provide bigger loans than the societal average, and are therefore more trusting. It found that social capital in the form of personal trust between individuals through prior ties and social homogeneity within groups has a positive effect on borrowing group performance. In contrast, it was found that social capital as measured by simple acquaintanceship with other individuals or an individual's general trust in society has little effect on group performance. It is possible that social homogeneity may be providing an informational content also. When members don't pay back, others are also tempted not to pay back, but if the defaulting member is helped out in emergencies, he is more likely to reciprocate since he becomes more trusting.

Offline Models: ROSCAs, Cooperatives, and Mutualist Banks

Different forms of group lending have been experienced in different cultures and different periods.

Rotating Savings and Credit Associations (ROSCA) are composed of members who agree to meet for a predetermined period of time with the objective of carrying out saving and lending activities. ROSCA members are required to make monetary contributions on the basis of pre-established selection, enforcement and conformity rules of selection and switch status as borrowers and lenders (Bouman, 1983). In a study conducted in a village in Cameroun, where half of the adult population was enrolled in a ROSCA, it was found that members had no kinship ties. Although there was no written contract among the ROSCA members, default rates proved to be relatively low (Etang et al., 2011).

The principles and characteristics that have led to the success of ROSCAs are equally present in cooperative organizations (Taylor, 1972). These principles include reliance on savings, self-regulation and governance, local promotion and outreach, collateralized lending, and limited liability. It is noteworthy that cooperative banks date back to late 19th century, when early credit union banks began to deploy their services in Western countries. Early KASAS in the former Soviet Union, as well as other cooperatives and credit unions in Eastern Europe operated in a similar way (Pytkowska, 2006).

The basic principles of credit cooperatives include open and voluntary membership, self-assistance, transparency and control of members' resources, sharing of facilities with a flexible and reliable reimbursement mechanism with the objective of safeguarding financial stability, encouraging cooperation among cooperatives, boosting employment and performance in rural areas and improving production quality (Baltača & Mavrenko, 2009). Large cooperatives operate in a similar way as microfinance institutions. This is the case of Bank for Agriculture and Agricultural Cooperatives (BAAC) in Thailand which provides financial services to farming groups (Mutua et al., 1996). Recent banking regulations in Europe have imposed more stringent control mechanisms on credit cooperatives and their financial operations.

Many cooperatives are involved in solidarity missions. This is the case of the organization of Catholic Relief Services established in Bulgaria and the Self-Employed Women's Association (SEWA) established in 1972 in India, both of which extend small loans to unbanked populations who lack social collateral. Recent studies in Nigeria have demonstrated that membership in the Obazu Progressive Women's Association has brought significant improvement in women's work environment. Marx and Seibel (2012) found that Nigerian cooperatives that function in a similar way as ROSCAs obtain 2.5 times better monthly contributions, 8.3 times higher entrance fees and 6.3 times higher income. While giving out larger volumes of loans (4.8 times more loans) at greater frequency (8.4 times more) (Marx & Seibel,

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Table 1. Compliance mechanisms in offline microfinance and social lending model

Source of Group Pressure		ROSCA	Group Lending	Cooperatives
Motivations for joining group	Cognition-based	To save and get lump sum earlier than individually possible, Lump sum consumption	To borrow	Many economic motivations, Especially operational cost reduction and increasing sales
	Affection-based	High impact of previous affiliation: in small groups they know each other	High impact of previous affiliation: small group size	Mutual understanding, respect and dependence, reduced impact of previous affiliation with increased size, even though a federative structure may increase impact
Group typology	Primary or. secondary origin	Primary and secondary	Primary/Secondary Previous ties help in building trust	Secondary
	Formal vs. informal group	Informal, no written formal contract	Informal within the group, formal with MFI	Formal
Forms of influence	Normative (rules)	Implicit	Explicit and implicit	Mainly explicit, and some implicit
	Value-expression	Solidarity	Entrepreneurship/ Independence	All shared purposes
	(Shared value)			
	Informational	Strong or medium ties	Medium or Weak ties. Loan officers and other group members give advice to borrowers.	Weak or no ties. Money management skills are required, need to find out about the expected viability of the projects
Group conformity	Acceptance	Willing to be integrated socially	Willing to be integrated socially and professionally	For having access to money
	Compliance	Fear of exclusion	Fear of exclusion and possible penalties	Fear of penalties
Motivation and monitoring process	Carrot/Stick	Social exclusion, possible penalty in some ROSCAs	Perspective of bigger loan in the future No loans to other is one doesn't repay., group exclusion	Strong penalties for defaults, perspective of bigger loan in the future
	ability to monitor	High because of proximity and repayment in public	By group members' taking over and repayment in public	By requiring physical collateral or demonstrating regular savings

2012). Nigerian and West African cooperatives show improving performance (Seibel 2012, pp vii-viii, Lawal, 2012; Nzekwe, 2012). These results have been confirmed by other studies on cooperatives in West Africa, Latin America and South Asia (Ashta et al., 2010, Ouédraogo and Gentil, 2008, Marx and Seibel, 2012, Seibel and Thac, 2012). As microcredit organizations and credit cooperatives expand and allow more participants to join in, they deepen and broaden the scope for microfinance operations.

Traditional lending groups operate both in rural and urban areas and are used by those who cannot afford to have a bank account or repay the loan in full. The time life of the groups varies from weeks to months or even years depending on geographic zones and countries. Lending groups force members adopt a rigorous 'work and repay' discipline ensuring mutually benefiting group behavior. As friends, relatives

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

and colleagues, group members interact, cooperate and comply on the basis of trust and reciprocity. While member relationships tend to be informal, the terms of business agreement; nature and objective of activity, the amount of initial loan and its repayment terms, the person in charge of the project, number of recipients and beneficiaries, peer meetings and commitments are formally defined (see Table 1).

The nature and extent of social ties affect the organization and development of ROSCAS and cooperatives as well as the relative effectiveness and group lending. Table 2 provides an understanding of the impact of social ties on the social lending models that have been studied in ROSCAs, social groups and cooperatives.

Peer-to-Peer and Online Social Lending Groups

Online crowdfunding and microlending platforms reached a total of 5 billion dollars' worth of investment in 2013 with an annual growth projection of 10% over the next decade (Massolution Annual Report 2013). Online social networking sites were initially designed to exchange texts but gradually moved in the direction of interactive transactions as a result of rapid deployment of online applications and Web 2.0 technologies (Okleshen & Grossbart, 1988). Online communication channels tend to be less inhibitive because people feel free to express their opinions (Fischer et al., 1996, Kuan, 1996, Bain & Company, 2009).

Among the early comers to online social networking one can refer to early bulletin boards and chat rooms, Six Degrees and Livejournal who began their activities in 1997 and 1999 respectively (Burt, 2010). The advent of broadband powered by new technologies turned the early online communities into audiovisual platforms (Watkins, 2009). The first big hit for broadband-based online community was Friendster followed by social media pretenders MySpace and Facebook in 2003. A number of online business and social platforms have emerged as the new millennia bonanzas. These communities are characterized by several features. Online communities operate though virtual relations rather than face-

Table 2. Impact of social ties on social lending models

Typology of Social Tie	ROSCA	Group Lending	Cooperatives
Origin	• Members come together to form a rotating savings and credit association for a predetermined period of time • Weak ties among members	• Members join the community in order to be able to have access to micro loans under predefined borrowing terms • Communities show trust through family and friendship bonds	Members engage in voluntarily actions and comply with flexible and reliable rules when defining borrowing and reimbursement mechanism
Process	Monetary contribution of all members is based on a pre-established selection mode that strengthens their social ties	Group lending is used as social collateral and a mechanism for empowering individual borrowers through collective engagement	Open and voluntary engagement boosts solidarity, enhances financial stability and cooperation among the cooperative members
Expected Impact	• Self-regulation and greater reliance on ROSCA members for local outreach • Governance mechanisms are reinforced through collective action	Greater confidence and self-reliance result from collective engagement and social commitment	• Reliance on common rules and objectives enhances trust and leads to economic and social performance • Governance mechanisms are reinforced through collective action

to-face direct contact (Okleshen & Grossbart, 1988). As a result, communication in virtual communities tend to be less inhibited since peers' identity remain anonymous and users feel less pressured by face-to-face contact (Fischer et al., 1996, Kuan, 1996). Online commuters do not radically alter their habits and social bonds and instead look for peers who connect, interact, and share information and insights on similar matters. A strand of research opposes the claim that virtual communication makes people more isolated and finds instead greater bonds and compliance among community members (Comley, 2008).

However, Paul Martino, an entrepreneur who launched Tribe, an early social network, believed that the quality of interpersonal connections on such networks might considerably decrease if people do not dare to dump former friends or to reject unwanted friend requests from casual acquaintances. Therefore, the power to ex-communicate a member from a group may be an important factor of the sustainability of online communities. It is worthwhile to mention that an online community is not always created by organizations for promoting connections with their two-sided users-clients (Rocher & Tirole 2006). They are also increasingly created by independent individuals for mutual dialogs and interactions. Brown et al. (2002) have found that on-line communities (such as chat rooms, bulletin boards, and product review pages) increase the value for users and therefore the "stickiness" of the Web site. Their study of 40,000 consumers' visits to Web sites shows that users of community features generate two-thirds of the Web sites sales despite accounting for only one-third of the visitors. Users who contribute product reviews or post messages visit these sites nine times as often as nonusers do, remain twice as loyal—and buy almost twice as often. Even users who read but don't contribute to community exchanges are more frequent visitors and buyers (Brown et al. 2002). A particular online community is created to ease interactions and transactions between peers. The most familiar case of this type is eBay. The business model behind this type has been widely studied and coined under the names such as "market maker" (Mahadevan, 2000) or "exchange facilitator" (Assadi, 2004). There are now P2P lending sites that facilitate loan transactions by directly connecting lenders and borrowers online (Galloway, 2009).

Peers have always lent money to each other. This model is now replicated on the Internet. Beginning in 2005, P2P social lending websites have emerged as a credit alternative to the conventional financial and banking institutions. Hulme and Wright (2006) believe that "social lending" is becoming increasingly and seriously rival to the traditional mainstream financial services because it embraces the social trends that are definitional of our age. The P2P social lending websites represent a specific category of market makers or exchange facilitators. These are essentially platforms which use different kinds of Web 2.0 technologies (Ashta & Assadi, 2009) to permit connections and interactions between investors and/or lenders (or good doers) and the potential borrowers, unbanked and micro-entrepreneurs.

P2P lending platforms vary in mission and status. Some connect peers directly; others engage third-party intermediaries. Some are not-for-profit; other not lucrative. Some fix interest rates according to historical credit records; others leave it to the loan partners. The most noticeable difference between the P2P social lending websites is arguably their legal status; not-for-profit as embodied by the US based Kiva and the lucrative ones such as mainly Zopa, but also Prosper and LendingClub. Kiva operates as an international operator, transferring funds from US based individuals to the rest of the world through the local Microfinance Institution. On Zopa, borrowers can get a loan from lenders who have money to invest and looking for ways to get higher profits than the bank's offers. Despite differences, they all have a common denominator which is the factor of trust between peers who meet only on the Internet (Galloway, 2009): Borrowers share information about their personal and financial characteristics; and lenders decide whether to trust and contribute to their loan requests or not.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Within this sector, social communities also play a significant role. While usefulness of credit score as a predictor of creditworthiness and default behavior is repeatedly confirmed, some studies empirically show that belonging to online groups increase both the chances of getting a loan (even for borrower with poor credit records), and that of reimbursing them (Iyer et al., 2009b, Ryan et al., 2007).

Herzenstein et al (2008), have investigated the determinants of funding success on Prosper.com, an online P2P lending platform. Their study shows that the effects of demographic attributes such as race and gender are very small in comparison to those of borrowers' financial strength and their ability to list and publicize the loan. Their research confirms that social affiliation increases the probability of obtaining loans at competitive rates even for borrowers who do not possess a bankable profile.

Problems of debt or low credit scores can be overcome by social affiliation with highly rated groups, endorsements or friends' support. Affiliation with Trusted Groups not only doubles the probability of getting a loan request fully funded, but also, establishes the scenario for borrowers with a priori non-bankable profile to get a loan with reasonable rates. However, people affiliated with Open Groups, where anybody can join, do not easily get a loan, and lenders are more skeptical (Herrero-Lopez, 2009). Online social lending groups significantly lessen the asymmetric information problems which represent a potential hazard for lenders. In fact, in absence of borrowers' true credit scores, lenders can infer creditworthiness of borrowers through the soft information provided in the peer-based listing (Iyer et al., 2009a). "Soft" information such as friend endorsements and friend bids within the social networks can compensate the lack of "hard" information, like actual credit score on borrower risk (Freedman & Jin, 2008). Berger and Gleisner (2009) demonstrate that the recommendation of a borrower on the P2P lending platform Prosper.com significantly improves his/her credit conditions.

More recently, Lenddo.com has found innovative mechanisms of linking the giving of loans and credit scores to the capacity to form groups with offline friends and relatives, including family members and co-workers. The networks' scores increase or decrease according to the behavior of members. Thus, Lenddo has transposed the offline group to an online platform. Virgin Money (USA) was the first website that enabled direct P2P lending between relatives and friends. As formerly stated, we have considered the cases of Kiva and Zopa. In addition to the status differences, it is worthwhile to mention that Zopa is actually P2P, while Kiva links the lenders to a MFI. The individual borrowers on Zopa may fear losing their credibility rating, while institutional borrowers may have less fear in this regard. Table 3 represents the summary of our cases studies.

FUTURE RESEARCH DIRECTIONS

Future research will provide further insight as to how microfinance and microfunding communities can achieve social and economic goals through different cooperative schemes that encompass more novel modes of curation and compliance across network boundaries. It is equally important to consider different geographic zones as well as specific market and nonmarket factors when studying the formation of online and offline networks. The analysis of a growing number of microfinance and crowdfunding organizations, Djanggis in Cameroon, Likelembas in Congo, Susus in Ghana, Xitique in Mozambique, Arisan in Indonesia, Chit Funds, milaap, and Micrograamin India, Tontines in Cambodia, Wichin Gye in Korea; Tandas in Mexico and Lenddo in the Philippines will provide a comprehensive framework for measuring the strength of social dynamics in fighting social exclusion within different socioeconomic and cultural contexts.

Table 3. Compliance mechanisms in online microlending and crowdfunding models

Source of Group Pressure		Kiva	Zopa
Motivations for joining Group	Cognition-based	Sharing information and insights on borrowers and on lending process Reducing the asymmetric information	Sharing information and insights about borrowers (for lenders) and lending offers (for borrowers) Reducing the asymmetric information
	Affection-based	Relating to and sympathizing between lenders, Self-expression	Relating and sympathizing between lenders, Self-expression
Group typology	Primary or secondary origins	Secondary (formed ex post by social oriented individuals)	Secondary (formed ex post by independent and "anti-big", "free formers")
	Formal vs. informal group	Formal (defined in terms of use)	Formal (defined in terms of use)
Forms of influence	Normative (rules)	Explicit	Explicit
	Value-expression (Shared value)	Focus on social goals and issues	independent and interpersonal initiatives
	Informational	No ties. Knowing entrepreneurial projects (for lenders)	Weak or no ties. Knowing entrepreneurial projects (for lenders) and lending offers (for borrowers)
Types of conformity	Acceptance	By adhering to social causes	For enjoying better interest rates, higher for lenders, lower for borrowers
	Compliance	Self-expression	By fear of losing credit rating, coercive actions
Motivation and monitoring process	Carrot/Stick	Do good and do well	Continuous access to higher returns (for lenders) and cheaper loans (for borrowers)
	Ability to monitor	Moderate checking of lenders online. Low checking of borrowers because the monitoring role is delivered to the partner MFIs. Field audits by volunteer Kiva fellows.	Strong: payments and repayments are checked, shown on the platform Augmented probability of getting loans even for borrowers with unattractive profiles

CONCLUSION

This chapter provides a framework for evaluating and comparing sources of compliance commitment and cooperation associated with offline social lending and online microfunding business models. Microfunding organizations mobilize financial resources through peer-to-peer relationship in conformity with group-led rules and norms of social collateral. While social collateral is a familiar and common notion in the literature of microfinance, the determinants of its functioning for monitoring and controlling individual and group behavior have not been fully explored in the literature. Social collateral has proven to be not only an efficacious solution to the problem of the unbanked, but also a source of inspiration for the fast growing peer-to-peer lending and crowdfunding operations on the Internet.

By exploring and exploiting a growing web of social interactions, crowdfunding offers equity, credit, donation and reward-based opportunities to a wide array of investors. The development of social media and communities of interest has been closely associated with the advent of the Internet as a general purpose information and communication technology. The use of Web 2.0 applications has broadened and deepened social relations and accelerated the formation of numerous business webs driven by network ubiquity. In ubiquitous business networks, people know and trust each other and are dedicated to common

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

goals and sharing rewards. Trust, engagement, transparency and accountability reduce the transaction cost of carrying out business transactions. Peer monitoring, cooperation and compliance enhance trust among members in both offline and online communities. This is the case of many crowdfunded and microfinanced ventures in which trust and engagement accelerate business innovation and social dynamics.

KEY TERMS AND DEFINITIONS

Community: The term conveys both traditional notion of people who reside in local proximity and neighborhood sharing a common cultural and historical heritage, and popular meaning of social ties and solidarity among people who share similar norms and values. Many researchers have developed concerns about the adequacy of the concept for analytical purposes, and suggested new ideas such as social network for studying the patterns of social integration. Here, we define community for the sake of research studies as a social group whose members share common values and recognize the strong bonds of belonging.

Conformity: Conformity is the adaptation of an individual's behaviors and attitudes to a reference group's norms. This adaptation often requires changing one's perceptions, opinions, or behaviors in the perceived desired direction of the group, and in response to real or imagined group pressure. Conformity leads to uniformity of behavior among the members of a group. Individuals comply with a group's norms at the expense of their own freedom when the rewards of compliance exceed its costs. Individuals might comply without accepting all the values of a group. Obedience is an extreme case of compliance where an individual completely complies and abandons other aspects of his/her self-identity.

Crowdfunding: Crowdfunding is not really new. It is an updated version of a traditional fundraising process. It involves a mechanism for obtaining funding by soliciting and collecting small contributions for specific projects from a large number of backers. Church or civic groups used to raise money to build schools or hospitals within communities. With the Internet, that local group extends to the world. A project initiator can thus launch an open for collecting small amounts of money from a large number of people (crowd). The crowdfunding platform accommodates one or more types of fundraising between project initiators and contributors: credit-based crowdfunding, donation-based, equity-based and reward-based crowdfunding.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Microfinance: To most, microfinance means providing poor entrepreneurs with small loans (microcredit) for their productive activities. However, in a broader –and more accurate- sense, microfinance refers to providing low-income households access to basic financial services such as loans, savings, money transfer and insurance. While the modern microfinance is symbolized by Muhhamed Yunus, founder of Grameen (rural) bank in 1976, who started the initiative by giving out a loan of $27 to 42 women in a village in Bangladesh, the movement of microfinance dates back to Jonathan Swift who commenced microcredit within the Irish Loan Funds in the 1720s, Friedrich Wilhelm Raiffeisen who initiated the village-bank movement in Germany reaching two million farmers by 1901, Alphonse Desjardins who encouraged "Caisse Populaire" movement in Quebec, or even the traditional trust groups in different cultures all around the world.

Social Collateral: Collateral is a guarantee pledged by a borrower to a lender until the loan is paid back. There are two types of collaterals for securing a loan. Conventional asset-based collateral is based on debt record, income, and property. It can be seized in the case of default. Formal financial institutions use this kind of collateral to decide if they grant a loan or not. Social collateral refers to group guarantee. It is based on group pressure, frequent visits, risk of public shame, peer monitoring, promise of future credit, and the collective makeup of payment if one member defaults. In a microfinance context, where there is little or no asset for pledging a loan, potential borrowers form groups, usually with acquaintances and neighbors, to secure loans. The system of cooption reinforces the mutual confidence among members. Some microfinance institutions, however, prefer to adopt selection techniques based on an assessment of the individual.

Social Innovation: Novel, transformative, and sustainable solutions that chiefly aim to meet social problems such as climate change, disease, discrimination, and poverty. Solutions, generally interdisciplinary, collaborative, and market-based, tend to deliver economic prosperity, environmental sustainability and social solidarity. The value thus created is primarily for society rather than for profit maximization.

Social Tie: Individuals not only belong to social groups, they also relate to each other through social ties. These ties can connect people from different groups. The strength of a tie is a function of the amount of time, the emotional intensity, the intimacy (mutual confiding), and the reciprocal services. Social tie might be strong, weak, or absent. It is believed that weak social ties are the major driver of the social embeddedness and the transmission of information through the related networks. Novel information tends to flow more through weak ties because friends in the circles of strong ties actually possess and know it.

Chapter 16
Plan for Prevention of Risks of Corruption and Related Infractions: The Application of FMEA Methodology

Marisa Pinho
University of Aveiro, Portugal

Carlos Santos
University of Aveiro, Portugal

ABSTRACT

This chapter presents the results of the application of the Failure Mode and Effects Analysis methodology, within the scope of the Organisational Risk Management Plan, in the Municipal Division of Contract Works and Concessions of Oliveira de Azeméis City Council of the metropolitan area of Porto located in the north of Portugal with an area of approximately 164 Km2 and a few more than 20,000 inhabitants. The application of this methodology establishes a bridge between risk management and the Plan for Prevention of Risks of Corruption and Related Infractions, describing the application of this methodology and referring how the levels of severity, occurrence and detection of a specific failure, which are essential in the implementation process. Once the application of this methodology is understood, an example of its implementation for the management of risk in the contract works service of the Municipality of Oliveira de Azeméis is also provided.

INTRODUCTION

The public organisations are subject to strong pressures due to the need for a constant updating, the growing complexity inherent to the introduction of new procedures and technologies, and due to a greater involvement of citizens. These pressures may cause failures in the internal control system, exposing organisations to a high number of risks, such as corruption and related infractions, which are unexpected,

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

inopportune, and which can also reach large proportions. Thus, organisations should identify and assess the risks which threaten their activity in order to implement control mechanisms to mitigate them, without hindering the accomplishment of objectives and the sustainability of the organisation (Pinho, 2014).

The Portuguese municipalities have been focused on identifying and validating risks associated with corruption and related infractions, and have been developing adequate control mechanisms to prevent them, through the creation of the PPRCRI, recommended by the Council for Prevention of Corruption, through recommendation Nº. 1/2009 of 1st July. The creation of the Plan for Prevention of Risks of Corruption and Related Infractions (PPRCRI) should take into account that risk management, associated with any organisational activity, is essential to ensure its success, considering that an ineffective risk analysis can lead to non-detected failures which may have a considerable impact on the organisational performance and outcomes. However, the above recommendation does not include any guiding methodology, and thus, this task is left up to the team responsible for the creation of the PPRCRI. Having identified this failure, the authors propose, in this work, to adopt the methodology Failure Mode and Effects Analysis (FMEA) for risk management while developing the plan.

The authors will apply this methodology specifically to the contract works service of Oliveira de Azeméis City Council, a council of the metropolitan area of Porto located in the north of Portugal with an area of approximately 164 Km^2 and a few more than 20,000 inhabitants. This service is usually integrated in the Municipal Division of Contract Works and Concessions and exists in all the remaining Portuguese municipalities, transferring considerable amounts of funds and affecting many and varied local interests. In this study, the effects, the causes of occurrence, and the risk priority numbers (RPN) will be identified, taking into account the risk management standard of the Federation of European Risk Management Associations (FERMA), FMEA methodology (Pinho, 2014), and the guide suggested by the Portuguese court of auditors (see Appendix 1).

The European Risk Management Standard - FERMA provides guidelines to identify risk which is always associated with any public or private organisational activity. Considering that this risk results from events which can produce either positive artefacts (opportunities for continuous improvement) or negative artefacts (threats to the good performance of the organisation), the authors can assume that the organisational risk profile is made up of two components: a component with positive risk profile and another with negative risk profile (FERMA, 2002; Santos, 2009).

The risk management (RM) should systematically assess or predict all risks inherent to past, present or future organisational activities as well as include the organisational culture of the organisation through adequate procedures and good practices established by the management bodies. From the organisation strategic vision the RM should also identify the tactical and operational objectives, thus promoting the efficiency of the operations regarding all organisational levels. So that the RM effectively contributes to mitigate the risk it is essential to use adequate methodologies and/or techniques. FERMA (2002) suggests some tools which can be adopted by the organisations for this purpose, mainly: the analysis of threats; fault tree and FMEA.

The FMEA methodology was developed in 1949 by the US Department of defence with the aim to assess the impact of failure occurrence on their systems/equipment. However, from 1988 onwards, it started to be used in several enterprises such as *Chrysler, Ford* and *General Motors*, among many others, as part of their quality assessment programmes in different projects and processes (Matos & Milan, 2009).

CORRUPTION AND RELATED INFRACTIONS

Governments in general and the Portuguese government in particular have been focused on ensuring that the management of public money, values and heritage meets the principles of public good. Thus, the Council for Prevention of Corruption was created through Law Nº. 54/2008 of 4th September passed by the National Assembly, with the aim to contribute to the prevention of corruption and related infractions recommending the rules to be respected in the development of the PPRCRI. Regardless of the nature of the entities, these plans should identify, regarding all their areas and/or departments, the risks of corruption and related infractions, and the measures which can prevent these and mitigate their occurrence, with special emphasis on the internal control mechanisms and the definition of the individuals responsible for their management. These entities should develop an annual report about the plan implementation and execution (Martins, 2010).

This is an overall concern that has benefited from the increasing attention paid by several world leaders. Thus, a thorough assessment has been made in cases of corruption of different types. Internal control is important mainly due to the high number of non-financial and financial transactions which may be propellers of corruption. GRIEC (2007, p. 11) defines corruption as "any lawful or unlawful act or its omission, (...) against undue receiving or promise of any reward for themselves or a third party", i.e. crossing the red line which separates the public interests from the private ones (Sousa, Larmour & Hindess, 2009).

Related infractions are another type of crime which may also damage the good functioning of organisations and the markets where they operate, with the ultimate goal of obtaining an undue advantage. An example of this is the misuse of powers, embezzlement, economic participation in business, concussion, influence peddling and bribery (GRIEC, 2007; MOA, 2012). Thus, the PPRCRI aims to identify not only the signs which may increase corruption but also the mechanisms which exist or that, when implemented, can prevent and/or mitigate behaviours and attitudes which may increase the risk of corruption (GRIEC, 2007).

As corruption hinders the increase of gross national income as well as the governance performance (Aidt, 2009), and since it has been proven to be a global phenomenon, it is necessary to implement global prevention measures. In general, it is important to strengthen the vital role of society in this combat, raising awareness as to its supervisory role (Sousa, 2011; Lima, 2011). Only in this way will it be possible to fight corruption, monitoring the decision-makers' actions and controlling the efficiency of governance (Cunha, Serra & Costa, 2012). However, for an effective prevention of corruption and related infractions there is the need for a pro-active, transparent and objective action by all the stakeholders and by the entities governance bodies (Lima, 2011). Concerning the Portuguese municipalities, the authors can already find a few internal auditing offices made up of people who are external to the services regarding the provision of municipal services. Regardless the fact that the countries have different realities, Khan (2006) and the OECI - CPLP (2011) consider that the measures to fight corruption should involve the settlement of agreements and international conventions of combat to corruption; governmental laws amendments and repeals; promotion of public transparency; reduction of bureaucracy; promotion of legality; integrity and ethics in the organisational behaviour; optimisation of information and internal control systems; improvement of work teams between the criminal police and the governing entities; setting-up of an external entity against corruption in order to guide prevention actions of corruption in the public sector; and development of management and corruption prevention plans.

RISK AND RISK MANAGEMENT

Regardless the place where we are or what we are doing, there is always risk connected to our regular activity, and this may have a personal or professional impact (Stamatis, 2014). Thus, risk, is always underlying any organisational activity, since several events or situations are likely to occur, can create opportunities to gain competitive edge or threats which pose obstacles to its success (FERMA, 2002). Thus, the occurrence of an event with negative impact, representing a negative risk profile, requires managers to come up with solutions which aim to minimise it. On the other hand, the events which represent positive risk profiles represent opportunities which favour the accomplishment of the organisation's objectives, through procedures for continuous improvement, culminating in added value (COSO, 2007).

The RM is a core process of the strategic management of any organisation, allowing the systematic observation of risks inherent to its activity. Its main objective is to identify and assess the most significant risks and to develop and implement adequate procedures/mechanisms which minimise them so that the performance of all activities of the organisation is sustainably increased (AIRMIC, Alarm, & Irm, 2010). Hence, its added value is related with the possibility of implementing efficient controls, according to the impact of the identified and assessed risks, which acceptably reduce the risks, contributing to ensure the fulfilment of applicable laws and regulations, preventing damage to the reputation and sustainability of the organisation.

So that the RM process is effective and provides adequate support to the decision-making processes of the bodies, it should integrate that same process and be part of the organisation's culture and practices, adapting these to its business processes (CRA-SP, 2009). This process starts with the creation of an organisational role, which can ensure the consistency and control of the organisation and all intervenients (FERMA, 2002), integrating a model which allows the identification and assessment of organisational risks, namely those which should be mitigated first. As can be verify, the identification and assessment of the organisational risks will allow their prioritisation and enable that the procedures/mechanisms of internal control are focused on the control points of high criticality (Cicco, 2006).

The RM generates different types of relevant information, allowing the management bodies to gain awareness of the limitations/failures which exist in the organisational structure, and thus be able to rigorously control the existing risks.

So that all this process of risk identification, assessment, and validation can be effective, regular audits must be performed to ensure respect towards applicable policies and the legal framework, and to assess the organisational performance in order to identify opportunities for improvement (positive risks profile) or that internal control mechanisms which are adequate for the activities of the organisation should be implemented (negative risks profile), thus ensuring that these are known, understood and used (FERMA, 2002).

APPLICATION OF FMEA METHODOLOGY

As aforementioned, this chapter is related to the use of FMEA methodology, one of the methodologies suggested by the European Risk Management Standard to support the process of risk management associated with the contract works service of the Municipality of Oliveira de Azeméis (MOA), concerning the development of its PPRCRI. The MOA includes this plan in another wider plan, named: Organisational Risk Management Plan (ORMP).

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

The FMEA methodology is an analytical technique which allows ranking severity, occurrence and detection of a certain failure (Moura, 2000), through a quantitative scale, defined by the team responsible for the development of the PPRCRI. The use of this scale allows to prioritise the control points and to develop the needed actions, aiming to reduce risk associated with the respective control point, systematically managing the human and material resources available for this purpose. In this specific case the authors will consider a scale of 1 to 10.

Once the scale is defined and, according to this same scale, the rankings of severity (see Table 1), occurrence (see Table 2), and detection (see Table 3) are determined, the authors adequately fill in the record sheet of FMEA methodology (see Appendix 2) with the respective information. This record sheet should be updated from time to time, keeping compliance with possible changes made to the organisational structure. The team responsible for the development of the PPRCRI should define the frequency of the updates to the record sheet.

The use of FMEA methodology typically comprises 3 phases: (1) qualitative analysis; (2) quantitative analysis and (3) record analysis and corrective actions. In the qualitative phase the authors make a selection of the organisational unit/division/office or service, object of implementation of the methodology. Next, the auditing team is built. This team will then perform a qualitative analysis listing for each activity the potential failure modes associated with possible causes and respective systems of detection and prevention as well as the estimation of their effects and consequences. In the quantitative phase, the likelihood of occurrence and detection of a potential failure and the severity of its effects on the process under analysis are evaluated, leading to the calculation of the RPN ranking. Finally, the phase of record analysis and corrective actions corresponds to the analysis of the aforementioned rankings and to the recommendation of the corrective actions which should be put into practice. For failures with RPN equals to or greater than 100, the auditing team should discuss improvement actions with the heads of the service in order to reduce the likelihood of occurrence and/or increase the likelihood of detection. In the following sub-sections can be seen the tables which have been created for the severity, occurrence and detection rankings, using a scale of 1 to 10, and which have been used to fill in the record sheets used for the risk management related to the PPRCRI (see Appendix 2).

The column concerning severity (see Appendix 2, column 14) should be filled in with values obtained in compliance with the information displayed in Table 1. Severity is an assessment of the seriousness of the effect that the potential failure may have on the business processes in case of occurrence.

The column corresponding to occurrence (see Appendix 2, column 16) should be filled in with values obtained in compliance with information displayed in Table 2. The occurrence is related to the likelihood of a certain failure to occur.

The column concerning detection (see Appendix 2, column 18) should be filled in with values obtained in compliance with information displayed in Table 3. The detection ranking is related to the capacity of current controls (column 17 of the record sheet, Appendix 2) to detect the causes of failure.

The cross-linking of the severity and occurrence rankings allows us to regard the risk as minor, moderate, major or critical, according to the weighing done between the rankings, which will determine the risk criticality level, Figure 1. According to the risk level can be used colour cues, for example the green for a low risk level, yellow for a medium risk level, orange for a high-risk level and red for a critical risk level.

Similarly, the cross-linking of the criticality matrix with the detection ranking allows us to label the risk as desired, acceptable, marginal and unacceptable, Figure 2. Thus, the green colour is usually assigned to desired risk, the yellow to the acceptable risk, orange to the marginal risk and red to the unacceptable risk.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Table 1. Severity ranking, adapted from Santos (2009) & Quality-One International (2011)

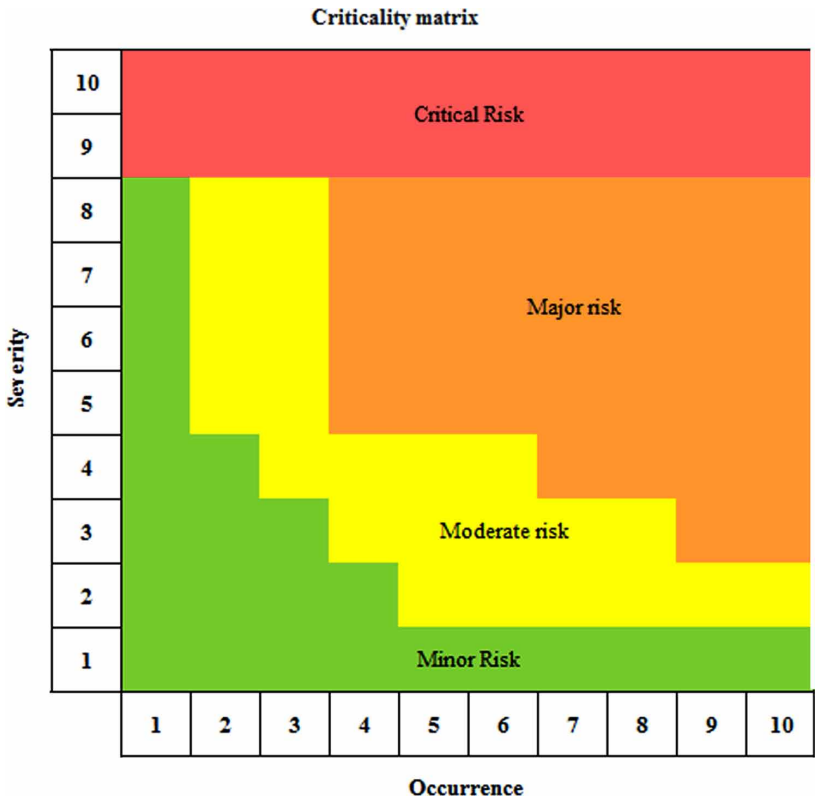
Impact	Criteria: Severity of Effects in the Process	Rank
Hazardous without warning	Strong dissatisfaction with the nature of the failure, which may not be in compliance with the laws and regulations in force and will result in major damage.	10
Hazardous with warning	Dissatisfaction with the nature of the failure, which will result in major damage.	9
Very high		8
High	It may result in dissatisfaction with the nature of the failure, causing damage.	7
Moderate		6
Low	The nature of the failure can cause minor damage	5
Very low		4
Minor		3
Very minor	The nature of the failure is secondary, and may not be detected.	2
None		1

Table 2. Occurrence ranking, adapted from Santos (2009) & Quality-One International (2011)

Impact	Criteria: Likelihood of Occurrence	Rank
High	High likelihood of occurrence	10
Moderate	Moderate likelihood of occurrence	9
		8
		7
Occasional	Occasional likelihood of occurrence	6
		5
		4
Remote	Remote likelihood of occurrence.	3
		2
Low	Low likelihood of occurrence through preventive control	1

After the FMEA methodology has been implemented, it shall become a tool of daily use. As aforementioned, the record sheets should be reviewed from time to time as there are constantly changes in the conditions of a system, product, process and/or service which may alter the initial conditions and which have also served as a basis for the implementation, and thus consistency is lost.

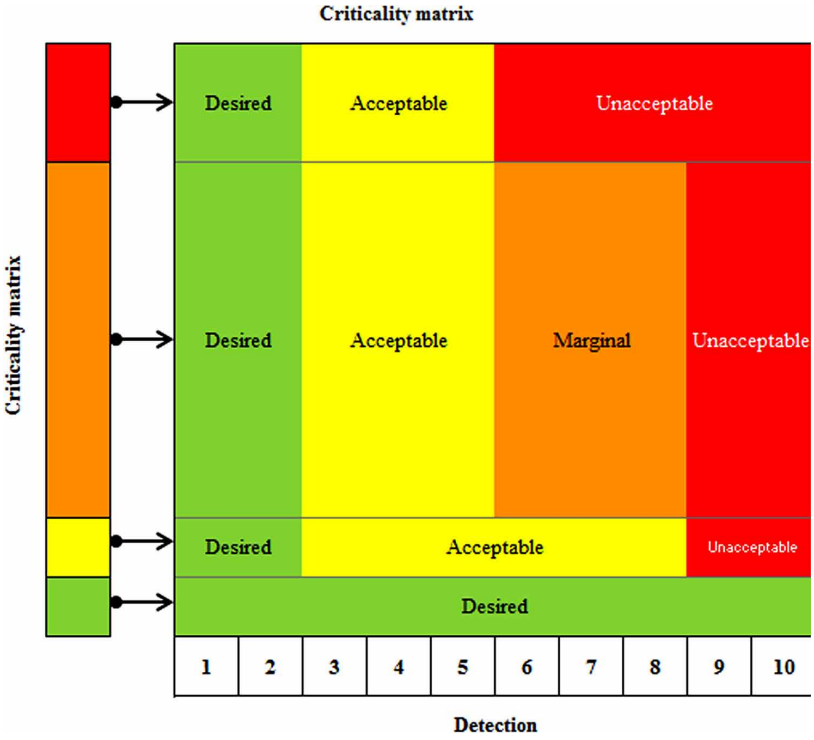
The use of FMEA methodology requires the users to understand and know how to fill in the record sheets, and, therefore, the content of each field of the record sheet is explained in Appendix 4. The application of FMEA methodology to each organisational unit should be done by respecting the following steps when filling in the record sheet (see Appendix 1 and 3):



- Comprehensively analyse the process, identifying all its phases;
- Identify how the performance of these functions can cause failures;
- Identify the consequences of each failure;

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Table 3. Detection ranking, adapted from Santos (2009) & Quality-One International (2011)



Detection	Criteria	Criteria: Likelihood of Detection by Process Control	Rank
Null	Absolute certainty of non-detection	The process control will not and/or will not be able to detect the cause of a potential failure; or it does not exist.	10
Very Remote	The control may not detect it	Very remote possibility of the process control to detect the cause of a potential failure.	9
Remote	Low likelihood of the control to detect it	Remote possibility of the process control to detect the cause of a potential failure.	8
Very Low	Low likelihood of the control to detect it	Very low possibility of the process control to detect the cause of a potential failure.	7
Low	The control may or may not detect it	Low possibility of the process control to detect the cause of a potential failure.	6
Moderate	The control may or may not detect it	Moderate possibility of the process control to detect the cause of a potential failure.	5
Moderately high	Control is very likely to detect it.	Moderately high possibility of the process control to detect the cause of a potential failure.	4
High	Control is very likely to detect it.	**High possibility** of the process control to detect the cause of a potential failure.	3
Very high	The control will almost certainly detect it.	**Very high possibility** of the process control to detect the cause of a potential failure.	2
Very high	The control will detect it	The control **can detect** the cause of a potential failure.	1

Figure 2. Adapted from Quality-One International (2011)

- Identify the causes of each failure;
- Assess severity of each effect;
- Assess each failure regarding its frequency or likelihood of occurrence;
- Identify the most critical factors;
- Assess the impact of the recommended actions in the processes.

The main objective of this methodology, according to Matos and Milan (2009, p. 979) consists in "emphasising the minimisation of the likelihood of failure occurrence and its effect" and thus, some of its advantages can be identified, as follows:

- Improvement of quality and safety of products and services;
- Improvement of the corporate image and its competitiveness;
- It can increase the levels of customer satisfaction;
- It can reduce the cost and time of developing products;
- It can aid diagnostic process; and,
- It allows the establishment of priorities to implement corrective actions (Matos & Milan, 2009, p. 979).

The FMEA methodology is clearly efficient when applied to the analysis of factors which cause a failure in a single system. However, there are not only advantages. There are also disadvantages, such as:

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

- Difficulty in applying this methodology to complex situations, which involve several functions that can lead to different procedures in order to achieve the objective of the methodology;
- The level of significance of the effect of any failure may be difficult to minimise due to the need for thorough knowledge of the different procedures and the service characteristics.

The authors should also emphasise that human error and the environmental effects are usually the most common mode and/or failure taken into account in this methodological analysis (Stamatis, 2003).

EXAMPLE OF IMPLEMENTATION

In this section is given an example of application of FMEA methodology to the risk management of a municipal service, namely the contract works service of the MOA. This service was chosen due to its risk level, identified as high, as this is a service with a great financial impact considering expenses for the municipality and also because it is a service in which the good practices are strongly based on the fulfilment of the legal procedures, mainly the code of public contracts, which can facilitate the method application process (Pinho, 2014). This option was also influenced by the results of a semi-structured interview which was carried out with the objective of obtaining an overview of the application and monitoring of the ORMP of MOA (the ORMP includes the PPRCRI) as well as of the importance assigned to it concerning RM. The interview aimed to determine if the PPRCRI is being implemented and its level of importance, and to assess if the adoption of RM methodology, specifically FMEA method, is important for the improvement of the municipal RM. The interview was also analysed by the audit office, which corroborated the acceptance of the use of FMEA methodology in risk management.

In this implementation potential failures of risks of corruption and related infractions were identified in contract works service of MOA and, based on this identification, the effects, causes of occurrence and RPN were determined, as can be verified in Appendix 4. The sequence of the work done was the following: 1) creation of flowcharts showing the legal procedures; 2) identification and characterisation of potential failures inherent to the existing risks, their causes, prioritisation of risks according to their severity, occurrence and detection rankings; 3) development of a proposal for a risk management plan to be integrated in the ORMP of MOA, including FMEA methodology; 4) presentation of the PPRCRI record sheet to the internal audit office, so that the necessary adjustments and improvement suggestions can be made; 5) performance of an internal audit to the Municipal Division of Contract Works and Concessions (MDCWC), using FMEA method; and finally, 6) analysis of the results obtained with the audit performed.

The flowcharts were drawn in compliance with the legal and regulatory framework in force and were then analysed by the head of MDCWC and were also reviewed based on the work instructions defined by that service, in accordance with its specificities. The local power has work procedures based on specific flowcharts, regarding each phase of the contracts, and with high information specificity. Thus, the different stages of the contract works service were identified to allow the identification and detection of possible failures to be, then, registered in the PPRCRI record sheet. The flowcharts depict the different phases of procedures, with the specificities which may occur in each of them, identifying the investigation procedures of each works contract. These flowcharts will allow the identification of potential negative risks inherent to the defined procedures.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Once the flowcharts were completed, in a second phase, the risks were then identified, assessing the potential failures in MDCWC. As the risks identified with a high level of criticality were already identified in the ORMP, the processes associated with these risks were taken into account when filling in the PPRCRI record sheet, giving support to the internal audit procedures, which, in a very interactive way, rectify and identify new risks whenever necessary. Then followed the association of mode, effect, cause and potential failure mechanism(s) for each identified risk, and the presentation of an RM proposal to be included in the ORMP.

After the aforementioned association and the proposal were made, the PPRCRI was developed, being readjusted to FMEA method, having all the information included in the current PPRCRI of the ORMP. This information is related to the contract works service and was transferred to the PPRCRI record sheet with the necessary adjustments, and the effects and causes inherent in the failures identified in this service were then defined. However, and because some actions had previously been defined in the ORMP, that information was also taken into account in order to identify the effects and causes, and a new PPRCRI was created for the MDCWC as seen in Appendix 4. This new PPRCRI was given to the heads of the internal audit office of MOA so that they could give their opinion, suggest any adjustments and validate the scales of the used rankings. Thus, all the work behind the application of FMEA methodology was verified and validated by the heads of the internal audit office of MOA so that it could reflect the reality of MDCWC.

The work carried out by the internal audit team focused on the verification of compliance with the procedures adopted by the organisational units in accordance with the action plans defined for the implementation of ORMP. In addition to this verification, the auditing made to the service of contract works and concessions also aimed to apply FMEA method, assessing severity of failures, likelihood of occurrence and if the detection means were effective in order to assess whether severity, occurrence and detection rankings assigned by the auditing team were adequate.

This was followed by the auditing analysis aiming to establish actions which minimise risks. The auditing team noticed that the values obtained for the RPN obtained show that the MDCWC has a low likelihood of failure, as the values range between 12 and 200, in a scale of 1 to 1000. Therefore, it can be concluded that the levels of failure detection are desired and acceptable. From the analysis made to the rankings of risk prioritisation, no procedures with major risks were identified. However, point 3.4.1 (column of PPRCRI recommended controls, Appendix 4) presents an RPN of 200, greater than the remaining procedures. Although it is a comfortable situation, the auditing team suggested contract works service to review all the procedures regarding the works contracts in order to reduce the occurrence of possible failures, and to increase their detection with more internal controls. They also recommended filling in the checklist at the beginning of the procedure in order to ensure a high detection by all internal control mechanisms defined for the contract works.

The application of FMEA methodology, in the MDCWC of MOA was successfully carried out, allowing us to successfully conclude, concerning the similarity of this process in the many Portuguese municipalities, the possibility of implementation in the contract works services of other Portuguese municipalities. This service is cross-cutting to all municipalities, as it is guided by legal and regulatory procedures defined for the public contracts. Given the fact that all the municipalities have to develop a PPRCRI every year, the authors have concluded that it is possible to apply FMEA methodology in the municipal PPRCRI, with its own adjustments according to the reality of each area/service.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

CONCLUSION

The recent scandals which have gone public in Portugal and which may represent situations of corruption and related infractions have revealed the existence of weaknesses in the mechanisms of management which are associated to it. Thus, the present study is of utmost importance, as it is necessary to consider the risks in all phases/procedures in the public organisations. In this work, as aforementioned, the authors introduce a methodology, FMEA methodology, which has been internationally tested, to identify and assess the risks of PPRCRI, focusing on the Portuguese municipalities.

It is to consider that there are several limitations concerning the organisational risk management. Thus, it should be highlighted that risk is intrinsically related to the future performance of organisations, which is always difficult to predict in a rigorous way. Another limitation to be mentioned lies in the assumption that risk management ensures the efficiency of the control mechanisms to be implemented. The authors should take into account that not all events are simple to control because they can occur in different contexts and with different objectives (COSO, 2007).

The application of FMEA to the contract works service of MOA allowed the identification of the effects and causes of occurrence of potential failures, an aspect that has not been mentioned in any document so far. The awareness of these two items allows us to have a clearer idea of what can happen if failure occurs, and therefore effectively identify the RPN. This method also allows to assess quantitatively and qualitatively the procedures of risk assessment, as it enables us to view the most significant risk in each service and through the colour associated to it, being red and orange the colours used for more significant risks, thus allowing to improve the efficiency of their management. From all FMEA record sheets it is possible to see the risks/failures which need to be taken into account first, therefore making it easy for the auditing team to define the actions to recommend.

After the audit was concluded, FMEA methodology allowed the auditing team to detect the RPN and to facilitate mitigation of risk connected to different business processes, through internal control mechanisms. It also allowed the assessment of risk inherent to activities developed in MDCWC, according to three dimensions: severity, occurrence, and detection. In addition, it enabled the identification of the effects and causes brought about by potential risks which may be connected to different business processes.

The study conducted allowed to conclude that MDCWC has a low likelihood of failure occurrence because it has a low RPN, as mentioned in *APPLICATION OF FMEA METHODOLOGY*. However, there are potential failures identified with a very high level of severity, in case they occur. Hence the auditing team recommends that the service adopts internal control mechanisms in order to reduce the occurrence and increase the detection level of these failures.

As a result of the work carried out, the authors could verify that FMEA methodology can be successfully integrated in the PPRCRI of any Portuguese municipality, complying with recommendation Nº. 1/2009 of 1st July. This applies as it was possible to identify the risks, propose measures/controls which allow the prevention of occurrence and also identify the heads of both the team responsible for the implementation of FMEA methodology and contract works service (the service under analysis). It should be highlighted that there was no negative reaction by the contract works service and that there was a meaningful collaboration by the heads of the service, which is a relevant fact for the conducted research. Thus, the authors believe that the adoption of this method in most public entities will not cause negative reactions, which usually hinder the implementation of risk management processes. Therefore, it will contribute to prevent and minimise occurrence of potential actions of corruption and of related infractions.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

The authors should also point out that success in the implementation of this methodology can be achieved if the service/area where FMEA is going to be applied is known in advance. Moreover, it is important to be aware that a comprehensive analysis of the work procedures should be performed, and that sometimes this may be time-consuming. However, after applied, it facilitates all the planning process of internal auditing to the PPRCRI, as it prioritises the most significant risks and, thus, allows the establishment of priorities when defining the actions to recommend.

KEY TERMS AND DEFINITIONS

Contract Works: Included benefits and obligations for both sides in a similar way to any contract between a client and a supplier.

Council for Prevention of Corruption: The Council for Prevention of Corruption (CPC), created by Law No 54/2008 of 4 of September, is an independent administrative institution with a nationwide mandate for the prevention of corruption and related infractions.

Failure Mode and Effects Analysis (FMEA): Was one of the first systematic techniques for failure analysis and it has been applied in various sectors both sales of products and/or provision of services.

Gross National Income: is defined as the sum of value added by all producers who are residents in a nation.

Municipal Services: Services produced directly by a municipality using an in-house workforce.

Municipality: As defined by the 1976 Constitution of the Portuguese Republic, the municipality is the second-level administrative subdivision of Portugal.

Negative Risk Profile: transactions behaviour responsible for risk situations.

Plan for Prevention of Risks of Corruption and Related Infractions: This Plan, was based, as recommended by Council for Prevention of Corruption (CPC), complying with recommendation from July 1st, 2009 and identifies the main areas which may potentially be subject to acts of corruption, as well as the ensuing risks and the controls set forth by the organisation in order to mitigate these.

Portuguese Court of Auditors: As defined by the 1976 Constitution of the Portuguese Republic is defined as "the supreme body, which examines the legality of public expenditure and rules on the accounts which the law has ordered to be submitted to the Court".

Positive Risk Profile: expected transaction behaviour.

APPENDIX: PHASES OF RISK ANALYSIS (GUIDE SUGGESTED BY THE PORTUGUESE COURT OF AUDITORS)

Table 4. Guide developed by the Court of Auditors, corresponding to the mentioned phases of risk analysis

Methodology of Risk Analysis		
Analysis Itinerary	**Analysis Criteria**	**Questions**
Definition of context	Strategic Operational	• What are the organisation's activity areas and characteristics? • What are its missions and aims?
Risk Identification	Date Area Description	• What can happen? • How can it happen? • When can it happen? • Is there opportunity for improvement?
Risk Analysis	Likelihood Seriousness of the Consequence	• What are the causes for the occurrence of risk? • What are the effects if the risk occurs? • Is the risk strategic or operational? • How can these effects be reduced?
Risk Assessment	Major Moderate Minor	• What are the risk prevention measures? • What is the operational efficiency? • What results from the comparison of costs and benefits of risks?
Development, Treatment and Control of Risk	Avoid Prevent Transfer Accept	• Should the risk-generating activity proceed, or should it not / or not • As can be reduce/control the likelihood and consequences of occurrence? • Is it possible to fully or partially delegate the activity or risk effect to a third party, by means of contacts, partnerships, insurance, etc.? • Is the risk acceptable in relation to the cost/benefit it is associated to? • Have there been any organisational improvements?
Plan Monitoring, Review and Update	Every year Every semester	• What is the frequency of the Monitoring of the Impact of Risk? • How effective is the Review of Risk? • Was there any change in the risk priority number?
Communication and consultation	Information Release	• Who is affected? • Who needs to know? • Who should be responsible?

Table 5. Record Sheet

| **Potential Failure Mode and Effect Analysis** | | |

Table 6. Description of pprcri record sheet

FMEA number (1)	It refers to the number of the FMEA document that can be used for traceability.
Department (2)	Refers to the name and number of the department, OU and/or organisational subunit under analysis.
Organisational Unit (3)	
Organisational Subunit (4)	
Person responsible for the process (5)	Fill in with the name of the person responsible for the process.
FMEA Date (6)	Date when the initial FMEA was compiled and date of its last review.
Created by (7)	Fill in with the name and department of the delegate responsible for FMEA.
Key Date (8)	Original date as timing for FMEA completion. It should not exceed the audit release date.
Mission (9)	Brief description of the OU mission.
Main Activities (10)	The main activities of the OU should be described as briefly as possible. This includes description of all procedures, because they give rise to potential failures.
Activity (11)	Describe briefly the activity process to be analysed; Refer the necessary requirements (specification).
Potential Failure (12)	The potential failure means the way that the process would potentially fail in meeting the requirements of the activity. It should be assumed that the failure may happen, but it will not necessarily happen.
	For each activity operations list the potential failures, according to the type of process.
Potential Effect of Failure (13)	The potential effect of failure will be the consequence of failure in the activities.
	Describe the effects of failure from what can be observed.
Severity (S) (14)	Severity is the assessment of the seriousness of the effect of the potential failure mode. Severity is only applied to the effect and should be rated on a scale of 1 to 10 (or other).
Potential Cause(s) and Mechanism(s) of Failure (15)	The Potential Cause of Failure is defined as the way the failure could occur, described in a way it can be adjusted or controlled.
	List, as thoroughly as possible, all the mechanisms/causes of failure possible for each potential failure. If a cause is exclusively connected to a failure, i.e. if the adjustment or control of this cause has a direct impact on the cause, so this part of the FMEA is complete. Meanwhile, many causes are not mutually exclusive and to adjust or control these causes, the main factors should be determined and among these, the ones which can be easily controlled. The causes should be described in a way that makes it possible for the preventive measures to be related to the pertinent causes.
	Only the specific failures should be listed. Unclear and generic sentences should be avoided.
Occurrence (O) (16)	Occurrence is the likelihood of a specific mechanisms/cause to occur. It should be rated on a scale of 1 to 10 (or other).
	Only the occurrence connected to the failure should be considered for this ranking, and the failures of the current process controls should not be considered.
	The only way to effectively reduce the occurrence ranking is to remove or control one or more mechanisms of failure by changing the procedure.
Current process controls (17)	The current process controls are descriptions of controls which can detect or prevent as much as possible, the occurrence of failure. These controls can be process controls. The assessment can occur during the operation, or in following operations which can detect the failure of this operation.
	There are three types of Control of Process /Characteristics to consider, which are: • Prevention of occurrence of cause/mechanism or mode/effect of failure, or reduction of its occurrence ranking. • Detection of cause/mechanism and promotion of corrective action, and • Failure detection.
	The suggested approach is to use first the control type (1), when possible; secondly, use the control type (2); and third, use the control type (3). The initial occurrence rankings are affected by the control type (1), when they are included as part of the objective of the activity. The initial occurrence rankings are based on the current controls type (2) or type (3), when the process being used represents the objective of the process.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Table 6. Continued

Detection (D) (18)	Detection is an assessment of likelihood that the process control will detect the cause of the failure mode. It is ranked on scale of 1 to 10 (or other). It should be assumed that the failure occurred and, in this way, assess the «current controls». It should not be automatically assumed that the detection ranking is low due to the low occurrence, but assess the capacity of the controls of the process in detecting a low frequency of the failure or prevent it from occurring in the process.
Risk Priority Number (RPN) (19)	The Risk Priority Number is the result of Severity (S), Occurrence (O) and Detection (D) Rankings.
	RPN = (S) x (O) x (D)
	It is a risk measure of the process. This number should be used to prioritise the process deficiencies. The RPN ranges between “1” and “1000”. For high RPNs the auditing team should concentrate on reducing the calculated risk through corrective controls. On the whole, special attention should be given when severity is high, independently of the resulting RPN.
Recommended controls (20)	Corrective actions should be proposed for items which are critical and have high RPN.
	Every time the effect of a potential failure represents a threat to the activity, corrective actions should be taken in order to prevent this failure through controlling or removing the causes.
	The need for implementing corrective actions which are positive, specific, with quantifiable outcomes, recommending actions for other activities and monitoring all recommendations, should be enhanced. A well planned and well developed FMEA will have little value if the corrective actions are not implemented. It is the responsibility of the heads of the affected OUs to implement effective monitoring programmes to take all recommendations into consideration.
	The following actions should be taken into account:
	In order to reduce the likelihood of occurrence, process reviews are recommended. Statistic surveys can be performed in order to gather important information for the prevention of deficiencies and continuous improvement of the process.
	The only way to see the severity ranking reduced is to change the process.
	To increase the likelihood of detection, reviews must be implemented in the process. Commonly, the improvement of means of control only adds costs to the activity and is ineffective in the improvement of quality of the process. The increase in the frequency of inspection should only be used as a temporary action. Permanent corrective actions are needed. Changes in the current system of control can be implemented to increase this likelihood. Meanwhile, emphasis should be given to actions for prevention of deficiencies (reducing occurrence) and not only to the increase of their detection.
Responsibility and Timing (21)	Fill in with the OU or the responsible for the recommended control with the respective timing for execution.
Actions taken (22)	After an action has been implemented, a brief description about it and the implementation date are registered.
Actions Results (23)	After the corrective control has been identified, the severity, occurrence and detection resulting rankings are rated and registered. The resulting RPN is calculated and registered. If no actions are taken, the field “Resulting RPN” and the corresponding columns are left blank.
	All the resulting RPNs should be critically analysed and, if there is need for additional controls, items 20 to 23 will be repeated.
Monitoring	The responsible for the process must ensure all recommended actions were executed. FMEA is a dynamic document which should always reflect the last update to the process, as well as the last actions implemented, including those carried out after the procedure has been started.

Chapter 17
Application of FMEA to Study the Risk Perception of SMEs Throughout the ERP Adoption Life Cycle

S. Vijayakumar Bharathi
Symbiosis International University (SIU), India

Kanchan Chandrayan
KPMG India Pvt. Ltd., India

ABSTRACT

In this paper, the authors have tried to validate the risk perception of ERP adoption in SMEs using Failure Modes and Effects Analysis (FMEA). The work significantly contributes to the existing body of ERP adoption knowledge to the SMEs. Foremost, an ERP adoption life cycle addressed to SMES comprising of five distinct phases is proposed. Second, a well-laid out inventory of risk factors have been identified. Third, FMEA is applied to understand, validate the risk perception of respondents on ERP adoption in SMEs. Exploiting the ERP System, Inadequate financial management, Lack of Owners' Commitment, Ineffective communication with users and change in project scope are the top five highest perceived risks based on the risk perception number (RPN). The process centric approach to system implementation through FMEA also prescribes pertinent recommendations to the stakeholder ecosystem to proactively defend against vulnerabilities during the ERP adoption life cycle.

INTRODUCTION

One of the significant contributions of the information technology domain has been the evolution and revolution of enterprise systems. They carry on a pivotal role in the integration of the core business processes, thereby ensuring real-time information processing, transparency, standardization, and accuracy and minimize duplication of data. Shanks et al., (2003) stated that ERP acts like a central nervous

system of the human body because it connects and affects the whole of the system. Though enough evidence is put down to highlight the significance of ERP practically not many organizations have had success in ERP adoption. Many surveys have found disappointing and disastrous implications of ERP (Trimi et al., 2005). Many researchers and practitioners have placed and analyzed several factors regarding ERP adoption. The ERP initiative is a costly matter for many organizations and hence decisions on ERP adoption is an outcome of many iterations of assessing the purpose, mission, maturity, status on the organization's growth and growth expectations, and so on ERP implementation has proved to be quite risky and complex, which has resulted in failure for many organizations (Hajilari et al., 2017; Zeng et al., 2015; Chan et al., 2012). Most of the common ERP software is packaged ones and poses threats, if the modules do not integrate easily with the business operations. The effect of misalignment can sometimes be so severe that it may result into complete shutdown of the company. To avoid such failures in ERP implementation, it becomes very essential to understand the perceived risks related to the implementation and operation of ERP systems (Wright and Wright, 2002; Davenport, 1998). **S**ome companies have succeeded in implementing ERP systems, while other companies have failed in this regard, illustrating that ERP systems are complex and risky to implement and operate in companies. Perceiving and understanding the risk factors related to the implementation and operation of ERP systems could have a positive impact on the success of these systems. There is a lot of excitement among the SMEs about ERP adoption due to the fact that technology adoption can enhance competitiveness and drive business growth (Gunasekaran et al., 2011). The limitation of ERP adoption in SMEs is multi-dimensional. There are exogenous and endogenous factors that are contributed by all the 5Ms namely men, money, machines, materials and methods. Structure and organization reasons backed by the paucity of adequate knowledge and availability of financial resources have always been cited as the major inhibitor for ERP adoption in SMEs (Buonanno et al., 2005). The result, SMEs are unable to withstand the complex implementation methodologies, advanced process modelling and reengineering techniques before the 'as is – to be' gap is analyzed (Kramer et al., 2016). SMEs will need a failure mode analysis of ERP adoption, which is simple, transparent, yet rich and most importantly sync with their business terminology and practices.

Therefore, our principal motive is to explore and recommend a technique which enables organizations to perceive and understand risk factors in order to make ERPs more successful and reduce the failure of their implementation and operation (Mukwasi and Seymour, 2015). To realize our motive, we have explained and analyzed the application of Failure Mode Effect Analysis (FMEA) to systematically approach and address the risk perception and potential pain points along the ERP adoption life cycle in Small and Medium Enterprises (SMEs).

LITERATURE REVIEW

In this section, we discuss the risk assessment process in the existing literature and explain its relevance to ERP adoption projects in SMEs. Ricciardi, (2004) identified that risk perception studies have invariably been a matter of interest and many written reports have been undertaken in a diversity of research domains namely anthropology, psychology, psychometrics, social sciences and engineering. Surveys also have conveyed away the emotions of people in terms of their beliefs, attitude, knowledge, societal, commercial enterprise and cultural dimensions towards risk. Risk perception has been defined thoroughly by several researchers. The subjective assessment of the probability of a specialized type of accident

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

happening and how concerned we are with the consequences (Sjöberg, 2000). Pidgeon, (1998) states that risk perception is "the wider social or cultural values and dispositions that people adopt towards risk". Ciancanelli et al., (2001), Palmer, (1996) say that person's risk perceptions are influenced by their social networks and culture.

Risk perception about ERP adoption can be viewed from varied dimensions. The risk perception will depend upon how an exposure is treated with a probability of success and failure (O'Leary, 2002). From the works of Wiegers (1998) we can understand that risk perception can be stated as a problem of data compatibility if happened or probable to happen can cause a loss of time and the monetary value related with them. To draw meaningful inferences from risk perception in an ERP adoption, some subjects have also worked not only on the identification of risks, but also in judiciously categorizing along the adoption lifecycle (Huang et al., 2004). The SMEs have a comparatively shorter scalar chain compared to their larger counterparts. Perception of risks differs from person to person, firm to firm and industry to manufacture because of the subjective nature of such perception (Jamshidi et al., 2015; Nelson, 2004).

PHASES OF ERP LIFECYCLE

The ERP initiative from conceptualization to retirement journeys through various phases, participated by key stakeholders, multiple operation and body processes, varied features, relevant performance metrics and an extensive scope of outcome possibilities (Aloini, 2009). From the existing research works on an ERP life cycle, it is found that the life cycle is explained are multiple, incomplete, overlapping models. The popular ERP adoption life cycle models widely found is given in Table 1.

After examining all the selected ERP adoption life cycles, it was found that a careful scrutiny and analysis should be done before finalizing the ERP adoption lifecycle for SMEs in this inquiry. It should be clearly noted that the primary motive of this research paper is to identify and create an assessment model for risks during an ERP adoption life cycle in SMEs and NOT to comment or critically evaluate the existing methodologies of ERP adoption life cycle. To defend the assessment model creation a simple, yet convincing definition of ERP adoption is necessary. Consequently, this research identifies certain critical levels, namely relevance (focus on SMEs considering their nature, size), simplicity (phases should be self-explanatory, easy to read), comprehension (should be all-encompassing), continuity (should cover end-to-end journey of ERP) which are reckoned for the intentions of re-adjusting the existing models to customize and create the ERP adoption phases for SMEs (Snider et al., 2009; Upadhyay et al., 2010; Dixit and Prakash, 2011; Haddara, 2011). Grounded along the above premise for SMEs the following five distinct phases were identified for use in this research. These are Planning, Acquisition, Implementation, Usage and Extension. Table 2 brings out the relevance of the new model to the existing ones.

Several researches mention about cases of risk associated with ERP implementation. Table 3 presents a summary of the related works on ERP risks and possible causes along the different stages of the ERP adoption life cycle.

After the risks are identified and categorized, we used FMEA (Failure Modes and Effect Analysis) method to perform risk assessment.

FAILURE MODES AND EFFECT ANALYSIS (FMEA)

Failure Modes and Effects Analysis is a systematic and proactive method for recognition of failures before they take place and preventing the system of assessing and judging the relative impact of different failures. It is a routine that matches each item in a system, takes into consideration how that item can break and then sees how that failure will affect the organization. FMEA includes a review of the steps in the process, failure modes, failure causes and failure effects (Carbone and Tippett, 2004, Greene and

		Losing business due to not adopting technology (E2)	Beijsterveld and Groenendaal, 2015; Iris and Cebeci, 2014;

Bitar, 2015). The primary use of FMEA is to prevent problems associated with system, product and process, before they happen. It aids in cost reduction by identifying improvements early in the growth cycle. Some researches show that FMEA has created more robust processes by prioritizing tasks that decrease the risk of failure (Rhee and Ishii, 2003). FMEA is done with the purpose of evaluating the system, processes and design (Hassan et al., 2007).

With a high chance of success in performance and safety, it provides a documented method for extract. A documented uniform method of assessing potential failure mechanisms, failure modes and their impact on system operation, resulting in a list of failure modes ranked according to the seriousness of their system impact and likelihood of occurrence. FMEA is a cost-effective tool for maximizing and documenting the collective knowledge, experience, and insights of the engineering and manufacturing community (Neagoe and Martinescu, 2010; von Ahsen, 2008). Standardized format for communication across the disciplines and provide logical, sequential steps for specifying product and process areas of

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

concern (Johnson and Khan, 2003). FMEA is one of the popular techniques to identify and prioritize the risks that are perceived to be critical for failures. This design technique is widely used to systematically explore and probe the potential failure of a system from both a product as well as a process perspective. It takes a robust approach for holistically examining the failure drivers and their likely effects on the operation of a system (Segismundo and Miguel, 2008). FMEA is devoted to design the reliability of the chosen system. The main objective of FMEA is to prevent abnormal failures affecting end-user performance and to facilitate proactive decision making for the top management. It is known as a risk management method targeted to plug unacceptable errors that may aggravate customer dissatisfaction (Zafiropoulos and Dialynas, 2005). Some of the demonstrated outcomes of FMEA include higher product/process reliability, predicable and manageable product/process modifications, enhanced planning and execution, sustained process improvements, cost competitiveness and gap reduction between customer expectation and project deliverables (Shirouyehzad et al., 2011).

METHODOLOGY

This research includes both secondary data analysis (literature based) and survey-based empirical research techniques. The questionnaire solicited responses from 35 respondents who are subject matter experts in end-to-end ERP implementations. They belong to two major categories, namely, consultants (functional as well as technical) and practicing managers who had the experience of being ERP core team members. The practicing managers, belonged to SMEs affiliated with industry associations like Auto Cluster Research and Development Institute, Auto Component Manufacturers' Association, Auto-component Small Industries Associations and the Confederation of Indian Industry. The survey instrument consisted of two sections, namely the first general question relating to the respondents' current affiliation, total experience, ERP experience, FMEA knowledge and the nature of experience. The second section of the survey instrument comprised of FMEA questions. The descriptive statistics are presented in Tables 4 to 8 below respectively.

Table 9 and 10 presents the cross-tabulation between FMEA knowledge and period and nature of ERP experience of the respondents.

It is found that 65% and 75% of the respondents with 5-10 years and more than 10 years of work experience had prior knowledge about FMEA which is a welcome sign with regard to the appropriateness of respondents to the study. Interestingly, we also find that 61% of consultants and 77% of the ERP core team members of the manufacturing industry had prior knowledge about FMEA.

Table 4. Current Affiliation of the respondents

Current affiliation	Frequency	Percent
IT Industry	21	60.0
Manufacturing Industry	14	40.0
Total	**35**	**100.0**

Table 5. Work Experience of the respondents

Work Experience	Frequency	Percent
10-15 Years	21	60.0
15-20 Years	9	25.7
More than 20 Years	5	14.3
Total	**35**	**100.0**

		Consultant	Core Team Member	
FMEA Knowledge	Yes	14	10	24
	No	8	3	11
Total		22	13	35

ANALYSIS AND DISCUSSION

To identify the root causes of the risks, it is necessary to segregate them under several categories and then apply appropriate measures to prevent them. As said earlier, the risks have been separated under the five different stages of ERP adoption. Table 11 shows the segregation of risks along with their severity (SEV), occurrence (OCC) detection (DET) ratings as well as the risk perception number (RPN) which is given as SEVxOCCxDET.

The risk of exploiting the ERP system is perceived the highest by the respondents based on the risk perception number. All the three risks relating to the planning phase of ERP adoption are perceived as high. Table 12 presents the ranking of the risks based on the RPN.

Three out of the top five highest perceived risks are covered in the planning phase. This implies that the SMEs are yet not matured enough to see the significance of ERP from a strategic investment perspective.

Having arrived at the risk perception, values and their rankings, we proceed to discuss the implications on the five phases of ERP adoption in SMEs. We analyze the failure mode effects by means of a well-defined template sourced from the Lean Six Sigma Academy (Bezoek – Lean Six Sigma Tools Template at http://leansixsigmatools.nl/sixgma-toolset/fmea-template). In Table 13, the syncing of the FMEA template with the risk perception during ERP adoption life cycle phases is shown. In the FMEA parlance, we specify the following for analysis and treatment purposes.

E1	6	6	4	144

Table 13. Syncing FMEA Template with Risk Perception of ERP Adoption

Key Process Step or Input (What is the Process Step or Input?)	The five phases are listed
Potential Failure Mode (In what ways can the Process Step or Input fail?)	The risks identified under each phase of the ERP adoption life cycle is presented here
Potential Failure Effects (What is the impact on the Key Output Variables once it fails (customer or internal requirements)?)	The impact of risk in each phase of ERP adoption is narrated here.
SEV	The numerical values from the responses
Potential Causes (What causes the Key Input to go wrong?)	The 'as-is' status of the SMEs with regard to the preparedness and/or maturity in each phase of ERP adoption is explained here.
OCC	The numerical values from the responses
Current Controls (What are the existing controls and procedures that prevent either the Cause or the Failure Mode?)	The existence of practices or procedures if any is stated here.
DET	The numerical values from the responses
RPN	The product of (SEV x OCC x DET)
Actions Recommended (What are the actions for reducing the occurrence of the cause, or improving detection?)	The 'to-be' status and the recommendations to realize the expectations are explained here.
Resp. (Who is Responsible for the recommended action?)	The stakeholder or combinations of stakeholders who can drive the 'to-be' recommendations are referred here.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

The explanation of FMEA in all the five phases is presented in Tables 14 to 18 given in the appendix. The following paragraphs explain the major risk perception in each phase and prescribe the remedial measures to be conveyed by the key actors of the SME stakeholder-ecosystem.

Table 14 presents the FMEA results for the planning stage of ERP adoption. From among the three elements that interpret the risk perception in the planning stage, the highest risk perception based on the RPN score of 504 is related to inadequate financial management in ERP investments. The SMEs severely lacks the knowledge around the cost components, funding options and ROI of an ERP initiative. Without proper understanding of the ERP investments the respondents perceive ERP implementation can be a menace to the SME's financial solvency. It is recommended that the top management and the core team clearly internalize the KPIs relating to ERP investments and also relate some of the key financial ratios like solvency and turnover ratios to the pre and post ERP environments.

The second phase of ERP adoption, which is the acquisition phase is explained through the FMEA table given in Table 15. Lack of adequate technology infrastructure is perceived to be the highest risk contributor based on the RPN score of 270. This risk is a major impediment to the ERP acquisition strategies of the SMEs. They live with duplication, inaccuracy and redundant reporting structures. They continue to use a mix of manual and outdated software application and predominantly follow a people-centric process approach. The IT Officer in consultation with a reliable ERP consultant should prepare a comprehensive document of awareness about the benefits that can be accrued out of effective and centralized business process consolidation. Also, an audit of the current condition and future prospects of the IT infrastructure should be led to deliberate and define the road map for a strategic IT enablement in the system.

The implementation phase of ERP adoption comprised of four risk factors the FMEA details of which are presented in Table 16. Change in project scope with an RPN score of 315 is perceived as the highest risk. Since SMEs are very cautious in their approach to technology, they constantly tend to root for the ERP functionalities towards their legacy system rather that pushing them to the ERP prescribed working environment. In other words, they tend to resort to unplanned and unprecedented changes to the ERP scope, thereby delaying the time to go live. The respondents opine that the chief reason being the fear of losing their legacy operating environment and certain preserved pieces of excellences if any. The SMEs does not conduct adequate business process reengineering to analyze the as-is and the to-be process enhancements. The respondents have urged that a detailed and thorough analysis of the existing and the expected functionalities should be considered. They stressed the need for striking equilibrium between customization and default configuration settings of the ERP system. They also called for a synergistic approach from several stakeholders like the consultant, IT officer, top management and the core team.

In the penultimate phase of ERP adoption, which is the usage phase, we find that from among the four factors, exploiting the ERP system has a very high RPN score of 512 (please refer to Table 17). This is perceived to be one of the severe obstacles to ERP success. The respondents warned that exploiting the ERP system will contribute to various undesirable consequences like critical data loss, users distrust and eventually losing the sanctity of the ERP working environment. The respondents opined that the major reason being that the SME do not have well documented ERP usage policy which embeds the user authorization and access control rights and guidelines. Likewise, it is mentioned by the respondents that the SMEs are poor in information security practices. It is commended to the IT officers, departmental heads and users to get together and bring out a well laid out usage manual that integrates information security policies, particularly addressing within the ERP precincts so as to close up an unwanted exploitation of the ERP system.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

The final stage of ERP adoption is extension phase the analysis of which is shown in Table 18. This is comparatively a newer phase for SMEs because they have not yet technologically matured to seamlessly incorporate their core business procedures with their supply chain partners in the auto-component manufacture. Losing business due to not adopt the technology is perceived as the major challenge for SMEs by the respondents. This situation has pushed from the structure of the auto-component manufacture. While the large original equipment manufacturers (OEM) are concentrated at the center, the suppliers to the OEMs are in multiple tiers. The SMEs is majorly located in the outermost tiers. Several SMEs directly supplies to their larger counterparts. The big players are state-of-the-at ERP-enabled and call for high levels of process standardization and integration in the supply chain. The challenge for SMEs is how to meet such high levels of expectations of the large scale buyers. Due to stiff competition in the Indian auto-component market large scale buyers prefer SMES which have already implemented ERP while those which have not are vulnerable to losing their business. Hence the respondents have rated high with an RPN score of 210 for the risk of losing business due to non-adoption of information technology.

CONCLUSION AND SCOPE OF FUTURE WORK

To summarize, our work contributes significantly to the existing body of knowledge to the ERP adoption in SMEs. The contributions are multi-fold. Foremost, our work defines a clear ERP adoption methodology exclusively addressed to the SMEs by referring to the best practices from a broad diversity of authors. Second, we present a comprehensive and relevant inventory of risks to be considered at each phase of ERP adoption, which are carefully selected from the existing literature on ERP research for SMEs. The third and the most important contribution is the application of FMEA methodology to risk analysis. While a vast majority of research studies has already brought out inventories of success factors, we have addressed the ERP adoption from the standpoint of risk perception by not only listing the risks but also developing a methodology to assess the risk perception of the respondent group. The application of FMEA methodology is a unique contribution because we think that given the awareness of FMEA to manufacturing SMEs using this methodology the SMEs will be capable to better connect ERP adoption methodologies. Though, the approach to ERP risk perception is unique given the context of SMEs, the findings corroborate with the already available literature. In future it is planned to exhibit our approach and backing to the SME industry association to broaden the visibility and confidence of ERP adoption in SMEs.

ACKNOWLEDGMENT

The authors would like to thank the editor-in-chief and anonymous reviewers for their insightful comments and suggestions.

APPENDIX

Table 14. FMEA Chart for PLANNING PHASE

Item Name:	ERP Adoption Life Cycle: Risk Perception of SMEs	FMEA Team:		XXXX & YYYY		Prepared by: FMEA Date (Orig): May, 2015		XXXX (Rev.): July 2016		
Process Step or Variable or Key Input	**Potential Failure Mode**	**Potential Failure Effects**	**SEV**	**Potential Causes**	**OCC**	**Current Process Controls**	**DET**	**RPN**	**Actions Recommended**	**Responsibility**
What is the process step?	**In what ways can the Process Step, Variable, or Key Input go wrong? (chance of not meeting requirements)**	**What is the impact on the Key Output Variables (customer requirements) or internal requirements?**	**How Severe is effect to the customer?**	**What causes the Key Input to go wrong? (How could the failure mode occur?)**	**How frequent is cause likely to Occur?**	**What are the existing controls that either prevent the failure mode from occurring or detect it should it occur?**	**How probable is Detection of cause?**	**Risk Priority # to rank order concerns**	**What are the actions for reducing the Occurrence of the cause, or improving Detection? Should have actions on high RPN's or Severity of 9 or 10.**	**Who's Responsible for the recommended action? What date?**
Planning	Lack of Owners' Commitment	Postponing the ERP adoption decision	10	Lack of interest ERP ERP treated cost and not as investment Power-centric approach by the Owners	5	None (There is no clearly defined set of parameters/indicators)	8	400	Accelerate awareness on ERP benefits to the SMEs, Conduct forum/ meetings to share success stories, awareness about end-to-end support for ERP adoption	Industry Partners, SME Associations
	Ineffective communication with user	No transparency for users along the organizational hierarchy	8	Information flow is passive Decision Making is reactive No formal channels for information flow from decision makers	6	None (There is no clearly defined set of parameters/indicators)	8	384	Communicate early and timely, Prepare communication plan, Include key stakeholders to elicit their expectation	Top Management and core team
	Inadequate financial management	Threat to financial solvency and liquidity	9	Lack of understanding the components of costs in ERP (Capex & Opex) Lack of awareness on available financing options Lack of knowledge on ROI on ERP	7	None (Adhoc and limited to an introductory meeting by the owner/ director on the ERP initiative)	8	504	Understand the components of TCO, clarity about relating KPIs from where ERP benefits can be tracked, Training to top management on CAPEX & OPEX of ERP, Definition and calculation of key financial ratios that can be used as KPI for quantifying ERP benefits	Top Management and core team

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Table 15. FMEA Chart for ACQUISITION PHASE

Item Name:	**ERP Adoption Life Cycle: Risk Perception of SMEs**	**FMEA Team:**		**XXXX & YYYY**		**Prepared by: FMEA Date (Orig): May, 2015**		**XXXX (Rev.): July 2016**		
Process Step or Variable or Key Input	**Potential Failure Mode**	**Potential Failure Effects**	**SEV**	**Potential Causes**	**OCC**	**Current Process Controls**	**DET**	**RPN**	**Actions Recommended**	**Responsibility**
What is the process step?	**In what ways can the Process Step, Variable, or Key Input go wrong? (chance of not meeting requirements)**	**What is the impact on the Key Output Variables (customer requirements) or internal requirements?**	**How Severe is effect to the customer?**	**What causes the Key Input to go wrong? (How could the failure mode occur?)**	**How frequent is cause likely to Occur?**	**What are the existing controls that either prevent the failure mode from occurring or detect it should it occur?**	**How probable is Detection of cause?**	**Risk Priority # to rank order concerns**	**What are the actions for reducing the Occurrence of the cause, or improving Detection? Should have actions on high RPN's or Severity of 9 or 10.**	**Who's Responsible for the recommended action? What date?**
Acquisition	Lack of adequate technology infrastructure	Duplication, inaccuracy and redundant reporting structure.	9	Outdated, disparate state of current IT systems Transaction processing and consolidation manually Lack of expertise on identifying, scrutinizing & selection of ERP.	5	None (Only an IT officer is responsible for system and network administration)	6	270	Create an awareness on the benefits of Business Process Integration, study the existing IT compatibility of the SMEs, Identify and understand the areas for integrating information flow	IT Officer/ Manager & ERP Consultant
	Inadequate knowledge on ERP product and vendor selection	SMEs are vulnerable to exploitation from external or third party vendors	8	No or little knowledge about SaaS/Cloud models No study on ERP fitment to own organization No knowledge on vendor capability analysis No audit on success rates implementation and support No due diligence study on vendor	5	None (Only proprietary products are marketed alongside SME fairs and exhibitions). Awareness through their larger supply chain counterparts and OEMs	4	160	Evaluating the Implementation Vendor Analysis, Cost Benefit Analysis Role of consultant SMEs Process Owners' interaction	Consultant, IT Officer/ Manager, Top Management, Finance & Purchase Managers

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Table 16. FMEA Chart for IMPLEMENTATION PHASE

Item Name:	**ERP Adoption Life Cycle: Risk Perception of SMEs**	**FMEA Team:**		**XXXX & YYYY**		**Prepared by:** **FMEA Date (Orig): May, 2015**		**XXXX** **(Rev.): July 2016**		
Process Step or Variable or Key Input	**Potential Failure Mode**	**Potential Failure Effects**	**SEV**	**Potential Causes**	**OCC**	**Current Process Controls**	**DET**	**RPN**	**Actions Recommended**	**Responsibility**
What is the process step?	**In what ways can the Process Step, Variable, or Key Input go wrong? (chance of not meeting requirements)**	**What is the impact on the Key Output Variables (customer requirements) or internal requirements?**	**How Severe is effect to the customer?**	**What causes the Key Input to go wrong? (How could the failure mode occur?)**	**How frequent is cause likely to Occur?**	**What are the existing controls that either prevent the failure mode from occurring or detect it should it occur?**	**How probable is Detection of cause?**	**Risk Priority # to rank order concerns**	**What are the actions for reducing the Occurrence of the cause, or improving Detection? Should have actions on high RPN's or Severity of 9 or 10.**	**Who's Responsible for the recommended action? What date?**
Implementation	Inadequate project management knowledge	No equilibrium of cost, effort and time	8	Confusion over the formation of the core-team Interdepartmental rivalries No clear-cut performance monitoring and evaluation mechanisms	7	None. A senior employee from Production or Purchase department is designated as the lead for ERP. Only macro level indicators like revenue/profit growth expected is fixed.	5	280	Motivate project management training to sensitize the top management and ERP project team about expectation-realization gaps and trade-offs.	Top management, core team and consultant.
	Inefficient ERP Project Leadership	No accountability for ERP implementation. ERP project gets orphaned.	7	Lack of clarity and knowledge in identifying and prioritizing Wrong selection of people as process owners to support implementation	6	None	4	168	Clearly define the indicators to measure the stages and outcomes of ERP adoption. If possible during critical stages of the project, relieve the project lead and his team from their functional routine.	Top management, Functional heads
	Change in project scope	Delay to go live due to unplanned and unprecedented changes. Risk of losing best practices and legacy pieces of excellence.	9	No gap analysis Inadequate BPR Unplanned changes in scope of the project	5	None	7	315	Clarity in segregating what is to be retained from legacy system, if any. Identify the need and extent of customization during gap analysis. Recommend a SOP for change management	Consultant, IT Officer/Manager, Top Management and Core team
	Insufficient and inefficient training	Negative buy-in of ERP among users.	8	Improper training calendar. The trained resource is incapable of giving transitional training resulting in increased dependence of implementation partner or consultant. Non/less participation by users	7	None	4	224	Prepare clear schedules for training with the reference to time, user-group and duration. Encourage transitional training to reduce dependence of external consultants. Link ERP training participation to their performance appraisal indicators.	Consultant, IT Officer, Functional Heads, Selected end-users

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Table 17. FMEA Chart for USAGE PHASE

Item Name:	**ERP Adoption Life Cycle: Risk Perception of SMEs**	**FMEA Team:**		**XXXX & YYYY**		**Prepared by: FMEA Date (Orig): May, 2015**		**XXXX (Rev.): July 2016**		
Process Step or Variable or Key Input	**Potential Failure Mode**	**Potential Failure Effects**	**SEV**	**Potential Causes**	**OCC**	**Current Process Controls**	**DET**	**RPN**	**Actions Recommended**	**Responsibility**
What is the process step?	**In what ways can the Process Step, Variable, or Key Input go wrong? (chance of not meeting requirements)**	**What is the impact on the Key Output Variables (customer requirements) or internal requirements?**	**How Severe is effect to the customer?**	**What causes the Key Input to go wrong? (How could the failure mode occur?)**	**How frequent is cause likely to Occur?**	**What are the existing controls that either prevent the failure mode from occurring or detect it should it occur?**	**How probable is Detection of cause?**	**Risk Priority # to rank order concerns**	**What are the actions for reducing the Occurrence of the cause, or improving Detection? Should have actions on high RPN's or Severity of 9 or 10.**	**Who's Responsible for the recommended action? What date?**
Usage	Failure to justify ERP in business operations	Core business activities will struggle with workflow and process related inefficiencies. Chapter 18
Towards a Framework to Improve IT Security and IT Risk Management in Small and Medium Enterprises

Stephan Mühe
University of Duisburg-Essen, Germany

Andreas Drechsler
Victoria University of Wellington, New Zealand

ABSTRACT

In this article, an IT risk management (ITRM) framework for small and medium enterprises (SMEs) is designed and evaluated. The framework's objective is to provide an uncomplicated and accessible ITRM approach primarily aimed at SMEs without a dedicated ITRM. The framework combines essential elements from three leading (IT) risk management frameworks: COBIT 5 for Risk, ISO/IEC 27005:2011 and M_o_R. The framework was developed by employing a design science research methodology for social artefacts and evaluated in two healthcare SMEs. The ITRM framework itself was assessed as comprehensible and potentially useful. Simultaneously, over-arching IT governance issues prevented the immediate framework implementation in the two cases. IT management researchers can draw on this article's findings to better understand the role of the social context in SMEs to achieve an effective practical impact. Practitioners in SMEs can draw on the current state of the framework for an initial ITRM implementation or to increase their current ITRM approaches' maturity.

1. INTRODUCTION

This paper's goal is to design and evaluate an IT risk management (ITRM) framework that is better suited for small and medium enterprises (SMEs) than existing comprehensive ITRM frameworks such as the ISO/IEC 27005:2011 or COBIT 5. The literature often describes the SME sector as vibrant and growing (Levy & Powell, 2005) and – at least within the European Union (EU) – as the backbone of the

economy (Wymenga, Spanikova, Barker, Konings, & Canton, 2012). Whereas the authors acknowledge that SMEs are commonly defined as having 250 employees or less (Australian Government, 2014; European Commission, 2014; U. S. Census Bureau, 2014), they do not limit themselves exclusively to this quantitative, and somewhat arbitrary, characteristic (Osteryoung & Newman, 1993). Instead, somewhat larger organizations are also included as long as they exhibit typical SME characteristics, particularly regarding the way they have institutionalized their IT management (ITM).

Here, Welsh and White (1982, p. 18) make the point that "a small business is not a little big business", i.e. SMEs function and need to be managed in a fundamentally different way than large enterprises. The key differences in SMEs' ITM include 1) emphasising personal leadership rather than abstract management frameworks and 2) that formal measuring and controlling instruments are less important than achieving transparency to inform decision-making and foster communication with managers within and beyond the IT organization (Drechsler & Ahlemann, 2016). SMEs also tend to have a low number of ITM personnel – perhaps only even 'involuntary IT managers' (AMI Partners, 2013).

Operating a business always incurs risks, and if SMEs' business models or their internal processes are reliant on information systems and technology, managing the corresponding IT risks (including IT security threats) are as important for them as they are for large enterprises. The Information Systems Audit and Control Association (ISACA) defines IT risk as the "business risk associated with the use, ownership, operation, involvement, influence and adoption of IT within an enterprise" (ISACA, 2015, p. 56) and thus includes the need for IT security management (ITSM). Therefore, ITRM and ITSM are important tasks for SMEs, since they often do not have the necessary financial reserves to overcome crises caused by severe incidents that an effective ITRM and ITSM could have prevented. Moreover, owing to the SMEs' importance for an economy, the wide-spread occurrence of IT risks in and IT security threats to SMEs may even have severe consequences for an entire economy, which the recent series of ransomware attacks ("Locky", "WannaCry", and others) showed (Pencavel, 2016). Moreover, the increasing digitalization of entire industries will not only increase SMEs' dependency on IT, but also the relevance of ITRM and ITSM.

Simultaneously there is consensus in the literature that only a small percentage of SMEs undertake RM on the corporate level and even, if they do, they only consider a few selected aspects (Britzelmaier, Häberle, & Landwehr, 2015; Hölscher, Giebel, & Karrenbauer, 2006, 2007; Verbano & Venturini, 2013). The same applies for ITRM and ITSM in SMEs (Sadok & Bednar, 2016). One contributing factor for the lacking RM in SMEs are poorly tailored approaches that do not take the special requirements of SMEs into account, but merely try to scale down existing large enterprise approaches for SME purposes (Altman & Sabato, 2007; Stroeder, 2008). Consequently, SMEs do not often adopt management frameworks they perceive as complex or costly to implement (Laporte, Alexandre, & O'Connor, 2008; O'Connor & Coleman, 2009). Hence, none of the three most common RM / ITRM frameworks (COBIT 5 for Risk, ISO/IEC 27005:2011 and Management_of_Risk) seems particularly well suited to institutionalize effective ITRM and ITSM in the SME context. The same applies to existing predominantly technically-oriented ITRM or ITSM solutions, as SMEs would have neither the managerial awareness for the necessary decision-making to introduce these solutions nor the necessary expertise available to effectively implement and maintain these solutions.

Consequently, this paper's main goal is to design an ITRM framework that is more suitable for the SME context than the existing frameworks. The designed ITRM framework is evaluated ex-ante (Pries-Heje, Baskerville, & Venable, 2008) by means of an interview study with the managers of a small and a medium enterprise in the healthcare industry who would be responsible for deciding whether to adopt

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

the ITRM framework in their SME. The interviews contribute implications for the framework's implementation, but also novel insights into the SME context regarding the interrelation between the ITRM on the one hand and enterprise risk management, quality management, business-IT alignment, and IT governance on the other hand.

The goal of achieving effective ITRM and ITSM is therefore approached from a predominantly managerial and social point of view. The high-level security policy that results from the framework's application sets the stage towards 1) identifying and establishing suitable processual and technical ITRM and ITSM solutions as well as 2) corresponding changes to individual and organizational risk and security management practices (Sadok & Bednar, 2015). In other words, these new or changed individual, organizational and technological practices are to be developed and anchored in a changed wider social context, whose establishment and change the ITRM framework seeks to facilitate during its adaption and implementation.

The paper is structured as follows: In the second section, the paper's research methodology is outlined. The third section contains a high-level depiction of the ITRM framework's initial version. In the fourth section, the framework is evaluated and implications for its subsequent implementation are discussed. In the fifth and sixth sections, this paper's findings and limitations, respectively, are discussed. The seventh section contains a conclusion and an outlook. Note that, due to space restrictions, a more detailed literature review and a more detailed assessment of existing ITRM and ITSM approaches and frameworks are omitted. For the purposes of this paper, neither would yield substantially greater insight than given so far in the Introduction.

2. RESEARCH METHODOLOGY

Solving an identified, concrete real-world problem – such as the lack of ITRM and ITSM frameworks suitable for SMEs – calls for a design science research (DSR) approach (Gregor & Hevner, 2013; Hevner, March, Park, & Ram, 2004). The goal is to develop an artificial entity – called an artefact – that can contribute to solving the identified real-world problem and that needs to prove its usefulness or utility in its application. Artefacts are designed, evaluated, and refined in cycles (Hevner, 2007). Here, the artefact is the ITRM framework for SMEs. Artefacts can be designed on an abstract level and then be tailored to specific application contexts or, alternatively, to a specific context and generalized afterwards (Iivari, 2015). Owing to SMEs' idiosyncratic nature, the authors follow the former approach to achieve the largest wide-ranging impact and set out to develop an abstract ITRM framework that can be (and, in fact, most probably will need to be) adapted to an SME that wants to establish or improve its ITRM and ITSM.

This ITRM framework is a social artefact for a managerial audience and is thus developed by following a DSR approach to design such social artefacts (Drechsler, 2013). A key difference between this approach and DSR aimed at developing technical IT artefacts is that it focusses on the artefact's conceptual relevance (Nicolai & Seidl, 2010) first. In other words, the focus lies on guiding and inspiring managerial action, before instrumental relevance — the actual artefact utility — can be achieved. This focus can be achieved by developing an object design (van Aken, 2004) – the ITRM framework itself – and a corresponding implementation design. The implementation design should outline 1) how to achieve conceptual relevance with the decision-makers (= people responsible for the ITRM in SMEs) and 2) how to adapt the abstract object design to these decision-makers' particular organizations. By doing so, the apparent paradox of developing a single ITRM framework that can be potentially useful for a large

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

number of SMEs with an idiosyncratic nature can be resolved. The ITRM framework is therefore designed and evaluated on the conceptual level and subsequently allows individual instantiations and adaptions to the special needs of individual SMEs, instead of claiming to be a generalized ITRM approach.

Moreover, it is not expected that the framework artefact will *cause* a solution upon its implementation. Instead, the idea is to achieve a positive resonance on the individual level (Drechsler, Hevner, & Gill, 2016) for the framework's adoption and to inspire and guide future ITRM and ITSM-related decision-making. On the organizational level, the framework's purpose is to trigger path-dependent (in case of existing nascent ITRM and ITSM approaches) or, alternatively, path-creating change processes (Pandza & Thorpe, 2010) within a particular SME towards establishing effective ITRM and ITSM practices, which may or may not be supported by technology.

In this paper, a first cycle of artefact design and evaluation is documented that leads to an alpha version of an ITRM framework as well as documented implications for its implementation. The ITRM framework is designed based on requirements (cf. Section 'Requirements for the ITRM framework' below) that take the common state of the RM and the ITM in SMEs into account (as outlined in the Introduction) as well as on the 'essence' of common RM and ITRM frameworks (COBIT 5 for Risk, ISO/IEC 27005:2011 and Management_of_Risk). Thus, the framework is conceptually built from the ground up and only includes those elements from the extant common frameworks that the authors deem to be necessary to fulfil the identified requirements and its purpose, in order to keep the framework as simple as possible while retaining its utility.

The authors subsequently subjected the designed ITRM framework to practitioner feedback by conducting semi-structured interviews with the chief information officer (CIO) of a medium-sized German hospital (350 employees overall, but only 2 IT employees employed as 1.5 FTEs) and the chief executive officer (CEO) of a German pharmacy with seven employees overall and no dedicated IT personnel. Note that the hospital's number of employees exceeds common SME limitations (250 employees, cf. the Introduction), but the size and characteristics of its IT organization are very much in line with ITM organizations in SMEs. The authors selected these evaluation contexts, because they represent archetypical instances of medium and small enterprises in an IT-reliant industry (healthcare) in which incurred IT risks, such as IT security breaches or extended downtimes, may not only affect the enterprise severely, but also profoundly influence human lives and well-being.

The first author performed the interviews in person and focused on the following aspects: 1) the general organizational context, 2) the employed IT and how it is managed, 3) the existing RM and ITRM practices, and 4) the evaluation of the ITRM framework. In this fourth interview phase, the interviewees were asked to estimate the value of the designed ITRM approach, whether and to what extent they were familiar with the suggested techniques and concepts, where they expected threats and problems related to their organizational context, who would be responsible for the implementation and continual execution of the ITRM process within the framework, and whether they regarded the application of the ITRM framework in their SME to be generally conceivable and possible. An examination of the local IT facilities and the employed ITRM practices complemented the interviews to validate the statements.

3. DESIGNING THE IT RISK MANAGEMENT FRAMEWORK FOR SMES

In this section, the designed ITRM framework as well as the underlying requirements are documented.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

3.1. Requirements for the ITRM Framework

As previously shown in the Introduction, there is consensus in the literature that limited personnel and financial resources as well as lacking know-how and suitable guidance often hamper the RM in SMEs. Consequently, suitable ITRM approaches have to take these limitations into account. Since "a small business is not a little big business" (Welsh & White, 1982), a simple scaling-down of the ITM frameworks for large enterprises is not advisable (Drechsler & Ahlemann, 2016) and therefore not pursued in this paper. In addition, limited SME resources do not allow the analysing of different risk frameworks to select the most important techniques (Henschel, 2008). Instead, the ITRM framework is built from the ground up. Established good practices and techniques from existing RM and ITRM frameworks are carefully selected and integrated. To counteract the perception of a framework being overly costly to employ, a suitable ITRM framework has to generate a tangible benefit, even if there is no extant enterprise-wide business or IT strategy planning approach.

Moreover, the ITRM process within the framework needs to be performable besides having to perform other tasks, because one cannot assume that SMEs have a dedicated risk manager – especially in the IT department. However, SMEs managers are often reported as having a high level of risk awareness and knowledge of the risks that their companies face, but it is simultaneously said that they rarely document their knowledge or the risk treatment steps that they take (Henschel, 2008). The framework should therefore foster the explication and documentation of existing, but tacit, risk knowledge.

However, increased risk assessment formalization leads to additional challenges, because SMEs are usually unable to draw on in-depth IT and business management know-how and specialist support (Islam, Tedford, & Haemmerle, 2006), which prevent the easy application of even seemingly simple techniques such as Balanced Scorecards (Henschel, 2008). In addition, as findings regarding software engineering (Laporte et al., 2008) and project management (O'Connor & Coleman, 2009) indicate, SMEs often reject frameworks perceived as complex or costly to implement. Therefore, the ITRM framework needs to be self-containing and to capture 'the essence' of existing frameworks and techniques, while retaining simplicity and accessibility. In order to be considered suitable, SMEs' limited resources should be able to manage the selected techniques easily. In particular, this should not require special software tools, as such software usually exceeds the expertise available within SMEs and they are often not willing to invest in such tools (Leopoulos, Kirytopoulos, & Malandrakis, 2006).

Consequently, the framework needs to enable its users (business or IT managers and perhaps other IT or even non-IT personnel) to strike a balance between the effort they are willing and able to invest in the ITRM and the immediate benefits they will receive. The ITRM framework's scope should therefore be adjustable to each SME's specific situation and should also allow its scope to be expanded over time – for instance, when newly enacted regulatory requirements have to be met, a newly discovered threat to the SME's IT needs to be countered, or an RM certification is required. Moreover, the framework needs to be easy to understand and accessible to allow even untrained practitioners to gain an insight into and a deeper understanding of the ITRM. Ultimately, the overall objective of the ITRM framework for SMEs is to provide them with a solid basis for IT-related RM.

3.2. Framework Design

All high-level RM process steps of all three of the common (IT) RM frameworks (COBIT 5 for Risk, ISO/IEC 27005:2011 and Management_of_Risk) fit the four following processes:

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

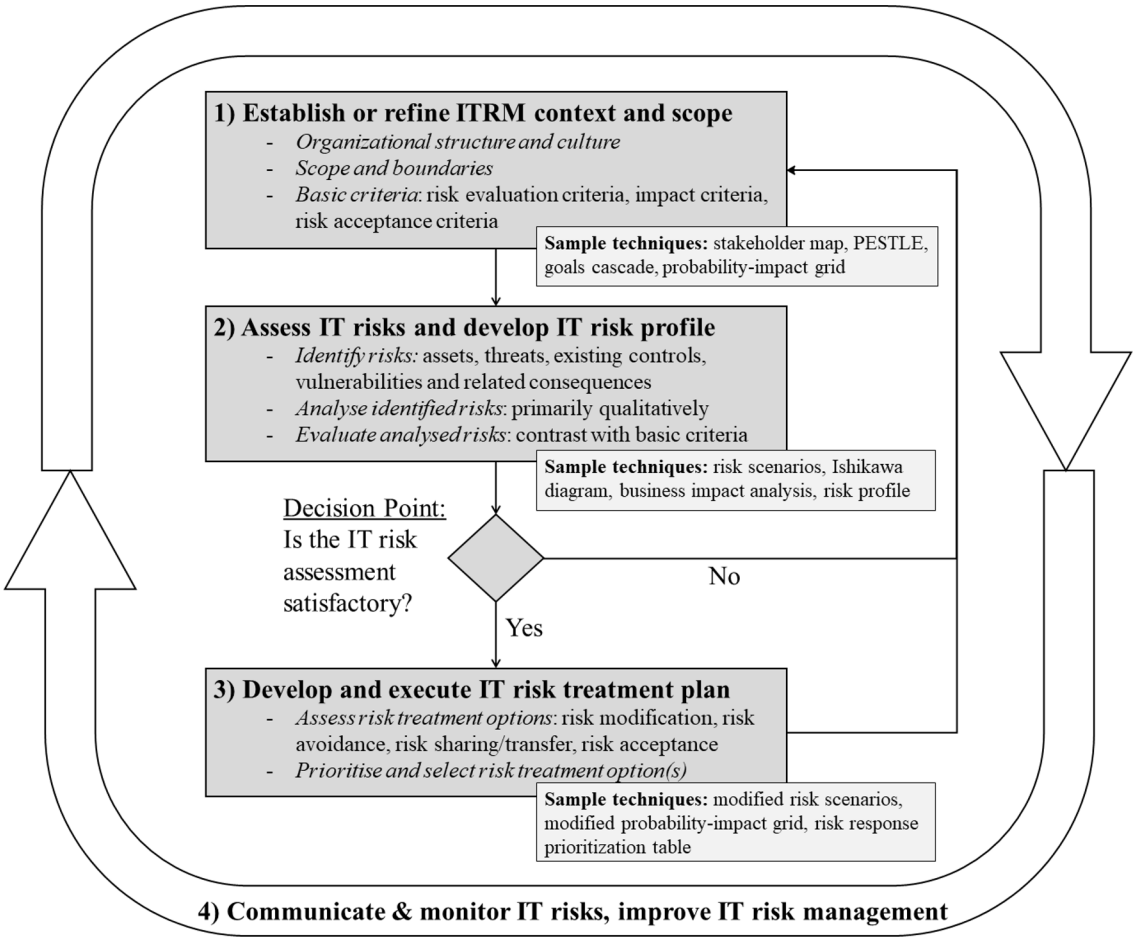
1. *Establish or refine the ITRM context and scope*: including the initial definition or refinement of enterprise objectives, assessment criteria, responsibilities, and stakeholder goals.
2. *Assess risks and develop IT risk profile:* including, for instance, risk identification, risk analysis, risk evaluation and prioritization as well as policies for documentation and communication.
3. *Develop and execute IT risk treatment plan*: including risk treatment options such as risk avoidance or risk acceptance.
4. *Communicate and monitor IT risks, improve IT risk management*: an overarching process that includes, for instance, guidance for effective and efficient communication, guidance for risk indicators and measures as well as suggestions on how to link and improve all ITRM processes.

These four processes constitute the underlying foundation of the ITRM framework (Figure 1). The first three processes (the dark gray boxes in Figure 1) are divided further into steps (in italics within the gray boxes). Also included are proposals for sample techniques for each process (the light gray boxes on the lower right area of each of the three dark gray boxes) – based on the recommendations given by the underlying frameworks – that can be employed within the respective process steps and that the authors deem to be sufficiently easy to use in a SME context.

Note that the overall ITRM process is cyclical to highlight the RM's continuous nature. Any iteration beyond the first will typically require fewer resources than the initial one, while continually enhancing the ITRM effectiveness. Space restrictions prevent us from describing each process and the corresponding steps in this paper in greater detail.

4. FRAMEWORK EVALUATION

In this section, the results of the ITRM framework evaluation in two SMEs in the healthcare industry are described. First, their current ITRM state is summarized as the backdrop for the subsequent evaluations of the ITRM framework itself and the additionally gained insights for an actual framework implementation.



4.1. The IT Risk Management As-Is State

In general, the interviews show that neither of the evaluated SMEs practise formal RM – neither within the IT department nor enterprise-wide. Nevertheless, both SMEs' interviewees claim that they can define their most important risks – IT-related as well as general risks. In terms of their IT, the hospital CIO primarily fears severe IT infrastructure failures, while the pharmacy's CEO stresses that the threat that the private customer data stored within their information systems could be made public is especially grave. Despite this realization, neither SME analyses these risks systematically. The hospital CIO primarily justifies the lack of a formal ITRM system and plans to implement such an approach by pointing out that there are no legal regulations requiring this, the additional effort that doing so would require as well as his personal belief that his previous 20 years in the hospital IT department have not shown the necessity for such steps. Additionally, neither of the interviewees controls their external IT service providers explicitly. Combined, all these facts reveal many potential risk events.

While neither SME practises formal RM, the evaluated pharmacy has an ISO 9001:2008 certified quality management system (QMS). In Germany, pharmacies' legal regulations currently require a QMS, although it does not have to be externally certified. The CEO states that, after being forced to implement

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 1. The ITRM framework for SMEs

a QMS by these regulatory requirements, he realized that it was actually sensible for his organization. In contrast, the hospital CIO mentions that the implementation of a formal QMS had already been discussed several times, but that no decision had yet been made.

Despite the absence of a formal ITRM, both the evaluated SMEs have some isolated IT security policies in place; these restrict, for instance, the use of private devices such as USB flash drives and the internet for non-work-related purposes. The hospital CIO nevertheless acknowledges that various employees do not comply with this agreement and use their own USB flash drives and the internet for non-work-related purposes. Furthermore, he mentions that he lacks the power in the hospital's hierarchy to issue binding instructions to, for instance, the medical director.

These examples highlight the importance of an explicit risk communication approach, as suggested in the ITRM framework. Although several risks have already been identified, the risk treatment and communication processes have specifically been found to be lacking, while the absence of harmful risk events and security breaches in the past can be attributed to sheer luck.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

4.2. ITRM Framework Evaluation

Before the practitioners' evaluations of the newly designed ITRM framework are described, note that neither could compare the provided ITRM framework to an already implemented formal ITRM approach. Simultaneously, they stated that they possessed at least some theoretical RM knowledge. Further, the QMS implemented in the pharmacy enabled its CEO to easily understand the ITRM framework's process orientation.

The first finding is that both practitioners agree that the newly designed ITRM framework is generally applicable to their SMEs and that the chosen detail level is suitable. Both interview partners are already acquainted with, for example, the suggested risk scenario technique and use it in a simplified form. They are, of course, familiar with Office programs such as Word and Excel, which directly enables them to use several of the suggested ITRM methods, because the designed ITRM does not explicitly require the use of RM-specific tools. Nevertheless, the pharmacy CEO directly requested more guidance that describes the concrete procedures and provides examples of good implementation practices. Such requests were anticipated, because the ITRM framework is designed to be abstract, while the concrete implementation requires individual process and method adoptions (cf. the 'Research Methodology' section), which may include tailored and detailed guidance.

Moreover, the interviewees mentioned several immediate benefits they could achieve by implementing the designed ITRM framework for SMEs. Both appreciate the presented ITRM approach being based on an ISO/IEC standard, the ISO/IEC 27005, as they are both familiar with the ISO and the pharmacy is already ISO 9001:2008 certified. Thus, especially the pharmacist expects continuity between the different ISO standards, which would allow a facilitated adoption of the ISO 27005. The continual and overarching risk communication process was mentioned as another benefit. The CEO of the pharmacy expects his employees to demonstrate an increased sense of responsibility. The hospital CIO points out that the ITRM framework offers a suitable and structured approach to improve the efficient identification of IT-related risks and security issues. He additionally emphasizes that the suggested risk treatment options (see Figure 1) are very useful, because the hospital does not currently consider risk treatment activities on such a detailed level. Such a differentiated risk treatment would enable the organization to individually assess risks as either opportunities or threats in order to attain an acceptable residual risk level.

Both interviewees mention the benefit of an efficient identification of IT-related risks in terms of the temporary or permanent loss of key knowledge bearers. Owing to the emphasis on personal leadership over impersonal management systems in SMEs (Drechsler & Ahlemann, 2016), the risk of losing knowledge bearers is typical for SMEs. The pharmacy CEO states that there are no concrete regulations concerning his unplanned absence, which would currently cause the pharmacy's temporary closure. Further, if one of the two IT employees of the evaluated hospital were to leave, this would mean a substantial loss of tacit knowledge. Users of the ITRM framework would notice this risk and they could ensure that a more detailed risk assessment and subsequent treatment were undertaken, taking the shape of, for instance, formal documentation or emergency plans.

4.3. Implications for a Future ITRM Framework Implementation

In contrast to the two practitioners' largely aligned responses concerning the ITRM framework itself, their responses concerning a potential implementation of the presented ITRM framework differ substantially. Owing to his enterprise's small size, the pharmacy CEO would not implement the provided framework

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

solely for ITRM, but for an enterprise-wide RM. He regards the designed ITRM's generic nature as suitable and promising, even for an enterprise-wide approach. Besides this potentially expanded scope, the possible coupling to the existing QMS (or, perhaps, other established management systems) is another implication to consider in a future ITRM framework implementation design.

In contrast, the hospital CIO could well imagine an implementation to address IT-related risks, but would not actually do so without legislation or his CEO requiring this. Given the backdrop of the generally challenging financial and resource-limited situation of his hospital, he cannot see the benefits of the ITRM justifying the additional effort. He also states that his informal RM has succeeded in the last 20 years and it is better to "never touch a running system". Additionally, he argues that every formal approach entails additional bureaucracy and can unnecessarily complicate easy matters. Since the hospital does not have any kind of QMS or another comparable management system implemented, it cannot draw on additional process documentations. The hospital CEO would therefore have to make the final decision to implement an ITRM approach, perhaps on the grounds of their CIO's recommendation. Moreover, the effective execution of such a decision may require additional resources such as IT personnel, especially since 1.5 FTE IT employees serve an enterprise with 350 employees. A future implementation design would therefore have to consider gaining top management support first by addressing the IT governance, IT alignment and financial issues before an ITRM process can be considered.

5. DISCUSSION

The ITRM framework contributes to the ITRM and ITSM literature in several ways. First, the ITRM framework itself constitutes this paper's main practical contribution. The ITRM framework was evaluated in two typical settings – a small and a medium-sized enterprise in the healthcare industry – by means of expert interviews. In both settings, the proposed ITRM was evaluated positively in terms of achieving conceptual relevance – guiding and inspiring managerial action (Nicolai & Seidl, 2010) – and, therefore, in terms of its potential utility. The practitioners particularly acknowledged the benefits of a formal documentation and risk communication, which would allow both SMEs to treat risks in a more mature way compared to the status quo. They also appreciated an orientation towards an ISO/IEC standard.

Moreover, the evaluation demonstrated how the ITRM framework fulfils the requirements derived in the section 'Requirements for the ITRM framework' above. These requirements include the possibility to integrate the ITRM into existing planning approaches (through communication or, for instance, by coupling it with an existing QMS), to generate an own tangible benefit (as confirmed in the interviews), to explicate the existing tacit risk knowledge (as fostered by techniques that includes documentation in scenarios or tables), its low resource requirement (by focussing on essential activities and techniques as well as through its inherent scalability), its independence of tools other than office software, and its general accessibility even by non IT or RM experts (as confirmed in the interviews). Simultaneously, the interviews highlighted several – and differing – implications for the framework's implementation. The interviews demonstrated that well-received suggestions to implement a formal ITRM approach in SMEs were not as such sufficient to disperse all the related reservations. The findings underline the benefits of considering an implementation design as a separate artefact – an artefact that does not exist yet. The practical contribution therefore needs to be regarded with this limitation in mind.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Second, in Gregor and Hevner's (2013) design science research contribution matrix, the ITRM framework constitutes an improvement. A new solution is designed for a known problem (poor ITRM and ITSM in SMEs) by appropriating extant ITRM and ITSM knowledge and creating a novel framework tailored to the SME context. The solution therefore constitutes a type VIII research contribution (Mandviwalla, 2015). In contrast to existing ITRM frameworks, the newly designed framework specifically suits SMEs' requirements by distilling essential ITRM and ITSM elements from established good practices, with the aim that SME practitioners do not have to deal with highly complex approaches or techniques. These would be necessary if their SMEs were to implement a comprehensive ITRM based on one of the established frameworks.

Third, this paper also contributes to a more differentiated understanding of the relationships between ITRM, IT governance, business-IT alignment and quality management in the SME setting: In the case of the pharmacy, which turned out to be too small for a separate IT-related RM approach, the CEO highlighted the possibility of the framework's utilization as an enterprise-wide RM framework. In other words, there is a particular configuration of small enterprises without any dedicated IT personnel where the ITRM and ITSM is essentially inseparable from general business RM. The corresponding business-IT alignment takes occurs in the mind of a single business executive who is also responsible for the RM. Moreover, the pharmacy case illustrated the close relation between quality and risk management as well as how an established QMS can foster a subsequent introduction of an ITRM approach (see also Heduschka (2006) and Henschel (2008)). In an even more abstract perspective, this example illustrates that one existing management system in an SME can potentially foster another's introduction.

The hospital, on the other hand, was evaluated as potentially benefitting from a dedicated ITRM approach. However, the CIO stated that there was no interest in implementing such an approach. To overcome the organizational inertia, the hospital CEO would have to intervene and, potentially, provide the IT department with additional resources. This prerequisite not only illustrates the close relationship between the business-IT alignment, the IT governance and the ITRM, but also the typical shape this relationship can have in an SME. Without alignment on the CEO level, where the strategic IT governance of the hospital seems to be effectively located, the hospital's ITRM and ITSM cannot be expected to advance substantially.

The fourth contribution is to provide an example that contradicts the findings in the literature that there is a positive correlation between an enterprise's size and the extent of its formalized RM (Britzelmaier et al., 2015; Henschel, 2008), as evident by the lack of interest in any formal ITRM implementation despite the hospital's size (350 employees), which even exceeds a typical SME's boundary (250 employees). In both cases, the implications for the ITRM framework's implementation lie beyond the ITRM and ITSM scope, highlighting the afore-mentioned other (IT) management-related areas' interconnection with the ITRM and the need for a holistic perspective as a prerequisite to introduce and establish an effective ITRM.

The fifth contribution is a methodological one: The findings illustrate the benefit of taking a design science research perspective beyond artefact-centrism and beyond a focus on immediate utility to an artefact's immediate application context. As the implications for the ITRM framework's eventual implementation highlight, introducing effective and sustainable ITRM and ITSM into a SME is less a matter of the adoption of the framework as a social artefact (let alone of a technical one) in a narrow sense. Instead, the framework itself turned out to be merely a catalyst to start a discourse for identifying relevant audiences (hospital CIO vs. the CEO, …) and the most suitable scope (ITRM vs. enterprise-wide RM, ITRM vs. IT governance, …) to trigger a future organizational change process towards adopting ITRM.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

The paper's sixth and final contribution is the uncovering of the limited usefulness of commonly accepted quantitative measures regarding delineating between small and medium enterprises and large ones when focusing on ITRM-related matters. Whereas the hospital exceeded the employee count of medium-sized enterprises by 40% (350 to 250 employees), its IT organization merely consisted of 1.5 FTE employees and it exhibited clear characteristics of SMEs' typical ITM practices (Drechsler & Ahlemann, 2016).

6. LIMITATIONS

The six afore-mentioned contributions need to be seen against the backdrop of the research's inherent limitations. Since the evaluations were only ex-ante evaluations before any implementation had taken place, there is no demonstration yet of actual utility for the ITRM framework artefact, or its superiority to existing (or non-existent) ITRM and ITSM practices in SMEs. Here, it is necessary for further research to establish meaningful criteria for utility prior to an introduction of the framework to a particular SME that can adequately capture the difference or impact the framework makes on ITRM and ITSM practices. One particular challenge here is to account for the nature of RM and SM, which only become effective in preventing risks from occurring and do, in an ideal (= risk-free) world, not necessarily contribute any value per se. The evaluation would also have to account for possible unwanted side-effects, such as overconfidence of being protected against IT risks and IT security threats just by following established processes, or an over-emphasis on IT security over other aspects of IT use (such as business value contribution). Currently, the evaluations are also only limited to two instances of SMEs in a single industry in a single country, therefore limiting the generalization potential of this paper's findings within and beyond the German healthcare industry.

There is also as yet no corresponding implementation design that can guide the ITRM framework's adaption and adoption. The evaluations' rich findings – which are even more notable when considering that they only stem from two evaluation instances – indicate that such an implementation design may ultimately be the more important artefact to achieve a high practical impact in the sense of a substantially increased ITRM and ITSM effectiveness in more than one SME. Such an implementation design would need to demonstrate conceptual relevance (to trigger and guide actual organizational change processes towards improved ITRM and ITSM practices) as well as instrumental relevance (as in achieving an actual and sustained improvement in effective ITRM and ITSM practices).

Lastly, on a more fundamental level, the question remains whether the idiosyncratic nature of SMEs – as already illustrated by, again, merely two evaluation instances – is at all compatible with a process framework-oriented and therefore artefact-oriented approach, even if the framework is designed from the ground up (as opposed to being scaled-down from extant and more comprehensive frameworks) and designed to be as uncomplicated and accessible as possible, while retaining a high level of potential utility for the SME context.

7. CONCLUSION AND OUTLOOK

In this paper, an ITRM framework tailored to the SME context was designed and evaluated. While no actual implementation of the framework has yet taken please, it was nevertheless possible to derive several concrete implications for future research within and beyond the selected project scope based on

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

the insights from the two evaluation cases. While the ITRM framework itself can be left as it is for a first concrete implementation, any future implementation needs to take several aspects beyond ITRM, ITSM, and even ITM into account, namely issues related to IT governance, business IT alignment, other existing management systmes, and organizational change management. After the development of an initial implementation design, an obvious task for further research is the adjustment and application of the framework in one or more concrete instances of SMEs to demonstrate actual utility and to refine the framework or the corresponding implementation design.

Beyond the scope of improving ITRM and ITSM effectiveness in SMEs, this paper's findings highlight the need to further the attention in DSR towards designing for change and transformation, in order to achieve not only practical relevance, but actual impact through research (Drechsler & Hevner, 2016). Here, one possible source to inform the conceptual and methodological DSR foundations is the well-established socio-technical approach in IS (Bednar & Welch, 2005; Checkland, 1999; Welch & Sadok, 2016), where the emphasis in the past has been less on what DSR would call an artefact, but more on the change and transformation-related aspects of enacting IT-related change in organizations.

Chapter 19
Adoption of Online Marketing for Service SMEs with Multi-Criteria Decision-Making Approach

ABSTRACT

This chapter attempts to fill in the gap of evaluating the viability of adopting online marketing for small and medium enterprises (SMEs) in service industries. As SMEs are generally characterized by shortage of resources, the use of online marketing strategies is apparently difficult. However, the current landscape of competition among SMEs in a global market economy prompts the necessity of adopting online marketing. With these, the decision-making process of SMEs in this area becomes complex and the decisions must integrate complex and interrelating criteria and constructs in order to provide a more holistic solution. Thus, this work adopts a multi-criteria decision-making (MCDM) method particularly the analytic network process (ANP) in order to evaluate the practicability of using online marketing for service SMEs. It becomes highly relevant as it provides significant insights to decision-makers in SMEs regarding the use of online marketing strategy. The contribution of this chapter lies in the application of MCDM in evaluating viability of online marketing in service SMEs.

INTRODUCTION

On a global scale, small and medium enterprises (SMEs) are growing and are expected to compete strategically. In the U.S., SMEs are categorized according to the number of employees and asset size; particularly with less than 250 employees and annual sales of not more than US$ 50 million (Barad and Gien, 2001; Gonzalez et al., 2012). In the Philippines, SMEs are those enterprises that have 10-199 employees with Php 3 million to Php 100 million asset size (Jumamil-Mercado, 2013). SMEs have been a significant sector in economic development and are essential in generating employment (Harvie and Lee, 2005). A decade ago, Harvie and Lee (2005) estimated that 70% of new jobs creation in Southeast Asia came from SMEs. Across domain literature, SMEs are considered crucial in employment generation, output and export growth, poverty alleviation and better distribution of wealth (Asasen et al., 2003; Harvie, 2008). In the Philippines, SMEs play a vital role in "rural industrialization, development and decentralization of industries, creation of employment opportunities and more equitable income distribution, use of indigenous resources, earning of foreign exchange (forex) resources, creation of backward and forward linkages with existing industries, and entrepreneurial development" (Jumamil-Mercado, 2013). They are considered vital in dispersing new industries to the countryside and stimulating gainful employment (Jumamil-Mercado, 2013). Around 70% of non-agricultural employment was contributed by SMEs in the Philippines (Harvie and Lee, 2003). SMEs are known to be labor-intensive such that they generate jobs in the locality where they are situated (Jumamil-Mercado, 2013). This setup gains relevance in developing countries such as the Philippines. SMEs are quick in assimilating new design trends, developing contemporary products, and bringing them to the marketplace ahead of the competition (Jumamil-Mercado, 2013). This promotes SMEs as the seedbed for the development of entrepreneurial skills and innovation can make an important contribution to regional development programs (Department of Trade and Industry, 2008).

The trend of present economic progress demands businesses to compete more strategically, especially that various firms struggle to think of viable solutions in addressing customer needs. Implications of these requirements brought firms to gauge more on how to maintain and increase a good standing relationship with other businesses. This triggers fundamental questions to businesses the location, the time, and the components of the target market. The key to answer these questions relies largely by the appropriateness of the marketing tool carried out by SMEs. Coming up with a good marketing strategy attracts more customers and introduces the market with the products that firms can offer. For instance, firms seek to gauge into marketing program in order to promote their product and services through various strategic marketing implementation. This could be pursued with the use of traditional marketing and online marketing.

The widespread use of the internet across the globe highlights communication and mobility between buyers and suppliers. In this regard, online marketing has gained increasing attention over the past decade or so and has helped overcome the barriers of several business-related communications. As internet users carry out more active roles as expected, online marketing increases visibility of firm's profiles and products, and thus, it becomes an arguably good avenue for marketing and advertising. However, with the cost of pursuing online marketing which is a relevant issue in SMEs and the conditions that govern a geographical area, the decision of pursuing online marketing is certainly nontrivial that requires attention and focus. This decision of whether or not to implement online marketing strategy becomes complex due to the presence of several factors which oftentimes constitute inherent relationships. This decision domain exposes a multi-criteria decision-making (MCDM) problem.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

The use of MCDM methods is widely accepted in current literature. Coulter and Sarkis (2005) adopted the ANP evaluating web or internet media advertising strategies. Wu et al. (2010) utilized an integrated ANP-TOPSIS in evaluating a marketing strategy for the hotel industry. Wang and Tzeng (2012) applied the combination of DEMATEL, ANP and VIKOR methods in evaluating customers' satisfaction through brand marketing in electronic manufacturing firms in Taiwan and concluded that value pricing yields as the most important factor in brand marketing strategies. Furthermore, Tsai et al. (2011) applied similar approach with DEMATEL, ANP and VIKOR methods in evaluating web-based marketing for air transportation industry. Similarly, Chiu et al. (2013) proposed a hybrid MCDM method involving DEMATEL, ANP and VIKOR to improve e-store business. Yang and Chang (2012) combined means-end chain and fuzzy ANP to explore customers' decision processes in choosing product bundles.

In this chapter, a decision model that depicts the intricacies of real-life decision-making assessing the viability of online marketing in SMEs is developed. An Analytic Network Process (ANP), developed by Saaty (2001), is used to handle the decision-making problem. ANP is used due to the multi-criteria nature of the problem where criteria exhibit overarching dependence relations. The goal is to come up with a decision of implementing online marketing strategy in SMEs from complex relations of several factors which include online marketing, traditional marketing, technology, and criteria. A case study in the province of Cebu which is located in central Philippines is carried out in this work. The contribution of this chapter is the development of a decision model that assesses the viability of implementing online marketing in SMEs.

BACKGROUND

The trend of current modernization underlines the use of technology and promotes intensified but positive rivalry of business sectors on which strategy formulation must be of high regard. There are factors to consider in obtaining the advantage of using online marketing and knowledge of these factors becomes increasingly important. In addition, the motivation behind departing from the traditional marketing to online marketing must be made clear and plausible. The role of the decision-maker is to ensure the viability of the marketing strategy. Current competitive scenarios require strong foundation in product promotion and implementation. In order to gain an understanding and perception of both traditional and online marketing strategies, this section provides the benefits and challenges of each strategy.

Traditional marketing utilizes strategies such as direct sales, TV, radio, mail, print advertising and promotional materials. The advantage of this approach is that traditional methods may be the only means of reaching a particular group of the market. For instance, if the firm is interested in targeting a group of farmers in a remote area, online marketing may not be appropriate. Furthermore, a person-to-person selling strategy of traditional marketing may be the most effective way for a particular time and place. In addition, there is something to be said about handling a customer some tangible printed material they can read at their convenience. However, challenges of traditional marketing include: expensive and cost prohibitive, difficulty in tacking results, requires technical help from outside the firm and is forced upon the customer.

Online marketing promotes and advertises the products and services through the use of the internet. Through instant leverage of wide marketing spectrum, organizations can build qualified potential customers and take business development to a much higher opportunities than the traditional one by utilizing such strategies like website creation, search engine optimization (SEO), banner ads, social media, pay-

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

per-click advertising and email marketing. Some of the advantages of online marketing include: results are more measureable, decisions can be based on using real data and qualitative results, ability to drill down into demographics to accurately reach its target market, social media as essentially the word-of-mouth marketing based on personal experiences, inexpensive data and results are available immediately, accessible to any size business, and the ability to build direct relationships with the customers using social media and communities. However, the main downfall of online marketing is that it relies heavily on customers being highly interactive on the internet. Online marketing often demands time to continuously create, edit, approve and publish contents. Comments in several platforms must be responded to and sites and pages must be well maintained.

Thus, the challenge for businesses is in assessing the viability of adopting online marketing strategy. The assessment is highly nontrivial due to several factors that must be considered in the decision-making process. This complexity is further enhanced by taking SMEs into consideration with meager resources and lack of economies of scale. The assessment process becomes a multi-criteria decision-making (MCDM) problem and requires the adoption of MCDM methods. In this area, several previous studies reported the adoption of MCDM approaches in online marketing domains. Coulter and Sarkis (2005) developed a media selection model using ANP with internet/media advertising as one of its alternatives. Yang and Chang (2012) combined means-end chain and fuzzy ANP to explore customers' decision processes in choosing product bundles. Wu et al. (2010) provided an integration of ANP and technique order preference similar to an ideal solution (TOPSIS) as a five-step decision support to assess marketing strategies. Wang and Tzeng (2012) combined DEMATEL with ANP and VIKOR method to verify the interrelationships of brand marketing and then to identify the best strategy. Tsai et al. (2011) proposed an effectiveness evaluation model for web-based marketing of the airline industry which is an integration of marketing mix, i.e. the 4Ps, and website quality. Chiu et al. (2013) proposed a hybrid multi-attribute decision-making (MADM) model which combines linking the DEMATEL, DEMATEL-based Analytic Network Process (DANP), and VIKOR in the creation of marketing strategies of e-store business. Ocampo and Promentilla (2016) utilized the ANP in developing a sustainable manufacturing strategy which is an integration of both manufacturing strategy and sustainability. A review of literature shows that ANP was used in related studies; however, there were no studies which dealt with ANP in determining the viability of online marketing for service SMEs. One of the major issues that must be addressed is the interrelationships between traditional marketing, digital marketing, technologies, audience, and cost which are critical factors in adopting an online marketing strategy.

ANALYTIC NETWORK PROCESS (ANP)

ANP is the general theory of analyzing complex decision problems wherein analytic hierarchy process (AHP) is a special case (Saaty, 1980). AHP considers a decision problem with linear hierarchical structure while ANP extends this into a network of interdependent components. AHP/ANP is grounded on its three basic features: modeling system's complexity, measuring on a ratio scale and synthesizing as presented by Promentilla et al. (2008). See Table 1 as described by Promentilla et al. (2008).

Using pairwise comparisons and judgments, local priorities in ANP are computed in similar to how local priorities in AHP are generated. Unlike other MCDM methods, ANP captures both qualitative and quantitative criteria in an analytical decision model with components that are interrelating. Figure 1 represents an example of the form of the network structure used in a particular decision-making process.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Table 1. The main basic characteristics of AHP/ANP

Functions/Features	AHP	ANP
(1) Structuring system's complexity	One-directional hierarchical structure with the assumption of mutual dependence of elements	A non-linear network structure of interdependence and feedback. Hierarchy, a linear structure, is a special case
(2) Measuring on a ratio scale	Local priorities derived from pairwise comparison matrices	Local (or initial) priorities derived from pairwise comparison matrices
(3) Synthesizing	Global or overall priorities from hierarchic composition or additive synthesis	Overall (or final) priorities from supermatrix calculations

Adopted from Promentilla et al., 2008.

Figure 1. A sample network structure and its corresponding supermatrix
Promentilla et al., 2006.

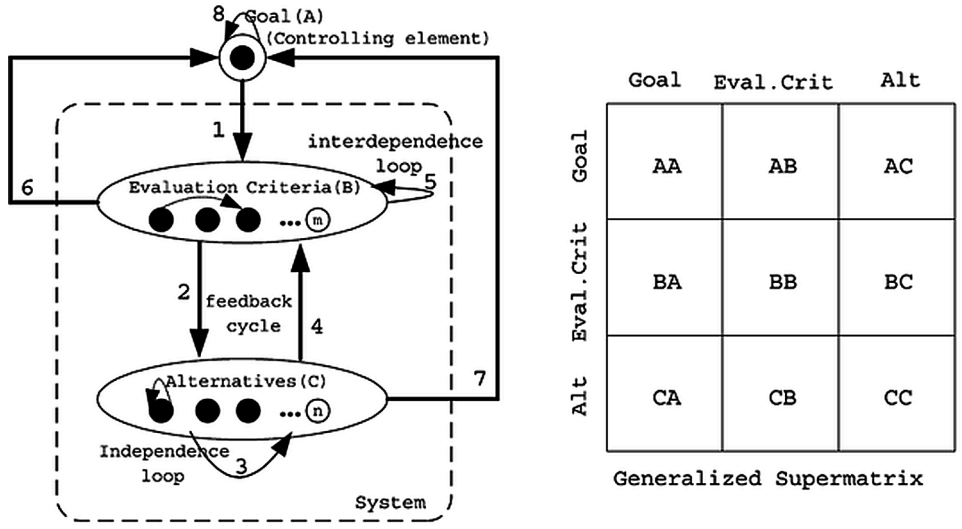

Figure 1 shows a hierarchical network or a hiernet which is a digraph. The goal is composed of a single element and it controls the criteria and the alternatives components as represented by arcs 6 and 7, respectively. These arcs allow the network to be a strongly connected digraph in order to form an irreducible supermatrix (Saaty, 2001). Arcs 1 and 2 are unilateral hierarchical dependence. Arc 4 represents a feedback loop which means that the alternatives also depend on the elements of the criteria component. Arc 5 represents an interdependence loop which means that each element of the criteria component is interrelated with some or all of the elements in the component. Arc 3 is an independence loop which means that the alternative depends only on itself. In this digraph, the direction of the arrow or arc determines the dominance of the elements of the component to other elements of another component or being dominated by other elements of another component. When an arc is pointing to a component (Arc 1 and 2), it means that the elements of that component influence the elements of the component from which the arc is emanating. The construction of the supermatrix is detailed in the reference books of the ANP, e.g. Saaty (2001).

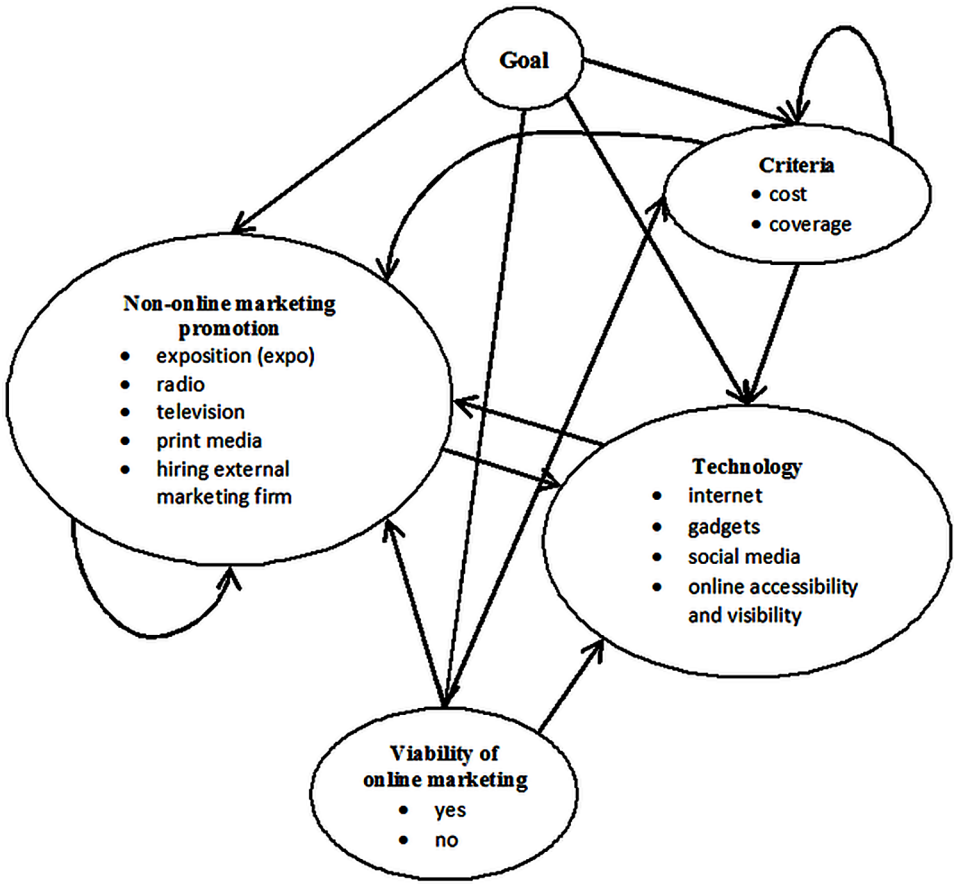
CASE STUDY: VIABILITY OF ONLINE MARKETING IN SMALL AND MEDIUM ENTERPRISES – CENTRAL PHILIPPINE SCENARIO

A case study was conducted in Cebu City where majority of the business firms in central Philippines is located. The economic stability of Cebu City is known to be the next of the busiest enterprises in the Philippines. Cebu is less than 2% of the entire Philippines in terms of surface area. Despite of its size, it accounts for 4.9% of the total population and 10% of the exports. It also has more than one million tourists, which means that about half of the visitors of the country choose to come to Cebu.

Cebu has a large population which means that it could support a good number of small and medium enterprises (SMEs). In fact, long before the last population count in 2007, Cebu had already close to 3,000 SMEs with estimated assets of about Php 5.5 billion (around US$ 122 million), sales of Php 12 billion (around US$ 266 million) and total employment of about 180,000 workers (Fajardo, 2010). The Department of Trade and Industry of the Philippine government Cebu provincial office established the Small and Medium Enterprises Development Council – Cebu (SMEDC-Cebu) and was formally organized in February 21, 1996 by virtue of a law otherwise known as the Magna Carta for Small Enterprises. It was created to effectively spur the growth and development of SMEs throughout the country by way of facilitating and closely coordinating national and local efforts to promote the viability of SMEs.

These service industries were selected as they are still emerging industries on the use of online marketing. Although a handful companies on these industries are currently engaging on online marketing, in general, their orientation is still primitive. Target firms range from small to medium enterprises. Out of ten respondents, two of them belong to medium enterprise and the rest were from small enterprises. In this approach, specific category of firm is irrelevant as long as these firms have not fully engaged in online marketing. Respondents had to be owners or marketing managers of these SMEs who have adequate information and experience in making critical business decisions. Based from previous works, these respondents were sufficient to draw relevant findings. This had to be taken from a point of analytic generalization described by Yin (1994) as opposed to widely adopted statistical generalization. Unlike statistical generalization where the selected sample describes the population, analytic generalization aims to develop, strengthen, or contest a theory. Thus, this study did not intend to describe all service SMEs but to provide findings related to the use of online marketing. Table 2 shows the profile of case respondents.

Thorough literature review has been conducted to identify literature gaps. Literature review was divided into two parts. The first part focused on the review of online and traditional marketing literature. The second one highlighted the review on several MCDM methodologies that attempted to address a complex decision problem. Further on the study, it noticed that current literature lacks assessment of the viability of online marketing for SMEs. This is a significant issue as it provided guidelines for SMEs on choosing whether or not online marketing is appropriate for them taking into account several components in decision-making. It also found out that ANP is the most appropriate tool in handling complex decisions. Thus, this work focused on applying ANP to assess the viability in using online marketing for SMEs.



A survey questionnaire was formulated to collect adequate data from respondents involved in the study such as SMEs and decision-makers. The questions in the questionnaire were based from the operational model developed in Figure 2. Ten sets of questionnaires were disseminated to respondents in an administered manner. The survey questionnaire enables the respondents to perform pairwise comparisons in the context of the ANP.

Table 2. The profile of SMEs under consideration

Respondents	Type of Industry	Workforce Size	Asset Size (Million Php)	Classification
Coffee Dream	food and beverage services	100 - 120 crews	40-60	medium
Gilnaks Food Industries	accommodation and food service activities / food manufacturing	13 workers	8	small
Prime Nurselink Review Center	training services	11 staffs	7	small
Claire's Bakeshop	accommodation and food services activities	10 workers	4	small
88DB Phils., Inc.	advertising services	90 employees	100	medium
iRepublique	wholesale and retail trade	10 workers	3	small
Masaji Oriental Spa	spa services	12 therapists	5	small
Verlan Lending Inc.	lending investor services	10 staffs	7	small
Berdin's Firecrackers	pyrotechnics services	12 workers	8	small
Sofia Store	mini groceries services	10 crews	3	small

Figure 2. Decision model on the viability of online marketing for SMEs

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Table 3. Codes used in the study

Code	Decision Components and Elements
G	Goal (component)
O	Online marketing (component)
O1	yes to online marketing
O2	no to online marketing
T	Technology (component)
T1	internet
T2	gadgets
T3	social media
T4	website
C	Criteria (component)
C1	cost
C2	coverage
N	Non-online marketing promotions (component)
N1	expo
N2	radio
N3	television
N4	print media
N5	external marketing firm

The objective of this work in general is to guide SMEs in their attempt to implement online marketing strategy. There are five components or cluster in the digraph. These are the goal, criteria, non-online marketing promotion, technology, and viability of online marketing. Figure 2 shows the goal as a main controlling element with interdependencies with the rest of the components. This model was verified by the case respondents. To facilitate easy recall and ease of presentation, a coding system was provided in this study. Table 3 presents the codes of each element in the decision model.

Table 3 presents identified clusters or decision components with their corresponding codes. Goal, technology, criteria, and non-online marketing promotions are coded with G, T, C and N, respectively. The sub-criteria are coded in a way that shows reference from their parent criterion. For instance, the elements under component criteria are coded as C1 and C2. Likewise, other decision components and elements were coded similarly.

METHODOLOGY

In general, the proposed method in determining the viability of online marketing for SMEs can be described in the following steps:

1. *Decompose the decision problem into a network.* This has been made in a form of wide-ranging review of literature with identification of gaps. It has been established from the review that previous

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

studies failed to identify the viability of online marketing for SMEs. It was also found realized that the problem requires an MCDM approach, particularly ANP, because of the interdependencies and the number of factors that must be present in the decision model. From this, five decision components were recognized which are the goal, criteria, non-online marketing promotions, technology and alternatives. The interdependencies of these components were structured as shown in Figure 2.

2. *Elicit pairwise comparisons based from the network model developed in step 1.* A questionnaire was developed and distributed purposively to all identified respondents. The questionnaire in itself was prepared to allow pairwise comparisons among elements of the decision network. A supervised survey was implemented so that questions raised by the decision-makers (respondents) would be clearly and promptly assisted. This approach enabled the decision-maker to re-examine the pairwise comparisons matrices if in case the decisions are inconsistent. In eliciting pairwise comparisons, generally the question being asked is: "Given a control element, a component (element) of a given network, and given a pair of components (or elements), how much more does a given member of the pair dominate the other member of the pair with respect to the control element?" (Promentilla et al., 2006). The Saaty's Fundamental Scale (Saaty, 1980), shown in Table 4, was utilized to compare the elements pairwise. Pairwise comparisons matrices were generated with a reciprocal characteristic. For instance, comparing C1 and C2 with respect to G has a ratio scale of 5, then comparing C2 and C1 must have a ratio scale of 1/5 as the reciprocal of 5. Local priority vectors were computed using equation (1); consistency ratios are checked using equations (5) and (6).
3. *Compute the local relative weights obtained from the pairwise comparisons processes in step 2.* The input to the supermatrix of a hierarchical network depends on the presence and type of dependencies described in the digraph. The eigenvector method is one of the popular methods used to quantify the relative dominance of the elements from pairwise comparison matrices. Saaty (1980) proposed the following eigenvalue formulation to obtain the desired ratio-scale priority vector (or weights) w of n elements:

$$Aw = \lambda_{max} w \tag{1}$$

Table 4. Saaty's fundamental scale

Rating	Definition	Explanation
1	Equal importance	Two elements contribute equally to the objective
2	Weak	between equal and moderate
3	Moderate importance	Experience and judgment slightly favor one element over another
4	Moderate plus	between moderate and strong
5	Strong importance	Experience and judgment strongly favor one element over another
6	Strong plus	between strong and very strong
7	Very strong or demonstrated importance	An element is favored very strongly over another; its dominance demonstrated in practice
8	Very, very strong	between very strong and extreme
9	Extreme importance	The evidence favoring one element over another is one of the highest possible order or affirmation

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

where A is the positive reciprocal pairwise comparisons matrix, λ_{max} is the maximum (or principle) eigenvalue of the matrix A. λ_{max} can be computed using the following formulations:

$$Aw - \lambda_{max} w = 0 \tag{2}$$

$$(Aw - \lambda_{max} I)w = 0 \tag{3}$$

$$A - \lambda_{max} I = 0 \tag{4}$$

Equation 4 yields a polynomial of λ to the degree n and the largest root of the polynomial is the λ_{max}. For consistent judgment, $\lambda_{max}=n$, otherwise, $\lambda_{max}>n$. The measure of consistency of judgment is measured through the Consistency Index (CI) and Consistency Ratio (CR). The Consistency Index (CI), as a measure of degree of consistency, was calculated using the formula

$$CI = (\lambda_{max} - n)/(n - 1) \tag{5}$$

The consistency ratio (CR) is computed as

$$CR = CI/RI \tag{6}$$

where RI is the mean random consistency index (see Alonso and Lamata (2006) for values of RI). Acceptable CR values must be less than 0.1. Decision-makers were asked to repeat the pairwise comparisons for CR values greater than 0.1.

4. *Aggregate expert judgments.* Corresponding pairwise comparisons from SMEs decision-makers were then aggregated into a matrix where each element consists of aggregated judgment elicited by all decision-makers. The aggregation process requires determining the geometric mean of all elicited judgments. To compute the aggregated value, it is said that for each pairwise comparison matrix, a total of k number of samples was taken which corresponds to k number of decision-makers. To aggregate judgment of these decision makers, a geometric mean method is used as prescribed by Saaty (2001). Aggregation using geometric is described as follows,

$$X_{ij} = \left(\prod_k x_{ij}^k \right)^{1/k} \tag{7}$$

where X_{ij} is the aggregate score of comparing row element i and column element j in any pairwise comparison matrix, k is the number of decision-makers or assessors and x_{ij}^k is the score of the kth decision-maker of comparing row element i and column element j in a given pairwise comparisons matrix.

5. *Populate the initial supermatrix with the relative weights from step 3.* Global priority ratio scales or priorities can be obtained based on the synthesizing concept of the supermatrix. By raising the matrix to large powers, the transmission of influence along all possible paths defined in the decision structure is captured in the process (Saaty, 2001). The convergence of initial priorities (stochastic

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

matrix) to an equilibrium value in the limit supermatrix provides a set of meaningful synthesized priorities from the underlying decision structure (Promentilla et al., 2008). Saaty (2001) assured that as long as the supermatrix representation is a primitive irreducible matrix derived a strongly connected digraph, the initial supermatrix will converge to a limit supermatrix. Each column of the limit supermatrix is a unique positive column eigenvector which corresponds to the stable priorities from the limit supermatrix and can be used to measure the overall relative dominance of one element over another in a network structure (Promentilla et al., 2006).

RESULTS

An illustrative decision model, presented in Figure 2, is carried out in the case study. The decision problem consists of goal component, non-online marketing component with five elements, the technology component with four elements, criteria component with two elements and lastly, the alternative viability of online marketing with two elements. Note that the given framework is not only limited to the number of factors but could extend to sufficiently large number of components and elements. The structure of the decision problem must agree with reliable information obtained from related studies and from practical experience of field experts.

There are seven types of pairwise comparisons carried out in the study. First, pairwise comparisons are done on the outer dependence of the elements of non-online marketing promotions, criteria, technology, and viability of online marketing with respect to the goal. Second, pairwise comparisons are done on the dependence among the elements of the criteria component. Third, pairwise comparisons are done on the dependence relationships of non-online marketing promotion component towards criteria elements. Fourth, pairwise comparisons are done on the independence of non-online marketing promotions elements. This is due to the interrelationships on the factors influence by the component. Fifth, pairwise comparisons are done on the dependence relationships of the elements of the technology component towards criteria component. Sixth, pairwise comparisons are done on the feedback loop between non-online marketing promotion and technology components. Lastly, pairwise comparisons are done on the dependence relationships of the elements of non-online marketing promotion, criteria and technology components towards the elements of the viability of online marketing component. Note that only upper triangle of the matrix is filled out as the lower triangle represents the straightforward reciprocal of the upper triangle. For succinctness, all pairwise comparisons in all types and in all experts could not be presented in this chapter due to the large amount of space requirement. Nonetheless, aggregated pairwise comparisons matrix of each type is shown here for discussion. The decision model in Figure 2 served as the basis for pairwise comparisons among components and elements.

An aggregated pairwise comparison of the first type is shown in Table 5. The question being asked in Table 5 is like this: “From non-online marketing promotions component, comparing expo (N1), radio (N2), television (N3), print media (N4), and external marketing firm (N5), which one more dominates the goal (G) and by how much?”. The resulting eigenvector or priority vector together with the maximum eigenvalue and consistency ratio CR are shown in Table 5.

Table 5. Aggregated pairwise comparisons comparing non-online marketing elements with respect to the goal

G	N1	N2	N3	N4	N5	e-Vector
N1	1	0.8272	0.7410	1.2821	1.8015	0.1983
N2	1.2089	1	1.4140	1.1962	2.1689	0.2534
N3	1.3493	0.7071	1	2.3246	2.1946	0.2642
N4	0.7800	0.8360	0.4300	1	2.8772	0.1849
N5	0.5551	0.4611	0.4560	0.3476	1	0.0993

$\lambda_{max} = 5.143$, CR = 0.032

Table 6 shows an aggregated pairwise comparisons matrix of the relative importance of the elements in the criteria component with respect to the goal. The question being asked in Table 6 is like this: "Comparing cost (C1) and coverage (C2), which one more dominates the goal (G), and by how much?". The resulting eigenvector as well as the maximum eigenvalue and the consistency ratio CR value are reported in Table 6.

Table 7 shows the aggregated pairwise comparisons of the third type. The question being asked in Table 7 goes this way: "Comparing expo (N1), radio (N2), television (N3), print media (N4), and external marketing firm (N5), which one more dominates cost (C1), and by how much?" The resulting eigenvector or priority vector with consistency ratio CR are shown in Table 7.

Table 8 shows another type of aggregated pairwise comparisons of the elements in the non-online marketing promotions component. The question being asked in Table 8 goes this way: "From non-online marketing promotions component, comparing expo (N1), radio (N2), television (N3), print media (N4), and external marketing firm (N5) elements, which one more dominates the goal (G), and by how much? The resulting eigenvector with the maximum eigenvalue and consistency ratio CR are shown in Table 8.

N3	1.6986	0.6640	1	3.4418	3.0840	0.2965
N4	1.5784	0.3188	0.2905	1	2.4210	0.1500
N5	1.0649	0.4509	0.3243	0.4131	1	0.1030

$\lambda_{max} = 5.266$, CR = 0.060

Table 9 shows another pairwise comparisons of the fifth type. The question being asked in Table 9 is like this: "Comparing internet (T1), gadgets (T2), social media (T3), online accessibility or otherwise known as website (T4), which one more dominates coverage (C2), and by how much?" The resulting priority vector with the maximum eigenvalue and consistency ratio CR are reported in Table 9.

Table 10 and 11 show another type of pairwise comparisons in a form of feed-backing from non-online marketing promotions (N) component to the technology (T) component. The question being asked in Table 10 is like this: "Comparing expo (N1), radio (N2), television (N3), print media (N4), hiring external firm (N5), which one more dominates the element internet (T1) of the technology (T) component, and by how much?" In respond to the feedback of the element internet (T1) to elements of non-online marketing promotions (N), the question being asked in Table 11 is like this: "Comparing internet (T1), gadgets (T2), social media (T3), online accessibility and visibility (T4), which one more dominates the element expo (N1) of the non-online marketing promotions component, and by how much?" Again, the eigenvector is computed together with the maximum eigenvalue and consistency ratio CR are shown in Tables 10 and 11.

Table 12 shows another aggregated pairwise comparisons of the last type on the dependence of technology (T) with respect to the element yes to online marketing (O1). The question asked in Table 12 is like this: "Comparing internet (T1), gadgets (T2), social media (T3), and online accessibility and visibility (T4), which one more dominates the element yes to online marketing (O1), and by how much?" The resulting eigenvector or priority local vector with maximum eigenvalue and CR are likewise presented in Table 12.

$\lambda_{max} = 4.150$, CR = 0.056

These local eigenvectors were plugged into their respective locations in the supermatrix. By assigning G, C, T, N, A of goal, criteria, technology, non-online marketing promotions and viability of online marketing components, respectively, a generalized supermatrix of the decision-making as shown in Figure 2 can be drawn. Local priority vectors obtained from the pairwise comparisons are populated in the generalized supermatrix. The initial supermatrix (unweighted) is presented in Table 13. After populating the supermatrix with the local priority vectors, a column stochastic supermatrix is obtained which is dome by obtaining column sums and dividing each element with its column sum. Table 14 provides the column stochastic supermatrix.

The column stochastic matrix in Table 14 is raised to large powers in order to obtain limiting supermatrix. When the supermatrix converges to its Cesaro sum (Saaty, 2001), column values become identical. Each column represents the principal right eigenvector or the global eigenvector of the supermatrix. Table 15 shows the limiting supermatrix with the global eigenvector.

The global priority vector was analysed on a component basis. Table 16 provides the ranking of elements per decision component. Note that each element in the supermatrix determines the influence or dependence of row component on column component. Shown in Table 16 are the raw global priority vector, and the distributive, ideal, ranking of elements according to their components. The raw column indicates the column values obtained from the limiting supermatrix found in Table 15. Distributive col-

umn is computed by normalizing each element in the raw column with the component sum. Thus, each component in the distributive column has sum equal to 1. Ideal column is also computed by dividing each element in the distributive column with the maximum value in that column. Ideal column provides decision-makers pertinent information on the distance of a particular element to the ideal element, on a normal scale. Rank column which provides the rank of the element relative to the component is computed by assigning a rank order of the elements in a component in a descending fashion. Thus, large values in the distributive or ideal column are assigned with higher ranks.

DISCUSSION AND CONCLUSION

Ranking shows that with the given decision model, online marketing is viable in service SMEs. This implies that SMEs decision-makers must consider adopting online marketing strategies to promote their products and services. The magnitude of this priority as shown in the ideal rank is twice compared to its contrast of not adopting online marketing. In the technology component, internet is the most prioritized technology followed by social media, online accessibility, and gadgets with the least priority. In this context, this can be explained as follows. Decision-makers perceived internet as an enabling resource in promoting online marketing. Inaccessibility of firms and markets with the internet fails any online marketing program and initiatives. Thus, appropriate policies regarding internet accessibility and use must be in placed by the government, firms and other sectors in order to promote online marketing. Secondly, social media is considered as second from the top priority in supporting online marketing. This can be easily understood from the point of view of community's desire for greater communication and socialization. In this respect, SMEs and markets can divulge on feedback mechanisms towards better products and services. This can be observed as a growing number of firms, both small and large, which promote their products and services through social media. Online visibility, e.g. websites, is considered third in the list as it highlights the details of firms' profile, structure, programs, products and services. With respect to service SMEs, this approach seems to have been outperformed by internet and social media because these firms have not yet established their name and brand in the market and internet and social media are faster approaches to catch the attention of the market. While gadgets support mobility, these are heavily dependent on internet and social media in the context of online marketing. Thus, this is considered as the least priority.

In the criteria component, cost is more prioritized compared to coverage. This is relevant because SMEs have tighter financial constraints. They are also likely considering short term benefits over long term goals. Thus, any initiatives which entail considerable costs are usually brought to long discussion tables with firm's decision-makers. Thus, SMEs must optimize the use of online marketing by drawing out strategies that could possibly lower down associated costs. Lastly, considering the non-online marketing component, television, and radio are highlighted as relevant supports to online marketing as well as its relevant alternatives. These are relevant because these media cover wider coverage at a modest cost and maintenance. Hiring an external marketing firm is an unlikely strategy for SMEs as it entails additional investment which is a major constraint to most SMEs. As support media, carefully integrating this with online marketing could be a possible route for SMEs.

Chapter 20
Crowdfunding for Non-Profits: Opportunities and Challenges

Amir Manzoor
Bahria University, Pakistan

ABSTRACT

Crowdfunding has been applied to equity investments as well as in a preproduction consumer purchase model. Crowdfunding is projected to become a $US90-96 billion industry by 2025, and is being touted as a valuable tool for fundraising for charitable non-profits. For leading non-profits around the globe a critical question is whether charitable crowdfunding is a threat or an opportunity for them. This chapter demonstrates that charitable crowdfunding represents a powerful new fundraising tool for leading, start-ups and not for profit organisations. This discussion contributes to the financial knowledge, specifically in the online crowdfunding and non-profit organisations and concludes that non-profit organisations through crowdfunding has the potential to expand the donor base.

INTRODUCTION

Crowdfunding, a recent phenomenon of the contemporary not for profit marketplace, raises capital from an extensive online community of individuals, called a crowd. The funds obtained from the individual is usually small-to-medium (Ordanini, 2009). According to Mulvey, (2013), the non-profit sector can couple crowdfunding with social media to produce radical changes in the way nonprofits obtain funds. Crowdfunding has changed the dynamics of funding and has become the new avenue of fundraising for non-profits to do so social good (Hobey, 2014). Crowdfunding occurs on an information technological platform which directly links donors and requestors, resulting in a very effective fundraising method. In the contemporary marketplace environment, non-profit stakeholders should seriously analyze the potential of crowdfunding revenue raising and the financial contributions to the organization. Crowdfunding today has become so important that some researchers now consider crowdfunding for non-profit sector as important as what digital file sharing once was for in the music industry (Southin, 2013).

This chapter examines crowdfunding as a phenomenon, applications and impact of crowdfunding as an additional source of revenue for nonprofits. Following the introduction, a background of crowdfunding is provided. A brief summary of the non-profit sector and crowdfunding explores recent trends that have made crowdfunding a significant opportunity for non-profits. Section four explores various regulatory changes that would be needed keeping in view the trends that are occurring in the nonprofit sector. The behavior of donors, aggregated increase in funding for not for profit organizations, legislation and taxation are discussed. This chapter generates knowledge in facilitating alternative revenue opportunities and concludes with

CROWDFUNDING PHENOMENON

Crowdfunding is an attractive alternative to traditional funding even for individuals. Crowdfunding is so popular that the campaign sponsors can achieve their funding goal in a very short period. It takes a lot of preparation before the launch of crowdfunding campaign to achieve funding goal. Sometimes, celebrity power can also help achieve funding goal. Take example of music legend Neil Young. He started his crowdfunding campaign and was able to achieve his $2.4 million funding goal in just one day (Ursery, 2014). For small businesses, crowdfunding is a great source of alternative funding. These businesses, musicians, and real estate are the major beneficiaries of crowdfunding (Hogue, 2015; Fisk et al., 2011). In 2014, more than 60% of small and medium businesses (SMBs) in USA alone were looking at alternative sources of funding including friends and family.

For not for profit organizations as well, there is enormous potential to secure financial resources and to leverage the power of the crowd to achieve organizational outcomes by using crowdfunding platforms, such as:

1. Kickstarter,
2. Fundly,
3. IndieGoGo,
4. Kiva,
5. Peerbackers,
6. Fundable.

The US Jumpstart Our Business Startups (JOBS) Act of 2011 allowed smaller investors to purchase shares of a company and some US states enacted their own legislation to allow exemption for intrastate crowdfunding. Several states (including Georgia, Michigan and Washington) were actively seeking actions to shape crowdfunding industry to suit today's needs (Ursery, 2014). The JOBS act allowed the use of small amounts of capital from a large number of individuals to finance a new business venture over the Internet.

Crowdfunding is an opportunity as well for both large and small non-profits. Specifically, crowdfunding is a powerful fundraising tool for nonprofits that can substantially increase the donor base for all nonprofits. It's easy for anyone living anywhere to set up a web page for his/her crowdfunding project and start soliciting donation from the crowd. There are however, few basic requirement that the initiator of the crowdfunding project must meet. These requirements relate to the crowdfunding platform the initiator will be using. First, the initiator must set a funding goal. A funding goal determines the amount of funds the initiator wished to receive. Second, there must be a timeline of the crowdfunding project.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

A timeline determines the possible number of days in which the funding goal can be achieved. Third requirement is the project pitch. A project pitch refers to the verbal and/or visual description of the crowdfunding project. Recent technological developments, especially web 2.0, has boosted crowdfunding. Now crowdfunding project initiators and donors can easily interact with each other e.g. by using social media. One great example is the 2008 US presidential election campaign. In this campaign, Barack Obama obtained 1 total of US$ 750 million in donation. Out of this amount, more than 50% came from donations whose individual worth was less than US$ 1000 (Glaser, 2010). During last decade, many crowdfunding platforms have emerged on the scene. One of the largest of these is the kickstarter.com.

Kickstarter

Kickstarter is a very large global community developed to support creative projects. Around the globe, more than 10 million donors have supported Kickstarter project. In July 2016, Kickstarter was running 108,651 successful projects. The successful project is the one that achieved its funding goal. These project raised approximately $2480 million worth of donations (Kickstarter, 2016). The basic model of Kickstarter is based on a reward for donation. Kickstarter solely operates in US.

Fundly

Fundly is another large online crowdfunding platform that operates exclusively for nonprofits and charities. Fundly only services U.S-based crowdsourcing campaigners and donors. Despite this limitation, by 2013, Fundly was running more than 3000 campaigns. These campaign raised more than US$ 300 million in donations (Fundly, 2013). Fundly charges a platform fee 4.9% + credit card processing fee 2.9 percent + $.30/transaction to set up a fundraising page (Fundly, 2016).

Indiegogo

Indiegogo (www.indiegogo.com) is one of the world's largest crowdfunding platforms. With social media integration, direct email, and announcement features users can easily spread the word, raise awareness, and increase funding. For 501c) 3) nonprofits and charities in the US IndieGoGo offers a 25 percent fee reduction (indiegogo.com, 2016). In general, this exemption is applied to not-for-profit organizations (scientific, charitable, educational, religious, etc.) that must be registered and verified by the US Government through the IRS. 501(c) (3) tax exemptions and deductions are only available in the United States. Besides these very large crowdfunding platforms, there are many other small-to-medium sized crowdfunding platforms for nonprofits such as:

1. **Causes**,
   Causes is a crowdfunding platform for GuideStar-verified 501(c) (3) nonprofits. Users can create a cause to support a nonprofit and integrate the campaign page with social media to mobilize their network to make donation.
2. **CauseVox**,
   CauseVox is an online crowdfunding platform that nonprofits can use to create customized fundraising websites for campaigns.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

3. **Crowdrise**,
   Crowdrise is an online crowdfunding platform that followers of nonprofits can use to create personal fundraising pages where their friends and family can donate.
4. **Giveffect**,
   Giveffect is exclusively for charitable crowdfunding where donations go directly to partner nonprofits (Chung, 2013).
5. **Donate Now**,
   Donate Now/Network for Good provides free and economical fundraising tools that nonprofits can use to obtain donations on their own websites and on social networks.
6. **DonorsChoose**,
   DonorsChoose is a platform that individuals can use to obtain donations for needy students.
7. **FirstGiving**,
   FirstGiving can be used by individuals to obtain online donations.
8. **Fundraise.com**,
   Fundraise.com can be used by both individuals and organizations to manage their online fundraising activities.
9. **FundRazr**,
   FundRazr is a social fundraising tool for both individuals and nonprofits.
10. **Givezooks**,
    Givezooks! Can be used by nonprofits to create custom online crowdfunding campaigns and integrate their campaign sites with social media to increase donor base.
11. **GoFundMe**,
    GoFundMe is a do-it-yourself online fundraising service for nonprofits.
12. Help Attack,
    Help Attack! uses social media to collect donations.
13. **Just Giv**e,
    JustGive (www.justgive.org) is crowdfunding platform where donors can give to nonprofit organizations through e.g. fundraising registries.
14. **Pay It Square**,
    Pay It Square is a crowdfunding platform to create customized fundraising pagesand collect donations online.
15. **Razoo**, and
    Razoo is a platform that individuals and organizations can use to create fundraising pages and accept donations.
16. **StayClassy**
    StayClassy is used by small- and medium-size nonprofits for online crowdfunding.

To evaluate how effective the crowdfunding for nonprofits can be, the hurricane Sandy is a good case example. Within days after Sandy hit USA, many affected individuals started crowdfunding campaigns on sites like GoFundMe and IndieGoGo. The response received by these campaigns was very impressive and many initiators reported that they received donations from donors completely stranger for them (Goldmark, 2012). The American Red Cross also set up two campaigns with the option of directly contributing. These campaigns raised about US$ 2 million (Goldmark, 2012).

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

The scope of nonprofits crowdfunding can be easily judged by noting that American Red Cross collected US$ 178 million for Hurricane Sandy (American Red Cross, 2012a). Fundly (the largest non-profit crowdfunding platform) was able to raise US$ 305 million since its inception. In comparison, The American Red Cross' was able to generate of a revenue of $3.2 billion in 2012 alone (American Red Cross, 2012b). These examples make it clear that while nonprofit crowdfunding platforms are still in their nascent stages they have garnered attention for its success and become a novel approach of fundraising.

Many nonprofits have used crowdfunding successfully. Malaria No More is a campaign run by malarianomore.org to end malaria deaths. The campaign is run on causes.com and has 20,000 supporters. Ricky Martin, a Grammy award winning singer, human rights activist, launched a campaign to help combat human trafficking. The campaign had 21,000 supporters. Maria No More auctioned shirt worn by Andy Murray during his winning Wimbledon match to raise £10,000 (News, 2016).

The An Hour of Code for Every Student was initiated in December 15, 2014 at Indiegogo and was able to raise $5 million. The objective of the project is to provide every student in every school the opportunity to learn computer science at Code.org. Kids Company is a UK nonprofit that supports vulnerable children with various kinds of support including meals and clothing.

Kids Company became UK's innovation leader in fundraising after they raised more than £100,000 in a crowdfunding campaign run on Crowdfunder (Ratty, 2015). In USA, a young woman was fighting multiple life threatening diseases. The diseases put her into a situation where she needed a full accessible home; one in which she could move freely. Website Chive was inspired to feature Smith's story and in just 14 months, over 12,000 donors helped raise $US413,000 through the Hope for a Home campaign (Kim, 2015).

TRENDS FOR CROWDFUNDING IN NOT FOR PROFITS

The Demographics of Donors

Very little is understood about the demographic variables about crowdfunding donors. To gain insight into the demographic variables of donors and crowdfunding trends in nonprofit organization fundraising highlights how nonprofit organizations can capitalize on the opportunities provided through the crowdfunding platforms. An exploration of these trends can reveal the current strategic position of nonprofits to benefit from crowdfunding.

Nonprofits generate most of their revenue through government grants. However, for most non-profits individual donors are still a significant portion of the charity donors (Government of Canada, 2015; Fritz, 2015). In Canada, approximately one in five individual taxpayers made an average donation of $446 in the tax year 2010. According to Charity Navigator (Charity Navigator, 2016), charitable giving continued its upward trend in 2015. In 2015, as an estimated $373 billion was donated for charity. For the second year in a row, total giving reached record levels. During 2014 to 2015, donations for charity increased by more than 10%. In Canada, individual donors contributed 50% of the total amount of charitable donation in 2010.

More than two-third of charitable donations came from individuals aged 45 years and more. In 2010, the United Kingdom was the eighth most charitable nation in the world while the world's fastest growing major economies - China and India - rank among the least altruistic (Ramesh, 2010). Few notable characteristics of top donors included: aged 75 and over, widowers and widows, university graduates,

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

and people with household income of at least $120,000. A glance over the demographic trends of donors reveals that most contributions come from same group of older and wealthy donors (Snipes & Oswald, 2010; Guy & Patton, 2013; Marx & Carter, 2014). This can be a problem for nonprofits of all sizes. With increase in population, the donor base remains stagnant. One particular demographic group of donors can be key for success in fundraising campaigns.

Crowdfunding for nonprofits can provide a distinctive solution to this problem. Since crowdfunding platforms to not release the demographic information of their donors, it is difficult to model demographic profile of crowdfunding donors. However, there is increased possibility that these users are technologically sophisticated and do not belong to the same old and wealthy demographic group of conventional donors (Gore & DiGiammarino, 2014; Belleflamme, Lambert, & Schwienbacher, 2013). Crowdfunding appears to be attracting newer donors. These are people who haven't given philanthropically before. However, in the early days of crowdfunding, it's not yet clear what demographics the fundraising method appeals to (The Canadian Press, 2012).

While there exist no clear picture of demographic profile of crowdfunding donors, one piece of information available is their average contribution amount. In 2012, the average amount of donation made at IndieGoGo was $76 (Indiegogo, 2012). It is probably safe to assume crowdfunding campaigns can attract smaller donations from a large group of donors. If this trend increases substantially, it can encourage nonprofits of all sizes to leverage this large base of online donors capable of making small donations. These donors would be the individuals who most probably would never have been accessed through traditional fundraising methods. Non-profits already tapping the conventional group of donors can tap this additional group of donors to add another revenue stream.

Behavioral Motivations of Donors and Non-Donors

The understanding of behavioral motivations of donors can supplement the nonprofit crowdfunding efforts. Nonprofits of all sizes can equally benefit from crowdfunding. A review of studies on behavioral motivations of donors suggests that many factors are responsible for people's decision to donate for charity including self-esteem, public recognition, satisfaction of expressing gratitude for one's own wellbeing, and relief from feelings of guilt and obligation (Hibbert & Horne, 1996; (Bennett, 2003; White, 2001; Wojciechowski, 2009; Gore & DiGiammarino, 2014; Belleflamme, Lambert, & Schwienbacher, 2013). Self-esteem and public recognition are two main behavioral motivations for donors to donate. That means nonprofit crowdfunding is in a unique position to capitalize on these two factors. Nonprofits can harness self-esteem by narrowing the cause of their crowdfunding campaigns and by making modest funding goals. To harness public recognition of the donor, nonprofits should link their crowdfunding campaign with social media platforms such as Facebook.

Bendapudi, Singh, and Bendapudi (1996) developed a model that explains the donors' behaviors towards charity. This framework outlines multiple factors divided into categories that influence donors' behavior towards charity. A nonprofit can shape the factors of source (i.e. the overall image conveyed by the nonprofit in their crowdfunding campaign), message (i.e. all the elements in the message used to convince the donor to donate), and request (i.e. the amount of help solicited for) to modify the frequency and volume of donors' behavior in their favor. In a study based on the analysis of data obtained from IndieGoGo, Evers, Lourenço, and Beije (2012) applied these drivers and found that most important success factors were setting an achievable funding goal and the number of comments on the page of crowdfunding campaign.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

To achieve greater success, fundraising campaign should have a short and positive pitch. Evers, Lourenço and Beije, (2012) found that the fundraising campaigns were able to gain more generous donations and achieve a large fundraising goal when they used campaign messages which praised potential donor's compassion and generosity. It appears that donors have a self-esteem motivation with a philanthropic drive and want to feel that their contribution made some significant difference in the lives of people who need help. This apparent donors' preference was reflected in the findings of Statistics Canada. Statistics Canada (Statistics Canada, 2010) found that donors felt most motivated to donate when they felt compassion towards people in need. Nonprofits focusing their pitches on a narrow cause can leverage this preference of donors. Nonprofits, such as World Vision, are already using this approach by running Adopt a Child program. Nonprofit crowdfunding campaigns can harness public recognition of donors though interconnectedness with Facebook and other social media platforms.

Smith, Windmeijer, and Wright (2012) analyzed a large dataset of donations made on behalf individual fundraisers. The donations were made through two websites (Justgiving and Virgin Money Giving) that both worked the same way. Fundraisers set up a web page on behalf of a nonprofit and then used social media to appeal to people for donation. Smith et al. also found that, on average, a £10 increase in the mean of past donations lead new donations of £3.60 more. Findings indicate that this crowding in occurs in nonprofit crowdfunding because the crowdfunding platform can be linked with social media so that a donor's network sees when they make a donation. Established charities like the International Red Cross and Red Crescent Movement capitalized on this and were able to get more than 129,000 likes on Facebook. This supporter base can also notify other people in their network when they donate. This social currency can quickly transform into charitable currency via crowdfunding (Southin, 2013).

Understanding Non-Donor Behavior

A survey of Statistics Canada (Statistics Canada, 2010) revealed that the most common reason for donors not giving more was that they could not afford to give more. Two other popular reason were that they were happy with what they had already given and that they had given money directly to people in need rather than to organizations. Another study found that Americans donated twice as much as individuals in other rich nations but many donors did not donate more because of various reasons such as they felt they had already given too much, they needed savings for themselves and family, they thought their donation was not large enough to make an impact, they poverty is inevitable, that their donation don't get to people in need, that eradicating poverty is the job of government only, people should solve their problems themselves, and that giving donation can lead to overpopulation (The Life You Can Save, 2016).

To appeal to non-donors, nonprofit crowdfunding campaigns should be narrow and personalized. One more issues is these non-donors negative perception of how organizations used their money. This negative perception can increase with age. This concern over efficiency of fund use is particularly relevant to crowdfunding. To overcome this concern, nonprofits should ensure that they get themselves registered with the relevant tax authorities and highlight it in their crowdfunding campaigns. When donors know that a nonprofit is registered, they know the risk of fraud is minimum because authorities know where a donation is going. In this aspect, established nonprofits are in a better position to take advantage of crowdfunding than the newly started nonprofits.

MISSAPPROPRIATIONS OF CROWDFUNDING

Since crowdfunding has become a new and attractive source of financing, more and more stories are surfacing about the misuse of crowdfunding. On crowdfunding platforms, many campaigns are started with a story to appeal potential donors to donate. These stories may range from saving a cancer patient to help an infertile couple have a baby. Truth of such stories is difficult to prove. Several U.S. states have issued warnings for immense potential misuse of crowdfunding. One example is a crowdfunding campaign that was initiated by a women to raise funds for her breast cancer treatment. It appeared that this women used the funds generated for her breast augmentation that could have been done free of cost at some breast implant service providers (DocCheck News, 2012).

In another case, the Europe's biggest Kickstarter project, the Zano mini-drone ended up nothing. The project had 12,000 backers and raised £2.3m in funding. The project was started by Torquing Group, a business started by a self-taught engineer Ivan Reedman to build a marketable drone. The Zano project was cleverly marketed and a video was released that showed a drone was already developed but its performance was poorer than expected. This video excited so much interest in the project. Later it was discovered that video showed features of drone that were not operational at the time it was shot.

The Torquing's directors managed their business poorly and spent the Kickstarter money too freely. Kickstarter chose Zano as a "staff pick". The Zono project was one of the projects shortlisted by the tech news site Engadget for their best of CES 2015 award. All this happened even though the Torquing team could not demonstrate the drone flying at the show. The creators of the "Smarty Ring" raised about $US400,000 on Indiegogo without having to provide any background information on the team or the production company. They missed delivery dates but occasionally provided terse updates saying that they would deliver at some point. The most important lesson to be learnt is for crowdfunding platform providers. These crowdfunding platforms need to reconsider the way they deal with projects involving complex hardware, massive overfunding, or large sums of money (Cellan-Jones, 2016).

The current crowdfunding mechanisms provide little consumer protection. While crowdfunding platforms claim to use complex algorithms and automated tools to identify and investigate suspicious activity on projects it is caveat civitas. The platforms get bigger and delve into equity crowdfunding and crowdfunding audience is getting larger and more money is flowing to projects and sponsors with relatively limited information about them. For example, Altrius Management, a company that raised $25,000 on Kickstarter for a playing card game called Asylum designed by a Serbian artist. The company missed delivery dates and provided no updates. The company was sued by the state of Washington and sought restitution for donors and penalties for violating the state's consumer protection statutes.

In another case, Federal Trade Commission (FTC) charged Erik Chevalier for misuse of $122,874 he raised on Kickstarter for a board game called, "The Doom That Came to Atlantic City". The game was never delivered and Erik promised to refund the money but he never did. The FTC settled the matter with Erik by refraining him from future misrepresentations about crowdfunding and penalized him $111,000, though the penalty was suspended due to Chevalier's inability to pay. The FTC has launched a program called FinTech aimed at protecting consumers in crowdfunding projects. Still with no objective third party review/validation of the investment details presented, investing on equity crowdfunding platforms can be a very risky business (Cohen, 2015).

REGULATORY REGIME

Tax Credit

Current tax incentives are limited to those taxpayers itemizing deductions or designating bequests. This structure leads to lost opportunities in higher levels of donations. A recent study indicates that tax deductibility encourages charitable giving at all levels of income (Enders, 2016). The regulatory regime needs many changes to support crowdfunding for nonprofits. In Canada, Imagine Canada (a large Canadian charitable organization) proposed 'stretch tax credit' to address the issue of limited number of conventional donors and encourage new and less wealthy donors to become philanthropists.

The Stretch Tax Credit is a proposal to increase the federal charitable tax credit on giving that exceeds a donor's previous highest giving level. The tax credit would increase from 15% to 25% for eligible amounts below $200, and from 29% to 39% for eligible amounts above $200. The broad objective of this proposed tax credit was to provide Canadians with an extra incentive to stretch their giving, as the proportion of Canadian tax filers claiming charitable donations is declining and the amount they collectively donate has gone down.

Research shows that more than half of donors would increase their giving if there were better tax incentives (Imagine Canada, 2016). The Canada's House of Commons Standing Committee on Finance endorsed this proposal (Imagine Canada, 2015) and submitted it for further consideration by the Finance Minister due to its potential to expand the donor base and the overwhelming support it had received from nonprofits and charities. Offering similar incentives worldwide to first time and small donors would assist crowdfunding's ability to increase donor base. All donors may not value tax incentive the same but we saw earlier that one major reason cited for not donating was the unaffordability. This reason, coupled with non-trust on nonprofits for their ability to utilize donations, tax credit can ensure charitable crowdfunding could significantly increase overall because donors can feel positively about their finances (Southin, 2013).

Crowdsourced Policing

The herding behavior can be encouraged by crowdfunding and there is inherent chances of fraud in crowdfunding projects (Hazen, 2012). To address the threat of fraudulent use of crowdsourced funds, it is important that tax authorities should initiate programs where citizens could inform them of any tax violations. In Canada, the Revenue Agency implemented an expended online crowdsourced Informant Leads program. This is an online system that citizens can use to report suspected income tax violations by organizations (Government of Canada, 2012).

Expansion of systems like these can enable citizens to report suspected fraudulent crowdfunding campaigns by individuals or nonprofits. Tax authorities could run campaigns to guide independent investigations conducted by people who find any suspect of fraudulent use of the funds. To extend their crowdsourced policing mechanism, tax authorities can provide online crowdsourced investigation of nonprofits to assure future donors that their funds will be used as promised. Use of social media can ensure getting prompt response from people and ensure the funds raised in response to onetime events such as disasters are administered properly (Schneider & Trottier, 2012).

Crowdfunding Legislation

In many parts of the world, crowdfunding is effectively banned due to the extensive registration and disclosure requirements imposed on parties seeking to raise capital from the public. Some accredited investors (i.e. those who meet certain requirements for income and net worth) are exempted from these registration requirements. The growing crowdfunding industry has also highlighted a need for establishing frameworks through which can invest in a company's shares without being subject to traditional rules of publicly traded securities. These frameworks, such as US JOBS act, will permanently allow crowdfunding and shrink the regulatory burden for companies seeking to go public. At the same time, these frameworks will have broad implications for the capital markets and their participants, particularly CFOs.

The US SEC amended the Regulation A of the Securities Act of 1933 to provide tiers of crowdfunded businesses. Smaller businesses made up the first tier and had to fulfill specific documentation requirements, such as disclosures to the SEC staff prior to the offering as well as periodic disclosures. The larger companies were placed in second tier, were required to provide audited financial statements and subjected to stringent conditions with respect to the amount of company stock that investors who are not accredited can purchase. However, opponents of these favorable legislations for crowdfunding argue that the Internet-enabled fund raising brings so many risks. For example, the crowdfunding platform can be closed, failed or hacked. In these cases, there will be a significant loss of data and investment losses for crowdfunding investors. Another concern is that decreased transparency can greater risk of fraud and malfeasance.

The regulatory authorities may not have the resources or the time to effectively police these relatively small, localized securities offerings before they are sold to the public. Governments need to enact legislation so that these crowdfunding campaigns receive appropriate regulatory scrutiny to ensure investor protection. If these legislations are not in place, there is a danger that crowdfunding investors may undervalue the good companies against companies with inferior prospects or less transparency. Governments also need legislation that ensure crowdfunding campaigns do not misguide the non-professional and less-sophisticated investors. These less sophisticated investors are more likely to trade on pro forma earnings and tend to overestimate the stability of company's earnings (Gaynor, Morse, & Pevzner, 2015). The crowdfunding legislation also needs to take into account the corporate malfeasance (such as accounting fraud) that can significantly hurt crowdfunding. When companies raising capital through crowdfunding are subject to relaxed underwriting rules and less scrutiny, there is a high risk that non-professional investors can run into financial losses. Besides legislation, one remedy for this risk is the use of online communities. These communities can various parties to monitor and provide ongoing feedback for a crowdfunding project.

CONCLUSION

Crowdfunding is a relatively new phenomenon and at its early stages of development in the nonprofit sector. It has become an important source of revenue and fundraising for startups and nonprofit organizations. As an additional resource, crowdfunding can provide additional financial avenues for both large and small nonprofits. In the contemporary marketplace environment, non-profit stakeholders should seriously analyze the potential of crowdfunding revenue raising and the financial contributions that can be made to the organization.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

However, research on crowdfunding in not for profit organizations is just beginning to emerge. This chapter provided a snapshot to understanding crowdfunding and highlighted the emerging trends and opportunities that could benefit not for profit organizations in future.

Crowdfunding also addresses the issue of limited number of conventional donors available for funding nonprofits. Nonprofits can use their enhanced understanding of the behavioral motivations of donors and non-donors to take advantage of crowdfunding. There exists a level playing field for both large and small nonprofits with respect to crowdfunding.

However, to expand use of crowdfunding for nonprofits it is important that some changes should be made in the regulatory regime including the tax credit scheme and crowdsourced policing. These changes can help extend donor base and aggregate funding by them for nonprofit crowdfunding campaigns. Future search projects could be undertaken to:

1. Explore the impact of crowdsourcing taxation on not for profit organizations globally, comparing different taxation policies across countries.
2. Conduct a comparative analysis of internal organizational crowdfunding knowledge in large and small not for profit organizations would expand existing insights on organizational capacity exploit this contemporary financial resource as an alternative fundraising mechanism.
3. Examine online behavioral characteristics of donors who provide financial support for not for profit organizations through the online crowdfunding platform could be further investigated to enhance understanding of donor-non-donor support for the not for profit organizations that seek, and access financial resources through the crowdfunding online platform.

KEY TERMS AND DEFINITIONS

Branding: Refers to aligning what an individual or firm want people to think about itself with what people actually do think about the individual or firm.

Business Plan: A business plan defines business goals, explain why they are attainable, and plans for reaching them.

Community: Refers to a group of people who share some common interest.

Crowdfunding Platform: Refers to a website used to develop and run a fundraising campaign.

Crowdfunding: Refers to raise funds for a venture using a large group of people.

Donor: Refers to a person who donates something, especially money to charity.

Non-Profit: Refers to an organization that uses its surplus revenues to further achieve its purpose or mission.

Recognition: Refers to public acknowledgement of person's status or merits.

Social Networking: Refers to the use of dedicated websites and applications for people interaction.

Sponsor: Refers to a person who pays for a specific item to be released.

Chapter 21
Horizontal Crowdfunding Platforms:
Socio-Economic Impact and Exogenous/Endogenous System of Rules

Tomaso Greco
Università degli Studi dell'Insubria, Italy

ABSTRACT

In recent years arose a multitude of crowdfunding platforms of different nature and with different goals. In this chapter some peculiar aspects of crowdfunding platforms will be examined, both in terms of their socio-economic impact and in terms of the exogenous and endogenous system of rules with which they interact. Crowdfunding is not governed exclusively by the rules of law and the regulations of the platforms that host it. Every campaign involves the construction of a community, with its specific rules, that are in part pre-established by the campaign creator and in part the result of the interaction of the community. However, these rules do not live in a closed set, building a case history to which the future campaigns will not necessarily have to conform, but with high probability they will use as a parameter. Although it is not possible to identify the rules that are common to all the crowdfunding campaigns, could be observed an evolution mostly harmonic between different campaigns with respect to the methods, the mechanisms of involvement and, of course, the rules.

INTRODUCTION

In recent years we have witnessed the spread of crowdfunding platforms of different nature and with different goals. In this chapter we will examine some peculiar aspects of crowdfunding platforms, both in terms of their socio-economic impact and in terms of the exogenous and endogenous system of rules with which they interact.

A Major Distinction between Crowdfunding Platforms

Firstly, we can make a macro distinction with respect to the goals of the platforms, identifying three main categories: equity crowdfunding, donation crowdfunding and reward crowdfunding.

The first one is aimed at collecting investments around a business plan, recognizing to the (micro) investor a participation in the company. They have proven to be particularly useful for business in the start-up phase, a phase in which it is of vital importance to raise the necessary funds to cover the initial expenses. Furthermore, the road of equity crowdfunding does not necessarily represent an alternative road to traditional methods of raising venture capital. It rather belongs to an earlier stage, leaving the door open to further rounds of financing when the company is "more mature" and, therefore, more attractive for the investors (whether they are business angels or private equity funds, etc.).

However, we will not dwell here in a specific manner on the system of rules of equity crowdfunding, for at least three different reasons. The first reason is the lesser extent - both in absolute terms and in geographical terms - of equity crowdfunding with respect to other forms of crowdfunding, while the second reason is related to the intimate relationship between the rules of the crowdfunding platforms and the set of rules and structures that govern the corporate participation in the different Countries, and the third one is that several countries – as, for example, the United States - are structuring rules and regulations specifically for equity crowdfunding and investor protection, a regulatory process of great interest, but which will necessarily need some time to produce results and to influence the large-scale spreading of this funding model. Here - postponing to a more specific discussion the analysis of critical aspects and perspectives of equity crowdfunding - we will just hope for a system of shared rules regarding equity crowdfunding that allows to collect micro loans from different parts of the globe, without creating many small or large regional sandboxes that would weaken the characteristic of globality (to which we will return later) of the funds collected through the network, and the solidaristic-interested nature (we will also return to this important aspect) of crowdfunding.

Donation Crowdfunding Platforms and Reward Crowdfunding Platforms: Focus and Funding Models

Therefore, only the donation crowdfunding platforms and the reward crowdfunding platforms will be at the center of our investigation. More than of platforms it would be correct to speak of crowdfunding methods because it often happens that the same platform hosts both the donation campaigns and the reward campaigns, perhaps applying different commissions to the campaign creators (as for example the case of Indiegogo that through Indiegogo Life applies a commission of 0% to the personal fundraising campaigns and of 5% to the normal reward campaigns).

However, as above-mentioned, we will analyze these methods in relation to the attitude of the platforms to create communities and to the system of rules that they apply. In fact, despite the most obvious distinction between the two methods is tautological, that is the reward campaigns offer a reward, usually equated to the value of the offer, while the donation campaigns offer rewards that are purely symbolic - and, therefore, not comparable to the value of the offer - or they do not offer material rewards, limiting to consider as reward the same implementation of the project and, of course, the moral gratification for having participated in the campaign, the relationship between reward and donation will be the subject of a further in-depth analysis.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

In fact, we cannot just accept a schematic and rigid separation between the two methods. An aggregate of realities, which are very different between them, hides behind the expression donation crowdfunding: civic crowdfunding or crowdfunding based on geographical and emotional proximity, philanthropic crowdfunding and crowdfunding as a substitute for welfare. These three methods have in common, in addition to the information technology technicalities, a redistribution mechanism of individual wealth on a voluntary basis. But there are also several points of difference. Civic crowdfunding or crowdfunding based on geographical and emotional proximity, which can be an instrument activated by the public administration in order to carry out a project to promote the area and/or the fabric of the city, but which can also be seen as the initiative of one or more individuals aimed at overcoming the shortcomings (no matter whether political or economic) of the administration or at acting as a complementary activity with respect to the administration in a spirit of subsidiarity, necessarily brings with it the above-mentioned element of interested solidarity that both the proponent (campaign creator) and the backers have in common. This is the case, for example, if we consider the expansion or maintenance of a museum structure (it is possible to make the example, for all cases, of the use of crowdfunding by the Louvre in Paris for the conservation of its "Winged Victory of Samothrace" and for the acquisition of Lucas Cranach's "The Three Graces"), the implementation of a bike sharing service (this is the case of Kansas City) or of public works (as in the case of the +Poll campaign, an initiative to bring a floating swimming pool to the East River, on the Manhattan/Brooklyn banks, in New York City).

The case of those who finance a hospital in a distant area of the world (philanthropic crowdfunding) or who help to finance medical care or studies of an unknown person (crowdfunding as a substitute for welfare) is different. In these last two assumptions, in fact, the impact in the sphere of the campaign creator and the impact in the sphere of the backer do not coincide at all, the first one having a direct-material interest and the latter an ethical interest. Not even the objection that the backers might help to have a beneficial effect of psychological and/or social type, thing which is common to all types of philanthropy, including also the traditional ones, is sufficient to close the significant gap asymmetry of the interests of campaign creator and backers.

Therefore, this premise that for reasons of space fails to consider other experiences of sure interest and spread as the lending crowdfunding and the loan crowdfunding, as well as other forms of micro-patronage, is necessary to define the perimeter of the discourse relating to an in-depth analysis: reward crowdfunding platforms and, to some extent, donation crowdfunding platforms that have the characteristics (at least potentially) of the global fundraising and a solidaristic-interested nature prevailing in the proposed campaigns. To these requirements it should be added the horizontality of the platform, that is the availability of the same to host campaigns aimed at financing products or activities of different nature (we will return to the vertical and specialized ones in another chapter of the same volume). This additional requirement is aimed at identifying and describing the most possible homogeneous set of rules that is applied,

The homogeneity of the rules needs inevitably not to consider jointly, in this comparative analysis, platforms that apparently provide the same service, but that basically aggregate communities and sets which are profoundly different between them.

This does not mean that the generalist platforms do not aggregate communities, quite the opposite (approximately 12% of the campaign creators of Kickstarter launched more than a campaign - Kickstarter data March 24, 2015 - and 29% of the backers finance more than one project, for a total of 60% of the funds raised - Kickstarter data October 23, 2013), but it rather means that some communities know interactive methods that are very different with respect to the vertical and territorial platforms. But, as it has been said, we will return to this interesting aspect later.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

A main difference between the philanthropic oriented campaigns and the campaigns designed to achieve a service or product is the nature generally keep-it-all of the first ones and all-or-nothing of the second ones (some reward platforms, as Kickstarter, do not allow keep-it-all campaigns, while where both types of campaigns are permitted, as Indiegogo, relatively to the reward campaigns the percentage is 95% of all-or-nothing, against only 5% of keep-it-all. Data referred to the period 2008-2013). This aspect indicates a real disparity, which is not limited, as above-mentioned, to the different spirit that animates the campaign creator and backers, but it reaches the deep relational mechanisms underlying the campaign itself and, more specifically, it helps to determine the set of rules of the campaign.

THE SYSTEM OF RULES OF THE CROWDFUNDING PLATFORMS

In fact, the cardinal points of a campaign are: project, campaign creator's profile, duration and economic objective to be achieved. In the campaigns that we will consider these points represent a rigid set, a parallelepiped with pre-defined angles, precisely because of the first rule (which is, therefore, the real challenge of the campaign): that is to collect a certain amount of money in a given time frame. If the pre-determined figure is not reached, the all-or-nothing mechanism means that none of the offers is actually collected, due to the rule, fixed on the basis of a more or less arbitrary evaluation of the campaign creator on the minimum amount of funds required to implement the project, an arbitrary evaluation but that becomes a shared rule through the participation of backers to the campaign. Mr. Blue (the campaign creator) can assume that he can build the time machine if he collects $100,000, but there is nobody who certifies that this is the case. It may not be feasible at all, or feasible only with figures much higher or lower, or feasible at the current level of science and technology, but not with the skills of Mr. Blue. Mr. White, and Miss Orange and the other backers, participating in the campaign of Mr. Blue, decided not only to declare their interest in the project (and to participate economically to its implementation), but also to accept the premise on which Mr. Blue has based the project itself: what for the rest of the world can remain assumptions, becomes a real contract between the backers and the campaign creator. But this contract is subject to the achievement of the pre-determined economic objective. If it will not be possible to reach $100,000, the money of the backers will not be withdrawn and Mr. Blue will not receive it, thus dissolving the moral and legal obligation to build the time machine.

In particular, from the legal point of view and not only, the rules involved in crowdfunding of reward type are those that regulate generally pre-sale contracts: a deposit is paid for the purchase of a product not yet implemented, the contract will be finalized upon the occurrence of a pre-determined condition (the achievement of the economic objective according to schedule) and this will implicate the obligation for the backers to make the promised payment (but here there is the intervention of the main online payment methods, adopted by almost all platforms, which will make automatic and immediate this step at the positive end of the crowdfunding campaign) and, the most important thing, they will allow the campaign creator to implement the work.

In this way, both the campaign creator and the backers have to observe at least three distinct sets of rules: the exogenous one that regulates the agreements subject to a suspensive condition, and those that are endogenous to the crowdfunding platform, between which we can distinguish a set of general rules, valid for all campaigns hosted on a certain platform, and a set of specific rules, valid for the single campaign.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

They are all three sets of pre-determined rules, in the sense that even before the campaign starts they were explicit in their basic parts and, in good logic, will not change during the campaign. Relatively to the specific set of rules, for example, it is not possible to lengthen the duration of the campaign (and neither turn an all-or-nothing campaign into a keep-it-all campaign), nor to modify the economic objective nor to diminish the scope of the project.

It must be said that with respect to these parameters the platforms apply rules that can be defined passive at the beginning and rigid during the running phase of the campaign.

Generally, in fact, to accept or not a campaign the platforms do not evaluate neither the feasibility of the project, nor the attitude of the campaign creator to implement it, nor whether if the target set for the implementation is reasonable. They just make sure that the limiting criteria are respected, within which the campaign creator has great autonomy. But this autonomy is rigidly limited at the moment when the campaign becomes public and enters the fund collection phase.

In fact, the "forbidden campaigns" or not accepted campaigns are those that fall in a general definition with large approximation for Indiegogo:

Campaign Owners are not permitted to create a Campaign to raise funds for illegal activities, to cause harm to people or property, or to scam others. If the Campaign is claiming to do the impossible or it's just plain phony, don't post it. Users must comply with all applicable laws and regulations in connection with their Campaigns, including offering Perks and using Contributions. Campaign Owners shall not make any false or misleading statements in connection with their Campaigns. (Indiegogo Terms of Use, 2015)

while Kickstarter, after specifying "Kickstarter does not allow projects to fundraise for charity or offer financial incentives" (Kickstarter Creator Questions, 2015) prepares a list of activities and materials that are not allowed on the platform:

Item claiming to cure, treat, or prevent an illness or condition [..], contests, coupons, gambling, and raffles, energy food and drinks, offensive material, political fundraising, pornographic material, resale, drugs, nicotine, tobacco, vaporizers and related paraphernalia, weapons, replicas of weapons, and weapon accessories. (Kickstarter Prohibited Items, 2015)

To these it adds some rewards that may not be offered, even if they were related to accepted campaigns:

… genetically modified organism, alcohol, financial, money-processing, or credit services; financial intermediaries or cash-equivalent instruments; travel services (e.g., vacation packages); phone services (e.g., prepaid phone services, 900 numbers); and business marketing services. (Kickstarter Prohibited Items)

But it should be said that Indiegogo also integrates the above-mentioned rules in relation to the allowed campaigns with rules on rewards, and in particular:

… any form of security (as such term is defined in the Securities Act of 1933), any form of financial incentive or participation in any profit sharing, any alcoholic consumer products, any controlled substance or drug paraphernalia, any weapons, ammunition and related accessories, any form of lottery or gambling, any form of air transportation, any items promoting hate, discrimination, personal injury,

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

death, damage, or destruction to property; or any items (a) prohibited by applicable law to possess or distribute, (b) that would violate applicable law if distributed, or (c) that would result in infringement or violation of another person's rights if distributed. (Indiegogo Terms of Use).

It should be noted that these lists can largely overlap each other while setting the boundaries of the field inside which "everything that is not forbidden is allowed", both platforms apply forms of control and both make use also of users' reports to find eventual violations of rules.

It is true that the major platforms promote certain campaigns as "featured", ensuring them so not only more visibility, but in general a feeling of trustworthiness of potential backers. This combination of images between the one of the platform and the one of the campaign, that is generally related also to the dissemination activities of the campaign through the social channels of the platform (Facebook, Twitter, etc.), follows rules but not necessarily coded, which can be related to several factors: the innovativeness of the proposal, the reputation of the campaign creator, the result that the proposal is having in terms of money and supporters, but that Is difficult to translate into an assumption of responsibility by the platform towards the project. For the platform of a "featured" campaign that although reaching the goal does not keep its promises (product not made or different from the description, or poor workmanship), the only negative effect could be a reputational damage for the platform itself.

Therefore, the generalist platforms essentially tend to present themselves as a passive tool, which hosts campaigns that fall in parameters not particularly strict, and which monitor some aspects relating to the conduct of the campaign, but not on what happens after the campaign, that is when the platform/tool is no longer the instrument for collecting pre-orders in exchange for promises of money. Moreover, the fee retained by the platform is quite low (both Kickstarter and Indiegogo provide a fee of 5% for campaigns in the United States) and this hardly could bind the platform to an action of control and verification that goes beyond the methods of implementation of the campaign or beyond a closed group of possible actions (e.g., violation of a copyright by the campaign creator), as specified in the Terms of Use of Indiegogo

Indiegogo makes no representations about the quality, safety, morality or legality of any Campaign, Perk or Contribution or the truth or accuracy of User Content (as defined below) posted on the Services. Indiegogo does not represent that Campaign Owners will deliver Perks or that Contributions will be used as described in the Campaign. Users use the Services at their own risk.

which adds that in case of disputes between campaign owners and contributors "Indiegogo is under no obligation to become involved in disputes between Campaign Owners and Contributors, or Users and any third party." This approach is common to Kickstarter, a platform that provides in its Terms of Use:

Kickstarter isn't liable for any damages or losses related to your use of the Services. We don't become involved in disputes between users, or between users and any third party relating to the use of the Services. We don't oversee the performance or punctuality of projects, and we don't endorse any content users submit to the Site. When you use the Services, you release Kickstarter from claims, damages, and demands of every kind — known or unknown, suspected or unsuspected, disclosed or undisclosed — arising out of or in any way related to such disputes and the Services. All content you access through the Services is at your own risk. You're solely responsible for any resulting damage or loss to any party.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

However, it is useful to note how the situation is evolving fast, especially in light of some negative experiences at the limit of the scam perpetrated through crowdfunding, some episodes that, if replicated on a large scale, could put at risk the element of trust that underlies the crowdfunding campaigns. As we have already seen, the relationship of trust is essentially always between campaign creator and supporters, not between supporters and platform. But this is not necessarily the perception of general public and, in fact, to support a project it is still necessary to connect to a particular platform, to create an account (becoming a user of the platform) and to make a payment - whether without immediate effects - on a page of the platform, accepting the rules of the platform itself. Therefore, it seems obvious that, quite rightly, the backer will put his trust also in the control activities carried out by the chosen platform.

Beside the four basic elements of a crowdfunding campaign (project, campaign creator's profile, duration and economic objective to be achieved), there are, however, other elements deserving to be taken into account. They differ from the previous ones because of their less characterizing and less rigid nature with respect to the campaign. For example, they can be inserted in an ongoing campaign, or can be changed, or can have a merely indicative function, or can be the result of a confrontation between campaign creator and backers.

Below we will try to make a (not exhaustive) list of these elements. The rewards are the first of them. The so-called reward levels correspond to the amount committed by the backers. They are essentially items which provide that a certain financial commitment of the backer matches a certain type of product or a particular service offered by the author. They can be primary rewards, that is the product that the campaign proposes to make, or secondary, that is gadgets related to the product, or opportunities to meet with the author, or a mix of primary and secondary rewards. To exemplify, in a campaign aimed at producing a music album, the CD of the album will be a primary reward, a message of thanks by the musician a secondary reward, the CD with a thank-you note by the musician will be a mixture of primary and secondary rewards.

However, the author may decide to include new rewards in the ongoing campaign, giving or not the possibility to those who have already supported the campaign to opt for a new reward, maybe paying the difference. It is not said that a reward for the same offered product/service is related to the same figure during the entire duration of the campaign. Returning to the example of the CD, the singer may decide to make available the CD for $15, but only for the first 100 supporters, then he may make available the CD for $20 only for a further 100 supporters, and then he may decide to make it available to anyone for $25 (we could make many examples in this sense, now it is a fairly widespread practice; not being able to list all of them here, I will only indicate as an example the campaign for LightBlue Bean+ on Kickstarter). In fact, limiting the availability of a level of a product related to the campaign, or the availability of that product to a given price, could be an important instrument in the hands of the campaign creator to attract early backers, supporters that already in the first hours of the campaign make their promise of payment. It should be remembered how it is useful so that a campaign is perceived as successful, to give the impression of being able to easily reach the goal. The backers, although the all-or-nothing mechanism protects them against the risk related to the failure of the campaign, prefer to contribute when it is reasonable that the goal will actually be achieved. Through this mechanism, vice versa, there is the dual effect of attracting early backers with a promise of economic savings (or now or more expensive) and more supporters having shown them that the campaign has a good response from the public.

But what are the rules that the campaign creator has to follow? Substantially two, the first one is a common-sense rule, that is, not to change a reward already entered (if the campaign creator says that there are 100 CD at $15, it would be good that he did not subsequently diminish the availability of the

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

same level of price to 90 or he did not increase it to 110), while the second rule is that he does not betray the trust of the early adopters, making available later the same reward at a lower price, maybe at the end of the campaign to raise additional funds. We will return later to the fiduciary relationship between backers and campaign creator.

Another element of great interest is the inclusion of overgoals, that is further objectives with respect to the achieving of goals that may be announced during the campaign and that involve, if they will be reached, a further development of the project. The overgoals respond to a double need. On the one hand, they protect the campaign creator against controversies about how the funds raised in excess will be used, since it is true that if there is a surplus of collected funds this is due to a large number of orders, implicating, consequently, higher expenses. But it is equally true that the campaign creator must necessarily get some margin on each order to cover the costs of the project (it could be just the fee of the platform) and we could hypothesize that the costs for the implementation of the single reward will significantly decrease.

On the other hand, they maintain a high interest for the campaign in the backers and public, giving a further incentive to involve more the potential supporters and to create a larger audience.

While overgoals generally involve all the backers who supported a project, intermediate goals are less used, but no less important, being rewards that the campaign creator decides to grant to the supporters precisely when some intermediate objectives related to the funds that have hitherto been collected or to the relationship between the money raised and the time elapsed since the start of the campaign have been achieved. Usually these intermediate goals are not pre-announced. They do not add anything to the project (which at that time has not yet been financed) but integrate the description of the project, showing specific features (in the case of technology projects) or parts of the concept not made public until then.

The campaign creator can decide these elements (rewards, overgoals, etc.) unilaterally or together with the backers who, until then, have decided to believe in the project. This is the case, for example, of the campaign of Jide to finance Remix Mini, a computer with small dimensions and an affordable price, the first campaign created by Chinese campaign creators up to exceed one million dollars on Kickstarter. To decide the development of the project and some level of rewards the campaign creators have decided to make some real surveys between the backers. In other words, they have introduced explicitly some elements of democracy and bilateralism in the construction and development of their crowdfunding campaign. They were surely not the first ones to have done this, but can be considered a significant example for the size of the campaign, the number of people involved and the consultation methods that have been chosen.

In fact, the construction of the community is a central moment of a crowdfunding campaign. And it proves to be the crucial moment in our investigation on the setting of a system of internal rules in a crowdfunding campaign.

To simplify, it can be argued that the crowdfunding campaign is proposed to an indeterminate plurality of subjects, without any linkage with it strictly speaking, and that this plurality decides to participate under certain conditions. These conditions cannot be contracted because they have been pre-determined by the campaign creator. In this sense, the birthright of the community and its boundaries, are created by the campaign creator clarifying what the project is, what its goal implicates and what not until to achieve the economic objective. The campaign creator accepts as limit to his power to establish rules and conditions, the limits of the current legislation and the ones of the platform. But within those limits he may provide the rules and conditions that he considers the most useful, correct and appropriate. We will define this moment “unidirectional”.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

When a person decides to participate in the campaign, he joined the community of the campaign. Bragging rights. In part these rights will result from a self-restraint by the campaign creator, that is strictly part of the contractual synallagma which was originally proposed, but to some extent the subscriber will acquire a right to participate, to be informed, to communicate with the campaign creator, to ask questions, to give advice, to interact, using different forms and methods, with other backers that are part of the community. It should be noted how this process goes to build a set of other rules, expressed or implied, that together with the aforementioned rules define the overall framework of the life of the community built around the campaign. This moment can be defined as bidirectional (with respect to the relationship between the community and the author), and multi-directional (with respect to the relationship between the members of the community).

The person who chooses to support a campaign acquires the status of backer, that is of active member of a community of purpose, a community of purpose that has its first regulatory element in the unidirectional determinations established by the campaign creator, but then lives a democratic participatory life. We could dare a comparison that seems fitting to reflect the position of those who choose to enter the community. When a person gets the status of a citizen of a Country, with all probability that country has its own pre-existing Constitutional framework which that person has not helped to build. From then on, contributing to the civil and democratic life of that Country, the citizen will not only (or not exclusively) be a passive party in the process to establish the regulations and the system of rules of the country, that is he will get an active role. This does not means that the active role will be exercised in its entirety, for example, relying on the rights of which the person is a bearer, exercising the right to vote or participate in the political life, but it is a potential of which the citizen is the bearer. Similarly, the backer will simply wait that the project is finalized and his reward is packed, shipped and delivered, as if he had participated in a unique buying group. But he may also decide to participate without that nobody can stop him, at least until he respects the system of rules that was established.

However, this does not mean that all backers enjoy the same rights; if we look diachronically the evolution of a crowdfunding campaign we could note that a decision taken by the campaign creator and the backers a certain day affects those who decide to become backers the next day. However, those who decide to become backers do it accepting the conditions of the moment, without that this represents an imbalance. After all, returning to the example of the citizenship and democracy, two people that become citizens of a Country within a few days, the first one on the day before an important referendum and the second one on the day after the referendum, will be in a condition of inequality: the first one will participate in the referendum while the second one will not. But it is also true that they have both to adapt their future expectations (and their behavior as a consequence) to the result of the referendum and that, if the first one has had an active role and the second one has had exclusively a passive role, it is also true that the second person chooses to become a citizen already knowing the outcome of the referendum, while the first one, whether it is the preference for which he expressed his vote, must comply to what has been decided by the majority.

Therefore, it is evident that, considering a crowdfunding campaign as a process to establish a regulatory system and to define the structures of a community, the first one who participated has more chances to influence the choices of the community and the campaign creator.

But even in the case that the community is built around a democratic participation - and not forced - of the backers, it is equally clear that the expectations of each backer and more generally of all the backers are placed in the campaign creator and in his determinations, rather than in the community itself. In other words, the issue is to understand whether the campaign creator can be seen as a “primos

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

inter pares" within the community, or whether he must be considered as an absolute monarch, in conditions to assign more or less margins for participation to the supporters of his project, but this margin of participation is only granted in order to meet a need of the sovereign, that is to motivate the backers to seek other backers to achieve the economic objective in time.

Moreover, even the economic objective, once reached, marks an asymmetry between those who receive money (the campaign creator) and those who pays money (the backers).

Giving a clear answer to this dilemma would be to deny the premise, that is how each crowdfunding campaign builds a peculiar set of rules and a community whose composition, interests and participatory attitude may vary significantly.

In fact, nothing prevents the campaign creator to minimize the interaction with the backers, limiting it to merely occasional communications on the progress of the project. Neither the issue of the participation and construction of a community in a communicative technicality, in an instrument that the campaign creator can use to better reach the goal can be solved. It would not be simply restrictive, but it would be, in my view, an incorrect evaluation. Of course, as we know, a significant part of the marketing tries, with always more sophisticated and effective techniques to create an involvement among the intended audience of the campaign, transforming it from an audience into real testimonials and to feed a word-of-mouth using gaming mechanisms and social networks, uniquely designed to spread the pre-determined advertising message.

If the assumption of the communicative technicality could be accepted, a crowdfunding campaign would be classified simply as a campaign of marketing and communication and, as such, it should be evaluated through the social and economic sciences that deal specifically with marketing and communication.

However, I think that it can be found at least a strong element of difference, so strong and central to become, in the light of a careful analysis, an element of divergence between a marketing campaign and a crowdfunding campaign.

The concept of moral property, as a legal and economic element, differs from the concept of ownership in the strict sense. The moral property of a crowdfunding campaign, or rather the result promised in the event of reaching the goal, does not belong to the campaign creator, but to the community constituted by the campaign creator and the backers. Without the backers the product, the specific product developed according with the proposed methods, could not exist. This creates a deep relationship that appears not only in the active involvement of the backers during the campaign (of which it is a prerequisite). The linkage is the moral reason with which the community identifies itself and at the same time is the condition of formal and substantial legitimacy of the participation to the crowdfunding campaign. A potential supporter might expect that other people finance the product so that he will enjoy it after the purchase, once available through the traditional channels. Or, if the product is not financed, he might expect to turn to other products to meet his own specific needs. He decides, instead, to get involved, to participate, not buying, or rather, not simply pre-buying a tangible good, but registering in his name a fraction of the moral property of that product.

The element of the sharing of the moral property, which is accepted by the campaign creator even before he can describe the product, the methods of implementation and before to be able to open to the public his campaign, distinguishes the crowdfunding and its inherent need to build a community. After all, it is based on an exchange. The campaign creator, owner of the potential property of the product/idea, provides the moral property in exchange for the feasibility of the same. He shares something to get something else in a mechanism of mutual exchange and mutual enrichment that creates relationships at different levels, some destined to manifest themselves in the material exchange as money for goods, others destined to precede this exchange and to survive to it once it has been perfected.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Crowdfunding shows all the elements that belong to the sharing economy: an element of exchange, an element of reciprocity and the construction of relationships of mutual satisfaction.

Therefore, it is not correct to say that a crowdfunding campaign is animated by two separate interests, that is to raise money to implement the work and to receive a copy of it, but rather these two interests, which constitute the premise of the campaign, merge together into one common interest on the basis of that element of interested solidarity of which we talked about at the beginning. This interest is shared by the entire community.

While keeping in fact a distinction of roles, both campaign creator and backers have an active function, because it is mainly the activity of the latter that determines the success of a campaign. In fact, we focused until now on the activity of the backers within the platform and in the page of the campaign, but it is only one aspect of the activity of the backers.

Backers are called to share the news of the campaign, its evolution and its results. The campaign creator can certainly push them in this sense, but the solicitation is implicit and inherent to the crowdfunding, so much so that almost all platforms integrate sharing tools, which are mainly designed for the backers in the hosted campaigns. In fact, it is assumed that the campaign creator is not able to reach a large audience alone - that is if he had the economic means and/or media he would not undertake, with all probability, a crowdfunding campaign - and it is, therefore, up to the backers to share the message of the campaign, either through a message addressed generically to their contacts on the social networks, either through more specific business relationships with other people potentially able to sensitize a wider audience (e.g., influencers, journalists, bloggers, etc.).

We will not dwell here on the means of dissemination, although they are interesting and innovative, but we will focus on the mechanism of involvement in the relationship of trust existing between campaign creator and backers. As we have already seen, the relationship of trust is a relationship aimed at establishing the rules of a community and, as such, it has a value merely within the same community. When a person, who has become a backer adhering to that relationship and has contributed to its subsequent construction and explicitness, suggests a crowdfunding campaign to others, he actually suggests adhering to that relationship, becoming its guarantor. We return to the campaign for the time machine of Mr. Blue, the campaign creator. Mr. Yellow decides to adhere to the system of rules proposed by Mr. Blue, becoming in this way a backer. Shortly after joining it, Mr. Yellow suggests publicly that the time machines, once they are ready, will be shipped by airmail, an aspect that has never been specified before in the campaign. Many of the backers adhere enthusiastically and Mr. Blue takes note of this request, perceived as a need by the community, updating the description of the campaign. Since then, the shipping by airmail has become an integral part of the rules of the campaign as well as of the expectations of the community. However, when Mr. Yellow shares the campaign, he does not share his specific contribution to the campaign, neither in economic terms, nor in terms of the proposal, but the entire set of rules as they have been established since that time. So, Mr. Yellow adhered to the proposal of Mr. Blue, after receiving a message from Mr. Yellow, Miss Red decides to become a backer giving her trust to Mr. Yellow, who she already knows to have a good reputation, even before than to the community or to Mr. Blue, who is a totally unknown stranger for her.

In this way, therefore, reproposing the original relationship of trust, Mr. Yellow is not only a substitute for Mr. Blue, because he represents the entire community.

It could be objected that the mechanism is not so innovative, it is the traditional word-of-mouth that always, or almost always, determines the fortunes of restaurants, museums, gyms, hotels, etc. However, we can identify two elements in my opinion highly innovative. The first one is that when Mr. Yellow

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

suggests participating in the campaign, he has not had the opportunity to try the product of Mr. Blue, therefore the relationship is based only on trust and what happens in the moment when Miss Red is also involved reproposes precisely the relationship of trust. The second element, in my view highly peculiar of crowdfunding, is the attitude of this mutual trust to create value. The community does not die with the end of the crowdfunding campaign and we have seen more than one case in which the community at the end of the campaign is transferred to other portals (social networks, etc.), but it has continued to be active, representing on the one hand a source of strength for future works of the campaign creator and on the other hand an aggregate and active group of individuals joined by an experience as well as by a strong common interest. To remain in this example, it is certainly possible that those who financed the time machine of Mr. Blue are interested then, a few years later, to the illustrated guide for travelers in the time that Mr. Purple proposes to implement, if he reaches his economic objective.

That is to say that aggregating people concretely motivated around an interest, and for it willing to invest, makes easier to find in the future funds for activities that are related to that interest, but we will return to this in detail in the chapter on specialized (or vertical) crowdfunding platforms.

The elements that I would like to highlight in this reconstruction are that crowdfunding is not governed exclusively by the rules of law and the regulations of the platforms that host it.

Every campaign involves the construction of a community, with its specific rules, that are in part pre-established by the campaign creator and in part the result of the interaction of the community. However, these rules do not live in a closed set, building a case history to which the future campaigns will not necessarily have to conform, but with high probability they will use as a parameter. Although it is not possible to identify the rules that are common to all the crowdfunding campaigns, we can observe an evolution mostly harmonic between different campaigns with respect to the methods, the mechanisms of involvement and, of course, the rules. The lowest common denominator of the crowdfunding campaigns is the sharing of resources aimed at achieving a common interest as the sum of two different interests; the pursuit of this common interest can be defined as the moral property of the work or product. This moral property does not lose its importance with the subsequent commercialization of the product in the same way that the community and the sense of belonging/identification do not disappear. In this manner the crowdfunding campaign creates value also for third parties, not because, and not only because, there is the implementation of something that did not exist before and that can meet the needs and requirements which had not been satisfied until then (crowdfunding is not, in fact, the only existing system to finance projects), but because of its nature, of its being able to unify communities that previously did not exist, communities that could be facilitators, in their area, of future projects, which may, but not necessarily must, pass through new crowdfunding campaigns.

It also represents a democratic, transparent and accessible validation system for the proposals of the campaign creators, through a system that rewards the usefulness and interest in a project and that, in theory at least, puts in a position to collect important figures campaign creators little known, but with a good idea - and an educational and professional background - which demonstrates that they are able to implement it, or at least to create a trust relationship in this sense.

NOTE

To refer to systems of specific rules, we have taken into account the internal regulations of Kickstarter and Indiegogo platforms, both because they are globally widespread and because the level of complexity of the issues faced by the two platforms has allowed them to develop a comprehensive system of rules that is functional to their activities and has become a reference point for all the reward crowdfunding platforms, at least as regards the policy.

Chapter 22
Vertical and Community-Based Crowdfunding Platforms

Tomaso Greco
Università degli Studi dell'Insubria, Italy

ABSTRACT

If the inherent nature of the horizontal crowdfunding platforms makes the relationship between campaign creator and backers basically without intermediation of the platform, in the case of vertical platforms there are different and sometimes complex levels of intermediation. The vertical crowdfunding platforms can be considered more than a subset of the horizontal crowdfunding, as an independent system of relationships and rules which has in common with the horizontal crowdfunding a large part of the fundraising methods, but that is also profoundly different with respect to the aggregative procedures and the system of rules.

INTRODUCTION

Beside the above-mentioned horizontal platforms, a large number of specialized and local civic crowdfunding platforms have spread in recent years.

The specialized crowdfunding platform has in common with the generalist platforms the method and, in some ways, the approach to funding, even if there are more or less differences - depending on the platform that we are considering - with regard to the development of internal communities and the system rules which determines their daily lives.

We have seen the emergence of crowdfunding platforms exclusively dedicated to publishing, culinary art, music, wine, culture, cinema and many other specific interests. They are, in almost all cases, platforms of reward type, aimed at the implementation of the project, project of which some examples/copies will be sent to the supporters as a reward.

Not all platforms have a global vocation; in fact, the most of them combine the criterion of specialization with the one of territoriality. The common feature, in any case, is the verticality.

In fact, if the inherent nature of the horizontal platforms makes the relationship between campaign creator and backers basically without intermediation of the platform, in the case of vertical platforms there are different and sometimes complex levels of intermediation. It could be argued that this distinction is not necessarily due to organizational reasons: the staff of a horizontal crowdfunding platform cannot certainly be omniscient, while it is likely that the staff of a vertical crowdfunding platform can boast strong and specific skills on the specific area of interest of the platform.

In reality, this argument would be quite insufficient to explain the real reason for the need to create platforms that are strongly vertical. Moreover, this need finds a correspondence in the choice of many campaign creators to rely on a vertical platform rather than on a horizontal platform.

For a correct examination we will have to compare the three different types of methods of fundraising through crowdfunding: with horizontal platforms, with vertical platforms and with self-hosted campaigns, that is campaigns hosted directly on a pre-existing website of the campaign creator or on a website created for that purpose.

In the horizontal and vertical platforms the campaign creator will count on no entry costs or almost non-existent fees while for a self-hosted campaign he will need to acquire the necessary technology, to enter into agreements with one or more payment systems (especially if the campaign involves the all-or-nothing method, a method according to which the payments of the backers are effectively collected only if the campaign reaches its pre-fixed goal), and also to establish a system of rules relating to the campaign, the payment management and the privacy of the backers. The economic advantage, on the other hand, is that on a platform (either horizontal or vertical) the campaign creator will have to pay a fee on the total amount of the campaign, while on his website, as it is reasonable to expect, there will be no fees to pay.

But the choice of the campaign creator to rely on a platform rather than another, or to prefer a self-hosted campaign is certainly not only due to an economic aspect.

Otherwise, there would be a race to the bottom of the fees of the different platforms, a race that could not obviously have a different ending than the survival of a single platform: the one with the lowest fees. However, the offer of crowdfunding platforms is going in a different direction, and the reasons for the effective failure of the *"*war of the fees*"* is, in my opinion, due to the different needs of the campaign creators, related to the different characteristics of the campaign creators themselves and their projects.

Which characteristics, in fact, orient the choice of a campaign creator? We start from the lowest common denominator: to fund a project. However, to do it, there are also other channels, while the peculiarities of crowdfunding, as we have seen in the chapter on horizontal platforms, is to build a community around a project and, through the community, to give the maximum possible visibility to the project, developing its potential in a context of constructive dialogue with the backers.

In other words, we need to recall the four basic elements of a crowdfunding campaign: project, campaign creator's profile, duration and economic objective to be achieved. On the basis of these elements it is established or, rather, it is possible to establish a relationship of trust between the potential supporter and the campaign creator. However, to establish the initial relationship of trust, it is necessary and preliminary an element of validation of the project. This does not mean the attitude of the project itself to be valid, but that it appears to the potential donor as valid. This process can take place, in the horizontal crowdfunding platforms and the self-hosted crowdfunding platforms, through three different elements: the potential backer may have the technical knowledge to define the proposed project as valid, the potential backer may deem necessary to fund that particular project, the profile and reputation of the campaign creator provide sufficient guarantees to the project.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

It is clear that the relationship of trust is based on the unknown, on the result of a promise, result that could be postponed at the end of the campaign and, in most cases, even several months after the end of the campaign. However, these three elements are generally sufficient, considered individually and even more combined with each other, to justify the participation in a campaign, validating at least the premises of the project.

But this does not implicate that all good projects can meet at least one of the three requirements. Vertical crowdfunding platforms compensate this lack, firstly - as we will see - aggregating communities with similar interests and, therefore, that potentially have strong technical knowledge in the specific area of the project, on the other hand - and above all - providing an independent validation element, express or implied.

In fact the most of the platforms of vertical crowdfunding evaluate project (and campaign creator's profile) even before that the campaign begins, in some cases granting or not hospitality to the project, in other cases ensuring or not the visibility on their platform. It is a rigid, or less rigid, barrier at the entry, which responds to two distinct needs: on one hand that potential supporters find a good quality and reliable proposal because it was already validated by the platform, on the other hand the same platform needs not to saturate its public with proposals of poor quality or that will hardly reach the pre-fixed goal (it must be remembered that the platforms, especially those that use the all-or-nothing model, receive their fee only upon successful completion of the campaign).

This selection at the entry, which is a first validation parameter of the project, is an intermediation element of the relationship between campaign creators and backers and, as we will see, it will not be the only one.

A feature common to different vertical crowdfunding platforms is precisely to provide services, boasting a specific knowledge of crowdfunding campaigns for a specific sector. These services can sometimes be optional, but most of the time they are inherent to the offer of the platform.

A service of great importance for the present discussion is the so-called campaign strategy service, that is the preparation of explanatory content of the project, of its methods and of the rules of the campaign. In this way, the platform meets two needs: the author's own need and the own need of the community of subscribers of the platform.

In fact, it is not at all certain that an author with a good idea is also able to communicate and build a series of promises around that idea for the potential supporters. For example, we can consider a writer who has a good project for a book, or at least a project for a book judged valid by the platform. It is not at all certain that he knows how to prepare his own crowdfunding campaign, nor it will be enough just to know the general rules of the platform for doing it. In fact, he could make a series of errors, in good faith, with the effect to ward off potential supporters, rather than to involve them in the project. He could, for example, omit an even hypothetical delivery date, or fix it as too remote in time, or not be available for dialogue and interaction with the backers or even not explain in sufficient detail the key elements of his manuscript, as well as he could not highlight the elements of his professional background and culture that make him the right person to write and publish that particular book. In meeting these needs the platform on the one hand will try to study the best strategy for that specific campaign, and on the other hand it will apply a set of rules and methods which, always through the campaign strategy service, have already been seen and experienced in other campaigns of the same platform. This aspect ensures strong homogeneity to the campaigns present on the vertical crowdfunding platforms and marks a profound difference with respect to the horizontal platforms.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Therefore, in the horizontal platforms, as we have seen, each campaign develops a set of rules, while respecting the general rules of the platform, and around these rules aggregates its own community of backers, it matters little, in our reasoning, that all the backers contributing to the various campaigns of a horizontal platform will form the user base, in fact user base and community are two very different concepts. Users of a horizontal platform may be very heterogeneous among them with respect to their interests: it is not at all certain that persons who have funded a new model of backpack may then be interested in an innovative coffee machine. Indeed, there are the same opportunities as for anyone else. Nor those who have supported the campaign for the backpack will expect to find the same rules and procedures at the time to support the campaign for the coffee machine. For those familiar with social networks, it is easy to make a comparison with Facebook groups. The platform (Facebook) provides a number of possibilities and provides a set of rules. The groups hosted on Facebook, within the rules of the platform, may provide specific rules designed to lead at the best the discussions on their specific theme. Each group may, however, adopt special rules, while sharing the same frame.

Unlike the case of vertical platforms, where the supporter of a campaign may theoretically be interested in supporting any proposed campaign platform, and, therefore, if it is true that each campaign builds its own specific community, it is equally true that all communities are, in fact, a subset of the community of the platform. In other words, the community that aggregates a single campaign will be partly made up of people who have already funded other campaigns on the platform and partly of new supporters who will actually populate also the general community of the platform. Therefore, there is not a rigid boundary between the communities of the platform and the community of individual campaigns; in this way the individual campaigns will have an incentive, when not explicitly forced, to adopt rules that overlap each other, in which each member of the platform can easily recognize himself and that generate the same expectations. This does not exclude margins of customization of rules, but such customization must not affect the overall system of rules of the platform, or the system of rules and procedures that generally the campaigns of the platform adopt. We return to the example of the writer: who decides to fund the campaign for his book on a vertical platform will expect, if he has already funded a book earlier on that platform, the same methods of interaction with the author. Methods which may vary, mainly in the sense of being strengthened only if the specificity of the text requests to do it and the exceptional nature of that greater interaction is such that it is clear to all supporters and does not modify their expectations with respect to the platform.

To conclude this part of the reasoning, it seems a correct simplification to argue that in the horizontal crowdfunding the relationship of trust is mainly between campaign creator and backer, while in the vertical crowdfunding it is, instead, characterized as a trilateral relationship of trust between platform, campaign creator and backer. For this reason, the horizontal platforms will tend to give a good dose of freedom to the campaign creator in identifying the rules and procedures of his campaign, while the vertical platforms will aim as much as possible at maintaining homogeneous procedures and rules, not being satisfied only to define the scope of the rules, but building together with the campaign creator - or even replacing the campaign creator - the profile of the campaign. It is, therefore, a relationship explicitly intermingled, not only as regards the methods. Backer and campaign creator, in fact, expect that also the final product is the result of a relationship between platform and campaign creator, more or less invasive depending on the number and the type of services that the platform offers to the campaign creator.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

In other words, a project that is funded through a successful crowdfunding campaign on a horizontal platform will have taken a path of validation from the bottom, having found a certain number of backers willing to commit a certain amount of money. A project that is funded through a vertical crowdfunding platform, vice versa, will have obtained a double validation process: from the top with respect to the platform, from the bottom with respect to the backers.

But also in the specific relationship between campaign creator and backer it is possible to assist, in vertical crowdfunding, to a situation of co-creation that goes well beyond what has already been observed about the instruments of participation and internal democracy of horizontal crowdfunding campaigns.

In fact, being able to turn to a less heterogeneous audience and, of course, more vertical, the campaign creator cannot only record its desires and draw important information on how to enhance the project, but he can draw from the individual skills and experiences that will characterize a vertical crowdfunding campaign as a true moment of collective intelligence. In fact, the campaign creator can often find, among his backers, those willing to make available skills aimed at achieving the common goal of making feasible the final product. In this way, returning to the example of the book, our writer can find people willing to proofread, to carry out a thorough editing, to make the cover or the website of the author. Or, more generally, the writer could find some people willing to give advice not generically motivated by their personal taste or their desires, but rather on the basis of a specific knowledge of the target market.

It should be noted another important difference between the horizontal and vertical platforms precisely with respect to the target market. In fact the latter will, in all probability, be most frequented by market operators (and consumers), with the result that there will almost automatically be the passage of the project from a prototype for a community of supporters/early adopters, to the distribution in the target market.

We will explore more in depth the rules and procedures of the different platforms of vertical crowdfunding in the following paragraphs. As mentioned above, there are considerable differences between them, due to the specific field under consideration, their territoriality, some peculiar choices of their founders and, more generally, due to the fact that if the crowdfunding is still a young and, in some ways, unexplored field, the vertical crowdfunding being one of its expression will still need some time to reach full maturity.

CROWDFUNDING PLATFORMS FOR MUSICIANS

The most common vertical platforms include platforms to finance independent music, that is the musical productions that rather than use traditional methods to raise money, prefer to rely on fundraising from the bottom. It should be noted that a certain part of the music production in crowdfunding does not pass through the vertical platforms, and we will examine some platforms merely for illustrative purpose, aimed at comparing the rules and operational methods of the different platforms. In fact, it is not possible and it is not our aim, to provide an exhaustive list neither for music platforms nor for other platforms.

In particular, we will compare the models of PledgeMusic, Sellaband and MusicRaiser, platforms, that differ profoundly, despite having in common the crowdfunding and the verticality with respect to the music.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

PledgeMusic

PledgeMusic is a London-based platform, but it also has offices in New York and Boston, exclusively dedicated to music, although in its broadest sense (in fact, you can also finance concert DVDs, books etc., if they are related to music). It is a reward platform, in the sense that it accepts campaigns that recognize a reward to the supporters (basically the musical album that has been funded). It accepts campaign creators (musicians) regardless of whether they are signed record label artists or completely independent. It provides both of all-or-nothing crowdfunding methods, for the projects yet to be implemented and funded, and methods of keep-it-all campaigns, called pre-order, which allow artists to make their albums available for purchase before they are available on the market. This second model, which actually is not intended as a real crowdfunding, however, allows to international artists to participate in the platform, raising their profile and, ultimately, helping indirectly emerging artists. The fee, in both the cases, is 15%.

The platform does not provide a selecting mechanism at the entry ("You must evaluate, and bear all risks associated with, the use of any Content or any reliance on said Content, and in no circumstances will PledgeMusic be liable in any way for any Content or for any loss or damage of any kind incurred as a result of the use of any Content made available via the Service. You acknowledge that PledgeMusic does not pre-screen or approve Content, but that PledgeMusic shall have the right (but not the obligation) in its sole discretion to refuse, delete or move any Content that is available via the Service for any reason." fromTerms and Conditions, PledgeMuisc, 2015), nor provides special services to the artists, however, it advises to involve the public as much as possible.

In doing so the platform does not assume responsibility for the music produced by the artists nor with respect to the contractual obligation contracted between artists and audience ("PledgeMusic is under no obligation to become involved in disputes between Pledgers and Artists, or between Pledgers and any third party. In the event of a dispute, you release PledgeMusic, its officers, employees, agents and successors from claims, damages, or demands of any kind, known or unknown, suspected or unsuspected, disclosed or undisclosed, arising out of or in any way related to such disputes and our service. Artists are wholly responsible for fulfilling obligations both implied and stated in any campaign they create." from Terms and Conditions). However, the platform maintains a form of control on the effective delivery of the rewards to the backers, as we can read in the Payment Processing and Payout Details "Automated payments are executed as follows:

1. 75% of the target 15% PM (PledgeMusic nd) commission is released the Thursday after the funding finalizes. This equals 60% of the target amount (and accounts for all of PM's commissioned funds on the target amount).
2. 25% of the target is released the Thursday after the download portion of the campaign is released on PM. If PM is not sending this release, or there is no digital release product, a bespoke payment request needs to be justified to accounting in order for these funds to be allocated.
3. All remaining funds above the target amount 15% PM commission are released the Thursday (post a 2 week holding period) after all items have been marked as shipped and all outstanding questions have been answered and closed."

This expectation appears aimed at ensuring the credibility of the platforms and to protect against the eventual delays in the implementation and shipping of the work.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

The management of the rights of the artists is also interesting because, even if specifying that these rights remain available to the artists, the platform requires in Terms and Conditions:

Artist shall fully own all the intellectual property to all publishings and recordings they create through or result from their Campaign. Artist grants to PledgeMusic a non-exclusive, worldwide, royalty free license to reproduce, digitally distribute, and publicly perform the recordings (as well as any underlying musical compositions) created or contributed by the Artist as part of the Campaign via any means developed, owned, or controlled by PledgeMusic or its partners solely for the purposes of promoting the Artist's Campaign or PledgeMusic. Artist also grants to PledgeMusic a non- exclusive, worldwide license to (i) to reproduce, display and distribute any artwork, photographs supplied by the Artist, liner notes, metadata, track data lyrics and editorial content relating to the recordings, and (ii) to use the name (including professional name(s)), likeness, performances, photographs, and biographical material of each performer, producer, and songwriter featured on a recording, in connection with promoting the Artist's Campaign or PledgeMusic. Notwithstanding the foregoing, Artist acknowledges and agrees that PledgeMusic's business model may involve free promotional downloads and/or streams of recordings. (PledgeMusic, n.d.)

It is interesting to note that the types of behavior and interaction within the campaign are also closely regulated, providing a true "Code of Conduct", which is not reported only for reasons of space, tracing in a large extent, the rules of conduct and etiquette that every user, and in any case the users of a crowdfunding platform, should follow on the global network.

SellaBand

The mechanism proposed by Sellaband has many features in common and some element of distinction. Since from the introduction page of the site it is clear that Sellaband relies on the value of the community (the backers are called "Believers" in the front end and "project sponsors" in the policy) and on the experience of the platform in the sector.

However, the platform does not make quality control on the proposed campaigns, but it establishes a minimum funding target to the campaigns of € 3,000 and a maximum funding target of € 250,000. Like PledgeMusic, Sellaband also accepts both artists signed to record labels and independent artists. Sellaband accepts campaigns aimed at three separate targets "for music recordings, for promotion/marketing, for live concerts/ tours/festivals" (Sellaband, 2015) provided that they are always closely related to the world of music.

It is very interesting the role of Sellaband, which acts as "interface between you, the artist, and your investors, who are hereinafter referred to as project sponsors, and as the administrator for the invested money" (Project Financing Agreement Sellaband) and as such assumes a role which hardly could be called passive or mere tool. The maximum limit provided for campaigns is 12 months and is announced when the artist activates the project, even if "SellaBand can also determine final dates for achieving certain percentages, so-called milestones for the project financing goal", if these interim targets are not satisfied the project is de-activated (a kind of all-or-nothing made even more severe with regard to timing, however, this expectation is mitigated by the fact that the artist is allowed to increase or reduce the goal of the campaign before the goal is reached). Another peculiarity is that in the event of the successful conclusion of the campaign, the platform will retain 15% as fee, but will not directly transfer the rest to

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

the author, in fact SellaBand "will rather pay the invoices authorized by the artist on his or her behalf for the experts in order to conclude the music project". It is an element of protection of the backer and also of the credibility of the platform, because if it is true that the artist can choose providers/technicians which he better prefers to finish his project, it is also true that the payment is handled by the platform. Consequently, the system is difficult to circumvent and the risks of a lost production of the album are low.

As regards the rights management, Sellaband specifies:

The artist may design his or her career freely and, according to this agreement, has the right to complete contracts with record companies, managers, agents or publishing houses. The artist retains 100% of his or her entire music rights

and also that

SellaBand will not assert any claims to the copyright, master right or other rights in connection with the music project.

The aspect related to rewards is particularly interesting, partly because the artist is obliged to include in the rewards:

A music download in connection with the music project at minimum. The artist may offer other benefits in the form of benefits in kind, which may also include CDs, T-shirts, concert tickets, etc. All offers are effective only after achieving the project financing goal and completing the music project", but also because it is provided a kind of economic reward for backers, through a mechanism configured as follows: "The artist may distribute offers to potential project sponsors about the purchase of project shares in the music project. This offer may contain a financial component and benefits in the form of benefits in kind. The financial component corresponds to a percentage of the possible profits which are generated in connection with the music project. This percentage share must be determined before activation of the music project. The artist has the right to increase this percentage share before the project financing goal is achieved […] If applicable, the project sponsors' participation in the profits runs throughout the entire duration of the project. For music recordings, this period is 5 (five) years and begins on the day of the publication of the music recording. The artist undertakes to distribute all net profits that are generated in connection with the project […] If the model for the participation in profits is used, the parties are obligated to provide each other with quarterly reports showing all gross and net profits in connection with the commercial exploitation of the music project. The parties have the right to mutually review the accounts and documents associated with the gross and net profits of the music project. (Sellaband, n.d.)

It is a model rather complex, involving the backers also from the economic point of view, in the destiny of the work, maintaining an active linkage that is not only moral but also related to material interests, even after the campaign for the implementation of the project has been funded. It could be drawn a parallel with the equity crowdfunding campaigns, in which the supporters become business partners, but I think it is more correct in this case to frame the backers as digital agents; in fact, they not only make possible the implementation of the musical project, with direct, contributions, but in all likelihood they will also determine its spreading and popularity, having the dual interest to spread something that they have helped to fund and with an economic return which could be potentially higher than the amount that they paid.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Speaking of backers and their offerings, it should be noted that the all-or-nothing mechanism operates differently in comparison to other platforms, meaning that if it is an all-or-nothing standard for the artist (if he does not reach the goal by a certain date he does not receive anything), it is not possible to say the same for the backers; in fact, it is provided that "if the project financing goal is not achieved by the final date, all project shares are transferred into the project credit of the project (sponsors of the music project". In other words, funding is not lost, but is transferred to the user's credit, which will then in turn transfer it to another project that he likes.

As regards the services offered by the platform, it must be highlighted that it offers a support service - through a helpdesk - which offers to directly bring on the market the music funded through the platform ("if you want to we can arrange the global online distribution of your music via our partners like Amazon in the UK, USA and Germany, BOL.com in the Netherlands and The Orchard who make sure the music is available in all download stores like iTunes and eMusic") without making this road mandatory for the artist and offers a network of selected partners for several other services related to music production.

Musicraiser

The Musicraiser platform divides the offered services into three main categories: crowdfunding ("The Crowdfunding Service consents the Creator to collect from Users, so called raisers, the required amount of money to realize its Project; the Users, in fact, by disbursing an amount corresponding to the economic value of the chosen Reward will consent the Creator to reach the targeted objective"), wishow ("The Company offers, through the Website, the possibility to organize a music event, a festival or a concert, if the minimum amount of pre-sales is placed to Users. The event may be organized by artists, agencies, promoters, etc.") and pre-order ("The Pre-Order Services may allow the Creator

1. To sell his music album even f still in production (so called album pre-order);
2. To find alternative channels to sell tickets for an event, concert or music venue (so called ticket pre-order) (Musicraiser, 2015).

While crowdfunding and pre-order methods are essentially modeled on what has been seen about PledgeMusic (with the first one offering an all-or-nothing mechanism and the second one a keep-it-all), the wishow offers a hybrid model, offering a keep-it-all crowdfunding designed exclusively for the events, where the pre-fixed goal is not expressed in economic terms, but in number of tickets sold

The Creator must pre-determine the minimum number of tickets to be sold to organize the event. Once the threshold is reached, the tickets for the event may still be sold through the Website until the event date. In case of failure to reach the minimum number of tickets purchased by the Users, the Project will be deemed not realized.

As regards the projects, which are of course eligible only if strictly related to music, the platform reserves a controlling syndicate ("The Project and its profile, the Reward and its corresponding economic value may be subject to Company's assessment and control through discussions and/or verification of personal documentation") and, with regard to the events to be promoted through the wishow, the campaign creator will have to demonstrate to the platform that he received confirmation by the involved artists ("In case of Wishow Services the Creator must deliver to the Company satisfactory evidence of the relevant artist's acceptance to perform the live event on the chosen date.").

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

The duration of the campaigns is exclusively established by the platform ("Project duration is decided by the Company only") and the artist will have to complete the project within one year from the end of the campaign ("The Creator must realize the Project and deliver the Rewards within 1 year from the end of the relevant campaign"). The all-or-noting mechanism is of classic type in the sense that the money is automatically returned to the supporters in the event of failure to reach the goal, unlike what has been observed with regard to SellaBand.

The most interesting aspects is related to the rewards, which are determined by the campaign creator, after approval by the platform ("established by the Creators, subject to the Company's prior approval"), not so much because their costs and the responsibility for their implementation are up to the author ("The Creator is fully responsible for the delivery of Rewards to the Users and shall bear any related costs"), a feature common to other platforms so far analyzed, as well as the rule of modest economic value of rewards ("Rewards are strictly non-monetary in nature, with little economic value and can no longer be modified once the Project is uploaded on the Website"), generally a characteristic inherent to the platforms of donation type, while the reward platforms usually provide rewards with an economic value quite similar to the amount committed by the backer.

Therefore, this is a platform that adopts an average criterion between the total opening to every proposal and a strict form of control, that is maintaining an approving judgment on the proposed campaigns, but at the same time not making selections and not taking responsibility for the campaigns

The Company makes no representations or warranties, express or implied, with respect to accuracy, completeness, authenticity, legality or decency of the contents and materials uploaded on the Website by the Users. [..] The Company is not responsible for missed delivery of the Rewards by the Creator, events cancellation or failure to deliver tickets in case such activities are performed by third parties.

Rights management is transparent and limited to the offered service, advertising and communication:

Musicraiser has no intellectual property rights on the Projects uploaded on the Website. However, the Creator grants the Company and others acting on its behalf, the right to use the contents, brands, logos or similar intellectual property […] The above rights, limited to the Project uploaded on the Website, are irrevocable, royalty free, transferable and with no territory limits. As effect, the Company shall use the materials uploaded and published by the Creator on the Website with the purpose to distribute them, create derivative works, visualize related products without sort of limitation.

The platform provides a fee of 15%, promises to invest in promotion of the hosted campaigns, offers a service to the artists/campaign creators for the creation of the campaign and the distribution of music funded through the Tunecore service.

As in the case of SellaBand, there is a specific network of partners for the music sector.

CROWDFUNDING PLATFORMS FOR WRITERS

Publishing is another area of great interest for vertical crowdfunding. We will here consider only two platforms, both in English, which have in common the verticality, but differ profoundly for goals and methods: Pubslush and Kickstarter.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Pubslush

Pubslush is proposed as an open platform, in the sense that it does not make a selection at the entry (it only requires that proposals are "edited for spelling and grammar, and formatted properly" and that they do not impose unrealistic rewards) (Pubslush, 2015), specifically for writers who want to fund their own book through crowdfunding or who want to sell copies of their book before it is published through a pre-order mechanism.

On all aspects, two in particular appear to be of greater interest. The first one is the length of the crowdfunding campaigns, which have a deadline between 15 and 45 days (therefore, these campaigns are very short), the second one is the fee of 4%, which is lower not only than the standards of vertical platforms, but also than the ones of horizontal platforms - it should be noted that the fees of Kickstarter and Indiegogo are 5%).

Against a fee so accessible, the platform offers a series of packages upon payment, including promotional activities and publications, ranging from 50 to 1000 dollars, aimed at the success of the campaign.

It is a large list of activities, made possible by the verticality of the platform. However, it should be noted that in the keep-it-all crowdfunding campaigns there are immediate costs which have to be paid by the author, without being sure of achieving the goal (the risk, in this case, is asymmetrical between author and platform).

With respect to the copyright, Pubslush requires the writer a license limited to the needs of the campaign and platform

With respect to all Content, by submitting Content to Pubslush, you hereby grant to Pubslush, a worldwide, non-exclusive, royalty-free, sub- licensable, perpetual, irrevocable and transferable license to use, reproduce, adapt, publish, translate, distribute, prepare derivative works of, display, and perform the Content in connection with the Service and the business of Pubslush, and of its successors and assigns.

Pubslush boasts a rather large community, made up of writers, readers, publishers and partners in the publishing world.

Unbound

A different model is proposed by Unbound, a platform that accepts only crowdfunding campaigns aimed at the implementation, preparation and marketing of a book, strictly unpublished ("We cannot publish books which have been previously published or have been available to buy previously, even if the book is now out of stock or (in the case of self- publishing) you have stopped selling this yourself.") (Unbound, 2015). Firstly, the model differs because Unbound makes a selection of the proposed texts, through a selection process lasting about 6-8 weeks and it should be said that to participate in the selection the author must provide detailed information about himself and his work but the latter does not necessarily have to be already completed ("We do accept submissions for books which aren't yet written, but we would need to see evidence of the quality of your writing."). After passing the selection, the author will receive support for the creation of the campaign in all its aspects ("We need to get print estimates, work out the funding target for the project, sign a finished contract, shoot and edit the video and come up with a marketing plan before a project goes live").

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

The campaign is designed to cover the costs "Our editorial team review all projects to determine the cost they will need to raise in order for Unbound to publish them. This varies depending on the type of project. The average cost for text only books is around £15,000 whereas illustrated, photographic books cost considerably more. The costing includes everything from copy editing, editorial, production, marketing and distribution into the trade") of the activities necessary for the publication, and once covered these costs the platform will share profits with the author ("Unbound shares 50% of all profits (after costs) with the author").

Consequently, it can be said that on a campaign with a standard duration of three months (but which can vary depending on the project's needs), the platform withholds 100% on the economic objective, holding then 50% on the amounts subsequently collected (moreover, the platform when asked whether there are provided advance payments for the author, has specified

The target of the project goes towards the producing of the book, so no advance is given as this makes the funding target higher. After the project reaches 100% and the book is published the profits are split 50/50 with the author and Unbound. So, although there is no advance authors do get all of the benefits of having their book published by a publisher and get more of the profits than with a traditional publisher.

It should be considered that the goal proposed to the public, particularly important considering the all-or-nothing model adopted by the platform, is expressed as "pledges" regardless of whether there are offers from 10 to 20 pounds, or 1000, and then not in relation to a figure to reach. If on the one hand this allows to evaluate the actual potential of readers of a book (and it will not be published a book with a few - but generous - supporters), on the other hand this could discourage supporters very motivated to donate more because to donate a larger amount would not achieve any practical benefit for the book and the writer.

The role of Unbound thus seems to be a hybrid between the role of a crowdfunding platform and a traditional publishing house ("We act as your publisher") drawing up a specific publisher-author contract, by reason of which the platform generally holds the publishing rights of the volume that has been funded ("When a project is published Unbound usually own the worldwide or English language rights, but this can vary on a project by project basis as this can be negotiated in the contract."), for which it will provide all activities necessary for its publication ("We edit and proof all of our titles using in house or freelance editors and proofreaders. This is arranged by the managing editor and production manager. We organise for the cover art and design work to be completed along with the typesetting and internal design work. We collaborate with our authors on the production side of their books, and we would certainly work with you on some design aspects.") and will ensure the dissemination of the book by the distribution into bookstores ("We use a third party sales team to sell trade editions of Unbound books into bookshops") and advertising ("We help with traditional publicity, but encourage authors to help with this where they can"), always maintaining a high level of involvement of the author and sharing 50% of profits with him.

The all-or-nothing model has some points in common with the one proposed by SellaBand in the music sector; in fact, if a book is not funded, the credits are returned to the availability of the backer and the backer can use them to support other books, or may request a refund to the platform ("If a project fails to reach its target of readers all credits will automatically be returned to the user's account. The user can then allocate those credits to other book projects or they can contact Unbound for a full refund."). The rewards are shipped directly by the platform, which updates the backer on the timing of preparation and shipping ("After a book reaches 100% it normally takes around 6-8 months from the manuscript hand-in

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

date to go through all of the editorial and production processes. We'll send you updates throughout this time.") and deals with the reimbursement if it was not able to send the reward ("If a project reaches its reader target, but for whatever reason, Unbound fails to deliver the associated rewards to the user, then Unbound will refund these credits so they can be applied to another project.").

Although they both are dedicated to the publishing world, and mainly (but not only) to the emerging writers, Pubslush and Unbound differ to a greater extent than we have seen with regard to platforms for music. It could be argued that, beside the crowdfunding mechanism which represents the common phase in Pubslush and Unbound (albeit with significant differences related to the method), the services offered by the two platforms differ so much to have two different purposes: Pubslush for the publishing world, Unbound for the traditional circulation of books. Therefore, we should focus on the goal that motivates a writer to choose a crowdfunding platform (in primis) and to prefer a vertical platform to the inevitably more popular horizontal platforms. In fact, the author will not want to collect money, since the amount collected by the campaign should be functional to the creation and promotion of the submitted book and it should not - or at least not only - be seen as an economic compensation for the author, but in order to provide the best service to his own work.

That is to say, the entry into the target publishing market whether it is self-publishing or traditional publishing.

THE PATREON CASE

In conclusion of this brief and illustrative overview of some types of vertical platforms, I decided to consider Patreon, a platform dedicated to "content creators" (ranging from movies to writing, from comics to educational content), that more than a real crowdfunding platform could be called a form of micro-patronage.

It is, in fact, a mechanism that allows supporters to offer a monthly amount (which is a kind of subscription) to allow the content creator to continue his activity being financially supported..

In a platform like Patreon, the value of the community - and of every community built around a project and its creator - is even stronger and more central than what has been observed previously, for two distinct reasons: the pledge was renewed several times and it is, in most of projects, difficult to distinguish between campaign creator and project. This centrality is also recognizable in the rules of the platform.

In fact, the provided guidelines - in addition, of course, to ensure the authenticity of what is proposed by the creators - ("Do not put up fake pages or collect money for things you're not actually doing. You also can't use Patreon as a prank or to fund non-activity."), inhibit the use of the platform for certain categories of proposals ("We don't allow funds to be collected for organizations that promote, forums that distribute, or anything else that primarily facilitates harmful or dangerous activities. For example, an organization that promotes sexual abuse, intellectual property violations, weapons, commercial spamming, self harm, drug manufacturing techniques, or property crimes would be prohibited from receiving funds through Patreon") and even of individuals because of their conduct outside the platform ("We impose restrictions not only on the types of media and projects that can be funded on Patreon, but also on which people can and cannot receive funds through Patreon. After creating a Patreon page, any Creator caught in the act or convicted of making credible violent threats, committing violent crimes, malicious doxing, coordinating nonviolent harm such as fraud, or encouraging others to do the aforementioned harmful activities may be banned from using Patreon.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

People with a dangerous criminal history or known affiliation with violent or dangerous groups including terrorist or cyberterrorist organizations, organized criminal groups, and violent hate groups, cannot receive funds through Patreon, no matter the purpose or apparent intention of their Patreon page. Similarly, anyone who has ever been convicted of child sex abuse, fraud, or money laundering is not permitted to collect funds through Patreon.")(Patreon, 2015).

These are limitations that rigidly regulate the entry into the community, limitations that can be defined more subjective than related to the proposals and their contents. From this point of view Patreon itself as platform/tool, specifying that

atreon.com does not take part in the interaction between Users. Patreon.com does not have control over the quality, timing, legality, failure to provide, or any other aspect whatsoever of any ratings provided by Users, Content provided by Users, nor of the integrity, responsibility or any of the actions or omissions whatsoever of any Users.", and also "The Service is only a venue for connecting Users. Because Patreon.com is not involved in the actual contact between Users or in the completion of the Content Creation, in the event that you have a dispute with one or more Users, you release Patreon.com (and our officers, directors, agents, investors, subsidiaries, and employees) from any and all claims, demands, or damages (actual or consequential) of every kind and nature, known and unknown, suspected and unsuspected, disclosed and undisclosed, arising out of or in any way connected with such disputes.

The platform holds 5% of the amount collected as fee, the goals of the campaigns, considering the model of Patreon, are entirely optional and indicative, although the authors are encouraged to include them.

It is particularly interesting to see whether, and to what extent, Patreon becomes a system used on a large scale, not so much to fund projects, but to ensure an income - and especially the main source of income - for creators of cultural and informational content.

CONCLUSION

For reasons of space, we analyzed only some vertical platforms. However, in my opinion, this short comparison allows to identify the rapid evolution from a sociological point of view, from the point of view of the crowdfunding models and from the point of view of the system of rules.

In fact, it could be observed that, at least from the point of view of music crowdfunding, there are several points of contact between the platforms, without that this has undermined the research to offer a service as close as possible to the needs of the artist through elements of strong originality.

Even where we have observed the strongest differences, that is in the platforms for writers, it should be noted a common element in the value of the community and the creation of an ecosystem of relationships with subjects belonging to the target market.

Then, the vertical platforms can be considered more than a subset of the horizontal crowdfunding, as an independent system of relationships and rules which has in common with the horizontal crowdfunding a large part of the fundraising methods, but that is also profoundly different with respect to the aggregative procedures and the system of rules.

At the same time, it is likely that a larger spreading of horizontal crowdfunding could be useful for the world of vertical crowdfunding, also to allow more people to assimilate the economic and relational dynamics that are, as we have seen, a common and shared basis between the two types.

Chapter 23
Crowdfunding as a Marketing Tool

Fabio Allegreni
Crowd Advisors, Italy

ABSTRACT

Most people, at a first sight, perceive Crowdfunding as a specific and exciting process to raise money. Of course, this is correct, but it is not the whole truth. A successful crowdfunding campaign must be addressed to a community of people, rather than to an indiscriminate crowd, which is also typical for any marketing strategy. Leveraging on this key element, crowdfunding can amplify almost any kind of communication activity, provided it is able to meet the needs of a community and to provide the benefits that the community expects. Therefore, if well exploited, crowdfunding is a powerful tool in the hands of marketers, whose potential goes far beyond the evidence of pre-selling a new product, to reach new marketing horizons such as branding, business development, CRM, credit scoring and even HR management.

INTRODUCTION

When Coolest Cooler's campaign on Kickstarter closed in August 2014, it ended up being the most successful Kickstarter campaign ever, raising $13 million from more than 62,000 backers. The target was originally set to $50,000, but, in only two days, the campaign hit $500k. Was such a huge success only a crowdfunding campaign? Clearly not. It was definitely a marketing campaign. Money strictly needed for putting the product into production was only a fraction of the amount raised. Besides funds, the main achievements of the campaign were both a large amount of pre-orders and a worldwide awareness. Are not they two typical goals of a marketing plan?

The takeaway of Coolest Cooler story is that crowdfunding is not only a matter of getting funded, but, also, enterprises can exploit it as a powerful tool to implement a marketing strategy. The ways to achieve this objective may assume different shapes, formats, and even processes.

Moreover, the use of crowdfunding as a marketing tool is not limited to enterprises raising funds, but can be adopted also by those eventually investing. As always, planning and executing a marketing strategy cannot base on general rules, valid for every instance, but should be adapted to each single situation considering the opportunity, the environment and the strategic goals.

This chapter's purpose, far from aiming to present entrepreneurs and managers a set of rules following which their problems will solve magically, is to give them a structured idea and a few hints about how crowdfunding can widen their available weapons to reach their target.

BACKGROUND

Let us start by defining what crowdfunding and marketing are. Other chapters of this book deeply treat the Crowdfunding concept, so here we only remind its main elements. The two key elements are included in its etymology: "crowd", a mass of people, and "funding", collecting money.

However, "a mass of people" is not enough to describe the success of the crowdfunding phenomenon. The crowd - each single individual composing the crowd - must be engaged. Engagement is as more effective as more a campaign is able to catalyze people around a common need or feeling. That means a crowdfunding campaign must leverage on a community, which might be smaller or larger depending both on the subject of the campaign and on the campaign's creator's ability to communicate it. In other words: crowdfunding is all about identifying a group of people by its needs, reaching them through an effective communication and, finally, providing them with what they want (a product, a service, a return on investment).

Let us focus now on the definition of marketing.

UK based The Chartered Institute of Marketing (CIM, n.d.) defines marketing as

… the management process responsible for identifying, anticipating and satisfying customer requirements profitably.

The American Marketing Association states (AMA, 2013):

Marketing is the activity, set of institutions, and processes for creating, communicating, delivering, and exchanging offerings that have value for customers, clients, partners, and society.

Marketing author and academic Philip Kotler (Kotler, 1972) defines marketing as:

Satisfying needs and wants through an exchange process.

These three respected definitions have one theme in common: meeting the needs and providing benefits.

It clearly appears, matching this latter finding with what we reported above about crowdfunding, that we are talking about the same thing: both definitions go in the same direction by stating that marketing as well as crowdfunding are tools to meet the needs of people and to provide them the benefits they expect.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

The peculiarity of crowdfunding is that on top of satisfying needs and providing tangible benefits, it may reward people with intangible benefits too. Pledging money to help an entrepreneur dream come true or investing in a high potential startup to help its growth may eventually give a backer the opportunity to feel as an active part of the society's development; this may look rather more exciting than putting money on a listed though anonymous big corporation.

On the other hand, from the enterprise perspective, the process of aggregating a community in the name of both tangible and intangible needs and of its consequent benefits may be much easier and more rewarding. Easier because a communication campaign can leverage on a wider range of sentiments, more rewarding because, once engaged, people feel a stronger connection with the product and the enterprise, thus becoming a more loyal customer and a potential brand advocate.

According to a recent survey of Kickstarter projects by Wharton's Ethan Mollick and the University of North Carolina's Venkat Kuppuswamy (Mollick & Kuppuswamy, 2014), crowdfunding's ostensibly ancillary benefits are actually the primary reasons why successful startups use it. Author Kuppuswamy says: *Crowdfunding is not just a means for immediate funds, rather, it is a way to validate ideas, test markets, launch brands, find customers and impress investors*.

However, complications arise if we consider that there are different types of crowdfunding - i.e. reward base, equity based or social lending – and, additionally, that enterprises have different sizes and compete in many different industries. Marketing needs may then be quite different from case to case and, consequently, the opportunity of exploiting crowdfunding as a marketing tool may assume different purposes as well as distinct implementation modalities.

A structured approach to highlight the potential alternatives should be based on some classification. We suggest a first differentiation between marketing opportunities for Enterprises raising funds and those of Enterprises investing funds. This first distinction may help to detect the marketing opportunities of smaller and bigger enterprises. A further distinction within these two macros-categories will take into account the typical features of each type of crowdfunding, with a focus on Reward based and Equity based.

MARKETING OPPORTUNITIES FOR ENTERPRISES RAISING FUNDS

Reward Crowdfunding

Reward crowdfunding is usually the vehicle new entrepreneurs approach to raise the funds they need to bring an idea to reality. Usually, it works that somebody has an idea for a product or a video game, a book or an application. He/she uploads and describes it on a platform - say Kickstarter or Indiegogo – showing it off to the world and thus aiming to collect enough money to start the production. In order to stimulate donations, the entrepreneur offers some kinds of rewards whose value relates to the amount the donor is available to give. The most relevant is always the product itself, which will be produced and then delivered to donors if the campaign reaches its funding target.

Startups and entrepreneur are more and more using Reward Crowdfunding campaigns for the purpose to pre-sell a product, and this attitude, by now well-known and accepted by backers, opens a first set of great marketing opportunities. Companies are more and more applying crowdfunding not just to generate revenues, but more importantly, as a go-to-market strategy (Grell, 2015). Targeting a community of

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

individuals with a strong sense of belonging to that group, with the aim of proposing them something exclusive, may be a good lever to get valuable information, which can be later used to consolidate the launch of a new product.

A company in the process of deciding the production of a new product, its development or its launch may consider a reward crowdfunding campaign as a component of the marketing mix, by setting clear and measurable objectives.

A general warning on employing reward crowdfunding for these purposes is that people expect to gain something concrete as a reward. Therefore, while a physical product is a perfect subject for such a campaign, the same does not apply to a service, such as an eCommerce site or a sharing platform, which is an intangible good and therefore hard to convert into a reward.

Market test. Likewise, a new entrepreneur or a start-up, a consolidated company may have a plan to launch a new product. It could be the new release of an existing one, or a brand-new or, else, an additional innovative item within a product line. The more innovative the product, the higher the risk is to invest in it.

Before launching an innovative product, marketing department usually tests it by submitting it to a focus group and/or commissioning expensive market researches. However, only larger corporations can afford these techniques. Small enterprises, often do not have enough resources to develop a product and, simultaneously, assess the market demand. Coincidently, those companies are often the most innovative, operating with an "out-of-the-box" way of thinking.

Launching a reward crowdfunding campaign may help to solve the problem. The main assumption is the availability of a group of people (a community), already known by the company and reachable directly through a mailing list or social networks. The larger and tighter the community, the higher the probability of succeeding. The most loyal customers, the company might have already raised and classified, for instance, establish a great community. A crowdfunding campaign in this case submits the new product to the most loyal customers asking them to pre-order the new product. If the campaign reaches the minimum pre-sale target, it means customers not only have demonstrated their appreciation, but, also, their willing to buy. An indirect effect is that the new product fans will tell their friends, thus enlarging the potential number of pre-buyers.

GE opened FirstBuild, a subsidiary of GE Appliances focused on developing the next generation of home appliances, which has launched 8 new products through various channels including Indiegogo (Dawson, 2015). Their primary goal has been to get products they believed in to market as fast as possible. Reducing the time to market means reducing investment for any one product while engaging in an exchange of value with consumers. FirstBuild launched Paragon Induction Cooktop crowdfunding campaign on Indiegogo early in 2015. The original concept for Paragon showed up as an idea posted on the FirstBuild website by Brad Walchak, a FirstBuild community member. First, they launched a design challenge to their community about 3 months prior to the Indiegogo launch date. What was that time used for? Product design, lead generation, and community engagement. However, despite the confidence they had built in the product through direct interaction with consumers, only a real-time test in the marketplace would validate the product. The crowdfunding campaign ended up in April 2015: the product acquired thousands of customers and more than $300k in sales, making GE confident in their value proposition and pushing them to move forward with production.

A great advantage of doing a market test with a crowdfunding campaign is that costs are mostly paid back: if the campaign is successful, it implies that people have pre-ordered the product and have paid for it. Margins on pre-orders can be attributed to cover the costs of the campaign.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

In assessing the campaign, a company must clearly define its strategic objectives. With reference to testing a new product, they can be, e.g.:

- **Testing Market Acceptance:** Trying to reach a well-defined target in terms of the number of products sold gives a strong feedback on product's acceptability. Feedbacks are not only relative to how much people like the product, but, also, to how much they are willing to pay for it.
- **Testing the Features of a New Product:** Campaign may offer prototypes with different features as alternative rewards. The most pre-ordered prototype will be most probably the one the market will reward.
- **Reach a Minimum Volume for Industrialization:** Engaging engineers to project the product industrialization or committing with a supplier to build a mold is remarkable investment and can be a high risk for a small company. If, on succeeding with a crowdfunding campaign, a sufficiently high number of products are pre-sold, the risks dramatically decrease.

Product Launch

A company, a small one, but a larger one as well, may have a new product ready to launch on its usual market. In this case, unlike the previous one we highlighted, the company has already invested on prototyping and industrialization, and it is planning a marketing campaign to launch it.

Marvell Technology Group, a semiconductor producer that took in $3.4 billion of revenue in 2013, on March 2014 used Indiegogo for a small fundraising drive. The company's objective: gauge demand for Kinoma Create, a software and hardware tool kit that includes a Marvell chipset to help build app-controlled gadgets. The campaign raised 5 times its original target form 552 backers.

A crowdfunding campaign can be a valuable additional tool in the marketing mix. A traditional communication campaign uses media to inform about the product, to assess its brand and to highlight its features. Usually, call-to-action is implicit, if traditional media channels employed ("if you like it, go out there and look for it"), or a little more explicit if digital media are chosen ("click to learn more or to find an outlet"). Only if the company sells the product online, the-call-to-action bring directly to a sale.

A crowdfunding campaign included in the marketing mix for the launch of a product adds the possibility to both communicate and sell. The warning here is that a reason for backers must be established. Why someone should order a product on a crowdfunding platform that is going to be available anywhere else? For instance, the crowdfunding campaign could be a sort of pre-launch where people have the chance to order the new product in advance with or without a price benefit.

In this case, the enterprise will concentrate part of its communication effort on driving the target audience to order the product, thus getting a measurable result. In addition, the following traditional communication campaign can leverage on the crowdfunding success with a new exciting story to help the main one (the product's features) standing out.

Entering a New Market

A product may be new for a specific geographic market where the enterprise has strategically planned to expand its business. A crowdfunding campaign can be set up on a platform of the destination country, with the same goals highlighted above: testing a market or launching a product.

Additionally, the company may want to achieve a few more kinds of goal.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

- **Get Distribution:** The reputation gained during a crowdfunding campaign and at its successful end, can be exploited to address the search of distribution partners in a new country. Not only brand awareness to consumers, but also to distributors is a goal the campaign can achieve. The lever is the evidence, provided by people pre-ordering, that the product can have space in the market and that, therefore, it can be a good business to distribute it over the country.
- **Reach New Customers:** Even if an enterprise is already operating in a new country market, a crowdfunding campaign may offer the chance to expand the market reach if the need is to improve revenues. A company can achieve this objective by leveraging on existing customers. In this case, a campaign should offer either a brand new product or the new release of an existing one. Or else, it can promote an additional item within an existing line of products.
- **Set a Track Record for Further Investors:** A successful crowdfunding campaign, no matter how high the funding target has been, proves that the company is able to attract customers. This is not only a direct benefit, but also an indirect one, in terms of appeal for future investors, who become aware of the enterprise's ability to raise funds. In fact, after the launch of a product in a new market, the company might need money to invest in further development and, therefore, might need to raise more consistent funds from Angels, VCs, Banks or throughout an equity crowdfunding campaign. A successful crowdfunding campaign is then a "jewel of the crown" the enterprise can add to its score, presenting its business plan for a financing round. Before its 2014 first successful campaign on Kickstarter, Pebble Watch could not raise funds from any VCs nor angel investors. After hitting $10 million from the crowd, Charles River Ventures invested $15 million (Pebble Techonolgy, 2013).

Customer Relationship Management

Whichever is the main objective of a campaign, among those listed above, an additional benefit is commonly achieved: contacts. People may interact with the campaign in many different ways, from subscribing to following it, from pledging funds to leaving comments or asking questions.

Those interactions are ways for engaging people and can give back extremely valuable data and information, provided that, before the campaign launch, the company has planned to measure and track them. Depending on their origination, data can be useful in several ways, e.g.:

- **Lead Generation:** Of course, people pre-ordering the product are definitely buyers. Yet, all others who have been interacting with the campaign are potential buyers. Even if they did not place an order, they demonstrated anyhow some interest in the product by asking questions, following the campaign to get updates (if contemplated by the platform), leaving comments, sharing the campaign on social networks. Tracking them allows to build up a database of leads the company may contact afterwards with the objective to convert them into buyers.
- **Loyalty:** A crowdfunding campaign cannot run without starting from a solid network upfront to contact and engage. Company's customers, if any, may also compose the network. In this case, a crowdfunding communication campaign targeted on them, may consider leveraging on their sense of belonging to a community of "brand lovers" and, for instance, presenting the new product as an opportunity specially thought for them. Whether they will order the product or not, their binding with the brand will most probably increase.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

- **Customer Profiling:** Another way to exploit the data gathered during a crowdfunding campaign is to use them as additional attributes to better profile customers (or leads). It is easy to figure out "buyer" or "not-buyer" as an additional attribute. Less easy, and trickier, is to associate with the data stored in the company's CRM any behavioral information related to the interactive activities tracked during the crowdfunding campaign. These include sharing the campaign, social networks used, negative or positive opinions, number of interactions, etc. The more interesting side of it is that those kinds of information are dynamic and not static, meaning that they may change over time. For this reason, they must be added to CRM database only if the company is provided with an adequate technology and a CRM strategy.

Dodge did a great job with its DodgeDartRegisty.com campaign (Swart, 2014). Upon registration, customers could have parts of the car funded by backers. The campaign went viral, engaging more than 1 million social media impressions. Even if less than 40 cars were purchased directly, the company mined data from tens of thousands of potential new customers and saw sales more than double the following quarter.

Equity Crowdfunding

Equity crowdfunding, more than reward, is definitely a way to raise funds, to the extent that the entrepreneur is willing to give away part of his equity in exchange of money for growth.

However, even a crowdfunding campaign may have marketing purposes in addition to funding. Like reward crowdfunding, an equity crowdfunding round starts from involving an initial community. So, once again like reward crowdfunding, it is a matter of engaging people and converting them. In this case into investors.

The amount of money involved in an Equity Crowdfunding campaign is considerably higher than that of a reward one and, hence, the relationship built with people must create a tighter link. People investing are careful about where they are putting their money and want to know details about the company. Therefore, an Equity Crowdfunding campaign is much more complex, but right because of that, it builds such a strong sharing of interests between the company and its investors, that they become the company's first brand advocates. This concept is the gist of Equity Crowdfunding as a marketing tool and the basis upon which enterprises can build other kinds of marketing activities.

Setting a Benchmark for Further Investment Rounds

Companies are using the equity crowdfunding platforms as a way to market their offering in hopes of attracting further investments, beyond those collected directly. If the campaign succeeds, further to raising funds two more side benefits are accomplished:

1. The company obtains a certified value (a number of people invested their money in front of an equity valuation).
2. The business model is perceived as good enough to attract investors.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

After the crowdfunding financing round, if the company, during the following months, is able to achieve the results it promised, a further and higher round can be set up and, most probably, it would be successful, as the business proved to be financed once and to be credible.

Furthermore, the valuation of the company at this stage can easily be higher than the one obtained in the first round, allowing the company to raise funds at a lower cost.

Someone went even beyond. Burgundy Winemaker Domaine Chanzy, a French winemaker, launched an Equity Crowdfunding campaign on the UK leading platforms Seedrs, as an alternative way to raise money for its IPO on the London Stock Exchange's (LSE) Alternative Investment Market (AIM) (Seedrs, 2015). Domaine Chanzy apparently believed that blending an equity crowdfunding round with a public listing would have expanded its investor base and attracted advocates for the brand.

Entering a New Market

Launching a crowdfunding campaign in a new country can be a strategic move to enter a new market. The enterprise may have successfully marketed its products or services elsewhere and believes they are innovative enough even for the new destination country.

The main benefit of launching through an equity crowdfunding platform is the communication synergy: promoting the fundraising, communication activities promote the product/service as well.

An additional benefit is that campaign communication costs can be paid back partially or entirely by the new capital raised once the round reaches its target.

Finally, the "long tail" of new investors (people investing individually small amount of money) are the best witnesses of the product/service offered by the company they invested in. They are willing to have a return on their investment and will push their friends to buy the "their" company's products to let it be successful.

Increase Creditworthiness

Financing a business with equity crowdfunding accelerates the process of raising money in front of equity rather than against debt. Equity crowdfunding is therefore an especially useful funding tool for innovative SMEs, as it can improve their creditworthiness and make them attractive to bank lenders by reducing their debt-to-equity ratio. An AFME (Association of Financial Markets in Europe) report states that in Europe *lack of equity is a key bottleneck to the provision of further overall SME funding, the US has a much more developed equity network for SMEs*[1] (AFME, Boston Consulting Group, 2015).

Crowdfunded companies, then, may leverage on their funding success to more easily access debt funds.

Rewarding Current Customers and Business Partners

We stress the concept of how important leverage on an existing community is to run a successful crowdfunding campaign. An interesting way of doing it is to involve customers or business partners (e.g. distributors, b2b customers, suppliers, etc.) allowing them to become stockholders. It works particularly with large networks, where members are small enough and feel somehow in tune with the company.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Not only a campaign involving customers and business partners has a higher chance to succeed, but also it is a news itself and may have a better impact on media. Furthermore, partners and customers subscribing a funding call definitely certify that the company's business is attractive to the extent that even customers and suppliers are happy to invest in it. This looks as a great achievement for both the campaign and sales.

Finding New Business Partners

Pizza Rossa, after a £440 thousand successful campaign on Crowdcube, a leading UK equity crowdfunding platform, immediately received requests for opening franchises from all over the world (Crowdcube, 2013).

When a company is new to the market, it is often very hard and time consuming to find effective business partners, e.g. distributors, re-sellers, suppliers. A side effect of an equity crowdfunding campaign is to help the entrepreneur or management in the search process. The communication campaign supporting the funding round necessary hits the company's industry. If the round meets the target, enterprises operating in that industry may then be more likely to get in contact and start a deal. This may be a side benefit or can be set as one of the objectives the company wants to reach through the crowdfunding campaign. In the latter case, the company must identify in advance measurable KPIs and must plan a specific communication strategy.

Sugru campaign on the Crowdcube platform broke two world records (Crowdfunding Buzz, 2015): it featured the first ever £1m crowdfunding single investment, and boasted the widest reach, with investors from 68 countries. One of the founder's objectives was to raise the profile of the company, allowing it to more easily find industrial partners for entering new industries and distributors worldwide.

MARKETING OPPORTUNITIES FOR ENTERPRISES INVESTING FUNDS

Medium and large enterprises invest huge amounts of money in marketing activities and are constantly seeking new ways to stand out among competitors. Typically, they look for initiatives that maximize the exposure to their target and, at the same time, that minimize costs.

Reward and Equity Crowdfunding represent an alternative opportunity that may be extremely effective in both gaining visibility and containing costs.

Reward Crowdfunding

Those running reward crowdfunding campaigns are usually individuals or small businesses. They plan their fund raising to finance the launch of a product, as we have already seen, but also for charity or civic initiatives. This opens up a bunch of opportunities that enterprises looking for alternative marketing tools may effectively exploit in accordance with their objectives.

Brand Equity

Brand equity refers to the value of a brand. Brands are one of the most valuable assets a company has, as brand equity is one of the factors which can increase the financial value of a brand to the brand owner, although not the only one. Several elements can be included in the valuation of brand equity: changing

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

market share, profit margins, consumer recognition of logos and other visual elements, brand language associations made by consumers, consumers' perceptions of quality and other relevant brand values. Therefore, brand equity is the value perceived by customers on top of a product or service. It can significantly affect the price and it derives from branding investments. A strategic objective, for any kind of enterprise, consists indeed in increasing its brand awareness, which implies enhancing both the visibility and the appreciation of its products or services. Marketing actions to achieve this strategic goal include traditional and digital advertising, sponsorship, promotion, public relations, social networking. All these kinds of communication activity have several common denominators: a profiled target audience, a benchmark (the product or service itself, a testimonial, a context etc.), and one or more communication channels.

A reward crowdfunding initiative presents all of these items. It has a target audience itself, which is built upon both the individuals investing in the project and the potential investors. It has a benchmark to compare to, which might be the context, e.g. the development of new brilliant tech ideas, the restoration of an important monument, or a social aid initiative through a charity. Finally, it has its own communication channel - the crowdfunding platform – although it also extends to several indirect channels, i.e. those, digital or traditional, used by the crowdfunding campaign promoter.

How can an enterprise leverage on these kinds of campaign? Here below we suggest a few examples, though, as always, the scope may be wider and depends only on the marketing team fantasy.

- **Promoting Directly One or More Campaign:** A company may launch its own reward crowdfunding campaign, not much for launching a product, as we have seen in the previous section of this chapter, but for a pure brand equity purpose. The opportunity may arise in relation to supporting a cause or an event where the company may want to be accredited as the main promoter. This way, the campaign target audience and, more generally, whoever is interested will associate the brand with a praiseworthy activity, as it touches deeply his sensitivity.
- **Co-Investing:** This approach is more complex, though more intriguing and full of interesting implications. The hinge of the approach is the opportunity for a company to finance one or more high-impact initiatives without allocating all the money needed but only a part of it. The target audience will perceive the company to be the promoter of the initiative, or its main supporter, but the Company is investing only a fraction of the entire budget. The role of the enterprise, here, is double. On one side it acts as the lead investor (or donor), letting other individuals or enterprises to cover the remaining budget. On the other hand, it also acts as an "advocate" and a driver for the fundraising campaign, leveraging on its reputation to involve other investors/donors. Depending on the positioning the enterprise wants to give its brand, it can explore several options, for instance:
    - **Startups Co-Financing:** A corporation may agree with a reward crowdfunding platform to launch a call for choosing a few start-up projects to be co-financed whether their crowdfunding campaigns reach a percentage of the funding target, (e.g. 50%); the Company will participate by covering the remaining 50%. The benefit here is the possibility to allocate a relatively low budget (the sum of the maximum amount of money allocated for each project), getting back a higher value in terms of spontaneous media coverage. This is what several Italian large corporations – Fastweb (Telco), Unipol (Insurance) and Poste (Italian Public Mail) – have agreed with Eppela, one of the biggest Italian reward crowdfunding platforms. Each of them allocated a budget form €100,000 to €150,000 to be spread among those of

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

the previously selected projects that would have raised at least 50% of their target. On average, projects targets are lower than €20,000 allowing the sponsoring corporation to finance a relatively high number of new initiatives in a 4 to 6 month period.

  - **Co-Sponsoring a Monumental Restoration or a Social Activity:** Instead of paying the entire bill (e.g. for a monument restoration), whose importance for citizens could be either at a national or at local level, a Company might help promoters to set up a crowdfunding campaign. The corporation will then help them to both finance a part of the initiative and find other co-sponsors as well as to spread the message among people. The company might also help in other different ways. e.g.: a retailer can help by exploiting the proximity of its outlets to consumers to communicate and remind them the initiative. A significant example is The Giant Flag: a legacy project promoted by the South African branch of FCB, a multinational advertising agency. It includes the building of a flag made up of millions of colored desert plants, and a four-megawatt solar field, on a tract of land that was previously completely barren. Thanks to its size equal to 66 soccer fields, it will be effectively viewable from space. It will cost about $20 million, which FCB will fund both with corporate efforts and with a Crowdfunding campaign that will let citizens participate directly in this giant project.

- **Supplying Rewards:** In a reward crowdfunding campaign the promoter must plan to give back rewards to donors, proportionally to the entity of money they donate, and, hence, to establish a scale of rewards. As mentioned before, the main reward, in case of a campaign set to launch a product, is the product itself. However, that is not always the case. Indeed, the campaign might have other subjects than the launch of a product or it might need to allocate rewards for the donation of smaller amounts of money. In both cases, the promoter is forced either to invent some intangible rewards or to spend money for buying gadgets. By the way, it would be a great benefit for a campaign promoter to promise and to deliver attractive rewards which the platform might make available for free. A Company producing goods or selling services may consider promoting them by collaborating with one or more platforms and letting them offer to a selected number of initiatives a choice of its products (or coupon to get its services) as rewards. Of course, the selection criteria should be established taking into account the mutual compatibility between the product/service offered and the subject of the initiative. In any case, the donors must perceive a strong link between the two. Domino's Pizza created a competition in which their start-up businesses could win Domino's Pizza gift cards. Entrepreneurial winners could even reuse the vouchers as an incentive for smaller investors backing their projects through crowdfunding (Moules, 2013).

Research and Development

Among the classical marketing 4 Ps suggested by McCarthy (McCarthy, 1960), besides "*promotion*", which we considered above speaking about Brand Equity, "*product*" is another important item. A marketer considers a product in terms of its ability to satisfy a specific client's need. However, that need is not static, as it changes over time depending on the phase of the product/service in its life cycle. Therefore, among marketers' tasks, managing the product mix is a relevant one. Research is one of the main tools a company has to enhance its existing products or to create new. However, investing in research and development may be very expensive and risky for an enterprise, especially if the product or service is not part of its core line.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Crowdfunding can offer an opportunity to enhance existing products or services or to develop new ones without the need of allocating an outstanding budget. Indeed, it allows a bottom-up approach rather than a top-down. The disadvantage is a lower accuracy compared to that achievable with a dedicated research. That is why this solution may be a more suitable choice for the "*long tail*" products rather than the core ones.

A first draft distinction may consider a "market" approach and an "internal" approach.

- **Market Approach:** By market approach we mean the involvement of people outside the company, who can be consumers as well as professionals. Lego launched *Lego Ideas*, a platform where anyone can propose an idea for a new Lego set. If the idea gathers at least 10.000 supporters, it enters a special phase called the Lego Review. A review board of set designers and marketing representatives evaluates projects according to Lego's review criteria and pick those to become new Lego Ideas sets. Projects selected in the review go into production and receive a royalty on sales. Supporters can now own the set they helped make happen. This is not properly a crowdfunding process, but more a crowdsourcing one. However, the principle is similar as it leverages on the ability of the brand to attract fans who are rewarded if their idea proves to be successful. Similarly, other companies may set up platforms, or partner with existing ones, to let professionals or fans propose their project (e.g. a lamp, a game, a piece of furniture, etc.…) and pre-sell it. As long as the product has reached a pre-defined amount of pre-ordered pieces, the company will industrialize it and put it into production. An additional benefit of this approach is its ability to improve existing customers' loyalty.
- **Internal Approach:** Sony set up a business program encouraging employees to develop the most innovative ideas they can think of in an effort to find new hits. Then the company launched a crowdfunding and e-commerce platform called *First Flight* for products coming out of that project. The site aims then to take a project right from the idea stage, to fund it and finally to commerce it within the same platform. Unlike the "market approach", the internal one focuses only partially on customers (they are involved to validate the projects through the crowdfunding process offered by the platform), while it definitely points on the skills and passion of employees for raising new ideas. In such a large corporation, in fact, many good ideas may be kept hidden, simply because the procedure to raise them may be excessively complicated or it does not take into account several classes of employees.

The main common feature between the two approaches is the opportunity, given to either customers or employees, to let them raise their passion for a brand or a product. Skills and intuition beneath this passion can be disruptive, being detached from the rigid practices that a company usually establishes for its creative process.

Equity Crowdfunding

We are used to consider Equity Crowdfunding with the eyes of a Startup or an SME seeking funds for its growth. We have previously highlighted how these subjects may take advantage of it in terms of marketing benefits. Indeed, a corporation may even look at Equity Crowdfunding as a marketing tool by assuming the role of an investor. Investing in a growing company may give not only an interesting financial return in the medium/long term, but also it can give significant results as a marketing investment. Of course, the

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

hints we are highlighting below implies marketing objectives a company can achieve throughout other means than Equity Crowdfunding. Actually, a corporation may achieve the same strategic objectives by scouting the market directly to find the best opportunities to invest in. Nonetheless, the main advantage of resorting to Equity Crowdfunding stands in the opportunity to check the right horse (or horses!) to bet on among a wider list of initiatives, at considerably lower cost.

Research and Development

Google has acquired more than 180 Start-ups and, most probably, it owns a stake in many more. Recently the search engine giant has found a venture capital vehicle. Their objective is clearly to speed up the technological research process in order to expand their business faster than it is reasonably feasible with their internal R&D department.

However, not all enterprises have such a financial power as Google to let them scout a large number of new technologies and eventually invest in them. Here is where equity crowdfunding platform can help.

The market is still at its early stage phase. Nevertheless, an increasing number of Startups and SMEs all over the world has been exploiting this new funding channel. Moreover, the industries involved are not limited to high-tech industry, going from biotech to food and drink production and distribution, to manufacturing, to business services.

A corporation has then the opportunity to choose among a large number of initiatives and, if the case, to allocate funds to invest in them. In addition, unlike running a VC vehicle, investment management in this case may be quite simple, as it does not necessarily require a financial return, namely an exit strategy, nor it needs substantial equity stakes to subscribe. The advantage, then, consists in the opportunity for the corporation to monitor closely the activity of the companies participated, to better learn how the team operates and to acknowledge the potential of their business solutions. It will come a time when the corporation may evaluate to either buy the entire company or at least acquire a majority equity stake or else to establish a stronger industrial or commercial collaboration (see below).

Industrial and Commercial Partnership

Another purpose of investing a minority stake in one or more equity crowdfunding campaigns is to establish a commercial or industrial partnership with promising new businesses. The reason for doing that may be for either an industrial or a commercial purpose.

An industrial partnership, empowered by owning an equity stake, may rise as an opportunity when a Start-up or a SME launches a new product on the market. The corporation may evaluate the product is complementary to its offer or even disruptive compared to it. Else, the new product (or service) can be a semi-finished component able to improve the performances of the current line of products manufactured, or, conversely, an opportunity to expand their demand.

A commercial partnership may be an opportunity to enter a new geographic market if the Start-up is running a crowdfunding campaign and is operating in a market the corporation does not cover yet. Or else it allows expanding a product or service offer in order to better meet the customers' needs, thus helping to differentiate from competitors. Holding even a minority stake gives the corporation a better chance to affect the commercial policy of the participated Start-up and to evaluate the reliability of both its products and management.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Brand Equity

Sometimes, investing in growing businesses and helping young entrepreneurs to make their dreams come true may be an additional motivation for large companies to fund enterprises by equity crowdfunding. Besides the primary objectives we hinted before – R&D and industrial and commercial partnerships – a corporation may want to achieve a secondary one: strengthening its brand image by appearing as a financial supporter of new businesses. Of course, in order to achieve such an objective, though being a side one, a company should plan a solid strategy. Investing spot in a few initiatives does not work. For this to impact on the public opinion and thus to affect its brand equity a corporation must plan to become a serial investor.

It implies planning an investment budget throughout more than one year and an investment policy in terms of setting clear criteria to both select the investment targets and acquire equity stakes. For instance, a plan should define whether investing in businesses at the early or growing stage of their life cycle, or else it should set a maximum equity stake to acquire.

Nowadays, this kind of marketing opportunity is still limited being the Equity Crowdfunding market at its infant stage worldwide and, therefore, it does not present yet a significantly large choice of initiatives for each type of industry. Even though, Equity Crowdfunding is growing double digit year over year such that a mid or large corporation should start considering this approach as a winning one in the near future and getting ready to fully exploit it.

For the Dutch electronics group Philips, the opportunity has been as much about sharing knowledge as funds.

Its Innovation Fellows Competition offered up to $60,000 to companies creating technological innovation. However, they provided not only funds but also mentoring support to help bring the winning idea to life.

This approach is based on the concept of “open innovation”, the belief that big ideas can come from anywhere.

CONCLUSION

Crowdfunding is certainly a way for raising funds, but it is even a powerful marketing tool. In fact, if marketing is a way to meet the needs and provide benefits to people, crowdfunding does the same. Therefore, depending on the way a company approaches and exploits it, crowdfunding can give a wide choice of alternative options for achieving the typical marketing objectives particularly related to two out of the four marketing Ps: *product* and *promotion*.

First, we highlighted that enterprises raising funds through a crowdfunding campaign have the opportunity to accomplish additional strategic objectives that go beyond fundraising.

This is especially true for reward crowdfunding campaigns, where marketing goals can have an even higher priority than fund raising. For instance, testing a new product by letting backers pre-order it, before putting it into production, is a great way to evaluate its market approval. Also, a reward crowdfunding campaign can be exploited for entering a new market, launching a new product or even strengthening the relationship with customers.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Equity crowdfunding campaigns may pursue a side marketing goal too. It may concern the financial strategy by setting the base for further future funding rounds or increase credit worthiness. However, it also deals with the company's products or services strategy. Actually, a company may look for entering a new market, or finding commercial or industrial partners.

Nevertheless, marketing opportunities are not limited to enterprises using crowdfunding to raise funds, but even for those that invest funds. In the latter case, the opportunity is more suitable for mid and large corporations that hold a relevant marketing budget and that may look at crowdfunding as a more efficient or additional way to implement their marketing strategies. Similarly to what we reported for enterprises raising money, for those investing funds both reward and equity crowdfunding are suitable for pursuing marketing objectives.

Investing in reward crowdfunding campaigns can be a powerful tool for increasing a corporate brand equity. This is especially true when a corporation is a pro-active investor, meaning that, for instance, it supports a program for financing selected initiatives as long as they reach a share of their funding target.

Table 1. Summary of marketing objectives that crowdfunding can help to achieve

Raising/Investing Funds	Type of Crowdfunding	Marketing Objectives
Enterprises raising funds	Reward Crowdfunding	Market test: • Testing market acceptance • Testing the features of a new product • • Reach a minimum volume for industrialization
		Product launch
		Entering a new market: • Get distribution • Reach new customers • • Set a track record for investors
		Customer relationship management: • Lead generation • Loyalty • • Customer profiling

People will associate the company's brand to its commitment in supporting the development and growth of new enterprises. Another way a corporation can leverage on reward crowdfunding investing is to scout new technologies or products, by stimulating either external or internal initiatives.

Investing in Start-ups or SMEs by buying their shares offered through an equity crowdfunding campaign enhances the acknowledgement of these objectives. Instead of concentrating the whole R&D funds on expensive internal teams, a corporation may also acquire a stock of one or more promising business, thus controlling more closely their ability of developing new solutions. In addition, interesting Start-ups or SMEs can become commercial or financial partners whenever their offer is complementary to the investor's one.

The advantage of implementing such strategies by scouting opportunities on equity crowdfunding platforms rather than directly, is a matter of time and money: not all companies can afford an expensive due diligence on a large number of small companies, which, conversely, equity crowdfunding platforms facilitate.

The opportunity crowdfunding offers as a marketing tool depends of course on a company's marketing strategy, but they also rely on the ability of management or entrepreneurs to catch them by taking marketing decisions with an open mind.

Crowdfunding is still at its early stage and, especially equity crowdfunding. It has not expressed its full potential yet. Nevertheless, it is fast growing in the US as well as in Europe. This will certainly give rise to new ways of exploiting it as an even more powerful marketing tool than we hinted. As more enterprises and initiatives will list on crowdfunding platforms and the more both individuals and companies will get used in investing in growing businesses, the higher will be the scope and thus the higher will be the potential of using crowdfunding for pursuing marketing objectives.

So far, the opportunities we highlighted in this chapter are just hints to let decision makers find some ideas, which they can base on to set off their creativity. Table 1 summarizes our hints and their classification.

Chapter 24
The Diffusion of Voluntary ISO 26000 among SMEs: Evidence from Taiwan

Yen-Chun Wu
National Taiwan Normal University, Taiwan

Chih-Hung Yuan
National Sun Yat-sen University, Taiwan

ABSTRACT

Businesses are under the increasing pressure to demonstrably engage in social responsibility (SR). Following the demand, the International Standard Organization developed ISO 26000 for SR. small and medium enterprises (SMEs) are dominant in contributing to GDP. The relationship between SMEs and SR is still elusive. The purpose of this paper will be aimed at how SMEs will adopt ISO 26000 under what circumstances. We determine a set of hypotheses about diffusion of ISO 26000 and examine it empirically. We provide a better understanding of the cognition-behavior gap while "doing good". SMEs think that SR was Philanthropic responsibility, but strive for their subsistence as their top priority of strategy decisions. However, the impact of multinomial company and government are not decisive. Finally, SMEs take SR practices into consideration when evaluating stakeholder, they are more likely to adopt ISO 26000. Thus, SMEs must feed themselves with their own words and grow.

INTRODUCTION

Businesses are under the increasing pressure from their stakeholders to demonstrably engage in activities which are known as corporate social responsibility (CSR), social responsibility (SR), environment management and sustainability issue. In dealing with rapidly globalization, they have to increasingly face the challenge of doing more with less. Especially Small and medium-sized enterprises (SMEs) play a key role in the development of global economy (Morsing & Perrini, 2009), but lack of resource. Al-

though there are several private and public organizations focus on improvement of social welfare of firm (Retolaza, Ruiz, & San-Jose, 2009). However, such initiatives are little, so indeed much thinking about SMEs and SR are based on a range of unsubstantiated hypotheses about SME behaviors (Jenkins, 2006).

There is an increasing appeal for businesses to become involved in SR practices (Fassin, 2008; Stoian & Gilman, 2016). Following this demand, the International Standard Organization (ISO) developed ISO 26000 international guidance standard for SR in 2004 (Castka & Balzarova, 2008a). The ISO 26000 has been built on the practical infrastructure of ISO 14000 and ISO 9000 (Castka & Balzarova, 2008a). This standard is suitable for all scales of organizations, no matter large or small (ISO/TMB/WG/SR, 2009). Castka, Balzarova, Bamer, and Sharp (2004) demonstrated how SMEs can implement the SR agenda and benefit from it. Furthermore, SMEs need to understand more about the details and conditions through more studies to adopt SR practices (Morsing & Perrini, 2009).

Large companies usually start from a small scale. Many a little makes a mickle. Most of all the businesses in Taiwan, including SMEs, are export-oriented or part of multinomial corporate (MNC) supply chain (Chen, Lin, & Chu, 2013). Taiwan has a very sound economy, and the best approach to mainland china's expanding market. For these reasons, the purpose of this paper will be aimed at how SMEs among Taiwan will adopt ISO 26000 under what circumstances.

The rest of this article is organized as follows. We start by reviewing the relevant literature about SMEs, social responsibility and ISO 26000. We then detail our methodology and investigate empirically. Next, we focus on the diffusions of ISO 26000. Finally, we conclude the key factors that push SMEs to engage in social responsible.

SMEs AND ISO 26000

SMEs and Social Responsibility

In this article, the term "social responsibility (SR)" is used rather than CSR, since many perspectives of the CSR agenda cannot perfectly fit organizations well (Hammann, Habisch, & Pechlaner, 2009; ISO/TMB/WG/SR, 2009). SR is regarded as "the managerial obligation to take action to protect and improve both the welfare of society as a whole and the interest of organizations" (Davis & Blomstrom, 1975, p. 6), as well as " on a voluntary basis" (Gilbert, Rasche, & Waddock, 2011; Stigzelius & Mark-Herbert, 2009).

Before studying the SR issues in SMEs, researchers should take an important assumption into consideration when they investigate the relationship between small business and SR. SMEs tend to change with their surroundings, multi-tasking, limited cash flows, personal relationships and informality (Madrid-Guijarro, García-Pérez-de-Lema, & Van Auken, 2013; Perrini, Russo, & Tencati, 2007). SMEs have specific characteristics that differentiate them from large enterprises, such as being directly managed by owners or being highly personalized (von Weltzien Høivik & Shankar, 2011), which means that the personal wills of the runner decide the distribution of the resources of the company (Jenkins, 2006).

On the other hand, multiple management objectives functions makes it more difficult for managers to develop focusing strategy (Jensen, 2002). Therefore, the managers of SMEs are less interested in things irrelevant to daily operations (Nielsen & Thomsen, 2009). Under the globalized competition, the profits of enterprises are comparatively decreasing, so are the resources devoted to charities (Stendardi Jr., 1992). Especially SMEs are facing great challenges. Besser and Miller (2001) indicated that for business managers, it is hard for them to value the investments whose profits do not appear quickly, such as

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

supporting charities. Therefore, the owner-managers of small enterprises "never think about this issue" (Observatory of European SMEs, 2002), or believe that their influence on society and environment can be neglected (Hitchens, Thankappan, Trainor, Clausen, & Marchi, 2005).

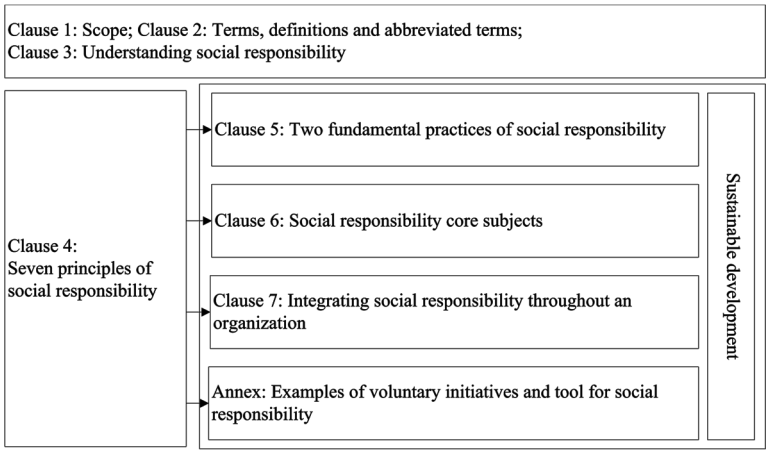
However, SMEs are considered generators of wealth in most important industrial countries, and they usually run in the global market (Hawkins, 2006). The increasingly worsened environment inevitably impacts SMEs, and it is important for them to face the demands of society under the inferior condition of personnel, funds, and limited resources. SMEs are really flexible that they can adapt themselves to the dynamic market opportunities and modify their ability to trade (Sen & Cowley, 2013).

What do SMEs need to learn to achieve things such as SR or sustainability? SR means something, but not the same thing everywhere. In recent years, SMEs have surprisingly gained salience in academic literature (Battaglia, Bianchi, Frey, & Iraldo, 2010; Fassin, Van Rossem, & Buelens, 2011; Fassin et al., 2015; Lund-Thomsen, Jamali, & Vives, 2014; Sen & Cowley, 2013; Stoian & Gilman, 2016; Wickert, Scherer, & Spence, 2016), but there are very few works about the engagement in the SR agenda (Ciliberti, de Groot, de Haan, & Pontrandolfo, 2009). SR agenda could provide SMEs with significant scope for competitive advantage (Castka et al., 2004; Jenkins, 2009; Tilley, 2003), guidance to know what SR is ((ISO/TMB/WG/SR, 2009), and tools that enable them to implement SR (Castka et al., 2004).

ISO 26000

In order to establish "Guidance on social responsibility: ISO 26000", The ISO found ISO/TMB/WG SR in 2005. This group included about 300 experts form 90 ISO member countries and 40 liaison organizations, which represent six different stakeholder groups (ISO/TMB/WG/SR, 2009). The ISO 26000 includes 7 clauses and one annex (Figure 1). A good concise introduction to ISO 26000 is available at www.iso.org.

ISO26000 is a voluntary guidance (Castka & Balzarova, 2008b). The very concept of SR in SMEs is confusing because of the specific practice carried out (Murillo & LOzano, 2006). Therefore, ISO 26000 have been described by the focus of SR as shifting from understanding "why" (i.e., reasons for SR engagement) and "what" (i.e. defining the SR principles and core subjects), to "how" to incorporate SR throughout organization, and then achieving sustainable development. For further discussion, see Castka and Balzarova (2007), Schwartz and Tilling (2009).



In last decade, a host of standards or principles have emerged to deal with SR, such as SA8000 (Ciliberti, Pontrandolfo, & Scozzi, 2008; Stigzelius & Mark-Herbert, 2009), SR agenda (Castka et al., 2004), AA 1000, and ISO 26000 (Castka & Balzarova, 2008a). However, there are only qualitative studies so far. (Lepoutre & Heene, 2006; Udayasankar, 2008). Empirical evidence is still limited (Morsing & Perrini, 2009; Perrini et al., 2007; von Weltzien Høivik & Shankar, 2011).

Hypothesis Development

The size of the firm plays an important role for SR. Many studies point out that compared with large enterprises, SMEs have better position and ability to carry out SR, and it is easier for them to receive the social interest brought by the growing of economy and innovation (Wennekers & Thurik, 1999), and they will attract many local customers and employees because of their fine reputation, which tightens the relationship between both sides (Lepoutre & Heene, 2006). On the other hand, SMEs are constrained mainly by their visibility, resource access and operations scales (Udayasankar, 2008; von Weltzien Høivik & Shankar, 2011). Therefore, SMEs will only be able to devote their resource to SR partly (Lepoutre & Heene, 2006).

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 1. ISO 26000
Revised from: ISO/TMB/WG/SR (2009)

Hypothesis 1: The larger the firm is, the more likely it will adopt ISO 26000.

Perrini, et al. (2007) indicated their familiarity and consciousness of SR that make their profile different from other company. Carroll (1991) proposed a four-part comprehensive definition of SR: Economic, legal, ethical and philanthropic responsibilities. These concepts are not mutually exclusive but rather mutually reinforcing. Which of these statements best describes the way in which SMEs define SR? The perception of SR will shift value of owner-manager. Owner-manager value is essential for SR and will drive SR strategies (Jenkins, 2006; Murillo & LOzano, 2006; Sen & Cowley, 2013).

Hypothesis 2: Arising awareness on social responsibility is positive with undertaking ISO 26000.

Spence and Rutherfoord (2000) chose 20 British small enterprises to conduct a semi-structured interview, used profit and socially active as indicator, proposed four "frames" to perceive the social perspective of SMES: Social priority, enlightened self-interest, subsistence priority, and profit maximization priority. The role of SR in SMEs depends on priority of decisions and perspectives of the owner-managers (Burke, 2015). Hence, the beliefs of owner-manager will influence their intentions and actions (Fassin et al., 2011; Mitchell et al., 2007).

Hypothesis 3: The better the perspective of SR through decision-making priority is, the more likely ISO 26000 will be adopted.

The resources will be limited in SMEs which means that it can be difficult for them to deal with new and changing circumstances. The current economic downturn will affect SMEs' commitment to address SR issue (Brilius, 2010; Giannarakis, 2011). Therefore, SMEs which will increase investment for SR under uncertainty will tend to adopt ISO 26000 (Peutz & Mass, 2011).

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Hypothesis 4: SMEs that will increase investment for SR under economic downturn will be more likely to adopt ISO 26000.

Codes will form infrastructural platform that facilitates communication between partners in a network (Ciliberti et al., 2009), and will also have an impact on adoption of the international standard (Castka & Balzarova, 2008a). Therefore, in order to reduce the inconvenience of integrations between systems, organizations will adopt similar management system due to their custom. Previous research confirmed that certification in the past, whether to the same standard earlier or to similar standards in place, leads to an increase in diffusion rates (Albuquerque, Bronnenberg, & Corbett, 2007; Stoian & Gilman, 2016).

Hypothesis 5: SMEs have adopted international management systems standards or business excellence model in the past will tend to adopt ISO 26000.

SR means that organizations should integrate environmental, social, and economic requirements into their practice (van Kleef & Roome, 2007). Who will push SR to SMEs? There are two major sources of demand for SR:

SR is getting more and more important to both buyers and suppliers (Eltantawy, Fox, & Giunipero, 2009). Buyers, such as IKEA, realize that suppliers involved in unethical responsibility will hurt them in the long run (Eltantawy et al., 2009). Pressure from customers or Multinomial Corporation (MNC) will drive the SR behavior of their suppliers (Giannarakis, 2011). They tend to employ uniform standards (Castka & Balzarova, 2008a; Christmann, 2004). On the other hand, Supplier, such as Taiwan Mirror Glass, will discreetly select their good-credit buyers. If their buyer had been mired in unethical behavior, such as discrimination, they would be also harmed. Hence, members of supply chain will carefully evaluate partners by SR practices.

Other stakeholders, including investors, community, governments, and employees, can contribute to the demand of contracts with SR (El Baz, Laguir, Marais, & Staglianò, 2016; Spence, 2007). A key characteristic of SR is responding to "improving the quality of life of the workforce and their families" (WBCSD, 1999, p. 3) and "their preferences in terms of charitable support and giving" (Spence, 2007). SMEs focus on a narrow range of human resources management may result in poor protection for workers (Spence, 2007, p. 538). Therefore, SMEs that have help employees to establish labor union or employee welfare committee will tend to adopt ISO 26000. Governments can also regard ISO 26000 as a contractual requirement for governmental procurement (Castka & Balzarova, 2008a). They will then reward the firms by preemption.

Hypothesis 6: SMEs are in the network of Multinational companies (MNCs) which will undertake ISO 26000.

Hypothesis 7: If SMEs take SR practices into consideration when evaluating stakeholder, they are more likely to adopt ISO 26000.

Hypothesis 8: If labor union or employee welfare committee has already been established in organizations, SMEs will tend to adopt ISO 26000.

Hypothesis 9: There is a positive correlation between government contracts and the undertaking of ISO 26000

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

A growing number of enterprises have incorporated SR into their strategies. The most of business leaders worldwide indicated SR will differentiate their reputations and brands as well as their products (Pohle & Hittner, 2008). Reputation building is an integral component of strategy formulation and in positive relationship with profitability (Khojastehpour & Johns, 2014). Companies can strengthen their reputations through SR (Fombrun, 2005). Therefore, SR is one of the key segments of the market (Siegel & Vitaliano, 2007). ISO 26000 has clear guidance about how to incorporate SR throughout an organization (ISO/TMB/WG/SR, 2009).

Hypothesis 10: SMEs which integrate SR into their business strategies will be more likely to adopt ISO 26000.

METHODOLOGY

The goal of the research design is to investigate whether SMEs will be more likely to adopt ISO 26000 when regarding business practice. SMEs can maintain a niche market as long as they embrace core technologies (Luo & Chang, 2011). The ways by which SMEs carry out SR are more divers, for example, they may take SR into consideration to increase the trust of clients. It is at this time of economic downturn that how enterprises realize their SR and how they turn SR into their unique competitive ability can be observed. Thus, it provides an ideal context for a study that focuses on diffusion of ISO 26000.

Data Collection

The European Union (EU) has standardized the SME concept (European Commission, 2005). In this research, current definition was applied to categorize companies with employees fewer than 20 as "micro", with 20-49 employees as "small", and those with fewer than 250 as "medium". To test the hypotheses proposed, a questionnaire survey is mainly employed in this research. Our empirical setting is the companies listed on database of China Credit Information Service and Taiwan Accreditation Foundation. The 2648 copies reached their destinations via mail, email or in person.

From these questionnaires, 283 are returned, making up 266 valid samples (10.06%) that contain sufficient information for SMEs analysis. Most of them are manufacturing industries, consisting of 72.93%, and next were service industries (17.67%). The characteristics of the samples were summarized in Table 1. There are 161 medium businesses (60.53%), and 66 small businesses (24.81%). Additionally, the average of the years for which enterprises found their companies was 28 years, which are twice of that of SMEs in Taiwan. 49.99% of the participants are executives, whose seniorities are 13.75 years on average, and this means that most participants that respond to our questionnaires are senior executives.

Questionnaire Design and Measure

The questionnaire consists of four parts. The first part contains questions about thing concerning SR, such as how SMEs define SR, decide the priority of decision making, and whether they have certification from the third party. In the second part, 57 questions are developed based on the principles, core subjects and fundamental practices of ISO 26000 to let the SMEs know more about ISO26000, but these

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Table 1. Demographic variables (N=266)

Characteristics	Frequency	Percentage
Industry		
Manufacturing	194	72.93%
Service	47	17.67%
Building	16	6.02%
Others	11	4.13%
Organization Size		
Less than 20 persons	39	14.66%
20-49 persons	66	24.81%
More than 50 persons	161	60.53%
Possibility of Adopting ISO 26000		
Less than 30%	48	6.39%
40-60%	141	34.97%
More than 70%	114	42.86%

results are not analyzed. The third part is basic information of the company. The last part is a two-paged introduction to ISO 26000, explaining that ISO 26000 contains seven clauses and one annex which include principles of SR, SR core subjects, and how to integrate SR into organization and so on. This gives SMEs preliminary ideas of ISO 26000.

We did the piloting of questionnaires on 35 EMBA students in National Sun Yat-sen University, and asked them to comment on any item that they found ambiguous. Furthermore, to assure expert validity, seven experts including those from academic circles, Chinese teachers and practitioners are invited to examine each item to confirm the meaning of the content. All items in questionnaire are specifically indicated. Additionally, to value dependent variable, respondents would complete the questionnaire items to get preliminary information, and they would be asked about the percentage of how they conform to ISO 26000. Measurement scale is adopted, the results range from 0 to 100 based on probability. The higher the score is, the better their acceptance is. Finally, the average of probability of adopting ISO 2600 is 60%

Results

A one-way analysis of variance (ANOVA) and t-test were run with different perspectives as independent factor and the probability of adopting ISO 26000 as the dependent variable. The results of hypotheses testing were presented in Table 2-7.

Statistically significant differences were found between firms size (F=3.527, p=0.016). Mean and standard deviations can be seen in Table 2. The enterprises with more than 50 employees agree that company had better possibility when adopting ISO 26000 more than companies with less than 50 employees. The larger the firm is, the more likely it will adopt ISO 26000. This set of results showed the impact of firm size on SR, which corresponded to previous research (Lepoutre & Heene, 2006), in support for Hypothesis 1.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Table 2. Organization size

Organization Scale	N	%	Mean	*F*	*p*
Less than 20 persons	39	14.66%	49.23%	3.527	.016**
20-49 persons	66	24.81%	56.67%		
50 persons and above	161	60.53%	61.80%		

$p<0.1$*, $p<0.05$**, $p<0.01$***

Statistically significant differences were found in the pyramid of SR, with $F=6.80$, $p<0.001$(Table 3). The result demonstrated that philanthropic (M=61.21%) and ethical responsibilities (M=61.75) are higher than legal (M=14.28%) and Economic (M=6.02%). Many SMEs took large consisting of cash donation as SR, but rarely related them to business needs, such as green management. If they understand clearly about different levels of SR, they will accept ISO 26000 more. Thus, Hypothesis 2 was supported.

Statistically significant differences were found in the social perspective frames ($F=7.52$, $p<.001$) and result were shown in Table 4. The result showed that social priority (M=62.27%) is higher than others. Interestingly, subsistence priority which followed it is 59.65%. Although their source were limited, but flexibility created differentiation for the energetic SMEs (Spence, 2007). For their survival, they will accept different challenges, in support of Hypothesis 3.

Statistically significant differences were found in organizations' commitment to SR under economic downturn, with $F=3.54$, $p=0.004$ (Table 5). When enterprises encounter financial meltdown, 44.36% of them believed that this would not influence their SR practices, and even 18.05% of them would carry out further investment. Although most SMEs saw survival as their top priority, they would continuously invest in SR if they are able to do so, which corresponded to the results of the survey done by Berns,

Table 3. Awareness on social responsibility

Best Describe of Organization Defines SR?	N	%	Mean	*F*	*p*
Philanthropic responsibilities	132	49.62%	61.21%	6.80	<.001***
Ethical responsibilities	80	30.08%	61.75%

et al. (2009) on 1500 enterprises worldwide through the perspective of sustainable development. The result demonstrated that enterprises that continue to devote commitment to SR would be more likely to adopt ISO 26000. Thus, Hypothesis 4 was supported.

The t-test results were presented in Table 6. The effect of management system standard showed a significant difference (t=2.17, p=0.031). The result showed organization that adopted international systems standards in the past would be more likely to adopt ISO 26000. This empirically examined the proposition proposed by Castka and Balzarova (2008a), who believed that enterprises who adopted international management system and other similar frames would restrain themselves actively based on ISO 26000, in support of Hypothesis 5.

The effect of MNC was not significant, with t=0.95, p=0.343. The result revealed that whether SME belongs to a part of MNC will not influence their will which tend to accept ISO 26000. Thus, Hypothesis 6 was not supported.

The effect of screening stakeholders by SR practice showed a significant difference (t=3.59, $p<.001$). The result showed that enterprises which evaluate their stakeholders with SR will place more importance on their SR behavior, so their probability of adopting ISO 26000 were more than those of enterprises which did not take these into consideration, in support of Hypothesis 7.

The effect of labor union was significant, with t=2.93, p=0.004. The probability of enterprises conformed to ISO 26000 exceeded those without labor union by almost 10 percent (9.1%). The result demonstrated that SMEs would tend to adopt ISO 26000 if employees were able to set up an authority in their company. Thus, Hypothesis 8 was supported.

The effect of government contracts showed an insignificant difference (t=*0.*16, p=0.876). This suggested that Taiwanese government did not add SR into the standards for evaluation. However, in sum, enterprises that participated in tenders were superior to others when carrying out SR. Hypothesis 9 was not supported.

The effect of SR as a business strategy was significant, with t=6.38, $p<0.001$. This meant that enterprises that took SR as the strategy for operation had higher probability to adopt ISO 26000 (25.33%). Therefore, successful company usually integrated a social perspective into the core policy to guide its business activities (Porter & Kramer, 2006), in support of Hypothesis 10.

DISCUSSION AND CONCLUSION

The growing significance of SMEs in economic development has seen an important shift towards their SR practice (Jenkins, 2006). Besser and Miller (2001) pointed out that due to the change of economic circumstance, enterprises might not be able to take on luxury for SR. How to put SR into practice effectively becomes an important issue, especially for SMEs whose resources are not abundant. von Weltzien Høivik and Shankar (2011) reported that ISO 26000 can meet the specific requirements of SMEs. Therefore, the purpose of this study is to explore SMEs' attitudes toward ISO 26000. The firm size, organization's commitment under economic downturn, codes, labor union, government contracts and business strategies are the key factors that push SMEs to engage ISO 26000. However, the impact of multinomial company and government are not decisive. It was also revealed in our research that SR is regarded as an important issue within Taiwan SMEs.

As our findings suggest, we offer several implications for academic practice. This study provides a better understanding of the gap between cognition and behavior in SR participation. The results showed that 49.62% of enterprises believed that SR was philanthropic responsibility, because they believed they should contribute to society as good corporate citizens. Small businesses in developing countries focus strongly on philanthropic responsibilities, usually based on religious beliefs (Azmat & Samaratunge, 2009). Only few enterprises (6.02%) chose economic responsibility, which was contrary to the impressions of normal SMEs (Hitchens et al., 2005; Observatory of European SMEs, 2002). This is inconsistent with the result reported by El Baz et al. (2016), who found that SMEs view SR as an economic tool. However, most SMEs (62.78%) chose subsistence as their top priority, pursuing long-term survival. There were differences between SMEs' cognition and the priorities of their strategic decisions. SMEs strive for survival in the global market and compete with large enterprises. As a result, they need to be innovative, fast, and dynamic, which makes survival their top priority.

From the viewpoint of the supply chain, MNCs drive the SR behavior of their smaller suppliers (Castka & Balzarova, 2008a). Taiwanese enterprises usually play an OEM role. To reduce unnecessary costs, suppliers use cheap, but low-quality chemicals, or push their employees to work faster and for longer hours (Ciliberti et al., 2009). Many believe that the supply chains of large companies harm our environment (Aguilera-Caracuel, Aragón-Correa, Hurtado-Torres, & Rugman, 2012). According to such research, being part of an international supply chain would make little difference to the possibility of an enterprise adopting ISO 26000. Whether SMEs focus on exports or home sales, they have the same attitude toward SR. A growing body of evidence suggests that MNCs should be responsible for the SR practice of their supply chain (Amaeshi, Osuji, & Nnodim, 2008; Baden, Harwood, & Woodward, 2009). In order to join the MNC network, we suggest that SMEs should adopt ISO 26000 (Castka & Balzarova, 2008a). SMEs will also consider SR as a means of reducing risk when choosing a supply chain (Pedersen, 2009). This suggests that SMEs might be more willing to adopt ISO 26000. However, if SMEs cannot do so in an open and sincere way, it will not be effective. SMEs need to motivate themselves and grow.

Moon (2004) indicated that when conducting SR, the government's influence is decisive, and deciding whether to participate in government tenders will affect firms' willingness to adopt ISO 26000. The Taiwanese government has set up SR regulations for OTCs, but not for government procurement. The best function of government is to provide businesses with a fair environment, and to stop enterprises from destroying the environment while performing charity work. Moreover, the government should encourage enterprises to maintain SR by providing incentives. Corporations need a healthy society for efficiency and innovation (Porter & Kramer, 2006).

Evidently, the sizes of SMEs could affect the probability of their accepting ISO 26000 guidelines. Perhaps due to limited resources at the early stage of development, the SMEs could focus only on the core aspect of business, that is, profit. As they increased in size, the SMEs began to increasingly consider SR. Furthermore, more and more SMEs have recognized the importance of SR (Perrini et al., 2007). Hence, SMEs integrated the social responsibilities into their business activities, which enhanced the relationship between them and the society (Witjes, Vermeulen, & Cramer, 2016).

The global financial recession was a test of corporate's response and survival ability. The results of this study indicate that SMEs will not change their SR commitments due to temporary changes in the economic environment. SMEs that maintained their commitment to SR were significantly more willing to comply with ISO 26000 guidelines than SMEs that reduced the commitment. The investment view of SR can help the enterprises to achieve differentiation strategies (Siegel & Vitaliano, 2007). Over 80% of SMEs considered SR as a part of their overall business strategy. Therefore, the combination and development of SR and corporate core policy is an important source of future enterprise competitiveness as well as barriers of new competition (Boulouta & Pitelis, 2014).

International standards are important guidelines of international economic and trade activities. These standards can promote regional trade and reduce the communication barriers between enterprises. Past research was not conclusive as to whether manufacturing-oriented or business-oriented enterprises tended to fulfill SR more extensively (Murillo & LOzano, 2006). The results of this study pointed out that SMEs that passed the third-party certification were more willing to accept ISO 26000 guidelines. This suggests that the convenience of infrastructure has a far-reaching impact on management systems (Castka & Balzarova, 2008a).

Limitations and Further Research

The major limitation of the study was concerning the sample scope and low respond rate, and the samples were constituted mostly of manufacturing business. Different samples might yield different results. The samples might not represent other regions, or even large enterprises. Therefore, better sampling method can be applied in future studies, or similar survey can be done in different regions or countries to improve the problems mentioned above. Moreover, in this research, SEMs understood what SR was through the frame of ISO 26000 and were asked about their will to carry it out, but they were not informed about further development or problems they might encounter after carrying out SR. So far, there was not any enterprise that really carries out ISO 26000 in the world. Thus, researchers can conduct richer and more studies on SMEs which have already adopted ISO 26000 in the future.

Chapter 25
Human-Factor-Based Risk Management in the Healthcare to Improve Patient Safety

Barbara Streimelweger
University of Geneva, Switzerland

Katarzyna Wac
University of Geneva, Switzerland

Wolfgang Seiringer
Vienna University of Technology, Austria

ABSTRACT

'Patient Safety' tries to increase safety and transparency within healthcare systems for both patients and professionals. Within the healthcare sector, workflows become more and more complex, while time and money become scarce. As a consequence, the risk awareness, fault management and quality aspects become more important. One of the most well established risk assessment method is Failure Mode and Effect Analysis (FMEA) – a reliability analysis and risk assessment tool widely used in various industries. The traditional FMEA is using a Risk Priority Number (RPN) ranking system to evaluate and identify the risk level of failures, and to prioritize actions. However, there are several shortcomings in obtaining a quality estimate of the failure ratings with FMEA, especially when human factors play an important role. Thus, a new risk assessment method called HFdFMEA (Human Factor dependent FMEA) based on the dependency of used parameters and the observation of human factors, is proposed to address the drawbacks. The opportunity to improve patient safety is discussed as result of HFdFMEA.

1. INTRODUCTION

In the healthcare sector, the patient safety has become one of the major quality targets, with aim in reducing risks. However, it has been recognized that the patient safety risks are evolving over time and for this they and analysed in depth on an ongoing basis (Institute of Medicine, 1999), (ANetPAS, 2014), (Paula, 2007). For example, it has been shown that in 1999 2.9% to 3.7% patients across US states suffered from disclosed adverse events (Institute of Medicine, 1999). A recent American observational study found that 45% of patients' experienced adverse events, like medical mismanagement, and 17% suffered from events that led to a longer hospital stay or more serious problems (Andrews, Stocking, Krizek, Gottlieb, Krizek, & Vargish, 1997). According to Paula (Paula, 2007) an adverse event is a damage caused by the medical treatment and not by the disease itself and therefore is as a patient safety issue. Vincent et al. suggested that "*the patient's safety needs to be addressed on the basis of a broad assessment of a system's health*" (Vincent, Taylor-Adams, & Stanhope, 1998), suggesting that Quality and Risk Management need to be addressed together in order to improve patient safety.

Human errors are one main source for accidents in any industry, including healthcare (Institute of Medicine, 1999). According to Reason (WHO, 2005), particularly important is the identification of cognitive processes common to a wide variety of human error types (Reason J., 1990). These errors are differentiated into variable and constant (Reason J., 1990) errors and are classified as active and latent failures (Reason J., 1990), (Vincent, Taylor-Adams, & Stanhope, 1998).

Risk Management implies the systematic handling of risks with intent of identification and avoidance of risks (Ennker, Pietrowski, & Kleine, 2007). Professional Risk Management starts before failures that would have caused any damage, happen. In practice this does not mean that we have an absence of failures, but that the accuracy, dependability and speed of handling failures reduce the consequential risks and damages. As a consequence, the use of professional Risk Management approach in an organization, can improve the safety within the organization. Quality Management deals with important risks as well but it is operated independently from Risk Management. Quality Management often serves as a methodical platform for Risk Management (Streimelweger, Wac, & Seiringer, 2015). With the updated standard ISO 9001:2015, the section Risk Management was extended and became an important part in the application of Quality Management according to ISO 9001. The gap between Risk and Quality Management seems to be reduced.

One of the most established risk assessment methods in healthcare is the Failure Mode and Effect Analysis (FMEA). The FMEA is used to demonstrate how a Risk Management methodology can be used to improve patient safety (Institute of Medicine, 1999), (Marx & Slonim, 2003), (Ennker, Pietrowski, & Kleine, 2007). The FMEA approach with its failure ratings based on an ordinal scale for occurrence, severity and detection of an event is simple, but there are some shortcomings in obtaining an accurate estimate of the failure ratings (Vikramjit, Harish, Sarabjeet, & Simranpreet, 2013), (EN 60812 - FMEA, 2006), (DeRosier, Stalhandske, Bagian, & Nudell, 2002).

An important shortcoming of FMEA concerns its limitations with respect to complex systems (Marx & Slonim, 2003), (DeRosier, Stalhandske, Bagian, & Nudell, 2002), (Vikramjit, Harish, Sarabjeet, & Simranpreet, 2013), in which a critical error arises from a sequence of errors. This can be evaluated by the FMEA but the causes of errors per se cannot be evaluated. Therefore, other methods are needed, like for example Fault Tree Analysis (FTA).

In a healthcare system different risks can occur simultaneously. A problem in the measurement and rating of such risks is that unrelated individual events often influence each other (Ennker, Pietrowski, & Kleine, 2007), (Marx & Slonim, 2003). Furthermore, the dependency between the internal and external

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

risks, and respectively risks indicators, as well as the dependency with human factors, is not taken into consideration in the current approaches. A new risk assessment method based on the dependency of risks and extended by the human factors has the potential to deal with these shortcomings.

In general human factors can increase risk levels and the associated Risk Priority Number (RPN). A reduction of the risk levels can be done by addressing human factors in interactive sessions like trainings, motivation management, etc. In this paper we propose the enhanced Failure Mode and Effect Analysis, i.e., HFdFMEA method. This is a human factor-dependent FMEA, to model the dependency between different risk factors expressed by human factors and assess the risk level of failures based on human factors

The extension of the FMEA method is done by adding our Human-Factor-based Risk Management (RiDeM) system, which we validate (showing that it enables to increase the patient safety) with real world data acquitted from a Critical-Incident-Reporting-System (CIRS) (Streimelweger, Wac, & Seiringer, 2015).

The paper is organized as follows. Section 2 provides an overview on the background and related work, while Section 3 is used to present the Human-Factor-based Risk Management (HFdFMEA) approach, where the model of RiDeM in Healthcare is described in more detail. In section 4 the HFdFMEA is evaluated with actual data from a healthcare system and the evaluation results are discussed in section 5. Finally, we conclude and give an outline in section 6.

2. BACKGROUND AND RELATED WORK

In this section we explain Quality Management and Risk Management at large, and focus specifically in healthcare. We further explain FMEA and the "human factor" approach and the different roles of human factors and their impact on risks related to investigations.

2.1. Quality Management

In general quality is defined as "*degree to which a set of inherent characteristics fulfill requirements*" (ÖNORM EN 15224, 2012). In the last years, different quality standards and systems, as well as "best practice models" have been developed and established in the healthcare area like KTQ (Cooperation for Transparency and Quality in healthcare, www.ktq.de), EFQM (European Foundation for Quality Management, www.efqm.org), or EPA (European Doctor's Surgery Assessment, www.europaeischespraxisassessment.at).

2.2. Risk Management

Quality Management and Risk Management are independent but related terms. "*Risk Management aims to conscious dealing with opportunities and risks*," (Ennker, Pietrowski, & Kleine, 2007). Quality Management, also deals with risks, serves as a *platform base* for the Risk Management. The significance of risk has changed radically over the last century; "*Until the first decades of the 19th century, risks were accepted as more or less natural in the sense that they were directly associated with human activity rather than with failures of systems or equipment*", (Hollnagel, de Paris, & Antipolis, 2008). With the beginning of industrialization in the 19th century a crucial change took place, where failures of systems were included in the risks to be faced.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

2.3. FMEA

FMEA is as a systematic method for identifying failure modes of a system, item or function, and tries to evaluate and identify the effects before they occur (Stamatis, 1995). The purpose of the FMEA is to seek answer for questions like: "*what could go wrong with [the system or process] involved in creating [the system]; how badly might it go wrong; and what needs to be done to prevent failures?*" (Vikramjit, Harish, Sarabjeet, & Simranpreet, 2013). The traditional FMEA is based on the three factors: *severity*, *occurrence*, and *detection*, to determine the RPN (EN 60812 - FMEA, 2006), (Vikramjit, Harish, Sarabjeet, & Simranpreet, 2013), (Kmenta & Ishii, 2000). The FMEA was recommended by the Joint Commission on Accreditation of Healthcare Organizations (JCAHO) for the annual risk assessment since 1 July 2001 (Marx & Slonim, 2003). Unfortunately, this official accreditation does not specify if and how the human factors shall be included.

Most of the methods for risk assessment and accident investigation that are still used today in safety critical industries have their origin in the 1960s, for example FMEA and FMECA (MIL-STD-1629A, 1980). Driven by major accidents, risk assessment methods have been enhanced. Some further major changes and developments since the mid-1990s are for example the associated change in view on "human error", from the "old" look to the "new" look (Dekker, 2006) or the change from reactive to proactive safety, as marked by resilience engineering.

2.4. "Human Factors"

In most branches the conception of the error-free working employee is no longer valid. Rather efforts are made to understand the human error as a "human factor", to plan and to control it by the use of appropriate strategies (Paula, 2007). Vincent for example describes the "human factors" approach "*as a hybrid discipline that focuses on the human component within complex sociotechnical systems*" (Vincent, Taylor-Adams, & Stanhope, 1998). Research in the area of human factors is just beginning to be applied to healthcare since 2005 (Institute of Medicine, 1999), borrowing from industrial engineering and psychology. In the meantime, two approaches for research including human factors have been established (1) Critical Incident Analysis and (2) "naturalistic decision making" (Weinger, Pantiskas, Wiklund, & Carstensen, 1998).

2.5. Human Factors in Clinical Practice

Errors in medicine are among the ten most common causes of death in healthcare (Brennen, Leape, Laird, Herbert, Localio, & et al., 1994), (Com Q of HC in A, 2001), (Kohn, Corrigan, & Donaldson, 2000), (Ennker, Pietrowski, & Kleine, 2007). Risk Management in clinical practice considers errors, failures and adverse events. Leape (Leape L., 1994) emphasized that safer practice can only come from acknowledging the potential for error and building in error reduction strategies at every stage of the clinical practice. Reason (Reason J., 1995) pointed out, that "*human factors problems are a product of a chain of causes in which the individual psychological factors (that is, momentary inattention, forgetting, etc.) are the last and least manageable links…*". This means, not all errors lead to serious harm. In fact, it usually requires a string of errors to result in harm to patients. Yet it is important to consider these human factors.

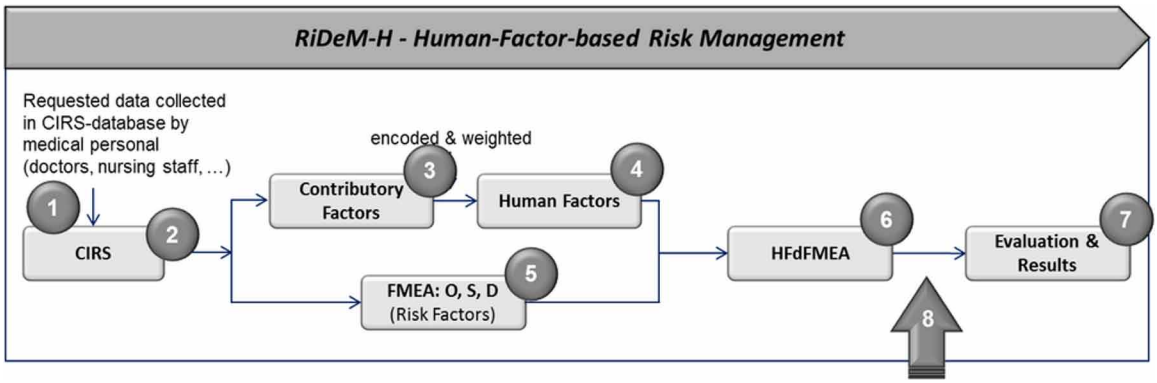
EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

2.6. Management of Human Factors in Clinical Practice

To mitigate errors in healthcare, CIRSs (Critical Incidents Reporting Systems) are used. Their goal is to gather enough data about incidents/events such that one can predict errors before they occur. Countries such as, e.g., Germany, Switzerland, Sweden, England, USA, and a number of others, have already established voluntary, national CIRS systems. In some countries, e.g., USA and Sweden, the use of such a system is compulsory, which results in more accurate and meaningful reports based on the investigated data. WHO provides a guideline of defining the content and implementation of CIRS (Institute of Medicine, 1999). However, none of the existing CIRS systems automatically enables to leverage human factors in Risk Management.

3. HUMAN-FACTOR-BASED RISK MANAGEMENT

This paper addresses the challenge of increasing the patient safety through active Risk Management by classifying human factors and by taking into consideration those human factors for risk assessments using FMEA. Our proposed approach is based on the three components: (1) CIRS, (2) human factors and their weighting and (3) derived risk factors HFdFMEA.



3.1. The RiDeM Concept for Healthcare

The concept for the proposed RiDeM is based on eight phases as shown in Figure 1: Phase one to three represent component (1) CIRS, phase four is equal to component (2), weighting, and phase five and six represent component (3), derived risk factors HFdFMEA. Phase seven deals with the evaluation settings and results (section 4) of the enhanced FMEA technique. For the evaluation of the derived human factors regression analysis has been used. In addition, the concept includes an eights phase not discussed in this paper, which points out the importance of monitoring and supervising. "*To manage risk means more than just to identify, evaluate, analyse and rate risks, as well as to define appropriate measures to minimize the risk. It is also important to follow the whole Risk Management process and to control and monitor risks and of course to go one step further and to supervise the implemented model*". More information about this 8th phase can be found at (Streimelweger, 2016).

(1) A CIRS as described in the previous section is leveraged to derive (2) human factors and weight them for the human-based risk determination later on. This is done once, over the frequency of all reported events per a human factor category (according to the column in CIRS) and once per each reported event over all human factors (according to the rows in CIRS). In practice, the human factor evaluation of the available CIRS data and risk-scoring need to be done by an expert team; scores of different experts must be evaluated for inter-expert agreement. (3) An expert team defines for each event the risk factors in terms of its severity (S), occurrence (O), and detection (D), all three on a scale from 1..10 in traditional FMEA, and from 1..5 in HFdFMEA. A scale from 1..5, allows the experts to have a clearer allocation of risk factors for O, S, and D. Furthermore, a Risk Priority Number (RPN) is assigned per each event in CIRS (RPN = S*O*D) (EN 60812 - FMEA, 2006), (Vikramjit, Harish, Sarabjeet, & Simranpreet, 2013), (Kmenta & Ishii, 2000).

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 1. Eight phases to RiDeM-H - risk-dependent-management (RiDeM) for healthcare, © (Streimelweger, 2016)

Therefore, the inputs of HFdFMEA method are weighted human factors derived from all the CIRS-contributory factors. The outputs of HFdFMEA are human-factor based RPNs assigned by each event in the CIRS.

We evaluate our HFdFMEA approach by a multiple regression analysis where the traditional (FMEA-based) RPN will be defined as the dependent variable and the weighted human factors are defined as independent variables.

3.2. The Proposed HFdFMEA Model

In order to derive human factors from a CIRS, we employ the framework by Vincent (Vincent, Taylor-Adams, & Stanhope, 1998) which is used for analysing critical incidents/events. This framework includes factors of relevance to clinical practice and outcome by combining the strengths of Reason's model of organizational accidents (Reason J., 1990), (Reason J., 1995) with socio-technical pyramid of Hurst and Ratcliffe (Wagenaar, Groeneweg, PTW, & Reason, 1994), (Hurst & Radcliffe, 1994), (Johnson, 1980), (Moray, 1994), (Mahajan, 2010). In this framework, the hierarchy of factors has been derived from previous publications (Leape L., 1994), (Vincent & Bark, 1995), (Cooper, Newbower, & Kitz, 1984), (Cook & Weisberg, 1982), (Bogner & ed., 1994), (Moray, 1994) as follows: Patients (patient factors) and staff (task factors) as individuals are at the bottom, team factors and working conditions in the middle, and organizational and institutional factors at the top (Mahajan, 2010).

Given the contributory factors from CIRS, the human factors can be derived by their encodings similar to Vincent's framework. More than one contributory factor can be assigned to the same event. If a contributory factor is assigned to an event, it can be yes (HF=1=present) or no (HF=0=not present). Events with non-assigned contributory factors are classified under "not assigned."

The human factor (HF) for an event (E) is expressed in terms as follows:

$$HF = HF_1 + HF_2 + \ldots + HF_k = \sum_{j=1}^{k} HF_j \ (j=1, 2, \ldots k) \quad (1)$$

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

In which HF_j is the cumulated human factor consisting of a number of different contributory human factors.

$$HF_{E_i} = HF_{1,E_i} + \ldots + HF_{k,E_i} = \sum_{j=1}^{k} HF_{j,E_i} \tag{2}$$

Whereat HF_{E_i} is the human factor of an Event i (i=1, 2, …n)

There are two possibilities to weight the contributory human factors for the human factor HF_j.

(A) Weighting over frequency of ONE human factor over all events (weighted per column).

The weighting of the contributory factors of HF_j can be expressed in terms as follows:

Weighting factor $w_j(HF_j)$ of a human factor weighted over frequency of ONE human factor over all events

$$w_j\left(HF_j\right) = \frac{\omega_j}{\sum_{j=1}^{k}\omega_j} \text{ with } \omega_j\left(HF_j\right) = 1 + \frac{HF_{j,E_i}}{\sum_{i=1}^{n} HF_{j,E_i}} \tag{3}$$

(B) Weighting on the frequency of ALL human factors per each event (weighted per row)

Weighting factor $w_j(HF_j)$ of a human factor weighted on the frequency of all human factors per each event

$$w_i\left(E_i\right) = \frac{\omega_i}{\sum_{i=1}^{n}\omega_i} \text{ with } \omega_i\left(E_i\right) = 1 + \frac{HF_{j,E_i}}{\sum_{j=1}^{k} HF_{j,E_i}} \tag{4}$$

Finally, the weighting method we use, is based on the conventional reliability allocation method by Kim, which typically considers a series system consisting of independent subsystems (Kim, Yang, & Zuo, 2013).

3.3. HFdFMEA Computation

As we have indicated, the objective of the FMEA is to compute the RPN per an event (equation (5)). The event having a higher RPN will have a higher priority for corrective action or preventive measure.

$$RPN = S*O*D \tag{5}$$

$$RPN_{E_i} = \sum_{i=1}^{n}(O_i*S_i*D_i) RPN_{E_i} \ldots \text{ RPN of an event i, i=1, 2, …n} \tag{6}$$

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

For our extended FMEA the traditional calculation of RPN is enhanced by the human factors HF_j:

$$HF = HF_1 + HF_2 ... + \ HF_k = \sum_{j=1}^{k} HF_j \tag{7}$$

Related to an event E_i this results in:

$$HF_{E_i} = HF_{E_i 1} + ... + \ HF_{E_i k} = \sum_{i=1}^{n} \sum_{j=1}^{k} HF_{E_i, j} \quad i=1, 2, \ldots n; j=1, 2, \ldots k \tag{8}$$

Therefore:

$$RPN'_{E_i, HF_j} = \sum_{i=1}^{n} RPN_{E_i} + \sum_{i=1}^{n} RPN_{E_i} * \sum_{j=1}^{k} HF_{E_i, j} \quad i=1, 2, \ldots n; j=1, 2, \ldots k \tag{9}$$

RPN'_{E_i, HF_j} … human-factor-based RPN_{E_i}

In the next section we validate the output of the proposed HFdFMEA model $\left(RPN'_{E_i, HF_j}\right)$ by means of regression analysis. For the validation of the HFdFMEA model we derive the values of RPN_{E_i} for each of the human factors (as described in equation (9)).

In the HFdFMEA model the setting of measures is depending on the RPN as well as on the rated factor occurrence, severity and detection itself. For example, if RPN=15 whereas occurrence=3, severity=5 and detection=1, according to RPN the put measures are strongly recommended, but due to severity=5 the put measures becomes mandatory required.

The human-factor-based RPN $\left(RPN_{E_i, HF_j}\right)$ shows, that the increase of the non-human-factor-based RPN $\left(RPN_{E_i}\right)$ depends on the approach of weighting of these factors: Using the approach (B) "weighting on the frequency of all HF per each event" results in a higher RPN_{E_i, HF_j} then using approach (A) "weighting over frequency of one HF over all events". On the other hand, when comparing the percentage share, the results differ only very slightly. And that implies that the used approach of weighting is relevant regarding RPN_{E_i, HF_j}.

4. EVALUATION SETTING AND RESULTS

To evaluate our approach, we could rely on data acquired from cirs-health-care.de (developed by Inworks GmbH), a public, not compulsory, representative CIRS for Germany and Austria where currently 400 medical institutions take part and report their critical incidents and events. The database entries are anonymous. Each listed event entry is assigned to one or more of 32 expertise areas, e.g. surgery or neurology. Additional data about the professional category (doctor, nursing staff, other staff), a place (e.g., hospital, preclinical / emergency medical service, ambulance) and, e.g., a professional category,

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

time of day, area of supply, gender of the patient, and state of an event, as well as (optionally provided) 'contributory factors' are stored. There are nine main categorised contributory factors: (1) patient, (2) organisation, (3) task, (4) person / individual, (5) communication, (6) working environment, (7) equipment /material, (8) team & social factors, (9) education. Except communication and education, which are specific to given CIRS databases employed in our research, all other are as defined in the Vincent's framework (Vincent, Taylor-Adams, & Stanhope, 1998), (Vincent & Bark, 1995). These entries provide the basis for the human factor evaluation. The CIRS uses up to 9 pre-defined categories for the contributory factors. From 2013 to November 2014, 194 TOP-events out of 5000 events were used for our analyses. The TOP-events are the evaluated and risk-rated events by an expert-team, consisting of healthcare professionals. Furthermore, the experts define necessary measures to help to avoid and minimize such risks in the future. The O, S and D ratings of an event range from 1…5, with RPN_{max} = O*S*D = 5*5*5 =125.

4.1. Defining the Human Factors

The traditional RPN of an event is calculated according to equation (6) as a result of the three factors O, S, and D. The above mentioned contributory factors simultaneously form the nine human factors for each event $\left(HF_{j,E_i}\right)$. Due to the contributory factors as well as other factors e.g. professionals, places etc. are provided as text, they need to be encoded before they can be used for further analysis, in that way 1=present/true and 0=not present/false.

4.2. Weighting the Human Factors

The derived nine human factors are weighted. Given the two approaches possible (A), (B), we selected both approaches to compare the impact on the accuracy human-factor-based RPN.

Comparing the reported events with weighting over frequency of one human factor over all events (approach A) and with weighting on the frequency of all human factors per each event (approach B) shows that in the first case, the weighted human factors are significantly lower compared to approach (B). That means, on the one hand, approach B emphasizes the human factors more, and, on the other hand, that the risk depends on the number of human factors assigned to an event.

Figure 2 illustrates the results of one reported event (event number: 123, event description: insufficient perioperative monitoring) and it's derived nine human factors. Only the human factors CForg, CFtask and CFwen are present and have value 1. Also represented are the weighted human factors Wpat to Wedu according to approach (A) and (B), the traditional $\mathrm{RPN}\left(\mathrm{RPN}_{E_i}\right)$ as well as the human factor based $\mathrm{RPN}\left(\mathrm{RPN}_{E_i,\,HF_j}\right)$. The used indices (i=1…9) are: (1) pat – patient, (2) org – organization, (3) task – task, (4) ind – person / individual, (5) wen – working environment, (6) com – communication, (7) equ – equipment / material, (8) tsf – team & social factors, (9) edu – education. The values for the factors S (severity), O (occurrence) and D (detection) have been provided by the CIRS-system provider Inworks GmbH.

As mentioned in section 4, the data for our evaluation are from cirs-health-care.de (www.cirs-health-care.de), a public, not compulsory, representative CIRS database for Germany and Austria where currently 400 medical institutions take part and report their critical incidents and events. The nine predefined categories are provided as text and derive into our nine contributory factors by encoding into 1

(present) or 0 (not present). The next step was to weight these factors as described in above section 4.2. The risk-factors severity (S), occurrence O) and detection (D) are mandatory for the RPN computation. S and O are both published, D is computed and monitored, but is not published on cirs-health-care.de due to data protection. So we used factor D from Inworks GmbH database. Only the TOP-events out of all reported events by the medical institutions are published on cirs-health-care.de. Those TOP-events include amongst others the risk assessment for S, O and D and measures to reduce the relevant risks. Only those TOP-events are part of our evaluation. For the first case-study we had access to 195 TOP-events and for the second case-study we could access 289 TOP-events.

4.3. Evaluation of HFdFMEA model via Regression

To test the validity of the proposed HFdFMEA model we have used the multiple regression analysis. This was done to evaluate the statistical significance of the relation between dependent variable RPN and the human factors (Aldrich, 2005). Three special measurements can indicate the significance of a regression 'R', 'adjusted R square' (R^2). The final output of a multiple regression is an equation derived from the computed coefficients, which can be used to predict a new value for the dependent variable only using the independent variables in our case the human factors.

Our hypothesis is that the human factors help to indicate the RPN level. Based on our CIRS database we run the regression analysis and verify the statistical significance. To compute the regression results we have used the nine human factors. The regression output was evaluated using the following six assumptions. (1) Independence of the observations was fulfilled due to an acceptable Durbin-Watson value of 1.589. (2) Linearity, was confirmed by graphically identifying a horizontal band on the scatter plot

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

between the residuals (Y axis) and the predicted values (X axis). (3) Homoscedasticity was tested using a scatter plot of the studentized residuals versus the unstandardized predicted values. Homoscedasticity can be rejected, as the residuals are mainly equally spread over the unstandardized predicted values. (4) Multicollinearity was excluded as the highest variance inflation factor (VIF) was 1.522 and the smallest tolerance value was 0.657. (5) Outliers with a standardized residual higher than 3 and all leverage and influential points are not part of the final model. (6) Normality was confirmed with a histogram of the standardized residuals.

As all six assumptions are fulfilled, the statistical significance of the regression result can be interpreted. R can be between 0 and 1, and a value of 0.274 unfortunately indicates a not so good prediction level. The R^2 value of 0.025 explains only 2.5% of the variability of the dependent variable. More importantly, the adjusted R^2 value of 0.025 means that the regression model explains just 2.5% of the proportion of variance, which indicates a low effect size. The effect size, which is explained by Cohen's classification, could be better, but based on the available data it was not possible to find a better model. In general, the R, R^2 and adjusted R^2 values do not always represent the real quality of a regression model. Also with a low adjusted R^2 the regression model can fit for the data. Due to the fulfilled test assumptions the regression output indicates a significant relation between the RPN and the human factors. As the prediction level is low would need to check why we have a significant relation, but we have problems predicting RPN with self-selected human factors. Due to the low R^2 a second case study should help to verify how the results would change if more data were used. Therefor the same CIRS-health-care database was queried. Since the first evaluation, 100 entries were added and the second trial a database with 289 reported top-events was available. The same settings for the regression analysis were used as for the first evaluation (Streimelweger, 2016). The final regression equation from the second trial is shown equation 10.

$$\begin{aligned} RPN'_{E_i,HF_j} &= 22.793 - \left(794.751 * \mathrm{HFpat}\right) + \left(134.140 * \mathrm{HForg}\right) \\ &+ \left(49.430 * \mathrm{HFtask}\right) + \left(188.762 * \mathrm{Hfind}\right) + \left(937.758 * \mathrm{HFwen}\right) \\ &+ \left(735.858 * \mathrm{HFcom}\right) + \left(319.293 * \mathrm{HFequ}\right) - \left(1614.985 * \mathrm{HFtsf}\right) + \left(1037.894 * \mathrm{HFedu}\right) \end{aligned} \tag{10}$$

Table 1 gives an overview of both case studies.

5. DISCUSSION

In the following three questions to discuss the importance of the data source, the approach and the implications for the health system as well as for the practitioners and patients are developed (Streimelweger, Wac, & Seiringer, 2015), (Streimelweger, 2016).

5.1. To Which Restrictions and Limitations Do the CIRS Databases Lead?

Based on our research we conclude that it is important that all fields of a CIRS database are filled with informative, real data. Otherwise each kind of evaluation result becomes vague and inconclusive. Furthermore, it is necessary to define the required information in a way, that there is no space for giving answer like "all", "other" or a blank field. A concrete assignment is absolutely necessary, since this leads to more accurate results for subsequent analysis. To be able to compare with other hospitals also over their own national borders, it is necessary to use similar contributory factors, which results in human factors. Therefore, Vincent's framework or ISO standards could be used as guideline and best practice models to define categories and factors.

5.2. How Generalised are the Results?

The derived human factors from a CIRS database are only valid for the analysed database and for the given period of the data made available for us. A CIRS database can only provide national data. Ideally all healthcare facilities are obligated to provide information for a CIRS database. However, it makes sense to perform it within an individual hospital. In this case the hospital can profit mostly because this will help hospitals to improve their individual standards for patient safety.

5.3. What are Implications for the Health System, Practitioners and Patients?

The proposed HFdFMEA method allows improving patient safety by means of enabling better understanding and management of human-factors influencing risks and the Risk Priority Number (RPN), which in turn is of importance for the patient. Investigations in the relation between risks and human factors help healthcare professionals to identify potential problems, to improve processes, to minimize risk and respectively to avoid adverse events and incidents by putting proactive and predictive measures. An open communication regarding the reporting shall be encouraged. Anonymity should help the practitioners to ensure that they have no fear of negative consequences when reporting an event.

The HFdFMEA can be implemented by hospitals using a CIRS database and through this the human-factor-based RPN $\left(\mathrm{RPN}_{\mathrm{E_i},\mathrm{HF_j}}\right)$ can be evaluated per event, and depending on the assigned human factors, it would be possible to take appropriate measures to minimize risks. In addition, it offers also the possibility to handle chances (positive impacts).

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

6. CONCLUSION

The target of this research was to answer the question "Is it possible to increase patient safety through active Risk Management by classifying human factors and by taking into consideration human factors for risk assessments based on FMEA?" The answer can be summarized as follows (Streimelweger, Wac, & Seiringer, 2015):

The proposed enhanced HFdFMEA embraces the human factor approach. The data recorded in the CIRS database upon an event can be used for this purpose. Therefore, the event-specific contributory factors are converted into the human factors, which are used in this model, by decoding into 1=present/true and 0=not present/false. As a result, those human factors are weighted. The HFdFMEA does not only reveal risk level of failures based on the human factor but also gives the possibility to reduce the risk level of failures through means of human factor interactions, like trainings, motivation, etc. This allows considering negative impacts, known as the 'typically risk', and positive impacts, known as 'chance'. Furthermore, the results of the regression analysis show that human factors, inter alia, may be interdependent.

In our research we did not differentiate between the different areas of expertise whereas this information could be provided quickly and easily by the analysis carried out in each area of expertise. This information will enable hospitals to focus on defined areas and to mitigate risks and increase patient safety.

Our on-going research activities are focused on a human-factor-based Risk Management (RiDeM) method, extended by the proposed HFdFMEA, which will quantify the relation between risks and human factors for an improved Risk Management method. The method consequently will facilitate to improve patient safety.

This research, the monitoring and supervisory part of the RiDeM-H model constitutes the phase 8 of our model.

Chapter 26
Insurance as an Optimization Tool for Risk Management in Small and Medium-Sized Enterprises

Katarina Ivančević
Law School of Union University Belgrade, Serbia

ABSTRACT

The SME risk management optimization model includes appropriate methods for identification, analysis and classification of risk assessment and developing a plan to overcome the risks and control the applied reaction to risk. Insurance is a classic way of a risk management process and is applicable to specific situations. The subject of this study is exposure and risk management in small and medium-sized enterprises (hereafter: SMEs) which are eligible for transfer of insurance coverage. This paper discusses the process of risk management in SMEs by transfer to insurance and indicates which risks and in what way can be transferred to the insurer. In this paper we analyze the supply of domestic insurers in Serbia, and insurance requirements, variants that offer coverage to overcome the particular risks to which SMEs are exposed. In the elaboration and research of mentioned theses the paper will use methodological procedures of analysis and synthesis, the inductive-deductive method, and if necessary, the comparative method of scientific research.

INTRODUCTION

The purpose of this chapter is to analyze the risks which SMEs transfer to insurance companies, and the value of risk optimization management in these businesses. The underlying premise is is that SMEs in Serbia fail to manage risks in an optimal way. The chapter starts from the premise that SMEs have difficulty in understanding insurance products, and that they need both support and assistance in this regard. In this sense, the chapter deals with main characteristics of insurance, with the aim to show how

SMEs can optimize risk management and what the role of insurance companies could be. In an effort to identify issues that occasionally arise and point to possible solutions the author will compare the experience of countries with an advanced insurance market for SMEs, Great Britain and Australia in particular, with that of Serbia. Experience shows that in advanced economies insurance market is very competitive. Next, the chapter will examine offers of insurance products in the Serbian market and the use of broker insurance services. To enhance this chapter, the author will consider issues of importance to SMEs using as an example insurance services in Serbia and possible differences in relation to countries in which there exists a developed insurance market. Insurance sector examples will be presented to support the approach, but the focus will be on opportunities for SMEs. Following the above main content, the chapter discussion will include future research directions. Finally, the chapter ends with a conclusion and key terms and definitions.

BACKGROUND

Small and middle sized enterprises (SMEs) are considered the key drivers for growth and development of national economies. They contribute to growth of employment, particularly in the sectors of transport, civil engineering, communications and tourism. (Jeremić, Živić, 2011, p. 78) For example, in United Kingdom SMEs play a vital role in the health of the economy and according to the Financial Conduct Authority (2015) "99.3% of private sector businesses are SMEs." Similarly, in the Serbian economy 99.8% of business entities are SMEs (Chamber of Commerce and Industry of Serbia, 2016).

SMEs are exposed to numerous business risks. Most organizations must take risks in order to develop, so not all risks are inherently a negative phenomenon (Udovičić & Kadlec, 2013). SMEs regularly face certain threats and numerous risks which endanger their operations. This can have unfavourable economic consequences. Exposure to risks, especially negative ones, must be taken into account also in good times, when profits are increasing (Simons, 1999). SME business success depends on decisions concerning protection of particular risks and measures that should be adopted in order to control and reduce risks. In that respect, quality management of each company includes the organization of monitoring and management of risk.

Realizing SME significance the Boston Consulting Group carried out an extensive survey of 2,500 small businesses in six largest SME insurance markets: U.S., UK, Italy, France, Germany, and Japan. The research explored the insurance decision-making processes of small business owners and found that SMEs are more open to direct interaction and outreach from insurers than many experts have expected. SMEs expect targeted outreach initiatives, improved value proposition for brokers and agents and a "*hybrid direct*" model that provides semi customized offerings, advice, and information (Hoying, Agarwal, Rapsch, & Yasushi, 2014).

At a time when businesses, particularly SMEs, face the consequences of the economic crisis and climate change increases the frequency of extreme events, it is important to discuss issues related to security as a model for overcoming the risks to which SMEs are exposed. Insurance provides a certain amount of security in terms of decrease of potential loss that may occur through realization of risks covered by the insurance. The main objective of risk optimization in SMEs, especially after the occurrence of adverse events, is to establish at least a minimum of business activities in the shortest possible period of time (Njegomir, 2011, p. 41). The additional benefit is that an insurer provides support to SMEs, stimulates better and safer SME operations.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

In the whole of European Union there is emphasis on the problems of financing for SMEs, but significantly less attention is paid to insurance for SMEs. The EU Commission has noted that insurance requirements are often difficult to comply with and that in some cases SMEs and professionals in particular have found it hard to obtain insurance coverage for cross-border activities (Jeanmart, 2015).

According to available insurance indicators, Serbia is significantly below the average of EU member states. For example, with the value of the realized premium Serbia is on the 86th place in the world (National Bank of Serbia, 2016, p. 9). However, this data does not include the premiums collected from businesses and there is in fact no data on SME insurance to evaluate. The development of the insurance market reveals the level of awareness and need to conclude insurance contracts. In countries where insurance culture is more developed insurance of the business sector is increasingly provided. For example, in Australia only 26% of all SMEs do not have any form of general insurance. And while in Serbia texts are rare that deal with risk management and insurance for SMEs Australia provides detailed analysis of data with basic insurance information of relevance to SMEs (Insurance Council of Australia, 2008).

SIGNIFICANCE OF SME RISK MANAGEMENT THROUGH INSURANCE CONTRACTS

Conclusion of an insurance contract requires understanding rules on which the insurance and main features of this service are based. The lack of required knowledge may complicate understanding of the insurer's offer and lead to a conclusion of a contract which may not provide adequate risk coverage. An optimal common aim is to envisage the SME insurance also from the perspective of advantages provided by insurance and not only from the perspective of insurance expenses which is what SMEs usually do.

SMEs evaluate the recurrence and intensity of damage and maximum amount of loss that may occur for each separate risk. Ranking of risks and damages that may occur enables a risk manager to choose the most adequate methods or their combination in the risk management process. SMEs may be protected from some risks by insurance. According to Dickinson (2001), "most risks that a company faces cannot be insured or hedged and must be retained or financed internally" (p. 363). Therefore, insurance is one of the methods of partial financial control applied to provide funds for coverage of loss (Andrijašević & Petranović, 1999, p. 14).

In addition, not all risks are insurable. Financial risks which produce impacts measurable in monetary terms are suitable for insurance as a method of loss distribution (Vaughan &Vaughan, 2000, p.17). It is common that only pure risks are accepted for insurance. Insurance neither provides protection of individuals from speculative risks which they have voluntarily accepted (Njegomir, 2011, p.24). The insurer undertakes only a part of the potential loss that he is able to bear in the course of the calculation period. Thus, some risks can only be covered by specific and not all kinds of insurance. Consequently, risk of war and strike risks are covered in transportation insurance.

When SME risk manager determines the risks which will be covered, he should decide which risks will be covered by insurance and which will be retained. "Some insurable risks could be prevented or their impact reduced through efficient loss-prevention or control systems while some could be retained and financed within the company" (Dickinson, 2001, p. 360). Therefore, insurance represents only one component of the risks management process. And not all risks suitable for insurance should be insured or they should not be fully insured (Ivančević, 2006, p. 415) Priority is given to those risks which SMEs

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

are legally bound to insure pursuant to the legal provisions or contractual obligations it had undertaken. This includes risks characterized by high intensity and low frequency because their realization could cause huge losses to SME.

In most cases the total risk of loss is not transferred to an insurer. Consequently, insurance indemnity will not completely cover the loss. The most important consequence for the insured SME is that, provided it is covered by the insurance, the amount of loss shall be reduced and the great loss shall be distributed into acceptable parts (Sneyd, 2003, p. 105). Laymen may believe that payment of premium is a waste of money if the insured event is not realized within the contracted period and if no loss takes place. However, even if the insured SME does not sustain any losses, it has received something in return for the premium paid: the insurers promise that, in case of insured event occurrence, it will be indemnified. The advantage of insurance is that the insured may recover the money invested in the insurance, by the indemnity payment in the current year in excess of the total amount paid for premium during previous years.

Besides providing a certain level of security, insurance can also improve the quality of SME operations. When deciding to insure a company against certain risks, insurers chose to insure successful companies. During the validity of the insurance contract period, they encourage clients to avoid activities exposing them to excessive risks, thus encouraging actions in the optimal interest of stakeholders (Kočović, Šulejić, 2002, p. 46). For example, insurance terms and conditions emphasize compliance with legal liabilities of the insured, such as the obligation of the regular bookkeeping in line with the provisions of the law. In some countries, insurers try to assist SMEs to improve risk management practices and knowledge of the benefits of insurance. For this purpose several publications have been prepared in the UK. AXA Insurance has already published "Guidance on preparing continuity plans for small businesses" involving business continuity planning for small businesses. Also, Association of British Insurers (ABI) issued a guidance ''Insurance for Small Businesses a guide to protecting your business''. However, in many cases there is still lack of risk awareness SMEs and according to Crichton (2009) "they are not meeting the very basic risk management standards to meet their insurance cover requirements." Risk management costs require the respective budgeting to cover all necessary activities. Generally, SMEs are not able to hire *full*-time *risk managers, as it is set forth in the concept of risk management.* Therefore, insurers are recommended to engage more and support SMEs in the process of risk management. In fact, experience of developed countries shows that when the insurer provides this type of support SMEs can reduce their loss ratio to 10% while increasing customer retention by more than 15 percent (Hoying et al., 2014).

Opportunities in Undertaking Optimal Preventive Measures in SMEs

Cooperation with the insurer and risks transfer to an insurance company may be useful for SMEs in many ways. Disbursal of compensation also contributes to the improvement of SME business environment and performance, and prevents the occurrence of certain risks covered by insurance (Mrkšić, Petrović, & Ivančević, 2007, p.7). Insurers also encourage SMEs to undertake preventive measures aimed at prevention of occurrence of certain risks. Prevention funds may be used for the purchase, replacement or rectification of equipment and protective devices, for employee training in proper use of equipment and for protective measures (Ilkić, 2015, p. 49).

Fire prevention measures are a particularly important example. Fire risk is a typical risk where coverage is provided through an insurance contract.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Training of insured personnel is important because unprofessional and inadequate behaviour represents a risk which can be reduced to a minimum through preventive training. These courses are also interesting for the insured, since in this way security level is raised, with an impact on the amount of premium which provides significant budget savings. Confederation of Fire Protection Association (CFPA) Europe has therefore composed an integral system of training of the insured employees to familiarize them with a fire risk assessment methodology (Vidaković, 2010). Through application of this methodology in industrial, commercial, administrative and residential facilities, adequate risk assessment and prevention level of future risks is provided. The installation of high quality equipment is encouraged (electrical equipment, heating and similar) in accordance with applicable standards, as well as prevention and equipping facilities with fire protection devices. It is required that all stocks and especially materials with explosive or flammable properties are stored in line with law. Hence, the insurer's liability shall be excluded if the insured has not taken these protective measures.

Emerging Fundamental Risks in SME Insurance

Fundamental risks affect material goods, lives and health of many people. They involve floods, windstorms, earthquakes, wood fires and similar. Regularly, these risks affect large segments of the SME sector. Their realization results in catastrophic losses for some businesses. Risks stemming from weather phenomena and climate change nowadays require a special approach. It is considered that climate change represents the greatest threat to modern economy and particularly to agriculture (Petrović & Grujović, 2016). The number of these events grows globally each year. In fact, there were about 14% more natural catastrophe events in 2014 than in the previous year, which was the record for one year (Swiss Re, Sigma, 2014). Similarly, financial losses caused by floods in May 2014, in Serbia alone, exceeded 1.53 billion Euros. The loss recovery was mainly financed from budgetary funds, donations and foreign credit lines. The insurance business participated in indemnity with only 2.4%, i.e. with about 37 million Euros (Business & Finance, 2015). There are no data on losses in Serbia suffered from SMEs, but it can be assumed that they were greatly affected by losses from floods and that, like the majority of economy and population, have not been insured against this risk. In other countries the situation is similar. For example, according to Figueres (2016) "70% of natural disasters that affect people's lives and livelihoods are still not covered by insurance, most often because the right combination of financing and policy are absent or uncoordinated" (p. 42). These figures speak for themselves in terms of SME insurance opportunities.

Given the number and diversity of SME activities in all countries the author assumes that they are significantly affected by the impact of climate change alone. However, their problems are not given enough attention by the media or adequate support from state and local authorities. Even in the UK only a small number of SMEs received flood assistance from the local administration. Damages are mostly covered from their own resources or from their insurer. According to Crichton (2009) "most of the help for small businesses comes from their insurance companies", however many SMEs in the UK were unable to renew their insurance. Therefore, it is estimated that extreme cases of floods could lead to SME bankruptcy (Crichton, 2009).

Losses resulting from the natural catastrophes are vast. Classic insurance is not able to take over and cover all these risks. Participation of the state in respective risk management is demonstrated through the creation of different funds for insurance against these risks, cooperation between state and the insurer, introduction of obligatory insurance against certain risks which are considered catastrophic and subsidies or assistance in case of such risks. Development and implementation of policies that encour-

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

age demand for insurance products against catastrophic risks and stimulate good practices of managing catastrophic risks are important. Accordingly, compulsory insurance against storms was introduced in France, Spain and Belgium which is contracted together with fire insurance (Saković, 2015). Turkey introduced compulsory insurance from earthquakes (Ivančević, 2006, p. 478)

There is no secure way to prevent natural catastrophes, but their devastating effects can be mitigated in part. Preventive and protective measures against loss occurrence are commonly applied. Accordingly, embankments, barriers, concrete walls are constructed and monitoring of meteorological data is organized. Some other activities are also taken. However, according to Crichton (2009) "SME are as yet not well prepared for the impacts of climate change and indeed many do not take the threat seriously, despite the fact that the smaller the business the more vulnerable it is to the impacts of climate related disasters while larger companies are more likely to describe their strategy regarding climate change and are probably more likely to have the resources to do so" (p.2). Only a partial loss can be covered by insurance and insurers have the right not to pay 100% of the claims costs. Which means a typical SME customer may not have the funds to meet the deficit. It is not possible to completely envisage all the consequences occurred by realization of these risks. Therefore, insurers limit coverage. If these risks were fully overtaken, premiums would be extremely high and therefore unacceptable for the majority of insured SMEs.

CHALLENGES OF SME PROPERTY INSURANCE

SME Property insurance requires rationality. Namely, the insurance of all property against all risks to would be too expensive and unnecessary. Decision on risks which will be transferred to insurance should be based on evaluation of the frequency and intensity of particular property risk exposure. Insurance of property assessed as low intensity risk with low likelihood of risk occurrence is not required. Such risk can be completely eliminated or significantly reduced through SME preventive and protective measures. The high frequency risks, including those of low intensity, as well as low frequency risks having great intensity should be insured. In the risk assessment processes the general statistical data should be combined with own experience. The place of insurance occupies an important place in the decision-making process. Some risks can be realized in some places to a lesser or larger degree, while elsewhere they cannot be realized. Duration of the insurance contract (short-term, long-term or multi-year) shall be matched to the risk type and effects.

Special insurance conditions and premium tariffs outline the contracting modalities of property insurance coverage. The insured sum represents the upper limit of insurer's liability and it must correspond to the actual value of the subject matter of insurance. Type of insurance coverage and the sum insured should be selected in accordance with the chosen risks and subject matter of insurance. Insurer's liability can be proportional and non-proportional. Under proportional coverage those parts of property exposed to high intensity risk (fire risk, e.g.) are insured because they can cause total loss of the insured object. In case of proportional insurance indemnity it is important that the insured object value is equal to the amount of the sum insured.

In order to avoid under-insurance some form of non-proportional insurance may be contracted as the insured is not always interested to insure property to the highest actual value. Under *The first loss insurance clause* each loss up to the agreed sum insured is contracted to cover the maximum possible loss that can be predicted for the insured SME facility. When applying this contracting modality, it is

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

important to properly assess the amount of the maximum possible loss. It is favorable for the insured since the insurance premium is significantly lower than for other types of coverage. In case of low intensity risks with lower impact and limited loss (e.g. water leakage from installations) it is assumed that it would be optimal to contract SME insurance coverage through the first loss insurance. Robbery and burglary insurance is also contracted in that way. Special form of the first loss insurance is the *agreed value insurance* applied for high intensity risks which may result in total loss of the insured item. It is applied for the insurance against fire risk and some machinery breakdown. Premium calculation is based on asset book value as of 31 December of previous year. Therefore, it is required to maintain orderly bookkeeping which is an added value in SME development. When insurance based on *tax value* is contracted the insured and the insurer jointly determine the value of the insured item and respective indemnity accordingly. This is a way to insure items having a subjective value for insured such as fine art paintings, jewelry and collections.

Insured Event Prevention and Rescue of Insured Object

The insured is obliged to take all necessary measures in order to prevent risk occurrence covered by the insurance. Should the insured event take place, the insured shall be obliged to take applicable measures (reporting to the competent authority, etc.) or specially stipulated measures, in line with possibilities and situation occurred in order to limit consequential damage. Should the insured, without justified reason, fail to fulfill the above mentioned obligations, insurer's liability shall be reduced by an amount equal to the increase of damage due to such omission (Serbia, Law on Contracts and Torts, Article. 926).

The advantage for the insured, that SMEs should take into account, is the legal liability of the insurer to reimburse the expenses, losses and other damages caused by the insured's attempt to eliminate the immediate risk of insured event occurrence, i.e. reasonable attempt to limit its actual consequences. Reasonable expenses are those expenses which are lower than the loss that could have been expected if the expenses had not been sustained. This liability exists also if all the attempts of the insured have been unsuccessful. In addition, in case that the indemnity and the reimbursement of these expenses are higher than the sum insured, the insurer is obliged to reimburse them in full amount. In that way the client is encouraged to take necessary measures to prevent the insured event occurrence and to reduce its adverse effects.

SME Participation in Loss and Exclusion from Insurance

Through exclusions from insurance coverage and franchise contracting SMEs are encouraged to handle their property with care, to use it properly and improve working environment. The insured is entitled to retain the portion of risk in the self retention insurance. The respective decision is based on statistical methods (Andrijašević & Petranović, 1999, p.20). Insurance against particular risks foresees obligatory participation of the insured in the possible loss (franchise). This is contracted through percentage franchise and determination of minimal participation in the loss for certain risks (robbery, burglary, machinery breakdown and some other risks in domestic transport). In this way, the insured reduces the costs of the premium.

Insurance excludes certain risks, such as vulnerable facilities of the low-rise construction category (kiosks, cabins, containers) and wooden structures. Legal entities and entrepreneurs whose movable property (inventory, equipment and supplies) is located in such facilities are sometimes refused insurance contract in line with the specially designed conditions for SMEs.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Legal Protection Insurance

Bearing in mind the complexity of legal system, SMEs need to engage professional assistance for any proceeding before the court or other dispute resolution entities in order to protect their rights. They will bear certain expenses accordingly. Legal protection insurance allows the insured SMEs to transfer the risk against occurrence of legal costs to the insurer, based on the premium paid. A party who loses the dispute partly or completely is obliged to reimburse the litigation costs to the opposing party, pursuant to court decision, in total or proportionally to the success achieved. (Serbia Law on Civil Procedure, Article. 153) Concluded legal protection enables the insured SME to be covered for expenses incurred during the potential litigation. This insurance type may have a positive effect for insurer as well. If the insured is successful in litigation, the insurer has a possibility to reimburse the expenses from the party which has lost litigation, i.e. from its insurer if that party has concluded a legal protection insurance contract.

Under this type of insurance, the insured has great influence on insured event occurrence, differently than under other types of property insurance. Therefore, insurers stipulate the participation of the insured in loss (franchise) and right of insurer to terminate the contract if two or three insured events occur during the same year (Ivanjko, 2005, p. 40).

This insurance type is developing and the new forms of coverage are offered. According to Serbian law, the legal expenses insurance is designed as a type of non-life insurance. This insurance covers legal expenses, lawyer's expenses and other proceedings costs (Serbia Insurance Law, 2014, Article 9). In Serbia there are no specialized insurers who deal only with legal expenses insurance. It is common that the legal expenses insurance is offered together with some other insurance type, most frequently with liability insurance.

Legal innovation is important since in clauses regulating dispute conduction, insurers should become authorized to require certain behavior from insured, not only in terms of litigation, but also their out-of-court behavior (Šulejić, 2005, p. 396).

However, Serbia has not demonstrated adequate interest in legal protection insurance. This is one of the reasons why the offer of domestic insures is poor. This type of insurance should be encouraged by the state. In return, the state would reduce expenses sustained for free legal assistance. Lawyers are interested in development of this insurance type, since it provides secure costs settlement. Due to the costs of the court and attorney, SMEs often renounce litigation. However, this insurance type may be important for SMEs, since it could enable better recovery of outstanding debts and better protection in legal proceedings initiated against them. SMEs should request from insurers to provide legal insurance coverage wider than coverage provided by classic insurance types. Or engage a lawyer in the pre-dispute proceedings in terms of preventive legal advice in order to avoid controversial situation occurrence, i.e. possible disputes, and obtain advice which could contribute to successful out-of-court dispute resolution. This form of legal protection could be realized in cooperation with lawyer's chamber, in the tradition of comparative legal experiences such as in Germany (Belanić, 2014, p. 32).

This kind of insurance is the most developed in Germany, with a large number of insurance types, high coverage amount and relatively low premiums (Belanić, 2014, p. 31).

Insurance of Persons

SME employers who contract collective insurance against the consequences of casualty for their employees are concerned for their employees and demonstrate corporate social responsibility. This contract can be subject to collective negotiations between employees and employers. Therefore, by paying the insurance

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

premium SME employer provides some protection. In that case, the indemnity received by the employee is included in the total indemnity amount which employer is obliged to pay to the employee if liable for the injury which occurred. SME employer is entitled to insure all employees, regardless of the kind of work contract. Scope of insurance coverage is determined according to the requirements and needs.

An employer is liable to insure employees for occupational diseases and work-related diseases, in order to ensure compensations. (Serbia Law on safety and health at work, Article 53, 2015). Legislator did not set forth the minimum sum insured, enabling employer to conclude contract in line with his financial possibilities. It is necessary to bear in mind that most insurance companies in Serbia excluded infectious diseases, occupational diseases and other diseases from insurance terms and conditions and did not consider them as causalities. Therefore they are not covered by causality insurance. Some insurers have special conditions for occupational diseases. Some of them offer this insurance through stipulation of special clause with collective insurance of employees against the consequences of casualty.

THE SME INSURANCE CONTRACT

Upon deciding to use insurance as a risk prevention method, SME managers need to take measures in order to obtain optimal coverage with the lowest premium. There are numerous insurance products suitable for various needs and situations on the market. Adoption of appropriate decisions on the selection of insurance products requires having a certain level of financial literacy, knowledge and understanding of the basic characteristics of insurance. It is necessary to know the way the insurance system functions, as well as the way in which insurance treats risk transferred to it according to the insurance contract. Insurance service is sophisticated and insurance products are specific and complex. The lack of SME knowledge and clear understanding of the insurer's offer, conditions and the scope of the covered risks can turn into a difficulty and cause rejection of insurance.

On some occasions, the insured may decide to change the insurer, for example if another insurer offers a lower premium. Prior to making this decision, the insured should check if the scope of coverage provided by the other insurer at a lower price is completely the same as the existing one. A lower price does not imply the same conditions, even though the product may have the same or similar name. It seems that for the majority SMEs having the right cover is equally important as the price of the insurance policy (Financial Conduct Authority 2015, p.14). In more developed markets SMEs are looking for a lower price, but will also change insurers if they can obtain better coverage or satisfy a specific need, not just receive a better price (Hoying et al., 2014).

On some occasions, the savings provided by changing the insurer can really be just short-term. In fact, if the insured SME's technical result in a certain period of time becomes negative due to frequent claims within the coverage period, the insurer shall increase the premium by applying the bonus-malus system (BMS). In case of compulsory automobile insurance, the insured cannot benefit from the change of the insurer. All insurers offer the same premium and they all apply BMS in a centralized and organized manner, regardless of the chosen insurer. Interestingly, research has shown how the performance of SMEs does not significantly affect the volume and change in insurance coverage (Insurance Council of Australia, 2008).

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Pre-Contract Information is Fundamental

As a professional, an insurer has knowledge and information which is important for the conclusion of contracts, and which, without a preliminary presentation and clarification to the counterparty, is either unavailable or difficult to understand. Pre-contract and contract information is aimed at informing the insurance users of all the facts they need to know of the product, contractual conditions and most of all the parties' rights and obligations (Ivančević, 2015, p. 236).

The right decision can be made only by the customer, or the service user, who has been properly informed (Weatherill, 2001, p. 180). A potential policyholder should assess the information received and based on it decide whether to conclude the proposed contract or not and under what conditions (Ebers, 2004). Additional customer information and clarifications also influence the final decision. Information must not make a false impression of the insurance products. Information should be unambiguous, comprehensible, clearly stated, timely and extensive enough. However, it should not be too extensive, in order not to confuse the recipient.

The Serbian law has established the minimum content of information that an insurer is required to make available to a policyholder prior to the conclusion of a contract and stipulates the manner of making this information available (Serbia Insurance Law, Articles 82-84, 2015). Unlike decisions in comparative law that limit the obligation of precontractual duty to inform a policyholder only in the case of consumer status, the Serbian legislator has decided to impose an obligation for an insurer to report in advance to all potential policyholders (Mrkšić, Petrović, & Ivančević, 2014, p. 184).

In comparative law, the obligation of mutual provision of information of an insurer and a policyholder in the process of the conclusion of an insurance contract is also considered a duty (Borselli, 2012). A sanction for omission to provide information opens possibility of insurance contract cancellation, given that there was a defect of will during its conclusion. If a contract is concluded under fraud, a policyholder is entitled to request damage compensation (Serbia Law on Contracts and Torts, Articles 61, 65, 111, 268). Serbia Insurance Law Act also provides sanctions for failure to provide information. In the course of supervision, National Bank of Serbia is authorised to order an insurance company to eliminate illegalities and irregularities in any operations. A fine is envisaged as a sanction in the case that the prescribed information is not provided or not provided in a prescribed manner. An insurance company can even be left without a work permit if it gives false information about its operations or information that may mislead users of insurance service (Serbia Insurance Law, 2014, Articles 260 & 214).

Most often, insurers offer coverage of certain risks in several ways. Doing so allows policyholders to choose a variant of protection that suits them in substantive and financial terms. However, most small-business owners consider commercial-insurance offerings extremely complex and difficult to understand (Hoying et al., 2014). SMEs' managers have difficulties in choosing an optimal insurance product since they usually lack specific knowledge. For them it is not easy to understand insurance conditions that define the scope of risk coverage, the scope of insured risks and the insurance exclusions. When closing an insurance contract, it is necessary to study insurance conditions of several insurance companies in order to find coverage that provides the SME client with optimum protection. Many SMEs accept inadequate insurance coverage which does not provide optimal compensation of loss. These observations were made in the UK (Financial Conduct Authority, 2015). It was also noted that managers of SMEs who have suffered damage from floods, did not understand the scope of coverage obtained by concluding an insurance contract, or that the coverage is limited (Crichton, 2009). Insurance in case of flood,

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

torrent and high water was an additional risk within the basic insurance covering the damages in case of fire. Those who suffered damage and had only the basic insurance package could not get coverage for the damage caused by floods.

Significance of Hiring Insurance Brokers for Optimal Coverage

When procuring insurance services SMEs can benefit from hiring a licensed insurance broker or a company specialized in insurance broking. SMEs have more complex insurance needs than retail clients but are not always more sophisticated buyers of insurance. Hiring a broker increases the chances of SME managers to obtain optimal insurance coverage according to their needs and financial resources. In United Kingdom many SMEs rely on the services of brokers to help buy insurance. However, in Serbia intermediaries in the collection of the total life insurance premium in 2015 accounted for only 9% and their share in the distribution channels for all types of insurance was only 7% (National Bank of Serbia, p. 14).

Indeed, the Serbian legislator has defined specific obligations for insurance brokers (Serbia Insurance Law, 2014, Article 94). This obligation is also present in comparative law and regulated in accordance with EU directives. For non-compliance with these obligations, a sanction is envisaged in the form of a fine (Serbia Insurance Law, 2014, Article 261). A broker reports to an ordering party or a third person for any damage caused by his omission to perform the obligation, or for its incorrect performance (Ivančević, 2014).

Brokers provide highly professional services specifically expressed when providing information and advice to the SME clients. The duty to advise a policyholder is also established for a broker. The broker is obliged to furnish the insured with all necessary advice and guidance in terms of circumstances valuable for closing and implementing the insurance contract. The duty of information means providing information that describes a product or a service (Ivančević, 2010) which relates to presentation of certain facts. Advisory service is preceded by an analysis of facts from collected information and provided by a person who advises. Recommendations should help the advised person to make a decision that is in his best interest.

As an expert in this field, a broker is obliged to analyze the dangers that the insured could face, define the specific insurance needs based on data provided by the insured, propose adequate insurance coverage, specify his advice and proposal for signing the contract with a specific insurer and mediate in the insurance procuring process in order to provide optimal coverage. Many SMEs in UK don't have contracted optimal insurance coverage especially because they did not understand. Obviously lack of adequate advice is a problem and consequently many SMEs do not use brokers to arrange their insurance (Crichton, 2009). Indirectly, it can be concluded that the situation in Serbia is similar.

Possible contribution of a broker does not end with the conclusion of a contract because during the term of the insurance contract there will appear other significant tasks (Ivančević, 2014, p.158). The last risk management phase is controlling and possibly revising the acts, procedures, measurements and plans for eliminating the risks. An SME risk manager can receive significant support from a broker in terms of risks transferred to the insurance company. After the contract becomes effective, the broker is obliged to review the content of the policy and contract, audit the performance of the contract and make a proposal for contract changes and annexes in the insured SME's optimal interest. The broker must provide necessary assistance to the insured while the contract is effective, as well as in case of the event covered by the insurance. The broker must make sure the insured has taken all the measures that enable it to exercise and

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

protect contractual rights. During the contract validity all SME managers and employees must be aware of contractual obligations in order to prevent losing insurance coverage due to contract breaches.

The risk manager must be aware that insurance decreases the loss over a certain period of time. This way, static risk becomes reduced risk in terms of transferring the risk to the insurance company. For the insurer, the insured static risk becomes dynamic risk since two alternatives are possible: gain or loss (Sneyd, 2003, p.103) When the insured risk occurs, the insurer might not pay the necessary amount in a short period of time. This happens for various reasons, such as untimely insurer's reaction, the lack of resources, or an oversight by the insured SME, which represents a breach of the insurance contract and causes loss of the insurance coverage. By hiring a broker these new risks for SMEs can be reduced (Financial Conduct Authority, 2016). The broker is obliged by law to protect the insured's optimal interest during the closure of the insurance contract. He should clarify reasons why a certain insurance company was proposed, take care of insurance company's professional and other references, introduce the insured to all legal and economic connections with the specific insurer and provide professional support during contract realization in order to avoid any oversights by the insured.

Sometimes involvement of the broker does not guarantee that SMEs will be provided adequate coverage. A review of insurance brokers in the UK found that their service when arranging insurance for SMEs is not always consistent with customers' expectations (Financial Conduct Authority, 2015). Hence, the Association of British Insurers has published a brief guide whose purpose is to encourage SMEs to verify that the broker works in their best interests (ABI, 2016).

A Review of SME Packages in Serbian Insurance Companies

Most insurers work with SMEs according to general and special conditions for particular types of insurance products. Some insurance companies in Serbia are developing their marketing strategy on the basis of introducing new SME insurance products while others are focused on offering classic insurance support for SMEs. Therefore, some Serbian insurers have come to understand the essence of SMEs, their specific activities and are in fact offering special insurance packages. The author shall present the basic characteristics of the insurance products tailored to SMEs needs.

Dunav Insurance Company manages „*Business Bonus Packages*", which include different solutions for insuring certain activities of SMEs (Dunav, 2016). This insurer designed packages for retail, production and artisan industry, catering services (restaurants, cafes, and hotels), service industry such as beauty and spa services, as well as for the office, firms and agencies. Insurance contracts are closed for the period of up to one year. When it comes to price of insurance, the premium is lower compared to standard coverage offered within these packages. In case the insured SME decides to take two or three types of coverage in addition to basic package, 5% discount is granted. For all four types of coverage, 10% discount is granted. The insurer shall assess the damage within 24 hours and quickly process the request and pay for damages. The coverage that was completely or partially expended by the damages can be arranged again, within the remaining period and under favourable conditions.

Risk coverage can be arranged by combining risks from several packages. The basic insurance package includes compulsory coverage and a number of optional types of coverage in order to provide a comprehensive insurance protection. The basic package provides property protection against the consequences of: fire and other dangers, burglary theft and robbery, glass breakage, machines breakdown and other dangers as well as t employees insurance in case of an accident. The optional types of coverage are chosen according to specific needs of an SME industry sector: to insure machines, equipment and installations

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

in case of a failure; business profit and income costs in case of a work interruption due to fire or to have comprehensive general liability insurance. Bonus types of coverage *Dunav Insurance Company* are also foreseen for each package. Each package offers the following bonus two types of coverage:

1. Increasing the insured sum for stocks in the selected period by 20% of the insurance sum for the stocks on each individual account;
2. Costs covering the door lock change due to key loss – 200 Euros per event and per year. Bonus coverage for employees' belongings due to burglary theft and robbery is offered with most packages. The coverage is 50 Euros per employee and per event and 200 Euros per year.

Property insurance is arranged as the insurance sum for each of the risks in the specific percentage of the basic-total insurance sum and with the individual risks with the exhausted insurance sum. The insured also participates in covering damages through franchise deductible. Minimal participation is foreseen for certain risks (burglary theft and robbery, machine breakdown and other dangers, as well as the optional coverage for the work interruption due to fire and other dangers).

Accident insurance covers the death risk in case of an accident and the total permanent disability in three combinations of the insured sums.

Grawe Insurance Group offers SMEs their1 ''Entrepreneur'' package, (Grawe, 2016). Forty different kinds of SMEs can be insured through the package, such as shops, pensions, restaurants and cafes, gyms, kindergartens, schools, retirement homes. It includes property insurance ''at first risk'', without an expert's assessment. Insurance within the package can be agreed on for the period of one to ten years, with the possibility or renewal. Premium can be paid on instalment plan, whereas an instalment cannot be lower than 30 Euros. The package provides insurance of: office space in objects and condominiums (up to 250 m^2 or up to 500 m^2 for certain SMEs, used for entrepreneurial purposes), equipment, machines and furniture, goods, stocks and merchandise.

According to client's choice, insurance provides protection against the following risks: fire and natural disasters, flooding, burglary theft and glass breakage. Insurance sum varies from 10,000 to 75,000 Euros, whereas equal insurance sum is valid for each of the insured risks.

Wiener Stadtishe insurance company offers the „*Insured business"package* intended for micro businesses and SMEs, Wiener (2016). It provides SMEs with the possibility to insure their property through a compulsory package for equipment, stocks, third parties, employees' belongings, and money and cash assets. Within the optional package, the insured can insure its own and the third party's construction sites, as well as investments into others' construction sites.

Basic package provides protection against the following risks: fire, thunder strike, explosion, windstorm, hail, civil unrest, snow pressure, outflow of water from installations. The coverage can be expanded for the case of work interruption due to any of the risks from the basic coverage. The coverage can be additionally arranged for material damages caused by the following risks: flood and high water, burglary theft and robbery, cash on hand in the cash register of the premises exclusively against the risk of robbery, as well as the machines, appliances and equipment breakdown.

The coverage may also be expanded in terms of optional package covering for damage caused by glass breakage at the construction site and waterworks and sewage installations breakdown at the construction site. As additional coverage, insurance of portable equipment can also be arranged, as well as general liability insurance for damages to the third parties, with the possibility to expand it to the employer's liability.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

AXA insurance offers firms, micro firms and SMEs specially designed insurance package called *''Complete BUSINESS''* (AXA, 2016). The insurer provides damage assessment within 48 hours from the claim and payment of 50% of the damage in advance, so that the insured could eliminate the consequences of damage and continue with operation.

This package covers the insurance of office space, employees, equipment, stocks, glass and advertisements, SME's guests and service users, money, computer equipment, as well as SME's liability towards third parties and employees. Three insurance packages are available: Standard, Superior and VIP.

VIP package provides insurance against the basic risks: fire, hail, thunder strike, explosion and other; outflow of water from installations, flood, high water, snowmelt, glass breakage, general liability, burglary theft and robbery, machine and installation breakdown, computer equipment insurance. Superior package does not cover for the machine and installation breakdown or for computer equipment insurance. Besides these two risks, standard package does not cover burglary theft and robbery.

Optional coverage can be arranged for all the packages, including the protection against the consequences of landslide, earthquake, employee insurance against work-related injury whereas treatment costs are covered, employer's liability insurance, and protecting insured's users against work-related injury.

Besides basic and additional coverage, bonus coverage is offered as well: insurance coverage for fixed costs caused by work interruption due to fire, insurance coverage for renting a new space due to work interruption caused by fire or explosion, insurance coverage for the production of marketing materials necessary for business promotion after business continuation, coverage for the construction and erection works, coverage for the damage on summer and winter gardens of the cafes and restaurants and key person insurance.

Therefore, offers of Serbian Insurers targeting SMEs are various. Dunav insurance has included in the basic package the employee insurance against accidents, but for most insurers it is contracted on demand. With AXA Insurance employees insurance may be stipulated as collateral, as well as accident insurance for customers insured.

Most insurers offer SMEs property insurance to the sum insured but Grawe Insurance offers first risk. Insurance from liability to third parties in Dunav can be arranged as an optional coverage, while in Wiener Stadtishe this can be additional coverage and liability insurance to employees. Bonus coverage are offered in packages of Dunav Insurance and AXA Insurance.

Variety offer Serbian Insurers shows that SMEs have a choice but also a difficult task to choose among various options. In order to conclude a contract it is essential to obtain assistance from insurers or brokers.

Review of coverage of certain risks through packages is shown in Table 1[1].

FUTURE RESEARCH DIRECTIONS

Overcoming risks through insurance in the normal course of SME business is left to assessment and evaluation of their managers. Insurers are recommended to engage more and support SMEs in the process of risk management. On its side the state can encourage and streamline SMEs to insure against financial loss by providing subsidies for insurance or other financial incentives such as introduction of tax relief for SMEs if they transfer certain risks on insurance companies.

There is an imperative need for the state to identify and take specific measures, using suitable methods, in order to protect from damages that are the result of fundamental risks. The SME sector is considered to be further threatened by the fact that as a rule the state does not allocate funds for the rehabilitation of

the consequences on incurred losses so that they are actually left to themselves and their own resources. For this purpose some of the solutions that have given good results in other states, or some of the suggestions of experts can be applied.

It would be important to reinforce awareness of SMEs about offers, opportunities and benefits of insurance. Insurers will need to simplify product offerings and become proficient at providing customized counsel. The state and the educational system have special responsibility to develop and improve models of financial education among citizens. Socially responsible behavior of insurance companies can be expressed through the support of the state, educational institutions and non-governmental organizations in the process of financial education modeled on activities carried out in other countries. Clearly, the state also has an interest in developing proper training of SMEs. In this way it contributes to the realization of the social function of insurance that is manifested through financial security, raising living standards and creating a favorable impact on the overall social welfare.

CONCLUSION

In developed countries the share of SMEs in total premium is much more significant than in Serbia and this affects the number of SMEs and the culture of security. In their business operations SMEs in Serbia underutilize risk insurance. Most often the payment of insurance premiums is considered an unnecessary

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

and not a necessary business expense. Insurance can provide protection from many unforeseen events that may cause losses in business. The chapter has showed that SMEs in the process of risk management have similar weaknesses in Serbia and in the countries with developed markets. SMEs need assistance in risk management as well as appropriate advice and technical support from insurance brokers. In fact, SMEs are in need of the same kind of support that is normally provided to consumers.

Properly choosing risks that will be transferred to insurance, selecting appropriate ways of providing insurance coverage is in the function of SME development. Insurance therefore contributes to the stability and security of SMEs. Through preventive and repressive measures insurers encourage conscientious and responsible business of their policyholders. Consequently, insurance becomes high-quality support for clients, particularly by providing necessary suggestions, advice and in assessing individual risks in SMEs.

SME businesses operate in a tough and changing environment. Their operations are still held to the same standards of corporate governance, employee welfare and liability as in larger companies. They often have to manage risks with fewer resources in less time besides concerns of the day to day business. SMEs therefore require a suitable packaged insurance policy which will protect their assets, liabilities and employees from the risks associated with operating a business. Insurers should be able to adapt and improve their products aimed at the needs of SMEs.

When evaluating the insurer SMEs need to study and understand the insurance terms, comparing the amount of premium for a particular volume of required insurance coverage for individual insurers. Conclusion of appropriate insurance contracts that will meet their actual needs requires expertise and quality assessment of many factors. Hiring a professional person, a broker, is a good option for SME risk optimization, because, as a rule, these entities do not have their own experts, or are exposed to complex risks in their business operations.

It is realistic to conclude that optimization of risk management for SMEs contributes to the stability of their business, their development and overall social security, encourages their investment in innovation and consequently allows greater degree of their overall market exposure.

KEY TERMS AND DEFINITIONS

Insurance Beneficiary: One who will receive the benefit in the event of an insured risk.

Insurance Premium: Amount a policyholder or contractor is obliged to pay as compensation for the provision of insurance protection and represents a measure of risk.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Insurance Policy: The basic written document that accompanies an act of insurance and evidence of the conclusion of insurance containing all essential ingredients of a contract.

Insured Subject Matter: The subject clearly stated in the insurance policy specifying what is ensured. The existence of the object of insurance with certain characteristics is an essential precondition for the conclusion and duration of insurance.

Insureable Risk: The risk covered by insurance if an insured event takes place provided possible loss is plainly explained, it is accidental, it is part of a similar group of risks and the insurer must be able to compute the probability of a loss.

Over-Insurance: Insurance sum is greater than the actual value of property insured.

Property Insurance: Indemnity for damage caused by realization of the insured risk to the extent suffered.

Risks Prevention: Measures aimed at eliminating the possibility of the event of loss such as installation of alarm systems which reduces the risk of burglary and which simultaneously reduces insurance costs.

Sum Insured: The amount paid to the insured if the insured event occurs representing the upper limit of the basic obligations of insurers.

The First Risk, *First Loss Insurance***:** Property insurance policy that grants only partial insurance where the policyholder agrees to accept an amount less than the full value of damaged, destroyed or stolen items/property. In return, the insurer agrees to not penalize the policyholder for under-insuring their goods or property.

Underinsurance: The sum insured is less than the value of insured property (in case of damages paid to the extent of the sum insured).

ENDNOTE

[1] Editors' note: This is just an example of the combination of possible insurance products described in earlier sections of this chapter.

Chapter 27
Regression Analysis for Environmental Practices:
Participation among Finnish SMEs

Nurul Aida Abdul Malek
University of Vaasa, Finland

Josu A. Takala
University of Vaasa, Finland

ABSTRACT

The aim of this research is to shed light on establishing a successful integration of environmental practices among small and medium enterprises (SMEs). The purpose is to develop a better understanding of what drives SME participation into potential environmental practices within a context in Finland. Specific objectives are to: 1) assess the willingness to participate (WTP) among Finnish SMEs based on four drivers - financial performance, internal readiness, supplier pressure and governmental regulations; 2) separate respondents into demographical subgroups based on their WTP; and 3) determine features that characterize Finnish SMEs which are WTP based from the studied sample.

INTRODUCTION

There has been increasing pressure from public institutions, consumers as well as non-governmental agencies regarding environmental performance of business industries due to their association as being the most visible contributor to environmental pollution. In such conditions, firms have begun to enhance competitiveness through environmental performance by minimizing environmental impact in their business activities. Despite emerging literature on various justifications on factors influencing firms in green participation, the emphasis is mostly on large firms while SMEs remain relatively unknown. SMEs are a source of job creation and introducing innovation and competition to the market; however, it is estimated that SMEs account for around 60 percent of carbon dioxide emissions (Revell & Blackburn, 2007). In

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

addition, they also contribute 70 percent of the total global pollution (Aragón-Correa & Sharma, 2008). According to previous research, little attention was paid to SMEs which represent suppliers within the supply chain. As a result, SME suppliers can be treated as missing links between SME environmental management and green issues in the supply chain management.

Most Finnish SMEs in the manufacturing sector are part of the value chain of domestic large companies. In order to compete globally, large companies have to fulfill the growing needs of environmental practices in their operations. In order to remain in the value chain, SMEs have to incorporate green elements in their operations as well. The government has played their role in providing a number of incentives to assist in the installation of environmental practices among the SMEs. However, it is interesting to note that a relatively high proportion of firms receiving public support have yet to be translated into a higher proportion of SMEs offering these products or investing in resource efficiency (DG Enterprise and Industry, 2014).

Therefore, the aim of this study is to develop a better understanding of drivers that can influence potential environmental practices in the context of Finnish SMEs because each country has their own particular characteristics such as policies, natural assets and technological capabilities. The objectives are to:

1. Assess the willingness to participate (WTP) among Finnish SMEs based on four drivers - financial performance, internal readiness, supplier pressure and governmental regulations which were highlighted in the literature
2. Separate respondents into demographical subgroups based on their WTP
3. Determine features that characterize SMEs that are WTP based from the studied sample.

The study addressed two important gaps in literature from the perspective of the practitioner and academia. It is essential for practitioners to recognize the driving factors of green participation for the benefit of future strategy formulation as well as to extend knowledge from a new point of view in the academia based on a sample from Finnish SMEs.

This study gave rise to a current discussion out of existing studies with an extension on the influence of financial performance on Finnish SMEs toward their WTP in environmental management. The conceptual model was partly based on a framework by Lee (2008) with an additional variable focusing on the influence of financial performance. The study attempted to find out the possibility of financial performance to become an antecedent to WTP in environmental management.

BACKGROUND

The Small Business Act (SBA) for Europe conducts a review of the act annually to provide a better understanding of recent trends and national policies related to SMEs in Europe. According to the DG GROW (2015), the estimated number of Finnish SMEs was 219,584 which covered 63.7 percent of the employment rate in Finland and did not include enterprises within agriculture, forestry, fisheries, education and health industry. This implies their importance as a job creator and contributor to national value added industries. Finland being one of the Europe Union (EU) member states is not excluded from being monitored in policy measures which incorporate ten principles including environmental factors. In a nutshell, the 2013 review indicated that the environmental performance of Finnish SMEs were all

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

above average and ranked at the top of the list of all the EU member states. Finnish SMEs scored remarkably well in resource efficiency practices along with the development of green products and services. Therefore, this study is relevant to be conducted within the Finnish SME context which could provide an indicator to other SME populations with regards to environmental focus. Moreover, Finnish SMEs are recovering from the economic crisis in 2008 and expecting future growth especially in internalization. Consequently, this study could enhance understanding on how SMEs are stimulated to strengthen their environmental performance.

Previous empirical literature has used several theoretical perspectives to explore the internal driver(s) of a firm to respond to the demands of environmental concerns. Based on strategy resource based logic, both financial and non-financial resources are crucial to support any firm to continue to develop certain capabilities in order to enhance overall competitiveness (Wernerfelt, 1984, 1995). The availability of internal resources enables for the type of strategy that they intend to formulate and compete in. The major difference between small and large firms is the amount of resources that are available. Small firms are often associated with an impression that they are very limited in resources and less capable to invest for a new particular strategy that can bring them more advantages in market positioning. In conjunction with environmental practices, most SMEs are financially incapable of availing their firm to be more environmentally responsible oriented (Pacheco, Dean & Payne, 2010; Roberts, Lawson & Nicholls, 2006 and Simpson, Taylor & Barker, 2004). Moreover, SMEs also lack the competencies that it takes to bring them to become more environmentally active. Limitations of knowledgeable staff on environmental regulations and the ability to meet environmental performance requirements suppress the interest to participate.

Financial resource is a key driver to stimulate the adoption of environmental practices (Ghisetti, 2015). In order to develop green strategies, companies require huge amounts of investment which increase the role of public and private actors to support the initiatives. Financial constraints always reduce the ability of firms to innovate (Savignac, 2008). In view of these needs, Collector Bank Ab (a private credit company, formerly known as Collector Finland Oy) is interested to seek a specific role of finance as a driver to sustainability growth within Finnish SMEs. This study could promote their understanding in decision-making on credit granting processes and indirectly remove the barrier of environmental practices adoption. Therefore, this study separates the dimensions of finance from the previous framework into a new variable named financial performance. In this study, financial performance is the current financial measures of each SME as indicated in Table 1. On the other hand, readiness is referring to internal characteristics of SMEs which permits environmental practices adoption. Consequently, this study is interested to examine whether the internal factors of Finnish SMEs stimulate them to participate in green practices.

It is common for global players to have suppliers from all over the world to take advantage of the lowest cost source possible in order to minimize the total cost of end products. These type of suppliers are mostly SMEs (Walton, Handfield & Melnyk, 1998). However, this approach could end up with far more costly consequences if the products are rejected due to their non-compliance with environmentally oriented markets. In such situations, large firms have to assure their suppliers to integrate environmental standards required by their targeted markets. Consequently, SMEs are pressured to integrate environmental considerations into their business processes. In this respect, Asian SMEs that supply goods to foreign markets have to consider getting accreditation such as ISO 14001 to fulfill the standards of their buyers to secure their position as suppliers (Lee & Klassen, 2008; Rao, 2007; Zhu, Geng, Fujita & Hashimoto, 2010 and Zhu, Sarkis & Geng, 2005).

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

On the other hand, literature has highlighted the importance of regulations as a significant driver of environmental participation among firms. Regulatory pressures are viewed from penalties or fines issued to industrial organizations that are found to violate the environment. SMEs are always associated with being reluctant to adopt environmental practices in their business operations and therefore, regulation is an important driver for them to initiate the transition with at least minimal participation. Moreover, government plays an important role to stimulate awareness among SMEs by providing appropriate supports to promote environmental practices adoption (Lee, 2008). Therefore, buyer's practices and government involvement are chosen as external factors which stimulate the WTP in environmental practices among Finnish SMEs. Buyer's practices refer to the buyer's practices to improve environmental performance of their suppliers which includes supplier assessment criteria, the environmental performance of incoming supplies and environmental focus supporting activities. Meanwhile, government' involvement includes environmental efforts related to technical and financial incentives, economic benefit such as tax reduction and infrastructure supports. Following are the hypotheses of the study.

Hypothesis$_1$: Financial performance has a significant influence on the willingness to participate in environmental practices among Finnish SMEs.

Hypothesis$_2$: Firm readiness has a significant influence on the willingness to participate in environmental practices among Finnish SMEs.

Hypothesis$_3$: Buyer pressure has a significant influence on the willingness to participate in environmental practices among Finnish SMEs.

Hypothesis$_4$: Governmental involvement has a significant influence on the willingness to participate in environmental practices among Finnish SMEs.

Table 1 lists all the items measured under each variable.

METHOD

This study used primarily a quantitative approach with a survey method. The conceptual models of this study is partly based on the framework developed by Lee S. S.-Y. (2008) with an extension of additional variable that is focusing on the influence of financial performance toward WTP in green practices among Finnish SMEs. Hubbard and Armstrong, (1994) stated that a successful replication leads to reliability of results and a replication with extension provides an enhancement generalization of the findings beyond the prior context.

According to DG GROW (2015), the number of Finnish SMEs is 219,584. Therefore, the research samples of this study totaled 383 in accordance to Krejcie and Morgan (1970) who indicated that it is sufficient and valid to represent the population. The survey was conducted online for the duration of two months from May to April 2015. The total response compiled was 170 sets which was equivalent to 44.3 percent response rate.

The survey questionnaire contained 32 items; 7 related to the demographic and 25 related to the conceptual framework and measured on a seven-point Likert scale from strongly disagree to strongly agree. Cronbach's alpha value for all constructs was 0.769 which provided sufficient value for the data to be used in this study.

Table 1. Conceptual framework

Internal drivers	
Readiness	**Financial performance**
• Managers are aware of the importance of environmental issues • Environmental issues are well communicated in our company • Implementing environmental management system • Will implement environmental practices if we can have financial support • Has knowledge related to emerging environmental issues • Has human resources to deal with emerging environmental issues	• Company's turnover category (million euro) • Has financial reserves to invest in environmental technology • Firm's current financial situation • Firm's financial situation over the last few years • Firm's financial situation for the coming few years
External drivers	
Buyer's influence	**Government' involvement**
• Incorporate environmental considerations in selecting their supplies and suppliers. • Firm's financial situation for the coming few years • Have interest in greening the supply chain. • Environmental management system (e.g. ISO 14001). • Provide us with environmental training, education or technical assistance.	• Coordinate the environmental practices initiatives • Increase funds for the environmental practices initiatives • Provide guidelines to SMEs in environmental management practices. • Spread knowledge of environmental management. • Build infrastructure for facilitating environmental practices initiatives.
Company Willingness to Participate	
• Aware of the environmental management practices initiatives. • Willing to participate in the environmental management practices initiatives. • Have managers who have interest in the environmental management practices initiatives. • Expects environmental and economic benefits from the environmental management practices initiatives	

Source: Own presentation of authors.

The researchers performed analysis of the data and exploration of relationships determined through descriptive and inferential statistics. All research objectives and hypotheses were addressed accordingly. First, the dispersion of respondents were described and analyzed. Next the correlation results were evaluated to determine the relationship between the drivers, company profiles and their participation in green practices. Lastly the regression results were tested to evaluate the association of the drivers in terms of the participation of Finnish SMEs in green practices1.

ANALYSIS AND FINDINGS FROM HYPOTHESES TESTING

Demographic Profile of Respondents

Table 2 describes the dispersion of respondents with respect to their demographic variables. 170 SMEs took part in the survey and the majority of them were from metal, building, wholesale and retail trade industries. 66 percent of the respondents belonged to entrepreneur job positions. A cumulative percentage of 94 percent generated up to 10 million euro of sales turnover within a year. Two-thirds of the total number of respondents comprised family-oriented companies with more than 20 years of operating experience. A combined percentage of 80 percent of the respondents belonged to SMEs with less than 19 employees. More than half of the respondents did not export their products or services internationally.

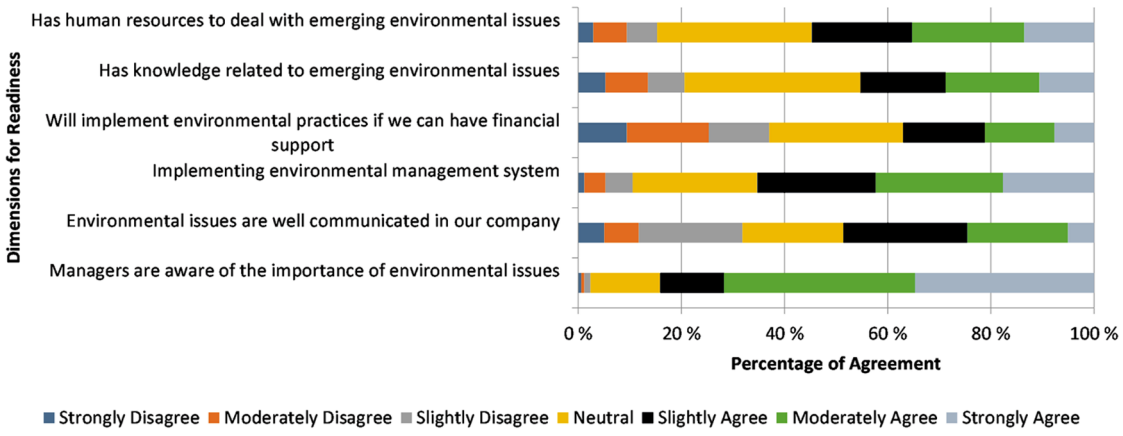
Percentage Distribution of Drivers

Figure 1 is the percentage distribution of agreement for each dimension under readiness. At first glance, 50 to 60 percent of the respondents agreed with all the measurements and up to 80 percent were aware of environmental issues. The percentage of Finnish SMEs which have already implemented environmental management systems exceeded 60 percent. This reflected a considerable level of participation with regards to environmental practices. In terms of human resources, half of the respondents already have the knowledge and the employees related to environmental concerns. Their low priority on environmental practices investment is signified by varying responses on issues of implementation with financial support (see Figure 1).



As indicated in Figure 2, even though 50 percent of their buyers incorporated environmental elements in choosing their supplies and suppliers, other indicators suggested weak buyer influence within the respondents' value chain pertaining to environmental considerations. Only 10 percent of their buyers had initiatives to offer environmental knowledge or skills enhancement. Their buyers' slight interest of greening the supply chain with low request on environmental concerns indicated their relatively minor role in stimulating respondent participation.

Meanwhile, Figure 3 illustrates the distribution of percentage for government drivers. The percentage of respondents who chose to be neutral was just as many as those who disagreed to government linked measures. It seemed that only a modest 20 percent were receptive to governmental support in promoting environmental concerns in their company.

Correlation Analysis

The strength of prediction of one variable to another is indicated by a correlation coefficient which ranges from +1.00 to -1.00. The value of +1.00 suggests a strong positive relationship, whilst -1.00 shows a strong negative relationship and 0.00 indicates no relationship. Table 3 shows the correlation coefficient values between the dependent variable in this study, which is the willingness of Finnish SMEs to participate in environmental practices (WTP) and their respective independent variables: readiness, buyer pressure, governmental influence and financial performance.

Figure 1. Percentage level of agreement on dimensions under readiness

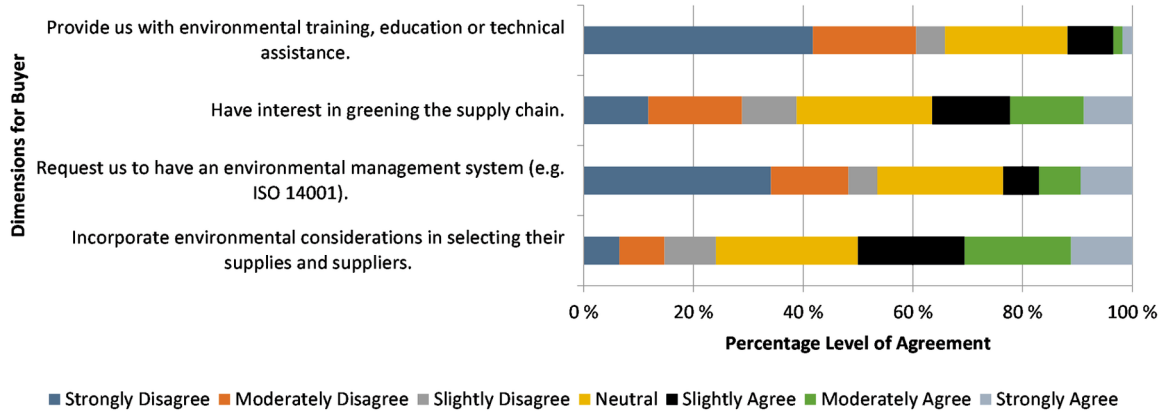
Figure 2. Percentage level of agreement on dimensions under buyer driver
Source: *Own presentation of authors.*



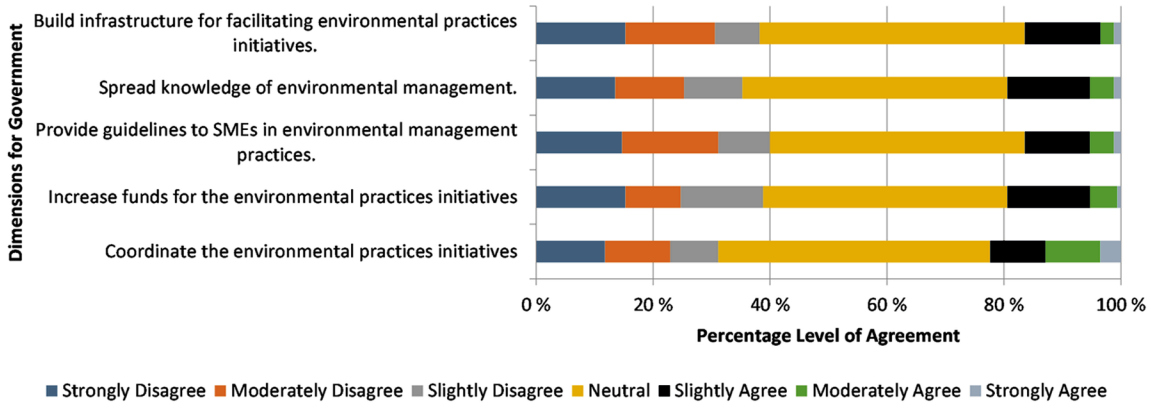


Figure 3. Percentage level of agreement on dimensions under governmental drivers
Source: *Own presentation of authors.*

As illustrated in Table 3, all relationships are significant toward WTP. Company readiness with organizational resources associated with environmental concerns has the highest correlation value of 0.619. This is followed by buyer pressure, 0.529 and governmental influence, 0.439. Although significantly correlated, financial performance holds the lowest correlation value toward WTP with 0.365.

The researchers were interested to find out the relationship of the respondents' profile with their WTP. Table 4 portrays the correlation coefficient values according to demographical categories. Post, company turnover as well as company size appeared to have a significant relationship with WTP. Even though the strength of the relationships was moderate, it provided potential insights on certain groups within these variables which could diversify the level of WTP.

After identifying the significant demographic variables, the results of the correlation analysis between the drivers and WTP were divided according to the respective groups. The reason they were divided was to trace groups that were more driven toward WTP by comparing the strength of their correlation values with those in Table 3. The status of each relationship is indicated in the status column. As illustrated in Table 5, there are 15 relationships with higher correlation coefficient values. The relationship which was

most significant was within a group with a company size of more than 100 employees with governmental involvement and WTP with the r value of 0.960 which suggested a very strong relationship. Moreover, a group of company turnover with one to two million also represented improved relationships in terms of their readiness, buyer pressure and governmental involvement toward WTP.

Regression Analysis

Regression analysis was performed to investigate the degree of company readiness, buyer pressure, governmental pressure and financial performance of a company to predict the participation of Finnish SMEs in environmentally sustainable practices (WTP). The result of the regression is summarized in Table 6 which provides all the parameters and if the p value < 0.05, it would indicate that the driver would have a significant impact on the WTP. The normality test of the residuals was also performed and the requirement for normality was met which suggests linear relationship between the dependent and independent variables. A significant regression equation was found ($F(4,165)=40.940$, $p<.000$) with an R square of 0.498. The predicted WTP is equal to -2.396 with + 0.418 readiness, + 0.185 buyer pressure, + 0.153 governmental pressure, and + 0.196 financial performance. The value of R square suggests that the drivers investigated provided 49.8 percent variation in determining Finnish SME participation. Based on the coefficient table, all factors were significant and supported the participation with readiness as the most influential factor.

DISCUSSION

This research explored how Finnish SMEs reacted toward driving factors of their behavior to participate in environmental practices. The implications of the study can be useful for SMEs and large-sized companies as well as governments which continuously strive to improve environmental performance along the value chain within nations. Based on the findings, it can be concluded that all hypotheses proposed at the beginning of the study were supported.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Discussion of Hypothesis 1: Readiness has Significant Influence on the Willingness to Participate in Environmental Practices among Finnish SMEs

Regarding the extent of readiness as a driver toward WTP, the findings suggested that the majority of Finnish SMEs were stimulated to some extent. There exists a significant association between organizational resources and capabilities with environmental concerns towards WTP given a high correlation coefficient. The findings supported the notion embedded within resource based views which claimed that companies could sustain competitive advantage based on internal firm characteristics (Barney, 2001a, 2001b and Wernerfelt, 1984, 1995). Interestingly, the results suggested that more than 60 percent of Finnish SMEs are already involved in environmental practices by engaging environmental management systems within their operational systems. This is consistent with the findings of TNS Political & Social (March 2012b) which reported almost 93 percent of EU SMEs are using at least an approach to become more resource efficient. More than 80 percent of the companies are aware of emerging environmental issues although it is moderately communicated internally. In Finland, SMEs are more likely to be conscious of the rising cost of non-renewable energy and most of them are supporting efforts to look for alternative renewable energy solutions which are actively developed within the country. Human capital plays a vital role to ensure the successful growth of a company. Half of the respondents claimed that they have the knowledge and skills in environmental concerns. Universities in Finland provide assistance initiatives through regular attempts to engage their SMEs in training with an environmental focus (DG Enterprise and Industry, 2014). Dynamic capabilities development through employee empowerment could be achieved through these opportunities. SMEs should be mindful that green practices lead to long term cost efficiency as well as promoting synergy among their current and potential buyers. They should put more effort in gradually improving their internal readiness capabilities through training to develop skills and competencies among their human resources and also exploiting the wide-ranging potential for enhancing energy efficiency in their operations.

This highlights the importance of flexibility development within a company for future adaptability to the dynamics of a market. In order to sustain a competitive advantage, companies have to develop inbuilt flexibility within their value chain to face the uncertainties of future global environmental markets.

Discussion of Hypothesis 2: Buyer Practices have Significant Influence on the Willingness to Participate in Environmental Practices among Finnish SMEs

This study also indicated an important influence on buyer practices and governmental involvement. Although more than half of the respondents did not export their products or services internationally, 50 percent of the respondents' buyers strongly incorporated environmental requirements in conducting business transactions. This could explain the reason that more than half of them have already implemented environmental management systems. Even though this does not associate largely with international environmental regulations and requirements, effects of second tier regulations are seemingly delivered through the value chain. Furthermore, Finnish SMEs are largely attached to the value chains of large domestic companies. It can be seen that medium-sized companies with more than a 100 employees are very strongly stimulated by buyer pressure as compared to smaller-sized companies2.

Only 10 percent of buyers include knowledge and skills enhancement assistance which suggests less urgency of environmental needs in supplies. The buyers could be relying on government support to facilitate the SMEs with regards to environmental concerns. The interest to promote environmental

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

practices in the value chain has drawn a variety of responses which implies that they have yet to see it as a main competitive advantage. In this case, the external network which is the buyer provides only moderate pressure to Finnish SMEs to mobilize their internal resources and capabilities for environmental performance.

Discussion of Hypothesis 3: Governmental Involvement has Significant Influence on the Willingness to Participate in Environmental Practices among Finnish SMEs

Based on the results, most of the respondents are sitting on the fence with regards to governmental involvement in implementing green initiatives in the value chain. Essentially, in Finland there is SITRA (The Finnish National Fund for Research and Development), an environmental program to support the creation of start-up companies with an environmental focus as well as to promote specific markets. Furthermore, the government provides support to two of the main industries in Finland i.e., metal and construction. For the construction industry, enterprises as well as research institutes with the government's assistance have developed products and processes which are embedded into construction projects such as heating and cooling systems. Likewise, awareness campaigns are also conducted within the metal industry. The government has also been providing resource-efficiency improvement support to assist companies to enhance their environmental performance (DG Enterprise and Industry, 2014). Finnish SMEs also ranked second amongst EU SMEs for their interest in bidding for a public procurement which require them to include environmental practices (TNS Political & Social, March 2012a). This suggests that Finnish government has managed to stimulate them to some extent. However, based on the measures of this study, these efforts have not yet reached the Finnish SMEs as a whole. It is recommended that the government provides indirect assistance such as by promoting collaborative opportunities between SMEs and large companies.

Discussion of Hypothesis 4: Financial Performance has Significant Influence on the Willingness to Participate in Environmental Practices among Finnish SMEs

Internal source of financing is not a strong determinant for Finnish SMEs to participate in environmental practices based on a weak relationship coefficient. It has been argued that the SMEs' lack of participation is mainly due to their financial constraints to fund the adoption. Apparently, this research suggests that financial performance led slightly for Finnish SMEs to actively increase their environmental performance. Although SMEs' economic development in Finland has recovered since the financial crisis in 2008, the study has shown that they could possibly have other concerns other than being environmentally oriented (DG Enterprise and Industry, 2014). Varying responses on the issue of 'environmental implementation with financial support' reflects the priority of Finnish SMEs toward environmental practices adoption which is perceived more like an option rather than a need.

Nevertheless, the demographical variable on 'sales turnover' has a significant relationship with WTP. It appears that rather than higher sales turnover, Finnish SMEs with a 'one to two million euro sales turnover' and 'smaller-sized companies' have a higher probability to participate. It may be that companies with small capacities are more flexible to accommodate their resources and engage in environmental practices (Shukla, Deshmukh & Kanda, 2010).

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

The correlational relationship of financial performance and WTP also implies that both variables can be performed in a similar manner. Significant results suggest that Finnish SMEs which choose to participate in environmental practices adoption also have a high tendency to perform well financially.

LIMITATIONS AND FUTURE RESEARCH DIRECTIONS

The sample of this study was obtained through Collector Oy's customer directory. Therefore, generalizations from the results may not comprehensively represent all Finnish SMEs. Furthermore, there is potential existence of social desirability bias where respondents may have a tendency to respond in a favorable manner towards environmental issues. However, the number of responses was sufficient and the respondents also came from various industries in Finland which increased the presence of heterogeneity. In addition, each item was measured in a seven-point scale to minimize the presence of social desirability bias.

In order to achieve an in depth view of Finnish SMEs based on the model of this study, it is suggested that a qualitative approach be adopted in gathering and evaluating responses. Three entities of the model could be incorporated in future research i.e. companies, suppliers and government sectors within a study to determine how these variables may be able to drive and complement one another to promote environmental practices adoption nationally.

CONCLUSION

The managerial implication of this study is that this analysis enhances the awareness to improve the governance of Finnish SMEs through an understanding of the drivers that influence them in environmental practices adoption. The study has statistically analyzed 170 responses and demonstrated that Finnish SMEs are aware to some extent that their companies need to play a role in achieving environmental sustainability. Internal and external resources play a critical role to steer the growth of Finnish SMEs towards environmental improvement. The buyers of Finnish SMEs provide both direct and indirect pressure along the value chain. Governmental involvement should be more comprehensive within the SME context. Universities as well as the public sector are encouraged to equip the SMEs on the significance of environmental practices and assist them to execute the transition.

The addition of 'financial performance' in the previous conceptual framework developed by Lee S. S.-Y. (2008) has improved the *r squared value* of the multiple regression analysis. This implies that the revised model in this study contributed to a higher variation in determining the participation of Finnish SMEs. Furthermore, this model also provided a stronger significance level in all drivers toward the willingness to participate in environmental practices rather than just two out of three drivers as in previous models.

From the financial perspective, this study provided some insights as to how the current financial performance of Finnish SMEs was associated with environmental concerns. This study can assist in promoting public and private funder understanding in decision-making of credit granting processes and indirectly remove barriers in environmental practices adoption.

KEY TERMS AND DEFINITIONS

Buyer's Practices: Buyer's practices to improve environmental performance of their suppliers which includes supplier assessment criteria, the environmental performance of incoming supplies and environmental focus supporting activities.

Environmental Practices: Operational activities that reduce the amount of damaging impact to the environment.

Financial Performance: Current financial measures of the Finnish SMEs.

Government' Involvement: Finnish government' environmental efforts related to technical and financial incentives, economic benefit such as tax reduction and infrastructure supports.

Readiness: Internal characteristics of the Finnish SMEs.

Willingness: The willingness of Finnish SMEs to participate in environmental practices.

ENDNOTES

1 Editors' note: Regression analysis as a mathematical method of modeling the relationships among three or more variables is also used in chapter 12.

2 Editors' note: Research results from chapters 1, 6, 7, 8, 12 and 14, also inductively suggest this notion of the unique significance of medium-sized enterprises in the whole set of ensembles of criteria.

This research was previously published in Optimal Management Strategies in Small and Medium Enterprises edited by Milan B. Vemić; pages 44-59, copyright year 2017 by Business Science Reference (an imprint of IGI Global).

Chapter 28
Student Projects and Virtual Collaboration in IT Degrees: Incorporating Entrepreneurship into Study Programmes

Markus Helfert
Dublin City University, Ireland

Igor Lyutak
Ivano-Frankivsk National Technical University of Oil and Gas, Ukraine

Howard Duncan
Dublin City University, Ireland

ABSTRACT

This paper describes a framework that assists the inclusion of Entrepreneurship into computing study programs. It has been developed within a European Tempus Project and is built following a process-oriented view of innovation and entrepreneurship. It outlines key activities and capabilities of entrepreneurship. An approach is presented that combines existing online tools with the traditional methodologies for creating courses on entrepreneurship. We introduce a concept -the virtual innovation space- to take the most advantages from opportunities that the Internet gives us for increasing efficiency of learning entrepreneurship for IT students. A summary of the course content on entrepreneurship that is developed and used by the project partners for their local courses is presented. We present and discuss feedback received from the project partners and describe some student projects and experiences. The work in this paper can be useful for other universities and similar projects to compare their effort and receive some justification or ideas for their initiatives.

INTRODUCTION

Higher education, innovation and entrepreneurship are long established as key pillars to provide various ways of engaging with enterprises. Over the last decades there has been an increased demand to include innovation and entrepreneurship into educational programs, emphasising the importance of engagement between industry and academia. However, the inclusion in curricula and educational programmes still seems to be challenging, although some successful examples illustrate how collaboration between academia and industry can be beneficial. There is no doubt that links between training, research and innovation by means of introducing advanced training in entrepreneurship and innovation capabilities are beneficial. In relation to the education domain, comparable professional standards, frameworks and curricula are important but less well established. Furthermore, although e-learning concepts seem to be particularly suited for collaboration and entrepreneurship, it appears that in e-learning programmes collaboration between academia and industry is less prominent. Furthermore, training transferable skills and creativity as part of entrepreneurship is challenging in an e-learning environment. In particular support for student projects and engagement practices are less well-developed.

This paper provides a framework and description of an open infrastructure for student projects as part of an IT entrepreneurship course that can facilitate collaboration between students and enterprises.

RELATED WORK: ENTREPRENEURSHIP, INNOVATION, AND STUDENT PROJECTS

Many researchers have discussed innovation management and entrepreneurship as part of Information Systems (IS) and Information Technology (IT). Many have described insights into innovation processes in organisations and the role of IT (Carroll & Helfert, 2015, Carey & Helfert, 2015) and many tools have been suggested (Auinger et al., 2014). A large body of research is, in general, concerned with the impact of IT and the successful application of IS to support businesses becoming more innovative (Legris, 2003). Entrepreneurship and innovation are closely linked (Huff, 2013; Blundel, 2011). Recently the concept of Open Innovation has been discussed in many papers (Maccani et al. 2015; Huff, 2013; Chesbrough, 2006; Drucker, 1993). Innovation can be seen as an outcome (product) or a process (activity) or a combination of both. Process innovation has been described as any new way of developing, implementing and maintaining IS in an organisational context (Swanson, 1994). In his seminal work, Drucker focused on two aspects of innovation: the process of innovation i.e. how innovators search for opportunities and transform them into a new practice in the marketplace; and the practice of "entrepreneurship" i.e. how institutional ways and processes embed the practice of innovation into an organisation (Drucker, 1993).

A process can be described as a repeatable set of value-adding activities with a discrete beginning and a discrete ending that produces desired, predetermined, measurable outcomes. This view posits that all work is a process and all products or services are the outcomes of processes. A so-called "resource-based" view of IS/IT innovation has been popular in the literature (Feeny, 1998) and more recently a "capability-oriented" view of IS (Peppard, 2004).

Research concerning the influence on students of technical specialities in an educational program in engineering showed that there is no connection between presence of the program and a positive and significant effect on the venturing rate of the students (Militaru, 2015). Moreover, the students, with an average age of 21 years, had an opinion that entrepreneurship skills did not matter at all or that it

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

was not closely related to the technical skills. Another investigation aimed to test an idea whether an entrepreneurship course can improve the entrepreneurial intentions, and learning efficacy of technical specialities students (Chen, 2015). The results found the entrepreneurial intentions of students have not been improved. This indicates that with the implementation of the entrepreneurship course, students should better assess their suitability to pursuing an entrepreneurial career. However, the presence of formal factors in entrepreneurial education (e.g. university's incentives to create a new business, entrepreneurial knowledge, training and skills as part of entrepreneurship education) is a base for student entrepreneurship (Urbano, 2016). Entrepreneurship education may not teach students only to initiate a start-up but to apply what they learned to their future careers. The above research indicates that introducing a generic course on entrepreneurship for students of technical specialities is mostly not effective. Moreover, research demonstrates that education should be only in terms of ethical entrepreneurship and innovative behaviour in everyday life (Ibáñez-Romero, 2016).

There is a need for further research on new approaches and for developing course and curricula for these set of students. Research towards finding approaches for increasing entrepreneurial intention during entrepreneurship education is performed by comparing results from the course for two categories of students (for business and science and engineering students) (Maresch, 2016). The principal results show that entrepreneurship education is generally effective for business students and science and engineering students. However, the entrepreneurial intention of science and engineering students is actually negatively affected by subjective norms, whereas that effect is not apparent among the business student sample. This paper did not give effective didactic approaches as to how to develop a course program, but it gives an understanding of what we need to research.

Research concerning evaluation of assessment methods in engineering entrepreneurship education shows a lack of effective tools that can be used (Purzer, 2016). This research shows that multiple forms of assessment instruments are needed to create a complete picture of one's entrepreneurial mind-set and competences. The tools for student assessment come usually from business courses and include such topics as business planning, design, communication, business realisation, teamwork, and leadership. These topics omit technical knowledge for engineering students. Another aspect of student assessment lies in differences between general communication skills and the skills critical to engineering entrepreneurship. The latter should be assessed with specific approaches, for instance as described in Pistrui (2012).

Increasing the effectiveness of courses can be achieved by catering for the educational needs of an individual (Sarkar, 2016), described as the knowledge and capability profile that is not given any importance in conventional education programmes (classrooms). Sarkar (2016) provides an analysis of forms of educational activities as transnational based by a university or a multinational company, online inclusive with a learning management system, a distance education online mode, and a collaborative education. Some forms of educational activities can be more effective using virtual class rooms. In addition, a successful and effective e-learning system should include personification (Kattoua, 2016) that considers personal, social, cultural, technological, organizational and environmental factors. Furthermore, building collaborative approaches between various organisations can increase effectiveness and can help to ease the career bariers (Colibaba, 2016; Bauer, 2016; Akhter, 2016). Using virtual and e-tools in this collaborative educational activity are important in order to design guidance services for students and enhance their motivation to complete their studies.

In addition, students should have a good understanding of the different stages and aspects of the entrepreneurial process. They should be able to understand how and why exposure to the main dimensions of the entrepreneurial process stimulates entrepreneurial competence development, for the individual IT

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

entrepreneur as well as for the entrepreneurial IT team. They should also be able to assess the potential and feasibility of a new IT-based venture, with a specific focus on how to identify and make use of different entrepreneurial financing models and alternatives, and what role entrepreneurial judgment and entrepreneurial identity plays in this decision-making processes.

Research Approach

In our work to build a framework for including entrepreneurship and student projects into the curricula we follow the principles of engaged scholarship. Van de Ven (2007) describes engaged scholarship as a participative form of research for obtaining the views of key stakeholders to understand a complex problem. By exploiting differences between these viewpoints, he argues that engaged scholarship produces knowledge that is more penetrating and insightful than when researchers work alone. Engaged scholarship has a number of facets; a form of inquiry where researchers involve others and leverage their different perspectives to learn about a problem domain; a relationship involving negotiation, mutual respect, and collaboration to produce a learning community and an identity of how scholars view their relationships with their communities and their subject matter. We follow this approach in order to develop the proposed framework within the European Project. In the following we describe our framework together with some experiences. We conclude our paper by outlining some further research directions.

PILLARS FOR ENTREPRENEURSHIP AND VIRTUAL COLLABORATION

The framework was developed with consideration of training and advance key entrepreneurship skills for students. This research was developed in the context of a European Project: NEFESIE "The National Education Framework for Enhancing IT Students' Innovation and Entrepreneurship" (http://tempus.nung.edu.ua). A consortium of four universities from EU countries and the five Ukrainian Universities have worked together since 2012 to build this framework. The objective of the project is to promote the synergy between academic programs, research expertise and businesses in Information Technology (IT). Critical objectives for the NEFESIE are:

- Identification of the best models and frameworks for university – company cooperation
- Development of an infrastructure that enables the sustainability of a new ecosystem of university-company cooperation
- Development of a web portal called Virtual Innovative Space to maintain contacts between students, companies and universities as well as to enable knowledge transfer between the actors

In addition, recent research on entrepreneurship, leadership, and innovations has turned the focus on sociological aspects, which lead us in turn to centre the framework towards the micro-level, viewing creativity, innovation, management and leadership as social processes that unfold in real time from moment to moment in and amongst a group of individuals. As the focus has shifted, we recognised the shift from traditional phenomenological and methodological boundaries to consider "on the ground" interactions of multiple participating agents who make up these processes (Iszatt-White, 2011, Lundberg, 2014).

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

The selected research methodology of engaged scholarship seemed to be well suited for this investigation. These multiple participating agent activities are microsocial communications among actors (e.g. students, lecturers). In our research, we tried to adapt the research into our course packages to increase innovation and entrepreneurial potential in IT students. This laid the foundation for leveraging virtual collaborations among IT students and among students and IT companies.

One of the goals of the Tempus project is to develop an eco-system for enabling students', universities' and companies' continuous interaction and exchange of experiences. Based of the best experience of the universities involved in the project and results of similar international projects we have developed a set of guidelines for how to effectively organize objects in regional eco-system. These recommendations have the form of algorithms by following which a university, a student, or an IT company can organize their own resources in the best way to cooperate with others.

In order to connect all these substructures, we have proposed four steps:

- Nationwide training seminars for acceptance and understanding of the improved guidelines produced in the project.
- Awareness campaigns for students. Running an innovation competition for students.
- Organizing "The first student innovation forum in Ukraine". Create an advisory board based on a consortium of IT companies.
- Involving companies (associations of companies) as a support network for student/company contacts for good innovation.

Furthermore, for involving students, we have designed course packages for boosting innovation and start-up projects within the university environment. The courses are in-line with the establishment of a virtual collaboration platform described below. The courses have already been implemented in the study process in the Ukrainian universities. In addition, the proposed eco-system was established regionally involving five Universities from the Ukraine. The five universities have been selected due to their technical focus and the importance of their IT departments. They have established experience in cooperating with the IT industry.

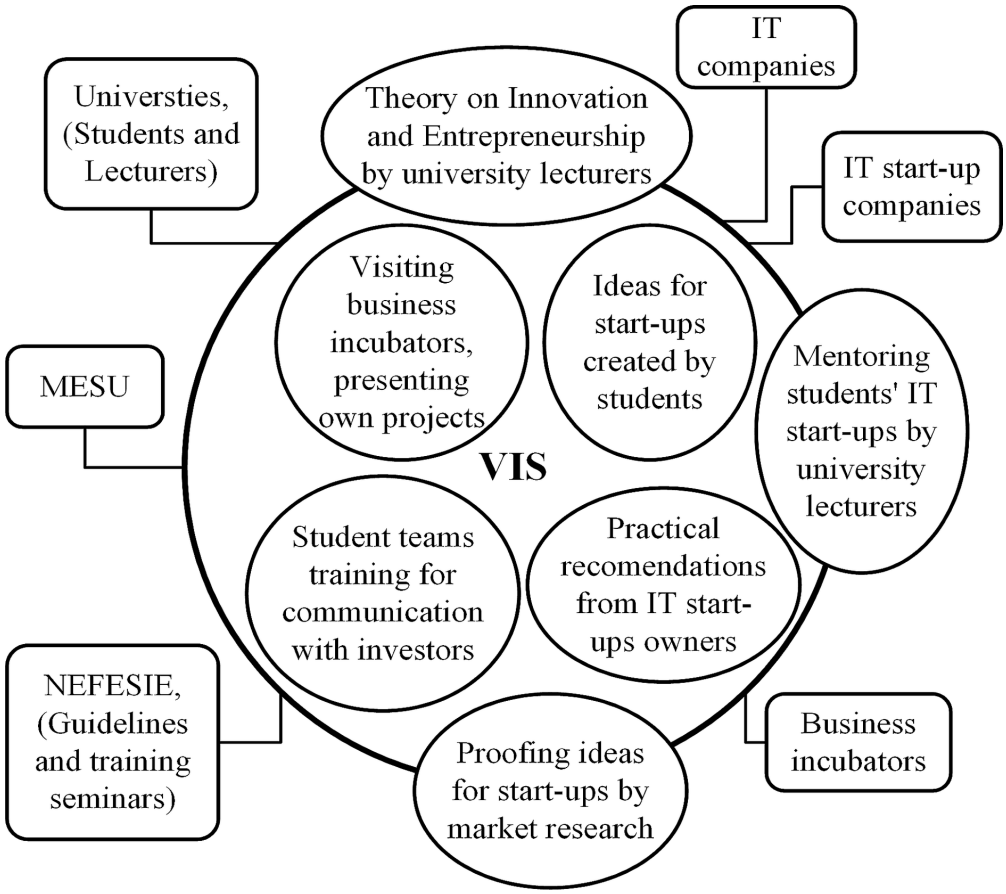

Figure 1 illustrates the overall framework. The course on innovation and entrepreneurship is supported by the Virtual Innovation Space (VIS). The course chapters enclosed in ovals correspond to the course curriculum logical. The course chapters placed in the circle are supported by native activities of the VIS. The chapters that are partly overlapping the circle can be supported by VIS partially or mediated by additional regional structures. For example, the theoretical material will be part of the VIS but lectures will be conducted by university lecturers.

Entrepreneurship Module

As one example, the BSc in Enterprise Computing at Dublin City University gives students the foundation for a career in information technology for the modern business enterprise. This degree is intended to educate high-end IT professionals with knowledge of how business works and the roles of technology in the enterprise. It will teach practical skills in designing and managing information systems, and deploying them effectively and creatively. This degree provides students with an understanding of how

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 1. NEFESIE framework and virtual innovation space

software addresses real-world computing problems and will teach them how they can best use computing technology to help people to work together and give companies a competitive edge in the marketplace. They learn how to use and manage information technology and systems to improve and even re-design the way they do business.

The first year is devoted to gaining a strong overall competence in computing technologies, such as computers themselves, operating systems, web systems and the internet, and to acquiring fundamental mathematical skills. In subsequent years, by specialising in information technology, web systems or networking technologies, students are equipped with the necessary skills to work with computing technology across a broad spectrum of business enterprises. They are able to manage, improve and re-design the way businesses use computing systems. In Year Three, they will have the opportunity to spend seven months on our INTRA paid work placement programme, which integrates academic study with a closely related job. It will give them an understanding of the professional and practical business world and will help them to stand out in the graduate employment market. In final year, students study advanced modules in information systems, business strategy and management. In addition, they complete a major team-based project. Practical experience is a principal component of their learning. Throughout the four years of the degree, there are formal lectures, with a strong emphasis on the practical applications in the computer labs, tutorials, ongoing assessments and projects drawn from real-world situations.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

The objective of the final year enterprise module is twofold. First, to introduce students to the theory and practice of entrepreneurship in the context of high technology venture creation. Secondly, it provides the student with a set of theoretical concepts and practical tools that can be used for understanding how IT-based innovative ideas and solutions can potentially be transformed into economic, social and/or other forms of value of which a distinct demand can be identified. The module is a combination of lectures and practical elements where students apply skills related to creativity, leadership, planning, and team management involved in initiating and developing a new business venture.

Learning Outcomes

- Analyse different stages and aspects of the entrepreneurial process
- Be able to initiate the development process of an IT-based value offer (commodity, product, service, experience or a bundle of), by doing business modelling and business planning
- Assess the potential and feasibility of a new IT-based venture
- Assess the role of universities, governments, firms and entrepreneurs in the innovation process
- Practice enhanced team working, planning, negotiation and problem solving in a high-technology product development environment

INDICATIVE CONTENT AND LEARNING ACTIVITIES

The content of the course consists of different topics related to entrepreneurial competence development and IT based value creation. We paid particular attention to innovation, creativity, and leadership as they unfold in micro-level social interactions (Lundberg, 2014; Avolio, 2016; Lundberg 2017). The execution of a team project will be the practical component of this course in which the theoretical aspects will be practiced and the practical doings will be theorized. The main focus is to gradually integrate the entrepreneurship and innovation part with development of an IT based value proposition into a coherent proposal by the end of the course, as this is key to entrepreneurial competence development within high tech sector.

Topics include:

- Foundation for High-technology Entrepreneurship.
  Definitions of high- tech entrepreneurship and the Entrepreneurship process. The environmental influences affecting entrepreneurship. Ireland's high tech sector, structure and performance. Indigenous versus Overseas entrepreneurship.
- Innovation and Entrepreneurship.
  Sources of innovation; Relevance of sources to the entrepreneur; New Product Development Strategies; Technology Adoption Lifecycle. How to work and think processual in loops between creative idea generating and bringing an innovation to the market.
- Ideation
  Sources of new business ideas, effective brainstorming, product benefits, idea screening, product concept development. Intellectual Property Rights. turning an opportunity into innovation, Bringing an innovation to the market,

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

- Entrepreneurial process and tools
  The relationship of creativity and innovation to management of IT projects, How opportunity and innovation are linked within the IT domain. Business model canvases and business plans
- Financial Planning and Commercialisation
  Financing requirement, financial projections and analysis, cashflow, profit and loss account, balance sheet. New product pricing. Stages and sources of financing in high tech venture, government grants, venture capital and stock market flotation.

VIRTUAL INNOVATION SPACE

In addition, to in order to facilitate virtual collaboration we have developed an online tool called a Virtual Innovation Space (VIS), aiming to facilitate the company-university-student cooperation service. In trends of increasing the role of e-learning in the Tempus project an approach to create a virtual innovation space as a website was introduced. The VIS is seen as a single network source of information, a collaborative environment, a source of mutual assistance and potential investors, e-help for more reliably improving the innovation and entrepreneurship potential of IT students and increasing the quantity of successful start-ups organized by university graduates. As the e-learning tool VIS enables IT students to: 1) enrol in innovation and entrepreneurship courses, 2) carry out their diploma project activities, 3) join in company projects, 4) present and discuss their ideas and build a team around the idea. For lecturers in universities the VIS can offer a tool for cooperation with IT companies, finding research partners, and carrying out the students' diploma projects. IT companies can see the VIS as a resource for promoting themselves and establishing connection with IT departments in universities through collaboration with lecturers. VIS provides an infrastructure and mechanisms that support interaction and knowledge transfer between students, universities and companies.

Key functionalities that this tool provides, includes:

- Competence databases, for companies, students and universities;
- Projects and assignment suggestions and support for their formation;
- Connecting people and projects, matching services;
- Collaborative space for supporting project start-ups;
- Funding mechanisms.

In the context of Ukrainian University, the VIS was a novel concept to engage with companies, students and the university to structure educational activities. The VIS facilitates and supports creating ideas from students and business concepts. It helps the preparation of a viable business and project proposal and helps to communicate and present the ideas. In conjunction with the students' contests the VIS supports the assessment of the project and ideas. Using the VIS demonstrates the improved microsocial communication among students in different universities and IT companies. VIS leverages Ukrainian student's entrepreneurial potential in order to create viable ideas and effective collaboration between companies and students. As demonstrated by some example projects from the Ukrainian students' contest and DCU, ideas cover a wide range of topics, however illustrating a common motivation seeking a market potential. That we regard as good result for Ukrainian technical students.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

STUDENT PROJECTS AND VIRTUAL COLLABORATION

The main goal of the course is to teach students to create their own start-up projects in IT and train students in entrepreneurship. During the course the students need to learn several different approaches essential for new company creation. They have to form groups to develop an IT project to a level of getting the first potential customers.

For students, reaching the goal of having customers during one or two semesters is a hard task. On the one hand, they do not have enough knowledge and have to constantly learn as usual students. On the other hand, they deal with the real market and have to obtain experience with gaps in knowledge. To solve the problem of the first steps in start-up we use the VIS. We have organized the students' innovation projects competition within the VIS. The students' projects were assessed by professionals from well-known IT companies and professors. During the first competition, the students had submitted several hundred IT innovation projects.

A few of the example projects from the competition and DCU are:

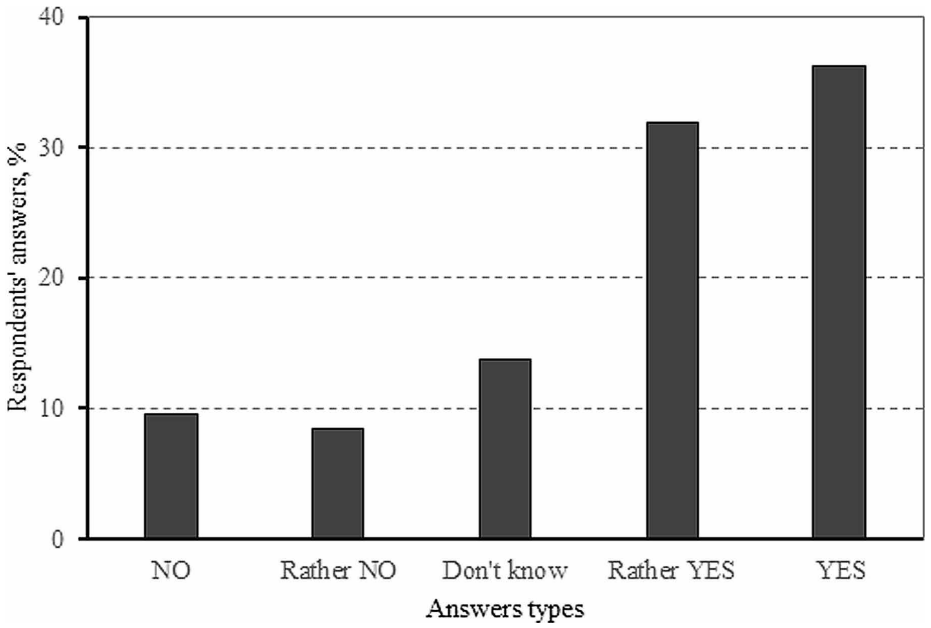
- **Spectrex**: The intellectual system of pulmonary survey. New unique technique for diagnosing diseases of the respiratory system will speed up and simplify the diagnostic process in medical facilities! The project aims to improve the quality of human respiratory system diagnosis by developing an expert pulmonology diagnostics system based on modern methods of analysis of macromolecular structure of moisture in exhaled air.
- **An Application for Learning Foreign Words "Words with Frog"**: This is an effective method, based on associative memory and creating visual images. It provides quick learning of foreign words while preserving quality. The application combines a scientific approach and gaming principles for effective and rapid learning of foreign words.
- **MeViCS**: It offers you one of the ways to prevent slouching at home - a device «MeViCS». «MeViCS» should be applied to align the spine and preventive curvature of the spine.
- **YouDrop**: Architecture and software tools for building the infrastructure of distributed cloud. The idea of YouDrop is based on Peer-to-Peer (P2P) technology as a means of providing Cloud services to individuals, companies and organizations, with the view to facilitating cost-effective scalability, flexibility and efficiency and enhancing the experience of creating, organizing, publishing and sharing content.
- **HotBox**: HotBox(Hotspot Jukebox) is an idea for a mobile application that acts as personal jukebox interface for people in a public premises. Using this application, users can select the music playing in pubs, cafes, restaurants, bars etc. using their phone or mobile device by selecting from a music collection provided by the proprietor. It gives control to both the host and the user to select what music is being played on the premises.
- **New York CitiBike Data Visualization**: A web application to give users a visual representation of data obtained from www.citibikenyc.com going back to July 2013. Users will be able to view heatmaps of stations over time and to view graphs and charts of data of their choice. The application is built using Python on the Flask micro-framework using Bokeh for the visualization.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

- **Manage IT**: Designed to help IT Managers monitor their department's service desk performance. The IT manager can input data related to service desk incidents that is then visually represented on graphs and charts. Each logged incident is assigned a RAG score based on completion success rate. This gives the IT Manager a simple way of tracking performance and identifying areas that need improvement.
- **Web Based Octiv User Interface**: The project is a web based user interface for controlling and retrieving information from an Octiv unit, owned and developed by Impedans Ltd. The idea behind this project is to allow remote control / data gathering from the unit, regardless of the device size or operating system. By using technologies such as JavaScript, JSON, HTML, CSS, Foundation framework, the website provides intuitive, responsive and impressively looking interface for the Octiv unit.

Let us show how the VIS helps a student project by an example of a "Learning Circle" that is developing by one group of five people. In the first stage students organised a group to prepare an application announced on the VIS website. In the process of preparing the application they have to describe technical and financial aspects of their idea. The application made them to be more realistic in terms of resources and values they want to produce in the project. But the process of filling in the application form is creative rather than realistic. It describes students' desires more than their capabilities.

The second stage was after assessment of the project by a jury. There were two processes during competition that had an impact on the project. The first was competition results and comments from the experts. Those comments were rather critical based on different experiences from technical to financial aspects. The second was the possibility to compare their own project with others. They could see the same mistakes and incompleteness have been made by others and are therefore more visible. We have developed a way to improve their own project. From the first two stages, they had an internal vision of changes but from the course they took direction and tools.



EVALUATION AND FEEDBACK

In practice, we have found that boosting integration processes between IT companies and a university on a regional level requires a kind of additional effort that we can call "an introduction". We do not mean that a university does not know about regional IT companies or vice versa. They do not use to their full potential all possibilities of each other's internal structures. In order to receive further feedback, we have conducted a series of interviews and surveys among key stakeholders.

In 2016 a survey involving 546 students of all years of study of Ukrainian universities was carried out. Figure 2 shows that more than 66% of respondents thought it necessary to introduce new university courses on innovation and entrepreneurship. Negative answers can be explained that students previously had a course on basics in economic science that is in the list of compulsory courses in most of the universities. Analysis of responses distribution per years of study shows a tendency that students of the third and fourth years of study are more interested in innovation and entrepreneurship courses than second-year students. This can be explained that the students of the fourth year of study have more technological competences in IT to develop software projects. The survey results allow the conclusions to be drawn that the Ukrainian students have high entrepreneurial and innovative potential and a tendency of the growing experience of practical activities. The analysis of the survey responses has

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 2. Consideration to introduce new disciplines on innovation and entrepreneurship into the curriculum

shown the overwhelming importance of developing and implementing the disciplines of innovation and entrepreneurship in the University courses list for IT students in the educational and vocational training programs for "master" level.

In trends of increasing the role of e-learning in the Tempus project an approach was introduced to create VIS. Surveys among students and university staff show undeveloped innovation and entrepreneurship in both educational and research activities in universities. In summary, the feedback highlights:

- Lack of courses for IT students in innovation and entrepreneurship in the majority of Ukrainian universities
- Low level or absence of infrastructure for implementing institutional innovation and entrepreneurship policies
- Inefficient managerial capacities, (lack of well-trained management personnel) in Ukrainian universities for supporting innovation and entrepreneurship activities of IT students at the level of the modern IT market.
- Low level of research cooperation with IT companies and participation in international projects.

In the project to solve stated challenges we had decided not to follow a traditional approach like building innovation and entrepreneurship offices in partner universities or make a network among partner universities for implementing some changes in internal university policies.

In relation to the VIS collaboration platform, we tried to meet the challenge of boosting the VIS among potential users by conducting a contest for IT students. The contest had two nominations for IT idea and IT solution. For judging the contest, experts from IT companies and lecturers were invited. Up to now two contests had been conducted. To increase popularity each contest was conducted in a differ-

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

ent city in the Ukraine. As a result of contest, more than 60 university and IT company representatives, 29 universities, and 18 IT companies were registered in the VIS. During the last contest, more than 200 applications were submitted by students' teams.

From a survey of lecturers that are users of the VIS we got positive and very positive responses regarding increasing knowledge and skills for implementing innovation and entrepreneurship activities among IT students.

CONCLUSION

The running of VIS project shows that modern students got into the habit using online resources for learning and easily combine them with traditional university courses. We found that at least Ukrainian IT students from the fourth-year of study and later are interested in implementing their own ideas as real start-up projects, but they do not have the necessary competences. Therefore, we can conclude that the perspective approach is to involve in traditional education online resources that can be seen as theoretical and practical tools for connecting IT students with different aspects of real market activities.

From analysis of the students' projects we can conclude that they have a good communication among themselves. Students in a team are aware of strong and weak sides of each other. That helps them to quickly start developing technical projects by dividing the work among themselves in the most efficient way. By introducing the course on entrepreneurship for IT students we use established microsocial communication connections (Lundberg, 2014) among them for leveraging of spreading innovation ideas in their start-ups. We found that a previous experience of IT students in solving technical tasks in a team is a very good ground for start-ups. The perspective research lays in finding optimal ways to take advantage of students' technical microsocial medium (teams of students for solving technical tasks created in their social medium) to boost start-ups.

Further research should be directed towards establishing more trusted connections with big IT companies through involving them in VIS activities.

Chapter 29
Cloud Service Footprint (CSF): Utilizing Risk and Governance Directions to Characterize a Cloud Service

Mohammad Shalan
JEA, Jordan

ABSTRACT

Cloud Computing (CC) services have made substantive advances in the past few years. It is rapidly changing the landscape of technology, and energizing the long-held promise of utility computing. Successful jump into CC is a considerable task, since the surroundings are not yet mature and the accompanied risk and governance frameworks are still evolving. This effort aims to portray an identity for CC services by employing risk and governance directions among other elements and techniques. Cloud Service Footprint (CSF) is considering practical aspects surrounding the CC paradigm and prescribing the associated directions. CSF will help Cloud Service Providers (CSPs) to characterize their service and benchmark themselves. The Client Enterprises (CEs) can utilize CSF dimensions to find a better way to navigate through CC service arena and to understand its parameters. Along with cost and functional capabilities, the Cloud Service Footprint (CSF) can provide enough information for business executives to evaluate CC services and make informed decisions.

INTRODUCTION

Cloud computing (CC) is increasingly asserted as the technology with the potential to change the way internet and information systems are being utilized into client enterprises (CEs). CC has emerged as a growing trend of scalable, flexible and powerful computing, capable of introducing a paradigm shift in how technology is delivering value to the business. With significant global investments, CC is showing the power to completely revolutionize the business mindset and to promote new business characteristics such as on-demand self-service, broad network access, shared resources, rapid provisioning and minimal intervention. However, CC benefits are not coming hassle free; several risks, technical concerns, contracting and compliance issues are surrounding the CC services.

Some challenges arise because the adoption of CC services might begin outside the technology organization (TO) or against the CE strategy leading to loose associations. Other challenges are due to immaturity of particular CC service measures, even worse is the reduced maturity of CC associated risk and governance models. Business and technology teams have to increase correlation and communication to collectively agree upon the right balance.

This chapter consider few surroundings to portray a picture for CC deliberate challenges. It investigates the effects of maturity status on the enhancement of key CC service features and its value propositions. It then researches the governance abilities to orchestrate heterogeneous environments, setting rules and responsibilities, leading the way to maintain the CC phenomena. Risk management (RM) is called-out to handle the associated risks in a reliable and trustworthy way. This chapter devote to define a new term called Cloud Service Footprint (CSF) to portray an identity for a CC service.

The trust and trace natures of CC services provide a major motivation to characterize the CSF. When correlated to cost and functional capabilities, CSF deemed to be the third element to provide enough information for business executives to evaluate CC services and make informed decisions. This aligns to an early lesson, whereas realizing value from new services requires a mature organization that can recognize associated benefits and own the tools for effective performance management.

CSF dimensions and parameters are categorized in a systematic manner as related to the CC concepts to separate the potentially significant business benefits and threats from the hype and hyperbole that are surrounding. The conferred CSF components provide first pass among a jungle of elements that shape the CC structure. These components include architecture dimensions, data considerations, licensing and agreements, collaborations and adaptations in addition to the ethical and legal aspirations.

This chapter is factorizing the CSF dimensions as evidence-based insights while looking at CC benefits, associated risk elements and governance contributions. It appeals to both academics and practitioners. Its length and design precludes extensive treatment of each area, but highlighting some key concepts and practices that can help smoothing the CSF consideration and evaluation.

BACKGROUND

Cloud Computing (CC) represents the network of business platforms (Baya, Mathaisel & Parker, 2010). It is a new way to conceptualize and manage the integration between business and technology. Yet, there is no universal way to measure business and technology alignment in literature (HBR, 2011; De Haes & Grembergen, 2009). Risk and governance are gaining more space to reshape the cloud era. The parameters of CC services are extensively discussed in literature, similarly are risk management and governance. But, they are evolving with plenty of research dedicated to each topic individually or bi-combined (Aven, 2008; Ackermann, 2012; Goranson, 1999). We are jointly correlating these topics. The joint understanding is unique since everyone know these topics individually, but limited client enterprises (CEs) are doing all of it.

CC and technology transformations have reshaped significantly the business domains (Menken & Blokdijk, 2008). Usually we used to say that technology must support business strategy, nowadays, there are times when technology will lead into the next realm of the previously unthinkable (Vice, 2015). This is obvious today with many CEs are establishing technology in the core of their operations (Turban, Leidner, McLean & Wetherbe, 2008). This shift will require more collaboration between business people and technology organization (TOs) with both parties are invited to understand the terminologies and concepts of each other.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Researchers agree that CEs are facing a continuously changing business environment and a highly complex set of rules and regulations. Collaboration is required to establish a governance model for CEs based on utility driven computing which is started to stay and grow (Shawish & Salama, 2014). The movement towards CC adoption is in line with the global trend of moving from product procurement to service procurement. That is why board members are being directly accountable for technology and requiring strong governance in analogy to their responsibility for enterprise objectives and key assets (Hardy, 2006). With such speedy progressing and emerging, it becomes crucial to understand and characterize all aspects about the CC services and associated technologies. Here comes the introduction of the CSF.

CC chaos is passing a hurdle with everyone is asking; What is a cloud services? Why do I need to move to the cloud? What is a service lifecycle? Who are service owners? CSF is introduced to help executives answer such question and take informed decisions. CC practitioners are trying to take a more structured approach to the art of governing, and turn it, as much as possible, into a science (Brown & Laird & Gee & Mitra, 2008). Risk Management is the process enables the enterprise to set the risk tolerance, identify potential risks and prioritize them based on the enterprise's business objectives in association with internal controls (AAIRM, 2002). Plenty of books and articles have defined and discussed risks, the enterprise risk management and the risks associated with CC (Hillson, 2008; Brotby, 2006; Davis, Schiller, & Wheeler, 2006; Schlarman, 2009).

Plenty of articles are trying to answer the practitioners concerns when asking why do we need the new esoteric terms when evaluating the CC services? (Stantchev & Stantcheva, 2013). The advent of CC has enabled every CE to acquire software, often without the need for technology team support or capital (Marks, 2015). Thus it is more important to set new rules and define parameters that everyone may understand.

In summary, it can be argued that recent progress in CC and technology environments have promoted more research on enterprise risk management and governance (Abram, 2009; Segal, 2011). The main differentiator of this chapter is the orchestration of a wide spectrum of elements to help executives, practitioners and researches understand correlations and plan necessary CC service elements and supporting functionality. Joint understanding produces the CSF as a scalable, measurable, sustainable, and defensible term that is continually improving.

CLOUD SERVICE FOOTPRINT (CSF)

In its original and primary form, the footprint is a tracing that contains lots of information about the identity and nature of the beast that made it. This chapter is introducing the Cloud Service Footprint (CSF) as an invented term to identify aspirations and interdependencies of a given cloud service. CSF is intended as a control element that provides client enterprises (CEs), cloud service providers (CSPs) and regulatory bodies with necessary visibility to measure each CC service independently or collectively. CSF is intended to work in discrete and continuous basis. This section is providing few insights to define, generate and correlate CSF, additionally it will look into its feasibility and motivations. CSF is crafted for CEs considering to implement CC services. It provides a multi-category approach to evaluate the CC impacts on the CE from various angles. Yet, it also adds value for CSPs who are trying to bench mark their CC services. CSF helps to clarify the service transformation mechanisms and fit it within the CE governance, service management and operations. Overall, the CSF dimensions help to move away from reactive and unreliable CC services evaluations.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Definition

In analogy to the original definition of a footprint, the Cloud Service Footprint (CSF) is intended to provide a tracing that contains lots of information about the identity and nature of a given CC service. At one place, CSF is used to describe the trails and traces left online. On the other hand, it can contain weighted indices that consider the service risks, controls, maturity and momentum considerations. CC associated risks are understood, mapped, segmented, weighted and monetized by the CSF.

CSF will enhance the CE technology decision-making processes and assist CSPs in communicating the value proposition of their products and services. Additionally, this helps to demonstrate, justify and realize the tangible value of CC initiatives by senior management and key business stakeholders. It also assists CSPs in winning, serving and retaining customers.

Motivations

When applied to CC, controls that exist today need to be stretched and distressed to cope with the demands placed on it. Modifications may be insufficient, this assures the need for new mechanisms and parameters to control various CC aspects and associated risks. CC services should have adequate internal controls, applied security levels or enhanced values for each business area. CSF is intended to touch on the scope of technical controls required to mitigate threats. It draws from the quality management procedures and the governance models to introduce a simple to use and easily-to-understand parameters or techniques that can be easily dictated and managed.

CC increasingly require the management of Middle Circle Contractors (MCCs) or the "men-in-the-middle". CSF shed special light and controls for selecting and contracting a suitable MCC or CSP. The critical elements of CC service deployment boil down to "trust and trace". An appropriate CSP will maintain sustainability and quality to prevent loss of data and vendor or technology lock in. A malicious user can move from one CE to another through the CSP environment because CSPs are providing support and services for multiple CEs on a shared basis. Furthermore, if an MCC is using common devices it is important to separate the interfaces between CEs with distinct accounts separate privileges and folders. CSF can summaries such roles and help the CSP or MCC to "commensurate with the level of risk to which the CE is exposed to" (CSA, 2015).

CEs utilizing CC services need to develop robust service schema in collaboration with CSPs. This schema is required to achieve agreed-upon goals to support the business mission and technology goals regardless of the service or deployment model. CSF may act to adjust the defined roles and responsibilities in the combined schema based on the respective scope of control. The deployment model may define accountability and expectations based on risk assessment. CSF is trying to combine many parameters to help CEs, MCCs and CSPs and enhance the common understanding.

Derivation

CSF was derived through a reverse engineering process for several CC implementations. Lessons learnt were collected and the development elements were analyzed. To find the best fit, attained data were categorized with respect to the main CSF dimensions and subs. Every CC service were examined based on composite expectations of CEs or considering the characteristics of a specific CE. Controls modeling

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

and risk adjustment were deliberated based on highlighted issues and concerns. Such tunings played a key part in the CSF crafting to outfit categories that include a broad range of details or in situation that have a large number of outside forces.

Feasibility

CC increasingly emphasized the trend of separate independent services that run in the background. Multiple services are invoked together to make an action. CSF can demonstrate an increased value as a facilitator for these "off-the-shelf" services. In this context, CSF can provide the power needed to seamlessly automate processes and manage CC services effectively. CSF is introduced to give business and technology organizations the necessary visibility and control for continuous improvement of CC services. Factoring in, CSF is intended as an essential element to better identify the merits of a selected CC service. Promoting clarity and transparency, CSF may derive an efficient delivery process with optimum performance to control costs, maintain compliance and reduce vulnerability.

Solid measurements provided by CSF allow CEs to enumerate action delivery and optimize the operation. Better service understanding produced by CSF enhances the mechanism to improve the value calculations of CC services and technology investments, such as total cost of ownership (TCO) and the return on investment (ROI). It helps to standardize the CEs and CSPs interaction processes with each other also with various stakeholders. With enhanced asset and business orchestration, CSF is expected to affect the CC strategy, analysis and decision hierarchy and to reduce the traditional sophistication of technology. CSF may synthesize various results to provide a clear picture of the total impacts of a CC service.

Correlations

Three elements are claimed to provide enough information for business executives to evaluate CC services and make informed decisions. In addition to the CSF, cost and functional capability can provide the basis for prioritizing CC and technology initiatives in a manner that saves huge struggle among CEs. The correlation between these three elements can produce an effective business value and ensures that CC service benefits can be realized.

Cost signify the investment necessary to achieve certain value and acquire the associated benefits of the proposed service. Cost combine all investments and expenses necessary to deliver the proposed value. Additionally, it captures incremental or ongoing payments over the existing environment if it is associated with the service. Costs must be tied to the benefits that are generated. Direct benefits and functionalities represent one part of the investment, although it is typically used as the primary way to justify the service attainment. Another significant part is related to measuring the strategy alignment of the CC service or the expected drawbacks on the CE future. Flexibility represents the value that can be generated if new features are built on top of the acquired service.

Functional capability represents the operational value derived from the proposed CC service as measured by the entire CE combining the technology organization (TO) and/or business units (BUs). Benefit estimates involve a clear dialogue with the CE stakeholders to comprehend the specific value being created. Prior to cloud era, functional justification focus on one business silo, leaving little room to analyze the effect on the entire CE strategy. CC services are enabled across the CE and effects its entire environment, consequently it promotes full examination and places variable weights to measure benefits and capabilities.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

CSF can be hired to ensure CC service sustainability and ability to perform as promised, in a secure, trusted and reliable way. It enables better design, evaluation and management of CC services. This defines a clear line of accountability that can be considered whether the focus is external from the public cloud, or within a private cloud inside the CE. CSF may also consider the side effects or enhancements of a CC service. For instance, acquiring an industry accredited service can potentially increase standardization and efficiency. However, an embedded collaboration feature may translate to greater worker productivity if activated. The bottom line is that correlating CSF with cost and functional capability provides the ability to measure multiple dimensions related to CC services and to capture their future and strategic values.

CSF BUILDING DERIVES

CC is positioned in a convergence mode as a technology adoption that inherits business risks. Problems are typically associated with the newly emerging business models. Substantive advances occurred for the CC service delivery models in the past few years. But, associated risk and governance practices have not matured at a similar rate. The dynamic scalability of CC enhances the possibility of quick upsizing and downsizing, but there exist some roadblocks. Business and technology teams have to increase correlation and communication to collectively agree upon the right balance.

Some internal and external factors add up to increase the efficiency of CC services, including the compliance strategies and risk based auditing. CC aspirations encourage governance in its participatory form as the job of every stakeholder, particularly the most vulnerable. The board of directors are playing a main role in CC governance under the corporate governance umbrella while aligning the CE strategy. Understanding CC service aspirations and alignment help in setting related policies and ensuring the CE credibility.

This section is putting risk and governance in the heart, looking at service maturity and momentum to introduce Cloud Service Footprint (CSF) as a guideline to evaluate the CC services. It supports moving business infrastructure, processes and applications into the cloud while increasing the navigation clarity through the fear, uncertainty and doubt. It also provides answers to improve the understanding of CC adoption in a structured and systematic approach.

Risks Management

The ISO Guide 73:2009 define risk as the "effect of uncertainty on objectives" (ISO:2009). This includes uncertainties caused by ambiguity or lack of information. According to COSO "Risk is the possibility that an event will occur and adversely affect the achievement of objectives" (COSO, 2012). Positive and negative uncertainties are contained within the CC services and their surroundings. Tracking and measuring risks, enhances the opportunity to meet original projections. Risk Management (RM) is the act of aligning exposure and capability to handle risks as per the stakeholders' guidelines. In this regard, it acts as a primary means to support technology decisions triggered to protect the confidentiality, integrity, and availability of CC services and assets. Different categorization of risks may be introduced to allow stakeholders understanding the qualitative distinctions between the types of risks that CEs can face. Although some categorizations defined before the cloud era, they are now becoming more recognized and deep (Kaplan, & Mikes, 2012).

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Business risk mapping is the process used to identify and segment contemplations that can hinder the normal business flow. CC services enable cross functionality with all business processes introducing a joint risk arena. Hence, CC related risks need to be delineated in the functional space and categorized along functional lines to identify their inter-dependencies. No two industries will have a common generic set of functional risks. "After the risk management plans are implemented, there is a need to follow-on actions as part of a comprehensive assessment and continuous monitoring program for effectiveness" (Alnuem, Alrumaih & Al-Alshaikh, 2015). Risk assessment is crucial to help management evaluating the risk events associated with its cloud strategy. This will help to determine the potential impact of the risks associated with each CC option (Broder, 2006). The ability to make risk assessment more accurate depends on whether the CE has a comprehensive, accurate, and current inventory of risks. The outcomes of risk treatment plans should be incorporated into service agreements where applicable to analyze risks' likelihood, acceptance levels and criteria.

RM functions are critical to every CE. It includes the valuation of CC assets and the analysis of associated threats and vulnerabilities. Risk likelihoods are usually based on a related probability density functions The underlying impacts of risk scenarios necessitate the development of risk action plans defining the proper risk technique either being mitigation, avoidance, transfer and acceptance. "The occurrence of an event, which is associated with the adoption and use of cloud computing can have undesirable consequences or impacts on user companies" (Dutta, Peng & Choudhary, 2013). CC can affect critical focal points of RM including the CE risk profile which encompasses the entire risk population. This profile should be extended by the inclusion of a subset of the risk universe associated with business units, CSPs and MCCs. The inherent and residual risk levels of CC options can be either greater or less than those as the non-cloud computing solutions. Similar changes occur to the likelihood and impact in many cases when CC solutions are adopted.

There are many variables, values and risks in any CC opportunity or program that affect the business decisions. Risk types may not be affected if CC services are procured, but some of them may have different characteristics. However, the CE level of risk thresholds will, in most cases, change based on CC purpose and how far the CC solutions will be adopted. As CC services are going through, some changes are associated with the CSP who has been engaged. "With cloud computing poised to move from its nascent phase to a more robust growth phase, a systemic understanding of the risk space enveloping cloud is becoming important" (Warrier & Shandrashekhar, 2006).

Each CE has to weigh few variables to decide for cloud appropriate solutions with the executive board to be engaged when required. Some risks can be managed through a rules-based model; others may require alternative approaches. CEs acquiring services from CSPs should ask whether their own management has defined risk tolerances with respect to CC services and accepted any residual risks. Normally, a CSP should demonstrate comprehensive and effective RM processes in association with its services. The CE should carefully evaluate the risk behaviors of a CSP in conjunction with their own abilities to compensate for the potential RM gaps. Risk assessment approaches between CSPs and CEs should be consistent or mapped. They should jointly develop risk scenarios for the cloud service. Such scenarios should be intrinsic to the CSPs' design of service and to the CE assessment of CC service risks.

Governance

To be effective, CEs must establish clear chains of responsibility to empower people and to widen the communication channels to keep all stakeholders informed. This should be accompanied by measurements to gauge effectiveness and policies to guide the entire CE toward its goals. On top of this control

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

mechanisms are necessary to ensure compliance and strategy alignment. Governance is a strategic lesson learned the hard way over the past decade but it need to be revisited in the cloud era to handle all challenges and controls. Governance represents a set of processes, customs, policies, laws, and institutions affecting the way an enterprise is directed, administered or controlled. It also controls the relationship among involved stakeholders.

There exist plenty of good governance principles, including four major pillars:

- Accountability obligation to report, explain and be answerable for the consequences of decisions that was made on behalf of the stakeholders.
- Transparency to enable stakeholders understanding the decision-making process and follow the consistent rule of law to achieve justice.
- Responsive to serve the entire stakeholders in a responsible manner while balancing competing interests appropriately. It also produces a positive timely response to change.
- Effectiveness to implement decisions and follow processes with efficiency. The best out of the available people, resources and time will be utilized to produce superior results in equity and fairness.

Good governance is based on the acceptance of the shareholders' rights as the true owners of the CE and the role of senior management as trustees. Governance lead to "establishing chains of responsibility, authority, and communication to empower people carry out their roles and responsibilities while establishing measurement, policy, and control mechanisms" (Brown, Moore, & Tegan, 2006). There are many governance practices that follows similar basic principles in terms of audit behaviors, board and management structures, corporate responsibility and the exercise of control rights.

As cloud correlates business with technology, governance will enhance both executive and non-executive oversight. Business directors will gain significant benefits as they have limited amount of time to devote to the CE, but almost unlimited responsibilities. Governance need to start with the decision makers who are building cloud architectures. It is aimed as a constitution that is required to articulate a common agreement about cloud definitions and follow the best possible process for decision making. Good CC Governance is expected to deliver well-defined solutions that will satisfy stakeholders and resolve any conflicts. Cloud governance roadmap is a sub-journey of the governance roadmap with long-term view to deliver short term solutions with a coherent vision.

CSF acts to maximize business value by incorporating effective business-driven management and governance tools into the CC applications from the ground up. It also aims toward minimal disruption of business, technology operations and stakeholders inconvenience. CSF is a critical success factor for both achieving standardization, reducing costs and improving business process flexibility. CSF is ultimately turning business agility from a platitude to reality. Typical governance paradigm includes requirements of technology infrastructure, employee behavior, and business processes. These components are often recorded, implemented and measured in silos, CSF acts to cross link these capabilities. Effective governance will be produced as executives break down the walls between business silos and devise common approaches. CC technologies helped in resolving the trade-offs between diverse, sometimes conflicting, needs and interests.

Governance will be utilized as a mechanism to orchestrate heterogeneous elements in the cloud environment, setting rules and responsibilities, leading the way to review the cloud phenomena and the associated risks in a reliable and trustworthy way. It should be noted that migrating to the cloud is not

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

an abdication of responsibility. Even, the outsourced service still need to be governed. The opposite understanding may place the whole enterprise at risk of falling over technical and compliance barriers. CSF helps to embed and link the governance practices inside CC lifecycle end-to-end. The cycle includes requirements gathering, planning, architecture design, deployment, bursting, CSP switching and off-boarding from cloud.

Maturity

The National Institute of Standards and Technology (NIST) defines CC as: "A model for enabling ubiquitous, convenient, on-demand network access to a shared pool of configurable computing resources (e.g. networks, servers, storage, applications, and services) that can be rapidly provisioned and released with minimal management effort or service provider interaction" (Mell & Grace, 2011). The NIST definition aimed towards a mature setup, which is not the situation today where CC means various things to different stakeholders. Developers often equate CC and web services as one and the same. Designers view CC as a set of implementation patterns that should be applied during development. Business executives and technology leaders consider CC as a core underpinning to their information and technology strategy. CSF supports creating a shared vision and definition to achieve the promised benefits as expected by every stakeholder in a mature, responsible and diverse environment.

Cloud metrics are stacking without clear capabilities and boundaries, even "the terminology of cloud service measurements is not well defined" (NIST, 2015). Different interpretations exist between CSPs, CEs and regulatory bodies who should monitor, control, and report on CC services. This require more transparency to precisely align CC services, expenses and demands. Effective measurement of CC services is still evolving to optimize resource utilization and enhance controls. Mature and unified metering will impose unique benefits on the top of every CC service. Various stakeholders are expected to benefit from enhanced controls. CSF supports leveraging the CC metering capability according to a suitable level of abstraction in order to enable fair judgement on the reliability and effectiveness of CC measures.

In its mature setup, CC offers a value proposition that is different from traditional technology environments. It enables the CEs to provision computing capabilities based on self-service model and on-demand requirements. It offers economies of scale that would otherwise be unavailable. For example, CC enabled computing resources such as servers and network storage to be acquired and upgraded automatically without requiring physical intervention or human collaboration. Effective resource pooling is a value that is enhanced along with CC maturity. The CSP resources may serve multiple CEs using a multi-tenant model. Different physical and virtual resources can be assigned or reassigned as per CE demand. "Resources can be rapidly and elastically provisioned" (Shinder, 2013). With rapid elasticity, resources often appear as unlimited and can be purchased in any quantity at any time. CSF acts to standardize and formalize the CC value proposition including its various elements.

To cover the requirements of CEs across the whole business spectrum, CC are utilizing four main topology deployment models. These models are progressively elaborating to cover a wide matrix of cost and features. Private clouds are dedicated to a single enterprise for private use. Public clouds are owned and provided by external CSPs, their services are priced based on actual consumption basis. Hybrid clouds blend the benefits of public and private clouds by enabling CEs to retain confidential information in a private cloud, while providing access to the wider choice of applications available in a public cloud. Community clouds share collaborative resources between number of CEs with common interests. CSF is considering the topology deployment model while accounting for the maturity of a CC service.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

To support multi-layers on-demand services, CC encompasses a variety of service delivery models (SDMs). These models are evolving to provide different service forms while spanning all computing layers. Infrastructure-as-a-Service, IaaS, is generally the CE first step into CC. Platform-as-a-Service, PaaS, acts at the platform level to provide an environment that supports rapid evolution for key business application development. Software-as-a-Service, SaaS, are available at the application level, via standard browsers to support device independence and anywhere access. Database-as-a-Service, DBaaS, is a cloud-based approach to store and manage structured data, with similar functionality to relational database management systems (RDBMS). The maturity levels of these models vary significantly in accordance to their spread. CSF measures the disruptive behaviors of these models as they deliver new functionalities.

Positive correlation exists between CC maturity levels and the refined organizational practices. Maturity helps to realize CC benefits and measurement instruments, especially when there is no common agreement to define the service elements. Effective maturity assessment is a key to measure readiness and to establish CC roadmaps and improvement plans. Immaturity may affect CC decisions explicitly causing a disturbed enterprise architecture and service agility. Even the project and portfolio management approaches should be unique and mature to deploy CC services as a holistic single overall process. CSF consider correlations, measurements and deployment techniques to help producing a transparent blueprint for CC services.

Getting optimal value from CC requires maturity at the strategic and operational levels. Strategy can enhance alignment and governance while operation can provide continuous measurements and performance enhancements. The combination of activities at both levels augments the conditions for adequate value delivery. A robust governance framework operates at the highest levels to enable the transition and operation of CC. Such framework may compensate for some immaturity or weaknesses. A high level steering committee is recommended to operate at the executive level to align with business strategy and enterprise architecture. Overall, the CSF is introduced to enhance CC maturity, provide visibility to the business, communicate uniform maturity measurements and define clear tradeoffs if necessary.

Service Momentum

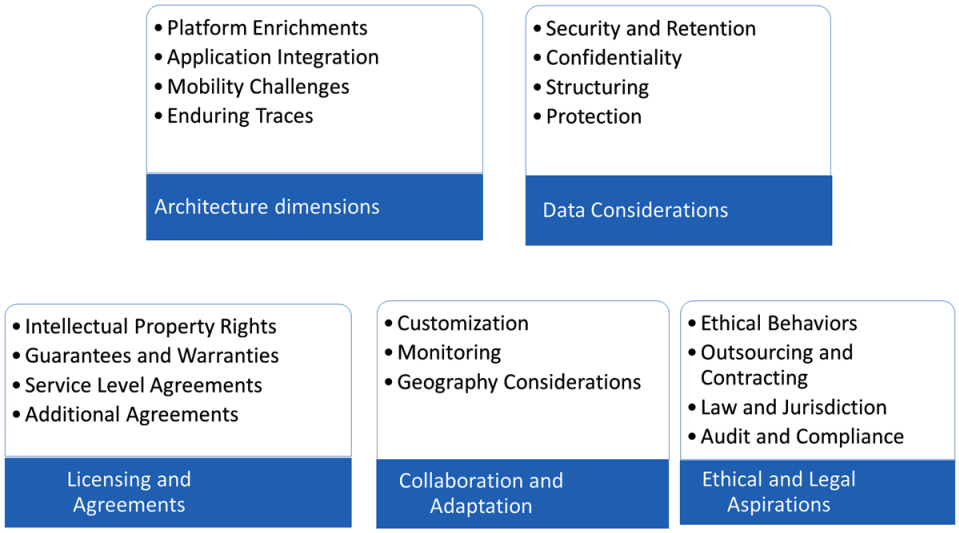
Plenty of CC services are spread across the arena. CEs select and adopt new services based on their future economic benefit or utility. The concept of service potential was described in ITIL as "the total possible value of the overall capabilities and resources of the IT service provider" (Axelos, 2016). In its definition, service potential relates to the service providers' ability to better utilize their resources and capabilities in a way that will allow their CEs to deliver business outcomes. It drives up the demand for services from CEs and reduces the idle capacity of the service providers.

The proposed service momentum approach complements the service potential landscape. It covers broader service areas and use additional variables to evaluate the CC service capabilities and predict its future. Service momentum is meant to measure the ability of a CC service to deliver value at any point in its life and support the CE business that is committed for. It identifies collaboration junctions with various business elements to achieve efficiency and absorb the CC service as a strategic business asset that can last onwards. It also includes the service capacity to deliver an economic output from the moment when the service is first acquired in addition to benefits from subsequent upgrades.

During CC service implementations, service momentum helps to validate the ecosystem components. It can be viewed as a broad-scale assessment and spatial mapping of every component. This may determine the overall service relevance to CE policies, business scope and the expected success likeli-

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

hood. Service momentum can achieve an integrated assessment to represent the expected business value without masking the individual contribution of each component. It includes the identification of the key service-specific processes and the relationships with the targeted ecosystem services.



To measure the future sustainability of CC service, service momentum may include selected predictor variables to establish a scoring scheme that is allied with the service attributes. Various techniques can be used to identify the scores associated with each attribute. Thresholds can be accompanied based on accepted standards and relative observations. Reliable spatially explicit data may enhance the key business processes and support the management decisions. Sometimes there exist no clear thresholds or attributes to support the identification and development of quantitative future estimations. Modifications can be triggered based on the service performance and business relevance.

Service momentum is sought out to utilize the best available approaches to assess the current and future capabilities of each individual CC service based on abstract and expert opinion. This allows service momentum to act as a quality indicator to ensure CC service availability and feasibility. Service momentum approach is not yet complete; it needs further analysis to develop. Hands-on practical experience, market research, deep knowledge and industry relationships are utilized here to tentatively measure the service momentum for every CSF dimension or component.

CSF DIMENSIONS

CSF penetrates various fields to create an identity for every CC service and help both CEs and CSPs to better utilize resources, conduct the contracting and handle CC projects implementation operation and service management. CSF is encompassing various aspects including the architectural dimensions, data considerations, licensing and agreements, service collaboration, and legal aspirations. All dimensions, parameters and sub-parameters are shown in figure 1 below.

Figure 1. A list of all dimensions and sub-parameters of the Cloud Service Footprint (CSF)

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Architectural Dimensions

When planning CC projects, suitable architecture is considered among the most natural and necessary prerequisites. It determines few dimensions related to the CC service such as the number of users, transactions and its price list. One challenge is to determine the unique scope and parameters to provide an optimal relationship between service cost and effectiveness. This section is considering CSF capabilities to boost and optimize CC architectural elements including the platform enrichment, application integration and mobility challenges.

Platform Enrichments

While acquiring new CC service, CEs are expected to assess how this service can be utilized to enhance their technology adoption and promote business integration. Stakeholders may require to satisfy specific technical constrains, especially for unique requirements or sensitive information. Understanding technology concepts is important to determine what efforts are reasonable to address the CC risks. The CEs ability to assess the CC platform is important to give informed consent to forgo certain measures. CEs must be competent to assess the architecture related to the CC services or consult with someone who is. Number of platform measures and concepts are important to achieve the planned integration or correlation with on-premises technologies. Platform enrichment may consider the effect of various technologies on the CE future and adaptation.

CC services requires well-structured platform that foster adaptive implementations and accept sets of standards. Enriched platform need to leverage all solutions, share and re-use the existing infrastructure in a repeatable and cumulative means. A successful CC implementation may require blending of traditional on-premises infrastructure with public shared systems. Poor integration can prohibit the realization of multiple benefits. Infrastructure ownership can be a differentiator where some CSPs don't own their CC servers and instead use Amazon or Microsoft infrastructure for storing data and backing it up. Such a case creates an issue if the CSP defaults on a payment to servers' owner who might immediately cut off access.

Application Integration

CEs are looking to modernize and enhance their entire business applications environment. CC services attracted CEs to focus on rapid-deployment implementations that is delivering simple and scalable solutions. They encourage CEs to abandon the engagement in expensive implementations and customizations of protracted enterprise applications that is based on specific vertical solutions. Instead the applications based on CC services proofs their ability to deliver cost-friendly solutions that address a specific business processes in a short time. CSPs are trying to utilize best practices to jump start CEs with new efficient applications in smaller time frame. Application integration is meant to facilitate smooth connectivity of CC services with the existing and future applications.

The CC applications are what they are, as they are "generally implemented on the provider's terms, thus the degree of negotiability pales in comparison with the contracting model in traditional services" (Opelt, Gloger, Pfarl & Mittermayr, 2013). There is a general recognition that CEs have to start at CSP configurations, especially those well-established large CSPs who dictate their rules. Consequently, if a CE expects customization with genuine configurations of service parameters, then there should be special considerations related to the acquired solutions or components.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Mobility Challenges

The 3As (Anytime, Anywhere and on Any device) phenomenon resulted from the prioritized mobile access (Mastorakis, Mavromoustakis, & Pallis, 2015). Mobility required by CEs to engage with their customers, business partners and employees. Mobile engagement is increased to enrich customer experience and transform data into actionable insights. However, it exposes applications and data on a small, light and always-on portable device. Every CC service should be evaluated against its mobility practices and its engagement with mobile service providers (MCPs). CSPs are expected to manage mobile application distribution and governance by considering several MCPs and public application stores.

Mobility is located at the front end of the new interaction system, which is people-centric as opposed to traditional systems, which was record or process-centric. CC services should support effective mobility platform that has a scalable hierarchy and architecture and can progressively deliver the optimum service based on existing resources. It should respond timely to the iterative, faster lifecycles, fragmented mobile devices with various operating behaviors. CSPs are expected to accommodate advanced mobile services such as push notifications and geo location services. CSPs are expected to have a robust mobile strategy to reduce risks across the CE infrastructure including mobile devices (endpoint) and other mobile stacked layers.

Enduring Traces

While information is transmitted online via website registration, emails, attachments or any other forms of uploads, they leave identifying traces and information. Such traces can be seen by others online or it may leave a permanent effect in the supporting platform architecture. CEs can be susceptible to security flaws originating from the leak of personal information via this digital footprint.

A CC service should be evaluated against the trace it leaves online. Network technologies tend to leave large traces due to its spread and expansion. Functional technologies tend to leave fairly small footprints as they may not be used outside a specific silo. One functional example is Computer Aided Drafting (CAD) system which is used only by engineering department. Some technologies or services can have small footprints or very large ones based on their complexity and usage. One example is the Enterprise Resources Planning (ERP) and Customer Relationship Management (CRM). Technology borders should be set up carefully when moving any functionality to the cloud. The enduring traces can play a major role in the complexity and cost of CC service.

Data Considerations

When contracting a CSP or an MCC to process data on its behalf, the CE will continue to be accountable and responsible for what the third party does with the data. This means that the CE could be liable if the data handled by the CSP is lost or destroyed. The CE has an obligation to ensure that the contracted third party has adequate measures in place to protect data securely against unauthorized or unlawful processing, accidental loss, destruction and damage. The CE also should consider data confidentiality, structuring, protection and backward collection when the contract is ceased. CSF is considering such dimensions as described in this section.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Security and Retention

CEs are required to ensure that all data processing under their responsibility is handled in adherence to their data protection principles. Whether data handling is outsourced or being processed internally within CE data controllers. CEs can manage those requirements by including a security schedule within the CSP contract to outline data handling mechanisms. This includes:

- How the CE data is separated from others' data?
- Applicable restrictions on data and the associated security measures.
- Responses to security breaches of all kinds
- Reactions to legal requirements under various scenarios

CEs need to validate the CC service dimensions in relation to data disposal and retention schedules. Legal obligations and committed practices should be cascaded when the data is hosted and processed in the cloud. Data procedures need to comply with the stakeholder agreed schema and clarified during the contracting with the CSP or an MCC.

Confidentiality

There are many occasions when data access is restricted to authorized CE staff. Prior to signing a CC service agreement, CE seniors need to test CC solutions for data confidentiality and compromising immunity. It is required to assess whether the cloud is an appropriate place to store and work with classified data where confidentiality is critical. Outlining provisions in the contract may be required to detail the processes required to protect confidentiality (JISC, 2014).

CSP standard terms and conditions vary in the degree they undertake to maintain the data confidentiality. Some CSPs state that they have no duty of confidentiality regarding CE data and place the responsibility on the CE. Therefore, it is desirable to state clearly in the contract the confidentiality terms and obligations between CEs, CSPs & MCCs.

Structuring

The ownership of CC services and applications may not be available for licensing on CE systems outside of CSP provision. This pressures the importance to keep a copy of data locally under CE control to have the ability to download and use data in a native standardized format. Alternatively, the CSP should be able to move data to a different host if the CE becomes dissatisfied or otherwise wants to change providers. The CE need to confirm the CSP capability to purge and wipe any copies of the data according to different scenarios. This goes in line with data usage rights where the ownership of data supplied by the CE to the CSP need to be clearly disclosed. Even the ownership of metadata and other statistical information should be considered with the purposes it may be used for.

Data format may consider the portability and interoperability features to ensure that all CE data can be exported to multiple standardized format at any stage of the service delivery. Data encryption responsibilities should be completely understood by the CE if the provider encrypts confidential data, including who can determine the encryption sufficiency and how it should be used in all data transportability scenarios.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Protection

CSP should back up data adequately to include data, configuration items, settings, files, documents, operating systems, applications and permissions. Backup frequency can be either immediate, hourly, daily, weekly or monthly and the storage location can be offshore or offsite with pre-determined relative location and distance from the location of the data being backed up. Access to backup data or archived data should be clearly articulated including the method it is available through and the management of restoration requests. The timeframe that it will be commenced within and the backup data retention period. The permission of client audits of backup data. Regular maintenance program is also required to ensure the reliability and stability of CSP resources and service offerings. If any service is paid the expected costs should be mentioned

CSP is expected also to take every reasonable action to protect data and guard against unauthorized attempts of access. Breaches include unauthorized access to confidential CE information by the CSP employees, MCCs or by outside parties like hackers. There should be procedures to be triggered if the CE discover that his data has been lost or compromised and policies to notify CEs of security breaches and next actions. CSF in intended to mask the complexity of data structures and protection allowing the CE to make informed decisions. It simplifies the CC data interaction with the systems and can be utilized easily to optimize operational decisions.

Licensing and Agreements

The nature of CC services allows information to be continuously generated, constantly added, removed and modified. It is important to agree upon the ownership of this data and to ensure that the CSP contract terms are clear. In certain conditions, it is essential to state in the contract that all data will continue to be owned by the CE including the residual database rights.

Intellectual property rights, warranties and guarantees should be considered while crafting the agreement accord. The CE, as data controller, will remain responsible for the adequate protection of their stakeholders' data. Combined with CC contracts there should be some agreements or provisions in order to clearly define the acceptable behavior of personnel from both parties including the service level agreement (SLA). Contract and agreements accord are important for both CEs and CSPs and is considered as a crucial part of the CSF dimensions

Intellectual Property Rights

CEs and CSPs need sloid arrangements to manage the intellectual property rights (IPRs). It is important to consider those rights from the outset of the service agreement as CC services are usually operated from the CSP cloud. CSPs can claim the ownership of the service itself, but CEs need to have the ownership of unique processes, contents and data uploaded by their users. A reviews for the CSP standard terms and conditions should be conducted at the early start-head to validate the IPR. Negotiations may be required to modify certain terms and conditions especially for emerging conditions. One scenario is to set out how intellectual property rights are assigned for new materials created as part of the jointly launched CC service.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Software Escrow Agreements (SEAs) is a smart, simple way of protecting intellectual property rights for software owners while ensuring the long-term availability of business-critical systems for end-users. SEAs are used to ensure continued use of critical business systems by depositing the software systems source code with a neutral third party escrow agent (Olson & Peters, 2011). SEAs can be used effectively in CC.

Guarantees and Warranties

Certain services or applications may require a guarantee that only named authorized persons can use certain resource and on local servers only. Using CC services create a possibility of third party access including the CSP or MCC staff, additionally data location may not be specified. This necessitate that contractual agreements between CE stakeholders or clients to be reflected in the CC service contracts if correlated. CE should guarantee preventing unlicensed users and any unauthorized usage of the licensed resources.

CE should also consider to have necessary warranties related to the performance of the CC services. It is important to examine the terms and conditions of any warranties provided by the CSP according to its requirements. If a special warranty is required, it should be negotiated at the service start-head.

Service Level Agreements (SLAs)

When CEs utilize CC environments, they are inherently giving up control over certain aspects of the provided services. Service Level Agreements (SLAs) define the acceptable service levels to be provided by the CSP in measurable terms. SLA acts to define the necessary roles and responsibilities appendices to provide careful delineation between the accountabilities and relationships among all parties. As a best practice, SLAs should clearly define how CSPs monitor their service levels, provide timely notifications of failures or upgrades and submit evidences that problems have been resolved or mitigated. Issue reporting, communication mechanisms and response times for support requests should be defined and classified into reasonable agreed scenarios. If an SLA is not met, the consequences can be catastrophic to CEs.

Service Level Agreements (SLAs) represent an important component under the umbrella of the overall CC contracting between CSPs and CEs. SLA performance clauses should be consistent with other performance clauses within the contract. SLA should be fully contemplated by both of them prior to procuring CC services. SLA usually includes provisions that detail how end-users may use the services, responsibilities of the CSP, and how the CSP will deal with customer requirements. It is noteworthy that the definitions, measurements/metrics and enforcement of this performance vary widely among CSPs. Therefore, a CE "need to fully understand any ambiguities in the definitions of the terms in order to know what levels of service to expect" (Metheny, 2013). The bottom line is that value is provided where terms are clearly defined and performance metrics are measured and guaranteed.

Additional Agreements

CC contracts may require to set out additional agreements or workflow processes to be activated in case of non-performance, breach of contract or even the special scenarios. Consortium agreements handle the special case when several CEs are working together on a private cloud to outline the terms and conditions of collaborative working. Software Escrow Agreements (SEAs) are necessary for business

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

continuity and more crucial in CC to mitigate the inherent risks resulted because CEs rely on the CSP tools and applications. It ensures that the systems utilized by CEs can be made available in severe cases with an access the source code and documentation. The source code is released to the licensee (CE) if the licensor (CSP or MCC) vanishes out or fails to maintain and update the software as specified in the software license agreement.

Some CEs may require that CSP and MCC personnel to sign Non-Disclosure Agreements (NDAs) when dealing with their data to ensure that they protect sensitive non-public information or details. The acceptable behavior prescribed by NDAs requires reasonable oversight, including examining its clauses and monitoring some end-users' activities. CSF is shedding the light on the additional agreements to ensure reliable CC service is provided. On top of this, there may be a need for specific service agreements, rights and responsibilities clauses, license arrangements, security schedules and what is required.

Service Collaboration

Unlike traditional applications, temporary interruption in CC services may be the norm, not the exception. Each CSP can define its own service approach and limitations which is outside the CE controls. Cloud and related technologies have promoted new service status including the "always on" concept, Omni-channel experience and the versioning control tracking. Multiple dimensional synchronization poses a new set of requirements, as customers demand seamless uniform look and feel.

CSF is considering necessary parameters to ensure that CC services are effectively designed, well-documented and closely monitored and collaborated by the CSPs and CEs. It provides the ability to have a continuous experience across multiple brands, formats and devices that is completely bespoke. CSF is considering the promise of new thinking and marketing ways that has been fabricated by the CC and associated services.

Customization

There are areas where CEs need to show their naivety by asking for changes that directly contradict the commoditized nature of the service offering. Usually little changes are accepted by the CSP who may comply with CE's complex requests only at a very high cost. Special requirements take backseats with CSPs who prefer to incorporate any processes changes to all CEs. The management of specific application changes for every CE will drive down CC efficiencies and raise costs. Silo implementations may delay the CSP strategy, root-in the ability of swift change reactions and necessitate setting new policies.

CC enables the most sophisticated analytic tools and applications along with increasingly diverse data sets. CC resources are being put in use to solve problems in ways people can scarcely imagine. CSPs utilize an infrastructure that enables CEs to deliver value more quickly. This is leading the way for context-driven variability by understanding CEs and engaging them in more authentic or personalized ways. CC services changed the collaboration obligation and technologies in a manner that is very useful for CEs as they reduce the costs associated with expensive travel and communication. Cloud also converted the ways data transactions are facilitated along plenty of industries and activities.

CSF needs to measure the easiness and effectiveness of CC service to deliver new applications to a broader set of users. Collaboration benefits and parameters need to be measured by the CSF to improve operational efficiency and facilitate effective mechanism and an integral element.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Monitoring

CEs may require their usage of the CC services not to be monitored by CSPs either due to concerns regarding the outcome of such monitoring or their fear to disclose confidential data. CSPs consider different monitoring policies to control the nature/pattern of use or to ensure good quality service provision. Monitoring may be used for statistical analysis or to enforce the acceptable use policy (AUP). CSF is opening the CE eyes to examine the contract details related to the level of monitoring and to confirm that associated terms are consistent with their own requirements.

Geography Considerations

CSPs are likely to store and move data around multiple servers situated in a number of jurisdictions which are most likely located in different countries. Some jurisdictions do not allow the transfer of data abroad unless the hosting country has an adequate level of protection or transparency (JISC, 2014). CEs will need to find out where the CSP is processing data an ensure satisfactory geographical location are chosen to store and archive data. Some major CSPs offer a number of "regional zones" in which a customer may be assured the data will remain. Yet, it is good practice that CE ask for warranty or legal assurance of data location during the contracting phase. The CE should also verify that reporting and auditing mechanism are compliant with local requirements.

CSF consider such geographical information to evaluate service reliability and spread. Additionally, this gives a description of how much territory the CC service is intended to cover, utilize and reach functionally.

Legal Aspirations

CEs, CSPs and MCCs usually follow the contractual agreements but also they need to consider ethical rules and other applicable laws. Behavioral and legal circumstances should be closely considered by the CEs when acquiring a CC service. The experience and reputation of a CSP is important as well its geographical spread, divisional and functional reach and its service coverage. CEs are expected to do their due diligence or consult for recommendations to choose a CSP with a proven record of ethics and functionality.

This section is pinpointing few CSF dimensions related to legal, ethical, law and jurisdiction controls. It also looks at to determine the outsourcing and contracting recommended behaviors and some considerations related to audit and compliance surroundings for CC.

Ethical Behaviors

Inadvertent disclosure or unauthorized interception may pose a great effect on the CEs and their clients and partners. CEs should ask themselves how bad it would be if unauthorized parties gained access to information in bulk or case-by-case basis. The CE should take the proper precautions and measures to prevent access or disclosure. Some measures are easy to set up and then run without additional input while advanced or custom measures may require expert knowledge.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

One reason why ethics are important, is the difficulty of evaluating every functionality and implementation of safeguards in particular. Some measures are less likely to be deemed necessary as they may prevent service access or disrupt the flow of practices. Therefore, it is preferred to compensate by a CSP ethics to provide a holistic assurance of safeguards and functionality measures. Service can be re-visited occasionally and selectively to verify or advise situations where additional considerations are necessary.

When evaluating CSPs, CSF imposes a considerable scoring weight to the possibility of expected breach and handling ethics. The extent to which ethical behaviors affect the CEs' ability to collaborate with stakeholders is considered. CSF is required to validate some ethics and conditions to reduce the likelihood of the disclosure and to determine when it is necessary to implement additional safeguards.

Outsourcing and Contracting

Trust and confidence are key factors when the CE decide to participate-in or engage-with a project or a program. In the CC era, these factors are further complicated due to multiple interdependencies. CSPs and middle circle contractors (MCCs) are major players in the CC supply chain loop. The lack of physical control over infrastructure in many CC deployments necessitate mechanisms and parameters to reduce deployment and operation concerns. Stakeholders are more likely to engage with CC projects when they have sufficient confidence that the CSP and other MCCs can control and deliver the desired business outcomes in a consistent manner as they are contracted to.

Prior to the CC era, the failure due to purely external challenges was limited, however this is increasingly being a possible reason of failure. Clashes between various parties may occur due to the inadequacy in understanding the functional and technical specifications or their rigidity to be accommodated into new business realities. The terms of the agreement for CC services should always be read with particular attention to the CSP mechanisms. CEs should ask questions to fully understand how service is implemented, information is protected and how it is aligned to their business goals. It is important to identify the legal and ethical surroundings of the jurisdictions, especially, when the CSP is located overseas. To avoid clatters and disappointments, the CE need to ensure that the CSP or MCC understanding and protocols are on par with the CE expectations. Confusion may affect many stakeholders and increases the likelihood of external action to curtail the actions of the CE. The CC deployment teams need to place huge efforts to avoid loss of confidence and participation which is pervasive in change management.

CEs need to ensure that CC service contracts are adequate to handle their requirements and concerns and to respond to the future expectations. Policies and procedures in the contract need to comply with the CE obligations, strategies and policies. CC contracts can vary in format and wording depending on the CSP and the type of procured solution. For all CC contracts, it is a good practice to ensure that legal obligations are managed according to the CE satisfaction. An important factor at the contract stage is to ensure that the CSP will take reasonable steps to meet the CE's existing legal duties while they are providing the service (JISC, 2014).

CC service contracts are expected to handle the obligation to comply with data protection legislations and obligations. Appropriate management of intellectual property rights, licensing of resources and law enforcement obligations may be detailed to the appropriate level. CEs need to consider also the CSP's take-down policy for its internal and external published content if some materials are declared to break the law. The procedure, authorization and CE involvement in removing such material should be assessed and documented.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

CSF visualize the CC projects to have deep engagement with business strategy, thus large-scale failure in them could be part of the board agenda. There are times when, in spite of all care and consideration, projects get so far off-the track, thus there is no alternative to pulling the plug. CSF aims to examine and assess the CSPs and MCCs relationships and dependencies to the extent possible. The CSF is intended to provide the stakeholders with enough visibility to navigate the trust and confidence factors. CSF aims to make all stakeholders, including the board, more aware of the consequences and prepared to make decisions from the early days of the project.

Law and Jurisdiction

Due to its nature, multiple legal jurisdictions are involved in off-shore CC services. Relevant jurisdictions are likely to include the country in which the CE is based and the country where the CSP headquarters are located, in addition to the locations where CSP servers and its MCCs reside. Defining which country's laws apply to a particular issue and which country's courts will hear a particular dispute can be complex. The resolution may vary according to the area of law and the jurisdiction in which the question arises. However, some general observations are possible.

A CSP normally specifies within the contract terms the governing laws of a specific country and that disputes will be heard in which country's courts. Usually jurisdiction is performed in the country where the cloud provider has its principal place of business, but occasionally it may be the legal system where the CE is based. The law typically places few restrictions on this type of contractual clause, except the situations of specifying a totally irrelevant jurisdiction or stringent controls.

In the event of a dispute CEs need to avoid enforcing contractual terms or defending an action in an overseas jurisdiction and under foreign law. They may therefore have to consider the possible additional costs, efforts and impacts if the CSP choose to apply a foreign law and jurisdiction against the benefits of that particular service.

Audit and Compliance

Due to the on-demand provisioning and multi-tenant aspects of CC, traditional forms of audit and compliance may not be available, or may need to be modified. CC enforced major changes in the auditing arena causing external and internal audits to stretch, also continuous auditing concept is introduced. Similarly, the compliance is expanded to propagate into the CC service insides and not to stop at the boundary of the CSP. The embedded audit and compliance procedures need to provide the required value to all stakeholders including CEs, CSPs and regulatory bodies. New parameters and techniques need to be invented to accommodate the audit and compliance techniques that are appropriate and necessary for the CC service and the CE circumstances.

CSF may consider adding reasonable care for any CSP or MCC related restrictions or missing contractual exceptions. Its parameters will simplify CC audits and will enhance some behaviors, components and related aspects. CSF behavioral involvements will reduce the misunderstanding between various stakeholders and provide more visibility and awareness. CSF is intended to achieve higher degrees of communication, comprehension, and buy-in of all the stakeholders. Thorough audit and compliance processes can avoid regulatory fines and reputational damage and reduce disruption. Ultimately, this will give CC platforms the ability to implement system changes and refinements faster and in a more cost-effective manner.

FUTURE RESEARCH DIRECTIONS

The relation between technology organizations (TOs) and business users is being rephrased leading to a wide change in mentality and collaboration of both teams. Risk accompanies change, it is an inherited component of life. The willingness to take and accept risk is crucial for development and progress. Governance is setting the roles to enable stakeholders benefiting from change while minimizing the negative consequences. Technology is now everywhere, and cloud computing (CC) is extending its reach and stretching services so it can be used without significant capital expenditure or even the involvement of technology organization (TO). It is the time to promote unique measures to help business and technology stakeholders including executives to compare CC services and understand associated risks and implications. This is triggering a joint research in CC risk and governance, along with the business and technology alignment in the CC era.

Cloud computing (CC) and associated technologies opens a wide research terrain in theories, characterization and measurements of CC services. Cloud Service Footprint (CSF) is a measure that is introduced in this chapter to provide self-characterization of CC services. It enables the CC service to be utilized everywhere with a standardized business implications and approaches. It also endorses advanced measurement techniques for CC services and mini-services structures, paving the way for independent CC services and extensible enterprise transformation. It aims also to enhance scalability, reduce costs, simplify service management and the decision making process. However, all these phenomena are improving gradually while the CC services are maturing. Extensive research is required to accompany these phenomena, enhance the CSF dimensions and produce effective measures.

In summary, this chapter suggests two main research topics, the first is related to the development of an effective measures for CC services based on risk and governance concepts. This effort, in order to be successful, requires the participation of a very wide range of stakeholders and to benefit from existing frameworks, theoretical bases and practices. The second is to widen the CSF dimensions to include all possible aspects of the CC services whenever they can be realized and measured. Qualitative description and analysis to be conducted continuously, comprehensively and while quantitative description of the CSF dimensions need to be added, if applicable, at a later stage. Quantitative analysis is suggested to follow the weighted average mechanism considering the risk, governance, service maturity and momentum levels.

CONCLUSION

Cloud computing (CC) is reshaping the future, plenty of benefits are justifying its acceptance both from technical and management perspectives. However, it is important to re-invest the savings obtained from CC utilization to attain additional controls, ongoing assessments and more optimization. This chapter studied some CC aspirations including risk, governance, service maturity and momentum levels. It then defined a combined factor that can measure continuously the CC service performance and validate business benefits. Cloud Service Footprint (CSF) is introduced to evaluate a CC service, certify if accepted challenges are rewarded and to identify if the acquired CC service is adequate. CSF as a footprint consider all dimensions and subs surrounding the CC service and the traces that can be residual out of any dimension.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

CC services are undoubtedly forming the dynamic heart of the next transformation and utility based computing. Practice has shown that associated CC technologies and risks are often not well understood by the key stakeholders in the client enterprises (CEs) including board members and executive management. However, without a clear understanding, major stakeholders have no point of reference for prioritizing and managing CC services and align them with the CE objectives. CSF is designed to provide executives with more clarity to navigate into the CC journey with long-term view to deliver short term solutions in a coherent vision.

CC service benefits are introduced through evaluation and deployment phases but become measurable during the utilization and operation. This chapter define some CSF dimensions to help business and technology stakeholders working for the CEs, CSPs, MCCs or even regulatory bodies to evaluate and compare CC services. It is intended to support the selection and rollout of CC services with sure steps to satisfy the integration and isolation rules on the way towards well governed "off-the-shelf" CC services. In this regard, the CSF measure the CC service dimensions related to the supporting architecture, data considerations, licensing, service collaboration and legal aspirations. In every dimension and subsequent branches lookup items are identified and commented to achieve the best performance.

CSF is expected to apply equally to existing services and future components and to help in deriving the policies, mechanisms and metrics associated with a CC service. It also needs to judge new components of CC services as well the pre-defined ones. Well-governed CC services can help to regenerate the CE processes and fit business areas. Clear, fact-based efforts and communications are required to lay the foundation of CC service measurements and to include standardized methodologies.

By introducing the CSF, this chapter attempts to present an effort and aspirations to ignite fruitful discussion that will eventually lead to an increased number of research studies in the field of CC service characterization based on governance, risk, service maturity and momentum. This field is really important as it is paving the way to enhance the standardization of CC service and associated technologies. The ultimate goal is to help CEs evaluate existing CC services while the CSPs can brand and benchmark their services in standardized formats

KEY TERMS AND DEFINITIONS

Client Enterprise (CE): An organization that uses the professional, networking or computing services provided by Cloud Service Providers (CSPs) according to a signed contract against some agreed financial charges. This is compared to ITIL:2011 definition of "business customer" as a comprehensive term for a recipient of a product or a service from the business.

Cloud Service Footprint (CSF): An invented term intended as a control element that provides client enterprises (CEs), cloud service providers (CSPs) and regulatory bodies with necessary visibility to measure each cloud service independently or collectively in order for stakeholders to make informed decisions.

Cloud Service Provider (CSP): An entity that provides computing services based on their existing platforms and apply certain rules for these services.

Governance: A set of processes, customs, policies, laws, and institutions affecting the way an enterprise is directed, administered or controlled. If added to a specific area such as technology it has similar meaning in addition to alignment between that area and the enterprise strategy.

Middle Circle Contractor (MCC): An external or internal person, group or organization that is appointed to perform work or to provide goods/services at a certain price or within a certain time. The MCC appears as a middle person who usually disappears after the specified task is complete.

Risk Management: The act of handling the risk exposure through mitigation, acceptance, sharing and avoidance. It includes the ability to handle information and technology risks based on stakeholders' risk parameters.

Service Momentum: Is meant to measure the ability of a CC service to deliver value at any point in its life and support the business that is committed for. It complements the service potential landscape to evaluate the CC service capabilities and predict its future.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Take-Down Policy: A process operated by online hosts including Cloud Service Providers (CSPs) that is developed to balance the risk between continued availability of data content that may infringes certain law and the damage that may result from wrongful take-down. It may be activated as a response to court orders or personal allegations.

Technology Organization (TO): A team either inside the client enterprise (CE) or outside it, that is in charge of establishing, monitoring and maintaining technology systems and services. In addition, the "TO" supports strategic planning to ensure that all technology initiatives support business goals. It was referred to as the information technology (IT) department which does not reflect the entire spectrum of technology usage nowadays.

Chapter 30
Project Portfolio Management: Tool for Strategy Implementation in Non-Governmental Organizations

Beata Jałocha
Jagiellonian University, Poland

Ewa Bogacz-Wojtanowska
Jagiellonian University, Poland

ABSTRACT

Project Portfolio Management is a relatively new practice for the majority of non-government organisations. Project portfolio management is important in the areas of management and education of third sector practitioners. However, project portfolio management, corporate management tools are usually used in the business sector with very little research undertaken in the non-government sectors. This chapter fills that research gap by identifying and analysis of project portfolio management practices in non-governmental organizations. Findings suggest that non-government organisations manage multiple projects simultaneously but that project portfolio management could support them to build their portfolio in accordance with a strategic plan that can fulfil their strategic objectives efficiently and effectively.

INTRODUCTION

The NGO sector in Poland is growing. There are nearly one hundred thousand foundations and associations (100,000), two hundred thousand other organizational forms, including semi-formal, large groups and Catholic organizations (200,000). Despite the increase in number of NGOs in the last 26 years of transformation of the country, Polish NGOs still face many difficulties. In particular the lack of permanent funding for activities, a strong focus on project work, lack of funds for hiring full-time employees, as well as a common distrust of society, resulting from disclosure of unethical and illegal practices of some NGOs. The most important feature of Polish NGOs is their not for profit character, hence the interchangeable use of two terms: non-governmental and non-profit. However, taking into considerations

diverse conditions of formation and nomenclature of third sector organizations, the term NGO used in this chapter is similar in its meaning to the concept of non-profit organization described by Salamon and Anheier (1999). Many NGOs implement large projects and contributes to building and developing a strong and credible third sector in Poland.

Project management is a widely used business management concept used in NGOs globally and regardless of the type of activities that are managed (Khang & Moe, 2008; Golini, Kalchschmidt, Landoni, 2015). It is not a new approach to the implementation of tasks in organizations in general – dating back to the construction of the Egyptian pyramids and Roman aqueducts. Traditional project management was focused on the management of a single project in a single location. However, the 1990's technological change, the globalization process and the different needs of customers projected project management into new forms (Kloppenborg & Opfer 2002). In the field of project management, three main areas have been identified (tactical, operational, strategic) and particularly, project management, program management and project portfolio management have increasingly attracted attention. One important differentiating point as pointed out by Jugdey (2003) is that program management and project portfolios concern the management of groups of individual projects and differ from managing a single project (Jugdev, 2003). This is an important distinction in understanding project portfolio management in non-government organizations, which is the main objective of this discussion.

Although project management has been traditionally used in NGO's globally, Project Portfolio Management (PPM) is a relatively new practice for the majority of non-government organisations, and particularly so in Poland. PPM is important in the areas of management and education of third sector practitioners. However, project portfolio management, corporate management tools are usually used in the business sector with very little research undertaken in the non-government sectors. This chapter fills that research gap by identifying and analysis of project portfolio management practices in non-governmental organizations.

Following the introduction, the concept of projectification provides an overview of the conceptualisation of project portfolio management and its application in non-government organizations. This is followed by a discussion on project portfolio management, stages of project portfolio management and project portfolio management in non-government organizations. The chapter concludes with the importance of project portfolio management in non-government organizations and provides future research recommendations.

BACKGROUND

Similarly to the business and the public sector, the sector of non-governmental organizations is strongly influenced by projectification processes. Projectification is a phenomenon that can be observed in all areas of economics, and which results in an increasing, sometimes even predominant, part of organizational tasks being executed in the project-based form. Moving away from operating on the basis of repeatable processes, organizations execute short, one-off projects. In the case of NGOs projects are a natural form for their activities, since funds obtained outside the organization have a limited time frame and a specific purpose. Moreover, contracts concluded on performance of public tasks have a form of projects, as do tenders announced by grant-giving foundations (Bogacz-Wojtanowska & Jałocha, 2016). Projectification processes in NGOs also support models and principles of cooperation with other orga-

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

nizations, particularly public ones. Projectification of projects occurs in contracts for the performance of public services which exist in the Anglo-saxon model of NGO operations as well as in many Eastern European countries.

Project management, usually as a task performance method, is identified with a flexible, innovative and effective approach to management. However, with increasing frequency these shifts are being criticized, also in the NGO sector, and the criticism does not concern solely governmentalization processes. Project-oriented approaches are short-term focused and influences the stability and sustainable development of non-government organization (Bogacz-Wojtanowska & Jałocha, 2016). Subsequently, the long-term strategic planning and achieving long-term strategic objectives of non-government organisations are impacted by the short-termism of project-oriented approaches. For example, instead of thinking about their long-term development and achieving strategic objectives, NGOs may have to focus on seeking new projects to sustain the funding.

Sustaining income in turn funds the continuity of employment of staff who deliver the services and subsequently achieve the project objectives, organisational objectives and organisational mission. Failure to strategically plan perilously impacts the stability, sustainability and growth of the organization. The continuation of non-government projects is important for another reason, sustaining public trust. Sustaining public trust in services obtained from non-government services, strengthens community confidence and thereby contributes to a balanced approach to delivering services to the public.

Project Portfolio Management (PPM) attempts to shift the focus from the constant pursuit of new funding, and allows management to adopt a strategic approach where each project is observed as part of a jigsaw puzzle which when combined reflects the organisational strategy linked together in as a holistic and balanced phenomenon. Adopting PPM as a method which focuses on an inter-linking of projects to achieve the organisational objectives, prevents a pathological destabilising and distrust of non-government organisations.-

Golini, Kalchschmidt and Landoni (2015) indicate that NGOs apply varied methods related to project work. Golini et al (2015) argued that the level organizational maturity in terms of project management depended on the organisational ability to execute project management processes as well as document, measure, control and continuously development. Furthermore, Golini et al (2015) suggested that better project knowledge management leads to effectiveness of non-government organisations. The contention in this study is that the application of PPM could assist non-government organization in the effective knowledge management, strategic management, strategic planning and strategic implementation of projects and programs. To this end, the next section provides an overview of strategic management followed by a discussion of project portfolio management.

STRATEGIC MANAGEMENT

Strategic management is a set managerial decision-making tools and organizational activities which are used to create an organizational competitive advantage and facilitate long-term operations (Powell 2001; Bryson, Gibbons, 2001; Anheier 2006). Strategic management can be used by NGOs to develop their long-term organisational vision and programs (Powell 2001; Bryson, Gibbons, 2001; Anheier 2006). Furthermore, with the increasing pressure to measure performance and social impact, adopt a business model and professionalise non-government service delivery, adopting a strategic management approach is becoming an important approach for non-government organizations to achieve results (Reid, Brown, McNerney & Perri

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

D, 2014). However, according to Zharp and Brock (2012) substantial research demonstrated that nonprofits still exhibit a significant level of resistance in response to strategic planning process.

Bryson (1989) identified that third sector organisations needed to adapt to the application of strategic management as an answer to the changing circumstances and conditions for conducting third sector and non-governmental activities. This is a challenge third sector organizations continue to face. Interestingly, Wilson (1993) argued that there were two distinct sets of strategies which non-government organisations could consider. Wilson (1993) referred to the pluralistic strategies and the competition strategies. Pluralistic strategies was oriented towards the cooperation between organizations executing similar goals while competition strategies were pro-market orientation and focused on acquiring the largest market possible or overtaking market niches of interest to the organization.

However, Mulhare (1999) and Eisenberg (1997), questioned the usefulness of strategic planning in NGOs, indicating that it involved adapting inappropriate commercial practices, and strategic planning is an end in itself, eclipsing the essence of NGOs' functioning. Burdney and Murray (1998) argued that it is difficult for non-government organisations to adopt strategic management as both internal and external stakeholders must be taken into account. Despite the debates for or against strategic management, support of strategic performance management in the third sector has grown over the years Golensky and Mulder 2006, Miller 2002, van der Pijl, Sminia 2004). Fredericks (2008) and Domanski (2009) outlined strategic management application, methods and techniques for third sector organizations. Mara (2000) suggested that one of the most essential functions of strategic management in non-government organisations is the efficient allocation of resources which strengthened the organisational financial capacity and determined organisational survival.

Marucello (2001) suggested that since non-government organisations had to constantly seek new funding to continue the organisational objectives and service delivery outcomes, it has become increasingly more important for non-government organisations to focus on increasing resources than on providing services. Hafsi and Thomas (2005) and Ridder and McCandless (2008) argued that non-government organizations should consider the factors influencing the operations of the organisation. Bryson, Ackermann and Eden (2007) focused on the key competencies of strategic management. Renshaw and the need for strategic knowledge management in these organizations Renshaw and Krishnaswamy (2009), contended that strategic knowledge management in non-government is important to achieve organisational outcomes. However, strategic management, while it allows for the effective execution in long term strategy, strategic objectives focuses on strategic process with two separate process of strategic planning and strategic implementation. Project Portfolio Management, with its focus on achieving-strategic objectives through the executed projects, enhances strategic management.

PROJECT PORTFOLIO MANAGEMENT

Project Portfolio Management (PPM) distinguishes between two phases of the strategic process: strategic planning and strategic implementation (Ansoff, 1987) but relates to both the strategic planning and strategic implementation phases. PPM has its origins in business and particularly from project-oriented enterprise where projects play a key role in the process of executing activities to achieve the desired and planned outcomes. The fundamental objective of project-oriented enterprises is to synergise and execute projects to maximise as profits gained from project execution. PPM is therefore a strategic approach where the emphasis is on the strategic dimension of strategic planning and strategic implementation.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Meskendahl, (2010) argues that as the main premise of a project portfolio is the maximization of its financial value, combining the portfolio of projects with strategic organisational objectives and balancing the projects within the portfolio, levels the potential profitability, risk and financial gain. To achieve the maximisation of financial gain, PPM treats different projects as a combined and coordinated project which enables the execution of long-term strategic objectives (Meskendahl (2010). Gerais (2007) summarises that PMM is a project portfolio collection of all projects which a project-oriented organization conducts at a given time., and relationships between these projects. Similarly,

Archer and Ghasemzadeh (2007) define a project portfolio as a group of projects financed by a given organization. Meskendahl (2010) adds that a project portfolio is a collection of projects which compete for the same resources of an organization. In this sense, PPM assists organisations to cope with the increasing number of project activities (Meskendahl, 2010, Rad and Levin, 2006). Project portfolios differ significantly depending on the industry (Killen 2008; Archer, Ghasemzadeh, 2007). However, projects and programs are strategic initiatives combined into portfolios to create and maximise value for the organization.

According to Rad and Levin (2006), the portfolios of projects are created for the strategic management of project activity of the organization. PPM scope and objective, as opposed to individual projects, changes with the change of the strategic objectives of the organization. Programs and portfolios are different concepts. Programs are considered as a manifestation of strategic actions of the organization. However, programs restricted to one narrow area or an organisation rather than in a holistic organisational dimension. Project portfolios, on the other hand are considered as holistic organisational dimensions that like a jigsaw puzzle, fit together to make a complete whole. PPM fits the needs of project oriented non-government organisations.

Portfolio Management Process

According to one of the most popular definitions of the Project Portfolio Management formulated by the Project Management Institute, the process is the coordinated management of portfolio components to achieve specific organizational objectives (PMI, 2008). Project Portfolio Management can be defined as a process of managing organizational projects and programs at different stages of their life cycle, which are analyzed, prioritized, monitored and controlled in the course of a dynamic process (Jałocha, 2014). However, PPM is above all a strategic action and requires the organization's management to make a series of strategic decisions.

The most critical decision is to decide whether a particular project is going to be executed or not. This is the most fundamental decision in the entire process, with key impact on the shape of the portfolio and the process of its management (Jafarizadeh, Khorshid-Doust, 2008: 613). Due to the fact that very often in organizations different – both individual and group – interests clash, (e.g., interests of particular divisions, branches, departments), deciding which projects should be approved for execution and which to reject, is oftentimes very difficult. Sometimes the so-called "pet projects" promoted by important employees of a given organization in senior management positions, are chosen for realization, even though they should not.

In a correct PPM process, the selection of project for execution should be decided on the basis of the most objective criteria available, based on strategic organizational objectives. This is undoubtedly no mean feat, especially in the case of organizations whose main criterion of organizational success is not the financial profit, but e.g. social development, or welfare of the people, like in the case of non-

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

governmental and public organizations. The selection of projects for the portfolio is usually conducted by a commission – an appropriate committee is appointed, equipped with relevant authorizations for making decisions concerning the choice of projects for the portfolio. In order to ensure the transparency of this process and avoid forcing at all cost only projects favoured by particular decision-makers, it is necessary to provide a set of tools supporting this process and ensuring – as much as possible – impartial assessment of particular enterprises (Jałocha, 2014). The process of selecting projects for the portfolio cannot be too complicated – the selection of optimal projects should be based on relatively simple criteria.

Therefore, to ensure that the process of selecting projects for the portfolio proceeds correctly, a well thought-out concept of its construction and management is necessary. The basic question which should be posed is whether a particular project would allow our organization to develop further, and whether it fits into our strategy. Of course, we should also reflect on what we need to perform a particular undertaking and whether we have the potential and capacities for its successful execution.

Project Portfolio Management is a complex process derived from decision making about the future, operating in a dynamic turbulent environment with constantly changing circumstances, different stages of different project life-cycles, competing for available resources which are limited and decision making about the execution of one project decreased resources assigned to another for completion complexity results, among others, from the following factors (Jałocha, 2014). Jonas (2010: 822) argued that tasks connected with portfolio management can be grouped into four basic phases comprising the life cycle of a project portfolio as follows:

Phase One: Portfolio Structuring

Portfolio structuring involves strategic planning of activities and defining long-term objectives. This phase is also when proposals of projects, which could be placed in the portfolio, are evaluated and selected. It is repeated regularly, according to the cycles of the organization's strategic planning. Due to the importance of this phase and its impact on the final shape of the portfolio, it features strong involvement of senior management (Jałocha, 2014). The selection of projects for the portfolio is a periodic action consisting in making the selection from among new project proposals or organizational programs, as well as ones being currently executed (if it is not the first attempt at portfolio assessment), which comply with organizational objectives and do not exceed available resources and other organizational limitations (Archer, Ghasemzadeh, 1999: 208). Certain elements taken into account in the process of selection are strategic objectives, financial benefits, intangible benefits, availability of resources and the level of portfolio risk.

Phase Two: Portfolio Resources Management

Portfolio resource management involves planning the division of resources between projects, formally confirming the allocation of resources and managing conflicts concerning resource allocation (if they arise). Moreover, resources are allocated again, if a new, previously unplanned, need for them occurs.

Phase Three: Portfolio Steering

Portfolio steering comprises such activities as monitoring the portfolio strategic compliance, determining correction methods in the case of deviations from the set portfolio objective, identifying synergies between projects, or coordinating projects in departments.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Phase Four: Organisational Learning and Portfolio Exploitation

Organizational learning and portfolio exploitation. Portfolio results are subjected to evaluation; and post-project reviews are carried out to enable tracking the benefits gained. Furthermore, knowledge obtained through project execution is gathered and analysed, for the purpose of later application of best practices in future endeavours.

Problems accompanying the selection process result from several factors (Ghasemzadeh, Archer, 2000:73):

1. The organization has many different objectives which sometimes contradict one another, some of them are qualitative, and not quantitative – hence the difficulty in measuring and comparing them;
2. Uncertainty and risk influence projects – the selected portfolio may need balancing in terms of risk and time remaining until the end of particular projects;
3. The number of possible combinations in the portfolio is often very large, which makes the choice more difficult.

An array of portfolio project selection methods exists, yet there is no single leading method perceived as the ultimate or the most universal (Jałocha, 2014). Each portfolio organization should select its own set of indicators, which would best enable to characterize the executed projects and place emphasis on the most important factors, from the organization's point of view, which should determine the project's place in the portfolio. The largest differences between particular criteria will depend on the industry within which a particular organization operates. In the business sector, the main criterion for building the portfolio will usually be the financial profit generated for the organization. In public and non-governmental organizations, whose strategic principles are based on different objectives, the profit is not always the main criterion of the project selection. Of course, the Project Portfolio Management process does not end at a one-time selection of projects which fit organizational strategic objectives. It requires constant portfolio reviews and reprioritization of projects it contains, as well as including new initiatives.

PROJECT PORTFOLIO IN NON-GOVERNMENT ORGANISATIONS

Research Methods and Findings

Four non-governmental organisations operating in Poland were selected for participation in the Project Portfolio Management project. These organizations were identified as having a previously existing project portfolio. Due to a lack of detailed preliminary research on PPM in non-governmental organisations, an exploratory multiple case study approach (Streb, 2010) was used to investigate PPM in non-government organisations. Exploratory case study is very often applied as a preliminary step of an overall causal or explanatory research design exploring a relatively new field of scientific investigation (Streb, 2010). Exploratory studies provide an initial understanding of the situation.

However, conclusions based on exploratory case study are limited and requires enhanced quantitative and qualitative research. Non-governmental organizations with identified project portfolios of 4-5 projects executed annually provided a purposive sample of non-government organisations that have been operating for at least 7 years and have continuously executed projects for selected groups of stakeholders.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

The participating organisations were socially legitimate non-government organisations with employed paid staff and had reputations as reliable non-government organisations that fulfilled their objectives, worked in a professional manner and adopted an ethical approach and an organisational structure that coped with portfolio management (Suchman, 1995).

Qualitative studies were conducted in 2016 in Poland. On the basis of data analysis four case studies (Yin, 1984) of exploratory character were prepared. The study consisted of:

1. Conducting an in-depth interviews with persons managing the organization (served as our primary source of data in the current analysis);
2. Analyzing organizational documents, in particular strategic and project documents,
3. Analyzing websites and social media profiles.

In-depth interviews were conducted on the basis of a structured interview scheme. Interview questions were based on a preliminary analysis of the literature and related to aspects such as: process of portfolio selection (Archer & Ghasemzadeh, 2007), PMO's role (Desouza & Evaristo, 2006), portfolio management process (Project Management Institute, 2008). At the same time, when a given issue was significant, interviewees were allowed to express free, in-depth reflection on the subject. Each interview lasted at least an hour. Data analysis followed the transcription of the interviews. Due to the small number of interviews, computer software was not used for the analysis. Interviews were repeatedly read in order to identify emerging categories. Among the identified threads, in each of the studied organizations particular attention was brought to such issues as: the process of projects' selection, the role of PMOs, project knowledge management and managing the portfolio risk. These categories are discussed below.

Projects in Researched Organizations

The studied organizations were quite diverse in terms of their size and the number of executed projects. Table 1 features the characterization of the studied organizations.

A common feature of the studied organizations is that projects are very important for them, but at the same time they are neither the principal nor the only way of financing their activities. Contrary to organizations which base the entirety of their operations on projects, the studied organizations are determined to have, apart from uncertain, contract-based initiatives, also stable source of funding for their activities, based mainly on fixed membership fees or the conducted business activity.

Table 1. Characteristics of the studied organizations

NGO	Area of Activity	Number of Employees	Number of Projects Executed (Annum)	Value of Projects Executed (Annum)	Project Budget Within Total Budget (%)
1	Public assistance	80	40	11m	60
2	Local and regional development	31	6	1m	30
3	Financial support for NGOs and social enterprises	3	Between 50-100 micro	Between 500 and 1m	10-30
4	Local government development, support for the Polish diaspora	5	5	900,000	40

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

NGOs' leaders are convinced that the key is financial stability obtained by diversification of financial sources. It is quite difficult to achieve, because external sources of funding and projects undergo significant fluctuations, collapses, and by the year are hedged with increasingly complex bureaucratic regulations. According to some leaders, they often do not bring profit to beneficiaries, neither do they bring the organization closer to the fulfilment of its mission.

Diversification of funding sources is very important for the studied organizations and building organizational stability together with projects, but not based on them. In two of the studied organizations, the share of projects in the financing of the activities was usually larger than 50% of the budget. All organizations acknowledge that projects fit the strategic aspects of their activities, although none of the organizations has a formal strategy – they are either documents created by leaders but unpublished, preliminary guidelines for the strategy, or strategic guidelines, functioning in organizations only informally. In two organizations, to a large extent intentionally, innovative objectives are realized through projects – e.g. testing innovative products for stakeholders, which could not have been funded from the primary budget. It can be noted that these are research and development projects, which enable development of innovative services.

It could therefore be concluded that without securing financial stability based on constant revenues, the studied organizations are reluctant to diversify their project activities. In practice, the studied NGOs try to manage the project portfolio in their own way (adjusting structures, implementing regulations concerning planning and project selection), yet very rarely it is a deliberate, planned process of managing all of the organization's projects as a single, cohesive portfolio. PPM in the studied NGOs is partly an intuitive process, deprived of systematic approach.

Selection of Projects for the Portfolio

Ideas for projects emerge both on the part of leaders or managers of the studied organizations, and junior employees. Interviewees remarked as well that sometimes ideas for projects come directly from their stakeholders and beneficiaries, and sometimes they are the result of certain opportunities created by the institutional context. All project initiatives, in each of the studied organizations, align or coincide with key areas of activity, resulting from statutory objectives, as well as the specificity of organizations' operations. Established areas of activity, usually developed by the organization for years, are executed within the obtained own funds, or in the framework of its business activity. In order to strengthen, expand and make their offer more attractive, organizations seek and select projects for these areas.

Role of a Project Management Office

In two of the studied organizations, a separate unit was deliberately formed, to fulfil the function assigned to Project Management Offices. These divisions create projects, prepare grant applications, manage projects and prepare settlings of reports from them. They are a kind of a project centre for the organization. But such divisions exist only in two large organizations. In the case of smaller ones, project tasks are not assigned to divisions – individual persons are in charge of them. The need to create a PMO unit within the organizational structure arises with the increase in the number and the level of complexity of project activities, as well as in the situation where project tasks are doubled in various organizational units. It is noteworthy that one of the studied organizations intentionally left all *de facto*

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

project tasks to one person, who in a manner of speaking manages the project portfolio (with the NGO's board mandate), selecting projects in a way which maintains the balance in the area of employment and necessary own contribution.

Project Knowledge Management

Project knowledge management processes are not usually formalized in the studied organizations. Sharing knowledge happens mostly during face-to-face encounters, or via internal training or semi-formal meetings with stakeholders. One of the organizations deliberately introduced weekly managerial staff meetings, also to exchange knowledge.

There are also cases of gradual codification or organizational knowledge, in the form of preparing summary publications or long-standing project activities' portfolios. What is also deemed important for sharing knowledge is networking within mother or partner organizations. However, most frequently even many years of project experience is weakly codified, and sometimes it is mainly focused on the person of the leader or the main manager of the organization. Such cases, when knowledge is informally concentrated in the hands of one person, are quite dangerous for the organization. Most importantly, managers are aware of this situation, partly believing that this is a safety buffer, protecting them from movements of organizations' management boards. Two organizations experienced the departure of employees trained in the area of project management, either voluntarily, or in the situation when project activities were closed. Developed procedures with regard to project management, or knowledge sharing were lacking. This kind of approach may constitute a menace to the stability of portfolio management in the already mentioned, and very common situation for the third sector, namely staff turnover.

Project Reviews, Reprioritization Processes

In the studied organizations, mechanisms of portfolio review and its reprioritization occurred. On the basis of project reviews, preventive actions are undertaken, as well as reactions to problems emerging within projects. However, it has not been found that reviews are conducted on the basis of sophisticated business tools. The most advanced tool used for the analysis was MS Excel software, used for entering current data about the status of particular projects. The studied projects do not use advanced IT tools supporting the management process (e.g. MS Portfolio Server).

Managing Portfolio Risk

The key element of the portfolio management process, which interviewees approach with particular commitment, is portfolio risk management. It is understandable and stems from NGOs' attributes, their functions and ways of securing funds. The risk of losing any financial means can be triply dangerous: the danger concerns not only funds of the organization, but also the abuse of social trust in the NGO, as well as problems with securing other projects from public institutions (institutional limitations). The studied organizations emphasise that the analysis of risk connected to the enterprise is conducted for each project and on this basis, decision whether to initiate the project is taken.

At the same time, similarly to most managerial actions concerning the portfolio, they are not based on advanced procedures. Mainly simple financial analyses are conducted, which enable the organization to establish whether it is financially prepared to take on a particular project, and if so – when. Moreover,

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

the risk is assessed mostly before including a particular project into the portfolio, and substantive risk management process is not conducted at any later stage. In the situation when crisis occurs, remedial actions are taken ad hoc.

RECOMMENDATIONS

Adaptation of PPM in NGOs

According to Courtney (2002: 6) in the nonprofit sector "there is perhaps a tendency to create a simple caricature of strategic planning or strategic management in the private sector in order to refute its relevance for the nonprofit sector". To avoid such misunderstanding in terms of Project Portfolio Management, it has to be unambiguously stated that it is impossible to employ business methods of Project Portfolio Management in non-governmental organizations without their prior adaptation and adjustment to the needs of a particular NGO and conditions of the environment in which it operates. At the same time, by building their portfolio in a conscious and previously planned manner, NGOs can fulfil their strategic objectives more efficiently, and effectively work for their stakeholders. Among recommendations which could help in the adaptation of Project Portfolio Management methods, we could list:

Project Registry and Archive

Regardless of their size and the scope of activities, NGOs can create project registries which include planned, currently executed, and rejected projects. Such a registry would enable to gather information about various project initiatives in a systematic way, and allow for cyclical reviews in order to assess which initiatives should be taken up anew, which should be continued, and which – rejected. In addition, NGOs should consider the creation of a project archive, containing information about concluded projects, achieved results or applied methods and project approaches. The project archive can be also an element of a comprehensive evaluation system for organizational activities and the assessment of the progress with regard to fulfilling their mission, which is crucial for any NGO.

Strategy

Strategic planning is the key to portfolio management. Without a well-planned and developed strategy it is difficult to select appropriate projects, leading to the development of the organization and stakeholders' satisfaction. NGOs should have a prepared strategy, which serves as a reference point for all undertaken tasks. Both a certain way of strategy formalization and the participation of numerous stakeholders in its creation should be suggested.

Strategic Analysis of the Projects to be Included in the Portfolio

Such an analysis would be helpful in the process of selecting optimal projects, i.e., those fitting statutory objectives and the resulting strategic objectives of a given organization. Only the execution of projects related to strategic objectives should be recommended. Projects which do not fit the strategy should be rejected, unless they serve to offset the portfolio, e.g., through acquiring funds, which in turn would en-

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

able the development of statutory activities. However, the latter solution is ridden with traps connected to the decrease of social trust, the necessity for temporary employment of additional staff, and finally the so-called "grantosis", i.e., project dependency.

Criteria for the Selection of Projects for the Portfolio

When working on the criteria for the selection of projects for the portfolio, particular attention should be devoted to intangible criteria. Apart from purely economic factors, every NGO should establish criteria connected with its mission-related non-material activities. These are difficult to formulate, as their nature is often not measurable. Yet they are indispensable for the proper balance in the project portfolio.

Implementation of Project Knowledge Management Principles

Gathering knowledge in projects can proceed in various ways, both more formalized (e.g., in an electronic application, printouts) and less formal (e.g., during employee meetings in organizations aiming at the exchange of project-related experiences). However, the key is project managers' awareness in this respect. The formalization of knowledge gathering can protect the organization from its loss, in the situation of employee turnover, a very common occurrence in the third sector.

Creation of a Unit Serving as a PPM Office/Center of Project Knowledge

Such a unit could absorb and diffuse knowledge about concluded projects, as well as provide specialist support to project executors. It is particularly important in the case of organizations with significant employee turnover. Since this is when the hidden knowledge acquired by employees in projects is not retained in the organization.

Methodologies and Principles of Project and Portfolio Management

In the case of large NGOs, executing a significant number of projects, it would be beneficial to develop a set of principles concerning their selection and execution. These principles may take the form of a methodology, based on selected elements of widely recognized approaches to project management (Prince2, PMBoK). In smaller organizations, introducing strict methodologies seems unnecessary. However, it would be advisable to develop guidelines for project and portfolio management, based on the gathered experiences and best practices.

Project Portfolio Management Risks

Consistent with the findings of the non-government organisations, Jalocha (2014) pointed out that a lack of project knowledge management, incorrect estimation of the projects' budgets, weak communication process and not using previously acquired project experience are cited as some of the main reasons of project management failures in organizations (Jałocha, 2014).

Dai and Wells (2004: 527) organisations must have a willingness to:

1. Achieve a cohesive approach to project management,

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

2. Achieve a more effective way to use organizational resources, including human resources in a multi-project environment,
3. Link project management to strategic objectives and thus building competitive advantage.

Desouza and Evaristo (2006: 416), argued that knowledge management permeated three organisational levels:

1. Strategic,
2. Tactical,
3. Operational.

Strategic level, projects must comply with strategic objectives and growth. Tactical level, the integration between projects, execution and monitoringand compliance are imperative to ensure success. Operational level, integration of knowledge developing a source of expert knowledge, and regularly reports to the senior management on the status of particular projects in the portfolio (Dexouza and Evaristo, 2006:416, Jałocha, 2014).

In order to apply previous experiences and manage new initiatives, projects and programs more effectively, many organizations create Project Management Offices (PMO). A PMO can fulfil various functions – from supporting project managers, to realizing project training, to strategic support for management boards of organizations. Above all, one of its most crucial functions is the role of a knowledge hub, a center for gathering and managing project knowledge (Project Office Management, Jalocha, 2014).

CONCLUSION

The maximization of the portfolio financial value which motivates the idea of building and managing the project portfolio in business organizations has little application in the case of the studied non-governmental organizations. These NGOs do not aim at the maximization of the financial profit as a main criterion in selecting projects to be realized. In their activities, they aim to fulfil their statutory objectives and mission, and their projects are tailored to the needs of the organization's beneficiaries and stakeholders.

Among the studied organisations, in large and professional NGOs with an established reputation, Project Portfolio Management is rather intuitive and informal. There is no standardized approach to portfolio management, neither are there formal methods of comparing and monitoring projects as a whole. However, the study revealed that despite the low level of portfolio management professionalization, NGOs cope well with managing multiple projects simultaneously.

The studied organizations feature both single-person PMO units, and teams or offices charged with project management. Absorption and diffusion of project knowledge is significant in each of the studied organizations, but they are not highly formalized, and largely concentrated in the hands of main leaders or managers of the organization.

Undoubtedly, there is a need to expand the knowledge about Project Portfolio Management in non-governmental organizations. However, we should remember that this approach cannot serve chiefly the maximization of the financial value, and can only be a means to enable more effective realization of strategic objectives for the beneficiaries of a particular organization.

FUTURE RESEARCH DIRECTIONS

1. Despite the increasing marketization of the third sector, project execution still constitutes the basic form of third sector organizations' activities. It is a certain paradigm in NGO management, both in small and large organizations. The latter increasingly often have a project portfolio, yet they do not achieve the business level of portfolio management. A comparative analysis of large and small third sector organisational project execution would provide further insight into the business level of portfolio management in non-government organizations.
2. There is a shortage of good practices in the area of portfolio management in NGOs, which would facilitate particularly the implementation of management methods, as well as project tools which are useful and universal in business practice. Further research in the definition of good practice in the area of portfolio management in non-government organisations would facilitate and generate knowledge on future implementation of management and business models.
3. The present study is easily replicable, and acquiring data from NGOs is easy, perhaps due to a strong uncertainty of managers in this area, as well as their willingness to share doubts and problems. There are clearly limitations to the exploratory case study, although the propositions formulated in this chapter may be subjected to broader quantitative and qualitative analysis. However, it would be beneficial to consider further in-depth qualitative research of Project Portfolio Management practices in other countries, especially against the background of different institutional solutions in the area of financing projects from public funds, addressed to and executed by NGOs.

KEY TERMS AND DEFINITIONS

Diversification of Funding Sources: The process of financial management in NGOs involving the intentional exploration and use of funds from various financing sources, i.e. private or public that influences and corresponds to the Project Portfolio Management process.

Economic Analysis of Projects: A kind of simplified financial analysis used in NGOs' projects. It is based in particular on the analysis of their own resources and simple risk analysis.

Project Knowledge Management: The process of capturing, developing, sharing, and using lessons learned and project knowledge in general for continuous improvement of the organization.

Project Management: The process of planning, executing, controlling, and closing the work to achieve specific goals in a specific time under predefined success criteria.

Project Management Office: A department within an organization that defines standards for project management, maintains them and support employees in project execution.

Project Portfolio: A collection of projects and/or programs financed and executed by a given organization.

Project Portfolio Management: A process of managing organizational projects and programs at different stages of their life cycle, which are analysed, prioritized, monitored and controlled in the course of a dynamic process.

ABSTRACT

In this paper a Fuzzy Petri Net model (FPN) is developed and tested to assess the risks involved during Enterprise Resource Planning (ERP) adoption in Small and Medium Enterprises (SMEs). This model pertains only to the risks and risk factors identified in the extension phase of ERP adoption in SMEs. In other words, this work studied only the risk perception relating to extending the ERP integration between the supply chain partners. This paper addresses the problems of risk identification and assessment during the extension phase. There are two motives for this research namely, one to define the ERP extension risks and two to assess and quantify the risks in a simple yet robust model. The uniqueness of this paper is three dimensional because in addition to presenting and quantifying the risk values in FPN, the risks are categorized and further graded for decision support to SME stakeholders. Realignment and standardization of SMEs business process, lack of support from larger enterprises and incompatibility issues are perceived to be most critical risk factors.

1. INTRODUCTION

This paper presents an assessment model for risks and the associated risk factors that need to be considered while extending the Enterprise Resource Planning (ERP) functionalities of the Small and Medium Enterprises (SMEs) with their larger counterparts in the automobile industry. This paper is set on the premises of the automobile sector in India, where there is extensive depending on the SMEs for raw materials, component supplies and subcontracting. While that large firms place ERP adoption from an overall business perspective, the SMEs is found to confine such initiatives only at the process layer. Given the tier-wise structure of the automobile industry comprising of players from the large multinational to a very small firm there is a strong need for the SMEs to collaborate in process integration, because larger companies will call for the readiness in their smaller counterparts during supplies (Bharathi et al., 2013). Hence it becomes imperative to study the risks and the embedded risk factors on behalf of the SME segment in order to sensitize them about the risks. SMEs need to examine the barriers during their approach in ERP extension to their supply chain partners (de Búrca et al., 2005). SMEs will have to enhance their maturity in learning the right expectation out of the ERP during the supply chain integration (Lenny Koh et al., 2006). The SMEs need to come out of the traditional mindset of decentralized system and go for a more integrated planning approach to collaborate with the schemes of their supply partners. Yet the SMEs are not really confident to draw out their collaborative support due to the lack of understanding about business process integration. SMEs need to see the relationship between ERP benefits and its impingement on the supply chain performance (Yang and Su, 2007). The SMEs are however not very sure as to what are the risks that could impact in such an integration initiative. The demand for integrating ERP with supply chain management (SCM) has been emphasized to strengthen the existing body of knowledge particularly from the SMEs perspective. The challenges faced by SMEs in ERP adoption and then also trying to reach out the ERP functionality to the supply chain partners are still evolving according to many research studies. Several factors that pose a challenge to such integration are compatibility issues, extent of dependencies between the systems in the material flow, business relationship, percolation ERP usage in SMEs, etc. It was also found that SMEs need to approach and plan the extension strategically keeping the proper balance between its business and IT competencies. Just then the expectations of operational efficiency process integration, customer and supplier integration, etc., can be realized (Chien et al., 2007; Ho et al., 2004; Su and Yang, 2010; Braglia and Frosolini, 2014; Goh, 2002; Nishat et al, 1996).

2. LITERATURE REVIEW

Fuzzy Petri Nets (FPNs) have widespread application in identifying and analyzing parallel and concurrent behaviour of many physical and societal arrangements. A host of control problems has used FPN to model various issues which include control of CNC-milling machines (Hanna et al., 1996), control of nuclear instrumentation for safety (Son and Seong, 2000), autonomous vehicle control (Parhi and Mohanta, 2011, Rigatos 2003, Wai and Liu 2009, Zouaghi et al., 2014), railway traffic control (Fay 2000, Cheng and Yang 2009), control of excavation robot (Wang 2004) etc.

FPN is a fuzzy production rule based system enables us to perform consistency checks using tools for analysis of FPN. This will facilitate the creation of appropriate algorithms while defining the maximum or minimum thresholds of risks in any given phase of ERP adoption. FPN can be built as a graphical

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

representation of rule-based system which will also exhibit the analytical power of reasoning, consistency check and learning. FPN is used as a reasoning tool to model dynamic processes which are similar to simulation of a system in a more simplified manner (Fenves, et al., 1997). Ribaric and Pavesic (2007) used FPN to present a formal model of knowledge representation for uncertain and unclear domains. Their study used nine-level truth scale was used ranging from 'always true' to 'not true' with numerical intervals ranging from 1.0 to 0.00 in order capture the fuzziness of knowledge representation. The analysis and simulation on the sequence of the aircraft approach used fuzzy Petri nets to define the rule-based system which considered certain key factors like estimated time of arrival, nominal scheduled time of arrival, normalized separation time, speed difference, and distance to final approach that impact the sequencing of the aircraft arrivals into the terminals with the minimum time delay (Sun and Hua, 2009). FPN is used to study the offshore weather prediction (Chenghua, and Qixiang, 2009). The study considered wind value, cloud orientation, cloud base, wind direction, humidity, temperature value, pressure value and cloud cover do define and simulate the fuzzy production rules. Yan and Yu (2009) used FPN to study the selection process for international procurement selection process. The study used a two-tier model which comprised of the procurement selection constructs in tier 1 (supplier capacity and flexibility, product competitiveness, purchase risks, cooperative compatibility, technology use and innovation) and a select set of 19 variables explaining the constructs in tier 2. The fuzzy factors were defined as excellent, fine, common, bad and worse. Wang (2009) applied FPN model for evaluating the logistics and cash flow performance of automotive supply chain by taking certain critical factors like inventory procurement cycle, production cycle, distribution cycle. Purchase order closing rate, production passed rate, sales order fulfillment rate, cost of distribution, cost of inventory, cash flow cycle and inventory turnover. A study on the private finance initiative (PFI) project used FPN model to evaluate the implementation process of PFI projects in China (Hai-ling et al., 2009). For PFI implementation, evaluation a two-level index was developed which comprised of situational factors relation to implementation, resources, participant unit and project environment in level one and the underlying or contributing factors in the second level. Cai et al., (2010) applied FPN to model and simulate a fault severity degree criterion of self-propelled gun. The study considered four factors of fuzziness relating to the severity of faults namely quite severe, severe, common severe and light severe and applied it on certain evaluation constructs like functional influence, progress influence, economic loss and life loss. A FPN based decision support system for ambulatory treatment of non-severe acute diseases is proposed by Astilean et al (2010). Torshizi and Hejazi (2010) combined the use of fuzzy logic and Petri nets to propose an approach to monitor and track all the risk behaviours that can lead to potential failure of the machining system. A fuzzy decision and controlling strategy of collaborative implementation process for product design is proposed by Guo and Zeng, (2011). The FPN proposition was built using the fuzzy deduction algorithm which included the reliability and deterministic factor in product design.

The earlier works have in fact presented a wide range of risk assessment techniques for ERP adoption (Table 1). These risk assessment techniques were majorly applied on ERP selection and implementation.

Though these techniques are found to be relevant in their own contexts there was still a need for quantification and validation of risk perception of the SMEs. The perception of risk is volatile with the passage of time as well as the maturity and percolation of enterprise system technologies. Hence it is important to embed an element of fuzziness to their responses. A study found that user satisfaction is affected by the caliber of the ERP systems, which took up the use of fuzzy logic as an efficient method of measuring human satisfaction which is influenced uncertainty and vagueness. The study used Matlab tool for analyzing the data (Alimoradi et al., 2012). The fuzzy logic was used for dynamic strategic

Mabert et al., 2006	Data Envelopment Analysis

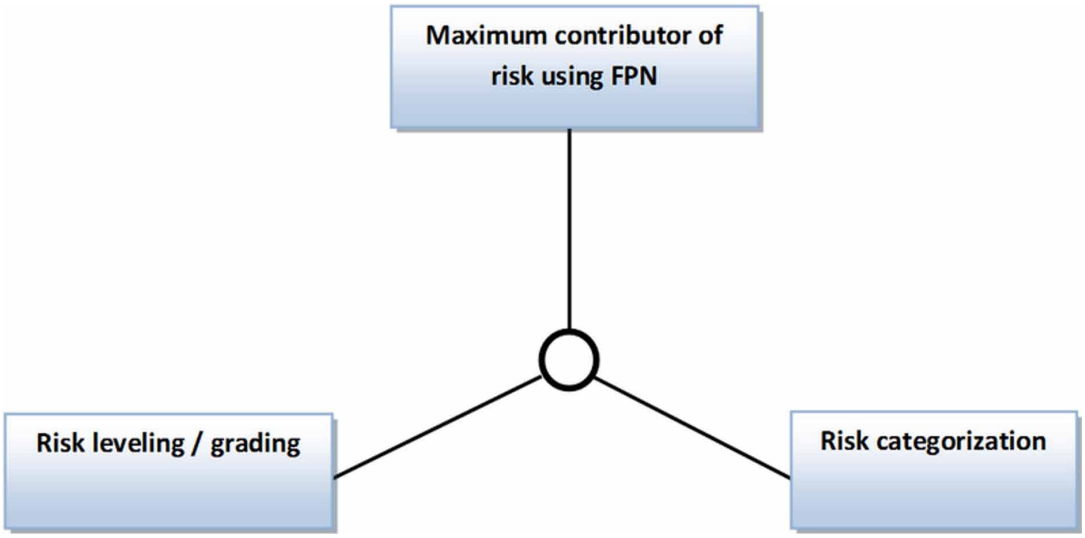
supplier selection system for enabling a more informed method of supplier selection because the study recommended that fuzzy logic based system to work well with uncertain parameters (Aksoy et al., 2014). ANFIS model was applied to predict the user satisfaction based on certain causal factors which were used as predictors. The data were collected from ERP implemented firms. The data was trained to predict the user satisfaction based on the pre-defined set of input predictors (Venugopal, et al., 2010). We think that this area needed more research exploration in order to strengthen the quantitative analysis of risk management using Fuzzy Petri nets which motivated us to conduct the research in this field.

However, there is no sufficient contribution to the existing research knowledge on the usage of fuzzy concepts to ERP adoption. One of the works closest to this research is found in the works of Wang et al., (2006). To appraise the human-related factors during ERP implementation a FPN evaluation model and method is projected. In the extension phase of ERP Adoption Life Cycle, expectations are forced back by business relationship of the SMEs with their larger counterparts in the auto industry. Here size does matter in terms of maturity relating to standardization of processes, technology and compatibility between the supply chain partners. Though the large scale industries in the automobile sector depend heavily on the SMEs for their raw materials, the latter is to a great extent determined by size in terms of number of employees, investment in fixed assets, and overturn. From their study, we understand that there is a strong need for the SMEs to collaborate in process integration, because larger companies will seem for the readiness in their smaller counterparts during supplies (Bharathi et al., 2013). De Burca et al., (2005) carried a case based research on four SMEs to analyze the barriers during their approach in running their ERP to their supply chain partners. It was found that SMEs were very cautious in their movement to extend the ERP and adopted a very cautious approach so as to bring into consideration their organizational impact. The SMEs was found to be equally anxious as well every bit excited to reap the

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

benefits of the seamless connectedness between their suppliers and clients. Koh et al., (2006) examined the interrelationship between ERP and supply chain. The survey focused on the expectations of SMEs about ERP in extending the information integration in the supply chain. The survey found that SMEs will have to go together in determining the right expectation out of the ERP during the supply chain integration. The SMEs need to get out of the traditional mindset of decentralized system and go for a more integrated planning approach to collaborate with the schemes of their supply partners. A study on the relationship between ERP benefits and supply chain performance was conducted by Yang and Su (2009). Established on an empirical study on the SMEs in Taiwan it was establish that the SME expect operational, tactical and strategic benefits of ERP while extending the integration of the supply chain operations. The challenges faced by SMEs in ERP adoption and then also trying to reach out the ERP functionality to the supply chain partners is still evolving according to many research studies. Various agents that pose a challenge to such integration are compatibility issues, extent of dependencies between the systems in the material stream, business relationship, percolation ERP usage in SMEs, etc. It was also found that SMEs need to approach and plan the extension strategically keeping the right equilibrium between its line and IT competencies. Just then the expectations on operational efficiency process integration, customer and supplier integration, etc. can be realized (Chien et al, 2007; Chin-fu et al, 2004; Su and Yang, 2010; Bernaert et al., 2014; Goh, 2002, Faisal et al., 2007).

Established along the extensive literature review a set of four risks is determined in the extension phase of ERP adoption. Twelve risk factors are identified and grouped into each of the four risks in the ERP. The Table 2 presents the risks and risk components that bear upon the extension phase of ERP adoption in SME.



In this study, we discuss in detail the three-dimensional model, shown in Figure 1, which includes the Fuzzy Petri Net rules for the risk assessment model, the risk categorization and the leveling or grading of the risks.

Table 2. Risks and risk factors in the extension phase

S. No.	Risk	Code	Risk Factors	Code
1	Nonalignment with supply chain partners	E_1	No clarity about what processes to be interfaced	e_{11}
			Mismatched business strategy with technology strategy	e_{12}
			Very less involvement by SMEs in supply chain decision	e_{13}
			Less bargaining power of SMEs	e_{14}
			No collaborative planning by SMEs with their large buyers	e_{15}
2	Losing business due to non-adoption of technology	E_2	Pressure from large customers (OEMs)	e_{21}
			Lack of support from large buyers	e_{22}
			Technological incompatibility	e_{23}
3	Realignment and standardization	E_3	Realignment of processes	e_{31}
			Inequalities of information flow efficiency due to technological imbalances	e_{32}
			Compatibility issues in web-interfaces of large buyers with the ERP system of SMEs	e_{33}
4	Cost implication on extension	E_4	Lack of planning for the additional investment in IT	e_{41}

Figure 1. Three-dimensional model for risk assessment

3. METHODOLOGY

This stage involved three major activities, namely the development of a structured questionnaire, identification of the sample and the size of the sample and conduct of the survey using the structured questionnaire for collection of data. The questionnaire design is one of the critical activities of this research because it directly impacts the response rate and explains the validity and reliability of data (Saunders et al., 2007).

The population comprises of several SMEs where decision-making is fully entertained with the proprietor or director and the management of ERP adoption is fully vested with the IT director. In fact, the IT managers of the SMEs have more awareness and acceptance about ERP and also deliver a fuller and deeper perception towards the risks embedded in the various phases of ERP adoption.

The SMEs operating in the auto-component cluster in Pune, India are the most appropriate parts of the sampling frame. The accurate number and the details of the total number of SMEs operating in the auto-component cluster was not available, in other words, there is no "single" authentic reference source to arrive at the total number of units in the cluster because of various agencies involved directly and indirectly in the census data. Established on the sources available with the Pimpri-Chinchwad Small Industries Association (PCSIA) and the auto-cluster development and research institute (ACDRIL) and Mahratta Chamber Of Commerce Industries & Agriculture (MCCIA), it is found that more than 7,500 SMEs are engaged in the job of manufacturing and trading auto-components in the auto-component cluster. In the beginning the target sample size was set at 10% of the total population, yet only 609 are found to be perfect and desirable for further analysis.

Both qualitative and quantitative methods were adopted for the development of the survey instrument. The qualitative research involved semi-structured interviews. From a targeted total of 20 interviewees only 11 interviewees consented to give time. These 11 interviewees comprised of subject matter experts from SMEs, industry associations like PSCIA, ACDRIL, Automotive Component Manufacturers Association of India (ACMA), MCCIA, and ERP consultants who had the adequate and required knowledge about the working of the SMEs in the auto component cluster, their linkages with the different tiers in

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

the industry and the extent of information technology adoption. The final questionnaire comprised of questions about the risks inherent in extending the ERP from an inter-firm perspective. The primary contribution to the questionnaire is from the extensive review of literature enumerated in the previous paragraphs as well from the semi-structured interviews with the experts. The questions are discussed in the subsequent section. A reconciliation of the experts' insights' and the study findings are later tabulated in the discussion section.

4. ANALYSIS, FINDINGS AND INTERPRETATION OF DATA

Earlier in Figure 1 we stated that the uniqueness of this paper is to present a three-dimensional model for risk assessment of the extension phase of ERP adoption in SMEs. In the subsequent paragraphs of this section, we will sequentially present the analysis of data to validate each of the three dimensions.

4.1. The First Dimension

The first dimension is the quantitative assessment of the risk based on the Fuzzy Petri Net model. The analysis of data is explained in paragraphs 4.1.1, 4.1.2 and 4.1.3 respectively. The paragraph 4.1.1 describes the data reliability. In paragraph 4.1.2 we present the risk assessment model using fuzzy Petri net production-rule system which is developed and tested using the VBA tool. Paragraph 4.1.3 presents the analyzed results in three levels namely risk-factor, risk and phase levels.

4.1.1. Data Reliability

The reliability of data was supported by applying the Cornbach's alpha (α). Alpha was developed by Lee Cronbach in 1951 to provide a measure of the internal consistency of a test or scale; it is expressed as a number between 0 and 1 (Bryman and Bell, 2000; Santos, 1999; Tavakol and Dennick, 2011; Cortina, 1993; Gliem and Gliem, 2003; Cronbach, 1951). There are different reports about the acceptable values of alpha, ranging from 0.70 to 0.95. In social sciences research an alpha value of 0.60 is considered as the minimum accepted value of reliability. The alpha value in this study is 0.862.

4.1.2. Risk Assessment Model

Basically, FPN is also a bipartite graph that comprises of two nodes namely place and transition. Additionally, in FPN a token incorporated with a place is associated with a real value between 0 and 1; a transition is associated with a certain factor (CF) between 0 and 1. As stated in the earlier paragraphs FPNs have wide usage in modeling for expert systems for fuzzy knowledge representation and reasoning due to their key properties like representation power, explanation power, reasoning, and learning. The representation of Fuzzy Petri net as a fuzzy production rule based system enables us to give consistency and representativeness to the problem under study (Gao et al., 2003; Shen, 2006). It enables the researcher to convert the logic into a simple yet robust graphical representation in order to perform modeling and simulation. It has been found that machine learning and artificial intelligence methods is that it is difficult to explain the processes that happen behind while results interpretation and reaching a conclusion. Some researchers have suggested the use of rule-based system with graphical representation to

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

overcome the issue of explanation (Konar and Chakraborthy, 2005; Shen, 2006; Yeung al., 2004). Fuzzy Petri nets are a solution here because the logic and process of obtaining the result can be represented graphically, but also be simulated for testing purposes which enhances the explanation power as well analysis power. The purpose of fuzzy reasoning is to make inferences by applying Fuzzy Petri nets to a process commencing from configuration of places to a terminal state. The reasoning algorithm provided in the FPN ensures the accuracy and appropriateness of the model to solve the given research problem. Moreover, the reasoning tools also facilitate the simulation of the system with dynamic processes (Konar and Chakraborthy, 2005; Yeung et al., 2004). There are many methods of providing learning algorithms for Fuzzy Petri nets. The learning environment is equivalent to the adaptive neural network training which is done for the purpose of reducing the errors between the trained and testing environments. In FPN, the fuzzy rules are applied from the user's experience and perception about the research problem under study and hence the fine tuning of the rules over a period of time enables better learning to the simulation methods (Wang et al., 2001; Gao et al., 2003).

FPN: FPN brings the synergies of fuzzy sets and Petri nets. A fuzzy Petri net structure can be defined as an 8-tuple. The representation of a data structure with a specific number and sequence of values is termed as a Tuple. In other words it is a finite ordered list of elements with a sequence:

$FPN = (P, T, D, I, O, f, \alpha, \beta)$

where:

$= \{p1, p2, \ldots, pn\}$ is a finite set of places

$= \{t_1, t_2, \ldots, t_m\}$ is a finite set of transitions

$=\{d_1, d_2, \ldots, d_n\}$ is a finite set of propositions

$\cap T \cap D = \Phi$, $|P| = |D|$,

: $T \rightarrow P\infty$ is the input function, a mapping from transitions to bags of places,

: $T \rightarrow P\infty$ is the output function, a mapping from transitions to bags of places,

: $T \rightarrow [0,1]$ is an association function, a mapping from transitions to real values between 0 and 1

: $P \rightarrow [0,1]$ is an association function, a mapping of places to real values between 0 and 1

: $P \rightarrow D$ is an association function, an objective mapping of places to propositions

Fuzzy Production Rule: It explains the fuzzy relationship between two propositions:

- If d_{j1} or d_{j2}, …, d_{jn} then d_k (C.F = μ_1). This rule type is modeled in fuzzy Petri-net and the fuzzy reasoning process of this type of rule is modeled Figure 2A & 2B;

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

- If d_{j1} and d_{j2}, …, d_{jn} then d_k (C.F = μ I). This rule type is modeled on fuzzy Petri Net and the fuzzy reasoning process of this type of rule is modeled in Figure 3A & 3B.

Fuzzy Production Rule: The fuzzy relationship between two propositions is described through the Fuzzy Production Rule. The notations of the 8-Tuple are explained in relation to the risk assessment model in the subsequent paragraphs.

At the place P_0, d_0 is the risk of failure in the extension phase of ERP Adoption. At place P_i (i = 1, 2, …, 4). D_i represents Risks identified that are associated with an ERP adoption phase. These factors will collectively lead to validate the risks of failure. At place p_{ij} (i = 1, 2, …, 4), (j = 1, 2, …, n), dij represent the risk factor and n represents the number of risk factors identified to explain the risks. At place p_{ijk} (i = 1, 2, …, 4), (j = 1, 2, …, n) (k = 1, 2, …, 4) where d_{ijk} represents the responses (options) for a risk factor viz., strongly agree (SA), agree (A), disagree (D) and strongly disagree (SD) and k represents the number of options (here 4) for recording the response to a risk factor. In other words:

- i = Number of risks in each phase
- j = Number of risk factors per risk
- k= Number of response options = {SD, D, A, SA}

which implies for i^{th} risk, j^{th} risk factor the options are as follows:

$d_{ij1} =$ SD

$d_{ij2} =$ D

$d_{ij3} =$ A

$d_{ij4} =$ SA

SA and A are defined as negative which implies that they will contribute/lead to risk while D and SD are defined as positive because they will not contribute/lead to risk.

If d_{j1} or d_{j2}, …, d_{jn} then d_k (C.F = μ_1). Figure 2A depicts the fuzzy Petri Net rule type and Figure 2B denotes the fuzzy reasoning process of this type of rule.

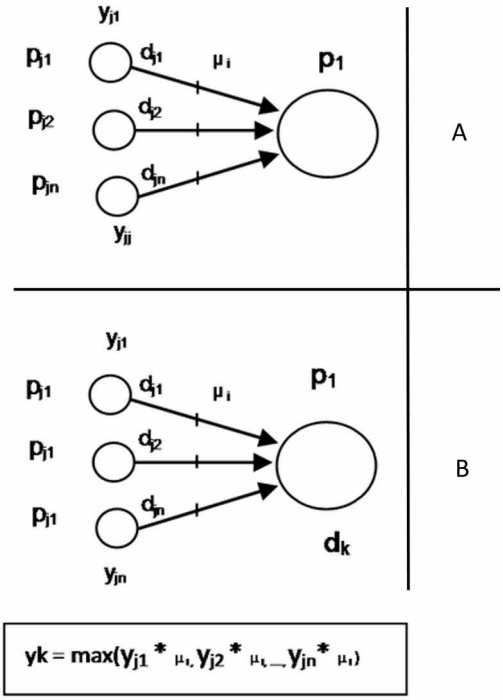
If d_{j1} and d_{j2}, …, d_{jn} then d_k (C.F = μ_1). Figure 3A depicts the fuzzy Petri Net rule type and Figure 3B denotes the fuzzy reasoning process of this type of rule.

The above model state that d_{ijk} (i = 1, 2, …, 11), (j = 1, 2, …, n) (k = 1, 2, …, m) where d represents the percentage of responses (ratio of number of responses to an option to the total responses recorded for all the options). If the percentage of responses are evenly spread in all the four options, namely SA, A, D & SD or if the sum of the response proportion of negative and positive options is equal (SA+A) = (D+SD) then that factor may or may not contribute towards risk. If for a risk factor, the proportion of responses in SA and A is greater than D & SD, then that element will contribute towards risk and vice versa (Bharathi et al., 2014, Torshizi and Hejazi, 2010; Bharathi et al., 2012, Bharathi et al., 2013):

μi (I = 1, 2, …, 9) represents the certainty factor, μi Є [0,1] that is the intensity of the belief in the principle

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 2. Fuzzy Production Rule – First proposition



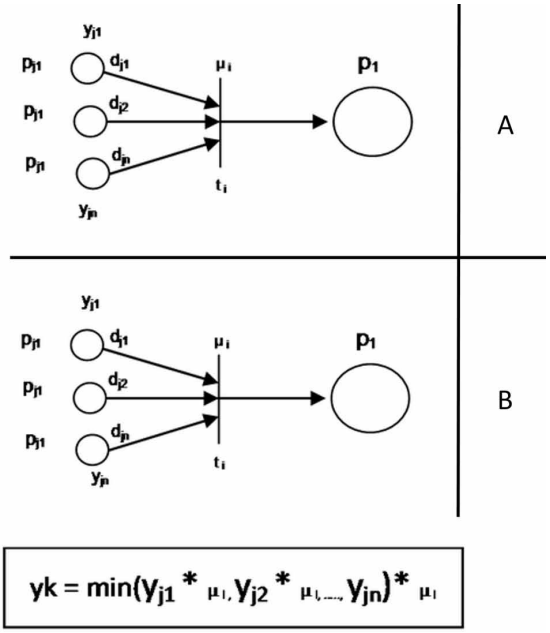


Figure 3. Fuzzy Production Rule – Second proposition

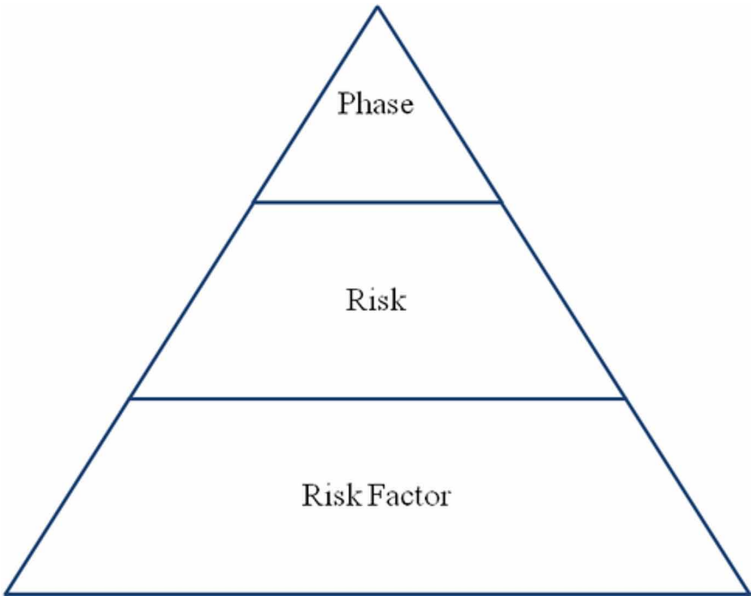
T_i (i = 1, 2, …, 9) represents the transition from input place to output place

μ_{ij} (I = 1, 2, …, 9), (j = 1, 2, …, n) where μ represents the certainty factor of the responses to fire a risk factor

Several research works have used a certainty or confidence factor (Pramod et al., 2014; Looney, 1988; Chen et al., 1990; Andreu et al., 1997; Pedrycz and Gomide, 1994) or a truth-value (Kouzehgar et al., 2011; Garg et al., 1991) associated with the transitions. As a transition in a FPN corresponds to a rule in production systems, the firing of a sequence of transitions, considering the confidence factor of each one, defines a fuzzy firing sequence which is more or less likely to be fired (Bugarin and Barro, 1994). In this study, for experimental purpose 9 (as a proportion 0.9) is fixed throughout, because the respondents are well informed and are fully cognizant of the context and their reactions can be extremely reliable.



4.1.3. Analyzed Results

The analysis of the data provided critical findings at three different and interrelated levels, namely the risk factor level, the risk level and the phase level which is given in Figure 4.

Risk Factor Level: At the RISK FACTOR LEVEL the maximum impact value is arrived based on the following rules:

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 4. Interrelated levels for risk findings and interpretations

1. The proportion of responses with regard to strongly disagree, disagree, agree and strongly agree is codified as 1, 2, 3 and 4 respectively;
2. The proportion of each of these four responses mentioned is multiplied by the certainty factor which is fixed at 0.9 the product of which will be the "weighted response value" (WRV):

WRV = max ((%SD*0.9), (%D*0.9), (%A*0.9), (%SA*0.9)

3. The WRV will be considered for risk assessment purposes only if it is arrived from the responses agree and strongly agree. This is because Strongly Agree and Agree WILL contribute to RISK while, Strongly Disagree and Disagree WILL NOT contribute to RISK;
4. The maximum of these WRV amongst all the given risk factors is defined as the most impactful risk factor.

Risk Level: At the RISK LEVEL the minimum value of risk (MVR) to be foreseen is arrived based on the following rules:

1. The WRV is adjusted with the certainty factor and the minimum of the adjusted WRV is defined as the minimum value of the risk:

MVR (P_1, …, P_7) = min ((WRV of each of all the risk factors*0.9)

2. All the values arrived as above will be listed at the phase level.

Phase Level: At the PHASE LEVEL the maximum risk contributor is arrived by selecting the maximum values of all the risks as arrived from the risk level determinations.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

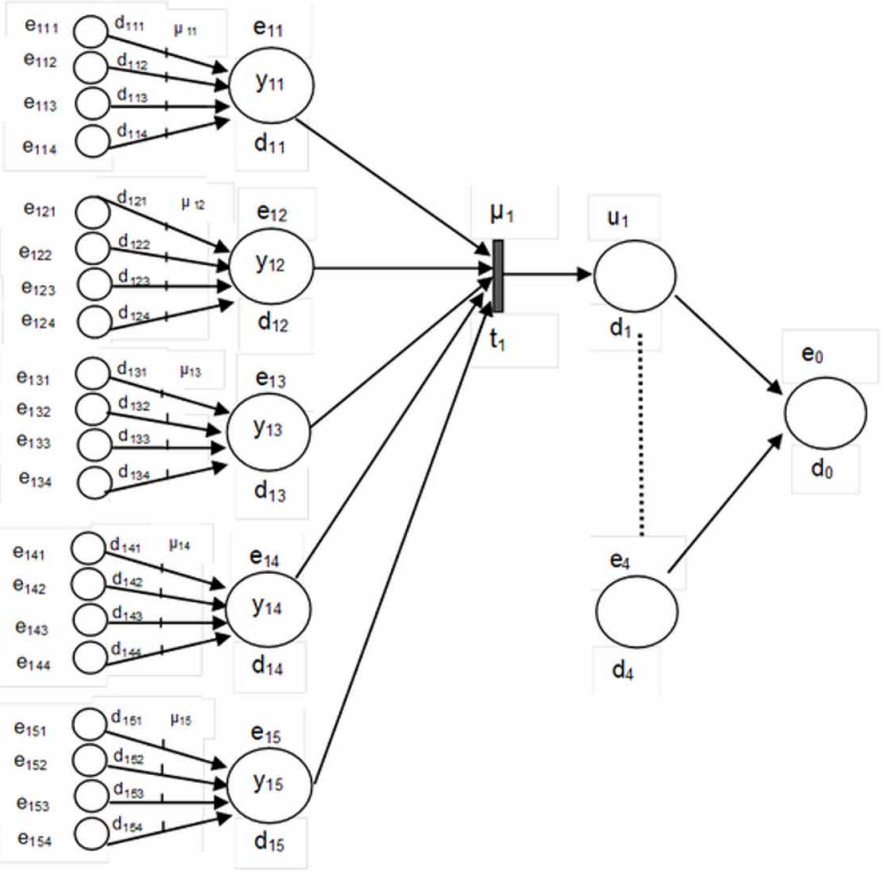
4.2. Second Dimension

The second dimension is the leveling or grading the risk values. We studied some of the risk leveling or evaluation methods like failure mode effect analysis (FMEA), Operationally Critical Threat, Asset, and Vulnerability Evaluation (OCTAVE) and the National Institute of Standards and Technology (NIST) evaluation methods. Most of these frameworks have high, medium and low levels of risk evaluation (Dey et al., 2013). However, considering the SME context which calls for simplicity and also comprehensiveness, we selected the the A-9 member linguistic term set (Cardoso et al., 1996; Umano et al., 1998; Zadeh, 1965; Xu et al., 2010; Garibaldi and John, 2003; Kumar Sahu et al., 2014; Liu and Rodriguez, 2014) for risk evaluation which is given in Table 3.

4.3. Third Dimension

In the third and last dimension of risk assessment, careful choices of certain relevant heading in which the ERP adoption risk factors are categorized. In other words, the risk factors in extension phase of ERP adoption are related to a particular dimension or category (Zeng, 2010, Amid et al., 2012; Chang et al., 2015; Arachchi et al., 2015). These dimensions are organisational (includes top management, culture, structure, strategic planning, business partner relationship etc.), managerial (project planning, organizing, decisions, financial, direction and leading, etc.), operational (project execution, process, workflow, procedural, documentation etc.) technological (hardware, software, compatibility, legacy systems) and personnel (human related involving owners, managers, users, competencies, efficiencies, psychological, sentiments, etc.) Further to bring in clarity in the understanding of the risk assessment, the quantified risks are also placed according to their appropriate categories.

5. FINDINGS AND INTERPRETATION



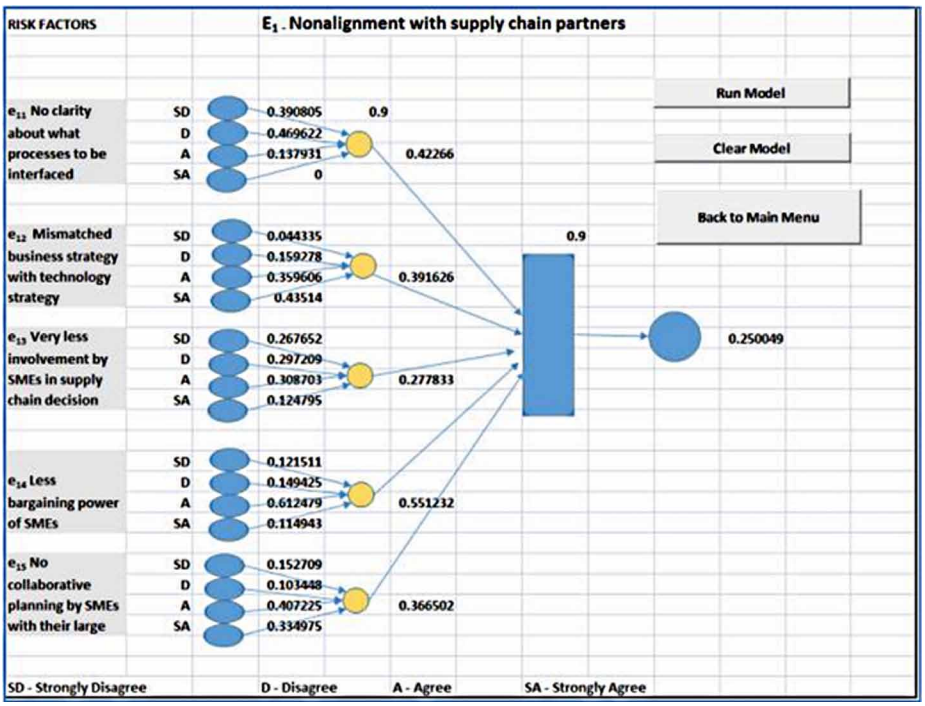
In the subsequent paragraphs we present the findings and interpretations of the three risk assessment dimensions stated in section 4. The first dimension which is Fuzzy Petri Net for modeling the risk assessment in the extension phase is shown in Figure 5.

Table 3. A-9 member linguistic term set

Linguistic Terms	Linguistic Values (Fuzzy Numbers)
Absolutely-low	(0,0,0,0; 1.0)
Very-low	(0,0,0.02,0.07; 1.0)
Low	(0.04,0.1,0.18,0.23; 1.0)
Fairly-low	(0.17,0.22,0.36,0.42; 1.0)
Medium	(0.32,0.41,0.58,0.65; 1.0)
Fairly-high	(0.58,0.63,0.80,0.86; 1.0)
High	(0.72,0.78,0.92,0.97; 1.0)
Very-high	(0.93,0.98,1.0,1.0; 1.0)
Absolutely-high	(1.0,1.0,1.0,1.0; 1.0)

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 5. Fuzzy Petri Model for Risk assessment in extension phase



In the extension phase of ERP Adoption (E_0), the risk called nonalignment of business processes with supply chain partners (E_1) is explained by means of five risk factors, namely no clarity about what processes to be interfaced (d_{11}), mismatched business strategy with technology strategy (d_{12}), very less involvement by SMEs in supply chain decision (d_{13}), less bargaining power of SMEs (d_{14}) and no collaborative planning by SMEs with their large buyers (d_{15}) (Forslund and Jonsson, 2010; Saleh Shatat and Mohamed Udin, 2012; Seuring et al., 2008). The test result is given in Figure 6.

The values for predicting the risk is based on the responses which range from strongly agree to strongly disagree (d_{111}, ..., d_{114}) given by the respondents. For d_{11} it is found that 14% of respondents say agree so the value of d_{112} is 0.15, 47% of the respondents say disagree, then the value of d_{113} is 0.47 and 39% of the respondents strongly disagree, the value of d_{114} is 0.39.

The strength of responses or truth value is denoted by μ, the value of which is the weight assigned based on the dependability of the responses. For example, if μ_{11} is assigned a value of 0.9 then it implies a high degree of dependability of responses. And so the value y11 is the maximum of (0.14*0.9), (0.47*0.9), (0.39*0.9) which is 0.42. This value of 0.42 is arrived from the response option disagree (D). As stated earlier, since SD and D denotes positive it means that no clarity about what processes to be interfaced (d11) is unitary of the decisive factor will not contribute to risk of nonalignment with supply chain partners (E_1).

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 6. FPN based RAM for the risk E_1

The values of all the other four risk factors, d_{12}, d_{13}, d_{14} and d_{15}, are arrived based on the ratio of responses. Then the y values which are the maximum of the proportion-of-response values multiplied by the μ_{11} value are arrived at 0.39, 0.28, 0.55 and 0.37 respectively. Interestingly, we see that for d_{13} though the maximum value is resulted from the response option agree, the proportion of the positive attributes, namely strongly disagrees (SD) and disagree (D) are higher than the proportion of agree (A) and strongly agree (SA) in other words (SD+D) > (SA+A). Hence, based on the rules defined earlier, we decide not to consider d_{13} as a contributor to the risk E_1. The other three risk factors, namely d_{12}, d_{14} and d_{15} are found to be contributors to the risk because their y values are resulted out of the response options agree. Figure 6 depicts the FPN model for the risk E_1.

In a similar manner, the risk analysis of the other risks, namely Losing business due to non adoption of technology (E_2), Realignment, and standardization (E_3) and the cost implication on extension (E_4) is carried out to arrive at the risk values.

After taking into consideration, all the risks and their contributing risk factors in the extension phase, the findings and interpretation template is presented in Table 4. The following step by step approach is followed to interpret the table:

Step 1: The table comprises of 5 columns namely Risk Factor, Weighted Response Value (WRV), Perception to Risk, Risks and Minimum Value of Risk.

Step 2: The Weighted Response Values for each of the risk factors. These values are arrived as explained in section 4.1 above.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Step 3: The Perception to Risk (+ / -) is given in the third column. (*) Negative (-) denotes that the answers relating to SA and/or A is greater than SD and/or D and hence will contribute towards risk. While positive (+) denotes responses relating to SD and D that will not conduce to the danger. The "y" value with negative perspectives only is considered for risk measurement. Accordingly of the twelve risk factors identified for the extension phase of ERP, we found that the risk perception to five factors, namely e_{11}, e_{13}, e_{23}, e_{32} and e_{41} are positive so these do not contribute to the risk.

Step 4: The 4 risk that is represented by the risk factors are enumerated.

Step 5: In the last column the Minimum Value Risk is arrived, which is a product of the minimum response value of the risk factors multiplied by the certainty factor.

From Table 4 we interpret the values based on the first and second propositions stated in section 4 above. Accordingly, lack of support from large buyers (risk factor e_{22}), software compatibility issues between SMEs and OEMs (risk factor e_{33}) and less involvement of the SMEs in the supply chain decisions with their larger counterparts (risk factor e_{13}) as the top three risk contributing factors. This is quite justifying from the previous works that SMEs will certainly seek support from the back and forth of the supply chain particularly in the automobile industry as large player like OEMs and tier 1 suppliers are already matured with advanced enterprise system enablement. Amongst the other factors perceived as risky include, inadequate funding from larger counterparts in information integration, compatibility issues relating to network interfaces, etc. It is comprehended that there is no risk relating to lack of clarity on the selection of process to be interfaced, additional IT investments etc. Our findings corroborate to the existing knowledge that one of the central challenges for SMEs is the lack of process standardization requirements to fulfill the expectation of their supply chain partners particularly the OEMs. This purports to the first proposition of the FPN model. For the second proposition of the FPN model we state that the SMEs are subjected to a minimum risk of 0.25 out of 1 in this phase which is related to non-alignment to the supply chain partners' requirements. This is evident because of the disparities due to the varying

Table 4. Findings and interpretation of risk assessment in the extension phase

Risk Factors (1)	WRV (2)	+ / - (3)	Risk (4)	MVR (5)
No clarity about what processes to be interfaced (e_{11}) Mismatched business strategy with technology strategy (e_{12}) Very less involvement by SMEs in supply chain decision (e_{13}) Less bargaining power of SMEs (e_{14}) No collaborative planning by SMEs with their large buyers (e_{15})	0.42 0.39 0.28 **0.55** 0.37	+ - + - -	Nonalignment with supply chain partners (E_1)	0.250
Pressure from large customers (OEMs) (e_{21}) Lack of support from large buyers (e_{22}) Technological incompatibility (e_{23})	0.37 **0.58** 0.38	- - +	Losing business due to non adoption of technology (E_2)	0.329
Realignment of processes (e_{31}) Inequalities of information flow efficiency due to technological imbalances (e_{32}) Compatibility issues in web-interfaces of large buyers with the ERP system of SMEs (e_{33})	0.51 0.51 **0.57**	- + -	Realignment and standardization (E_3)	0.455
Lack of planning for the additional investment in IT (e_{41})	0.48	+	Cost implication on extension (E_4)	0.428

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

levels of information technology adoption of SME and larger enterprises. Realignment of SMEs systems and processes to suit the standardization requirements of the large buyers in the automobile industry is perceived as highest (Figure 7).

Finally, the second and third dimension is presented interpreted through categorization of the risk factors and their leveling. The results are presented in Table 5.

From Table 5, we interpret that out of the total twelve risk factors considered under the reference phase of ERP adoption seven are risk contributors according to this survey. Out of these a majority of them numbering five risk factors are organizational, only one relate to managerial and three each relates to operational and technological category. With regard to the leveling, only one out of 7 risk factors is leveled as medium to fairly-high which is the lack of support from large buyers.

Figure 7. Extension phase result summary

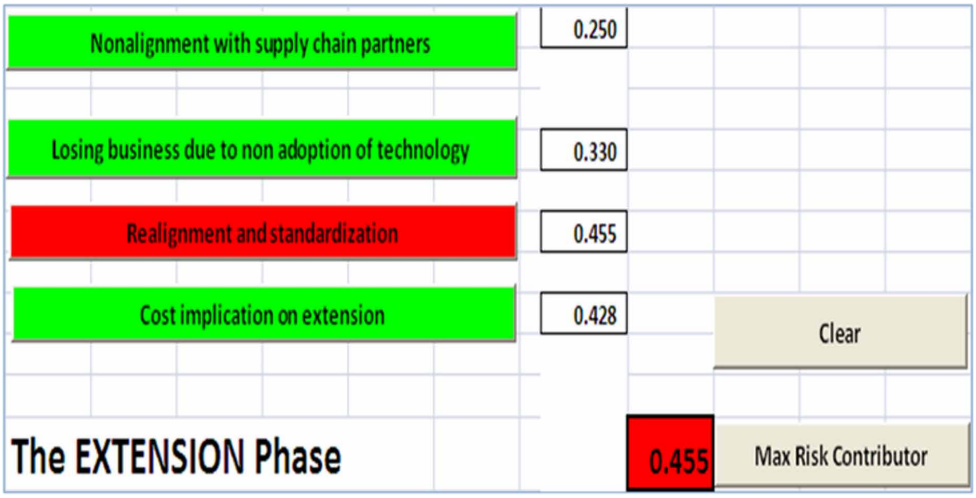


Table 5. Risk categorisation and leveling in extension phase of ERP adoption

Risk Factor Codes	+ / -*	Organisational	Managerial	Operational	Technological	Human	Risk Levels
e_{11}	+			0.42			NA
e_{12}	-	0.39					Fairly-low to medium
e_{13}	+	0.28					NA
e_{14}	-	0.55					Medium
e_{15}	-			0.37			Fairly-low to medium
e_{21}	-	0.37					Fairly-low to medium
e_{22}	-	0.58					Medium to Fairly-high
e_{23}	+				0.38		NA
e_{31}	-			0.51			Medium
e_{32}	+				0.51		NA
e_{33}	-				0.57		Medium
e_{41}	+		0.48				NA

6. DISCUSSION

Clear understanding of the risk factors is critical wherein this research paper has provided answers to (i) what risk factors are identified, (ii) how representative are these to ERP adoption in SME, (iii) which of these risk factors contribute to a particular risk, (iv) which risk factors and risks are perceived as critical by the SME respondents, (v) how to represent and understand the risks. The taxonomy of risk and risk factors provided the initial impulse for the development of the survey instrument which subsequently furthered by administering the questionnaire to empirically collect the answers from the SME participants to realize their perception (fuzzy nature) towards a given risk factor in the extension phase of ERP adoption.

The semi-structured interviews with the subject matter experts brought certain valuable insights like inadequate support from SME industry associations, non alignment with supply chain partners, business loss due to non adoption of ERP, lack of awareness, lack of business process interrelationship, ineffective ERP scope definition, inadequate knowledge on ERP vendor selection, unrealistic budget and schedules, user resistance, project failure, inefficient ERP project leadership, ineffective external consultant etc. Most of these insights matched with the respondents' risk perception about them. The reconciliation between experts' insights and respondents' perception is presented in Table 6.

From a contextual viewpoint, the contribution of this research thesis is an integrated approach to the risk assessment of ERP adoption in SMEs. The results provide a decent understanding in exploring the possibility of extending the integration of ERP in the supply chain. The research is of immense use to the SMEs who are in the different phases of ERP adoption (some considering to integrate with their supply chain, some already adopted, many keen interested to integrate) because the risk assessment of ERP adoption specifically to extension phase is distinctively identified, addressed and assessed. From a conceptual viewpoint this research contribution very comprehensive in the sense that it enabled the design, development, building and testing of a simple, yet robust risk assessment model through the application of fuzzy Petri nets.

The outcome of this paper offers an authentic source of reference for risk assessment of ERP adoption for an extensive scope of stakeholders, namely, SME participants, SME consultants of both business and technology, industry and cluster associations in India. The technique of risk assessment using the fuzzy Petri net to measure the risk perception of the respondents is very useful for practitioners. This is because it is easy to use and test the model for a broader scope of research roles. Also, our results provide a meaningful analysis of the synergies and deviations in the risk perception of ERP adoption in particular and other IT projects in general. The capability of the assessment model to arrive at the risk values is proved by getting it tested with live survey data. This enlarges the horizon of the research contribution to real-life business scenarios.

Table 6. Experts' insights vs. respondents' perception on ERP risks

Risk Code	Risk Factor Recommended by Experts	Respondents' Risk Perception
e13	Very less involvement by SMEs in supply chain decision	No
e14	Less bargaining power of SMEs	Yes
e21	Pressure from large customers (OEMs)	Yes
e22	Lack of support from large buyers	Yes
i112	No clarity on ROI from ERP Investment	Yes

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

6.1. Limitations of the Research

The limitations are related to paucity of time, data accessibility, generalization and bias in primary research. The robustness of the research findings is with regard to a definite time horizon only. In other words, technological advancements may alter the perceptual experience of ERP extension decision in SMEs which will result in redefining the risks and risk factors. This study is specific, with respect to country, region, industry and size of units. Hence the consequences cannot be extrapolated to the cosmos at large. Since the scope of this research work is limited only to assessment and quantification of risks and risk factors, the mitigation based on scenario analysis is not included and can be taken as the future scope only. Currently the tool is developed on proprietary software. Any modification to the underlying software can interrupt the working of the assessment model. This research result can also be utilized as a launching pad for further empirical researches in the same way, but can be differed by the similarities and differences in perceptions of the decision-makers across different SMEs clusters and geographies. Currently this research considered the risk assessment distinctively for the extension phase of ERP adoption. As part of an ongoing research the interrelationship between the risks and risk elements in the preceding phases like planning, acquisition, implementation and usage have not been considered as part of this study. Since this research is administered to the SMEs the profile of the respondents is restricted only to a restricted number of stakeholder-types, namely the director and IT manager of the unit whose perceptions can have limited generalization.

7. CONCLUSION AND SCOPE OF FUTURE WORK

The paper investigated the perception of risk elements associated to the extension phase of ERP system in small and medium enterprises, particularly those working in an auto component cluster. Besides this study took the important risks, risk factors that are perceived to be critical during supply chain collaboration between an SME and its larger counterparts. The possibility of extending this research work to other auto component clusters can be explored to bring out the similarities and divergences in the risk perception of the SMEs units. Grounded along the application foundations of the risk assessment instrument used in this research, the possibility of developing a comprehensive software tool can be explored which can get the responses of risk perception through an online survey and can execute real time analysis of outcomes. Also in the future, a structured hypothesized research model can be developed and validated to bring out the inter-relationship between the risk factors to the ERP adoption perception in all the five phases.

Further, the risk assessment model adopted in this study can be tested for other information technology solutions like customer relationship management, supply chain management, business intelligence and also to newer software deployment models like cloud or software-as-a-service. It would be a worthy attempt to investigate the risk perception about ERP adoption in different industry clusters.

Finally, to conclude, this research has designed and developed a risk assessment model using FPNs to the extension phase of ERP adoption. The model is tested and validated for its purpose by means of quantifying the risks and further classifying and grading them by applying the SMEs responses about the risk perception.

Chapter 32
Information Management for Network Transformation in Industrial Enterprises Associations:
The Case of the Internationalization Process

ABSTRACT

There is no doubt that nowadays internationalization is increasingly attractive for companies that want to become more competitive. However, many small and medium enterprises (SMEs) still are resource-constrained, lacking adequate information and facing problems to establish and manage relationships to operate in a sustainable way in international markets. Despite receiving some support from governments and from other institutional entities, these difficulties faced by SMEs call for a stronger support, which can be played by industrial enterprises associations (IEAs). This chapter brings the perspective of five different companies that are associated with IEAs. The main objective is to have their opinion about the role of IEAs as information managers and promoters of collaborations, mainly for internationalization processes. Another objective is to understand the acceptance by these companies regarding the use of collaborative platforms, managed by IEAs, for supporting their information and collaboration management activities.

INTRODUCTION

Small and medium enterprises (SMEs) are one of the main driving forces in economic development, representing in many economies all over the world an important pillar of growth and employment (London, 2010; Sommer & Haug, 2011). Globalization of markets and the consequent rise of competitive pressure lead SMEs to look at internationalization as a main priority to sustain their business (Costa, Soares, & Sousa, 2016a). However, only a few number of firms have been succeed in internationalize to foreign markets (Rodriguez, Barcos, & Álvarez, 2010). In comparison to multinational enterprises (MNEs), SMEs are typically regarded as resource-constrained, mainly lacking market power and adequate information and knowledge to operate in a viable way in international markets (Hessels & Terjesen, 2010).

To compensate the lack of information about foreign markets, SMEs can form collaborations and establish network relationships with different types of entities, such as suppliers (Hultman, Johnsen, Johnsen, & Hertz, 2012), customers (Cannone & Ughetto, 2014), competitors (Casillas, Acedo, & Barbero, 2010), foreign firms (Castellacci, 2014), institutional agencies (Santos-Alvarez & García-Merino, 2010), and government bodies (Child & Hsieh, 2014). Collaborations can be established between firms to complement core competencies, providing complementary and attractive products or services to markets and increasing competitive advantages to internationalize (Spence, Manning, & Crick, 2008). Networks are valuable sources of information about market conditions and information sharing is then crucial in collaborations to create trust and synergy to sustain relationships. Therefore, successful collaborations require using a collaboration-based mentality instead of a conflict-based one, with information sharing and not information controlling (Spence et al., 2008).

Despite of this, SMEs still face difficulties in managing both collaborations and information generated in a collaborative network context (Costa et al., 2016a). Due to the imperfect access to information, internationalization can be a risk for SMEs, representing extra costs associated with the collection of foreign market information and seeking and evaluation of partnerships (Hessels & Terjesen, 2010). Internationalization requires large amounts of information but many firms have a lack of suitable tools for managing information and knowledge from partners or from previous experiences (Rodriguez et al., 2010). When moving into new international markets the information processing demand increases and become more complex (Hsu, Chen, & Cheng, 2013), requiring suitable management approaches and information technologies tools to better predict and evaluate problems arising from internationalization strategies. Additionally, among all difficulties in managing internationalization information (Costa, Soares, & Sousa, 2016b), SMEs face significant barriers related to the lack of contacts and lack of adequate institutional support (Djordjevic, Sapic, & Marinkovic, 2012; London, 2010). Moreover, in Portugal, although representing 99% of the total number of enterprises, only 20% of SMEs are performing internationalization processes (Banco de Portugal, 2015).

These difficulties faced by SMEs in managing internationalization processes, with specific emphasis on managing information and on creating collaborations, call for a strong facilitating role that can be played by industrial enterprises associations (IEAs). IEAs can have an important role in fostering more collaborations among their associated companies, by disseminating opportunities and acting as an intermediary for establishing good relationships (Costa, Soares, & Sousa, 2015). Some previous studies have been studying the role of institutional networks in internationalization processes of SMEs, e.g. Oparaocha (2015), Makhmadshoev, Ibeh, and Crone (2015), and Gardó, García, and Descals (2015). However, these studies are not specifically focused on IEAs, i.e. results are concentrated in understanding the institutional network support of governments and other supporting agencies in general.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Internationalization processes require managing large amounts of information (Xie & Amine, 2009). Costa et al. (2016) state that a collaborative platform may allow better information management in collaboration, contributing to the effectiveness of these processes. Accordingly, the authors of the present chapter argue that by using a technological and collaborative platform, IEAs can act in a more active way in processes of internationalization of their associates (both SMEs and MNEs). This by providing advanced brokering, facilitation and coordination services, instead of only mere advices and basic services.

Therefore, the main objective of this chapter is to understand the perspective of five different companies associated with IEAs about two aspects:

1. The role of IEAs as information managers and promoters of collaborations;
2. The use of a collaborative platform for supporting information and collaboration management activities, with focus on internationalization processes.

The research questions are:

RQ1: What is the perspective of companies about IEAs as information managers and promoters of collaborations?

RQ2: What companies think of using collaborative platforms, managed by IEAs, for supporting their internationalization processes?

The motivation is then based on three main pillars:

- **Information:** SMEs need to access, organize and use information from their collaborative networks to achieve better internationalization processes.
- **Tools:** SMEs need to have new tools to convert information into knowledge for making better internationalization decisions.
- **Support:** SMEs need a more active support from institutional networks, mainly from IEAs.

The structure of this chapter is as follows. First, literature on internationalization of SMEs with focus on networks and information management processes is presented, as well as some background on IEAs as institutional network support for SMEs. After that, the research methodology applied for this paper is described and the selected five cases are analyzed according to the research questions. Finally, a discussion and the main conclusions of the chapter are presented.

BACKGROUND

This section provides a brief literature review about the topics under study in this chapter. First, recent developments on the internationalization process of SMEs are provided. After that, the information management process, as well as the network and collaboration processes in internationalization are discussed. Finally, this section ends with literature on IEAs, with focus on their institutional network support in the internationalization process of their associated companies.

Internationalization Processes of SMEs

The world is becoming increasingly globalized and the international markets more and more open and accessible. Domestic saturation and the need to reduce competitive pressures lead companies to expand their businesses across borders, in order to increase sales and gain visibility in foreign markets (Olejnik, 2014). Internationalization is the process of adapting firms' operations to international environments, increasing awareness in terms of direct and indirect influences of international transactions on their future (Beamish, 1990; Calof & Beamish, 1995). However, internationalization is a complex and hard process dealing with a large variety of decisions and, most of the times, requiring a great amount of resources (Andersson, 2011; Santos-Alvarez & García-Merino, 2010). Particularly in the case of SMEs, standing out in this competitive environment can be quite difficult, with the lack of information and the lack of contacts representing the main hindrances to internationalize (OECD, 2009).

The definition of SMEs differs across countries. E.g. SMEs are defined as firms with fewer than 250 employees in Europe, with fewer than 500 employees in the USA, and with fewer than 900 employees in New Zealand (Jabar, Tajuddin, & Paino, 2016). In the European context, in addition to representing firms that employ fewer than 250 employees, SMEs have an annual turnover not exceeding EUR 50 million and/or a total annual balance sheet not exceeding EUR 43 million (Kushnir, Mirmulstein, & Ramalho, 2010). Compared with MNEs, SMEs have limited managerial, financial, network and information resources (Knight & Liesch, 2016; Olejnik, 2014).

Internationalization processes and activities of MNEs have long been studied by many researchers and strong theory was developed on this. However, SMEs are structurally different and behave differently from MNEs, precluding the possibility of theory transferring (Knight & Liesch, 2016). MNEs have a highly internalized organization form (Liesch, Håkanson, McGaughey, Middleton, & Cretchley, 2011) while SMEs might invest abroad (not to the extent of MNEs) but opting for more basic forms of internationalization, such as exporting and other non-equity modes (Lu & Beamish, 2001).

The internationalization process model of Johanson and Vahlne (1977) is well established in the research area of International Business (IB). This model is incremental, describing that firms start the internationalization process with a low commitment involvement into close markets, progressing (through a learning process) towards higher commitment levels into more distant markets.

Nevertheless, in the last decades external environments where firms operate have changed and consequently more research have been made on cases that display other patterns of internationalization and on updates of the model of Johanson and Vahlne (1977).

Knight and Liesch (2016) present a comprehensive summary of the evolution of research on early internationalization and born global firms. "Born global firms" is a term used in the internationalization literature that is applied to firms (mostly SMEs) aiming for international markets right from their birth or very shortly thereafter (Andersson, 2011; Cannone & Ughetto, 2014; Kaur & Sandhu, 2013). The authors present a conceptual framework that summarizes future research on born global firms. The main conclusion of this study is that the internationalization process is evolving and born global firms are emerging around the world. This because companies of any size, age, experience and resources can participate in an active way and benefit from international business.

Olmos and Díez-Vial (2015) examine the relationship between the internationalization pathways and the performance of SMEs. Empirical findings show that the "export intensity-export performance" relationship can be characterized by a U-shaped curve for SMEs that have a gradual internationalization pathway and by a S-shaped curve for SMEs that have an accelerated internationalization pathway. Based

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

on the configurational theory, Cerrato, Crosato and Depperu (2016) develop an important framework that identifies four archetypes of SME internationalization: (i) marketer; (ii) investor; (iii) networker; and (iv) weak internationalizer. This framework allows to analyze the firm-level internationalization, according to six indicators: internationalization from the demand side, resources located abroad, geographical scope, international orientation, internationalization of the business network, and financial internationalization.

Nevertheless, many SMEs still face major challenges and internationalization barriers. In particular, they often do not know how to start an internationalization process, what are the decisions and entry modes involved, and which are the main types and sources of information about foreign markets that enable more confident decision-making (Child & Hsieh, 2014; OECD, 2009; Olejnik, 2014). In other cases, the lack of suitable tools, methods and practices for managing information and knowledge, both from previous international experiences and from partnerships with other firms, represents another problem in their internationalization processes (Nguyen, Barrett, & Fletcher, 2006; Rodriguez et al., 2010; Souchon, Dewsnap, Durden, Axinn, & Holzmüller, 2015).

Information Management in Internationalization of SMEs

Having value information is crucial for successful internationalization processes. Decision-makers in SMEs need to search and acquire information for identifying appropriate foreign market opportunities and to reduce internationalization uncertainties (Xie & Amine, 2009). In addition, SMEs with value information are able to increase creativity in decision-making and to reduce risk, facilitating the international expansion (Child & Hsieh, 2014; Perks & Hughes, 2008; Saarenketo, Puumalainen, Kyläheiko, & Kuivalainen, 2008).

However, as found by many authors in the literature, SMEs have imperfect access or have difficulties in managing information regarding internationalization processes (Hessels & Terjesen, 2010). The reasons for this to happen can be centered in the poor development of suitable information technology tools (Rodriguez et al., 2010), in the lack of organizational capabilities to process information (Aspelund & Butsko, 2010), or even by not allocating the right efforts to gather this information (Santos-Alvarez & García-Merino, 2010).

Recent studies show the importance of information in internationalization processes. Souchon et al. (2015) examine the key antecedents for generation of export information, concluding that export experience, export complexity, and export specificity are positively related with knowledge of export information sources. They point out that in cases of lack of export experience, companies should contact and recruit entities with experience in internationalization or with knowledge of specific markets. In addition, these authors state that firms exposed to many export markets may face some complexity and challenges regarding information management processes, mainly in what regards the organization and dissemination of knowledge internally. The study of Peschken, Shukla, Lennon and Rate (2016) explores the decisions of SMEs' decision-makers in internationalization using a cognitive perspective. Based on the structural alignment theory and regulatory focus theory, a conceptual model is developed by these authors. Scenarios are identified and findings show that the structure of the available information to internationalize has a strong influence on decisions regarding cognitive resource requirements.

Decision-makers have characteristics that influence the information management in internationalization, such as this age, tenure, international experience, information processing capability or organizational memory (Chen, 2011; Cui, Li, & Li, 2013; Hsu et al., 2013). In order to learn and develop new knowledge about markets, SMEs can use different internal and external sources of information, which can come

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

from social and business relations, from previous international experiences or experience of others, or from externally available information (Akerman, 2014; Santos-Alvarez & García-Merino, 2010). The main information subjects that SMEs seek within their sources are (Aspelund & Butsko, 2010; Cannone & Ughetto, 2014; Ibeh & Kasem, 2011; Peng, Yang, & Liang, 2011; Xie & Amine, 2009):

- Foreign market conditions.
- Host countries attractiveness.
- Internationalization strategies.
- Internationalization obstacles.
- Support programs.

To gather information from different sources, a possibility is to use formal techniques, such as market research, or informal ones, such as relying on gatekeepers (Rodriguez et al., 2010). Nevertheless, it seems that for gathering and sharing information about foreign markets, SMEs give more priority to their already established networks (Costa et al., 2016a). Information shared in networks allows to increase commitment in foreign markets (Hultman et al., 2012) and to reduce information asymmetry (Child & Hsieh, 2014), which is more important in internationalization due to the individual difficulties of SMEs in searching information (Casillas et al., 2010). Spence et al. (2008) consider that information sharing is crucial for developing trust and synergy to sustain collaboration relationships, requiring a collaboration-based mentality instead of a competition-based one.

Internationalization Networks

Another important development in the literature of internationalization of SMEs is to consider markets as networks of relationships (Johanson & Vahlne, 2009). There is growing evidence that SMEs need to create relationships and establish collaborations to gain competitive advantage in internationalization (Costa et al., 2016a). These collaborations can be (Spence et al., 2008):

- **Vertical Alliances:** Alliances with upstream and downstream partners.
- **Horizontal Alliances:** Relationships with competitors.
- **Other Alliances:** Collaboration forms with firms from different sectors.

Successful collaborations are achieved when value for all the parties is created, which can be obtained by choosing the right partners, by managing the relationship, and by accumulating relational capital (Townsend, 2003). Quite different types of intermediaries can be used in internationalization to form these collaborations, such as distributors, customers, competitors, managers' contacts from previous jobs or experiences, external parties, foreign firms, institutional agencies, government bodies, consultants, personal contacts, and friends (Cannone & Ughetto, 2014; Casillas et al., 2010; Castellacci, 2014; Child & Hsieh, 2014; Hultman et al., 2012; Ibeh & Kasem, 2011; Kaur & Sandhu, 2013). Some of the main reasons for establishing collaborations in internationalization processes are to achieve rapid international expansion and growth, to obtain information about foreign markets, to provide access to new knowledge, and to assist in mitigating the costs and risks of cross-border activities (Andersson, 2011; Child & Hsieh, 2014; Ibeh & Kasem, 2011; Musteen, Francis, & Datta, 2010).

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

The study of Oparaocha (2015) illustrates the differences and interconnections between the three main perspectives of network research in IB: (i) social networks (individuals, family, friends, colleagues, and employees), which influence the creation and development of social capital and business know-how; (ii) business networks (suppliers, competitors, strategic partners, and customers) that have an effect on the business deal and on supplementing or acquiring resource advantage and business know-how; and (iii) institutional networks (government, incubators, research institutes, agencies for international development, and business associations) that have influence through supporting functions and the institutional-based business environment. Since the work of Coviello and Munro (1997), business networks are those that are more explored in the literature. A recent study shows that, in order to reduce risks, SMEs imitate the internationalization modes of their peers based on formal network relations (Oehme & Bort, 2015). Social networks have been also receiving much attention. Pinho and Pinheiro (2015) highlight the importance of using social network analysis as a different methodological approach to understand the numerous complex interactions that occur in internationalization processes. Xie and Amine (2009) suggest that social networks must be properly recognized as one of the primary sources of information, knowledge, and fast learning. Nonetheless, the institutional network perspective is still in an early stage of research.

The importance of governments and institutional supporting agencies in the internationalization processes of SMEs have been recognized in the literature (Casillas et al., 2010; Child & Hsieh, 2014; Loane & Bell, 2006). However, more studies on the influence of institutional networks in internationalization processes are needed (Oparaocha, 2015). Current studies examine how this kind of networks are interacting with the internationalization activities of SMEs, in the context of international entrepreneurship (Oparaocha, 2015), transition economies (Makhmadshoev et al., 2015), and retail internationalization (Gardó et al., 2015). The focus of this chapter is on IEAs addressed as institutional networks for supporting the internationalization of their associated companies. This is a different contribution to the knowledge of internationalization as tendency of previous research is to consider institutional networks in general, or to give more emphasis to governments and other agencies.

Industrial Enterprises Associations as Institutional Network Support

The authors of this chapter consider an IEA, also known as business association (Bennett, 1998) or trade association (Lacerda, 2013), as being both an organization that represents different companies of a specific industrial sector (sectoral IA) or an entity that act as an intermediary within a multisector network of companies in a specific area of activity (multi-sectoral IA). In both cases, membership for companies is voluntary (Bennett, 1998).

IEAs act as an intermediary between individual business action and state action (Bennett, 1998), adopting a multilevel strategy of lobbying across different national and international government levels (Grossman & Woll, 2007). Therefore, the potential benefits of IEAs to governments are an enhanced level of compliance with regulations, as well as lower administrative costs of regulation (Bennett, 1998). In addition to establish standards and self-discipline and to promote an effective communication between industrial firms and local governments, one of the main focus of IEAs is to strengthen collaboration among members (Bell, 2006; Wang & Gooderham, 2014). An IEA also promotes activities such as advertising, publishing, and formation (Lacerda, 2013). According to Bell (2006), a capable or well-developed IEA is able to encourage associated companies to collaborate and achieve wider, medium-term collective goals, instead of working only in their narrow short-term interests. Irwin (2014) also considers that to be effective, IEAs must have capacities to represent the interests of their members, must have proper governance

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

arrangements, and must deliver appropriate services and information to their associates. In the specific case of SMEs, it appears that due to their resource constraints, SMEs are more dependent than large firms on the services, information and contacts generated through IEAs (Gashi, Hashi, & Pugh, 2013).

The recent study of Inomata et al. (2016) explores the channels and practices for knowledge sharing in Science and Technology Parks, as well as in IEAs. Knowledge sharing is the process when individuals mutually exchange tacit and explicit knowledge, creating new knowledge in collaboration (van den Hooff & De Ridder, 2004). In this study, based on empirical data, the authors conclude that companies in an IEA share technological knowledge (such a scientific knowledge, technological solutions, and patents), as well as market knowledge (such as investors and investments, business contacts, and business opportunities) with the other associates. Different channels are used, such as the personal contact, email, phone, cloud, videoconference, and websites. In fact, results of this study show that an effective process of knowledge sharing in IEAs is mainly facilitated by the existence of collaborative physical workspaces and informal and face-to-face interactions. Moreover, regarding the impacts of knowledge sharing in the organizational results, those are more related with continuous improvement, technology development and increased knowledge base of the associated companies.

Although it is common knowledge that IEAs promote activities and initiatives that are important for the internationalization of their associates (such as fairs, missions and market research), literature on the role of IEAs in internationalization processes is still very scarce.

RESEARCH METHODOLOGY

The research methodology applied for this study was exploratory interviews with five Portuguese companies associated with some IEAs. Therefore, the main goal was to understand the perspective of these companies on the possibility of considering IEAs as information managers and promoters of collaborations. In addition, it was intended to perceive the suitability of using a collaborative platform for supporting activities such as information and collaboration management in their internationalization processes. Table 1 characterizes the different companies interviewed.

Empirical evidence was collected using semi-structured interviews with different kinds of interviewees, such as CEOs, CCOs, and advisors. The open-ended style of the interviews allowed the respondents to describe their experiences and ideas freely, without being limited to standardized categories (Hutchinson,

Table 1. Companies interviewed

ID	Type of Organization	Industrial Sector	Position of the Interviewees	Duration of the Interview (min)
C1	Large enterprise	Textile industry	Chief Commercial Officer (CCO)	42
C2	Large enterprise	Textile industry	Chief Executive Officer (CEO), CCO, Chief Technology Officer (CTO), Chief Marketing Officer (CMO), Advisor	76
C3	Small enterprise	Information technologies	CEO	51
C4	Small enterprise	Information technologies	Business Manager	33
C5	Startup	Medical devices	Chief Operating Officer (COO)	71

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Alexander, Quinn, & Doherty, 2007). These companies were selected to have a sample representing different types of organizations, i.e. the sample is composed by one startup and by two SMEs, and two large enterprises. The startup C5 is not currently a member of an IEA but it was interesting to have a perspective from this different type of organization. All the interviews were carried out personally and were recorded for accuracy purposes. After that, these were transcribed and coded using the qualitative data analysis software MAXQDA.

FINDINGS

This section describes the main findings of the performed interviews.

Case 1: Large Enterprise 1, Textile Industry

C1 is a large company with 80 years of experience in the textile and clothing industry. It is a successful company in Portugal that has been focused in the last years in creating textile innovative solutions for the automotive industry. C1 has also many experience in internationalization processes with subsidiaries all over the world.

Regarding its membership with the association from the respective industrial sector, the interviewee considers that this IEA does not have the necessary human structure to deal with their needs to develop new projects. In terms of promoters of collaborations among associates, the technological center of this sector, which works in close collaboration with the IEA, seems to be more adequate for this task.

C1 is mainly interested with information about legislation and customs rules. Due to their growing interest in the automotive sector, another valuable information content is the one regarding patents. Therefore, the IEA can play an important role here, acting as an information manager to share this important information with C1.

The interviewee thinks that a platform for supporting information and collaboration management aspects can be relevant for their activities, since people are very closed in what concerns the process of information sharing. The perspective is that a technological platform can facilitate the task of finding partners and opportunities, creating good synergies among all the stakeholders. However, there must be the ideal of all parts sharing something meaningful to each other.

Despite having experience in internationalization processes, C1 considers that these are most of the times difficult processes. The interviewee knows that many companies have been had bad experiences in internationalization. In the specific case of C1, they had a negative situation in Brazil, where companies were very closed, without sharing information, which made it difficult to perform an international project with success.

Case 2: Large Enterprise 2, Textile Industry

C2 is a large textile company with more than 40 years of experience. The technological level and the know-how acquired throughout four decades of activity have positioned C2 in the forefront of the clothing industry in Europe. Today the company exports almost all its production all over the world. Therefore, C2 has many experience in internationalization.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

In this case, five members of the company were interviewed at the same time, allowing to have a broader scope in the thematic being discussed, representing the longest interview performed.

For C2, the internationalization is an adventure, a challenge often inglorious. One of the interviewees gives the example of China, where they made some four or five attempts to enter this market but have never been successful. So, they point out the need to understand the tangibility and how a person values the brand, but also to understand the distribution philosophy of each country. This last aspect because nowadays the logistics and distribution costs are very high. Therefore, it is in this lack of knowledge about markets that collaborations can have an interest for the company.

The interviewees consider that the IEA needs to expand its scope by helping companies to execute specific activities because C2 still has some reluctance in terms of associative schemes. In their opinion, one situation is when a company wants to move to a particular market and knows that it cannot do it alone and needs some support. An example can be the United States of America, which is a hard and large project for one company alone. So, the need here is for the IEA to create over there a physical space or showroom to present and disseminate the activities of a small number of specific companies. This could allow to create more collaborations among associates, mainly in terms of resource and risk sharing.

According to the interviewees, another possible way to improve the importance and the visibility of the IEA could be to promote the sector and not specific brands. The IEA can study a specific market, analyze and collect data, present this data to the Portuguese companies, and invite the press and companies of the market under study to come to Portugal and meet the industry, not specific brands. In Portugal, one of the most successful cases is in the footwear industry, where the IEA acts like this. One of the interviewees thinks that this approach can be more interesting for the sector, by giving a bad example that happened for example in a fair (one of the traditional support provided by IEAs): "there were situations in the past where I was representing the company in events organized by different IEAs and I remember of a fair that I stayed for six days and did not have a single customer… because it was out of context, we spent a lot of money…" So the perspective from the interviewees is to have quality, not quantity, i.e. the IEA needs to choose and take the best companies of the sector and present Portugal. After that, naturally, other companies will go after and will gain more visibility.

In the evolution of this, the interviewees see a platform as being interesting to make the positioning and alignment of the companies that have the same philosophy in terms of both resources and strategies. They think that the IEA can moderate meetings between associates with the same philosophy and with the same resources that can be complemented to reach specific markets, promoting here more fruitful collaborations.

These collaborations with other associates of the IEA are seen as a good possibility to create joint strategies and structures for making investments in markets to benefit the specific brands. This by complementing resources, sharing risks and also sharing investments. One of the interviewees reinforces the importance of having in these situations companies with the same strategy: "in this sense, companies must interact and collaborate according to their dimension… this only results if the companies are aligned at all aspects… if they conjugate companies that sell completely different products… it is a completely different world. Then, despite of wanting to share, there will be no benefit between the parties." So, the perspective of C2 is that for creating collaborations, companies should have common interests, since companies with a different economic power will probably have different requirements and objectives, but also different approaches, values and resources.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

In terms of information sharing in IEAs, C2 has interest if it is information about experiences in specific markets. The interviewees consider that if an associate is in a specific country, he knows the rules and the particularities of this country. Therefore, through a knowledge sharing process, C2 can learn with him, understand the problems and barriers to face, and consequently avoid making the same errors. So, they approve that the IEA can act as an information manager, by organizing and filtering information according to the needs of the associates. However, the interviewees think that it will be difficult to transpose all this management of information into a platform. They agree with the IEA sharing institutional information and opportunities but they have doubts about the willingness from companies for sharing their information. This mainly due to their lack of time for structuring the information in a pleasant and easy way to read, as well as due to the fact that some information may be confidential. Moreover, they believe that the interactive part, the exchange of experiences, could be easier if performed in a more informal way.

A platform can be interesting for C2 if it is not a generalized platform, i.e. if it has the ability to create groups and create market segments, where information is directed to and created within these segments. Other fundamental aspects are the platform to be the way where companies create synergies to approach markets or where all the funding opportunities for the sector are aggregated.

Case 3: Small Enterprise 1, Information Technologies

C3 is a small software developer and software consulting company with 15 years of experience with the objective of providing IT solutions to organizations, based on the latest technologies. Right from the start, the company has been present in international markets. Nowadays C3 has offices in 10 different countries, exporting to a wide range of foreign markets.

The interviewee considers that the creation of collaborations with other companies of the IEA is important for the development of the company. It is indicated that in terms of software development companies, there is a set of problems that can be solved in collaboration, such as the management of updates and versions. So, the opinion is that the IEA needs to foster these relationships by disseminating and promoting the skills of its associates, in order to increase their visibility for other companies in foreign markets. Therefore, the interviewee points out two important aspects to be improved in the context of IEAs:

1. First, the IEA can identify the innovation vectors and the competences of each associate to allow crossing opportunities with the interests of each company;
2. After that, using some collaborative tools, the IEA can perform a matchmaking process to help in the identification of different actors that can collaborate in a specific opportunity.

Therefore, the IEA can play here a crucial role for establishing good conditions for the collaboration among associates, by "finding the opportunities, present these opportunities to those who may have an interest, and have a collaborative tool that allows the matchmaking."

In terms of information sharing, the interviewee clearly thinks that C3 has not yet felt the impact of the IEA as an adequate information manager. When approached with the question for the value information to also be originated by the associates themselves and transform this information sharing into a knowledge sharing process, the interviewee thinks that this is a viable situation. However, the IEA knows the associates and can be responsible for most of the information, by giving itself more wealth

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

to its content. The interviewee considers that this can work for an example in a platform but only if the information is really useful: "And how, from my point of view, is it useful? If I receive once a week in my mailbox… a project, its title, its budget… does this and in 30 seconds I'm able to know that is this call, is for this, when, how, where, what time, values… a smart picture… and then have an option to say "I'm interested" or "like"." But this kind of information needs to be related with the activity of each associate, i.e. C3 does not want to receive emails or information about calls or other topics from other areas. Therefore, a platform managed by the IEA for supporting information and collaboration management can be very useful. For example, a platform may push the information that is on the websites of the European Union, i.e. to get this information and re-organize it for the interests of the associates. So, having a way of performing this matchmaking process between European projects with the research interests of companies, as well as alerting companies to these opportunities in an IT platform may represent relevant factors for the users' acceptance.

Another opinion from the interviewee is that the IEA of the sector has a long way to go because in this technological area there are issues that are useful for all associates and that need to have more focus. The IEA may have the role of knowledge aggregator both in terms of state-of-the-art and in terms of future prospects, such as pointing possible paths and markets of interest.

For the topic of internationalization, C3 has many experience in foreign markets and the first advice is that the internationalization is a multidisciplinary chain where some specific skills are required. The interviewee recommends that a company needs to have a product or service prepared to be internationalized and to have people with proficiency, at least, in English: "we must be prepared either from the product point of view and from the people (skills) point of view… be prepared for the process of internationalization." These have been the two main pillars for C3 to achieve successful internationalization processes. But in practice, the interviewee indicates the following key success factors:

1. **Critical Mass in the Domestic Market:** "In the first place, achieve critical mass in Portugal that was our first concern, i.e. have customers here in Portugal that somehow allow us to have really adjusted tools to real market needs.";
2. **Financial Capital:** "Internationalization is indeed a very expensive thing, for example, last year we participated in twelve international fairs... each fair costs 10, 15, 20 thousand Euros, from the stand, logistics, hotels,… therefore we must have financial resources to cope with these things.";
3. **Creativity:** "Another key aspect is not worth going to sell things that are abundant in another country and therefore we have to be creative… have innovative solutions, or that somehow differs from the rest, is crucial".

For these processes, C3 collaborates with different institutional entities such as governments and other support agencies to obtain support in terms of financing. In fact, the internationalization strategy of the company, besides this financial support obtained mainly through projects, has also been using human resources of these support agencies. These agencies have offices around the world and in many cases C3 used their offices and contacted some of their human resources to assist the company in getting new contacts. The interviewee has the opinion that this can be an interesting approach to be adopted by IEAs. Despite not having interest and capacity to have human resources in many countries, IEAs can have shared resources (offices, people, etc.) in key markets. The internationalization processes of C3 have been performed in most of the cases without the support of the IEA or of any other member (company) of the IEA. Nevertheless, the interviewee thinks that companies can share information and

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

knowledge about the markets where they are present, and consequently, share their experiences and the problems faced. This will allow to avoid making the same errors in a specific foreign market. This can be very useful for C3 but they consider that for reaching this situation, the IEAs must have a closer monitoring process to foster these partnerships and exchange of experiences: "The association may have here technological skills to push companies forward."

Case 4: Small Enterprise 2, Information Technologies

C4 is a small enterprise with 15 years of experience in the area of software consulting. This company aims to design, implement and optimize information systems for management support. Currently, C4 wants to attract international clients with high technological know-how, so the process of internationalization has been one of the main priorities to increase its turnover.

In this case, the IEA is very important for them, mainly to promote companies' complementarity and collaborations. Therefore, C4 has been maintaining close relationships with the IEA of the sector. The interviewee considers that small IT companies need to join efforts to gain competitive advantages and reinforces that C4 needs to promote more collaborations. However, the opinion is that many companies fear to share their know-how, which represents one of the consequences for the low levels of partnerships and collaborations that we still assist nowadays. In addition, the cultural aspect and the lack of promotion of entrepreneurship in Portugal can be other problems.

The interviewee points out to the need for improving the mission of the IEAs, transforming them into more collaborative networks. The IEA of the sector must understand who is really interested in participating in internationalization initiatives (for example) and then promote these successful initiatives for its members. If the IEA is able to present a real added value for companies, its members can really recognize the importance of its services and even pay more to have access to the services of the IEA. Therefore, the interviewee considers that "the IEA needs to foster this sense of collaboration and inject adrenaline into its associates… this is also essential for the own promotion of the association."

Regarding the information sharing process, the interviewee thinks that, currently, the IEA fails to be a good information manager. Having information content with quality is fundamental for the activities of C4. For example, the IEA has no relevant information about the associates themselves, such as the results obtained with specific initiatives. One suggestion from the interviewee is the IEA to have reports about internationalization experiences and share this information with its network of associated companies.

Finally, analyzing the possibility of using a platform, the interviewee thinks that C4 must be able to feel a real need to work with this kind of solutions. Moreover, it only makes sense if Universities and research institutes can participate in the development of such platform. This approach of bringing together the business world with the academic world is very important in the interviewee's opinion. Another relevant aspect for this topic is the governance part of the platform. The interviewee refers that a content manager is critical and that the IEA must have this role of information manager. However, companies must have interest and also contribute with content.

Case 5: Startup, Medical Devices

C5 is a startup that aims to develop biomedical engineering solutions to aid medical diagnosis. The internationalization process of this company has been a challenge but with successful initiatives in the last years.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

C5 is not currently a member of any IEA. Nevertheless, this startup has interest in being associated with one IEA or even with one science and technology park. The board of C5 is now trying to understand what makes sense to decide at this stage for meeting the company's interests. The perspective from the interviewee is that C5 is not associated with the IEA of the sector because of its life stage. This startup made some errors and wrong choices in the past, which made it difficult to reach a good baseline for obtaining successful associative schemes. However, C5 was able to learn with its own errors and now can think in some collaborative and associative arrangements. The interviewee thinks that another good possibility is for C5 to be part of a science and technology park. C5 is a startup that started in a University, through a spin-off, but it is now integrated in a business center. But the problem is that the other organizations of this business center are mostly medium and large enterprises, which have completely different thinking and functioning strategies. The opinion of the interviewee is that being in a Science and Technology Park can be better for them as a matter that *"it is the same air that we breathe"*. The interaction with other startups can be better in terms of ideas and knowledge sharing. However, this is a difficult decision for the manager of C5 as it maybe represents a step back for the company's path and objectives, as it requires some changes in the management and in the structure of the company.

Regarding collaborations with other companies the interviewee considers that this is very important, even in cases of bigger companies helping smaller ones in specific aspects and vice-versa. An example is when there are two companies, one MNE and one SME, which work in the same area but targeting different customers. The MNE can help the SME in terms of specific consulting services, such as quality norms, through a process of knowledge sharing. The problem is still the lack of willingness to collaborate and to help others. The interviewee thinks that large companies already understand the importance of these collaborations. For the rest, people want this work to be done and it is nowadays gaining more acceptance: "What is missing is to point out and to know the path to make this type of infrastructures, be it with the use of technology or with other forms, and understand how you can insert this in people's social and professional life".

Therefore, the possibility of using platforms can help C5 because, according to the interviewee, in many cases, a textile enterprise does not know where to find technology and the technological enterprise probably has difficulties in making the pinpoint for where interested companies are. So a platform may be useful for this matchmaking process. However the problem stills remain in what concerns the collaboration. The interviewee insists that, although having some successful cases, many companies still face problems in moments when information or knowledge needs to be shared or even to create simple collaborations with others. The reason is that each company only cares about its own business and there is no enthusiasm in "wasting time to help others". The interviewee recognizes that maybe this is a matter of countries' culture because in some countries (at least in some cases) things happen in a different way, where associations work well and companies give priority to collaboration processes.

Another opinion is that SMEs have not the same management model of the MNEs and some business managers and economists do not understand this, i.e. general theory and concepts learned in their courses are difficult to transpose to the reality faced by SMEs. So, the interviewee thinks that "we need someone who encourages and motivates, someone who creates new dynamics… and electronics and technologies can create this dynamics".

From the perspective of the interviewee, a platform for information management can be very useful for sectors such as the food industry, where companies need every day to follow and be aware of updates in legislation. Nevertheless, from other side, a platform like this always needs human resources, someone exclusively dedicated to content, and at a national level, many failures happen at the level of content management.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Lastly, in terms of internationalization, the first approach of C5 was to start with the national market but soon realized that, with the intention to increase sales, it would not be possible to only be limited at a domestic level. Therefore, after deciding to start to internationalize, the next decision was to find a way to commercialize the product, i.e. to decide if it would be better to use a distributor, to contact another company, or to choose a door-to-door approach. The first approach was to have an external commercial team to perform door-to-door sales, but it did not work. After that, C5 tried distributors but the doubt here was "Who is going to sell your product? It is the one that sells similar products or the one that will get your product as a differentiator and will leverage other products that already have sales?" So, in this internationalization process there are always issues and doubts, and today is still a challenge for the company.

According to the interviewee, there are many difficulties for people dedicated to the international markets because it is necessary to understand how it works, how the collected information is filtered, and where this information is primarily collected. In the case of C5, information and contacts are collected in three different ways:

1. By being present in conferences and fairs;
2. By direct contact, using their website, where customers and distributors can contact them;
3. By their own search, for example extensive search in the Internet to find partners.

However, there is still many problems and this internationalization process has been lonely for C5. The interviewee considers that "if there is an IT tool (like a platform), where you can understand, maybe find what is your best market, which has a global list of distributors… but at least direct to a right path… today we would be elsewhere in terms of the company's development".

DISCUSSION

Based on empirical evidence from five companies, one of the objectives of this chapter was to have first impressions on the role of IEAs as information managers and promoters of collaborations, mainly for internationalization processes. Accordingly, it defined the following research question: What is the perspective of companies about IEAs as information managers and promoters of collaborations?

The other objective was to understand the acceptance by these companies regarding the use of collaborative platforms managed by IEAs. For this objective, the research question defined was: What companies think of using collaborative platforms, managed by IEAs, for supporting their internationalization processes?

Therefore, regarding the first research question, there are mix feelings. C1 sees the technological center as having good resources and being more adequate than the IEA to promote collaborations among companies. In fact, the two interviewed large enterprises (C1 and C2) do not take many advantages from the services provided by the IEA and have some reluctance in terms of associative schemes. According to C2, a new strategy for the IEA could be to promote the sector instead of promoting specific brands. This by studying specific markets of interest for the sector and by disseminating and inviting foreign companies and the press to come to know this specific industrial sector. Nevertheless, creating collaborations with other associates, mediated by the IEA, is considered by C2 as being important to

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

create joint strategies and to share resources and risks. But to promote more fruitful collaborations, C2 thinks that the IEA should join associates with common interests and with similar economic capacities and resources, in order to reach specific foreign markets of interest.

On the other hand, both C1 and C2 agree that the IEA can play an important role as information manager. C1 considers that the IEA can share mainly legal information (legislation and customs rules, patents), which is one of the main interests of the company. In the case of C2, they think that the IEA can organize and filter some information according to the needs of the associates, such as information about the countries in which each associate is present or have sales. Actually, the sharing of experiences among associates about particular markets is clearly one of the key interests from the perspective of all the interviewed companies. This can allow to understand specific features and rules of markets and to avoid making the same mistakes.

For C3, there is no doubt that the IEA has capabilities to establish good collaboration conditions among the associates and these collaborations are of great importance for the development of the company. Again, the IEA needs here to foster these collaborations by disseminating the skills of each associate to increase their visibility within the sector but also for foreign markets. Regarding the perspective about the IEA as an information manager, C3 considers that the IEA must improve this part and be responsible for providing more wealthy information, for example information related with the activity of each associate and not general information.

In the case of C4, the IEA has been clearly a good promoter of collaborations. However, they think that small companies like C4 need to join more efforts to gain competitive advantages. But the problem is that many companies still have some reluctance in sharing information and this is considered by C4 as being a cultural aspect. So, in this case they consider that the IEA must have a different mission by presenting a more real added value for companies, such as understanding the interests of the associates in participating in specific initiatives and, after that, promoting collaborations for these initiatives. Like the previous cases, C4 considers that currently the IEA does not meet the requirements for being a good information manager. Again, they feel a lack of information about internationalization experiences (reports) of other associates, but even a lack of some information about results obtained with specific initiatives.

Regarding the second research question, all the interviewed companies recognize the potential of using a collaborative platform for supporting not only their internationalization processes but also some other activities. For C1, a tool like this can improve information sharing and facilitate the search for partners and opportunities. C2 also points out that, with the support of a platform, the IEA can share funding and research opportunities, as well as some institutional information. In addition, they think that it can also be interesting for the IEA to align companies with same strategies, resources and philosophies, by creating synergies to approach specific markets. This specific matchmaking process is also pointed out by C3 as one of the possible functions of such platform, but also the function of having another matchmaking between European projects with the research interests of companies. In the case of C4, the possibility of using a collaborative platform only makes sense if entities such as Universities or research institutes have some participation in its development. In their opinion, joining the business world with the academic world is crucial for achieving the success.

Although recognizing the value of such solution, for the interviewed companies there are some important aspects to have in consideration. C1 considers that all parts must share something meaningful in this platform. For C2, transposing all the information management into a platform can be very difficult because they think that most of the companies have no desire in sharing their information for confidential reasons but also due to the lack of time for structuring it in a simple and pleasant way to read.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Another reason is that people may prefer to exchange experiences in more informal ways, with personal contact. Therefore, for C2, a collaborative platform may result if it has not generalized information, but functionalities to create and direct information within groups and market segments. In the case of C3, an important issue is the platform to allow pushing information from different websites of interest and re-organize it for the associates' interests. Finally, C4 thinks that for using a platform, they must be able to feel there a real need. Moreover, in their opinion, the governance part of such solution can be difficult because both the IEA and the associates have resources problems in terms of time, people and finances.

To end this discussion, the case of C5 was interesting to include in this study to understand the perspective of a startup not currently involved in any IEA. Interestingly, C5 is now considering to join an IEA or a Science and Technology Park. In their opinion, they need first to measure all the pros and cons, according to the life stage of the company, to be able to decide. But C5 really believes that collaborations with other companies is fundamental for startups, not only with other startups and SMEs but also with large enterprises. Although remaining the problem in some companies for not wanting to share information, this aspect of collaboration is gaining more importance and acceptance, and C5 thinks that everybody wants this work to be done. Consequently, a platform is considered as a possible good solution, mainly for the matchmaking process of companies finding each other out, as well as for information management activities (e.g. for some sectors, daily follow ups in legislation). However, C5 considers that, to avoid failures, a solution like this needs great human power mostly dedicated to content management.

CONCLUSION

This chapter contributes to the scarce literature of IEAs. Based on empirical evidence from companies associated with IEAs, the contribution is to understand if IEAs can be considered as information managers and promoters of collaborations. Another contribution is to have the perspective from these companies about the possibility of using collaborative platforms, managed by IEAs.

In addition, this chapter also contributes to the scientific knowledge of International Business (IB) by focusing on IEAs as the institutional network support for the internationalization of SMEs. This by discussing the perspective of associated companies and by understanding how this specific institutional context is influencing their internationalization processes.

This chapter shows that IEAs can improve their role in the promotion of more collaborations between their associated companies. This supported by better information management practices. In the specific context of internationalization, SMEs can maximize the success of their internationalization processes and face competitive pressures. With a more active support of IEAs, SMEs can then access and interpret market information, decide on the best internationalization strategy and join competencies with other companies. A collaborative platform managed by IEAs may foster information sharing and also sharing of experiences between associates. This can be general information about foreign market conditions, but also some more specific subjects, such as attractiveness of specific locations and host countries, internationalization strategies or support programs for helping firms to internationalize.

However, there is a lot of work to do in these areas. It seems that many companies still fear to share their information and knowledge with others. The cultural aspect has been indicated as one of the main problems. Therefore, future work must be done in studying different contexts and different countries to understand these cultural problems or other possible problems that are precluding the creation of

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

more collaborations among companies. Regarding the use of collaborative platforms or other types of technologies, companies recognize the impact that these kind of solutions can bring to their activities. Nevertheless, there is important aspects to consider for developing these solutions, such as the informational needs, governance model, information organization, information life-cycle, solution's usability and decision-makers' informational behavior. Finally, future work can also be done in trying to discover new ways for promoting information sharing and collaborations, not only in internationalization but in other contexts such as product development, innovation or research project development. Moreover, networks from different institutional contexts can be explored such as, clusters, incubators, science and technology parks or innovation networks.

Chapter 33
A New Maturity Model for Project Risk Management in the Automotive Industry

Jose Irizar
University of Gloucestershire, UK

Martin George Wynn
University of Gloucestershire, UK

ABSTRACT

The purpose of this article is to present a new maturity model for the assessment and ongoing management of project risk management capability in the automotive industry. The research design is based on a multi-project case study analysis in a major German automotive company. The approach is qualitative and inductive, using 12 in-depth interviews with major stakeholders in the project management function in the company to provide data for the construction of the initial maturity model. This model is then verified and refined via an on-line survey and three follow-up interviews.The findings provide material for the construction of a new maturity model that can be used for the assessment of project risk management capability and as a tool for on-going monitoring and improvement. The model is structured around four dimensions of risk management – identification, assessment, allocation and appetite – and has four maturity stages – rudimentary, intermediate, standardised and corporate. The model is based on a detailed analysis of in-depth interview material in a specific industry sector. It can be used as a basis for similar research in other industries. The model adds to existing risk management maturity models and is unique in being specific to the automotive industry. It can be used by risk and project managers, and can also be adapted to other industry sectors.

1. INTRODUCTION

The management of risk is an integral part of the project management process and project failure remains an area of considerable concern in contemporary project management literature (McClure, 2007). Comprehensive risk management increases the probability of project success, and recent empirical studies show a significant positive relationship between project risk management and project outcomes (Jen, 2009). Risk management has become a significant element of some of the most widely deployed industry standard methodologies, yet there is no universally agreed method for managing risk; and, in part because of this, there have been some attempts to suggest more flexible and creative approaches to risk management (Bollinger, 2010).

Project risk management is a fundamental discipline in most industry sectors and can be defined as the process that dynamically minimizes risk levels by identifying and ranking potential risk events, developing a response plan, and actively monitoring risk during project execution (Zwikael & Ahn, 2011). It has implications for the effectiveness of the project management process itself, and for the management and communication of knowledge that is an inherent part of that process. Several organizations have developed industry specific formal policies and supportive analytical tools. Application of integrated risk management methods can support early risk identification and assessment, thereby improving project outcomes and avoiding delays and cost overruns (Zayed, Amer, & Pan, 2008).

Practitioners and researchers agree on the potential of risk management concepts and methods to improve the likelihood of project success in practice (Bannerman, 2008; Aloini, Dulmin, & Mininno, 2012; Martínez Lamas, Quintas Ferrín, & Pardo Froján, 2012). This research focuses on the development of a new maturity model for the assessment, monitoring and management of project risk capability in the automotive industry, specifically in a European context. The maturity concept first appeared in business and management literature in the 1980s and has become a mainstream concept for assessing organizational capability, and is thus appropriate for the study of risk management in a corporate setting. The following section explores relevant literature in this field, followed by a detailed explanation of the research methodology employed, and how the initial model was developed. It also then discusses how data from the in-depth interviews was analyzed, and how the initial maturity model was verified. Section 4 applies the model to one in-company project as an illustration of how the model can be used, in a manner that can be built upon by other researchers and practitioners. The final section draws together key themes covered in the article and assesses the contribution to research and practice.

2. LITERATURE REVIEW

2.1. The Key Dimensions of Risk

Risk identification is often viewed as the starting point for risk management in projects and is considered to be the most influential risk management activity for project outcomes (de Bakker, Boonstra, & Wortmann, 2012). It is recognized by many project managers as one of the key areas in need of improvement in complex projects (Harvett, 2013). The risk identification process was therefore seen as a key element of the maturity model. Holzmann (2012) views risk management as comprising five main activities, encompassing risk identification, risk assessment, risk allocation, and risk control. Other authors (Bannerman, 2008; Harwood, Ward, & Chapman, 2009) see risk appetite or treatment as an

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

important dimension for overall risk management. This research combines elements drawn from these sources to focus on four main dimensions of risk management: risk identification, risk assessment, risk allocation and risk appetite; and it does not see risk in a purely negative context, but also recognises the potential of positive risks or opportunities.

Risk identification is the process by which the project team detects prospective events which might affect the project and documents their characteristics (Holzmann, 2012). Risk identification is considered to have the highest impact on the effectiveness of project risk management and involves the detection and classification of all known and - as far as is possible - unknown, risks, thus producing the foundation upon which the overall risk management process can be established (Chapman, 2001). Risk identification is also perceived as the most influential risk management activity (de Bakker, Boonstra, & Wortmann, 2011; de Bakker et al., 2012), and particularly in complex projects is seen as an area in need of improvement (Harvett, 2013).

There is a clear link in the extant literature between risk identification and the "risk as a subjective construct" concept. The identification of risk as a subjective phenomenon coincides with its creation – the risk exists only once the stakeholder has identified it. However, as Khan and Burnes (2007) put it, whether one views risk from a subjective or objective standpoint, the key question for organisations is: how can risk be managed? Risk identification can be performed in a number of ways, such as filling in questionnaires, consulting experts or available documentation from previous projects, doing brainstorming sessions, or conducting interviews.

The concept of centricity can also be applied to risk identification, and the other dimensions of risk discussed below. Centricity in a managerial context can be defined as the mind-set or attitude that characterises the manager's or organisation's outlook and motivation in relationship to others (Berntzen, 2013; Olsen & Roper, 1998). The identification of risk as a subjective phenomenon can be seen as person-centric, whereas objective risk identification is at the other end of the centricity spectrum. Visual aids like the Visual Ishikawa Risk Technique (VIRT) can overcome the person-centric identification issue and promote objective risk identification (Jen, 2009). Centricity has been extensively analysed and applied in relation to customer, user and citizen concepts, and also in process and network contexts (Berntzen, 2013; Blakemore, 2006; Lamberti, 2013; McDonald, 2006).

Project *risk assessment* is the stage in the risk management process at which each identified risk is assessed for its probability or likelihood of occurrence, and its impact - in terms of time, cost and quality - on either the project phase or the entire project, should it occur (Patterson, 2002). Risk assessment entails the study of the probability of occurrence and any associated consequences. Generally speaking, two broad categories of risk assessments have been used - qualitative risk assessment and quantitative risk assessments (Dawotola, Gelder, & Vrijling, 2012). Qualitative risk assessment makes use of descriptive scales for the assessment of probabilities, such as risk scores. These scores or rankings are subject to interpretation and therefore entail an inherent level of subjectivity (Dawotola et al., 2012). The application of qualitative risk assessment suffers some serious limitations, mainly the subjectivity of the values estimated. Qualitative risk analyses are flawed in the sense that they can produce wildly different results (Emblemsvåg & Kjølstad, 2006).

Organizations have developed checklists based on which type of risk assessment is performed. Research shows that perception of risk varies between stakeholder groups, over time, across project and life cycle stages, and between cultures. This leads to the conclusion that risk assessment based on published checklists may be biased and/or limited in scope (Bannerman, 2008). Risk matrices are one of the most popular risk assessment methodologies employed across many industries, providing the

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

graphical output that enables the communication of risk assessment. The development of risk matrices (RMs) has taken place in isolation from academic research in decision making and risk management – risk matrices produce arbitrary decisions and risk-management actions. These problems cannot be overcome because they are inherent in the structure of RMs (Thomas, 2013). Their theoretical basis is superficial and the validity of the qualitative information they employ is highly suspect. Assessments of the likelihood of occurrence and their impacts suffer all the shortcomings associated with subjective assessment (Wall, 2011).

Risk allocation is a major task in the overall risk project management process (Harvett, 2013), and is based on the recognition that different parties have different objectives and perceptions of project risk, as well as varying capabilities for managing associated sources of uncertainty. Chapman and Ward (2007) consider risk allocation (or risk ownership as it is sometimes termed) a relevant phase within their formal process framework SHAMPU (Shape, Harness, And Manage Project Uncertainty). It involves allocating responsibility for managing project uncertainty to appropriate project parties. These allocations are fundamental because they can strongly influence the motivation of parties and the extent to which project uncertainty is assessed and managed by each party.

Risk allocation is related to the more general concept of business ownership which has seen a range of business functions take responsibility for various aspects of project delivery. In the past IT or engineering functions often owned exclusively the risk in their related projects. Now, it is often the case that the function in charge of the project helps business partners to take ownership of specific risks and assists them in making assessments and in following compliance mechanisms by themselves (Chobanova, 2014).

Project *risk appetite* (sometimes called risk treatment or risk propensity) reflects an organisation's attitude and strategy towards risk. It encompasses how risk is managed and whether exposure to risk should be reduced, or the impact of risk should be mitigated, transferred, externalized or accepted. These responses can be supported by a framework providing risk factor dependencies and priorities (Aloini et al., 2012). Harwood et al. (2009) see risk propensity as the organizational behavioural tendency towards taking reasonable risks, by recognising, assessing and managing risks. A risk-averse organisation is seen to have low risk appetite, and will take only those risks that are judged to be tolerable and justifiable.

A balanced treatment of risk would focus both on risk and reward. An overemphasized focus on risk versus reward may have considerable influence on strategic decisions such as entering new markets, developing new products or targeting new mergers and acquisitions (TowerGroup, 2014). Resultant executive inaction may lead to loss of potential revenue growth. Education and training in project risk management with subsequent additional experience in the organization can produce a better understanding of risk and reward. Risk management can then be understood as a protection shield, not an action stopper. Manager and employees learn through education and training to take and manage risks, not to avoid them. The organization will treat risk appropriately and not try to circumvent it.

2.2. Existing Maturity Models

The maturity concept has featured in a range of models used for assessing organizational capabilities encompassing the collective skills, abilities and expertise of an organization. Maturity can be understood as a measure of organizational performance in applying these capabilities. There are two major approaches to organizational maturity. The Organisational Project Management Maturity Model (OPM3) measures organisational maturity based on the level of best practices deployment, while the Capacity Maturity Model Integration (CMMI) assesses maturity based on organisational process effectiveness

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

(Man, 2007). Further, organisational capabilities may refer to both processes and projects (Maier, Moultrie, & Clarkson, 2012). Assessing an organization's project risk management maturity level can help develop its project capability and performance. Risk management maturity reflects the organization's understanding of its risk portfolio and its attitude towards those risks. Organizations intending to implement or improve their project risk management need a framework against which they can benchmark their current practice (Zou et al., 2009), and maturity models can be used to identify the priority areas in need of improvement, and remedial actions can then be taken to increase performance (Hopkinson, 2012; Ciorciari & Blattner, 2008).

Hillson (1997) was an early proponent of risk maturity models. His approach consisted of four attributes (culture, process, experience and application) and four levels of maturity. His model (Table 1) is not industry specific and does not focus on risk in projects, but is a general organisational approach to risk. Yeo and Ren (2009) developed and tested a five-level maturity model (initial, repeatable, defined, managed, and optimizing) with three key capability areas: organization culture; risk management process; and risk management knowledge and technology, based on research of Asian offshore and marine projects. Similarly, Zou et al's. (2009) risk management maturity model was industry specific, in this case the construction industry in Asia and Australia. It had four maturity levels (initial, repeated, managed and optimized), and encompasses risk identification, risk assessment and risk appetite - but not risk allocation - in projects.

An extension of Hilson's maturity model is Hopkinson's (2012) Project Risk Maturity Model, which establishes a framework for assessing risk management capability against recognised standards. Hopkinson's model offers a working model to assess risk management capacity and applies it to an equipment procurement case study. Crawford (2006) identified some key issues for developing and applying project management related maturity models. One is the intrinsic subjectivity associated with the determination of an organisation's maturity. Crawford also concluded that, rather than necessarily striving to achieve the next level of maturity, organizations should instead determine their minimum level of maturity at which optimum value can be achieved (Crawford, 2006). Maier et al. (2012) established a roadmap to develop maturity grids for assessing organizational capabilities. They review existing maturity models and conclude that they offer a contemporary representation of different conceptualizations of organizational practices and capabilities that are viewed as important for success.

2.3. Provisional Conceptual Framework

Whilst some of these maturity models are of value in certain industry contexts, there is no maturity model specifically geared to project risk management in the automobile industry. This research addresses this gap by building and verifying a maturity model for the automotive industry in Europe. The initial conceptual framework for this model builds upon the four dimensions of risk discussed above – identification, assessment, allocation and appetite. These can be defined as:

- **Risk Identification:** The process by which the project team detects prospective events which might affect the project and documents their characteristics (Holzmann, 2012).
- **Risk Assessment:** The stage in risk management at which the identified risk is assessed for its probability (likelihood) of occurrence and its impact, in terms of time, cost and quality (Patterson & Neailey, 2002).

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Table 1. Attributes of Hillson's Risk Maturity Model (Hillson, 1997)

	LEVEL 1 - NAIVE	LEVEL 2 - NOVICE	LEVEL 3 - NORMALISED	LEVEL 4 - NATURAL
DEFINITION	Unaware of the need for management of risk. No structured approach to dealing with uncertainty. Repetitive & reactive management processes. Little or no attempt to learn from past or to prepare for future.	Experimenting with risk management, through a small number of individuals. No generic structured approach in place. Aware of potential benefits of managing risk, but ineffective implementation, not gaining full benefits.	Management of risk built into routine business processes. Risk management implemented on most or all projects. Formalised generic risk processes. Benefits understood at all levels of the organisation, although not always consistently achieved.	Risk-aware culture, with proactive approach to risk management in all aspects of the business. Active use of risk information to improve business processes and gain competitive advantage. Emphasis on opportunity management ("positive risk").
CULTURE	No risk awareness. Resistant/reluctant t to change. Tendency to continue with existing processes.	Risk process may be viewed as an additional overhead with variable benefits. Risk management only used on selected projects	Accepted policy for risk management. Benefits recognised & expected. Prepared to commit resources in order to reap gains.	Top-down commitment to risk management, with leadership by example. Proactive risk management encouraged & rewarded.
PROCESS	No formal processes.	No generic format processes, although some specific formal methods may be in use. Process effectiveness depends heavily on the skills of the in-house risk team and availability of external support.	Generic processes applied to most projects. Formal processes, incorporated into quality system. Active allocation & management of risk budgets at all levels, Limited need for external support.	Risk-based business processes. "Total Risk Management" permeating entire business. Regular refreshing & updating of processes. Routine risk metrics with constant feedback for improvement
EXPERIENCE	No understanding of risk principles or language.	Limited to individuals who may have had little or no formal training.	ln-house core of expertise, formally trained in basic skills. Development of specific processes and tools.	All staff risk-aware & using basic skills. Learning from experience as part of the process. Regular external training to enhance skills.
APPLICATION	No structured application. No dedicated resources. No risk tools.	Inconsistent application. Variable availability of staff. Ad hoc collection of tools and methods.	Routine & consistent application to all projects. Committed resources. Integrated act of tools and methods.	Second-nature, applied to all activities. Risk-based reporting & decision-making. State-of-the-art tools and methods.

- **Risk Allocation:** The assignment of the responsibility for managing specific project risks or uncertainty to appropriate project individuals or parties (Harvett, 2013).
- **Risk Appetite:** The organizational (or individual) behavioural tendency regarding how to take reasonable risks (Aloini et al., 2012).

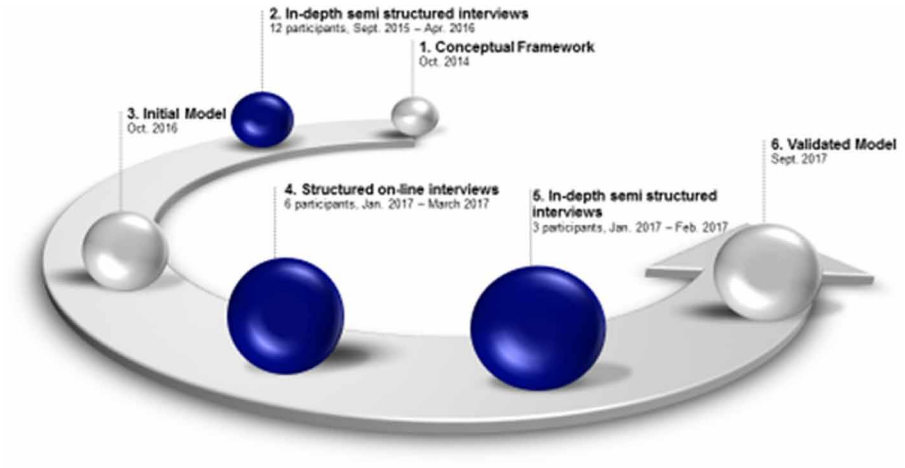
The research attempts to identify typical risk characteristics that can be associated with each of these four dimensions of risk at different stages of maturity in the risk management process. Like some of the models discussed above, the proposed model was assigned four stages with provisional stage labels of Rudimentary, Intermediate, Standardised and Corporate. Maturity models typically have either four or

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

five stages, but in the five stage models, the difference between stages one and two is generally minimal, with stage one often describing a non-existent or minimal initial capability. Four stage models have the additional benefit of avoiding an assessor's tendency to select middle values (Zou et al., 2009). These stages can be defined as follows:

- **Rudimentary:** The organisation has no sense of need for risk management; teams do not follow any common approach in managing risks. Project risk activities are reactive and no lessons learned or improvement process is established. Typically no project risk plan exists.
- **Intermediate:** Some project management practitioners undertake certain project risk management activities. Neither these activities, nor the systems and applications used to support risk management, are standardised. The organisation does not gain the full benefit of implementing these risk management activities.
- **Standardised:** Risk management is seen as part of core business processes, and risk responses and their effectiveness are reviewed in most projects. Systems and applications supporting risk management are accessible and lessons learned are established to improve the overall risk management process.
- **Corporate:** The entire organisation recognises and values risk management, which is integrated into other processes. Executives actively audit and support risk owners. Multi-user risk databases are widely available and used as part of continuous improvement programs.

3. RESEARCH METHODOLOGY



3.1. Overview of the Research Process

The overall research process (following the literature review) is depicted in Figure 1, and consists of six main steps. The process was largely sequential, although the interviews in steps four and five were conducted partly in parallel but independent from each other. The research centres on a single company case study, with two projects within that company analysed. The case study entails a "…detailed investigation of one or more organisations, or groups within organisations, with a view to providing an analysis of the context and processes involved in the phenomenon under study…" (Hartley, 2004, p. 323). This is exploratory research that adopts a qualitative approach. Project management success is complex, messy, and involves a range of stakeholders with different concerns and perceptions (Skinner, Tagg, & Holloway, 2000). A qualitative approach is particularly appropriate for research that seeks to explore real organizational goals, linkages and processes in organizations; to understand the failure of policies and practices (Marshall & Rossman, 2014).

The research is inductive, in that it builds explanations of risk management in practice from the ground up, based on interview evidence, observations, and analysis of available documentation. The interview is an important source for collecting data, and may take several forms (Yin, 2012). To achieve quality in data collection, interviews must be carefully planned. Data collection was undertaken through 12 semi-structured interviews, three follow-up in-depth interviews, an on-line survey, informal discussions, secondary material, and participant observation. The first batch of interviews, involving the 12 participants, were conducted in 2015/2016 (step 2 in Figure 1).

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 1. Research design, model development and validation process

This research took place within the automotive industry, one of the leading manufacturing industries worldwide, where scientific method has an undeniable influence in manufacturing industry development. Operational research and systems engineering are two of the main academic disciplines that provide the basis for process improvements in this industry. The underlying theoretical perspective of these disciplines is positivism (Taylor, 1911), and the concept of separating planning from doing is reflected in the emphasis on planning and control in modern project management. Furthermore, rationality, universality, objectivity, value-free decision making, and the possibility of generating law-like predictions in knowledge are basic assumptions of modern project management (Gauthier & Ika, 2012). The traditional project management paradigm has been described as "rational, normative, positivist and reductionist" (Harvett, 2013, p. 51).

The study aligns with recent academic research from authors such as Harvett (2013), Niebecker (2009) and Olsson (2006) all of which explicitly characterize their work on project risk management in practice as post-positivist. These authors criticise the existing methodologies as putting forward a too mechanistic and simplistic view of the risk management process. In similar fashion, although addressing different questions, this study complements the bald prescriptions from guides and methodologies through a qualitative research approach that identifies descriptive labels specific to different risk management contexts. Some may suggest this is an interpretivist approach, but interpretivism, as an alternative to the positivist orthodoxy, assumes there is no absolute truth, but multiple realities and is based on subjectivity (Biedenbach & Müller, 2011). However, this research assumes there is an answer to the questions posed, even if the researcher must seek for the consensus views of the practitioners to validate what is known. For the interpretivist, all meaning is believed to be subjective, based on subjective perceptions and experiences with external environmental factors. This research adopts a post-positivist stance which looks for an objective, singular truth, thus differentiating it from the interpretivist paradigm (Phoenix et al., 2013).

De Bakker et al. (2011, 2012) argue that individual risk management activities generate communicative effects which contribute to the effectiveness of instrumental actions and thus to project success. This communicative effect, not considered by the positivist tradition, is a significant component of the post-positivist view, and creates the context which influences the setting, itself an integral component of

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

activity that cannot be ignored. This study takes the post–positivist view of the world as open to interpretation in line with the observations of Krane, Olsson, and Rolstadås (2012) regarding different perspectives of risk held by project teams and project owners. The understanding of risk in the automotive project environment can be enhanced by the project stakeholders' subjective explanation of the phenomenon. This broader view of risk helps to better deal with threats and therefore to improve project outcomes.

The projects which serve as context for the case study are the implementation of SAP - a mainstream Enterprise Resource Planning (ERP) system - in several manufacturing facilities in Europe, and the launch preparation for serial production of new driver assistance systems for international car makers. The unit of analysis is the entire organisation. Following Yin's (2012) distinctions of designs for case studies, the one chosen in this research is holistic as opposed to embedded, in which more than one unit of the organisation are the units of analysis (Saunders, Lewis, & Thornhill, 2009). To obtain a general understanding of project risk management, project managers from the Research and Development (R&D) departments and also from the Information Technology departments were interviewed and their projects analysed.

In the selection of the organisation as the case study, several factors were considered - its regional presence, customer mix, and product catalogue. These characteristics make it a fair example of a global automotive supplier organisation. The company has over 135,000 employees, around 200 production facilities in some 40 countries, sales of €35.2 billion in 2016, and a yearly investment on R&D of about €2 billion. It is highly dependent on the success of its new projects and the smooth launch of serial production for global customers. Project risk management is a fundamental aspect of its project management process, and is applied globally. Project risks are documented, evaluated and risk controls are applied, and the risk management process is reviewed regularly to adapt it to the market challenges. A recent and dramatic example of the criticality of project risk management in the global supplier automotive industry has been the well-publicised failure to apply risk controls by one of Volkswagen AG's suppliers, resulting in the halting of production at six VW plants and a cut in hours for 28,000 workers.

3.2. Data Gathering and Interviewing Procedures

This research entails the collection of data on one single case from several groups in the organisation. The research phase was conducted over an eighteen month period with the results considered as having been obtained in a single point in time (Bryman & Bell, 2011), although do not focus on showing changes over time (Rübesam, 2015). Fourteen potential interviewees were initially invited, and 12 of them accepted the invitation. These business leads were chosen because collectively they represented project managers of major projects with high impact to the organization. An initial semi-structured interview took place with these 12 personnel (Table 2), in which their previous experience with regards to project risk management and their understanding of the risk management dimensions were explored. The Participant Consent form and the project information sheet were sent in advance to the participants, together with an interview agenda and questionnaire.

These interviews were conducted between April and November 2016 using responsive interviewing (Rubin & Rubin, 2011). This form of interviewing assumes that people interpret events and construct their own understanding of what happened, and that the researcher's job is to listen, balance, and analyse these constructions in order to understand how people see their world. Different from an ordinary conversation, responsive interviewing seeks detail, depth, vividness, nuance and richness. This technique encourages the researcher to adapt to new information and change directions if necessary to obtain greater depth on unanticipated insights.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Table 2. Roles and experience of the 12 interviewees

*1. **Program Manager:** 8 years' experience as Project Manager – published articles on project risk management, PMP*
*2. **European ERP Manager:** 12 years' experience in IT and project management as project manager and Steering Committee member, PhD in IT, PMP*
*3. **VP Program Management Global:** 25 years' experience in Project Management, responsible for the Project and Project Risk Management methodology, training, templates and business process methods defined/deployed through the global organization, PMP*
*4. **Global ERP Manager:** 20 years' experience, responsible for ERP competency center, responsible of several ERP rollouts worldwide, PMP*
*5. **Director, Global Program Management of business unit:** 20 years' experience, responsible of the global business unit programs, manager of 15 program managers, experience with Project Risk management quantitative methods such as Monte Carlo, PMP*
*6. **Chief Engineer, PMO lead:** 15 years' experience, responsible of the PMO, engineering programs methodologies and systems, PMP*

*11. **Applications Engineer and Project Manager:** 5 years' experience, Project Risk management expert, co-author of the internal project risk management procedures.*
*12. **Senior Vice President, business unit:** 15 years' experience - ultimate responsibility for 12 sites in 9 countries, acting as Sponsor and/or senior Steering Committee member on major customer programs.*

The questions were grouped according to the four sequential project risk management dimensions. To support and balance these main questions, follow-up questions were developed to ensure breadth of discussion of each of the risk dimensions. The interview was introduced by a brief presentation using PowerPoint slides, to set the scene. Just four slides were discussed initially, and the remaining three slides were discussed in combination with questions. The interviews finished with a debriefing, requesting whether anything else could be relevant to the questions discussed, any other aspect that should be mentioned, or any question needing further elaboration. All 12 stakeholder interviews were transcribed verbatim, resulting in 135 pages of transcripts. These were then analysed and the initial version of the maturity model was constructed.

Having built the initial model from data collected through the 12 semi-structured interviews, this was then tested for validity and relevance (Maier et al., 2012). First, an online survey was undertaken involving six practitioners who were contacted by phone where the maturity model and the aim of the online survey was discussed. The responders were then requested to assign each of the 151 statements emanating from the interviews to one of the four maturity stages via an online form distributed via Google forms; a simple tool used to create and distribute questionnaires. The respondents answered the survey on their own with no influence from the researcher, and the responses were collected and stored in a repository.

Out of the six practitioners who participated in this on-line survey, four had already participated in the previous in-depth responsive interviews conducted to develop the initial risk management maturity model. The other two participants were project managers from the same company with relevant experience that could provide a broader perspective in answering the survey questions. These on-line surveys were conducted between January and March 2017. In a further step to verify and refine the model, additional in-depth structured interviews were carried out with another three of the 12 participants from the first interviews. The interviews were conducted in January and February 2017.

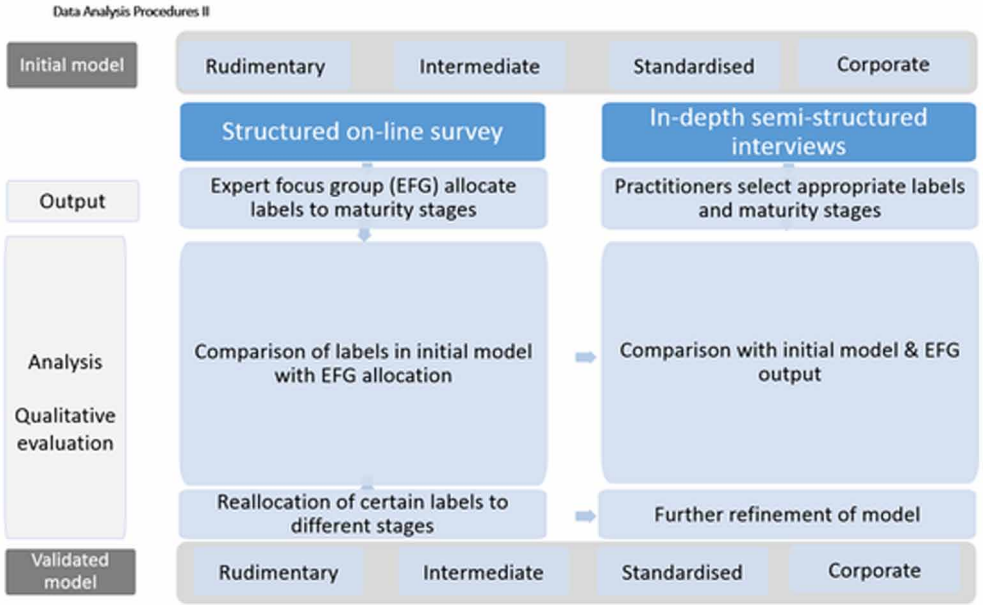
3.3. Model Development

The qualitative analysis to develop the initial model is depicted in Figure 2, and followed the ideas of Hopkinson (2012) and approach of Maier et al. (2012) on how to develop maturity grids based on organisational capability assessments. The responsive interviews included discussion of project related experiences of risk management, open-ended questions, and supplementary ratings to affirm and clarify meaning, particularly regarding the four dimensions of risk, and the maturity model stages. The data collected through interviews with practitioners and executives were analysed in line with the three step approach recommended by Creswell (2007): prepare and organise the data in transcripts, reduce the data into themes through coding and condensing the codes, and finally represent the data in figures, tables, or discussion. Continual synthesis of the data, thematic analysis, data reduction and coding were the basis for the data analysis. Building on the initial conceptual framework, the model was developed using initial categories for thematic analysis in searching through the transcript data. The transcripts were carefully read looking for keywords, trends, themes, or ideas in the data.



Certain data reduction techniques were applied without deemphasizing the importance of the context and richness of the data themselves (Namey, Guest, Thairu, & Johnson., 2008). The primary structural coding used was based on the four risk dimensions analysed. A secondary coding was done in the form of statements that were assigned to one of two extremes, either elementary (left) or advanced (right). This process then refined in a third stage that took the two extreme categories (elementary and advanced) and extended them to encompass the four categories or stages in the provisional model: rudimentary, intermediate, standardised and corporate. The data was assigned to the four stages by comparing the statements with the literature and quotes from the transcripts. The data was further processed into a set of "labels" or summary statements, and these were grouped into four types: people, organisation, process and systems. Finally, these labels were structured into a matrix form to build the maturity model. In order to simplify the number of label types, these were reduced to two: "process and systems" and

Figure 2. Data analysis procedures for development of the initial project risk maturity model

Figure 3. Data analysis procedures for validation and amendment of the initial model

"organisational and people" aspects. The initial maturity model was then subject to assessment and validation in two stages – via an on-line form circulated to six participants (the expert focus group in Figure 3), and then with three follow-up in depth interviews.

4. RESULTS AND MODEL APPLICATION

The resultant model comprises 156 labels allocated to one of the four dimensions of risk and to one of the four stages in the model. Following the verification process, the positioning of 51 of the labels was changed, 49 being changed by one stage in the model and 2 by two stages. For purposes of illustration, the model is now applied to one of the in-company projects, entailing the product development of a mechanical steering gear product for an international automotive Original Equipment Manufacturer (OEM). It encompasses formal customer confirmation of product technical and quality requirements, initial contractual forecast of volumes in a multi-years-period, and engineering product development through the start-of-production. As the steering system will finally be assembled in different countries with specific requirements and technical specifications, such as in the UK or Russia, several product variations needed to be validated.

The project team consisted of about 20 individuals with representatives of all functions involved in the project: Program Management; Sales; Engineering; Purchasing; Finance; Manufacturing and Logistics. The project followed a formal product development and introduction management process, which included risk management. The program manager reported directly to the Program Management Director, while the other team members reported into their departmental managers, with only a dotted line reporting to the project manager.

4.1. Risk Identification

The overall assessment regarding risk identification indicated the project was at the intermediate stage, with several characteristics of the standardised stage (Figure 4). Most project team members have several years' experience in project management, several of them are formally trained in project management, in which however only basic notions of risk management were discussed. The notions of risk management included providing instructions on how to use the risk register and fill in risk required information during the project phase exits. Mainly due to their professional experience, team members felt comfortable reviewing or discussing risks. When requested, they contributed openly with their input. Only the project manager had been specifically trained in project risk management. Management recognises the value of project risk management, but advanced training in risk management is not considered.

Risk descriptions are clear and address key issues in most cases. The documented risks in the risk register were generally well understood by the involved parts, e.g. regarding a risk associated with a new non-validated required technical solution the two involved functions - sourcing and sales support - coordinated the required risk response plan. This ensured the integration of all stakeholder views. End users, in this case the OEM, were informed about certain existing risks.

There is evidence in the risk register that a majority of risks have been identified and documented far in advance of their potential occurrence. Risk registers and phase exits required documentation to classify risk. Risk items were updated regularly and discussed with senior management as part of the phase exits. Lessons learned were supported by standard processes. Risk management was rarely the subject of review in lessons learned exercises or continuous improvement initiatives. Lessons learned

Figure 4. Risk identification capability assessment in the new product development project (blue labels match current project status; red labels are relevant but do not apply to current project status; black labels are not relevant to the particular project environment)

IDENTIFICATION						
	RUDIMENTARY	Negative perception of risk	End users no involvement with risk identification process	Fear of raising risk concerns	Compliancy risks not identified even though may exist	Risk identification is ad-hoc, basic, hit and miss
	INTERMEDIATE	People make full use of their freedom to act	Lack of integration of all stakeholder views	Disagreement among stakeholders if an event is a risk, subjectivity	Some compliancy aspects addressed but may have omitted significant ones	Potentially significant risk items may be omitted in reporting
		Lack of knowledge regarding what risk or uncertainty mean	Risk identification process characterised by subjectivity	No visibility of risk identification tasks / activities in project plan	Isolated non coordinated risk identification	Risk description is ambiguous, misleading
			New risks identified as they occur	Some remaining subjectivity (cultural differences)	Only focused on individual risks, managed at lower levels within team	Lessons learned not standardised. Unstructured documentation
	STANDARDISED	End users have an active role in the identification process	Timely integration of previous phases	Clear risk classification (standard risks)	Set minimum frequency risk identification rules with senior members	Shared understanding of group approach to risk identification
		Recognises risk management but not ready to invest resources	Instructions with project categorization / risk sources identification	Routine planning reviews to aid risk identification	Bridge from the lessons learned into the risk identification process	Mechanism identifies gaps between planned tasks and resources available
		Use quantitative risk methods (Montecarlo) to avoid subjectivity	Established procedure for contradictory views (objectivise)	A risk identification process guide may be available Visibility on new sourcing, 'make-or-buy' decisions	Visibility of implications of risks associated with all relevant suppliers	Structured accessible lessons learned & risk registers database (DB)
	CORPORATE	Earned Value (EV) monitoring highlights project performance shortfalls	Integrated process with involvement of all stakeholders	Formal communication regarding risk interrelations between projects	Top down approach related to project purpose and strategy	Real time reporting based on realistic data from all stakeholders

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

documentation was not easily analysed, and no specific risk management lessons learned were in place. Formal communication of potential risk interrelations between relevant personnel responsible for risk was missing.

Risk identification remains subjective in certain cases. One reason for this is the cultural differences which are accentuated by the virtual character or the team, with groups in dispersed geographical locations and infrequent face-to-face meetings. Analysis of the project's risk register shows five risk documented items which could be adjudged as subjective or subjectively identified. Four out of these five risks can be classified as "project schedule risks" (where timescale is a major uncertainty), and the fifth one can be classified as a "specification risk" (where completeness of specification is at risk). A lack of collective, objective assessment is indicated by the fact that, in the risk register, the risk type or risk category was not adequately maintained or updated by the project manager or any other team member during the project life cycle; and once the countermeasures agreed to mitigate the risk items were completed, these risks were then eliminated from the register without adequate consideration. From the risk register, examples of "project schedule risks" included "risk of delay in design verification due to component prototype timing" and "potential misalignment between supplier key product characteristics matrices". In the first example, once the manufacturing team had confirmed the prototype timing was not an issue for design verification, the risk item was closed. In a similar manner, for the second item, after the engineering representatives confirmed that there was no misalignment between the two lists with the responsible suppliers, the risk item was closed. The result of this confirmation was risk elimination. Project risk identification was not supported by use of any causal decision method, quantitative risk method, or earned value monitoring.

The computer applications supporting project management documentation were very limited in providing project risk management data. There were no intelligent systems which could enable querying and analysis of project risk management data in available project documentation. The involvement of certain stakeholders in risk identification was suboptimal, and the identification process did not reflect the overall project purpose and strategy, but the concerns isolated assessment of individual risks.

To fully reach the standardised stage, the model indicates a number of possible initiatives relevant to this project context and environment: first, increasing knowledge and usage of quantitative risk methods; second, improved usage and availability of lessons learned; and third, visibility of planned tasks against committed resources. Applying, for example, a first pass approach to estimate and evaluate uncertainties using the net present value (NPV) and Monte Carlo simulation is a simple and effective way to establish a simple risk model. Assessing and applying available lessons learned data and developing a reporting tool would also provide immediate benefit and require relatively little additional resource

4.2. Risk Assessment

As regards project risk assessment, the project exhibited most characteristics at the intermediate stage, but with some also at the standardised and rudimentary stages (Figure 5). The project risk management plan and risk register instructions exclusively consider risk items with negative impact, but not the potential of positive risks or opportunities. A higher focus on project issues than on risk is reflected in considerably higher time and resources dedicated to manage open item lists rather than on assessing and updating risks. The documented risk descriptions provide an indication of the source of risk and these are useful for qualitative risk analysis. Schedule analysis considers the documented risks using solely qualitative analysis. There is evidence of risk register maintenance, and consequently the identified risks

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 5. Risk assessment capability assessment new product development project (blue labels match current project status; red labels are relevant but do not apply to current project status; black labels are not relevant to the particular project environment)

are allocated to prescribed risk categories. Experts assess risk using mainly qualitative methods. Few quantitative methods are used in quality management in the product design phase. Probability estimation is weak, the lack of standard impact and estimation methodologies increases the risk estimation subjectivity. There are shortcomings in the methods used for risk prioritisation and quantification. The secondary effects of risks are not considered. Data on risk items which subsequently became project issues, or on the linkage and clustering of risks, is not available and existing computer applications do not support advanced data searches and queries. There is a clear procedure for risk assessment which establishes a minimum frequency for assessment activities, and evidence of the risk assessments is available. The project risk management plan is adapted to the project complexity, defined by the project categorisation.

To advance the risk management process and move to a consistent standardised stage for risk assessment, the model suggests several initiatives that could be pursued. First, improve risk analysis with the use of risk quantification and quantitative analysis. This analysis would allow improved integration risk management and cost planning. Second, the risk assessment would improve with a better understanding of the identified secondary risk effects, e.g. potential delays in new parts development may retain resources planned for next planned tasks and exacerbate other identified risks. Another opportunity would be to improve the risk management data structure and its reporting ability.

4.3. Risk Allocation

The model indicates that risk allocation resides between the intermediate and the standardized stages, and near to being fully aligned to the standardized stage (Figure 6). Risk allocation is equitably distributed among the business streams active in the project with participation of the purchasing, engineering,

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

sales, and manufacturing functions. The risk allocation process is led by the project manager who is open to others' inputs. The project manager demonstrates the ability to identify groups not involved in risk allocation and has experience in assigning risks across several groups. Project management and engineering are the drivers of risk allocation.

Expertise within teams is recognized and harnessed, but some functional representatives with dotted line reporting to the project manager limit and negatively affect their level of involvement in risk management activities. All risks have a risk owner with authority who accepts responsibility. Existing prescriptive risk classification of the documented items in the risk register does not enable allocation automation to existing job roles. There is evidence that risk item allocation is systematically reviewed according to the risk management plan. The project is characterized by fluid communication between customers and vendors. The contractual agreements specify financial liabilities for all parties, supplier with OEM, and sub-supplier with supplier. However, this is mainly about transferring risks from customer to vendors instead of developing risk sharing arrangements. The suppliers provide risk information, albeit sometimes late or incomplete.

To achieve a consistent standardized stage, the maturity model indicates a number of possible beneficial initiatives. First, improve the overall organisation attitude towards risk management. This is clearly reflected in the low recognition or support for appropriate risk management practice during steering committee meetings, and the very loose collaboration with suppliers to undertake complementary risk management. Further, within the project team, not all people working in the project actually use the risk management plan. With the exception of the engineering and project management team members, there is no evidence of autonomous risk allocation within other groups. There were no existing business guidelines regarding the risk taker.

4.4. Risk Appetite

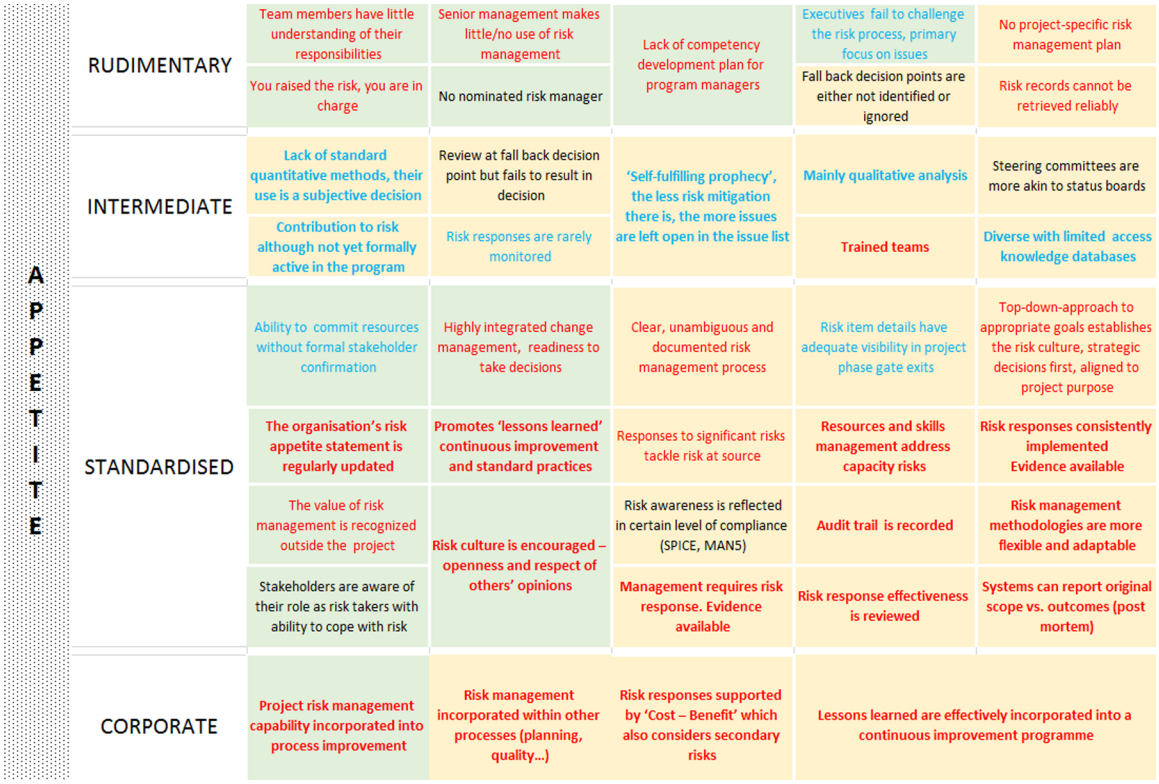
As regards risk appetite, the project exhibited mainly characteristics of the intermediate stage, but also some from the standardized stages (Figure 7). Executives responsible for the project failed to challenge the risk process, and did not review risk details or their prioritization. The risk management knowledge in the team only allowed it to perform simple qualitative risk analysis. There were no standard quantitative methods available, and their use is dependent on the project manager's knowledge and decision making. Not all project team members were trained in risk management. The risk responses and risk mitigation activities were not properly monitored and controlled. As a consequence, the number or issues increased which required increased management attention, reducing further time and resources dedicated to project risk management. This situation has been depicted as a "self-fulfilling prophecy".

There were some characteristics of the standardized stage that were evident in the project. Identified risk items had adequate visibility during the formal project phase exits, and certain team members had shown their ability to commit resources prior to receiving customer order confirmation. On the other hand, there was no formal risk appetite statement at organizational level. Risk data was available on diverse non-integrated systems with limited access to limited team members.

Risk mitigation activities with impact on cost, schedule, quality or regulatory compliance were not considered as part of change management, and the integration of risk management and change management was weak. Lessons learned sessions were not formally documented and data was not easily available. Historical valuable information for risk analysis, such as original scope vs. outcomes in previous projects, was also not available. Decisions relating to risk management are sometimes not considered in

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 6. Risk allocation capability assessment new product development project (blue labels match current project status; red labels are relevant but do not apply to current project status; black labels are not relevant to the particular project environment)



a timely manner in the change management process. A comprehensive programme of risk management training for all the project team members was required as a first step to move risk appetite to a consistent standardized stage in the maturity model.

Overall, the model has limitations. It has been developed from a small sample of practitioners in the German automotive industry. However, the participants have over 200 years of relevant project management experience between them, providing a unique knowledge base that was explored in depth in the interviews. Although the focus was on two current projects in their current company environment, previous knowledge and experience also informed judgements on the significance of specific factors, processes, or capabilities. The model is also aligned to the automotive industry and the particular type of projects that operate in this environment. The qualitative model provides a set of characteristics (labels) typifying different stages of risk management maturity, relating to both processes and systems, and to organisational and people aspects.

Future research directions will focus on using the model in different business environments, and developing its pedagogic and operational potential. The application of the model to date has provided valuable insights into the subjective phenomena of success and failure, and the link to the maturity concept has added to this area of knowledge. The model will be applied by the authors in other contexts in the host company, but would also benefit from application in other automotive organizations in other countries, and then in different industries. It has the potential to be developed into a more generic model with wider applicability, with more industry specific variations at a secondary level.

5. CONCLUSION

This article sets out a new maturity model for assessing risk management capability in the automotive industry in Germany. The model is based on 12 responsive interviews that provided the base material for model construction. The model was then validated and refined through an on-line survey and follow-up interviews with three of the original interviewees. The model can be used to gauge the capability level of an organization as a whole, or can be used to assess a particular project. Once an initial assessment of maturity stages has been made, the model can be used as a guide or for the development of action plans and initiatives to improve different aspects of risk management.

The model can be used in practice in a variety of ways and contexts and for different purposes. Company project practitioners may select the appropriate labels from each dimension to assess their risk management capability. Senior management and project practitioners can identify a desired maturity stage; identify gaps in their capabilities with the help of the label descriptors; and develop a list of actions required to reach the chosen stage. In a training or workshop session, the model can also be "deconstructed", removing the allocation of labels to specific maturity stages, and project participants to select labels that appear most appropriate to the environment in which they work. Ensuing debate can then suggest the current maturity level for that particular project risk management environment.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Joustra (2010, p.3) refers to project risk management as a set of activities often perceived as a "bolt-on-extra" rather than being integrated with the project management process and organization. This maturity model can be seen as an integrating matrix that encompasses a range of elements relating to process and systems and to organizations and people. The matrix can also be viewed as a means of achieving improved communication within and across a project team, termed the "instrumental effect of risk management" by de Bakker et al. (2011, p.76). A communicative effect occurs when stakeholders deliberately use risk management to convey messages to others, with the aim of influencing their behaviour, synchronizing their perception, and making them aware of the context and their responsibilities. The matrix stimulates action and increases the effectiveness of the action, synchronizing stakeholders' actions and perceptions, making a situation more predictable which can lead to less uncertainty (de Bakker, Boonstra, & Wortmann, 2014).

This article provides new knowledge on how to integrate multiple rationalities of risk management coexisting in a project with the objective of supporting rational and consistent decisions in projects. As a contribution to theory, the maturity model complements existing models, and is specifically oriented to the automotive industry, one of the major sectors in the global economy which is currently experiencing dramatic disruptions. Supplier dependencies and legal and normative changes are some of the issues constituting serious risk to this industry. The aim of this research was to support automotive companies in the management of project risk.

Chapter 34
E-Commerce in Small and Medium Enterprises in Sri Lanka

Kennedy D Gunawardana
University of Sri Jayewardenepura,, Sri Lanka

ABSTRACT

The growth of information technology in the business world is spreading at a phenomenal rate. The success of a business organization stands at the usage of IT in their business. Growth of e-commerce is the new born business method, which has originated through an extensive usage of IT in their business. This study will focus on the level of adoption of e-commerce in a population of 30 SMEs under the BOI, the relationship between firm-based characteristics and the adoption of e-commerce and also more importantly find out the critical success factors and discover potential benefits of adoption of e-commerce in SMEs. The results on the adoption of e- commerce showed a significant relationship with the two firm-based characteristics. That is management involvement and adoption of IT. The study also identified e- marketing and supplier service as the critical success factors in adoption of e-commerce.

1. INTRODUCTION

Today telecommunications are the keystone of the current technological revolution. The Sri Lankan government is currently on the process of upgrading the Internet infrastructure and developing it in the form of installation of super-fast telecommunication network using fiber optic cables and other necessary hardware. This is mainly due to the fact that Sri Lanka is unable to meet the changing requirements in the World Wide Web due to its weak and poor infrastructure. The rapid advancement in both Internet software and hardware has also lead to more and more organizations allocating resources to meet the changing requirements in E-Commerce. Large corporations, Small and Medium Enterprises (SMEs) and individuals are all investing more and more in the Internet business. The main challenge for these SME s in adoption of E-Commerce is the lack of facility and resources in according to changing needs of the customers. The large corporations are finding no difficulties in their concurrence in E-Commerce world mainly because they have large resources and facilities compared with the SMEs. Senarathna and Wickramasuriya (2011) indicated that in Sri Lankan context there is a positive correlation between the

adhocracy cultural characteristics among the SMEs and the level of e-commerce adoption. The lack of resources has been the major cause that has restricted SMEs in competing with their competitors. It is necessary to provide sufficient information and resources for SMEs by the BOI, since SMEs play a very vital role in the development of our country.

The main problem statement of this research would seek to understand, why and what are the reasons for SMEs to be reluctant to adopt E-Commerce to develop and grow their businesses in Sri Lanka and to identify the relationship between firm-based characteristics and adoption of E-Commerce in SME. It is hoped that with this information, more SMEs would be better prepared before venturing into E-Commerce activities. This information could also be useful for the larger corporations in Sri Lanka and those from abroad who wish to invest in E-Commerce in Sri Lanka. Through this research the SME will understand E-Commerce and its benefits. In the same time in the social benefit point of view this research will help make consumers more Internet friendly by making organizations push for E-Commerce adoption. Online purchasing will be the national shopping mall of the world. E-Commerce will increase consumer convenience and variety in choices; which will lead to the development of the economy of Sri-Lanka. This study will also help contribute to the little literature that exists on the Sri Lankan E-Commerce situation. It will help readers understand the E-Commerce landscape in Sri Lank and build on the studies conducted so far including this research.

2. LITERATURE REVIEW

There have also been a number of perspectives investigated with regard to e-commerce adoption and SMEs in recent studies. Of particular interest is the study by Wymer and Regan (2011) who have investigated the influential factors in the adoption of e-business and e-commerce technologies by SMEs. Further to this, Grandon et al. (2011) have compare e-commerce adoption theories, While Neilson et al. (2010) have examined the international perspective of the development of e-business by wine industry SMEs, and Beynon-Davies (2010) has considered e-business as a regional development driver. Additionally, scupola (2009) has studied the perspectives of e-commerce adoption by SME s in Australia and Denmark, and Williams et al. (2010) have explored small business sale growth in the UK and internationalization links to web site functions.

Sterrett and Shah (1998) and Stockdale and Standing (2004) have argued that micro-sized SMEs can compete with larger organizations through e-commerce as their size enabled them to be more adaptable and responsive to changing condition. Effective e-commerce deployment thus means that enterprises are no longer restricted by geographical locations and are able to compete in new national and global markets, both for customers and suppliers (Damanpour, 2001: Dholakia and Kshetri, 2004). In terms of financial support, Schneider and Perry (2001) and Galloway and Mochrie (2005) have suggested that SME owner/managers require support from government and support agencies to enable an effective transition in mindset. Such support can take multiple forms including business advice and/ or financial backing in grants and loans.

Daniel and Grimshaw (2002) found ICT adoption required consideration of a formal and appropriate ICT strategy (Chaffery, 2002) enterprise culture (Coates, 2001) and potential restructuring (Gulati and Garino, 2001). It was noted that SME owner/managers were reluctant to provide the time and finance to ICT development (Wolcott et al, 2008), without indications attainable benefit (Lockett and Brown, 2000). Lesjak and Vehovar (2005) recognized that ICT use contributed to the creation of current and future

economic benefits, which was reflected in increased market value. Lewis and Cockrill (2002) identified that 71 per cent of SMEs surveyed realized quality benefits in terms of reduced costs, increased efficiency and increased customers. In terms of key success factors, Daniel (2003) identified that integration of ICT services with internal information systems, was an important determinant of eventual effectiveness. Lee (2001) described the change process as a potentially disruptive innovation which could radically alter operating procedures. Indeed, several examples of highly innovative SMEs that were prepared to adopt higher levels of ICT technologies (Loebbecke and Schafer, 2001), and thereby potentially change the nature of their business operations have also emerged

Sadowski et al. (2002) and Bengtsson et al. (2007) suggest that successful adoption of ICT varies according to enterprise size, exporting activity, awareness of benefits, industrial sector, customers and influence of trading partners. Hadaya and Pellerin (2008) for example, considered the understanding of the role of virtual enterprises in supporting manufacturing SMEs' internationalization processes. Furthermore, Poon (2000) identified that customer participation in ICT was critical to success including relationships with suppliers, customers, partners and competitors, as was the nature of the business environment (Furnell and Karweni, 1999). These studies demonstrate that enterprises benefited from ICT deployment (Daniel and Grimshaw, 2002), but specific conditions had to be met to achieve significant benefit. Drew (2003) also noted differences could result in different internal requirements for SMEs, in relation to strategy development, training and support. Whilst adoption success has been reported in non-SMEs (Van Beveren and Thomson, 2002), however, doubt has been expressed regarding SMEs, particularly micro-sized enterprises' ability to exploit ICT successfully, given their limited access to in-house expertise and resources (Beckinsale and Levy, 2004). Levy et al. (2004) recounted that fewer than half the SMEs they surveyed believed that ICT was important.

Kleindl (2000) points out that the internet presents SMEs with a number of challenges, larger, technology enabled business are able to encroach on areas once held only by small companies. As transaction costs fail, it is becoming cost effective for large companies to enter niche markets in which SMEs traditionally had advantages. At the same time, customers in these markets are enabled to search for alternative suppliers. ICT & SMEs enterprises where ICT has a central focus it is employed to support business goals, and objectives as a reaction to customers and competitive forces (gale and Abraham,2005) Poon and Joseph (2001) and Simmons et al. (2011) also reported ICT benefits as increased competitiveness and improved performance. Mehrtens et al. (2001) identified three ICT SME drivers as perceived benefits (Poon and Swatman, 1999a) organizational readiness and external pressures (Ibbotson and Fahey, 2004) The ability of the SME owner/manager to recognize and understand benefits and relevance of ICT utilization also, however, represents an obvious driver towards usage and increased uptake (Bharati and Chaudhury, 2006) within this, owner/manager attitudes were a critical variable in deciding the competitive position of the enterprise. Fillis and Wagner (2005) concluded, for example, that some SMEs were only prepared to grow to a certain size, due to lifestyle influences and consequently the ICT adoption rate varied. Lifestyle business identified that they might adopt a particular level of ICT attainment, but would not actively pursue growth as a business objective (Chibelushi and Costello, 2009). Moreover, they noted the complex variables and relationships within SMEs meant that investment decisions, such as ICT, were not made in isolation. Hodson and Whitelock (2003), for example, differentiated between SMEs that operated as lifestyle businesses and entrepreneurial ventures which actively pursued growth.
