Chapter 66
Challenges for Innovation Due to Firm Size:
The Case of Brazilian Industrial Firms

Graziela Ferrero Zucoloto
Instituto de Pesquisa Econômica Aplicada, Brazil

Mauro Oddo Nogueira
Instituto de Pesquisa Econômica Aplicada, Brazil

ABSTRACT

This chapter analyses the innovative capacity of small firms compared to medium and large firms in Brazilian industry. It presents the Schumpterian debate regarding the role of small and large firms as inductors of innovation, including a brief discussion about the barriers and opportunities for innovation faced by small businesses, particularly in developing countries. The empirical analysis is based on the Brazilian Innovation Survey, which is used to compare the innovative efforts undertaken by small, medium and large enterprises. Its main findings are that in Brazil, large companies predominate in the creation of new products and processes, while smaller perform more effort than those in innovations associated with processes modernization. However, from the observation of the industry sectorial structure, it identifies that in high-tech sectors, Brazilian small companies outperform large in efforts in R&D.

INTRODUCTION

This study aims to analyze the differences in the innovative performance of small, medium and large companies in Brazilian industry. It considers that sectorial characteristics influence in these groups of firms differently. The paper raises the hypothesis that in high-technology sectors, micro and small enterprises (MSEs) aim to take part in the market through differentiation, technological niches and opportunities, while in the lower technology segments the MSEs innovative processes are limited to technical improvement of their industrial plants.

In Brazil, the literature about the productive and innovative performance of smaller companies is scarce, basically limited on those studies that will be mentioned in our literature review. Considering that most innovative expenditures are performed by large firms, the Brazilian studies have prioritized this group of companies. But, as it will be discussed later, based on the number of employees and number of innovative firms, smaller companies are a relevant category in Brazilian economy. So, it seems essential understand better their productive and technological performance to promote the diffusion of knowledge in the country.

The paper is composed of five sections and organized as follow. After this brief introduction, section 2 presents some of the main findings of the literature regarding innovation and firm size. Section 3 presents an overview of Brazilian industrial firms based on their innovative performance by firm size. Section 4 discusses the differences among sectors in innovative effort per firm size. Section 5 presents the main conclusions.

A REVIEW OF THEORETICAL AND EMPIRICAL RESEARCH

Micro, small and medium enterprises (MSMEs) account for a significant part of employment, production and sales in several countries. In the European Union, for instance, MSMEs represent 99 percent of industry and account for more than 70 percent of employment (Nieto & Santamaria, 2010). In the newly industrialized countries (NICs), MSMEs generally employ the largest percentage of the workforce, are responsible for income generation opportunities and, at least in the case of East Asia and India, MSMEs contribute with a substantial share of the manufactured exports. In China and India, they are responsible for most part of total businesses, gross industrial output value, sales revenues and employed people (Singh *et al.*, 2009).

Although their economic and social relevance is consolidated, the role of MSMEs on innovative performance is still controversial. The ancient Schumpeterian debate over how firm size relates to the ability and propensity to innovate continues to arouse controversy today (Nieto & Santamaria, 2010).

In his initial phase - known as Schumpeter Mark I - the author argued that radical innovations would be promoted by small businesses, through the action of entrepreneurs who would break with the prevailing technological paradigms (“creative destruction”). More than the generation of innovations itself, the economic development would result of their diffusion through the environment. Afterward - as Schumpeter called on stage Mark II - the author highlighted the central role of large firms in the development of new technologies and, consequently, of economic growth, in a processes known as “creative accumulation”.

As mentioned by Tether (1998), the contrasting hypotheses of Schumpeter have been widely but inconclusively examined. The existence of such a large literature is indicative of both the importance of the theme and the inconclusive nature of the results. Interpretation is especially difficult because of the different indicators used to evaluate the innovative performance, such as R&D expenditures, R&D employment, patents and others, suggesting different relationships between firm-size and innovative performance.

These differences in measuring and interpreting innovation efforts and results can be associated to the advantages traditionally ascribed to large and small firms. The main relative strengths of MSMEs lie in behavioral advantages, whereas those of large firms reside in their resource advantages. Especially in developed countries, smaller firms generally enjoy internal conditions that encourage innovativeness, such as entrepreneurship, flexibility, and rapid response. MSMEs present an increased ability to respond

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

to changing environmental needs. Less bureaucracy and more clannish structures, which are common in small businesses, might also improve inter-organizational trust, communication and cooperation that contribute to innovativeness (Hausmann, 2005). Small firms are relatively strong in innovations where effects of scale are not important and where they can make use of their flexibility and proximity to market demand, such as new products or improvements in existing ones for niche markets, and small-scale applications. This idea is corroborated by the fact that, on average small enterprises spend a much higher proportion of their R&D budget on new products than on new processes (Nieto and Santamaria, 2010).

On the other hand, large companies would have greater capacity to deal with the financial risks inherent to innovative projects, presenting advantages over small firms in making such investments (Fagerberg, 2006; Vaona & Pianta, 2008; Botelho, Maia & Pires, 2012). As mentioned by Hausmann (2005), small firms are not simply smaller versions of major corporations: not only they lack the financial and human capital common in large businesses, their governance is often entirely different. The relative weaknesses of small firms compared to large ones lie in the constraints they face on gaining access to critical resources and capabilities for innovation. The advantages of scale and scope provided by the size of large firms make them better equipped for innovations that require large and specialized teams or sophisticated equipment. MSMEs are also usually at a disadvantage regarding intangible resources, as they have access to a smaller range of knowledge and human capital skills (Nieto and Santamaria, 2010). In general, small firms have limited financial capacity, suggesting they lack the financial resources to capitalize on innovative opportunities that can be very risky and costly. Besides, small business managers often lack the types of education and training that have been linked with innovativeness. Commonly the MSMEs owners are reluctant to delegate authority or decision-making to others (Hausmann, 2005).

Despite the limitations presented, small firms remain innovative. In a literature review presented by Tether (1998), the author found many studies which indicated that MSMEs innovate more than large firms. (Table 1 presents these results).

Although several studies have found that small firms have introduced more innovations than their larger counterparts, which has been interpreted as indicating that small firms are more innovative or more efficient innovators, Tether (1998) highlights that such an interpretation depends on the assumption that, on average, the value of the innovations introduced did not change with the firm size. In his paper, Tether (1998) used a database of significant innovations introduced in the UK during the 1980s and put into doubt the widely held conclusion that small firms are more innovative, or more efficient innovators, than large firms. He found that large firms, rather than small ones, appear to have been the more innovative, if the average value of innovations is considered.

Some studies suggest that small firms remain innovative, especially because they innovate in different ways than large businesses, which means that small and large firms have different determinants of innovation efforts. Most MSMEs engage mainly in non-formal innovative activities, incorporating the state of the technique in the form of physical capital rather than investing in research and development (R&D) (Vaona & Pianta, 2008 *apud* Botelho, Maia & Pires, 2012). In other words, the most significant portion of the innovative efforts of MSMEs is directed to the modernization of their processes through the acquisition of machinery and equipment (M&E).

Besides size, technological phase and sectorial characteristics are some of the elements that impact on innovative capacity of the firms. Based on Rizzoni (1994), Maia (2012) synthesized some approaches that compare the innovative performance of large and small firms:

Table 1. Innovative intensities of small and large firms: the results from five studies (Tether, 1998)

Country and Year(s)	Coverage and Definition of 'Small Firms'[b]	Authors	SFIR / LFIR
UK (1979-1983)	Manufacturing; 'small' employ less than 500	Pavitt et al. (1987)[c]	1.31
US (1982)	Manufacturing; 'small' employ less than 500	Acs and Audretsch (1990)	1.55
US (1982)	Manufacturing and services; 'small' employ less than 500	Acs and Audretsch (1990)	2.38
Netherlands (1989)	Manufacturing and services; 'small' employ 10-499	Kleinknecht et al. (1993)	2.68
Italy (1989)	Manufacturing; 'small' employ less than 200	Santarelli and Piergiovanni (1996)	18.86
Ireland (1991)	Manufacturing; 'small' employ less than 20	Cogan (1993)[d]	2.67

1. **Industry Life Cycle:** Small businesses would present advantages in the early stages of the industry life cycle, while large firms would dominate the posterior one.
2. **Sectorial Approach:** The different inter-sectorial technological opportunities would imply different roles for each size of firm, according to the business segment.
3. **Neo-Schumpeterian Approach:** Emphasizes large companies as leading innovative agents and engine of technological progress.
4. **The Territorial Approach:** Innovations are developed in geographical areas, such as industrial districts.
5. **Innovative Division of Labor:** Large and small companies have complementary role in generating innovations.
6. **Networks:** The production of knowledge is not internalized in companies, being determined by the networks to which they belong. The innovative potential of firms would not depend on their size, but on their ability to establish inter-organizational relationships, share knowledge and participate in global circuits of information.

Regarding networks, the literatures dedicates several studies about their role on technology development, as they can overcome the lack of internal resources and promote the information exchange, resource acquisition, technology transfer and risk management. Networks, as well as cooperative agreement, are particularly considered an alternative to bridge the resource gap of MSME compared to large ones. The resources and capabilities that small firms can access through external partnerships may provide them with the stimulus and capability to innovate that they would not otherwise have. Also, small firms seem to have potentially more to gain from innovative partnerships than larger firms, due to their ability to use external networks more efficiently. The collaborations, though, are not homogeneous, since their impact varies among sectors and the type of innovation involved. In general, MSMEs commonly use their suppliers and clients as a valuable source of technological information. And although large firms are more likely to collaborate with universities and research centers, MSMEs also receive significant spillovers from them (Nieto and Santamaria, 2010).

Nieto and Santamaria (2010), based on a sample of 6,500 observations, analyzed how technological collaboration acts as an input to the innovation process and allows small and medium-sized enterprises to bridge the innovation gap with their bigger counterparts. The authors show that small firms are much less likely to innovate than large ones, whichever the innovation outcome analyzed. Besides, small firms

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

tend to collaborate far less than large ones. However, technological collaboration increases the likelihood that MSMEs achieve innovations. The results show that although technological collaboration is a useful mechanism for firms of all sizes to improve innovativeness, it is a critical factor for the smallest firms. Specifically, the impact of collaboration in small and medium-sized firms is more significant for product than process innovations. Regarding the type of partner, vertical collaboration — with suppliers and clients — has the greatest impact on firm innovativeness, though this effect is clearer for medium-sized enterprises than for the smallest firms.

Besides R&D cooperation, MSMEs usually engage in collective actions to share the costs of the acquisition of machinery and also to access financial resources. Regarding the cooperation between large and small firms, sometimes both groups of firms are on equal terms and share the technology, infrastructure, capital or knowledge available to the firms in a cluster. But, in most instances, MSMEs act only as subcontractors of large firms, and the transfer of knowledge can be very limited (Chaminade & Vang, 2007).

There is a strong debate in several countries regarding the policies to support MSMEs. As in most public policies, strong opinions exist in favor and against MSMEs supporting programs. On one hand, it has been argued that MSMEs employ a large proportion of the population and therefore by subsidizing MSMEs more employment will be created. Defenders of these policies argue that MSMEs are more flexible and more dynamic than large firms, even though they are usually constrained by specific market failures, which requires specific policies. On the other hand, detractors point out that these policies generate distortions that affect the allocation of resources and the size distribution of firms, and thus may have a negative effect on global productivity. Also, those against the widespread use of MSMEs policies point to the lack of documented results on the effectiveness of such interventions. (Ibarrarán *et al.*, 2009).

Despite the debate, governments of several countries have developed policies to support these firms. For example, an important policy was implemented by the USA government, which launched in 1982 the Small Business Innovation Research (SBIR) aiming to support innovativeness of MSMEs through non-refundable resources, which can be accessed by firms with less than 500 employees. Similar programs can be found in Taiwan, South Korea, China, Russia and India (Leite, 2011).

MSMEs in Developing Countries

In developing countries, although MSMEs are responsible for the largest part of employment and a significant share of value added, according to Chaminade and Vang (2007) the innovation policy supporting their particularities has been widely ignored. The general trend has been to follow the innovation policies of the developed world that might not be the most appropriate for them. Unlike advanced economies, where there is an important presence of high tech industries in the MSMEs segment, in developing countries these represents an exception among the firms. Their innovation systems should be rethought to consider the type of innovation support necessary to the particularities and fragilities of their MSMEs. According to the authors, upgrading of MSMEs in developing countries is possible if four forms of capital – social capital; human and organizational capital; financial capital and physical capital (infrastructure) – are present and supported.

Chaminade and Vang (2007) argue that, in several Asian countries, the lack of qualified human resources, the poor managerial skills of the manager, and the difficulties to access strategic information are the main obstacles to innovation in MSMEs, constraining the firms' absorptive capacity. As

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

a consequence, MSMEs have to deal with a significant portion of low-skill workforce, and rely much more on learning by doing, as opposed to formal training[1].

Asian MSMEs also have difficulties to access the financial capital, even when those funds are available in the productive systems. The government can play an important role in the provision of financial support for indigenous MSMEs. To finance R&D, the governmental support has been mainly in the form of loans at preferential rates explicitly targeting at groups of MSMEs. In the absence of an institutionalized financial structure, social capital facilitates the access to financial resources. When there is not a reliable infrastructure to provide MSMEs with risk capital, social networks might provide the access to microcredits and loans. Access to funds provided by transnational companies (TNCs), in most cases, is limited to a small number of MSMEs (Chaminade & Vang, 2007).

To summarize, the authors conclude that there is a need for innovation policies targeting the particular needs of MSMEs. Unless such measures are taken, MSMEs are not likely to perform relevant innovative activities and will at best maintain their role as low cost subcontractors to TNCs, without exploiting their potential. In the worst scenario, they could even lose their position as subcontractors, by being out-competed by world players.

These new strategies, which take into account the MSMEs needs, seem to be at least partially adopted in China. By the mid-2000s, private MSMEs had become the backbone of the local economy in some areas and/or regions mainly due to the implementation of new policies. Among then, the creation of incubators and science parks also promoted the technological innovation of China's MSME in high-tech sectors (Singh *et al.,* 2009).

However, despite the mentioned improvement, the majority of China's MSMEs still do not possess sufficient self-accumulated capital to meet their requirements. A shortage of management talent, underdeveloped technology transfer systems and lack of stability in the regulatory environment are also barriers to the MSMEs. The low level of technology, a lack of skilled workers and the difficulties in financial resources also limit the MSMEs development. In the case of high-tech new MSMEs, a remarkable feature is that their founders did not possess much personal management or financial expertise. Chinese MSMEs also face fierce competition from other NICs with lower labor costs (Singh *et al.,* 2009).

In India, the major problem with MSMEs is that they operate at very low scale of production and this hinders their capacity to reduce the costs of products and engage in technological upgrades. China, for example, produces on a mass scale while Indian MSMEs do not expand because they want to retain the facilities and incentives for a longer period even if this retention inhibits growth.

In China, and also in India, the major challenges of building product quality, reducing costs and upgrading technology generally are common to MSMEs. According to Singh *et al*. (2009), MSMEs of both countries should concentrate on developing human resources and implementing quality improvement techniques. Part of this process involves improving management talent and techniques as well as the level of equipment, technology and innovation capabilities of MSMEs. In addition, cultivating networks will help improve their competitiveness. The governments of both countries should continue to provide and develop efficient administrative and legal institutions, quality infrastructure and reduce bureaucratic hurdles at every opportunity.

Also in Latin America and the Caribbean (LAC), MSMEs are the most significant sources of employment and income. According to the OECD/ECLAC (2012), they represent 99% of businesses and account for 67% of all occupations in the region. However, the small contribution of MSMEs to gross domestic product signals a considerable gap in productivity and competitiveness between MSMEs and large firms. Low productivity is also related to the difficulty in accessing financing, human resources

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

and technologies, the high costs of innovation, difficulty exporting, and their position in a relatively inefficient business environment. As most of them operate in lower productivity sectors (trade, informal services and basic manufactures), which, by their nature in the region, demand little knowledge, their propensity to innovate is reduced. Thus, the main innovation activities of Latin American MSMEs focus on acquisition of machines and imitation of existing products.

Among the barriers that MSMEs face in expanding production and reaching new markets, access to credit is one of the most significant. Factors that might inhibit access to credit include the lack of guarantees for smaller firms, high interest rates, and excessive bureaucracy and requirements, among others (Angelelli *et al.*, 2006). So, generally, Latin American companies, especially MSMEs, self-financing their innovation activities.

The majority of institutions that support MSMEs do not possess the knowledge, experience, and resources to monitor and evaluate their programs and initiatives, understand impacts and incorporate learning. There exists little systematic research in the area of MSMEs and the programs and policies to support them.

Although most Latin American countries have in recent years given more attention to MSMEs, either through the creation of institutions and specific support programs, either by creating public agencies especially focused on the sector, the barriers for these companies to gain greater dynamic are still many. Despite the existence of various funding programs to support innovation in MSMEs, the results in terms of innovation rates have been less than optimal. Still according to OECD/ECLAC (2012), starting from national surveys on innovation in enterprises carried out in some countries in the region (Argentina, Brazil, Colombia, Chile and Uruguay), the main obstacles pointed to innovation are:

- Deficiencies in public policies to promote science and technology;
- Ease of imitation by third parties;
- Difficulty for cooperation;
- Shortage of skilled personnel;
- Risks of innovation;
- Time for return on investment;
- Domestic market size;
- Access to Financing;
- Uncertainty of the economy.

In short, in the mentioned emerging regions, both in Asia and Latin America, it is noted that MSMEs have specific characteristics that need to be considered in policy making.

But…What Is an MSME?

The relative size of the MSMEs varies across sectors and countries, and international comparisons can be affected by these differences. Number of employees and monthly or annual sales are the most commonly criteria used to define MSMEs but, for example, the number of employees may vary from 50 employees in the Netherlands to 1,500 in the US (Leite, 2011; Ibarrarán *et al.*, 2009).

In the USA, there is a complex official criterion for a firm to be classified as a small business, defined by the "Small Business Act". This criterion is dynamic - that is, constantly updated -, it is based on the NAICS Code (six digits) and may have as reference the Gross Revenue, the value of assets or the

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

number of employees. For activities classified by gross revenue, the values range between $ 0.75 and 38.5 million annually; for those based on asset value, the limit is $ 550 million and for those based on the number of employees, the limits range from 50 to 1,500 people (US SBA, 2015).

The European Union uses a unified criterion of classification based on number of employees, annual sales (turnover) and annual net income (balance sheets). (Eurostat, 2015). The main classes used for presenting the results are:

- **Micro Enterprises:** With less than 10 persons employed;
- **Small Enterprises:** With 10-49 persons employed;
- **Medium-Sized Enterprises:** With 50-249 persons employed;
- **Large Enterprises:** With 250 or more persons employed.

In Brazil, the legal concept of MSME has changed over the years. The art.2 of Law No. 9,841/1999 defined microenterprise (ME) as the legal entity whose annual revenue was equal to or less than R$ 244,000.00 and small business as the legal entity whose annual gross revenue was higher than R$ 244,000.00 and less than or equal to R$ 1,2 million. Decree No. 5,028/2004 changed these values respectively to R$ 433,755.14 and R$ 2,133,222.00. More recently, the Complementary Law No. 123/2006 defined micro-enterprises as those with annual gross revenues of up to R$ 240 thousand, and small businesses as those with annual revenue between R$ 240,000 and R$ 2.4 million. These limits were then altered by Complementary Law 139/2011, which set then in R$ 360,000 and R$ 3.6 million, respectively (Leite, 2011).

However, this legal definition of firm size according to the annual revenue is not unanimous among the federal public administration, state enterprises and mixed economy. The Brazilian Development Bank (BNDES), for example, considers that microenterprises and small firms are respectively those whose gross revenues is up to R$ 2.4 million and between R$ 2.4 million and R$ 16 million (Leite, 2011). But in some credit lines, the MSME can have a turnover of up to R$ 90 million (BNDES, 2014).

Public Banks such as Banco do Brasil and Caixa Econômica Federal operate a specifically targeted fund for MSMEs, the Guarantee Fund Operations. This fund uses the following classification (BB, 2014):

- **MSMEs:** Companies with annual gross revenues of up to R$ 15 million.
- **Individual Micro Entrepreneurs (MEI):** Sales up to R$ 36,000.

Table 2. Secex classification of firm size (Secex/Mdic, 2015)

Enterprise Size	Industry		Wholesale and Services	
	Number of Employees	Value	Number of Employees	Value
Micro	Up to 10	Up to US$ 400 K	Up to 5	Up to US$ 200 K
Small	11 to 40	Up to US$ 3,5 M	6 to 30	Up to US$ 1.5 M
Medium	41 to 200	Up to US$ 20 M	31 to 80	Up to US$ 7 M
Large	Above 200	Above US$ 20 M	Above 80	Above US$ 7 M

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

The Foreign Trade Secretary (Secex) associates the number of employees and the value exported to classify firm size. Its classification (Table 2) is the same as used in Mercosul parameter (Secex/Mdic, 2015).

Sebrae (2012), the Brazilian Support Service for Micro and Small Enterprises, classifies industrial firms as:

- **Micro:** Up to nineteen employees;
- **Small:** Twenty to 99 employees;
- **Medium:** One hundred to 499 employees, and
- **Large:** Five hundred or more employees.

INNOVATION PER FIRM SIZE: AN OVERVIEW OF BRAZILIAN INDUSTRIAL FIRMS

The analysis will be held from descriptive statistics prepared based on the Brazilian Innovation Survey (Pintec), conducted by the Brazilian Institute of Geography and Statistics (IBGE), which provides indicators on innovation activities of Brazilian companies. The analysis of Brazilian data is based on the last edition of the Survey, Pintec 2011, and focuses the industrial segment, excluding services' sectors. Regarding firms up to 499 employees, Pintec is a sampling, but in the case of firms with 500 or more employees it is census. Data by size and by sector are available, separately, on the Pintec's website. To aggregate both information, special tabulation was requested from the IBGE in order to obtain industry statistics by size. (IBGE, 2011)

The conceptual and methodological reference of Pintec 2011 is based on the third edition of the Oslo Manual and more specifically, the model proposed by the Statistical Office of European Community (Eurostat), embodied in versions 2008 and 2010 of the Community Innovation Survey (CIS). The quantitative variables refer to the latest year of the survey (2011), while most qualitative variables refer to three consecutive years (2009-2011). (IBGE, 2011)

In Brazil, large firm stand out in the debate on generation of technological innovations. They are the most studied group and the main target of public policy. The most recent Innovation Survey shows that they present an innovation rate[2] of 55.9% and accounted for 57.8% of total expenditures on innovative activities and 82.2% of private R&D expenditures. This data (Table 3 presents them), show large firms as the main engine of Brazilian innovative effort.

Table 3. Innovative activities per firm size (IBGE/Pintec 2011, 2013)

Firm Size (Number of Employees)	Innovation Rate: Products and/or Processes	Distribution of	
		Total Innovative Expenditures	R&D Expenditures
From 10 to 99	34.4%	18.3%	6.8%
From 100 to 499	45.5%	23.9%	10.9%
500 or more	55.9%	57.8%	82.2%

prepared by the authors

Table 4. Distribution of industrial firms by size: total firms, innovative firms and firms that perform R&D (IBGE/Pintec 2011, 2013)

Firm Size (Number of Employees)	Total	Innovative Firms (Product and/or Process)	Firms that Performed R&D Activities
From 10 to 99	91.2%	88.3%	70.7%
From 100 to 499	7.1%	9.1%	18.0%
500 or more	1.7%	2.6%	11.3%

prepared by the authors

If large firms are responsible for most technological investments, why smaller firms should be analyzed and supported by public policies? Some evidences justify this option:

1. MSEs represent 91.2% of Brazilian industrial firms, 88.3% of innovative firms and 70.7% of firms that perform R&D activities (Table 4). That is, even if they are not responsible for the main aggregate amount of innovative expenditures, they represent the largest contingent of firms that are engaged in these processes. Assuming the hypothesis that technological diffusion requires the existence of an "ecosystem" capable of absorbing these new technologies, stimulating the integration of smaller firms into the chains of innovation becomes essential.
2. Given the relevance of small business in the Brazilian industrial structure, it is important to understand their patterns of innovations - which tend to be different from that observed in larger firms -, so that appropriate support policies can be implemented. Providing similar incentives to firms with different sizes and features may not be effective, since the needs of different types of firms are diverse. This becomes even more relevant when one considers that the relative costs to access public incentives are, in general, significantly higher for MSEs.
3. If, in absolute terms, larger companies are responsible for most innovative expenditures, proportionally the innovative efforts[3] carried out by small businesses may be, according to several criteria, more significant. Total innovative effort performed by industrial MSEs reached 3.4%, compared to 3.1% in the case of medium firms and only 2.0% in large firms (Table 5). This percentage is especially significant among the smallest group of firms (between ten and 29 employees), which reached 4.6%. In general, a negative correlation between firm size and total innovative effort is observed in Brazilian industry.

Similar finding can be noticed regarding the acquisition of machinery and equipment (M&E): the effort made by industrial MSEs (2.4%) exceeds that observed among medium size firms (2.1%) and large firms (0.6%). On the other hand, a positive correlation between size and R&D effort[4] is observed. Large firms stand out over other groups, as they expended 0.84% compared to 0.38% (MSEs) and 0.42% (medium size firms). However, the smallest firms (10-29 employees) also present a high R&D effort (0.59%), only inferior to the presented by large companies (0.84%).

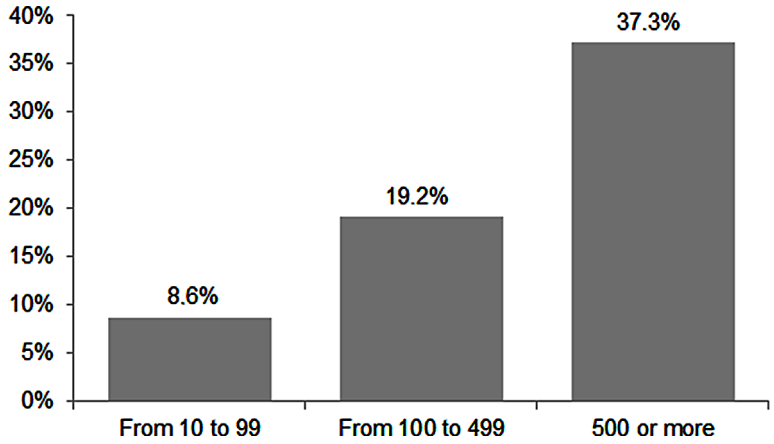
Proportionally, the acquisition of M&E is more significant for MSEs, representing 69.8% of total innovative expenditures. On the other hand, the share of R&D in total innovation expenditures is more relevant for medium and large companies (Table 5).

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Table 5. Innovative effort per firm size: Total, R&D and M&E expenditures (IBGE/Pintec 2011, 2013)

Firm Size (Number of Employees)	Total Innovative Expenditures / Net Sales	R&D Expenditures / Net Sales	M&E Expenditures / Net Sales	Share: R&D Expenditures / Total Expenditures	Share: M&E Expenditures / Total Expenditures
From 10 to 99	3.4%	0.38%	2.4%	11.1%	69.8%
From 100 to 499	3.1%	0.42%	2.1%	13.6%	68.7%
500 or more	2.0%	0.84%	0.6%	42.4%	30.6%
Total	2.4%	0.71%	1.1%	29.8%	46.9%

prepared by the authors



These percentages suggest differences in innovative profile of firms according to their size. The acquisition of M&E is associated with changes in the production process, aiming to increase productivity, while R&D performance is related to improving or creating new products - i.e. the evolution of the "state of the art". Thus, smaller firms mainly invest in innovative activities that are less directed to the generation of new products and with less potential for generating monopolistic profits. Another possible interpretation is that MSEs do not invest more in M&E than larger firms, but the acquisition of machinery is proportionally more costly to them.

Another data that supports this analysis is the rate of products that are new to the market - domestic and international - which means; they are not only new for the firm. Among MSEs, this percentage reaches 8.6%, compared to 19.2% for medium firms and, especially, 37.3% for large companies (Figure 1).

Summing up, innovative efforts of Brazilian small businesses are mainly concentrated in the acquisition of machinery and in launching of innovations that already exist in domestic and/or international markets. Their innovations are, therefore, less dynamic than that seen in medium and large firms.

It should be noted that the differences in technological innovation rates per firm size presented in Table 3 is not seen in the case of organizational innovations. Percentages are similar for all firm sizes, except for the large ones, which presents a lower rate (Table 6).

Figure 1. Products new to the market by firm size (%) (IBGE/Pintec 2011, 2013)

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Table 6. Organizational innovations by firm size (%) (IBGE/Pintec 2011, 2013)

Firm Size (Number of Employees)	Organization Innovation (Rate)
From 10 to 99	35.7%
From 100 to 499	33.5%
500 or more	28.6%
Total	35.4%

prepared by the authors

Table 7. Appropriability methods per firm size (%) (IBGE/Pintec 2011, 2013)

Firm Size (Number of Employees)	Appropriability Methods				
	Formal		Strategic		
	Patents and Industrial Design	Trademarks	Design Complexity	Industrial Secret	Lead Time
From 10 to 99	7.1%	22.5%	0.9%	7.1%	0.8%
From 100 to 499	18.6%	35.0%	5.0%	16.1%	9.3%
500 or more	38.8%	47.1%	12.0%	31.3%	19.3%
Total	9.1%	24.3%	1.6%	8.7%	2.1%

prepared by the authors

This can be another indicator that MSEs, in addition to invest in less sophisticated innovative activities and prioritize the launching of products that are new only to the firm, also consider management innovations more relevant than large companies.

At last, the use of appropriability methods per firm size shows a positive relation between the variables (Table 7). This result can be explained by two facts. Firstly, in the case of formal methods of protection (patents, industrial design and trademarks), in addition to the direct costs of intellectual property (IP) – such as registration fees -, there is a whole set of costs that, in general, are similar for all companies regardless of their size. It includes enforcement of IP rights and, eventually, litigation, which tend to be more costly than all the others. For small businesses, these costs are proportionally higher than for large firms. The strategic methods of protection, such as industrial secret and lead time, also involve costs that are, once again, more significant for small firms. For example, in the case of industrial secret, a small business would have greater difficulty in countering the harassment of a large firm on one of its employees that holds strategic expertise.

SECTORIAL INNOVATIONS PER FIRM SIZE

In section 3 of this study, we compared the innovation performance by firm size, without considering other variables that may influence in this result, such as industrial sectors and origin of capital.

Despite evidences indicating a positive relationship between innovation rate and firm, this correlation is not present in all sectors. Cohen *et al*. (1987) *apud* Botelho, Maia and Pires (2012) suggested that this positive relationship would be statistically insignificant when R&D expenditures are controlled

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

by firms' industries, since sectorial effects would be responsible for about half the intensity of innovative variation. Sectors present different technological opportunities, which impacts on the propensity to expend resources on innovative activities. Considering that the sectorial distribution of firms by size is not homogeneous, part of the aggregated differences in the innovative efforts of small, medium and large businesses may be associated with the sectorial composition of the economy.

From the comparison of the sectorial distribution of innovative firms between MSEs, medium and large firms bBased on the technological intensity' classification proposed by the Organization for Eco-

Table 8. Percentage of firms by industry and size (%) (IBGE/Pintec 2011, 2013)

nomic Cooperation and Development (OECD)[5] (Table 8), one can observe some sectorial differences. Food products present a significant share in all groups. In the case of MSEs, wearing apparel products and metal products also concentrate most part of the firms. Regarding medium size companies, besides food and metal products, manufacturing of machinery and equipment is also a significant industry. At last, automobile industry is, after food products, the sector that concentrates most part of the innovative large firms.

Table 9. R&D effort by industry and firm size (%) (IBGE/Pintec 2011, 2013)

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

At least, we can compare the R&D effort by firm size and industrial sector (Table 9). Despite some data are not available due to confidentiality, the available data suggests that, in high-tech sectors (pharmaceutical and computer, electronic and optical products), R&D effort of MSEs is higher than the observed in large companies.

In lower-technology industries, on the other hand, the positive relation between size and R&D effort is showed, despite some sectorial exceptions, such as textiles and wood products, in which smaller firms also presented a higher indicator than large companies.

In this case, sectorial analysis evidences two distinct dynamics. In high-tech industries, the opportunities for smaller firms in Brazil are concentrated on their ability to offer innovative products, boosting their innovative effort. On the other hand, these sectors are dominated by transnational corporations which tend to privilege the performance of R&D activities in their countries of origin.

In traditional industries, large companies perform more R&D, while the smaller are "technology-followers' and concentrates their effort in updating their production processes.

It should be noted that other factors besides size and sector can influence this result, such as origin of capital, labor skills, export performance and business maturity. However, regardless of these determinants, the data show a stronger R&D performance of small and medium firms in high technology segments. Such evidence challenged the validity of horizontal policies. Not only the specificities related to the size must be considered, but also sectorial distinctions must be incorporated in the public policies to promote innovation.

FUTURE RESEARCH DIRECTIONS

The next version of this study will incorporate the following analysis:

1. The relevance of cooperative relations to firms of different sizes;
2. The importance of fiscal and financial instruments to support MSE, medium and large firms;
3. An evolution of innovative performance of MSEs, medium and large firms throughout the decade of 2000, based on five editions of Pintec Survey;
4. The impact of innovative activities in the generation of product and process innovations to firms of different sizes, based on an econometric analysis. The idea is to identify if which activities, including innovation expenditures, cooperation and public financing, are relevant to MSEs and large companies.

CONCLUSION

This study focused on the differences between the innovative performance of small, medium and large companies, based on Brazilian Innovation Survey.

It shows that large firms present higher innovation rates than the others, and their rate of products which are new to the market - national and international - and not only new for the firm, is also higher.

However, total innovative expenditures of large companies are proportionately smaller, especially because the acquisition of M&E does not represent a significant amount of their net sales. On the other

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

hand, MSEs innovative expenditures stand out especially in the acquisition of M&E, which is mainly associated with changes in the production process, aiming at increase firms' productivity.

Moreover, sector becomes a relevant variable when R&D activities are observed. Corroborating the hypothesis presented at the beginning of this text, in high-tech sectors, MSEs opportunities tend to focus on their capacity of offering innovative products, leading them to a higher innovative effort. In traditional industries, the large companies present higher R&D efforts, while the smaller ones focus on the modernization of their productive processes.

Moreover, these findings go against what is being treated as a "common sense." The idea that the acceleration of the innovation process involves the structuring of large players, able to compete on equal terms with the highest world-class enterprises, has been increasingly widespread. This idea has been even materialized in the form of public policies, aiming to concentrate small firms in a larger group. However, data analyzed in this paper suggest that in high-tech sectors, small and medium firms spend proportionally more resources on R&D. One possible reason to explain the lower technological effort of large companies is that, in these sectors, these firms are mainly transnational corporations, which tend to privilege the performance of R&D activities in their countries of origin. Therefore, encouragement of mergers and acquisitions in order to increase the size of the firms will not necessarily raise the technological investments of Brazilian industries.

Thus, restricting the debate - and the public policies - about innovation at the universe of large companies may harm the innovative performance of the country. In other words, despite being small by the prospect of their size, these firms can be relevant inducers of technical progress, mainly through its dissemination by process improvement. This dynamic may be crucial for the creation of an "ecosystem" capable of absorbing technical progress and so boost the economy overall productivity. These observations indicate that incentive policies, rules and regulations that differentiate firms by size and sector are necessary to boost and disseminate the technological innovation in Brazilian industry.

KEY TERMS AND DEFINITIONS

Acquisition of Machinery and Equipment: It includes the acquisition of machinery, equipment and hardware to implement new or substantially improved products or processes.

Appropriability Methods: Methods of protection methods used by companies to ensure ownership of the results of innovation, such as formal methods (patent, trademark, copyright) and strategic methods (industrial secrets, design complexity, time advantage over competitors) employed by companies.

Brazilian Innovation Survey (Pintec): It is engaged in the construction of indicators of innovation activities in companies. It seeks to deepen the theme of innovation producing information on aspects such as spending on innovation activities; funding sources of these expenditures; impact of innovations on business performance; information sources used; cooperative arrangements; the role of government incentives; obstacles encountered to innovation activities; organizational and marketing innovations, and use of biotechnology and nanotechnology.

Organizational Innovation: Implementation of a new organizational method in the firm's business practices, in the organization of its workplace or in its external relations, to improve the use of knowledge, workflows efficiency or quality of goods or services.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Process Innovation: Introduction of new or significantly improved production methods or delivery of products. At industry, methods of production involve changes in techniques, machinery, equipment and software used in the process of transforming inputs into outputs.

Product Innovation: Is one whose fundamental characteristics (technical specifications, components and materials, incorporated software, functions or intended uses) differ significantly of all products previously produced by the company. The product innovation may be progressive, by a significant enhancement of previously existing product, whose performance was substantially increased or enhanced.

R&D Activities: It comprises creative work undertaken on a systematic basis in order to increase the knowledge to develop new or substantially improved products or processes. The design, construction and the prototype tests are often the most important phase of R&D activities. It also includes software development, since this involves a technological or scientific advance.

Schumpterian Debate: The role of small and large firms in the innovation development. In his initial phase, the author argued that radical innovations would be promoted by small businesses, through the action of entrepreneurs who would break with the prevailing technological paradigms ("creative destruction"). Afterward, the author highlighted the central role of large firms in the development of new technologies and, consequently, of economic growth, in a processes known as "creative accumulation".

ENDNOTES

1 However, not all Asian RIS lack the required qualified human capital. For example, Taiwanese SMEs have undergone an upgrading in formal competencies, and the level of education among the population is high. In the Bangalore software industry, there is also enough supply of qualified human resources.

2 Percentage of industrial firms that implemented innovations in product and /or process.

3 Total innovative expenditures / net sales.

4 R&D expenditures / net sales.

5 Considering that some indicators were exclusively available at 2 digits, "other transport equipment" sector - which includes aircraft, railways and shipbuilding - was entirely classified *as high-technology*, although by OECD classification only aeronautics would be included in this category.

Chapter 67
The Importance Role E-Collaboration Capability and Information System Maturity on Knowledge Sharing and SMEs Marketing Performance

ABSTRACT

This article discusses the effect of e-collaboration capability and information system maturity on knowledge sharing and SMEs marketing performance. This study was conducted at SMEs in Central Java which had used information system and technology in collaborating with partners and customers. There were 160 respondents in this research who were the owners or managers of SMEs in Central Java, Indonesia. This research used structural equation modeling analysis. AMOS version 21 was used to process the data. The result of this research showed that all proposed hypotheses were accepted. First, e-collaboration capability has positively and significantly influenced knowledge sharing. Second, knowledge sharing has positively and significantly influenced SME marketing performance. Third, e-collaboration capability has positively and significantly influenced SME marketing performance. Fourth, information system maturity has positively and significantly influenced knowledge sharing. Fifth, information system maturity has positively and significantly influenced SME marketing performance.

INTRODUCTION

Firm proactively change their business processes to reduce costs and improve competitive advantage (Carrol & Shabana, 2010). Brink (2017) reveal that collaboration contributes to SMEs competitiveness. Collaborative activities make SMEs become more sustainable (Govindan et al., 2016). Collaboration enable movement of resources to the other party to enhance value creation (Prahalad & Ramaswamy, 2004; Thomke & Hippel, 2002), innovation (Kim & Lui, 2015; Zhang & Tang, 2017), competitive advantage (Allred et al., 2011; Maulana & Rufaidah, 2014) and performance (Choi & Ko, 2012; Chuang & Lin, 2015; Vereecke & Muylle, 2006; Wang et al., 2015). Collaboration also allows for better managerial decisions.

The development of information and technology enables collaboration activities without having to meet face to face. Switzer and Hartman (2008) reveal e-collaboration as working together in electronic environment. Electronic collaboration enables a comprehensive long-distance collaboration for research and development, marketing (Bidgoli, 2012), learning, and tacit knowledge sharing (Harris, 2009). In order to develop electronic collaboration, SMEs are expected to have maturity in adopting information system (IS). IS maturity influences the knowledge sharing and firm performance (Rao et al., 2015). IS is strategically important when the organization are distributed geographically (Lang, 2001). Technology and information system makes SMEs receive information rapidly, easy to collaborate and communicate, and it influences the speed of decision making. IS also makes everything efficient (Alavi & Leidner, 2001; Wade & Hulland, 2004) and enhace companies' performance (Mohamed et al., 2006).

We find inconsistencies in the impact of e-collaboration on performance. Rosenzweig and Roth (2007) found that e-collaboration can enhance operational and business performance. Some experts reveal that the use of the internet in collaborative activities has not been able to show its benefits to performance (Deveraj et al., 2007; Jap & Mohr, 2002; Mukhopadhyay & Kekre, 2002; Rosenzweig & Roth, 2007). The inability is caused by less attention to the various costs that arise due to e-collaboraion, such as human relations, system information, process changes and administrative costs (Kumar & van Dissel, 1996; O'Leary-Kelly & Flores, 2002). This study investigates the effect of e-collaboration capability and information system maturity on knowledge sharing and SMEs marketing performance.

LITERATURE REVIEW

E-Collaboration Capability

E-collaboration is a collaboration among individuals who accomplish a task using electronic technology (Kock et al., 2001). Switzer and Hartman (2008) and Weiseth et al. (2006) emphasize e-collaboration as working together in an electronic environment. Collaboration is carried out without face-to-face interactions between individuals or members of virtual teams involved in shared tasks using information and communication technology (Bouras et al., 2008). E-Collaboration uses a combination of hardware, software and communication technology that enables decision makers around the world to communicate, participate and collaborate in decision-making activities (Bidgoli, 2012). E-collaboration uses electronic technology, such as web-based chat tools, e-mail, internet, websites, social media, decision support system groups, and teleconference tools. E-collaboration is important because the relationship between the firm and its customers and suppliers can be managed efficiently.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Social aspects are also important in building e-collaboration (Cai, 2005; Easley et al., 2003). E-Collaboration should not only be viewed from a technical point of view, but also related to the social construction process when different people perform their tasks in various adaptive situations (Berger & Luckman, 1966). Collaboration is based on social activities to establish good relationships. Relationships among participants will change collaborative entities. Collaborative activities is needed to manage conflict, improve the quality of tasks (Cai, 2005), reduce miscommunication (Baron, 1984), and coordinate in making decisions (Kannapan & Taylor, 1994). E-collaboration must understand other parties so that there is no conflict among parties. Intense communication is carried out to understand each other.

Information System Maturity

The concept of maturity model is increasingly applied in the field of IS (Vidal et al., 2019). A Maturity Model (MM) is a technique for measuring different aspects of a process or organization (Proença & Borninha, 2016). Several maturity models have been proposed, but there is no agreement on the stage of maturity. The stage of maturity is based on driver factors (Rocha, 2011), their application and quality (Pöppelbuß & Röglinger, 2011). Maturity models are important for decision making, and organizational transformation (Vidal et al., 2019). In this study, maturity model focus on information systems maturity of small medium enterprises (SMEs). Nolan (1979) uses the word "maturity" to explain the growth and development of information technology infrastructure is being adopted by businesses. Praničević et al. (2011) reveal the level of information system maturity, namely technological partner, service partner, and strategic partner. Technological partners are a level of information system maturity that focuses on data processing activities. Service partner focus on integration and comprehensive support to all business functions while the strategic partner focuses on improving business competitiveness.

King and Sabherwal (1992) revealed the maturity of information systems to provide benefits to companies. IS is fundamentally important for global reach when organizations are geographically distributed (Lang, 2001). Companies using Information systems and technology, especially the Internet and communications networks, will enhance collaboration and reduce costs (Mohamed et al., 2006), share information and communication efficiently (Zhu & Kraemer, 2005), and facilitate the creation and utilization of knowledge in a dynamic business environment (Lang, 2001). Information systems maturity also enable companies to enhance their performance (Rao et al., 2015).

Knowledge Based View (KBV) of the Firm and Knowledge Sharing

Knowledge based view of the firm (KBV) is one of the important approaches in the success of the firm. KBV explained that firm must be able to generate and apply various types of knowledge (Grand, 1996). Knowledge is the firm's most important resource and contributes to increasing added value (Grant, 1997) and competitive advantage of the firm (Jasinskas et al., 2015). The Firm strives to re-develop dynamic resources and knowledge-based capabilities to increase open innovation (Vanhaverbeke & Cloodt, 2014), competitive advantage (Jasinskas et al., 2015), the growth of the firm (Saarenketo et al., 2009) and superior business performance (Darroch, 2005). Kogut and Zander (1992) divides knowledge into information (explicit knowledge) and know-how based. Explicit knowledge can take the form of facts and symbols (Kogut & Zander, 1992). Explicit knowledge is easier to encode and articulate, so it's easier to transfer (Simonin, 1999). Tacit knowledge is non-verbal and very difficult to articulate (Polanyi, 1966). Tacit knowledge is often in the form ofpractical skill and expertise (Eric, 1988).

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

One mechanism for integration of knowledge is transfer of knowledge. Knowledge transfer is a process of managing knowledge where someone learns to other people who are more understanding (Grant, 1997). The form of knowledge transfer is knowledge sharing. Knowledge sharing is understood and defined differently in the literature. Basically, knowledge sharing is the process of flowing knowledge from the source to the recipient. People or organizations can be sources, senders, facilitators or mediators between sources and recipients. Yoo et al. (2007) explain the definition of Sharing knowledge as a process of creating knowledge between individuals or groups, through direct or indirect interactions. Matin et al. (2010) reveal knowledge sharing as knowledge transfer behavior. Sharing knowledge means the desire of someone to learn and help others in developing new capabilities (Bock et al., 2005), new knowledge (Van den Hooff & De Ridder, 2004), experience sharing, skill sharing to other (Lin, 2007). Knowledge sharing provides information to solve problems, develop new ideas, or implement policies or procedures together (Cummings, 2004).

Collaboration between companies enable companies to acquire knowledge and skills that are not available within the firm (Scott, 2000). Knowledge is an important organizational resource that provide sustainable competitive advantage in a competitive and dynamic economy (Davenport & Marchand, 2001; Spender & Grant, 1996). Knowledge that flows from partners will have an impact on the firm's competitive advantage. Transfer of tacit knowledge is a determinant of success (Harris, 2009). Iandoli et al. (2012) analyzes about sharing knowledge in the online environment. The study conducted by Iandoli et al. (2012) revealed the importance of online collaboration platforms designed to support distributed knowledge management and decision making. The platform allows companies to enhance collective sensing and mutual understanding.

SMEs Marketing Performance

Performance is a measure of the firm's success in achieving goals (Ardyan, 2016). Lönnqvist (2004) defines performance as the actual outcome / ability to achieve results. In the context of SMEs, Ardyan (2016) defines the performance of SMEs as a measure of the success of SMEs in achieving the level of profitability and growth in accordance with previously determined. SME performance can be seen in various ways including: profit, growth, net sales revenue, increased sales, increased market share, growth potential, satisfaction, reaching financial goals, and others (Bakar et al., 2014; Carey, 2015; Minchna, 2009; Omerzel & Antoncic, 2008; Sok et al., 2013; Zheng et al., 2009). This performance is basically divided into financial performance and non-financial performance. In this study, the focus of performance measurement is non-financial performance, especially SME marketing performance.

Measuring performance through marketing performance is an interesting topic (Ambler, 2000; Clark, 1999, 2000; da Gama, 2011; Gronholdt & Martensen, 2006). Marketing performance measurement can be explained as the relationship between marketing activities and their performance (Clark & Ambler, 2001). Clark (1999) revealed 4 reasons the firm used marketing performance measurements. First, the focus on marketing will drive profit, growth and sales in the future. Second, investors need information related to marketing activities. Third, the concept of balance scorecard (Kaplan & Norton, 1992) Elijah inspired that performance measurement is not just a financial measure. Fourth, many managers are frustrated after using traditional performance measurement, so they use marketing-based measurements. although measurement of marketing performance has a positive side, Ambler et al. (2004) said that some researchers criticized the use of marketing performance. Some reasons are because marketing performance has limited diagnostic strength (Day & Wensley, 1988), focus on short term (Dekimpe & Hanssens, 1999) and lacking in attention to shareholder value (Doyle, 2000).

HYPOTHESIS

E-Collaboration Capability and Knowledge Sharing

E E-collaboration is an innovative collaboration using information technology. The firm's ability to carry out innovative collaboration will affect the level of knowledge and accelerate access to knowledge (Zheng et al., 2013). Chen et al. (2014) argued that the firm requires collaborative innovation capability to transfer knowledge effectively. Tanriverdi (2005) argues that IT-based coordination mechanisms can increase the reach and wealth of corporate knowledge resources, and enable business units to learn about opportunities to share knowledge with each other. Group support systems and video-conferencing as e-collaboration tools such enable knowledge sharing process effectively. E-collaboration enables companies to gather other people's ideas and share creativity globally through the internet (Ko et al., 2011). Thus, we propose the following:

H1: E-Collaboration capability has a positive and significant effect on knowledge sharing.

Knowledge Sharing and SMEs Marketing Performance

In the business environment, knowledge management encourages organizational performance (Li et al., 2008; McAfee, 2002). Based on knowledge-based views, companies are institutions that integrate knowledge (Grant, 1996). Setia and Patel (2013) reveal the firm's ability to manage operational knowledge will have an impact on increasing its competitive advantage. Companies acquire knowledge through spillovers, acquisitions (Björkman et al., 2007), and knowledge sharing activities. Knowledge sharing plays an important role in the process of integration. Companies that have strong networks will easily carry out integration so that the knowledge sharing activity will greatly affect business performance (Saraf et al., 2007). The firm learns about information and knowledge from knowledge sharing activities, it will have an impact on its performance (Law & Ngai, 2008). Thus, we propose the following:

H2: Knowledge sharing has a positive and significant effect on SMEs marketing performance.

E-Collaboration Capability and SMEs Marketing Performance

Superior relationships will have an impact on firm performance as part of the development of marketing practices and theories (Morgan & Hunt, 1994). IT-based collaboration helps companies develop collaborative relationships, which can enhance firm performance (Bensaou, 1997; Hart & Saunders, 1998; Ko et al., 2011). In the study of relationship marketing, the goal of building relationships is to create profit and long-term performance (Hultman & Shaw, 2003; Palmatier, 2008; Palmatier et al., 2008; Ravald & Gronroos, 1996; Tse et al., 2004). Wang et al. (2015). Collaboration between SMEs in the cluster is expected to improve the performance of each UKM. Thus, we propose the following:

H3: E-collaboration capability has a positive and significant effect on SMEs marketing performance.

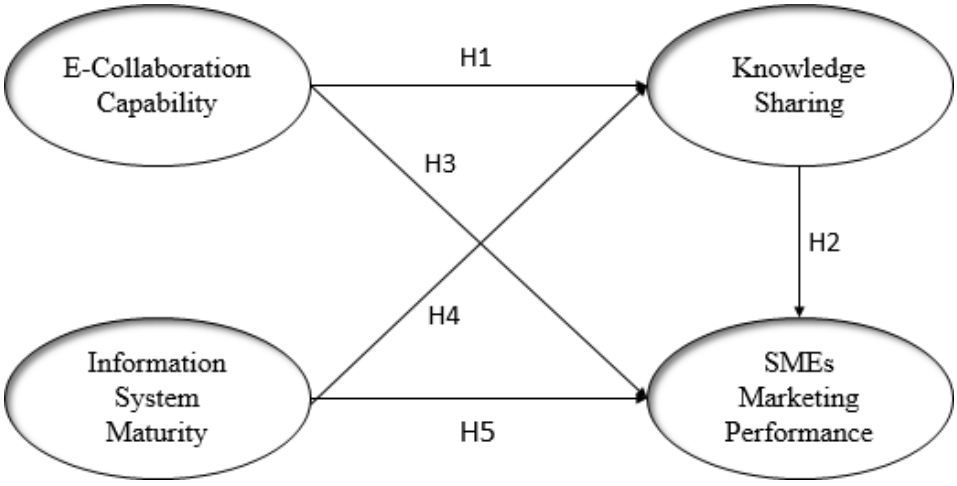
Information System Maturity and Knowledge Sharing

The results of the research conducted by Rao et al. (2015) Information system maturity has a positive and significant effect on knowledge sharing. Information system gives meaning about connecting people, where it is a source of knowledge (Alavi & Leidner, 2001). Rao et al. (2015) gave an example of network video conferencing to support collaboration between employees in different locations, online knowledge sharing portals such as wikis. Information systems make information flow from one party to another. Information System can make companies to share information and improve communication with other parties to achieve efficient coordination (Dong et al., 2009). Knowledge can be stored through IS and the Role of IS provides effective and efficient facilities for collecting, storing, transferring and accessing knowledge (Alavi & Leidner, 2001). Holsapple (2005) reveal IT is very important to facilitate the flow of knowledge between knowledge processors (humans or computers) and also to help measure, control, coordinate and knowledge leadership and knowledge processors. Thus, we propose the following:

H4: Information System Maturity has a positive and significant effect on knowledge sharing.



Information System Maturity and SMEs Marketing Performance

One of the important resources in the firm is the ability to adopt information system and technology. The firm's ability to adopt information systems will make it easier for companies to carry out various activities. The firm's ability to adopt IS will have an impact on its business performance (Bharadwaj, 2000). Holsapple and Wu (2009) also believes that IT capabilities will be able to improve firm performance. Thus, we propose the following:

H5: Information System Maturity has a positive and significant effect on SMEs marketing performance.

From the development of the hypothesis above, we propose the empirical research model shown in Figure 1.

Figure 1. Empirical research model

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

RESEARCH METHOD

Data Collection and Samples

This study was conducted on SMEs in Central Java. SMEs has used the information system well to collaborate with its business partners. The use of information systems means in establishing collaboration and communication using electronic technology, such as web-based chat tools, e-mail, internet, websites, social media, decision support system groups, and teleconference tools. To obtain the required data, we distributed questionnaires to the owners or managers of SMEs. The questionnaire was distributed to 400 SMEs in Central Java, Indonesia. But the returned questionnaire and can be processed for further analysis only 160 respondents (40% response rate).

Measurement

Each question item in this study was measured using a scale of 5, where 1 indicates strongly disagree and 5 indicates strongly agree.

This study defines e-collaboration as a collaborative activity using information and communication technology (Weiseth et al., 2006). The e-collaboration capability indicator was adopted from Choi and Ko (2012), including the ability of SMEs to develop and revise plans (EC1), the ability of SMEs to understand and predict partners (EC2), and the ability of companies to coordinate with their business partners (EC3).

Information system maturity is the maturity level of SMEs in the adoption of information and technology systems. Indicators of information system maturity are adopted from Rao et al. (2015), including SMEs have used information systems and technology (ISM1), each strategy is linked through information systems (ISM2), and SMEs are always developing information systems and technology (ISM3).

Knowledge sharing is the process of creating a group of knowledge between individuals or groups through direct or indirect interactions (Yoo et al., 2007). The knowledge sharing indicator was adopted from Gibbert et al. (2002) dan Zanjani et al. (2008), including SMEs are able to develop knowledge from partners (KS1), SMEs are able to assimilate information about partners (KS2), SMEs are able to disseminate information to partners (KS3), and SMEs are able to harmonize the knowledge they have with partner values (KS4).

SME marketing performance as a measure of the success of SMEs in achieving the level of profitability and growth in accordance with previously determined (Ardyan, 2016). The focus of SME marketing performance measurement is more likely to be growth. The indicators developed for this variable are profit growth (SMP1), growth of market share (SMP2), and sales growth (SMP3). This indicator is adopted from Acquaah (2012) dan Zheng et al. (2009).

Analisis Data

The analysis in this study uses Structural Equation Modeling. Amos version 21 is used when processing data. Based on research from Anderson and Gerbing (1988) SEM data analysis process is divided into two stages: (1) measurement model analysis, which involves initial analysis with confirmatory factor analysis (CFA) to measure the reliability and validity of latent variables, and (2) Structural model analysis, where the hypothesis is tested by examining the coefficient path and significance.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

RESULT

Measurement Model Analysis

In the measurement model analysis, this study tests the validity and reliability. Validity and reliability are used to test research instruments.

Validity test is a test that is used to show the extent to which the measuring instrument used in measuring what is measured (Sekaran, 2003). The validity in this study was measured using loading factor and average variance extracted (AVE). Tabanick and Fidell (2013) reveal that the loading factor is related to the correlation between indicators and variables. The higher the loading factor on the indicator, the higher the contribution of the indicator to the variable. The required loading factor value is 0.5 (Ghozali, 2013). Average variance extracted (AVE) is a measure of the amount of variance that is captured by a construct in relation to the amount of variance due to measurement error (Hair et al., 2010). The AVE value must be above 0.5 (Ghozali, 2013). Table 1 shows the loading factor and AVE values above 0.5. So, it can be concluded that the instrument developed is valid.

According to Sekaran (2003), reliability shows the extent to which the measurement is without bias (error free) and is able to guarantee consistent measurements across time and across various items in the instrument. Reliability test is done by using composite reliability and Cronbach Alpha. Composite reliability is defined as a measure of internal consistency of indicators of a formed variable that shows the degree in which variables are formed. Nunnally (1978) Kotler suggests that construct variables (composite reliability) must be above 0.7. Cronbach alpha measures the consistency of all scales used in research (Hair et al., 2010). Sekaran (2003) explained that the Cronbach alpha number at 0.70 is acceptable, above 0.80 is good. Table 1 shows that the reliability test (composite reliability and Cronbach Alpha) has met the requirements, so it can be concluded that the instrument is reliable.

Table 1. Hasil Uji Validitas dan Reliabilitas

Variabel and Indicator	Factor Loading	AVE	Composite Reliability	Cronbach Alpha
E-Collaboration Capability (EC)				
EC1 EC2 EC3	0.948 0.823 0.889	0.789	0.918	0.915
Information System Maturity (ISM)				
ISM 1 ISM2 ISM3	0.887 0.878 0.875	0.774	0.911	0.911
Knowledge Sharing (KS)				
KS1 KS2 KS3 KS4	0.789 0.873 0.891 0.843	0.722	0.912	0.911
SMEs Marketing Performance (SMP)				
SMP1 SMP2 SMP3	0.910 0.921 0.789	0.767	0.907	0.894

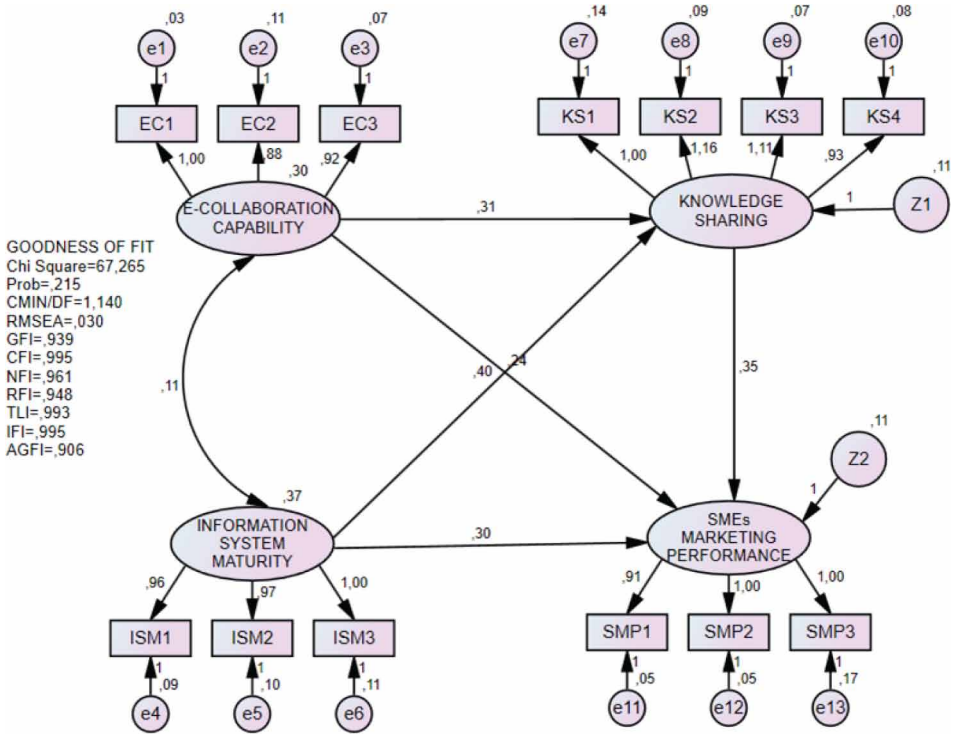
Table 2. The result of hypotheses test



Hypotheses	Result	Explanation
H1: E-Collaboration Capability → Knowledge Sharing	β= 0.307; α < 0.001	H1 is accepted
H2: Knowledge sharing → SMEs Marketing Performance	β= 0.349; α < 0.001	H2 is accepted
H3: E-Collaboration Capability → SMEs Marketing Performance	β= 0.237; α < 0.001	H3 is accepted
H4: Information System Mature → Knowledge Sharing	β= 0.395; α < 0.001	H4 is accepted
H5: Information System Mature → SMEs Marketing Performance	β= 0.295; α < 0.001	H5 is accepted

Structural Model Analysis

Goodness of fit is examined to show that the built models have been fit with acquired data. In this research, all indicators of goodness of fit that have been used show good in goodness of fit. Here are the indicators of goodness of fit: Chisquare= 67.265 (p value= 0.215); CMIN/DF= 1.140; RMSEA= 0.030; GFI= 0.939; CFI= 0.995; NFI= 0.961; RFI= 0.948; TLI= 0.993; IFI= 0.995; and AGFI= 0.906.

In order to examine the model and data analysis, we used supporting tool, AMOS version 21. Table 2 and Figure 2 show that all of the five hypotheses are accepted. First, e-collaboration capability has positive and significant influence on knowledge sharing (β = 0.307; α < 0.001). Second, knowledge

Figure 2. Hasil full model

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

sharing has positive and significant influence on SMEs marketing performance ($\beta = 0.349$; $\alpha < 0.001$). Third, e-collaboration capability has positive and significant influence on SMEs marketing performance ($\beta = 0.237$; $\alpha < 0.001$). Fourth, information system maturity has positive and significant influence on knowledge sharing ($\beta = 0.395$; $\alpha < 0.001$). Fifth, information system maturity has positive and significant influence on SMEs marketing performance ($\beta = 0.295$; $\alpha < 0.001$). Table 2 shows the result hypotheses examination.

DISCUSS

The results of this study indicate that e-collaboration capability has a positive and significant effect on knowledge sharing. The results of this study support previous research, where companies that are able to carry out innovative collaboration (e.g. electronic based collaboration) will influence the level of knowledge and accelerate access to knowledge (Zheng et al., 2013). In conducting cooperation, SMEs are often limited by geographical distance. These limitations make it difficult for SMEs to communicate and establish relationships. The use of IT in collaboration makes it easier for SMEs to communicate and share information. Tanriverdi (2005) argues that IT-based coordination mechanisms can increase the reach and wealth of corporate knowledge resources, and enable business units to learn about opportunities to share knowledge with each other.

SMEs in Indonesia have used technology to collaborate with their customers or business partners. The ability of companies to use technology makes communication between companies and customers or business partners easier to do. Information technology facilitates knowledge creation, knowledge sharing / dissemination, and use of knowledge (Choi & Ko, 2012). Collaboration makes companies able to coordinate, discuss, and give mutual input to make decisions with their business partners. This collaboration will make it easy to exchange knowledge and coordinate (Santoro et al., 2006). IT-based collaboration will make it easier to find new ideas, skills and knowledge through knowledge sharing activities.

The results of this study reveal that knowledge sharing can significantly improve SMEs marketing performance. Knowledge sharing will make companies and actors in the network have the desire to form a shared vision. This common vision is usually the desire to integrate or combine resources (Tsai & Ghoshal, 1998). Therefore, knowledge sharing will be able to make parties in the network equate the vision to create new values. Expósito-Langa et al. (2015) also believes that a shared vision (due to sharing knowledge) will have an impact on the firm's innovation. Knowledge sharing is an activity to disseminate knowledge to both internal and external parties. This activity is certainly capable of informing all information or knowledge about the business. Based on findings from (Surijah, 2015), both employee engagement activities and knowledge sharing are assumed to have an influence on firm performance.

Ko et al. (2011) verify that electronic collaboration can enhance a firm's ability to exploit information where its main purpose is to improve performance. Knowledge sharing enables SMEs in Indonesia to make companies understand the needs of customers or business partners (Ardyan & Sugiyarti, 2018). Collaboration can make parties make better decisions. Knowledge makes it possible to make predictions, casual associations, or predictive decisions about what to do, unlike information that only gives us facts. Effective managerial decisions will have a direct impact on the performance of SMEs.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

E-collaboration capability has a positive and significant effect on SMEs marketing performance. The results of this study support the results of previous studies (Bensaou, 1997; Hart & Saunders, 1998; Ko et al., 2011). Computational capabilities, speed of information processing, and computer connectivity and Internet technology can greatly improve the efficiency of business processes, as well as communication and collaboration between people responsible for managing, implementing and maintaining them. (Wade & Hulland, 2004). SMEs that are able to collaborate electronically with consumers who differ in geographical distance make the opportunity for SMEs to increase their market share and increase the number of customers. The internet is able to connect all parties that are geographically different. Electronic collaboration will have an impact on SMEs marketing performance.

The results of this study indicate that information system maturity has a positive and significant effect on knowledge sharing. The results of this study support previous research (Rao et al., 2015). Technology enables SMEs to communicate with other parties without having to meet face to face. Often SMEs need a variety of knowledge, skills, and experience owned by business partners. The obstacle is that the distance from the location of SMEs to business partners is very far. So, by using social media (YouTube, Facebook, etc.), chatting, electronic mail, it will be very easy for both parties to carry out knowledge sharing activities quickly. This is what makes SMEs mature in mastering information systems and technology, making it easier to carry out knowledge sharing activities.

The results of this study indicate that information system maturity has a positive and significant effect on SMEs Marketing Performance. The results of this study support previous research (Bharadwaj, 2000; Holsapple & Wu, 2009; Rao et al., 2015). O'Brien and Marakas (2007) explained that the ability to use IT as the main driver of business process reengineering, which integrates strategies to promote business innovation with a strategy of making major improvements in business processes so that companies can obtain and maintain competitiveness. The more SMEs have the ability to adopt system information, usually will have an impact on the costs incurred. Information systems help in the efficiency of knowledge transfer (Alavi & Leidner, 2001) and have an impact on efficiency when coordinating. Therefore, the efficiency that occurs in SMEs will also have an impact on the performance of SMEs.

IMPLICATION

Managerial implications as SMEs continue to develop technology and information systems are yet to be discovered. This capability in developing technology and information systems will enable companies to collaborate electronically. Both e-collaboration capability and information system maturity will make the activity of knowledge sharing and SMEs increase in marketing performance.

RESEARCH LIMTATION AND FUTURE RESEARCH

The limitations of this study are (1) this study is not specific to certain industries and (2) this study does not determine the maturity level of SMEs in the use of information systems. For future research, focus on SMEs in industries related to technology.

Chapter 68
IT Strategic Planning through CSF Approach in Modern Organizations

Neeta Baporikar
Namibia University of Science and Technology, Namibia

ABSTRACT

Although the purpose of strategic planning is straightforward - to outline where an organization wants to go and how it's going to get there - its nature is complex and dynamic. The, critical success factor (CSF) method, can augment strategic planning efforts by illuminating an organization's present situation and potential future. This chapter explores the value of enhancing typical strategic planning techniques with the CSF method and presents an integrated framework for helping modern organizations to understand the broad range of interrelated elements that influence strategy development for Information Technology (IT). The chapter synthesizes documented theory and research in strategic planning and CSFs. It also provides insights and lessons re the pros and cons of integrated strategic planning framework in the context of IT in modern organizations. Through in-depth literature review and contextual analysis, the chapter incorporates suggestions to modern organizations for IT Strategic Planning with CSF Approach for a holistic and effective strategic planning process.

INTRODUCTION

So many important matters can compete for one's attention when framing strategies especially information technology strategies in this ever changing and dynamic ICT world. This makes it often difficult to see the "wood for the trees". What's more, it can be extremely difficult to get everyone in the team pulling in the same direction and focusing on the true essentials. That's where CSFs can help especially in modern organizations which are becoming more and more complex because of networked economies. CSFs are the essential areas of activity that must be performed well if you are to achieve the mission, objectives or goals. By identifying CSFs, one can create a common point of reference to help in directing and measuring the success of any strategy, project or business. As a common point of reference, CSFs

help everyone in the team to know exactly what's most important which then helps people perform their own work in the right context and this creates to heave together towards the same overall aims. Thus in simple terms CSFs refer to identifying the things that really matter for success.

The idea of CSFs was first presented by D. Ronald Daniel in the 1960s. It was then built on and popularized a decade later by John F. Rockart, of MIT's Sloan School of Management, and has since been used extensively to help businesses implement their strategies and projects. Inevitably, the CSF concept has evolved, and you may have seen it implemented in different ways. This paper provides a simple definition and approach based on Rockart's original ideas. Rockart defined CSFs as: 'The limited number of areas in which results, if they are satisfactory, will ensure successful competitive performance for the organization'. They are the few key areas where things must go right for the business to flourish. If results in these areas are not adequate, the organization's efforts for the period will be less than desired. They are areas of activity that should receive constant and careful attention from management (Rockart 1979). CSFs are strongly related to the mission and strategic goals of any business or project. Whereas the mission and goals focus on the aims and what is to be achieved, CSFs focus on the most important areas and get to the very heart of both what and how to achieve.

BACKGROUND

Industry executives and analysts often mistakenly talk about strategy as if it were a chess game, but in a game there are just two opponents, each with identical resources, and with luck playing a minimal role. But the real world business and competition is different and certainly it is not a chess game – it is more than that. According to Moschella, D (1999), the real world is much more like a poker game, with multiple players trying to make the best of whatever hand fortune has dealt them. This paper explores the value of enhancing typical strategic planning with the critical success factor (CSF) method. It synthesizes documented theory and research in strategic planning, CSFs and proposes an information framework for enhanced strategic planning. The paper does not advocate or articulate a specific strategic planning approach, though theories are discussed and pointers to published methods are provided. Nor does the paper aim to document the CSF as a method; these are published elsewhere. (Caralli 2004; van der Heijden 1996)

CSF can augment strategic planning efforts by more deeply illuminating an organization's present situation and potential future. Critical success factors represent key performance areas that are essential for an organization to accomplish its mission. In addition, CSFs provide processes that help an organization establish strong ways of thinking, communicating, and making decisions. While future scenario and CSF methods have extensive histories with operational and strategic planning, neither method, on its own, constitutes a strategic planning effort, results in a strategy or strategic plan per se, or even has a direct, explicit interface with strategic planning. However, when used together within a strategic planning process, they noticeably enhance the process and the resulting strategic plan. According to a study by Esteves (2004), the critical success factors (CSF) approach has been established and popularized over the last 30 years by a number of researchers, particularly Rockart (1979). Today, the approach is increasingly used by consultants and IS departments as a means of support to IS strategic planning (Esteves, 2004). Ramaprasad and Williams (1998) underline this position by stating that "there is a great deal of attention devoted to the concept in the IS literature as many argue that the use of CSF can have a major impact on the design, development, and implementation of IS".

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

In literature, several definitions of CSF exist. Representing one of the most frequently cited definitions, Rockart (1979) uses ideas from Daniel (1961) and Anthony et al. (1972) in defining CSF as "the limited number of areas in which results, if they are satisfactory, will ensure successful competitive performance for the organization" (p. 85). Consequently, Rockart (1979) stresses, that these particular areas of activity should be constantly and carefully managed by a company. In a similar fashion, Bruno and Leidecker (1984) define CSF as "those characteristics, conditions or variables that, when properly sustained, maintained, or managed, can have a significant impact on the success of a firm competing in particular industry", while Pinto and Slevin (1987) regard CSF as "factors which, if addressed, significantly improve project implementation chances" (p. 22). According to Esteves (2004) however, both of these definitions fail to address the comprehensive concept proposed by Rockart (1979), which seeks to identify an ideal match between environmental conditions and business characteristics for a particular company. Within the field of strategic management, the definition of Key Success Factors (KSF) is closely related to the CSF concept. In this context, Ellegard and Grunert (1993) define KSF as a qualification or resource that a company can invest in, which in turn, accounts for a significant part of the observable differences in perceived value and/or relative costs in the companies' relevant markets. In literature, the terms CSF and KSF are often alternately used.

Thus, though the purpose of strategic planning is straightforward - to outline where an organization wants to go and how it's going to get there is complex and dynamic. The, critical success factor (CSF) method, can augment strategic planning efforts by illuminating an organization's present situation and potential future (Baporikar, 2013). This chapter explores the value of enhancing typical strategic planning techniques with the CSF method and presents an integrated framework for helping modern organizations to understand the broad range of interrelated elements that influence strategy development for Information Technology (IT). Critical success factors are defined as the handful of key areas where an organization must perform well on a consistent basis to achieve its mission (Baporikar, 2013). CSFs can be derived through a document review, analysis of the goals, objectives of key management personnel and interviews with individuals about their specific domain and the barriers they encounter in achieving their goals and objectives. The chapter synthesizes documented theory and research in strategic planning and CSFs and provides insights and lessons regarding the value and limitations of the integrated strategic planning framework in the context of IT in modern organizations. Through a method of in-depth literature review and contextual analysis, the chapter incorporates suggestions to modern organizations for IT Strategic Planning with CSF Approach for a holistic and effective strategic planning process.

CSF EVOLUTION

Research on CSF can be traced back to 1961, where Daniel (1961) first discussed "success factors" in management literature. In a broad approach, he focused on industry-related CSF which are relevant for any company in a particular industry. In 1972, Anthony et al. (1972) went a step further by emphasizing the need to tailor CSF to both a company's particular strategic objectives and its particular managers. Here, management planning and control systems are responsible for reporting those CSF that are perceived by the managers as relevant for a particular job and industry. Combining the perspective of both Daniel (1961) and Anthony et al. (1972), Rockart (1979) described a study on three organizations in 1979 which confirmed that organizations in the same industry may exhibit different CSF. The reasons for such a constellation are differences in geographic location and strategies among other factors. Nevertheless, Rockart was also able

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

to identify analogies between the CSF lists of the three examined organizations: "It is noticeable that the first four factors on the mature clinic's list also appear on the other two lists. (…) These, it can be suggested, are the all-encompassing industry-based factors. The remaining considerations, which are particular to one or the other of the practices but not to all, are generated by differences in environmental situation, temporal factors, geographic location, or strategic situation" (Rockart, 1979, p. 87).

In line with his initial study, Rockart (1982) gathered data in regard to IS executives. This data indicated that executives share a limited number of CSF. "Each executive (…) lists some, but not all, of the CSF gathered from the sample as a whole" (Zahedi, 1988, p. 190). The remaining differences were linked to organizational aspects as well as the time pressure facing the particular manager at the time the data was collected (Rockart, 1982). Furthermore, Rockart (1979) stressed that his approach did not attempt to address information needs related to the field of strategic planning. Instead, his CSF approach concentrates on information needs for management control and seeks to identify data which can be used to monitor and improve existing areas of business. In this context, Rockart (1979) follows Anthony's (1965) categorization of management activities into operational control, management control and strategic planning. However, it must be emphasized that Rockart (1979) limited his approach to management control which was precisely defined by Anthony (1965) as "the process of ensuring that resources are obtained and used effectively toward the attainment of corporate goals". Today, Rockart's (1979) CSF approach is particularly relevant within the limits of project management and IS implementation and therefore often used by IS executives. This is confirmed in a study conducted by Ramaprasad and Williams (1998), in which the results from 263 responses indicate the major areas in which the CSF approach is utilized: project management (63.49%), IS implementation (49.21%), and requirements (47.62%).

Dimensions of CSF

Reflecting the progress in research on CSF, several different CSF dimensions have emerged in literature over the course of the years. In the following, the most common six dimensions according to Esteves (2004) will be reviewed.

1. **Hierarchy vs. Group of CSF:** Rockart (1979) defines a specific hierarchy of CSF which is primarily based upon the organizational level at which the individual strategic issues are discussed. In line with this particular approach, CSF can be addressed on either an industry, corporate or sub-organizational level, thereby forming a certain type of CSF hierarchy within the organization (Rockart & Van Bullen, 1986). While a pre-defined level structure is dominant within the hierarchy suggested by Rockart, Barat (1992) argues that the hierarchy of CSF may also be built upon logical dependencies such as those existent between business aims and the factors influencing these aims. In addition, the hierarchical approach is extended to include groups of CSF. Here, either CSF for a group of organizations belonging to the same particular industry (industry CSF) or CSF for a group of managers in a particular role belonging to different organizations (occupational CSF) is identified. As a result, the idea of generic CSF for these particular groups is addressed (Esteves, 2004).
2. **Temporary vs. Ongoing CSF:** According to Ferguson and Khandewal (1999), CSF can be of either a temporary or ongoing nature. An example of an ongoing CSF is the existence of a project champion in top management, thereby influencing all phases of the project's implementation. On the contrary, the definition of the project scope represents a temporary CSF which is only regarded critical for a certain period of time. In this context, Ferguson and Khandewal (1999) note that all

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

CSF can be defined in a way that makes them temporary. However the CSF may differ in their individual degree of temporality, some spanning a larger timeframe than others. Consequently, the key is to recognize their individual relevance for different stages within a project's lifecycle.

3. **Internal vs. External CSF:** CSF can further be distinguished by the dimension of which they are internal or external to the particular organization or unit in which they are applied. Arce and Flynn (1997) state that "an internal CSF has related actions taken within the organization; while an external CSF has related actions performed outside the organization" (p. 312). As a result, internal CSF is linked to issues within a manager's range of control, whereas external CSF may not be exclusively controlled by the manager. According to Rockart (1979), the relevance of this CSF dimension is particularly high when determining the proper sources of information within a process of data collection.
4. **Building vs. Monitoring CSF:** Building and monitoring CSF refer, on the one hand, to the amount of control on the part of the management and, on the other hand, to the monitoring or building nature of the actions taken. According to Arce and Flynn (1997), "a monitoring CSF is concerned only with monitoring an existing organizational situation (whereas) a building CSF is concerned with changing the organization or with future planning" (p. 312). For instance, the maintenance of technological leadership would be a CSF which a company could build and control, while changing consumer demographics would represent a CSF which needs to be monitored and not controlled (Esteves, 2004). In a similar approach Rockart and Van Bullen (1986) distinguish between building CSF, used to achieve certain goals or implement a certain degree of change in performance, and monitoring CSF, used to monitor key issues over a larger time frame. Such long term monitoring is often closely related to the strategic and tactical CSF dimension (see below).
5. **Strategic vs. Tactical CSF:** This dimension focuses on the type of planning which takes place within an organization, thereby differentiating between strategic and tactical CSF. According to Esteves (2004), while strategic factors seek to identify which goals are to be achieved, the tactical factors describe possible alternatives in regard to how these goals can be met. Strategic factors, although based on opportunities, often contain a great amount of risk and, therefore, require long term planning primarily executed by senior executives. On the contrary, tactical factors deal with resources required to reach the goals described on the strategic level and only call for a short or medium term planning effort, most often performed by the middle management. According to Ward (1990), "there will normally be a mixture of tactical and strategic CSF. If they are all strategic, the business might founder in the short term while everybody concentrates on the blue skies ahead. Equally, if all CSF are tactical, the business might burn out like a super-nova" (p. 117).
6. **Perceived vs. Actual CSF:** The identified CSF in one organization do not necessarily apply to all other organizations. Rather, each individual company must align their CSF in accordance with their own specific goals and needs. This is where the final dimension comes into play, distinguishing between perceived and actual CSF. Initially proposed by Ellegard and Grunert (1993), the concept of perceived versus actual CSF could bring forth useful implications by shedding light on the knowledge concerning discrepancies between actual and perceived CSF. Experience in this field could, for instance, lead to more stable strategy formulations and implementations. Although the measuring of actual CSF is not possible, Dess and Robinson (1984) suggest a more frequent confrontation of key decision makers with these factors. By doing this, decision makers might win insight on their perceptions in regard to both truly relevant success factors and those which are only perceived as such.

Table 1. Research methods used for CSF identification

Action Research (Jenkins et. al., 1999)
Case Studies (Gibson et. al., 1999; Summer, 1999)
Delphi Technique (Atthirawong & McCarthy, 2001; Brancheau et. al., 1996)
Group Interviewing (handewal & Miller, 1992)
Literature Review (Esteves & Pastor, 2000; Umble & Umble, 2001)
Multivariate Analysis (Dvier et. al., 1996)
Scenario Analysis (Barat, 1992)
Structured Interviewing (Rockart & Van Bullen, 1986)

CSF IDENTIFICATION

In order to identify the relevant CSF, according to Esteves (2004), a wide array of research methods can be used (see Table 1). Among them are for instance the realization of case studies (e.g. Sumner, 1999), group interviews (e.g. Khandewal & Miller, 1992), structured interviews (Rockart & Van Bullen, 1986), as well as the analysis of relevant literature (e.g. Esteves & Pastor, 2000). According to Shah and Siddiqui (2002) the most frequently used method to identify success factors is the realization of a questionnaire.

CSF RELEVANCE

Pinto and Prescott (1988) argued that "the majority of the studies in the critical success factor research stream have been theoretical and have assumed a static view of the importance of various factors over the life of a project. In other words, a critical success factor was assumed to have the same degree of importance, throughout the life of a project" (p. 5). After having examined the criticality of CSF throughout the lifecycle of a project, they came to the conclusion that the degree of criticality of a CSF is subject to change during the different stages of a project lifecycle. Although the number of studies examining the relevance of CSF in regard to the individual phases of the project lifecycle has increased, most studies still remain limited to the sole identification of these CSF, not addressing their individual degree of relevance at all. Out of the more comprehensive studies addressing both the identification and the relevance, two different approaches can be found: The approach implemented by Pinto and Prescott (1988), for instance, is based upon the same set of CSF at all times, while examining their individual degree of criticality along the different project phases. In contrast, other studies have chosen to define different sets for CSF for each project phase. Although differently executed, both concepts generally tend to refer to the same set of CSF. According to Esteves (2004), in order to gain insight on CSF relevance, researchers most frequently use case studies as well as surveys based on interviews. Most of the time, participants are asked to either create a list of the most relevant CSF for each project phase or examine the relevance of individual CSF using a scale which indicates a low, normal or high relevance.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

CSF PAYBACK

According to Rockart (1979, p. 87), the following benefits exist for managers when applying the CSF approach:

- "The process helps the manager to determine those factors on which he or she should focus management attention. It also helps to ensure that those significant factors will receive careful and continuous management scrutiny."
- "The process forces the manager to develop good measures for those factors and to seek reports on each of the measures."
- "The identification of CSF allows a clear definition of the amount of information that must be collected by the organization and limits the costly collection of more data than necessary."
- "The identification of CSF moves an organization away from the trap of building its reporting and information system primarily around data that are "easy to collect". Rather, it focuses attention to those data that might otherwise not be collected but are significant for the success of the particular management level involved."
- "The process acknowledges that some factors are temporal and that CSF are manager specific. This suggests that the IS should be in constant flux with the new reports being developed as needed to accommodate changes in the organization's strategy, environment or organization structure. Rather than changes in an IS being looked on as an indication of "inadequate design", they must be viewed as an inevitable and productive part of IS development."

However, according to Esteves (2004), the CSF concept itself can be used for more than only IS design. Current studies, suggesting a number of additional areas of assistance to the management process, reflect this.

STRATEGIC PLANNING

Strategic planning is the process of defining an organization's intentions for achieving its mission. There are many ways to conduct strategic planning, most of which result in a plan or set of plans that articulate organizational goals and a high-level strategy for achieving them. Division-level and organizational unit-level planning should be tied directly to the organization's strategic plan. Strategic planning is not only an important foundation for executing work; it also sets the stage for enterprise architecture, process improvement, risk management, portfolio management, and any other enterprise-wide initiatives. There are many documented approaches to strategic planning (e.g., Fogg 1994).

Strategic planning is the process of defining an organization's plans for achieving its mission. An organizational *strategy* is a derived approach to achieving that mission. The product of a strategic planning effort is typically a document (a *strategic plan*) that elaborates a high-level strategy and articulates the elements that influence it—it is a full description of the organizational environment and intentions. Note that a strategy is directional in nature; although descriptions and analysis of the present situation are included, a strategic plan does not merely endorse the status quo, and it directs change of some kind (Cassidy 2006). Division-level and organizational-unit-level planning should be tied directly to the organization's strategic plan. Strategic planning is not only an important foundation for executing work; it also

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

sets the stage for enterprise architecture, process improvement, risk management, portfolio management, and any other enterprise-wide initiatives. There are many documented approaches to strategic planning (Fogg 1994). Typical strategic planning processes examine an organization's current environment and abilities (the present situation), considerations about how it would like to grow or evolve (the desired future), its aspirations as an organization (what it will strive to do), and its intentions for moving forward (how it will move forward).

These high-level elements are described below:

- **The What:** These are descriptions of what the organization does and what it aspires to achieve - its organizational targets - including its goals, objectives, and quantitative performance measures.
- **The Present:** The present situation, or current environment, is typically described in terms of the organization's mission, guiding principles (or values), organizational strengths (or enablers), and organizational barriers (weaknesses or challenges).
- **The Future:** The desired future is described by the organizational vision and targets.
- **The How:** The preferred route to achieving the organizational goals, objectives, and mission is communicated as a strategy or as strategic goals. Strategic goals typically reflect the primary goals of an organization or enterprise and imply a particular set of strategies.

STRATEGIC PLANNING ELEMENTS

A well-documented strategic plan is critically important for organizing thinking and communicating thoughts. Strategic plans include elements that describe an organization's present state, aspirations, and intentions for the future, and approach for going forward. Table 2 contains the definitions of the terms typically used to describe strategic planning elements.

Understanding these elements and their relationship to one another supports strategic thinking and planning, but also enhances the effective use of CSFs in strategic planning efforts.

Strategic Planning and Organizational Hierarchy

It is important when thinking about strategic planning to think about organizational hierarchy, both in terms of how the strategy will apply to the organization and in terms of the roles and responsibilities for planning. Table 3 presents model of organizational structure, used to organize enterprise architecture concepts. The model identifies three general levels common to most organizations: the institutional (or organizational) level, the managerial level, and the technical level (Thompson 1967, Bernard 2005).

Becoming more common is the organizational network model, where work is carried out by cooperative networks of local and remote individuals and teams. Teams are functionally based and locally managed, removing layers of organizational management. As a result, the teams are flexible and can change function, goals, or make-up as necessitated by internal or external influences (Bernard, 2005). Gunasekaran and Garets articulate some good criteria for strategic planning participation. A well formed strategic planning team should include - executive support and access, a representative microcosm of the organization, with multiple levels of management and an external perspective. (Gunasekaran, 2004) An empowered representative group is the best faction to conduct strategic planning. But strategic thinking must involve personnel at the highest level of an organization. It is not a low-level project or a delegated

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Table 2. Strategic planning terms

Term	Definition
Mission	An organization's mission is its primary business or purpose; it describes what an organization does, for whom, and its benefit. The mission of an organization is not a time-bound objective.
Vision	A vision is an ideal that an organization intends to pursue. It links the organization to the future by articulating instantiations of successful execution of the mission. An organization's vision is a source of inspiration and can be broader than the organizations capabilities. It might, in fact, describe what can be achieved in a broader environment if the organization and others are successful in achieving their individual missions.
Goals	Goals are broad, measurable, aims that support the accomplishment of a mission.
Objectives	Objectives are specific, quantifiable, lower-level targets that indicate an accomplishment of a goal.
Guiding Principles	Guiding principles are directive statements that articulate the constraints an organization chooses to place upon the way it achieves its goals. Guiding principles embrace core values and are used to shape an organization's strategy. Guiding principles reflect long-term intentions, but are not necessarily permanent. A guiding principle may seem similar in content to a goal but it lacks measurable aims. A guiding principle can generate a goal when an organization chooses to commit resources to achieving a measurable result regarding its content.
Enablers	Enablers are external conditions or organizational strengths that facilitate an organization's ability to accomplish its goals or objectives.
Barriers	Barriers are external conditions or organizational (internal) weaknesses that hinder an organization's ability to accomplish a goal or objective.
Strategy	A strategy is a derived approach to achieving the mission, goals, and objectives of an organization. It supports the organizational vision, takes into account organizational enablers and barriers, and upholds its guiding principles.
Strategic Plan	A strategic plan is a document that results from a strategic planning activity. It elaborates the organizational strategy and documents the elements that influence it.
Initiative	An initiative is a specific set of actions that implement a strategy.
Actions	Actions are specific steps to achieve a goal or objective and typically have assigned staff and schedule constraints.
Performance Measures	Performance measures describe performance targets relevant to each objective.

Table 3. Model of organizational structure

Level	Organizational/Executive	Managerial	Technical
Purpose	Establish rules and relate to larger society, making possible the implementation of organizational goals.	Mediate between the organization and the task environment; administer internal affairs; provide resources.	Create the organizational product.
Activities	Interface with the external environment to determine the organizational domain and secure legitimacy.	Provide internal political mediation between the organizational levels.	Execute production and/or development functions; protect the production functions from external uncertainties.

IT STRATEGY

Information technology is a resource for organizational and mission-specific requirements (Bernard 2005). In addition to being viewed as a resource for an organization, IT is commonly viewed as an enabler of the nonfunctional requirements, or quality attributes, of a system (e.g., reliability, availability, usability). IT strategy refers to a global level of thinking about IT and its integration with the rest of an organization. The ultimate goal of IT strategic planning is to provide a broad and stable vision of how IT contributes to the long-term success of the organization (Gunasekaran 2004). In today's environment, an organization's existence depends on the effective application of IT. As a result, organizations increasingly look to technology not only to support business opportunities, but also to create competitive advantage (Baporikar, 2014b, 2015 a). IT planning has coincidently been elevated from a tactical management tool to a strategic decision-making vehicle (Ward, 2002). As with organizational strategic planning, there are documented approaches to IT strategic planning (e.g., Cassidy, 2006). Critical success factors are defined as the handful of key areas where an organization must perform well on a consistent basis to achieve its mission. CSFs are typically derived through a documented review of the goals and objectives of key management personnel and interviews with those individuals about their specific domains and the barriers they encounter in achieving their goals and objectives. Levels of management introduce different types of operating environments and thus different levels of CSFs. Commonly identified CSF levels are*:*

- *Industry,*
- *Organizational,*
- *Division,*
- *Operational-unit* and
- *Individual*.

These labels are general terms that reflect most organizational hierarchies. There is a direct parallel between CSF hierarchy and a typical strategic planning hierarchy.

THE STRATEGY PARADOX

A common criticism of strategic planning is that it is overly involved with extrapolation of the past and present and can create the illusion of certainty regarding the future (Heracleous, 1998). The strategy paradox is the conflict that arises from the need to make operational commitments in the face of unavoidable strategic uncertainty (Raynor, 2007). One solution to the paradox is to separate, and align, the management of commitments from the management of uncertainty so that the work of delivering on organizational commitments is aligned with, but distinct from mitigating the risks associated with future uncertainty and providing exposure to promising opportunities. Because uncertainty increases with the time horizon under consideration, decision making should be allocated to the managerial levels responsible for each approximate time horizon. Executives tend to be well suited for managing strategic planning, scenario planning, and risk, while managers are well equipped for operational planning, the identification of critical success factors, and product or service delivery. With executives focused on managing uncertainty (strategic positioning), operating managers can focus on delivering on commitments (operational effectiveness). Operational effectiveness is akin to efficiency and means performing

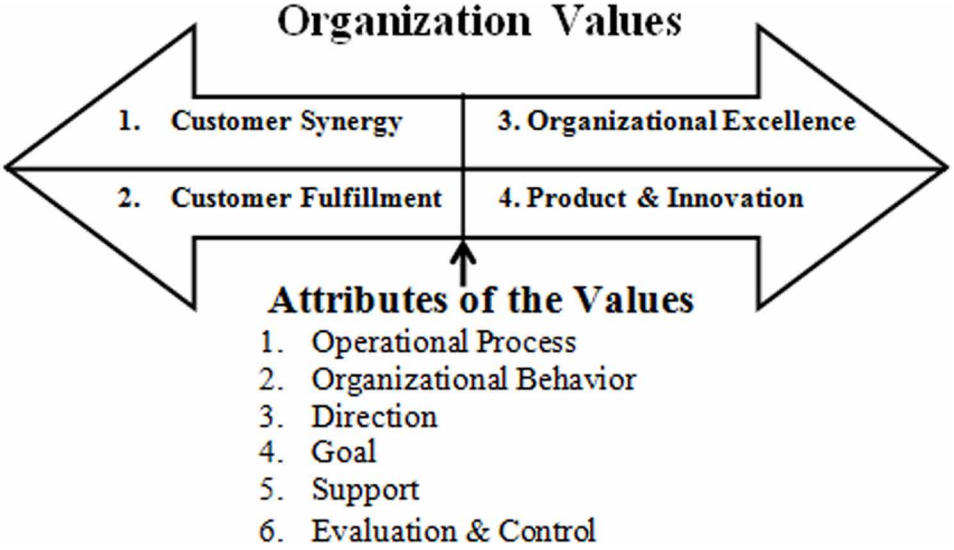
EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

similar activities better than one's industry peers. Strategic positioning means adopting activities that are different from one's peers or performing similar activities differently (Porter, 1996).

Expanding the breadth and depth of knowledge and thought that are available for making strategic decisions can only strengthen the decisions and strategies themselves. Thus, the CSF method supports strategic thinking and decision making by strengthening perceptions and assumptions that lead to information-based decisions. They also address the strategy paradox by forming a bridge between strategic and operational activities. CSFs identify operational activities that serve the achievement of the mission. Future scenarios help form strategies that lay the groundwork for operational activities.

USING CSFS FOR IT STRATEGY

Organizations often have difficulty developing and implementing IT strategies because they do not maintain an explicit focus on high-level business drivers. As a result, IT strategies often fail to reflect what is important to the organization, the accomplishment of the mission, and long-term resilience. The key to an IT strategy is that it explains how information technology will align with and support an organization's overall business strategy. It should reflect a global level of thinking about IT and its integration with the rest of the organization.



The success of an enabling resource, like IT, relies heavily on aligning IT-strategy with higher level, organizational strategy. Because CSFs can be derived at each level of an organization, they can facilitate alignment. They link organizational strategic interests and the information-planning function. In fact, a good IT strategic plan must include an understanding not only of its own CSFs, but of the CSFs for the divisions of the organization it supports as well as the higher-level organizational CSFs. Organizational CSFs are critical to IT strategic planning because they reflect the business goals of the organization and the field of vision of top management (Caralli, 2004). In addition to supporting strategy development, CSFs also enhance strategic planning to some degree. In particular, CSFs can provide an organizationally tailored filter for identifying driving forces for future development. This method has been piloted in several government strategic planning efforts with positive results. Not only has the integration of these techniques produced robust strategic plans, it has fostered strategic conversation among organizational leadership, inspired data-based decision making, and increased communication across the organizations. This approach can be implemented in stages, at any level, and still realize gradual benefits.

Improving Strategy Execution

Improving strategy execution is at the top of the list of important issues for most corporate executives, followed by concerns about actually having a sound strategy. When strategic planning is done well, with a mature and robust process that guides the effort to ensure completeness - the outcomes can be powerful and position an organization to thrive and sometimes even dominate the competition. Yet only a small percentage of organizations operate with mature planning models that yield complete and comprehensive strategic plans addressing alignment to key dimensions of the business. Not surprisingly, even fewer organizations have mastered the art of fully and successfully executing corporate strategic plans. With successful strategy outcomes continuing to be an elusive prize sought by so many corporate leaders, this part is focused on exploring eight critical success factors related to improving strategy execution. A common mistake organizations make during strategic planning is that over jumping directly into plan-

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 1. Current state analysis

ning for the future. That may not sound like a mistake at first blush, after all...isn't strategic planning all about the future? The current-state analysis phase of corporate strategic planning involves gaining a realistic perspective of where the organization is today so that it is possible to plan effectively for moving from the current reality to the desired future. Missing this step puts the strategy and the execution in jeopardy. It helps put everything about the organization into a singular context – with a holistic-360 degree, multi-dimensional view that allows for comparability and planning occurring effectively.

Sometimes organizations feel that they are adequately addressing the current-state by performing a traditional SWOT analysis to provide indications of Strengths, Weakness, Opportunities and Threats. The current-state analysis prescribed here Figure 1, provides far more relevant attribution of the organization and the environment in which it must operate (the business ecosystem) – inclusive of critical aspects, such as: the organization's culture, structure and core values as well as the relationships with customers, partners, employees, suppliers. Likewise, current-state analysis is reflective of the economic fluctuations that occur within that system we refer to as the business ecosystem. The assessment yields a more complete picture of the organization's strengths and weaknesses, and the same is true for the external assessment. Far more is understood and uncovered relative to opportunities and threats using this approach than when using the more traditional SWOT analysis.

A Value Quadrant Analysis (VQA) is an excellent method to truly understand key buyer segments by profitability. Such an understanding allows a business to make informed decisions to drive sales and marketing related strategies - even helping make key decisions related to remaining in one or more quadrants or exiting unprofitable segments. In short, VQA during current-state analysis drives value proposition messaging, strategy development and ultimately should determine strategic investment decisions. The organizational profile resulting from the current-state analysis, as described, encapsulates key data that will feed the planning process with richer data - broken down into three major components:

1. Operating environment & business processes
2. Business relationships

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

3. Key performance categories

The holistic understanding of the business ecosystem that comes from having conducted a current-state analysis allows for strategic planning to optimize the shortest path to the future-state, once it has been defined. That path is dependent upon an understanding of the business's core values, culture, value proposition, organizational value quadrants, org structure relative to culture and external competitive environment by line-of-business (including key players like customers, suppliers, partners and channel relationships). The comparison of the organizational profile to the challenges identified during this step result in the gap that serves as the basis for planning.

Requirements of Strategic Planning

Strategic planning requires "real" information related to questions like:

1. What is working well?
2. What is not working so well?
3. What are our organizational vulnerabilities?
4. Where are there untapped opportunities?

Table 4. Realisms

Serial No.	Type	Interpretation
1	Operational	Businesses need the discipline of a planning process which structures an analysis of operations – allowing the organization's employees to provide input into the panning process. This action engages employees and is especially beneficial in helping executives have a better understanding of today's reality across the business. That does of operational reality is essential to constructing meaningful strategy and planning realistic execution. Getting to business truth even extends beyond the organization to include engaging key suppliers, distributors, channel partners and customers in aspects of the planning process.
2	Cultural	Business truth includes understanding not only operational issues facing the business, but also more subtle disconnects and problems not so easily detected – yet equally important. Understanding culture is an understanding of "Who are we as a company, really?" Culture is defined by what members of the organization, and the organization as a whole, do to create success. Culture is about an organizations core values and how members define acceptable and unacceptable behavior. In planning a clear understanding of culture provides a framework for understanding the "What, Why and How" work gets completed.
3	Value Proposition	A value proposition can be thought of as a set of market promises based on capability and credibility, which helps prospective customers understand how the company's offering uniquely addresses specific problems, opportunities and challenges. Testing the internal perception of organization's value proposition at different levels of the organization provides yet another form of business truth. It indicates where there is consistency, where there are disconnects and if value is being communicated to the marketplace effectively.
4	Core Competency	Companies must realistically assess their core competencies because they are the underpinnings of the organization's skills and the cornerstone of successful strategic execution. They represent the fundamental knowledge, abilities and expertise of an organization. True ability to understand and measure organizational core competencies is a critical factor in reaching strategic goals.
5	Industry	Understanding the company's position in the market place is essential. Now more than ever, business leaders must clearly understand the directional flow of their industry and plan for transitions and consolidations that may be occurring now or are on the horizon. Data must be gathered from managers and employees in sales, marketing, customer service, supply-chain and other areas of the business in order to gain true visibility into the organization's industry and market sectors.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

To get to this information straight from the source that knows it best, employees must be engaged in the strategic planning process as early as the current-state analysis. This is where most companies make a big mistake. The executive team pulls into a shell to "meet" about the strategic plan and routinely locks out key people from the process that might well have contributed beneficial ideas and information.

This is not done intentionally of course. It is done out of habit and expediency. "*Let's get the executives and their managers into planning sessions and get this done...*" Such sentiments are common and can be heard in companies around the world. It is unfortunate, but closed loop thinking like this often hatches flawed strategies as a result of executive management groupthink. "Happy talk" takes control and the management team convinces themselves that the business is doing relatively well...oblivious to threats and issues awaiting them in the near future. The planning process requires realism to actually produce a valuable result. These realisms are reflected in Table 4.

The Global Factor

Approaches to strategy and planning in multinationals require more effort due to more complex organizational structures and market specific factors global companies face. Corporate strategy must be "localized" to allow the business to respond appropriately to geographic-based opportunities and threats. Likewise, strategy development must include the involvement of the company's foreign business leaders to help the strategy be adapted correctly to local needs. Exactly how this is done is dependent upon the type of structure the company has decided best suits the organization (e.g. matrix, product, geography, etc.). Multinational strategies are shaped by the trade-off between opportunity and risk. Three broad environmental factors determine that trade-off. The first is the prevailing political economy, including the policies of both host and home governments, and the international legal framework. The second is the market and resources of the host country. The third factor is competition from local firms. Given these factors, one challenge multinational companies face is recognizing the need to "localize" strategies. Once that recognition has set in, the next challenge is then determining how best to accomplish localization. Strategy localization is needed in order to allow the business to respond appropriately to geographic-based opportunities and threats. Corporations should expect cultural heuristics to differ from country to country. Likewise, markets operate differently across the world, and there is no "one size fits all" approach to successfully conquering them. Competitor threats must be addressed with locally adapted strategies to be effective, thus the competitive analysis involved with strategic planning is a requirement to successfully navigate the terrain of the region's business ecosystem. Marketing and sales tactics are only part of geographic differentiation, although they are certainly not insignificant in terms of importance. There are also unique supply-chain considerations to factor into local strategies. Resource costs, including labor, vary widely across countries. It doesn't stop there. Legal systems, labor laws and distribution systems also impact local strategy. For this reason, operational considerations related to pricing, production and distribution also cannot be ignored with a cookie cutter corporate strategy that is imposed across countries / geographies. None of this means that the foreign-based division can go rogue and operate business practices that run counter to the strategic goals of the parent. What it does indicate, however, is that parent company's corporate strategy must be operationalized to fit localities.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

The People Factor

Implementing corporate strategy is dependent upon the energy, dedication, hard work and faith of the organization's employees. Motivating employees to act decisively in the face of uncertainty is a challenge where many an organization has failed miserably. Simply stated, a considerable amount of energy is required to drive strategies to fruition - and that energy must be generated from within the organization. The more that employees have been involved in the process of creating the strategy, the more they will have already bought into it - helping fuel strategy delivery and thus propelling the momentum of execution to make it both easier and smoother. When it is not possible to broadly involve employees in some way, the communication effort surrounding the strategy needs to be amped up across the organization to compensate for the fact that many if not most employees will be in the dark regarding the strategy and what is expected of them.

CSFS AND GOALS

There can be some confusion between CSFs and goals, which are not the same. Goals are broad, high-level aims that support the accomplishment of the mission. Like goals, CSFs represent things that enable the success of or contribute to the accomplishment of a mission. Goals, however, are often derived from performance management exercises rather than strategic planning, and are set with an eye to achievability rather than organizational success or contribution to accomplishment of the mission. CSFs refer to ongoing operational activities that must be sustained for the organization to function successfully. Where goals help an organization attain success, CSFs ensure an organization's survival. If an organization focuses only on goal-setting, it might, as a result, drop attention from the day-to-day activities that sustain its success.

Goals and CSFs share a many-to-many relationship because organizational goals may rely on the achievement of more than one CSF and a CSF may affect the achievement of several goals. The potential many-to-many relationship between CSFs and goals is indicative of their interdependence and importance for accomplishing a mission (Caralli, 2004). CSFs reflect areas that are important to the organization in the current operating environment and to future success; they remain fairly constant over time, at least in the sense that they are seen as areas critical to the success of the mission in both the present and the future. Rockart writes, "Goals represent the end points that an organization hopes to reach. Critical success factors, however, are the areas in which good performance is necessary to ensure attainment of those goals" (Rockart, 1979).

There is some fluidity among CSFs and goals. As stated earlier, a performance gap in a particular operational area may cause a CSF to be elevated into a fix-oriented goal. Alternately, a goal, once achieved, may migrate to a CSF for sustainment.

FUTURE RESEARCH DIRECTIONS

In an early contribution to the work on critical success factors and management control systems Anthony et al. emphasized that the development of timely, concise measurements was crucial to monitoring identified CSFs (Anthony, 1972). Although not all documented CSF method descriptions include develop-

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

ing CSF measures, measures were also a fundamental part of Rockart's original CSF method. Rockart writes, "Critical success factors are areas of activity that should receive constant and careful attention from management. The current status of performance in each area should be continually measured, and that information should be made available" (Rockart, 1979). Critical success factors can establish a set of performance measures that directly link operational issues to the mission. Further area of research would be to establish this set of performance measures that directly link CSFs especially in the area of IT, Strategic Planning and Modern Organizations. Another interesting research thread would be to see how the dynamic environment of IT convergence with communication and technologies would affect CSFs and counter effect of this on identifying and linking CSFs to strategic planning.

CONCLUSION

Information has emerged as an agent of integration and the enabler of new competitiveness for today's modern organizations in the global marketplace. But the real concern is whether the paradigm of strategic planning changed sufficiently to support the new role of strategic planning, information systems and technology (Baporikar, 2015b). This chapter is an attempt to review the literature in this context and the focus is on CSF as approach for IT strategic planning in modern organizations. Critical success factors and future scenarios are particularly well-suited augmentations to IT strategic-planning efforts. They illuminate an organization's present situation and potential future, respectively, and facilitate the alignment of IT strategy with organizational business drivers. Each technique can be used to strengthen both strategy setting and operational activities. When the CSF method and scenarios are used together and integrated with a strategic-planning method, they also reveal the value of an overarching strategic thinking and strategy development process. They contribute to the strategic thinking and planning process and the development of robust strategic planning information assets.

KEY TERMS AND DEFINITIONS

Action: A specific step to achieve a goal or objective. An action typically has assigned staff and schedule constraints.

Barrier: An external condition or organizational (internal) weakness that hinders an organization's ability to accomplish a goal or objective.

Critical Success Factors (CSFs): The handful of key areas where an organization must perform well on a consistent basis to achieve its mission.

Enabler: An external condition or organizational strength that facilitates an organization's ability to accomplish its goals or objectives.

Goals: Broad, high-level aims that support the accomplishment of a mission.

Information Systems (IS): The means by which people and organizations gather, process, store, use, and disseminate information.

Information Technology (IT): The hardware, software, and telecommunications that facilitate the acquisition, processing, storage, delivery, and sharing of information and other digital content in an organization. It also is the use of computing, electronics, and telecommunications technology in managing and processing information, especially in large organizations.

Initiative: A specific set of actions that implement a strategy.

IT Strategy: A description of how information technology will support an organization's overall business strategy.

Operational Planning: The process of making decisions about the allocation of organizational resources (capital and staff) to pursue a strategy.

Performance Measure: Performance targets relevant to each objective.

Strategic Goal: A primary goal of an organization or enterprise that implies a particular strategy or set of strategies.

Strategic Plan: A document that results from a strategic planning activity. It elaborates the organizational strategy and documents the elements that influence it.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Strategic Planning: A process for defining an organization's strategy, or direction, and making decisions about how to allocate its resources to pursue this strategy, including its capital and people.

Strategy: A derived approach to achieving the mission, goals, and objectives of an organization. It supports the organizational vision, takes into account organizational enablers and barriers, and upholds guiding principles.

Chapter 69
Alternative Research Funding Mechanisms:
Make Funding Fit for Science 2.0

David Osimo
Open University of Catalonia, Spain

Laia Pujol Priego
ESADE, Spain

Riina Vuorikari
EC JRC IPTS, Spain

ABSTRACT

Funding affects how science is carried out. Over the last 50 years, the core of science funding has become competitive, project based and increasingly oriented towards societal challenges. Recently, alternative, more open and flexible funding mechanisms have emerged, such as crowdfunding, philanthropy and bottom-up mechanisms. This chapter analyses the development and implications of alternative funding mechanisms for science, through an umbrella literature review complemented by case studies. It concludes that alternative funding are an important component of research funding, which provides new opportunities especially for niche and unrecognized research, and require stronger communication skills by researchers. However, they can't and should not substitute traditional mechanisms. Researchers, institutions and funding agencies should redesign their activity accounting for a plurality of funding instruments, and facilitate collaboration between them.

INTRODUCTION

Science 2.0 is more than the adoption of Web 2.0 tools (blogs, Twitter or wiki) in science. It refers to a new approach that embodies the key values of Web 2.0 – openness by default, peer-to-peer recognition, presence of proactive users, perpetual beta and long tail – applied to the field of science and research.

The emerging literature on the implications of Science 2.0 points to a greater level of collaboration between scholars from different disciplines, including nonprofessional researchers; more creativity because of the scale of contribution, the myriad of different actors and wealth of data produced and analysed; a more emergent nature of collaboration focusing not only on paper publication but on a wider set of scientific outputs; higher accountability and transparency of science thanks to the wider sharing of data underlying the analysis (Ioannidis 2005; Murray-Rust 2008). The emergence of Science 2.0 is in many ways convergent with the so-called Mode 2 system of science (Nowotny, Scott, & Gibbons, 2003) which involves multidisciplinary teams working together for short periods of time on specific problems in the real world, as opposite to traditional research pursuing scientific knowledge free from application concerns.

The literature also identifies a number of main barrier to greater uptake of Science 2.0, for example the lack of a favourable institutional setting and the lack of appropriate incentives to scholars (Burgelman, Osimo & Bogdanowicz, 2010). Too often research careers and scholars' reputation remain based on "publish or perish" principles focusing solely on the research and discovery activities that fall under the "scholarship of research" (Nicholas, Herman & Jamali, 2015), and do not encourage other aspects of scholars' work such as multi-disciplinary work, data sharing and large scale collaboration for example in citizen-science projects.

The way science and research is funded, in particular, can play a determinant role in hindering or supporting Science 2.0. The funding of science has undergone significant changes in the last 50 years, mainly moving from a block-based funding to a competitive, project-based funding which deeply affected the behaviour of scientists (Laudel, 2006). As a result, for example, highly competitive mechanisms such as the EU Framework programme often turn out to fund professional project writers (the so-called "usual suspects" of EU funding) rather than frontier researchers who are less skilled in writing project application that tick all boxes of the evaluation process (Arnold, 2010). Such system, while being generally considered more effective, has also attracted several criticisms (Guthrie, Guerin, Wu, Ismail, & Wooding, 2013) as an inefficient way of distributing research funding because of the high bureaucratic burden it places on individuals; the high cost of the process; and the doubtful capacity by government to select the genuinely promising research priorities and projects (Sutherland, Fleishman, Mascia, Pretty, & Rudd, 2011).

Recently, there as been an emergence of a set of novel "alternative" funding mechanisms (AFM) for scientific research. They tend to be more open and flexible, examples of these are crowdfunding, philanthropy and open bottom-up mechanisms. These new mechanisms appear to be more in line with the agile, multidisciplinary and emergent nature of science 2.0. This chapter aims at shedding more light around such AFM practices as a potential institutional driver, or an enabler, of science 2.0. The research is based on a study carried out for the Joint Research Centre of the European Commission (Vuorikari & Punie, 2015) that aimed at analysing these new mechanisms for scientific research in order to address some key questions:

1. What are the key features of alternative funding mechanisms and to what extent are they available in Europe?
2. What are the implications for researchers and research institutions?
3. What are the opportunities and challenges for EU policy?

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

BACKGROUND

In order to analyse the implications of "alternative" funding mechanisms (AFM) in Europe, an "umbrella literature review" (Grant & Booth, 2009) was conducted. It was also complemented with a desk-based analysis of 67 AFM for scientific research that were identified through web search and desk research. The scope was international; the examples are spread in 14 countries, notably 45 out of 67 are based in Europe and the rest outside. Furthermore, four examples were selected for in-depth exploratory case studies as representative of AFM from different European countries. The aim of the cases was not to be exhaustive, but provide concrete narrative examples of AFMs in order to illustrate how they work and detect possible initial implications. The study is reported in detail in Osimo et al. (2015).

The notion of "alternative" is defined by referring to two dimensions, namely WHO and HOW. WHO refers to the source of the funding (private rather than governmental) and HOW to the modality used to distribute funds. This alternative modality concerns in particular the lack of a rigid top-down setting of research priorities and the openness of the decision-making process to select the beneficiary. Based on the above mentioned desk research, AFM for scientific research are defined as competitive research-funding mechanisms that fulfil *any* of the following cases:

- Are led by non-governmental organisations;

OR

- Set research priorities in an open way without strong identification of research priorities;

OR

- Select proposals through other means than peer review of the projects.

Under the definition of AFM the following instruments are included:

- Crowdfunding for science, where a large number of citizens donate money for a specific research project through dedicated platforms such as Kickstarter and IndieGoGo. While these platforms originally started for raising money for political causes, the arts and charity, start to be used to fund science projects and research (Mollick, 2014).
- Both privately and public funds sometimes adopt open, bottom up methods for selecting research projects. These mechanisms (such as open funding, inducement prizes and others) do not pre-emptively select the research priorities, but leave the scientist open to address a specific problem in the way she-he feels more appropriate.
- Wealthy individuals ("celebrity philanthropists) start to play a major role in science funding. Bill Gates (Microsoft), Eric E. Schmidt (Google), and Lawrence J. Ellison (Oracle) are among hundreds of relevant donors who are shaping the priorities in science for today and the coming years.

These new funding mechanisms are the reflection of long-term and society-wide trends towards a more active role of private citizens in co-producing public services, e.g. philanthropy and crowdfunding as part of the crowdsourcing movement (Shirky, 2009). Moreover, the increasing adoption of open mechanisms

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

such as FET (Future Emerging Technologies) is designed to better accommodate the complexity of the innovation process and enable disruptive innovation (Fraunhofer, 2012). On the other hand, inducement prizes can also help breaking the "usual suspects" problem and therefore reduce the asymmetry of skills between researchers and funders by rewarding concrete results rather than project proposals (Beckert, Friedewald, & Schaper-Rinkel, 2012).

One of the most interesting aspects of AFM is that traditional government players do not have a role in defining the specific research priorities and they therefore opt for a more open, demand-driven approach where the answer to the problem can come from unexpected sources and disciplines (Stallbaumer, 2006). While these mechanisms did not always emerge as a deliberate answer to the challenges of competitive research funding, we will see that they are often relevant to address these specific challenges.

REVIEW OF ALTERNATIVE FUNDING MECHANISMS

From the research conducted, it becomes visible that alternative funding mechanisms (AFM) are already a visible phenomenon in Europe and elsewhere. The mapping exercise identified 67 examples. Looking at the geographical distribution, the largest number of mechanisms was gathered in the United Kingdom, followed by Spain, Germany, the Scandinavian countries, Austria and Italy. Despite the recent growth in the number of European crowdfunding platforms as an alternative funding method for scientific research, the mapping highlights how philanthropy seems to remain the main alternative mechanism used in Europe. The majority of the cases pertain to philanthropy (19/45), whereas fifteen of the European cases represent the category of crowdfunding and 11 refer to bottom-up mechanisms. In most cases (47/67), scientific research projects in multiple scientific fields are funded. However, when a discipline is indicated, Health is clearly prevailing (14 mechanisms). When looking at AFM and disciplines, there is not a big difference between the mechanisms: they all tend to be open to all disciplines. The only interesting correlation is the strong focus on Health research by philanthropic mechanisms (11/19 mechanisms). More details and analysis are available in Osimo et *al.* (2015).

In the following section, examples of funding mechanisms are given in three of the following areas: philanthropy, crowdfunding and open bottom-up instruments referring to the desk research and cases studies for illustration.

Philanthropy for Science: Review and Case

The most conventional modern definition of philanthropy according to Wikipedia is "private initiatives, for public good, focusing on quality of life". In the US, the Foundation Center reports that donations from US-based foundations to science, technology and medical research were at 1.7 billion dollars in 2010. In the EU, the size of the private non-profit sector accounts 0.8 % of the total R&D expenditure in 2014 being equivalent for EUR 2.3 billion (Eurostatt, 2016). In Europe, foundations such as the Wellcome trust provided more than 600 M EUR in 2014 alone for scientific research. About 75% of European universities have tried to fundraise from foundations and 79% from corporations (Breeze, Wilkinson, Gouwenberg, & Schuyt, 2011).

Individual philanthropists are also forming a growing part to the support of science. Michael J. Fox, a famous Hollywood actor with Parkinson's disease, created his own foundation where first grants to support research in finding a cure for Parkinson's were given out already in 2000. Similarly, Gates Foundation

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

with its affluent support is steering, for example, the malaria research in new ways. At the same time, corporate private philanthropy has also emerged, for example in the form of inducement prize contests that award a cash prize for the accomplishment of a challenge. The X Prize, for instance, awards prize money to foster high-profile competitions to develop innovative ideas and technologies. One example is the Google funded "Lunar XPRIZE challenge", an inducement prize which aims to land a robot safely on the moon. In order to win, a team must successfully land an unmanned rover on the Moon, travel for a minimum of 500 meters from the landing site and send images back to Earth. The participating teams should be at least 90% privately funded, therefore with a maximum 10% of public funding. The first team to complete the mission objectives will receive $20 million, the second team $5 million. The final deadline for completing the challenge is December 31, 2016. The intermediate Milestone Prizes, totalling US$6 million, are for demonstrating (via actual testing and analysis) robust hardware and software to overcome key technical risks in the areas of imaging, mobility and lander systems — all three being necessary to achieve a successful Google Lunar XPRIZE mission.

One of the case studies focused on one of the European participants in the XPRIZE challenge. Namely, Team Puli from Hungary is a finalist of the prize, the team is led by Tibor Pacher. In his early career he was a scientist and since 1993, he moved to business and public outreach activities for promoting STEM education. The challenges related to the mission of Google Lunar XPRIZE are highly multidisciplinary, from physics to engineering to astronomy issues. The team relies on a combination of off-the-shelf components adapted to resist the conditions and on custom design. For instance, it will use an "off-the-shelf" Geiger Muller Counter that can travel in space, but they will build a custom microcircuit to send data to Earth. They plan to purchase a travel service to the moon, which is expected to cost several million dollars.

When comparing the example of costs and the final prize money ($20 million), it becomes clear that the prize covers little more than the actual expenses. Even in the case of winning, the financial benefit is minimal. According to the Team Puli project funder, "nobody is working for the money". The amount is rather perceived as a catalyser of the effort, to raise visibility and competence. The real goal is to build knowledge, expertise and visibility, and to build a brand for the new company in an emerging market. In fact, the main strategic objective of Team Puli is to build organizational competences in order to become a player in the "space market". The team sees a strong market opportunity ahead, valued by some reports at $1.9 billion during the next decade following the conclusion of the prize (XPRIZE, 2013). Therefore, one can consider that the funding mechanism is far from being the main financial support to the scientific effort.

Mobilizing resources from many different sources was also central to Team Puli's - and most other competitors' strategy. This brings up another interesting point about these AFM, namely the multimodality of marshalling funding. Industrial sponsors, for example, were mainly used to receive in-kind donations for products and software licenses necessary to carry out the work. On the other hand, crowdfunding was used in the initial phase to gather the necessary funding to register for the prize ($50.000) and to procure some radiation equipment. Additionally, self-financing and voluntary efforts are important; there are about 30 volunteers working in their spare time, and two full time employees (the funder) investing their own money in the project. In this case, personal wealth can be considered as a vital enabling factor, too.

Seen the above complex set-up of the project, it can be speculated that inducement prizes are not really to be considered as a pure funding mechanism. They seem to have many functions, one of which is also the awareness raising activity whose aim is to trigger additional investment. This "leverage effect" of inducement prize should be considered as one fundamental factor for participating. Just as prizes are

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

effective in orienting the attention of researchers towards a specific challenge, in the same way they are orienting the attention of other funders, either public or private. Because of the very nature of inducement prize, which have a "winner takes all" approach, researchers typically do not rely on the prize funding only to justify their investment, but use the visibility of the prize to attract additional funding. Indeed, as (Gök, 2013) shows, the amount of the prize itself would not justify the needed effort.

The case study also showed the importance for scientists to become highly skilled in fundraising from third parties. Fundraising from private sources implies dedicating extensive resources to PR, either by cultivating it directly or by employing dedicated resources. This communication effort, however, is also beneficial in terms of scientific awareness raising and dissemination. In other words, there is an alignment between the communication skills and effort needed for fundraising, and the skills and effort needed for scientific dissemination. The skills needed (for broad communication and investment pitching respectively) appear as complementary to research skills and helpful to the success of the project – not only to the fund raising activities.

Moreover, the case study highlighted an interesting factor related to the quality of research teams. The absence of direct funding seems to discourage opportunistic behaviour, and ensures that teams are driven by scientific curiosity and long-term entrepreneurial spirit. The interviews conducted with the Team Puli researchers showed that the quality of the participants in the whole XPRIZE mission was perceived as very high. It appeared that researchers were also often more willing to share information openly about their progress, because the risk of plagiarism is offset by the strong need to have attention and gather sufficient funding. The general high level of participants seemed to create a more trusted environment of researchers motivated by higher purposes.

Crowdfunding for Science: Review and Case

Crowdfunding has been recognized as a major source of funding for start-ups and it is expected to actually overtake venture capital in 2016 (Massolution, 2015). In Europe, crowdfunding has mobilized around 3 billion Euros in 2014, equivalent to around 40% of the most important European funding programme for innovation, Horizon 2020 (15 billions in the first two years).

Recently, the crowdfunding model has widened its scope to science. Researchers have started raising money for their work directly from the public both through generic crowdfunding platforms and through dedicated platforms for science crowdfunding, for instance through platforms like Experiment.com or Petridish.org. German platform Science Starter and Spanish platform Funds4research are just examples of a long list of crowdfunding platforms devoted to scientific research today.

However, the research-oriented crowdfunding still remains limited in size. Data related to an US experiment called the SciFund challenge raised about $253,000 in 2011-2012 through three rounds and funded 159 research projects by scientists (Byrnes et al., 2014). This reveals the very small amounts of money raised per project (median project $1,440 at the last round), both compared to the amounts of regular individual grants and compared to the amounts raised in reward-based crowdfunding (for a review of different types of crowdfunding platforms, see for example Gabison, 2015). Amid discouraging figures, many scientists share the hope that crowdfunding for Research & Innovation would grow in the future and would especially offer new means of funding to young scholars and out-of-the-box thinking, two areas that are typically less likely to receive funding through regular peer-reviewed panels (Siva, 2014).

As any funding model for research, crowdfunding also has its critics. One of the main critiques by the research community concerns the difficulty to screen the projects and detect possible fraud or the

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

quality assurance of the research projects and results. Online funding decisions are not in the hands of experts, the research community or peer review, instead it is the crowd and general public who decides, which research project they think most important or relevant according to their priorities and interests.

Two of the cases studies focused on crowdfunding scientific research. "I Lowe You" is a health related research project on an ultra-rare disease called the Syndrome of Lowe. The project completed a successful fundraising campaign through a Spanish crowdfunding platform called "Funds4Research" in June 2013.

In general, the progress of clinical research of rare diseases is held back by the availability of research grants due to the small impact of research in terms of population. In the case of "I Lowe You", the main reason for the research team to apply using a crowdfunding campaign was the past failed grant proposals presented to different governmental agencies and organizations. The benefit of the research proposed to the governmental agencies was always foreseen limited, as the target population is not large enough. Therefore, when competing with other type of research projects in health, there was always another project with larger impact in terms of population that could be positively affected by the results of the project in question.

Another reason was the limited access to patient data. The general problem in the field of the Syndrome of Lowe is that a doctor or a researcher rarely sees more than 3 or 4 patients in his entire career which limits the possibilities to "accumulate" personal experience and knowledge. On the other hand, the families who take care of a patient with a rare disease accumulate a large amount of information on a daily basis - information that can be very valuable for researchers of the disease. One of the goals of the "I Lowe You" project was the involvement of patients and caregivers in the research project. The case study shows that through the intensive fundraising campaign, the research group was successful in both raising funds and creating a community of patients. The duration of the campaign was 3 months and they raised around 45.000 Euros.

During the campaign, the effort of the coordinator and the entire research team was considerable in order to mobilize their networks, to provide constant feedback about the project to donors, and to negotiate with media players some free space to advertise the project. The members of team mobilized their social networks in order to achieve the threshold of funding fixed at the beginning of the campaign. Not only Facebook, Twitter and other social networks were used, but also the research team was in contact with mass media. Such efforts are to be expected when launching a crowdfunding campaign. The team members compare the efforts to an electoral campaign and highlight the level of stress they went through in order to achieve the target. More traditional funding mechanisms do not require such skills and type of activity. This is something one has to take into account when choosing for crowdfunding research activities - a piece of advice shared by the research team behind the project. In this particular case, the research team of "I Lowe You" consider the communication effort as worthwhile, as it served to identify families that had a child affected with Lowe syndrome. So apart from money, the crowdfunding campaign also helped to kickstart the research as the attention received was instrumental to gathering more data.

The other case study in this area focused on crowdsourcing financial support for young researchers with the help of "Fondazione Fondo Ricerca e Talenti" in Italy. It promoted fundraising and support projects for the benefit of young researchers at the University of Turin in 2013. The crowdfunding platform was born with the aim of complementing the traditional funding activities of the Foundation with new fundraising methods for additional initiatives beyond the scope of the traditional funding. In this case, the crowdfunding platform is a process based on a system of cooperative micro-finance. The Fund selects projects proposed by the University research facilities that will be published on the website of the Fondazione Fondo Ricerca e Talenti and are likely to appeal to the community to raise the necessary

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

funds. The crowdfunding platform has successfully funded three projects. Each project had a target of 3000 euro, and reached an overall amount of 10.540€.

This case study shows that even small amounts of funding (e.g. 3000 euros/project), which was mainly harnessed though family ties and other social contacts, can help young researchers in their work. The crowdfunding platform in this case was considered to be a complementary tool to traditional fundraising methods, such as events and communication activities. Importantly, the young researchers participating in fundraising were taught valuable skills for the future career regarding grant and alternative fundraising campaigns. Through the case study it became clear that in order to achieve the target set for funding, a very clear "marketing" idea was needed. A thorough preparation of a marketing template in advance was conducted with the help of the help of "Fondazione Fondo Ricerca e Talenti". In that regard, the marketing strategy has to be profit oriented and consistent in order to be efficient and feasible.

The Italian context, which can be characterized by governmental cuts to science funding, has encouraged young scholars and volunteers to use alternative funding mechanism for scientific research. However, it is also important to highlight that one of the obstacles to the development of the crowdfunding platform in question has been the university itself. Crowdfunding was initially not seen as a credible mechanism for funding projects nor as a real opportunity to research funding. In the opinion of the Team that led the crowdfunding campaign, it was not straightforward to convince the University of Turin to understand that the crowdfunding is a process involving trust. The mechanism of trust, which develops between members of the team and their personal network of contacts, is critical to the success of projects. An example of this is that every person of each project's team has donated and engaged his or her own network in the campaign in order to convince other people to donate.

Open Bottom Up Instruments: Review and Case

The debate between top-down and bottom-up priority setting is far from new (Gilman, 1995; Nature, 2012). Today, open, bottom-up instruments are becoming increasingly used in science funding by public and private agencies: for instance, the recent Horizon 2020 programme includes an increase of bottom-up instruments such as the European Research Council, inducement prizes and FET Open (European Commission, 2015). The mapping identified 11 such instruments in Europe, without any specific focus on a discipline.

These open mechanisms include different approaches: a selection process based purely on excellent curriculum of the researcher, who is then free to pursue his/her interests, such as the ERC; or a collaborative "sandpit" where researchers and a diverse group of experts come together for brainstorming sessions and interactive collaboration to decide which proposal to find; or inducement prizes, where companies and governments have set up "challenges", where the financial reward goes not to the best proposals, but to the innovators who come up with the best working solutions.

One example of such instruments is the IDEAS Factory, launched by the Engineering and Physical Sciences Research Council (EPSRC), the main UK government agency for funding research and training in natural sciences. Overall, EPSRC invests around £740 million a year in a broad range of subjects - from mathematics to materials science, and from information technology to structural engineering.

The IDEAS Factory is an alternative concept for funding scientific thinking, used by EPSRC to stimulate highly innovative and more risk-accepting research activities. It tries to break down traditional barriers of a specific topic and build new relationships with different kind of stakeholders to create new ideas to solve a particular problem.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

At the core of the concept lie "sandpit workshops" that assemble the dynamic range of people and skills to address the problems from different angles. These workshops enable people to group and come up with different ideas in five days, although not all participants receive funding. The quality of the research is guaranteed by the quality of the participants selected. Each group of participants presents the idea and all participants provide feedback and review other's ideas. Throughout the week, a peer review process is put in place and by Friday (last day) all ideas are ranked. Then the group has two months to make a more comprehensive proposal to be approved and validated. It has to be coherent with the idea presented in the "sandpit" and no major changes should be there. After the sandpit, 3 or 4 projects are selected to be funded. The participants that have not been selected will have some advantages too, for example to take home the network and all knowledge acquired on the topic.

Participants are foreseen to have communication skills in order to be able to share their ideas and projects. They are expected to be good team workers, open-minded to listen to each other's perspectives and with a clear will to interact with others. The scholars participating in the "sandpits" develop new thinking in the subject, they are offered new networks and contacts with relevant people in the field - and also strategic relationships with industry. There are usually researchers with a recognized career, but also PhD students and other type of stakeholders who provide valuable knowledge to the topic of the sandpit.

Stakeholders often include industry representatives, government officials, charities, lobby groups or citizens' groups. Their input helps other participants and researchers to better understand the issue and shape potential new ideas. This can include challenging presentations on the current state of play and can lead to future involvement with research groups.

Some of the disadvantages that have been highlighted in terms of success are the large number of applicants that apply for a sandpit and the low number of actual candidates that will participate in the workshop. A way to manage this potential "frustration" of rejected candidates is the possibility that the organization gives to those people to join the network of participants at a later stage. There is also later a workshop to share the outputs of the sandpit. This is an open workshop for the rest of participants.

SOLUTIONS AND RECOMMENDATIONS

The case studies and their analysis allow highlighting some conclusions that are relevant for EU policy priorities. In most cases, these are general implications valid for any government; in some cases, they are directly related to specific challenges of EU policies.

AFM Are More Than a Passing Trend

The first reflection is that alternative funding is not hype but a reality. The number of mechanisms identified and the overall amount of funding makes it clear that, while still fragmented, it is more than just an emerging trend. Researchers and research organization increasingly have to live in a context of multiple funding resources. At the same time, the multiplicity of small-scale platforms suggests the possibility of further consolidation in a more limited number of larger platforms, but it could also be that in the future a more fragmented landscape with "one mechanism for every institution" will emerge.

Moreover, alternative funding matters because it is deeply connected to long term trends internal to science. In particular, the emergence of "Mode 2" science identified the same trends that underpin alternative funding: the emergence of a plurality of funders, beyond government, that fund ad-hoc groups

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

of scientists and not scientists around problems that are socially relevant. In other words, one could say that the trends identified by Baber et al. (1995) have grown to their consequences, and are likely to be further developed in the future. They are part of a long-term historical trend towards more "liquid" forms of organizations that is visible in the development of science – and probably of society in general. As such, policy-makers should take them seriously.

AFMs Address Some Key Challenges of Traditional Funding

Alternative funding directly challenges two of the most critical areas of government funding activities: the identification of the research priorities and the selection of the projects to be funded. One of the key roles of government is to determine which research areas to fund, and which projects deserve to be funded. Governments typically do not make such decisions autonomously, but by involving the research community. Still, it is the government who typically mediates between different interests and decides who to fund. This role can be bypassed by alternative mechanisms. No longer is the government the only actor in charge of identifying the funding priorities by mediating between scientific curiosity, economic competitiveness and societal needs. In a context where wealthy and "normal" citizens can directly decide which project to fund with their money, they can directly take the decision to fund what matters to them.

Furthermore, no longer are research priorities and approaches prescribed "ex ante", but increasingly decisions tend to be left "ex-post"; once the project proposal is made (as in crowdfunding) or results are achieved (as in inducement prizes). This, again, reflects a broad trend as summarized by Shirky (2009) in the expression "publish, then filter": in a complex world, it is more effective to delay the filtering as much as possible and make judgments based on results, rather than assumptions. Rather than pre-selecting what social issues deserve to be targeted, citizens should decide directly which research to support, based on the proposals published on a crowdfunding platform. Rather than deciding ex-ante which research projects deserve funding, it is more effective to wait until the end of the project and award the funding to those that achieve the expected results.

For researchers, this potentially leads to greater opportunities to pursue original research endeavours without having to "fit into" the priorities of the funders, hence leading to greater scientific freedom, as the "I Lowe You" case shows. At the same time, young scientists, amateurs, and those active in niche disciplines and with low-capital investment research are likely to gain most from this plurality of mechanisms: no project will be "too small" to be funded. On the other hand, established research players, skilled more in the knowledge of the traditional funding mechanisms themselves rather than in the topics of the research, may tend to loose more in this increasingly "liquid" landscape. Well known, established scientists can less and less rely on a stable stream of funding, as funding mechanisms increasingly tend to vary over time. Clearly, this questions the role of government as "gatekeeper" of deciding what is beneficial to society and what needs to be funded. Taken to its extremes, it could go as far as undermining the rationale for public funding.

New Take-Home Messages

AFMs seem an effective way to involve top researchers and innovators, as shown by both the "I Lowe You" and Puli Team examples, by overcoming some of the key challenges of traditional funding. On the other hand, it also seems suitable for involving early-career researchers to acquainting them with such emerging methods, as shown in the case of Fondazione Fondo Talenti e Ricerche. The simplicity of rules

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

and the possibility to focus on the problem to be solved are working effectively to reach those innovators who are typically reluctant to be involved in complex government procedures with bureaucratic load. Whereas the bureaucratic load remains very reduced across all cases, new challenges are generated by a greater communication effort and design needs for fundraising campaigns that aim to appeal to fellow citizens as funders of the research.

Fundraising activity will, in any case, become more time-consuming in the future, but this time will be more related to the communication of the ideas and the results rather than fulfilment of bureaucratic requirements. AFM require greater communication skills for scientists and research organizations. The effort in communication was systematically mentioned by all interviewees as highly important and much more time-consuming than expected. Scientists must invest more time in communication, and have to develop excellent capacity to explain their research to a variety of funders, with different levels of skills and knowledge.

This effort in communication is not finalized only to raise money, but generates important positive by-products. Funding is not just a monetary transaction, but also the establishment of a relation. Scientists have to develop stronger links with citizens and other stakeholders, and hence have to better interacted with their needs and problems. As in the case of "I Lowe You", for instance, fundraising will also become a community-building activity that is likely to generate rich exchanges of information between researchers and patients that will advance the research itself. Or as in the case of "Team Puli", fundraising also can develop into an awareness raising activity about scientific research. Lastly, as in the case of the "Sandpit" initiative, funding decisions can become also an opportunity to create networks of collaboration among scientists with similar research interests, as well as other stakeholders. In other words, AFM seem to be more effective in stimulating greater systemic interactions with other actors in the ecosystem, and in particular between researchers and society, which traditionally was one of the long-standing goal of the introduction of competitive funding. In summary, the greater required effort in communication is likely to be not only a burden that deviates from "pure" research activities, but also a benefit in terms of knowledge exchanges.

AFM Are Not a Substitute for Traditional Funding

The literature review, the mapping and the case studies demonstrate that alternative funding mechanisms are important, but do not function as a substitute of traditional funding. Firstly, they are typically limited in budget and would not be able to be sustainable in the absence of traditional funding. Crowdfunding, philanthropy, inducement prizes and open methods are effective because they act in a context dominated by traditional funding, and add value to it. The projects found on European crowdfunding platforms, for example, are only rarely targeting amounts above €50.000. Because of the intense communication efforts required, they are difficult to scale up and there is a risk of "prize inflation".

Secondly, alternative funding is biased towards "real world problems" and applied research, specifically in some areas such as health, and tends to favour researchers more able to communicate. Alternative funding mechanisms are not balanced in their discipline coverage, and much valuable research would not be suitable for it. Most importantly, the funders are not accountable to any organization, and it is easy to think of the dangers that leaving the development of science to unaccountable organizations and individuals could produce: rich individuals would be in a position to determine the development of science. As such, it would be unthinkable to use alternative funding as main funding instruments.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Government funding has legitimacy and accountability, both in the identification of the research priorities and in the selection of research proposals, which private funding does not have. Researchers have to deal with, and meet the needs of, individual funders that might neither be wise nor ethical in assigning the funding.

Finally, all cases analysed in the study report that different funding mechanisms were used in combination. For instance, the Puli Team in the inducement prize had to first deliver crowdfunding to pay the registration fee, used sponsors for software, leveraged volunteer work and used direct funding from the project leader. Notably, the funding of the prize itself was not the main incentive, but rather a catalyser. Alternative funding mechanisms are typically designed to achieve a leverage effect, by mobilizing additional effort towards private sponsors, crowdfunding, as well as traditional funding. This interaction of different funding mechanism not only helps raising more funding, but also acts as a demonstration of the validity of the project, of the capability of the team to mobilize interest and deliver results. Achieving sponsorships and additional funding is a "sign" that the project is valid and makes it easy to gain further funding.

These reasons make us conclude that different funding mechanisms are effective for different needs, and that governments should design its funding with a strategic, holistic perspective that takes into full account the existence of different funding instruments. As positioned by OECD (2011) it is important to assess "whether the portfolio of funding mechanisms in place responds to an underlying policy mix or is, instead, simply the sum of different tools. Funding tools can either reinforce one another in a healthy, competitive environment or be overlapping, highly fragmented, potentially inconsistent and result in increased red tape". It is highly inefficient to design an instrument without taking into account the risks of redundancy, and the opportunity of synergy. Governments should recognize that, as in many other domains, there is a plurality of players working in research funding, each with its strength and weaknesses, and that public funding today is just one of the possible sources. Similarly, research institutions have to increasingly deal with many different funders with different selection criteria. This does not necessarily mean that organizations have to build their own mechanisms and platforms (e.g. crowdfunding platforms), but there should be an organizational culture (and skills) that enables dealing with different existing mechanisms.

FUTURE RESEARCH DIRECTIONS

The analysis presented so far points to the need for further investigation. It provides evidence that alternative funding mechanisms are an important trend that deserves both research and policy attention.

Firstly, there is the need for more extensive data availability about alternative funding for scientific research purposes. On the one hand, more systematic monitoring of available funding mechanisms and the amounts allocated through them to scientific research will encourage new initiatives and allow better community building around them. On the other hand, such monitoring will be valuable for decision-makers for planning new pilot initiatives as well as for in-depth discussions of possible policy measures.

In particular the need to research into AFMs to define synergies between already existing and emerging funding mechanisms was identified. The benefits of science-only or proprietary funding platforms should also be assessed, in order to explore, for example, whether universities should start to have their own crowdfunding platforms or use the existing ones. Along this line, more research into the use of platforms but also to their regulatory issues across EU should also be further addressed in order to facilitate such practices (e.g. Gabison, 2015)

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Secondly, there's a need for further research into "really new ways" to fund scientific research. For example, beside money, other support can be provided such as researcher's time, equipment like illustrated in by the case of Team Puli, but also by crowd-sourcing the subjects for the study. Furthermore, this strand of future research should also look into the "unexpected consequences" of alternative funding, such as crowdfunding as market testing, engaging potential customers and target groups and exploiting the advantages of community and proximity (Ramos, 2014); and as a way to promote new interactions between economic efficiency and democratic practices which are distinctive of the crowdfunding market (Ramos, 2014).

Lastly, it's important to understand how alternative mechanisms for scientific research are used within the institutional science and outside of it in order to monitor the emerging effects, such as "celebrity philanthropists", in the field of science in general.

CONCLUSION

In this study, the focus was on the alternative funding mechanisms (AFM) for scientific research and the issue was looked at from the European perspective with the aim to discuss some recommendations for European decision makers who are responsible for research and innovation policies and systems. Based on the research conducted, a collection of 67 examples of AFM for scientific research was gathered. They were classified under the following categories; philanthropy, crowdfunding and open bottom-up mechanisms. Examples of the case studies were given on top of the desk research and literacy reviews.

The initial recommendation of the study is the need for greater collaboration between AFM and the existing mainstream mechanisms. At the most basic level, it seems important to learn lessons from other mechanisms. The introduction of more open and agile funding mechanism as part of the public funding package is a good example of this. Recently, the EC has launched several inducement prizes. Additionally, there is clear potential for experimentation with mechanisms such as the Sandpit. However, it is necessary to go one step further: designing measures that ensure synergies between different mechanisms, such as the ones identified by this research, as a novel opportunity. For instance initiatives that match funds from different mechanisms could offer new opportunities. On the other hand, designing research priorities as complementary to existing alternative funding could be used as a way to select projects for funding that normally requires a heavy proposal writing process. Also, it could be envisaged that sharing data on the "performance" of projects using alternative funding mechanisms facilitate the access to mainstream funding for projects that otherwise would have hard time accessing public funding.

National governments should also acknowledge the essential role played by AFM and ensure that the combination of all mechanisms delivers the best results for the society as a whole. In other words, government should not fear being substituted by AFM, but move its strategic role to a higher level: rather than deciding what needs to be funded, it should ensure that the combination of the decisions of the plurality of funders leads to the best results. This could include the introduction of favourable measures to ensure, for example, adequate tax exemptions for donations to crowdfunding platforms (practices vary within Member States, see Gabison, 2015), or a quality system for alternative funding mechanisms. Last, it would be advisable that measures were be taken by governments, policy-makers and other responsible agencies to ensure that the most accurate information is available regarding the variety of funding mechanisms for scientific research. Such a complete map of funding mechanisms would serve as a service to researchers but also as a governance mechanism to ensure a systemic perspective over research and innovation funding, also helping with the early identification of possible funding gaps.

Chapter 70
The Role of Philanthropy on the Strategic Planning Process of a Selective Liberal Arts and Science College

Wayne P. Webster
Ripon College, USA

The George Washington University, USA

Susan Swayze
The George Washington University, USA

ABSTRACT

This chapter describes how constituencies of a four-year, private liberal arts and science college perceived the effect of philanthropy on the strategic planning process. Due to their reliance upon tuition revenues and private support, liberal arts and science colleges are particularly susceptible to ebbs and flows in the economy. How these institutions plan for the future and the extent to which philanthropy factors into strategic plans provides crucial information about the future of these higher education institutions (Connell, 2006). Gaining a deep understanding of how philanthropy shapes a strategic planning process and the decision-making model that was used during the process provides insight into how philanthropy, strategic planning, and decision-making models intersect to form a new decision-making model, described as feedback and revenue.

INTRODUCTION

Liberal arts and sciences colleges are uniquely American institutions. As highlighted, their very existence is due to the philanthropic generosity of wealthy individuals and/or religious or philosophical

movements (Thelin, 2004). As private institutions, they receive little direct state or federal government support and rely predominantly on tuition revenues, endowment earnings, and philanthropic support to balance their budgets (Balderston, 1995). Philanthropic support and earnings off of endowed gifts are on a rise during a time when increasing net tuition revenue is a challenge for all but a few institutions (Rivard, 2015). In a recent article in the Chronicle of Higher Education, Ripon College Board of Trustee Chair Ron Peterson underscored the important role governing boards of private liberal arts colleges play in fiduciary oversight of their institutions by stating that they must be prepared to "contribute green paper, gray matter, and brown shoe leather (Biemiller, 2015)." By providing high-touch experiences for their students in and out of the classroom, including low student to faculty ratios, liberal arts institutions are not particularly cost-efficient (Stimpert, 2004). Due to their reliance upon private support and tuition revenues, liberal arts and sciences institutions are particularly susceptible to ebbs and flows in the economy. How these institutions plan for the future and the extent to which philanthropy factors into these plans was an important question to examine (Connell, 2006). Further, what decision-making model was used to craft these plans was worth investigating.

Providing additional research and literature on this timely topic added to the current literature and helps in the effort to give current and future private liberal arts college presidents, governing boards, and other members of the campus community, a frame of reference by which to compare and guide their actions relating to these issues. Having a sense of how a similar institution carried out a strategic planning process in the shadow of economic challenges is beneficial to liberal arts and science institutions' campus and governance board leadership. In addition, scholars and researchers in the field will find this study beneficial as it provides additional literature in these emerging subject areas. The recently announced closure and sudden reopening of Sweet Briar College, a nationally ranked liberal arts and sciences institution, due to donor intervention provides additional urgency to examine how a financial sustainability plan can be best crafted (Bidwell, 2015).

The purpose of the study was to address deficiencies in the literature by providing an in-depth view of how the constituencies of a four-year, private liberal arts and science college in the United States believed philanthropy affected a strategic planning process and how administrative decision-making models were used during this planning process. The case study, which was conducted at a singular private liberal arts and science college following a recently completed strategic planning process, answers the following research questions: (a) How did philanthropy affect planning for capital projects within a strategic plan?; (b) How did philanthropy affect the focus of current and future academic offerings of an institution? It is common for case studies to focus on one institution so that researchers can conduct an in-depth examination of the functioning of an institution.

As private institutions, private four-year liberal arts and science colleges rarely receive funding from government sources with the exception of grants for research and the indirect benefits received through government financial aid programs supporting students. As a result, these colleges primarily depend on three sources of funding which include tuition and fees, endowment earnings, and philanthropic gifts (Balderston, 1995). While private liberal arts and science colleges have become increasingly dependent on tuition, endowment earnings, and gifts to sustain and enhance their programs, leaders of those institutions will be required to focus more of their attention on financial issues (Balderston, 1995).

Colleges will strive to keep the cost of tuition and education affordable and accessible for all. Thus, they will be called upon to seek other sources of support, including philanthropic gifts (Connell, 2006). As a result, colleges will need to take philanthropic trends and outlook into account when crafting their strategic long range plans (Connell, 2006). To what extent college leadership is willing to alter their

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

strategic plans in order to maximize philanthropic support may have implications on the mission, values, and financial outlook of their institution (Pully, 2002). Similarly, the degree to which leaders of these institutions believe philanthropy should play a role in the development of their college's strategic plans may change the influence philanthropy does or does not have over the process.

BACKGROUND

The institution which served as the site for this research has been given the pseudonym of Selective College. Selective College has the distinction of having served as a coeducational institution from its inception. Today, the college boasts an enrollment between 1,000 – 1,500 students with more than 90% living on campus. Selective College also provides an intimate learning experience with the student to faculty ratio of less than 15:1. During fiscal year 2012, Selective College, had expenses totaling nearly $50 million and a revenue stream nearly equaling that amount. Selective College is predominantly dependent upon tuition, board and fees, as well as philanthropic support for operating revenue. Members of the Selective College Board of Trustees have historically been the largest philanthropic supporters of the institution and thus have significantly impacted the college's finances and investments in facilities and programs. In recent years, the college has completed or begun two major building projects. How Selective came to the decision to significantly invest in their facilities using gifts and debt was a major focus of this study.

MAIN FOCUS OF THE CHAPTER

While there are numerous models regarding governance and decision-making processes in higher education and beyond, there are three main models that are most apt and widely-used. The collegial, political, and bureaucratic models highlight the primary spectrum of involvement in the decision-making process from one of total consensus-building to one of almost complete dictation of the goal and the path necessary to succeed (Tierney, 2008). The collegial, political, and bureaucratic models provide the three most basic approaches to decision-making and are thus most likely to be utilized due to their simplicity and common acceptance. Other models, such as cybernetic, rational, and cultural are also amongst the many decision-making theories that have been identified. Due to the intimate culture of private liberal arts and science colleges, it is assumed that a collegial and collaborative decision-making approach is most likely to be used. However, given the recent economic recession that has dramatically affected the financial state of these institutions, it is possible that other types of models may be used out of necessity to make quick and strategic decisions. Some common descriptions of these three models, as well as an analysis of each follows.

Tierney (2008) describes the collegial model as "a view of academic life that assumes a community of scholars operates around notions of respect and consensus" (p. 152). By nature, the collegial model encourages consultation and shared governance amongst all members of the respective community (Bess & Dee, 2008). Governing by consensus, as advocated by the collegial model of decision-making, has deep roots in higher education. Prior to the rise in power of college and university presidents in the 20th Century, the faculty of respective institutions served as the heart and soul of the institution both literally and figuratively. Faculty approval of operations of the university was, and remains, an important

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

weathervane regarding the direction of the institution to both internal and external constituencies. The symbolism, which remains an important aspect of academic culture, continues to support a culture and precedence that encourages consensus-building (Tierney, 2008).

Proponents of the use of the collegial model in higher education decision-making process cite that the "loosely coupled and decentralized nature of the academy is well suited to such a framework" (Tierney, 2008, p. 152). At the core of their existence, colleges and universities encourage and reinforce the need to foster an environment of inclusion of various thoughts and ideas. To dictate policy, rather than to openly debate it, would stifle this sense of community that truly makes higher education different from any other sector. A decision that is reached by consensus, which includes numerous points of view, would seemingly produce a well-thought out outcome (Tierney, 2008). Additionally, use of the collegial model helps to create a sense of loyalty and buy-in by the participants who subsequently embrace the decision as their own (Bess & Dee, 2008). Liberal arts and science colleges, in general, embody the philosophy of the collegiality model through their embrace of a shared governance model of operation. In particular, faculty governing bodies are consistently consulted and kept apprised of fluctuating conditions at their college by the administration (Gibson, 1992).

It is not uncommon for the faculty to have final say on new initiatives involving the curriculum or in the setting of admissions standards at liberal arts and science colleges (Gibson, 1992). Beyond faculty involvement, it is also common for senior administration to regularly consult student and staff leadership, as well as representative bodies of external constituencies such as alumni and parent boards. By involving and updating various constituencies of pending actions, the senior leadership creates this sense of community that is unique to liberal arts and science colleges. It can be argued that while the collegial model creates a buy-in from members of the academic community, it also results in a decision that supports the status quo or the least objectionable option (Tierney, 2008; Bess & Dee, 2008). Detractors of the use of the collegial model further state that the common ground that participants of a consensus decision-making exercise are striving to obtain is unrealistic and never existed (Tierney, 2008).

According to Bess and Dee (2008) a culture where the political model is utilized is "identified through its reliance on negotiation and bargaining among interest groups and coalitions within the organization" (p. 377). Further, a quid pro quo is established wherein support for a particular need or initiative is rewarded by the promise of future support for another need or initiative (Bess & Dee, 2008). The political model is also identified as having a decentralized form of governance where the power shifts from group to group and the dissemination of information can be ambiguous (Bess & Dee, 2008). The political model came to light in the 1960s and 1970s and is viewed as middle ground between consensus-building and a bureaucracy (Tierney, 2008).

The political model is often utilized during employment contracts through collective bargaining and with interactions with external constituencies such as donors, community leaders of the town or city the college is located within, or with legislators (Tierney, 2008). Although political negotiating is often utilized, it can be argued that it is difficult to use as a reliable model due to the natural ebb and flow that takes place during negotiating. It incorporates aspects of the collegial and bureaucratic models, but does so inconsistently and unreliably (Tierney, 2008). The political model appears to be utilized out of necessity rather than by the desire of any parties who are involved with the negotiation.

Max Weber (1864-1920) first described the bureaucratic model as it "assumes that decisions and planning take place by way of a coordinated division of labor, a standardization of rules and regulations, and a hierarchical chain of command" (Tierney, 2008, p. 151). In a bureaucratic culture, rules such as specified roles and reinforcing reporting relationships are followed in order to ensure efficient perfor-

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

mance (Bess & Dee, 2008). Information is also disseminated extensively and in a top-down fashion. Attempts are also made to reduce uncertainty and ambiguity for the college or university by valuing and embracing rationality in the decision-making process (Bess & Dee, 2008). According to Bess and Dee (2008, p. 547), in a bureaucratic organization there is little deviance from "organizational mandates" and the decision-making power is centralized.

Supporters of the use of a bureaucratic model in higher education claim that a more centralized and formal governance structure would result in higher quality outcomes (Tierney, 2008). They further state that with stronger presidential authority, 'antiquated' practices such as tenure could be eliminated, mediocre faculty could be dismissed, and the preservation of unproductive academic departments could be halted in order to ensure efficiency and quality (Tierney, 2008). The bureaucratic model views faculty as an asset to be managed rather than as a participatory factor in the decision-making process and that they should be utilized in a manner that most effectively advances the mission and needs of the institution (Tierney, 2008).

Robert Birnbaum (1991) suggests that the collegial, political, and bureaucratic models can live and thrive simultaneously within an organization. This system of co-existence is referred to as the cybernetic model. Senior administrators who use all three models simultaneously are better able to monitor various issues more effectively using these multiple frames of reference and leadership (Birnbaum, 1991). Thus, the three models are complementary to one another rather than being in competition (Birnbaum, 1991). The cybernetic model creates loops for negative feedback which serve as built in thermostats that alert the administration that a 'reset' is needed in a certain area of function of the institution (Birnbaum, 1991). Birnbaum (1991) argues that this model is particularly useful at an institution that has both loosely-coupled and closely-coupled organizational models.

Two other types of decision-making appear in the literature: rational decision-making and cultural decision-making. First, Weiss (1982) describes rational decision-making as one that follows as an established, or ordered, process for making a calculated decision. The model assumes that full information is available to the decision makers, and that possible consequences are rationalized before the decision is executed (Weiss, 1982). The ordered process by which decisions are made in the rational decision-making model differs from the cultural decision-making model. The cultural decision-making model encourages practitioners to "consider real or potential conflicts not in isolation but on the broad canvas of organizational life" (Tierney, 1988, p. 6). Further, the cultural model encourages leaders to "implement and evaluate everyday decisions with a keen awareness of their role in and influence upon organizational culture" (Tierney, 1988, p. 6). This model assumes that imperfect information exists for the solution and possible consequences, and the decision-making process must consider the framework of organizational culture within an institution (Tierney, 1988). Environmental elements, including the institution's mission statement, how new members are socialized, and perceived differences in leadership structures inform the decision-making process in this model (Tierney, 1998).

Although the collegial, political, and bureaucratic models best represent the range of traditional decision-making models that are utilized by college and university leadership, there are others that may be better fits for some institutions. It is possible that the studies cited for these three options were situational to specific institutions and in reality are not applicable to a broad sector of higher education. It is also possible that this research and use of these models are no longer applicable to today's world of higher education. Much has changed over the past few years in terms of financial affairs, enrollment and internal communications; therefore perhaps a new set of decision-making models would be more appropriate. In reality, it is possible that no model will fully encompass the decision-making process

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

of any institution as these decisions are complex and have various factors impacting the process at any time. It is also unknown the degree to which philanthropy and fundraising impacts these models at an institution which routinely seeks external support. However, the researchers believe that the collegial, political, and bureaucratic models represent the best range of decision-making models for liberal arts and science colleges.

SOLUTIONS

In order to answer the research questions, 23 semi-structured interviews with key informants (e.g., the college president, faculty, staff, and governing board members) were conducted during a campus site visit on the heels of the formal approval of the strategic plan by the Board of Trustees. To supplement the interviews, a document analysis of recent press releases, news and magazine articles, and fundraising campaign materials related to the strategic planning process were also conducted as part of the study. The review of these materials provided another perspective regarding how the planning process was facilitated, what decision-making model was used to carry out this process, and the resulting reactions of internal and external constituencies to this process.

The case study revealed three major findings. The first finding confirms the role of donor and philanthropic considerations and the influence they have over the strategic planning and decision-making processes. Donor and philanthropic considerations did influence both administrative decisions (i.e., construction of new buildings, performance reporting functions) and curricular aspects of the College (i.e., interdisciplinary academic work, student research opportunities). The second finding describes the rationale for strategic planning as being more business-oriented than altruistic. Declining revenues from enrollment and lower earnings from the endowment, spurred the growth in revenue-generating staff positions to attract new forms of tuition revenue and donor support as part of the strategic plan. The final finding describes a new decision-making model that emerged during the strategic planning process at the campus. The new decision-making model was more business-minded, accelerated in time, and limited collegial decision-making. That is, consensus-seeking processes that require extended time were absent from the process. Rather, key informants described decisions that were formed by senior administrators and vetted by faculty, alumni, students, and Board members in one-time meetings. These three findings serve as a foundation for a contemporary discussion of philanthropy and administrative decision-making models and their role at liberal arts and science colleges.

Finding One: Donors and Philanthropic Considerations Do Have Influence over Administrative and Academic Processes and Decision-Making

While there did not appear to be any significant donor influence over the core academic liberal arts program and mission of the college, donor influence and philanthropic considerations did appear to influence academic and administrative decisions of Selective College. Perhaps the most obvious example of philanthropic influence over the strategic plan decision-making process, and affecting both academic and administrative processes, was the combination of business and science departments into one new physical structure. As described by many members of the campus community, merging two academic disciplines with significant facility needs into one facility not only met programmatic needs, it also multiplied the potential donor base needed to support the construction. While the idea of integrated

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

learning between the business and science disciplines played a supporting role in the decision to build a joint facility, it is clear that financial limitations and the hope of developing a broader donor base played the leading role in the decision. This compromise of placing two disciplines into one facility made the project financially feasible and will ultimately strengthen both academic programs by placing them in a state-of-the-art facility as well as provide unique integrated learning opportunities within its walls.

A member of the administration confirmed the belief that financial and philanthropic considerations were a driving force behind the merger of business and science into one building. He said:

[We] did a little bit of looking at fundraising capacity and, and my response was, [we are] not certain that [we] can imagine getting the support to build a science building from our alumni base. I think we can get good support from our business alumni. You know my guess is that it [business department facility] is about a $6 million project and the laboratory is about a $35 million budget, and [we] think we can raise the $6 million twice but I don't think we can raise half of that, of the laboratory building. So, let's merge the two together and see if maybe for, for $35 or 40 million so we can build a combined building, and we will not break out the donors and so all our donor pool is working on the project. So it was purely pragmatic reasons driving the decision to put those departments together.

Even though the merger of the two disciplines was viewed as being a financial decision, some observers saw this merger as a way to creatively address the problem. One person said:

My impression is that between the president and some trustees, the idea was that we… could get more funding for the building if it weren't just a science building. But they needed something to attract former business alums, or alums who are doing business even if they haven't been business majors, who would donate to this project. And then one way to do that would be to fuse it and then maybe [the president] decided that 'wow, we could pitch this as we're integrating, you know, because liberal arts is all about putting different disciplines together' and so… there was a lot of faculty buy-in to that too, initially.

In addition to new capital projects, philanthropic support advanced special projects and initiatives at Selective College, including the presidential portfolio projects. Presidential portfolio projects are student and faculty initiated research and experiential learning projects. Not only do donors make these projects feasible, they can also have influence over which portfolio projects occur by funding them, or not funding them. Further, the recent addition of a new campus chaplain was donor-driven. The new position was purportedly pushed and funded by a donor, the idea of creating a strong tie to the church associated with the founding of Selective College was proposed as a way to broaden the tent of prospective donors.

Finally, philanthropic considerations influenced administrative decisions of Selective College. In order to show return on investment to its governing board and select donors, Selective College implemented an administrative function to measure outcomes of various aspects of its operations. This including the push for academic and co-curricular program heads to demonstrate quantitative evidence that their program is making the desired effect on students as well as the campus and local community. Feeling forced to demonstrate return on investment and to focus on the bottom line, in order to receive funds to maintain or expand their operations, can result in programs focusing less on providing learning opportunities and experiences and more on proving their relevance and defending their place on campus. One campus member said:

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

I think one of the changes we've had with our strategic plan is a real focus on measurement and milestones to identify progress…and a commitment to that. As a result of that we also had a donor, I believe, who had some specific requirements in terms of performance and allocation on a gift. And I think that was a further support that we were directionally sound.

The issues facing Selective College, and the way that institution tackled those challenges, can likely be found at dozens of other similarly situated liberal arts colleges across the country (Jaschik, 2010). Increasing philanthropic support is a common strategy to budgetary challenges, particularly when there is not a strong sense that the price tag can be increased to maximize net tuition revenue (Kiley, 2012). The leadership of liberal arts and science colleges, that are primarily tuition dependent, understand that the survival and success of their institution depends on its ability to gain ground thanks to donor support. As alluded to by Cook (1997), there are few measurements of performance more important than how effective a president, and their administration, is in raising philanthropic support and managing donor expectations. It is possible that the need to show solid performance in fundraising efforts, in order to help secure the legacy of the current administration and show positive movement forward, has opened the door for more donor influence and input at liberal arts and sciences colleges.

The finding that philanthropy does not influence decisions surrounding the core curriculum of Selective College is comforting to those who believe that the curriculum of a college is the foundation upon which it exists and is, thus, beyond influence. By not allowing philanthropy or tuition revenues to dictate the core of the academic program, Selective College did not find itself chasing fads, such as allied health programs, and instead invested in its liberal arts and sciences academic core. Others may argue that by not broadening the core curriculum, and finding ways to further maximize tuition revenues or leverage philanthropic dollars, leaves the college with few opportunities to be nimble and inventive. In addition, with an increased focus on post-graduate outcomes, prospective students and their families may feel that an inability to review the curriculum to make it more contemporary may mean that institution's degree has less value in today's job market. While the liberal arts and sciences mission of Selective College was not changed by considerations focused on maximizing revenue, many academic and administrative decisions of the college were susceptible to this influence.

Finding Two: Business Oriented Rationale for Undertaking Strategic Planning Process by Reacting to External Influences

An important outcome of this study was gaining an insight into why Selective College undertook a strategic planning process when it did and what was the expected outcome of this process. The evidence gained from the various sources of data makes it clear that the overall goal for completing the planning process was to create a plan for the college to follow over the next five years. In many ways, the need for a solid plan was a needed response to the recent economic depression that had reduced Selective College's endowments, as well as estimated family contributions towards tuition and fees. Selective College, in response to what was occurring in the external market, revised its business model in order to maximize short-term revenues. One individual reflected on the impetus for undertaking the strategic planning process when he stated:

[W]e got really serious about business planning right after the economic down turn. Right so the economic down turn came late in what 2008, early 2009? You get the idea. So the summer of 2009 we had

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

a task force get together and we said…let's presume this sticks around a while. We cobbled together the budget for next year. You know we said 'gee, maybe we're going to have to not make payments to [employee retirement funds],' well that didn't have to happen. But you know it was a possibility. We had a whole series of contingencies some of which we had to exercise some of them we didn't. And we said alright instead of, instead of doing this ad hoc here, let's come up with a long term plan.

As Balderston (1995) notes, institutions have become increasingly dependent on tuition revenues, endowment earnings, and fundraising activities to remain viable. Creating a plan to maximize these revenue streams, in response to external market forces, was important for the future vitality of Selective College. Reacting to external market forces by focusing on short and long term plans to increase revenues is a change of mindset for higher education institutions where change occurs much more deliberately. A new plan was also important in identifying, and subsequently, creating ways to improve the programs and facilities to attract higher quality students as well as those who can pay more for their education. One person said:

We sort of had an unspoken strategic plan before we got our written one and that was to get the campus into a position where students wanted to come and live comfortably and engage in student life and you can see…a quick visit to the campus shows you all the recent dormitories and that sorority house that we've built and things we've done there including the stadium, the [athletic] center to do that was never really a part of a written strategic plan like the one we have now.

A faculty member agreed that new facilities attract more high-caliber students. She said:

One of the reasons that [the sciences], don't have…large enrollment majors is their facilities are out of date and it's hard for them to attract students … and obviously new facilities … has the potential to attract more and better students. So, [business department] was put there because it was growing and big and the other set of departments [sciences] were put there because they were small and needed to grow.

A solid plan for the immediate future provides Selective College with a vision that it can now take to its donor-base in order to begin the process of fundraising for these needs.

The negative influence of the recent economic depression on colleges and university balance sheets forced institutions to retrench and rethink how they operate (Jaschik, 2010). Private liberal arts and sciences colleges like Selective College were particularly susceptible given its modest endowment, its regional draw for students, and the modest estimated financial contribution of its average student. As Hammond (1984) cited, economic depressions often have crippling effects on the enrollment and budget scenarios for small liberal arts college. This is particularly relevant when considering that most small liberal arts colleges gain 75% of their revenue from tuition and fees (McPherson & Schapiro, 1999). While Selective seemingly rode out the recession better than many institutions, creating a plan to strengthen its finances and prioritize its spending was important in order to be better prepared for future economic downturns.

Creating the Draw for Prospective Students

Part of preparing for a stronger financial future for Selective College included the creation of unique programs and upgrades to key facilities that will attract not only more students, but more academically

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

strong students. Selective College assumed that a percentage of higher achieving students would come from wealthier socio-economic backgrounds, which would enable them to pay more for an education that they assess as being higher in quality. Part of increasing that perceived quality includes creating programs, such as the integration between science and business, which provides unique learning opportunities with a nod towards the future. One person said:

You know, these small schools…are very enrollment driven so, if we had to put our weight on one over the other, I think [the assumption that Selective College] needs to be attractive to science majors was very important to us. Your science majors are your more high-end ACT kid typically. They have maybe a little higher propensity to persist … But then I and you know we can't discount our facility, our science facility was really worn out… not cutting edge in any way. [T]he building is also a difficult one to maintain and it was, it's just time and all of our competitors have a new science facility.

The strategic plan capitalized on the broadly held belief that families with means will pay more for what they perceive as having added value. A danger exists here in that Selective College cannot unilaterally pull out of the arms race with other colleges and universities who are trying to attract this student profile. However, there is no evidence that Selective seriously entertained the idea of eliminating, reducing, or consolidating existing programs and operations in order to reduce costs. A critical review of existing operations may have led to cost savings that could have been reinvested into the program, in addition to proposed investments funded by new philanthropic gifts or increased enrollment revenues.

Importance of a Strategic Plan in Attracting Philanthropic Support

Finally, having a solid plan for the future is important for stakeholders, particularly for donors and prospective donors. Not only does it provide donors with a sense of where the college is heading, it also provides a vision that can inspire them. A strategic plan can become a reality with the assistance and generosity of donors. It is also clear that people want to support successful, innovative, and impactful organizations. Having a plan for the future not only shows steadiness and strength, it also reaffirms the college's current and future sense of purpose and mission. As stated by Kotler and Murphy (1981), conducting a strategic planning process shows willingness by institutional leadership to examine the greater higher education environment and position their college in a way to be successful moving forward. As evidenced at Selective College, and referred to in the literature, strategic plans often provide the basis for subsequent fundraising initiatives. By having a clear, concise, measurable, and endorsed plan for the future, the various constituencies can work together to provide the appropriate resources towards programs, facilities, and personnel that will make the vision of the plan a reality.

Finding Three: An Emerging Decision-Making Model Focused on Feedback and Revenue

Over the course of this study, it was apparent that the decision-making model used during the strategic planning process at Selective College was not purely collegial, nor political, nor bureaucratic in nature. There was little evidence given by participants or in official documents of negotiation or quid pro quo as Bess and Dee (2008) suggests should be found in instances of political decision-making. There was also a lack of a formal rigid structure in the process that Tierney (2008) describes as being core to a

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

bureaucratic exercise. Bess and Dee (2008) describe a pure collegial decision-making model as encouraging consultation and shared governance amongst all members of the campus community. The process was also not purely collegial in that it was not an example of governance by consensus. Contrary to the scenario that Gibson (1992) describes, the faculty of Selective College did not have final say over which new initiatives were to be included or excluded.

One person expressed concerns that the lack of a strategic planning and governance committee resulted in less faculty input and control of the process. She stated:

I think the lack of continuity has made us more defuse. I will say that from our administrator's point of view that might be a better thing. Because what is does is it allows them [the administration] to control the conversation. … If the faculty feel like… governance is ours, which we do, then one of the things on this campus is that administrators have to be in sync with the faculty. And, if there is a diffusion of these sort of duties and conversations, it allows the administration to come in with the final word and say, 'well this is what I'm hearing.' Because we are not actually talking to one another… so when [the president] says this [strategic plan] was generated by a faculty discussion and discussion with the trustees, that's absolutely true. And he was in on, or the dean was in on, most of those conversations in various ways. … What most of us would want is a real Quaker model of going to the meeting house and just talk and get consensus. You know it didn't happen that way.

Another individual countered this idea. He indicated that the creation of a planning and governance committee would have been good for enhancing internal communication, but it likely would not have altered the outcomes of the process. He stated:

I will probably always wonder if we should have…after two or three years we could have created something that we called the strategic planning committee. And it could have held hearings and…I don't know that they would have gotten different or more input. Maybe they wouldn't even have got as much input as we did by doing things very…loosely, very organically with lots of different groups that were never called strategic planning committees. But at least the perception would have been 'oh yes, that's the damage, I got to say my piece about the strategic plan.' I think that there was so much discussion going on in so many different venues that, and also informally, that collectively there was far more information that went into the plan than if we…had been structured.

While various college constituents were given the opportunity for input, the final outcomes were not the product of a collegial Quaker-style town hall process where the pathway chosen was that of least resistance. Based on participant feedback and other data uncovered by the researcher, a new feedback and revenue-focused model was used during this process. One individual described the process as top down and not faculty-based, indicating:

[W]ho determines our priorities? Some of those probably come from trustees. Trustees talk to the president. The president talking to the business office, talking to development office… And then, feedback or input comes from the faculty and sometimes they ask for that and maybe…suggest directions that trustees and administration can go, but more often, and maybe this is just a bias from a faculty perspective, it seems to come from the top down rather than the bottom up.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

A faculty member agreed. He described the process as being one where there were many opportunities for input, but that the end result, was driven from the top down. He said:

I think there were a number of…times when this information was…discussed. …[B]ut for me it was, it was almost more about 'okay here's what we're going to do, kids.' And less about 'what do you want to do, kids?' So [the] number and kind of opportunities [for input and feedback were] certainly sufficient. I don't think anybody is, is going to…quibble or question…what the guiding principles are. I don't think… anybody particularly wants to fight about those but, but I think in some cases a view might be that this came more from the top down rather than from the bottom up and…that just may be the way things are.

Whether it was due to the economic pressures felt by Selective College during the recent recession, or the increasing professionalization of higher education administration, the new decision-making form that emerged met the need to make quick and decisive decisions. This evidence suggests that the traditional collegial, bureaucratic, and political models may be out of date and not useful for contemporary decision-making in higher education when considering the recent economic recession.

The decision-making model that emerged from the data has similarities to the cybernetic model championed by Birnbaum (1991) in that systems for input were put into place during the planning process at Selective College. However, given the size and culture of liberal arts and science colleges, as is the case at Selective College, employing different decision-making styles for various situations is not likely to be well received in a tightly-coupled organization. One person addressed what she saw as a possible change in decision-making practices in high education. She stated:

This college is more democratically run than the one I came from. Not to say the one I came from was total oligarchy or something but just that there was a continuum. But, I actually wonder if even this institution is moved to be…slightly less democratic. Every body has to have a say and everything to…get your voice heard but then…the appointed people make decisions, I think probably it's moved over in that direction. I think it is [because] these are different times. … looking back now, I see it was just a wonderful time. The stock market was going up and everything was great, and seemed like a real…stable and…enriching place. The pile seemed to be getting bigger and now I think we're all… struggling and that is different.

Another individual agreed, indicating a change in the planning processes conducted in higher education. He stated:

I sort of grew up and then began teaching in an era where when we talk about strategic planning the faculty thought, whether rightly or wrongly, that it should have a major role in the planning and implementation of any plan. I mean the world has changed and so you know in the last 35 years I think, and I don't mean this as a negative comment, but I think a lot of…college and university administration has become both more professional and perhaps more corporate. So I suspect that for many of us who sort of long for the good old days, if they were the good old days, that we're not going to have that kind of direct input into the process. So, at some level, those folks who were basically…making the final decisions may in fact tell us what's going on and you know give us some idea and…some input into that process. So, I think a lot of us then would like to say 'well I think building A should be a higher priority than building B or I think we should do this instead of that'. I'm not sure in 2012 that's really going to be realistic for many colleges and universities as they move forward.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

While there may be healthy competition between individuals and departments, there is not a strong basis for competition for substantial resources as might be found between Schools of a large loosely-coupled university. Thus, using various decision-making styles to accommodate different individuals or departments would not be an effective model in a lean administrative structure. In addition, with a small hierarchy, the need for 'thermostats' to alert the administration about departments or individuals losing focus or underperforming seems unnecessary (Birnbaum, 1991). The feedback and revenue model is a better fit for institutions like Selective College, which is a tightly-coupled organization that works to provide an quality product using limited resources. While feedback was accepted and encouraged, decisions were ultimately vetted based on their ability to enhance the finances of the college. One person summarized the process as a work in progress, yet representative of difficult decision-making processes at private liberal arts colleges. He stated:

I generally think the communication at the college, and I think this is typical of a lot of colleges,…takes place in pockets. Sometimes communication is inaccurate in those pockets. I don't think we've done a good enough job quite frankly of assembling the right people together with the president and maybe with [the board of trustees], with other people so they at least hear from us. … We could have done a better job of that. I think we did a good job trying to engage the faculty and certainly some outside constituents as we developed the plan. I mean, could we have done more? Sure. But I think that we probably didn't have to do as much because we felt the faculty was really aligned on this integrated learning [concept] since it came from them. … I think there's always 20% in any organization that says … 'I don't want to change.' … I think, overall, we did a good job. Could we have done better? Yes.

The rational and cultural decision-making models do not appear to be an exact model for the recently completed strategic planning process at Selective College. The boundedness construct of the rational model was not met as it was not clear who was charged with making final decisions, and within what timeline, with no formal committee in place. Further, the perceived significance construct was not met as there was no evidence of policy changes that carry consequences with them as an outcome of the planning process. While the focus on offering opportunities for feedback was in deference to the traditional collegial culture of Selective College, the planning process at Selective did not examine or address all of the issues at the core of the cultural decision-making model. While the liberal arts and sciences mission was reinforced during the process, other broad areas of focus in the cultural model, such as environment, socialization, and what is expected of institutional leadership, were not addressed.

The feedback and revenue model for decision-making allows for input from the broader community including faculty, staff, and alumni via formal and informal venues. Whether it be through representative committee structures where faculty and staff leaders funnel input to the senior leadership and the board, or through participation during question and answer sessions in scheduled town hall meetings, opportunities for input were given. However, unlike the pure collegial decision-making models, that input could be used or disregarded. As Tierney (2008) describes, collegial decision-making is truly present when "a community of scholars operates around notions of respect and consensus" (p. 152). Ultimately, the senior administration and the board of trustees made the final decisions about the future of the college and the best path to take in order to reach the desired outcomes. As a result, while opportunities for collegial input were granted and encouraged, the ultimate decisions were made by the senior administration and the governing board.

In addition to feedback, this new decision-making model stressed the use of opportunities to maximize revenue through tuition, fees, and philanthropy. While feedback from faculty, staff, and other constituen-

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

cies was encouraged during this process, the ultimate scale by which various proposals were measured by was whether or not these initiatives would help to generate additional revenues for Selective College. Recommended outcomes of this planning process validate this observation via investments in facilities, personnel, and programs to attract and retain more students and higher quality students. One person stated:

We have a beefed up … the student support services program. [They] have really upped the ante on what they're trying to do. … We got lots of new ways of tracking some of the students who are under achieving on the student support services side. There are tutoring services being offered for the students who simply need more help.

In addition, creating a vision for the future that includes opportunities for donors to realize immediate measurable results encourages philanthropic investment into the organization. According to a staff member, investments in personnel in the college's development operations have been deliberate. She stated:

On the budgeting side I know that we also did do some budgeting to make sure we had enough staff within the development office. That office started out five or six years ago with a very skeleton group. So one of the key things that they did early on was realize that if we are going to be in the next five, six years at that point in time, embarking on a capital campaign that we'd know we'd be embarking on… we have to get that staff in, established, settled. We've got to give them information they need. We've got to give them the research they need. We got to give them the tools and they've got to be ready, they've got to get ready to run.

A significant outcome of a strategic planning process is gaining a perspective of how an institution is viewed in the marketplace (Stevens, Loudon, Oosting, Migliore, & Hunt, 2013). Having external input from stakeholders and others regarding the strengths, weaknesses, opportunities, and threats that most accurately describe an institution is a valuable outcome of this process (Stevens et al., 2013). As was the case with Selective College, providing formal venues for feedback from external constituencies, whether it be through alumni representation in the process or by facilitating external listening and feedback sessions, adds an important element to the discussion. The opportunity for feedback from key external stakeholders will likely continue as the college may undertake a feasibility study prior to launching a fundraising campaign focused on the outcomes of the strategic planning process.

During the course of a feasibility study, key donors and prospective donors will be given the opportunity to share their reactions and interest in various aspects of the college's strategic plan. Feasibility studies are considered as being a best practice for institutions who are preparing to launch fundraising campaigns (Mai, 1987). It is during this exercise that it is determined which aspirations for the college have support amongst the donor base, thus it should be included in a subsequent campaign, and which may need to be addressed using other resources (Mai, 1987). While the strategic plan may be complete, which aspects of it can be funded through philanthropic support is often decided based on feedback from key external stakeholders. An additional factor in the success of a potential campaign, which can be assessed during a feasibility study, is whether or not the institution has the donor base, the culture of philanthropy, a mature fundraising organization (Pierpoint & Wilkerson, 1998).

In reality, higher education administration has become far more professional and organized in recent decades (Balderston, 1995). Fewer faculty members and deans are finding their way to the presidency and into other senior administrative positions (Cook, 1997). Thus, an increasing number of staff mem-

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

bers end up spending their entire careers as professional higher education administrators having limited classroom experience, research expertise, or having served on faculty committees. Not having experience collaborating on various topics with their peers as a member of the faculty, administrators do not have first-hand experience using collegial decision-making models in a professional setting. Instead, they are serving in positions in fundraising, admissions, marketing, and finance, where decisions often need to be made quickly in order to mitigate risk or maximize opportunities. The feedback and revenue model of decision-making has similarities to how businesses and corporations function, where key administrators are entrusted and expected to make decisions.

While the use of this new form of decision-making leads to a decreased sense of shared governance and ownership from various constituencies, it does allow the institution to be quickly decisive and responsive to changes in the external environment. In the case of Selective College, which was not financially strapped, nor flush, being able to create a plan to increase the quality and quantity of students was important. Similarly, by having a vision ready to reveal to donors was important and allowed the college to take advantage of opportunities to gain financial support. Given the recent shifts in the higher education landscape, it is likely that traditional decision-making models will need to be modified as institutions grapple with decisions in the future. For private liberal arts colleges like Selective College, the emerging feedback and revenue decision-making model allowed for broad input but attempts to mitigate errors by leaving ultimate decision-making authority with senior administrators and the governing board.

RECOMMENDATIONS

Findings of the study led to four primary actionable recommendations for college and university leadership engaged in a strategic planning process. The first recommendation is that a strategic planning exercise is valuable in garnering philanthropic support. The second recommendation focuses on the importance of selecting a decision-making model that is right for the institution and the current state of the institution. More affluent colleges and universities might opt to employ a collegial decision-making model with an extended time frame. Other institutions, like Selective College, may need to use a different model, such as the feedback and revenue model, to create an expeditious yet comprehensive future institutional plan.

A third recommendation suggests that investments in revenue generating positions in admissions, development, and marketing are key to the financial success of institutions. However, college and university leadership must keep in mind that the ultimate measure of success is the quality of instruction by faculty and staff in and out of the classroom. Investments in revenue generating positions should not be made in lieu of investments in the faculty. Fourth, campus leadership must be cognizant of the importance of philanthropy. Few private institutions would have been founded, or continue to exist, without donor support. Public institutions seem to be increasingly reliant upon philanthropy given a continued decrease in state support (Casteen, 2011). The pursuit of philanthropic support should not come at the loss of institutional mission and values. Finally, while new investments in programming and operations are necessary to maintain quality measures, new expenditures should be balanced with cost-cutting or cost-sharing efforts when appropriate.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Recommendation One: Strategic Plans Play an Important Role in Garnering Philanthropic Support

While the process of how a strategic planning exercise is carried out can be debated, the outcome of this process provides numerous benefits to institutions. Utilization of a strategic planning process results in a comprehensive business and operational plan which is helpful with setting fundraising priorities, prioritizing investments in programs and personnel, and budget modeling. Carrying out a planning process every five to seven years maintains communication among campus stakeholders on the institutional priorities, while allowing for flexibility due to changes in the economic and educational climate. While world and campus events can make aspects of a planning process seemingly void within a matter of a few years, having an agreed upon set of priorities by which all decisions can be measured provides campus stakeholders with a sense of direction. A strategic plan does not limit an institution from making a nimble and unforeseen move, but it engages college and university leadership to weigh that decision against previously established goals.

An established "checks and balances" protocol between the goals of a strategic plan and the temptation of pursuing previously unforeseen philanthropic development opportunities provides various constituencies with a sense of confidence about the direction of the institution. Included amongst those constituencies are faculty, staff, students, friends, alumni, and foundations who are current or potential donors to the institution. The strategic plan gives donors a feeling of whether their investment in that institution is wise and provides context for the investment. The strategic plan also helps the institution by creating a menu of priorities to be used in a proactive way with donors and preempts them from creating ways to give that may not fit with the mission and values and long-term priorities of the college.

Recommendation Two: Decision-Making Models Used during a Planning Process Must Fit the Culture and State of the Institution

A critical component of the strategic planning process, and whether it will be successful in galvanizing faculty, staff, administration, and alumni towards reaching goals, is how decisions are made regarding what is included in the plan. The decision-making model used during a planning process provides opportunities for engagement for various constituencies, but it also influences the pace by which decisions are made, and the culture of decision-making for campus decisions. The model utilized in various planning processes must match the culture and needs of the institution as determined by its current state and the perceived significance of the decision. For some colleges and universities, a prolonged collegial decision-making process may be feasible and necessary, while other institutions may need to make quick and more bureaucratic-like decisions in order to respond to current or imminent threats or opportunities.

In the case of Selective College, a decision-making model emerged somewhere in the spectrum between the collegial and bureaucratic decision-making models. The feedback and revenue model allowed and created formal and informal venues for constituent input and feedback on an accelerated timeline. Central to the model, senior administration and trustees made the final decisions with revenue generation being the primary filter by which decisions were made. While full-faculty and staff support is sacrificed in decision-making, it allows institutions to be nimble by entrusting a leadership group to make final and, if need be, expeditious decisions. This model assumes a high level of confidence or trust in the campus leadership; mistrust and poor leadership will alienate the strategic plan from the campus

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

community. Senior leaders using this model should assume their employment condition depends on the success of these decisions.

Colleges and universities that are either relatively affluent or cash strapped are more likely to benefit from using decision-making models, respectively, that are angled towards the collegial and bureaucratic ends of the spectrum. An affluent institution that is stable and can utilize a planning process to dream about program innovations without concern for how much or little revenue will be generated from them, or how long the process will take, has the luxury of carrying out a prolonged and diligent collegial process. An institution in the midst of a true crisis, financial or otherwise, needs to retrench immediately and is likely to benefit from the ability provided by a more bureaucratic model to be quick and decisive using a limited group of decision-makers. Either of these scenarios runs the risk of making an institution either inhibited in its ability to be nimble or of alienating constituencies not involved in the decision-making process. It is also likely that the traditional decision-making models (e.g., collegial, political, and bureaucratic) are outdated and that new models, including feedback and revenue, are necessary to match the complex internal and external environments of institutions. Ultimately, a planning process must use a decision-making model that is appropriate for the state of the college and is cognizant of the culture of that institution.

Recommendation Three: Institutional Leadership Must Embrace Donors and Philanthropy, but Not Lose Sight of Mission and Values

Donors have a key role to play in the life of liberal arts and science colleges, and an important role in promotion of institutions of higher education. Many institutions, particularly those that are private, rely on sustained support of alumni and friends through their philanthropy. In this era of reduced support from legislatures for state colleges and universities, public higher education has also ramped up their efforts in the race for philanthropic investment. Given this established trend, the role of donors and their philanthropic support for higher education is likely remain vital in the coming decades.

While donors are necessary to help fund the mission of colleges and universities, their gifts should help support these institutions and not unduly dictate their directions. Presidents and governing boards should focus on philanthropy and embrace donors, and avoid burdensome conditional gift commitments. It is important to remember that philanthropic gifts should enhance and improve the life of a college, not force it to alter its mission or values in order to meet a donor's wishes or demands. While it is important for colleges and universities to embrace the role of philanthropy in the history and culture of an institution, they should also avoid undue influences.

In order to protect against undue donor influences, the leadership of college and universities should work with their governing boards to develop and regularly review institutional gifts acceptance policies. These documents should clearly outline under what conditions certain gifts will be accepted and outline unacceptable gift conditions. Having a board-endorsed document provides the development staff and the president with guidelines by which to act in the best interest of the institution. A gift acceptance policy will help to ensure that donors act in support of the mission and values rather than using philanthropy as a way to alter them. Such a policy helps respect the role of philanthropy in the life of a college but provides donors with clear boundaries regarding what they receive in exchange for their gifts.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Recommendation Four: New Investments Should Be Balanced with Eliminations, Reductions, and Consolidations of Existing Services

While Selective College identified various areas of new investments, including facilities, personnel, and programs, there was no evidence that the elimination, reduction or consolidation of existing facilities, personnel, or programs. The need to remain competitive among peer institutions overshadowed the need to periodically and systematically examining the return on the investment of various programs or operations. Spending without committed resources is not a sustainable business model. The economics of small, moderately endowed, liberal arts and science colleges suggest that all aspects of the institution must be running at their fullest potential in order for the institution to be successful, viable, and demonstrate good stewardship of its resources.

One area for potential review is the scope of academic programs offered by colleges and universities. A large portfolio of basic and specialized academic offerings can lead to academic departments comprised of 1-2 faculty members enrolling 5-10 students. A balance between small and large departments with emphasize on creating cross-disciplinary courses and experiences for students also create opportunities to share budget, personnel, clerical support, and other resources. Another cost-sharing solutions may include joint faculty and staff appointments between program, joint ventures with regional peer institutions, and strong articulation agreements with pipeline colleges and universities.

On the administrative side, a number of possible solutions exist to free up existing resources to be invested in new endeavors. Using existing regional associations to share costs such as health care insurance, information technology and software purchases, and specialized facility maintenance positions, such as electricians, could provide cost savings. While additional 'feet on the street' are always welcomed in the development and admissions efforts, making sure that databases are being effectively used and that procedures exist to effectively use new human resources is important. Further, a review of whether an investment of $20,000 in digital marketing would produce more applicants than a $40,000 salaried admissions counselor should be considered. Investments in systems that maximize efficiencies may produce the desired results with less cost than new personnel. Whether it is in the academic or administrative side of the house, ensuring that existing expenditures are necessary and are producing the desired results is important and should be completed before new and additional investments are made.

FUTURE RESEARCH DIRECTIONS

The case study analysis of the strategic planning process at Selective College found that philanthropy influenced the development of administrative and academic goals. Further, the decision making process that created the strategic plan was revenue and feedback-focused and controlled by key administrative leaders. While specific to Selective College, the researchers assert the findings are useful to other liberal arts and science colleges that are engaging in a strategic planning process, especially in the context of an economic recession. The discussion of findings provides in-depth analysis and illustrative quotes to highlight how philanthropy influenced in the strategic planning process to inform future research among liberal arts and science colleges.

Future research to expand the knowledge of how philanthropy influences the strategic planning and administrative decision-making models should include other types of colleges and universities. Inclusion of public 4-year universities, research-intensive universities, and technical and community colleges

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

would provide new perspectives on the existing literature. Further, placing financial resources and stress of colleges of universities as a construct for greater consideration, future research might understand if this matters in the strategic planning process. Finally, a longitudinal study to follow the outcomes of the strategic planning process and its influence on the comprehensive fundraising initiatives would better understand the relationship between these two areas. A longitudinal analysis would also illustrate how changes within the decision-making model and leadership affect the strategic planning process.

CONCLUSION

This case study of the strategic planning process at Selective College provides a unique perspective regarding how philanthropy and administrative decision-making models contribute to this dynamic and multi-faceted process. There was evidence that philanthropic support, and the desire for it, influenced facilities and peripheral academic and co-curricular initiatives. Further, the need to increase philanthropic support was matched by the need to increase net tuition, room and board, and fees from prospective students. The urgent need to increase revenue resulted in a strategic planning process that was not conducted in a fully collegial manner. Instead, feedback was sought and given, but all decisions were vetted by the administration and governing board in an effort to increase revenues.

The strategic planning process of a financially-concerned institution that strove to fully recover from a tremendous economic recession resulted in the emergence of a new decision-making model, the feedback and revenue model. It is likely that similar institutions will need to create new models, such as the feedback and revenue model, in order to withstand the new economic higher education climate. Seeking feedback from various constituencies as an institution makes financial decisions is a strategy that many higher education administrators and governing boards will look to in coming years.

KEY TERMS AND DEFINITIONS

Administrators: Individuals who have some influence over institutional policy and how support of the institution is utilized and distributed.

Bureaucratic Model: "Assumes that decisions and planning take place by way of a coordinated division of labor, a standardization of rules and regulations, and a hierarchical chain of command" (Tierney, 2008, p. 151).

Campaign: A set period of time during which a set amount of money is raised for specifically mentioned projects and endeavors.

Capital Projects: The renovation of an existing facility or the construction of a new facility, including major changes or additions to the landscape of an institution.

Charitable Donations: Financial support of a non-profit organization or mission including, but not limited to, colleges, churches, hospitals, and youth programs.

Collegial Decision-Making Model: Calls for "decision making by consensus" (Baldridge, Curtis, Ecker, & Riley, 1977, p. 134) and allows for the full participation of the institution's constituencies.

Development Officers: Individuals who have the responsibility of advocating the institution's mission, values, and long-range plans in order to solicit philanthropic support for the institution.

Donor Incentives: A donor's reasons for giving.

Endowment: A corpus of funds which are restricted to support particular aspects of the institution including scholarships, professorships, lectureships, and the general operation of the college.

Institutional Mission: The direction, goals, and objectives for the institution.

Institutional Values: The common ethics, morals, principles, and standards an institution adheres to and embraces.

Philanthropists: Individuals who donate their time, money, and/or resources to support a non-profit cause or organization.

Philanthropy: The act of financially supporting a non-profit institution or mission.

Political Decision-Making Model: According to Bess and Dee (2008) a culture where the political model is utilized is "identified through its reliance on negotiation and bargaining among interest groups and coalitions within the organization" (p. 377).

Chapter 71
E-Marketing for SMEs

Neeta Baporikar
Namibia University of Science and Technology, Namibia & University of Pune, India

Rosalia Fotolela
Namibia University of Science and Technology, Namibia

ABSTRACT

This article describes that though there are few studies conducted on SMEs' life cycle, there are no studies specifically done around the globe with focus on electronic marketing approaches for SMEs. SMEs are flexible, so they can respond quickly to changing marketing requirements. Four approaches explain marketing role in small firms: the stages/growth model, the management style model, the management function model and the contingency model. SMEs face-marketing problems due to limited financial base, market knowledge, branding activities, expertise and over dependence on marketing ability of the owner/manager. They adopt reactive-marketing rather than planned marketing. Therefore, they face difficulties to exploit opportunities available in the market. Thus, the article aims to develop new ways of marketing approaches to every element of the-marketing mix (price, place, product and promotion). Further, as SMEs generally use a "conservative" approach to marketing, the study findings reflect that adopting electronic marketing approach can help them to offer new improved product or innovative use of existing product.

INTRODUCTION

Though, there are few studies conducted on SMEs' life cycle, but there are no studies specifically done on electronic marketing approaches in Namibia or any other country around the globe with focus. SMEs are flexible and can respond more quickly than large organisations to changing marketing requirements. According to Siu and Kirby (1998), four approaches try to explain the role of marketing in small firms. They are the stages/growth model, management style model, management function model and contingency model. SMEs face-marketing problems which are a resultant function of the small firms including: a limited base, limited marketing activity, expertise and impact; an over dependence on marketing ability of the owner/manager; reactive rather than planned marketing and difficulties to exploiting marketing

opportunities as well as lack of knowledge about the market. Some decision made by SMEs on which approach to be used do not match with the customers one, because SMEs do not conduct marketing research most often. In addition, SMEs known to apply traditional marketing approaches rather than innovative-marketing . Hence, the study aims to develop new ways of marketing approaches to every element of the-marketing mix (price, place, product and promotion). Secondly, SMEs might have using a "conservative" approach to marketing an existing product, basically, as entrepreneurs marketing approach can offer new improved product or innovative use of existing product. Further, the level of e-marketing practice reflects the extent to which information technology plays either a reinforcing, enhancing or transforming role in SMEs (Coviello, Brodie, Brookes & Palmer, 2003). Using a mixed research methods the aim of this research is to identify various marketing approaches used to market SMEs marketing mix, assess the innovative-marketing practices currently used by several of SMEs entrepreneurs to determine best marketing option to follow. It also delves into how to strategize the best e-marketing that offer new ways of marketing, replace existing ones, and then provides recommendations on various decision which can be made for the enhancing the benefit for customers. Thus, the focus of the research is on what are the types of marketing approaches that SMEs can use and which are the e-marketing advertising media that can optimal to replace the traditional ones for maximization of customers benefit.

LITERATURE REVIEW

SMEs can prove to be a major source of economic growth for many African countries if sufficient guidance and support on how best to overcome the challenges of adopting advanced marketing practices is available (Dlodlo & Dhurup, 2010). Further, marketing is an act of expertise, which mainstream enterprises find hard to play. Research has however revealed that any great competition needs dealing through successful innovation. As a result, firms need to take initiatives to deal with this growing global competition (Baporikar & Deshpande, 2017). It is hard to believe that movement to electronic marketing is spreading in the SMEs because of enhancing payback that is obvious day by day. Apart from worldwide prominence of SMEs, they face challenges in marketing in most of the countries, owing to changing business environment. Insufficient marketing ideas and weak attitude in leveraging complex marketing situations form operational blockages in selling the products. As a result, need persistently arises to improve the market setting which make up for an excellent marketing approach. Close observation of the-marketing challenges reveals that some of these challenges need addressing by identifying suitable approaches including electronic marketing approach. The focus of this paper is on the framework of electronic marketing approach for SMEs. Electronic marketing is the faster means of marketing in nowadays economy. One can sell and buy online while in one own house without having to step out. This means if SMEs can adopt the e-marketing approach it will help to reduce costs and enhance services. However, even though these benefits prevail in e-marketing , there are problems associated like lack of personal approach, dependability on technology, security-privacy issues, etc. According to Vuuren and Groenewald (2007), SME sector plays an important role towards contributing to the economic growth of an economy and averting the low gross national product, high unemployment and levels of poverty in countries. In addition, adoption of Internet marketing strategies if facilitated will contribute to the exponential growth of the SME sector. Despite its potential as a marketing tool, actual use of e-marketing has not met with expectations (Elliot & Boshoff, 2007).

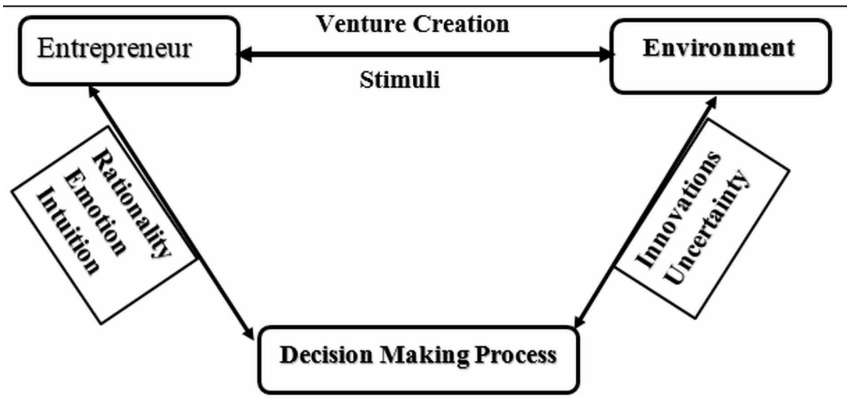
Table 1. Marketing Approaches

Marketing Approach	Description	Critique
Stages/growth model	-describes the development of a firm through several stage	-low predictive power -limited value as a framework for detailed analysis and planning
Management style approach	-marketing behavior is related to the motivation, belief, attitude and objectives of owner-manager	-ignores e.g. organizational structure, owner-manager's marketing decision process and behaviour
Management function approach	-acknowledges marketing as an important function and essential concept for small firm growth, survival and strategic development.	-too much or too little emphasis is put on the limitations and constraints of small firms when applying disciplinary foundation of marketing
Contingency approach	-tries to find balance between the limitations of small firms and marketing as a discipline	-variables are not clearly defined, are arbitrarily selected or cannot be measured effectively -is an outcome model, not a process model

Source: Siu and Kirby (1998)

In order to provide insights on how the adoption of a marketing approach in Italian SMEs could be encouraged, according to Marcati, Guido and Peluso (2010) it is important to understand: whether the entrepreneurs 'conception of marketing differs from that developed by researchers and which are the psychological factors capable of influencing the entrepreneurs' intention to adopt a marketing approach. This adoption of the-marketing approach is also crucial for these firms to reach a sustainable competitive advantage, Marcati, Guido and Peluso (2010). The study on SME's conception of marketing will verify whether the interpretation differs from that proposed by marketing researchers, to assess the psychological determinants of the entrepreneurs' intention to adopt a "marketing approach" by applying a traditional one to innovative way of marketing. According to Marcati, et al. (2010), yet, in the last few years, due to some drivers of market change (e.g., the global competition, the diffusion of ICT), their traditional factors of success have lost their strategic relevance in favor of other key factors, such as innovation and marketing orientation. Below presented in Table 1 are the approaches to marketing which generally in practice by the small firms.



Since most SMEs will have a product or service which they will offer at a price and they will promote this through some kind of medium that reaches their market place, it can be easily determined that SMEs marketing can be described under the frameworks of the Four P's' (Carson and Gilmore, 2000). Further, contingency model of marketing information, tends to understate the role of informal information sources while overstating the role of computerized information resources (Wright and Ashill, 1998).

Decision-Making in SMEs

Managers of small firms tend to know all the employees personally, they participate in all aspects of managing the business, and there is no general sharing of the decision-making process. Therefore, the literature concerning the organizational decision identifies three components of the decision-making process: the environment, the decision-maker, most frequently in the case of SMEs the owner-manager and the strategic decision process itself (Vermeulen and Cursen, 2008; Ogarca, 2010). Figure 1 gives the decision making process in SMEs.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 1. Decision Making Process. Source: Adapted from Vermeulen and Cursen (2008)

The present article proposes a personal synthesis of the few works concerning the decision-making process in the SMEs. The approach will start from a large framework, concerning the decision and the organizational decision-making process, abridged in the second part to the area of SMEs (Ogarca, 2010).

RESEARCH DESIGN AND METHODOLOGY

The study uses mixed (qualitative and quantitative). The research methodology specifies how the researcher undertakes the study to achieve the stated objective. Herein it is also to determine how an SME owner-manager's education and experience, and entrepreneurial orientation influence the firm's strategic development. In doing so, necessary support through secondary research along with empirical research is there. The research design includes questionnaires for collecting data from SME operator/owners. The questionnaire addressed the research question on business information needs, information seeking patterns and the utilization of ICTs in the SME sector. The use of marketing networks is an underdeveloped area of research within SME-marketing and there is little descriptive detail or insight available in general and more so specific to Namibia. The population selected for this study consisted of manufacturing SMEs operating in the Khomas region (Windhoek). Based on random sample selection of five SMEs from the list, the respondents were manufacturing SME owner/managers. Data collection is by distributing questionnaires and interviews to employees/owners of SMEs in Windhoek. This meant primary data collection and observation. After the data collection, the completed questionnaires numbered, to make it easier for data capturing and to avoid omission and duplication of data, codification done of the responses to capture in a spreadsheet document. Then analysis was undertaken using Microsoft excel and presented by means of tables, graphs and charts.

The findings of this study are of significance to potential investors, policymakers and marketers as well as academics community. Policymakers and SMEs support organizations might find the results of this study useful to set up mechanism that equip many more Namibians SMEs to become more entrepreneurial, learning and market-oriented as well as to give relevant training on enhancing their innovativeness and new product offerings.The study will also inspire young entrepreneurs on how to market their products in future. The research design contains certain inherent limitations. Since only manufacturing SMEs operating in Namibia are studied, the findings are not generalizable to all sectors

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

and firms operating in and/or outside Namibia. Finally, the results obtained might be indicative of the potential of similar analyses in explaining strategic development and revealing interesting avenues in the under-researched area of SMEs. It is consequently of significance to future researchers, entrepreneurs, and other stakeholders.

DISCUSSION

Decision-maker's parameters that affect the decision-making process are the set of personal values, specific training and experience in decision-making process. Ogarcă, (2010) commented that there are various impediments that make the previously presented model not suitable to be used in the understanding of the decision-making processes within a small and medium enterprise (although its valences are certain, predominant). The model conceived for the strategic decisions; the elements connected to the personal values, the influences exercised by the family, the entrepreneur's experience is ignored; it does not highlight very clearly the influence of some constraints connected to the financial resources or the time facto. Whilst marketing decision-making processes in the latter kind of organizations tend to be formal and highly structured, in small firms, such processes are simple, informal, instinctive, and, thus different from the theoretical paradigms developed in the managerial literature cited (Carson, 2000).

Carson and Gilmore (2000) stated that there is need of a pragmatic model of SME-marketing . In addition, in order to enhance the Internet technology readiness of Namibian SMEs, it is necessary to introduce through formal education and awareness tools right from national level. This will boost adoption of e-marketing . Adoption can rarely take off unless companies and individuals are educated about the opportunities offered by Internet related technologies (Stansfield & Grant, 2003) and adoption of e-marketing strategies can go a long way in representing the small business sector in the national economy as well as to stay ahead and maintain a competitive advantage (Steyn & Leonard, 2012). Hence, the proposed model and the preceding discussion is an amalgam of the following: adapting marketing techniques for SMEs, competency marketing, networking marketing, and innovative-marketing . Moreover, SMEs tend to relate better owing to their size and understand the needs of their valued customers or clients. How important is customer service, how is it generated, measured, and used by an SME to effectively create a competitive advantage depends upon the-marketing approach adopted (Baporikar & Deshpande, 2017).

Data Presentation and Interpretation

To whether SMEs do advertise the products online, 80 percent advertise and conduct it online while only 20per cent advertise at all neither traditional nor online. Though some firms do not make extra effort to advertise products, similarly, all these firms make use of their businesses to advertise. Figure 2 below depicts to what extent online advertisement is in vogue.

Demishkevich, (2015) commented that online-marketing provides a cheaper and faster way of increasing brand awareness and brand building.

On the issue, whether the firms create and form partnership the respondents' response is as shown in Figure 3.

On whether the respondents have formed partnerships are with customers and other businesses, the majority 60 per cent expressed that did not formed up any partnerships while 40 per cent expressed that they formed partnership with customers while have formed partnership with prime contractors and (cus-

Figure 2. Online Advertisement

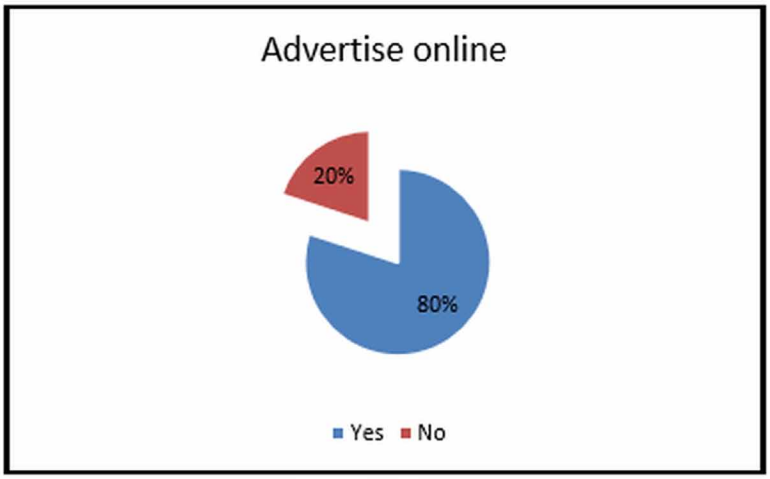

Figure 3. Formed partnership

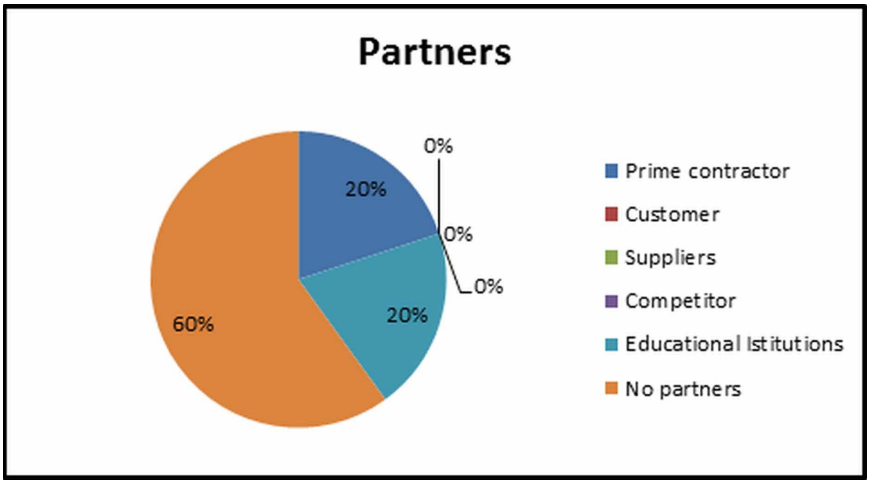

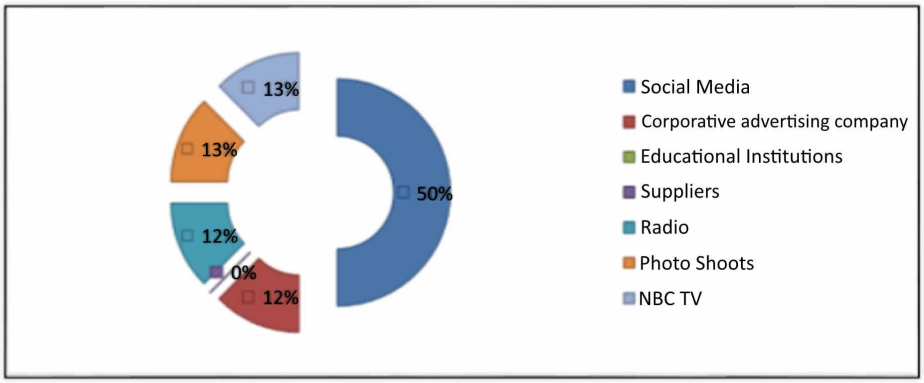

Figure 4. Advertisement Mode and Preference

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

tomers) educational institutions, 20 per cent respectively. The highest percentage of 60 per cent expressed that either they dot value the partnership or they do not think positively about it. According to UNIDO (2004) in the early stages of a partnership program, there may be considerable investment against limited direct financial returns. This effects and the challenge is to address SME capability gap and needs.

The current question requested the respondents to state whether SMEs advertise online. About eighty percent do advertise online and twenty percent do not. The respondents also added that the companies themselves without outsourcing and undertake all designs and advertisements in house. Updating of the every company advertisement is weekly, by adding pictures of new arrivals. According to Gilmore (2011) e-marketing activities allow entrepreneurs to advertise their products and services more widely with less expense, to answer customer queries in several languages if need be, to use e-mail as a marketing tool and to provide on-line quotes.

How firms advertise and what is the mode of preference to advertise is the next issue. Figure 4 reflects the response.

As shown in Figure 3 the most useful social media is 50% to all when advertising. Thirteen percent make use of the photoshoot while some of them also using the radio. The modern days industrial customers can be captivated by innovative-marketing practices like digital media, creative product placement, brand consistency, internet as promotional tool to name a few, (Trivedi, 2013).

Marketing Approaches

On whether respondents understand the different market needs of SMEs, the respondents had mixed feeling on issues such as; the incubators do not have access to internet facilities, which can be of help to run the business to the fullest. They only make business for survival without profit. Therefore, there is a need for diversification because incubators are not a place for a business to settle down but a temporary shelter (5 years only).

Respondents described how marketing has changed in the 21st century, as there is improvement on customers' lifestyle. Reaching out to customers through social media, video, skype and photoshoot is much easier to technology enablement. Customers enjoys the trend for designing their traditional tailor made clothing. Some other companies have found a slight improvement from previous years. Unfortunately, the businesses, which operate traditionally claims to have no customers any more. Municipality's Incubators are charging high rental fees though the spaces are not adequate. It is high time to determine profit in less than 5 years of business. The respondents do understand entrepreneurship and the challenges of creating new businesses such as lack of support financially and no adequate space. Competition with Chinese of copyright and low-price charges for fake products. Let alone capital, there is an economic crisis in the whole country.

Stages/Growth Approach

To whether the businesses will grow with or without partners, they said that business would be able to grow without partners because the owners decide to make final decision on their own.

About 60 per cent believe that businesses with partners undergo conflicts while 40 per cent believe that partners contribute to business growth. Businesses keep communicating with their partners on how they support each other. According to (Mole et al., 2016) A resource-based theory perspective emphasises the competitive benefits to be gained from seeking and taking-up external business assistance.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

To what products for partners are: some partners are schools, which connected the individual parents to come buy their children's uniforms. The other business also expressed that partners assist with hard cash if need be, apart from solar grid.

To whether respondents you have ability to initiate mutual relations with new partner, our business is to make enough uniforms and our partners are to buy. The supplier solar partners are Supplying solar panels and inventers to make business successful.

Management Style Approach

To what extent various decisions made in order to benefit customers, one point is to expose its business to exhibition apart from normal business area. To keep to its best quality they can and to make sure to deliver on time. To what perceptions held in SMEs in marketing, the respondents commented that as businesses grew SMEs need enough space and make it a permanent hub.

To what decision-making process made to create and implement online-marketing strategy, respondents commented with mixed ideas that online-marketing strategies keep the customers updated to current trends. Every week/month marketers do take the latest pictures and place them in social media. Respondents also added that Instagram expose each finished product to the targeted customers. According to Demishkevich (2015: p23) small business owners with limited marketing and financial resources need to find the optimal way of promoting their businesses.

To what the small firms do to market themselves SMEs replied that the best marketing platform is to display their brands, to work hand in hand with print media, magazine, and newspapers and to be proactive, NBC's Business Today programme, pamphlets and social media.

To whether employees/managers give feedback to all the stakeholders, they said yes, because they keep to regular meetings for information exchange and control flow of information. The partners discuss most often, on how they support each other, all the time (unlimited).

This raises two issues for the small firm cannot afford a marketing "expert" could not get an assistance to lent money, do not make enough revenue in order to sponsor other marketing efforts. Some owner-managers may be unsure of their ability to deal with 'smart and sophisticated consultants' on equal terms, (Mole et al: 2016). This might include concerns about the expense of obtaining expert advice, doubts about whether it provides good value for money and concerns about the time needed to fully implement and benefit from the advice. Another concern whether there be enough marketing activities, the respondents expressed that they do modelling, exhibitions though they look forward to creating an activated website. Some companies believed to have conducted enough marketing activities without underwent extra mile.

In addition, to who makes final decision as partners, responded that the main company does it. SME owner/managers are doing marketing through their natural and inherent networking activity, through all their normal communication activities, such as interacting and participating in social, business and trade activities, Gilmore et al. (2001, p. 2).

Management Function Approach

Here the respondents should have to indicate whether they explore a new development of business ideas (new packaging and new products). They replied by saying that they are moving towards new trends to

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

design bedlinen, clothes and carry bags matching with outfits. The businesses for solar panels always to bring the latest with latest solar systems.

To the question whether they have benefit to products during the past years, they responded that they advertise by use celebrities and improve on quality. The assistance by the government, which increased the needed sewing machines, had also improved on productivity. They added that they realized that adverts have also boosted customers. Although, those who do not add any value do not experienced improvements in this regard.

For the past years, on whether they have changed their product/service quite significant, the respondents replied confidently that there is a growth on clients by having fixed and occasional customers. Exposed at corporate and individual level. SMEs when asked whether current products find opportunities arising or they want to change to new products, some of them want to add new collections while some other are willing to increase their productivity to shortage of supply. Therefore, also designed additional product lines such as bedlinen. To what partners' products are: school uniforms and others are inverters, solar panels, batteries, regulators. In addition, design and build an operational marketing strategy for a start-up business or new product, making best use of limited resources to ensure that the firm can establish a viable presence in the market. The tailors' role is to design customers' own fashion.

Contingency Approval

To what specific products these enterprise concentrate on, some of them women and men official or if a customer chooses his/her own design for special events. Some respondents make seasonal and special events. The other ones make clothing and school jerseys. The solar company sells solar bulbs batteries, cylinder, solar panels, and solar geyser. By specifically design and build an operational marketing strategy for a start-up business or new product, this approach helps to make the best use of limited resources to ensure that the firm can establish a viable presence in the market.

Innovative-marketing Practices

Whether SMEs have professional background and work experience, the responses are in Table 2 below.

Many people get training in family businesses until they grow into that. Some of them received training for SMEs in how to grow their businesses. Entrepreneurs are equally curiosity, tailor can just observe and do the jobs from there they count on experience already. Those who inherited from family talents had picked up from the childhood. The majority of them were training in job-trainings though there are some of those who have gone through vocational and other trainings.

Figure 5 illustrates those respondents who believe that the training assist in educating SMEs by creating and implementing online-marketing strategy, which was, commented 6 per cent respectively: marketing and branding; awareness campaign; benchmarking and innovation marketing. In addition, to what training do you believe will education helping you in creating and implementing online-marketing strategy for their businesses, see the Figure 5.

To how SMEs would describe the-marketing mix and how do online-marketing fit into their marketing mix, the respondents the commented that marketing mix that fit into online-marketing is product, price, place and promotion which is 100 percent. The four P's are common. Because a product is sold at a certain place for a given price at either a normal outlet or exhibitions with either higher or special price. Further, according to product, promotion is to boost sales (Demishkevich, 2015). Here is promotional

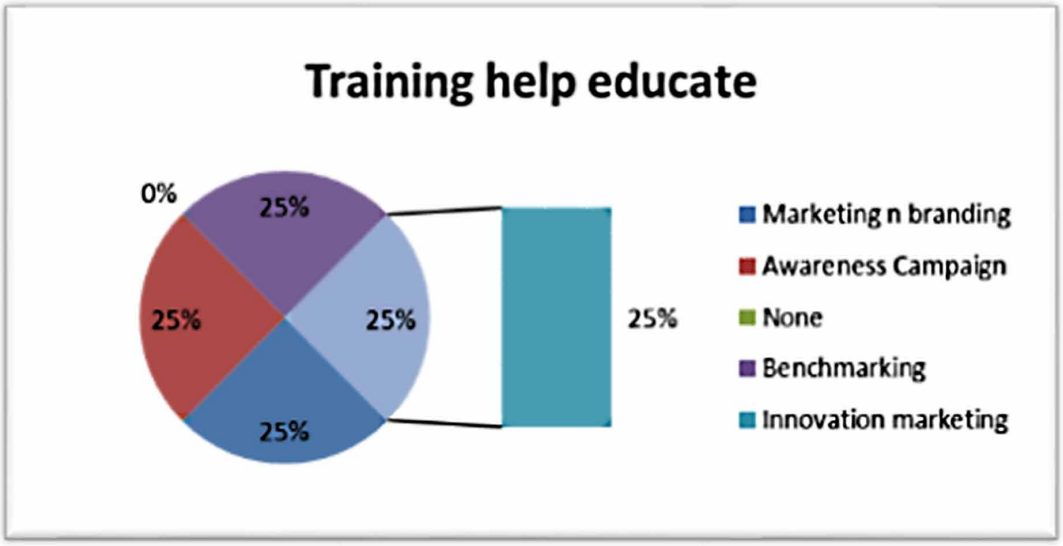

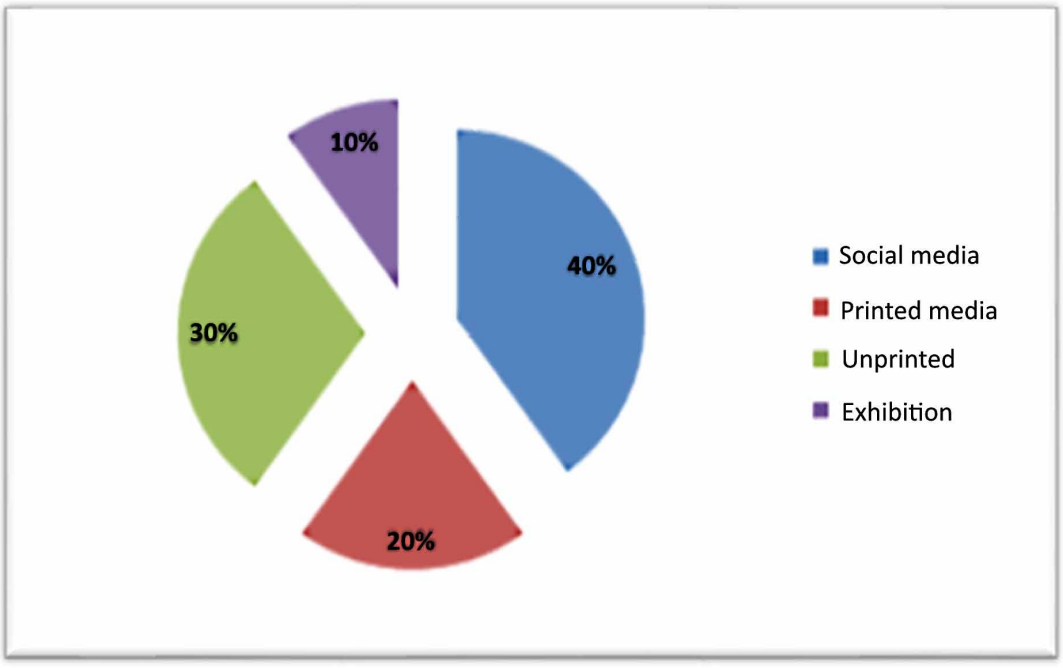

Figure 6. Advertisement Platform Use

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

material for magazines, where there is promotional material for pay-per-click and promotional material for signage. However, when advertising online the products only displayed as pictures without prices that do not open too much competition.

The online-marketing strategy is being updated monthly 75 per cent and those who do it weekly are 25 per cent. These SMEs always put aside 5per cent of their revenue for advertising cost. The budget estimated by all lies between N$ 2 000 to N$5 000 per month depending on a growth of revenue. The owner of the companies is the one responsible of handling online-marketing for the entire company 75 per cent and 25 per cent are using Marketing officer. Most of what small business owners learned about marketing online was from doing it themselves and reading about it (Demishkevich, 2015). They also added that the person in charge of online-marketing has to update and attend interviews at NBC panels when necessary. Other responsibilities are to be a cameraperson, updating and save in a stick.

For the issue as to what advertisement platform SMEs use and prefer, see Figure 6.

Responses shown on Figure 6 indicates that SMEs who advertise by using social medias (Facebook/ Instagram) are 40 per cent, unprinted medias (photoshoot, emails, radios) 30 percent, printed (newspapers, banner) 20 per cent while exhibitions are only 10 per cent. The highest tool almost used by all is social media. According to Demishkevich (2015), the Internet marketing channels included search engine optimization, pay per click advertising, email marketing, social media marketing, online events, video marketing, online public relations, coupon sites, lead aggregators, display advertising, and mobile-marketing .

Then the question to the respondents was how often the advertisement is running and the response was that they update weekly by taking picture of each new product line on WhatsApp, Facebook etc. Removal from the web page every month of the old fashion products, which have become obsolete, is also crucial. Regarding what on-going operational routine relates to online-marketing , some businesses find themselves in a situation where demand exceeds supply. Some of them experienced slow response while competitors challenged some of them. Few businesses may suffer the copying of their brands, but they good thing is that they will not be able to destroy the originality of such brand because of its neatness.

To whether there were challenges when creating and implementing online-marketing strategy, the responses are in Table 3.

Table 3 indicates the various challenges that the SMEs are going through. Some of the said that they wait for too long to hear from customers back. Some customers do not necessarily differentiate the products and brands from various competitors. Many businesses are imitators of other competitors' "Copy Cat" in order to gain recognition. Hence, they are not able to meet customers' expectations, therefore, there are few loyal customers, and they just receive the walk-in customers. While some felt the marginalization of their businesses.

To what three specific things are most satisfactory with online-marketing efforts, response is in Table 4.

Table 3 indicated there are few specific such exposed at the incubators, good sales and brand awareness. Customers make quick response to the adverts, exposed at incubators as well as SMEs exhibition

Table 3. Challenges

Slow Reaction from Respondents	Products Unable to Distinguish from Various Competitors Without Brand	Copying of Other Brands Imitators	Lack of Outstanding Customer Satisfaction	Lack of Awareness

and from time-to-time, the market improves to high market share. They gain customer by providing quality goods and services. The findings showed that there were quite a number of factors contributing to SMEs' electronic marketing approach. The study further found out that there is a high level of e-marketing (advertising online) than the traditional one. Social media use is mostly to advertise weekly as a cheaper and no need of internet facilities such as Wi-Fi connection at the incubators. Approaches such as growth, management style, management function and contingency were showing positive. This also indicates that SMEs are happy and look forward to diversifying their businesses.

The next part presents findings from both secondary and primary research and finally draws recommendations.

Adapting Marketing Techniques for SMEs

In the past decades, major studies undertaken were on how the international marketing strategy consisting of adaptation or standardization. When going out of the domestic market, the competition plays a role in the decision of adapting or not their marketing mix: the Export Manager says that "when competition is intense we have to adapt our product as much as we can, we must be better, make the difference", Valassis and De Rosen (2013).

Competency Marketing

Issues that are more specific have an impact on the nature of competencies for SME decision-making. Technical competencies relate to the operational aspects of the tactical aspects of SME-marketing activity and decision-making competencies are more specific to the roles and issues important to SME overall management decision-making.

Network Marketing

This paper advocates that networking is an inherent tool of marketing which is wholly compatible with SME decision-making characteristics in relation to marketing activities, Demishkevich, M. (2015). Timescales within networking can vary enormously; some individuals may be networked continuously and frequently, whilst others may only be contacted infrequently and occasionally, (Carson and Gilmore 2000). Accordingly, the way to do marketing by networking is often in pre-determination by industry behaviours and norms through regular or irregular meeting occasions and industry activities or in just doing business. Demishkevich, (2015) commented that online-marketing provides a cheaper and faster way of increasing brand awareness and brand building. Therefore, the paper further commenting by advocating that networking is a marketing "competence and as such can be developed as a way of doing marketing for SMEs, that is, marketing by networking.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Innovative-marketing

In defining innovative-marketing as "doing something new with ideas, products, service, or technology and refining these ideas to a market opportunity to meet the market demand in a new way", Kleindl et al. (1996, p. 214) demonstrate that although innovation can include new-product development, it incorporates innovative development in other aspects of marketing (Cummins et al.,2000). According to Gilmore, (2011), the individual person, who will adapt traditional marketing frameworks to suit the specific situation of his /her own firm, develops entrepreneurial marketing. The SMEs can easily bring in the innovative-marketing practices, as they do not have layers between the decision makers and the people who implement these decisions, Trivedi, (2013). Speed is a characteristic of the modern world, the factors which affect the internal environment and the external environment of an organization that the decision-maker must take into account, being very unstable, each of their changes urging a very quick reaction from an organization that wants to be performant, Ogarca, (2010).

According to Trivedi, (2013), the SMEs cannot generate revenue by selling same old products to the same old market in the same old way. Demishkevich, (2015) stated that in order to reach target audiences across different devices and platforms with the information they want, small business owners need to embrace online-marketing . Trivedi, (2013), further stated that the innovative-marketing techniques could then help the industries in building a niche for them in the market and stay ahead of time. Demishkevich, (2015) also added that Internet marketing offers numerous benefits when compared to traditional media channels. In practice, entrepreneurs usually focus on trying to be innovative, especially in relation to offering something in the market place and differentiating their company and products from the competitors, Gilmore, (2011). According to Carson and Gilmore (2013), innovative-marketing is not simply a focus on product innovation; instead, it covers the whole spectrum of marketing activity within an SME. The successful integration of Internet marketing into a firm's operations requires not only the knowledge of online-marketing , but also adequate IT infrastructure and the experience to know how the two work together. Digital marketing: Digital marketing encompasses wireless communications and digital television marketing activities in addition to Internet marketing channels cited (Li, Li, He, Ward, & Davies, 2011).

Electronic Marketing (eMarketing)

Electronic marketing is the use of Internet and its related technologies such as e-mail, search marketing, real-time communication to help achieve-marketing objectives in conjunction with other marketing communication tools cited (El-Gohary, 2012). According to Gilmore, (2011) e-marketing activities allow entrepreneurs to advertise their products and services more widely with less expense, to answer customer queries in several languages if need be, to use e-mail as a marketing tool and to provide on-line quotes.

Technology and SMEs

The introduction of new technology has changed the way business operates in the global world. According to Dzisil and Ofosu (2014), the SMEs can use social media to create a viral market for their products and services. The roles of technology in the process of bridging trade barriers include improving and diversifying methods of communication, widening the advertisement platform and ensuring efficient and timely delivery of goods and services, Dzisil and Ofosu (2014). According to Chiware, ERT (2007),

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Table 5. Approaches and Critique

Marketing Approach	Description	Critique
Stages/growth model	-describes the development of a firm through several stage	-low predictive power -limited value as a framework for detailed analysis and planning
Management style approach	-marketing behavior is related to the motivation, belief, attitude and objectives of owner-manager	-ignores e.g. organizational structure, owner-manager's marketing decision process and behaviour
Management function approach	-acknowledges marketing as an important function and essential concept for small firm growth, survival and strategic development.	-too much or too little emphasis is put on the limitations and constraints of small firms when applying disciplinary foundation of marketing
Contingency approach	-tries to find balance between the limitations of small firms and marketing as a discipline	-variables are not clearly defined, are arbitrarily selected or cannot be measured effectively -is an outcome model, not a process model

Source: Siu and Kirby (1998)

therefore, findings of some authors indicated that the most widely used means of communicating with SMEs are telephones, faxes and mobile phones, while the least used means are e-mail and the internet.

Internet Marketing (IM)

Internet marketing is the use of Internet and related technologies for creating, communicating, and delivering value to customers. Internet marketing can incorporate website, search engine-marketing , social media marketing, content marketing, email marketing, mobile-marketing , and banner advertising cited (Eida & El-Gohary, 2013; Jarvinen, Tollinen, Karjaluoto, & Jayawardhena, 2012). The SMEs have traditionally looked domestic market as their focus area and now times are changing they are looking forward to get into international business. The study conducted is at SMEs on electronic marketing approaches. The study collected data using structured questionnaires completed by a sample of five businesses. Table 5 gives first the findings from literature review and the critique thereof.

Findings from primary research are according to the research questions and objectives.

1. **Research Objective One:** Identify various marketing approaches used to market SMEs marketing mix:
    - Stages/growth model was looking at making the decisions in order to benefit customers.
    - **Management Style Approach:** SME owner-managers have individual management styles and in the absence of a marketing plan, they can find themselves using "self-marketing" of themselves as a means of promoting their businesses. Self-marketing can be defined as "varied activities undertaken by individuals to make themselves known in the marketplace", Resnick et al. (2016).
    - The-marketing function approach in SMEs is gets hindered by constraints such as poor cash flow, lack of marketing expertise, business size, tactical customer-related problems, and strategic customer-related problems, O'Dwyer et al. (2017, p. 2) cited (Doole et al., 2006; Chaston, 1998; Carson, 1985).
    - Management function approach, planning the managerial functions of marketing (planning, organization, control) are related to customers' problems whose needs have to be met on long

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

term in order to obtain the optimal planned profit, Minculete et al., (2014) cited (Schneider, 2005).
    - Contingency approach: the study then concentrated on specific products or if they planned to add to their products lines for these SMEs.
2. **Research Objective Two:** To assess the innovative-marketing practices of SMEs currently used by various entrepreneurs concludes on following the best marketing option. The professional background and work experience are Self-taught and few went through vocational and other trainings. E-marketing activities allow entrepreneurs to advertise their products and services more widely with less expense, to answer customer queries in several languages if need be, to use e-mail as a marketing tool and to provide on-line quotes, Gilmore (2017, p. 6).
3. **Research Objective Three:** To strategize the best e-marketing which offer new ways of marketing replacing the existing ones? Social media is the most useful is 50per cent to all when advertising. This led the firms to create or enhance transactions that gathered and used customer information. As a result, the businesses had a better understanding of customer's needs and what customers value by using their phone (Heierli, 2008).
4. **Research Objective Four:** The various choices are in order to benefit customers by exposing SMEs business to exhibitions apart from normal business area. SMEs to keep to its best quality they can and to make sure to deliver on time. The perceptions held in SMEs in marketing are that businesses grew SMEs need enough space and make it a permanent hub.

RECOMMENDATIONS

- Municipality must build permanent shelter graduated SMEs and keep for incubators for infant SMEs.
- There must be internet facilities for SMEs on only to their phones' data instead phone or to use data on their phones as well as to have updated company websites
- The business outlets need adequate spaces accommodate the employees and equipment.
- Allow SMEs to put posters for their products so that the passers-by can easily see them.
- Protection to SMEs is required from imitators of their brands.

IMPLICATIONS OF THE STUDY

Saffu, Walker and Hinson (2008) identify increased use of the Internet for conducting business as one of the significant trends in the past decade. This necessitates the integration of Internet-driven marketing principles such as emarketing into SMEs mainstream business practices. This research study therefore will give a positive impact on the SMEs so that they can implement better marketing policies clubbed with branding through the convenience of electronic medium. Further, eenterprises will be able to know and design the "customer focused" message so that they can base their branding philosophy relating to products. SMEs also will be able to design the brands to give message of their ability and it would thus be a strong instrument to earn revenue, grow and to survive in the business. In addition, policy makers may be able to set methodical trend for designing the brands and thus their branding policies will bring sustainability in SMES and specific line of businesses (Baporikar & Deshpande, 2017). Last but not the least SMEs may find it in effect functional to devise policies by using electronic marketing as core

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

and branding as complimentary approaches. Moreover, the new way of assimilating the desired brand values into the whole business requires systems, structures, plans based on comprehensive gap analysis, and a mobilisation programme designed to exploit the particular skills of brand experts to engage hearts and minds of everyone as 'brand capital generators' (Gilmore, 2001). This will enable skilled people's choice to decide where to work, investors' choice of investment opportunities and customers' choice of what to buy and where to buy it through increase in access due to electronic marketing approach.

This choice means that your stakeholders have both the right and the opportunity to understand and influence what SMEs do and does not do. Thus, SMEs that put the emphasis on customers, employees and shareholders significantly outperformed those that focused on only one or two of these groups (Duncan and Moriarty, 1997). Hence, by adoption of this innovative and mixed proposition and a high level of service delivery, SMEs will be able to attract consumers away from ingrained primary relationships and generate a lot of value from those customers by cross selling. For this, SMES need to do substantial investment in supplementing its telephone network with Internet and mobile phone services. An emphasis on constantly updating the website content within the framework of a strict brand template and based on constant customer feedback is crucial. Trying to make all channels work as seamlessly as possible within the constraints of technology by resisting an inflexible approach is also essential.

CONCLUSION

This study undertaken intended to develop new ways of marketing approaches to every element of the-marketing mix (price, place, product and promotion). Secondly, SMEs are using approaches, which are Stages/growth model (how the business develop in various stages), Management style approaches (how owners/managers are motivated in order to reach their objectives), Management function approach (realization on business growth or survival) and Contingency approach (what are the limitations or marketing as discipline). These SMEs have made use mostly social media as cheaper and more convenient in marketing an existing product or offer new improved product. SMEs made important decisions in order to benefit customers such as to expose its business to exhibitions apart from normal business area. They decided also to keep to its best quality they can and to make sure to deliver on time. Finally, the study also indicated that SMEs are happy and look forward to diversifying their businesses. The study involved e-marketing approaches for SMEs in Namibia. The results of the study have shown that social media was highly adopted in this study such as Facebook and Instagram, as an inexpensive means to connect with customers. The study, therefore found that SMEs are happy with incubators initiative. The study concluded that SMEs brands lack protection. Further studies will look at the exploration of Internet marketing practices of small business owners in different industries.

Chapter 72
Fostering Environmental Performance Management within Indian SMEs

Gurudas Nulkar
Symbiosis Centre for Management and Human Resource Development (SCMHRD), India

ABSTRACT

Research and discussions on environmental sustainability of businesses generally focus on large corporations. Their environmental impacts are more likely to be noticed while small and medium enterprises (SME) are largely ignored. With a small scale of operations, SMEs are generally perceived to have less environmental impacts. However, as larger corporations outsource their manufacturing to SMEs the environmental burden shifts within their supply chain. This research was conducted within manufacturing SMEs in industrial markets (B2B) in Pune, India. In depth interviews with large and small firms helped develop the conceptual model and the questionnaire. Responses from 60 SMEs were analysed. The research identified factors like owner awareness, barriers and influencers to green practices and categorized environmental practices within product life cycle. The results showed that owners with high awareness levels had advanced environmental activities. The strength of barriers and influencers was established and the author makes recommendations based on these findings.

INTRODUCTION

Why and when should businesses be attracted towards environmental practices? Can they be encouraged to improve environmental performance? Much of current research directs such questions towards large enterprises and less towards small businesses. However, entrepreneurs operate in the same business environment as large firms and small enterprises are no less connected with the industry environment relation.

Even as the link between human activities and climate change is debated, opinion on reduction of environmental impact of industry is in agreement. From the 1972 United Nations Conference on the Human Environment at Stockholm to the more recent one on Sustainable Development in 2012, industry awareness and response has grown. Our understanding of environmental impacts has improved and the

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

approaches towards mitigation have evolved. However, even as environmental sustainability gains importance, pursuing 'green' does not automatically save costs or lead to other business benefits (Reinhardt, 1999). This has slowed the diffusion within industry and particularly in small and medium enterprises (SMEs). Their resource constraints and limited managerial capabilities restrict owner attention to business operations and environmental activities within SMEs are often limited to compliance (Williamson & Lynch-Wood, 2006). In India, a complex regulatory framework and unsupportive agencies may be keeping SMEs away from a huge opportunity to improve the country's environment.

As the 'Make in India'[1] appeal, made by the new Indian Prime Minister, gains international attention, Indian SMEs, as suppliers in global supply chains, are expected to gain significantly in the process The recent investments by global giants suggests a positive and growing response[2] towards the campaign. This impending growth in the SME sector offers compelling reason to focus on the environmental practices within the Indian SMEs and offer a facilitative atmosphere for improvement. However, extant research within SMEs is sparse as little research is published. Of this, most focus on polluting industries and technological solutions. A deeper understanding of the SME sector is needed to guide policy and regulation. To contribute to overcoming this deficiency, this author conducted a study in the Pune region, an engineering SME belt in western India.

INDIAN SME SECTOR AND THE ENVIRONMENT

While SMEs have varying definitions in different countries, their characteristics are similar. Often these firms come into existence because of some particular expertise of the owner and are run single-handedly by them. Moreover, owners have low formal business experience (Deloitte, 2008). In this study the definition employed is from the 2006 Micro Small and Medium Enterprises Development Act (MSMED) of India. This defines and classifies SMEs on their investments in plant and machinery into micro, small and medium enterprises (Ministry of MSME, 2012).

Without being modest, the Indian SME sector is huge. An estimated 44.7 million units spread across a country of about 3.2 million square kilometres, inhabited by about 1.2 billion people living in 28 different states. They are significant contributors to employment, export earnings and the GDP. Their presence is a precondition for large industry, to which they serve as suppliers. This sector contributes to about 8% of the GDP, 45% of the manufactured output and 40% of exports (Special Task Force, 2010). Their sheer number alone makes offers a huge potential for improving the environment.

ENVIRONMENT AND THE REGULATORY FRAMEWORK IN INDIA

The environmental regulations in India can be broadly classified into regulatory controls and liability laws. Acceptable limits of pollution are set and harmful polluting industries are closely monitored. The liability laws can impose fines or order closure of defaulting industries. The Ministry of Environment and Forest (MoEF) governs environmental regulatory mechanism in India. They are the policy-makers while the monitoring responsibility lies with the Central Pollution Control Board (CPCB). Each state has its counterpart – the State Pollution Control Boards (SPCB) - responsible for monitoring industrial performance in their own state. Depending on the industry, a firm may require annual certification and periodic audits. The MoEF has categorized industries on their potential to pollute, into Red, Orange and

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Green. Firms in the red list are the most polluting and under close observation from the SPCBs. The National Environmental Policy (NEP) of 2006 brings out policies, principles and rules to implement environmental rules and regulations (MoEF, GOI, 2006) and encourages industries to adopt standardized environmental management practices by acquiring ISO 14000.

REVIEW OF LITERATURE

Even though environmental sustainability within SMEs is less researched than large firms, there are studies available from several countries. There is a general agreement among researchers about a scope for improvement of SME's environmental performance and that green practices of large firms may not be appropriate for SMEs due to specific constraints (Hitchens, 2004). Similarly, the barriers and influencers of environmental performance in SMEs seem to converge within many studies. The characteristics brought about by small size do not favour implementation of environmental initiatives, especially when they do not directly affect the firm's business. As a result, environmental management systems (EMS) are not widespread in SMEs.

The research conducted within the EU has contributed to the understanding of green behaviour in SMEs. Particularly the Organisation for Economic Co-operation and Development (OECD) has published studies and reports on greening SMEs (OECD, 2007). Elsewhere, studies have identified the motivators (Smith & Duff, 2000) (Moorthy & al, 2012), enablers (Gadenne, Kennedy, & McKeiver, 2009), barriers (Iraldo, Testa, & Frey, 2010), environmental technologies (Shrivastava, 1995) (Hobbs, 2000), strategies (Fischer & Schot, 1993) (Orsato, 2006) and what competitive advantages (Porter & van der Linde, 1995) (Ghemavat, 2006) a firm could stand to gain (Bianchi & Noci, 1996) (Hitchens, 2004).

As ownership and management often converge in SMEs, the owner has a major impact on the performance of the business. A number ofstudies indicate that awareness and knowledge of the SME owner is a major barrier to green performance (Gibson & Casser, 2005) (Iraldo, Testa, & Frey, 2010) (Ortiz Avram & Kühne, 2008). Gerrans and Hutchinson (2000) suggest that SME owners are generally unaware of current environmental standards while Williamson et al (2006) showed a low understanding of legislation within SMEs. Another study suggests that SMEs owners lack managerial training and experience which and tend to approach business through a process of trial and error and this is likely to be difficult in face of complex business decisions (Farsi & Toghraee, 2014). Similar conclusions are drawn by in other studies that business complexities take up a large portion of the owner's time which makes them focus on operational issues rather than strategic objectives (Bianchi & Noci, 1996) (Gelderen, Frese, & Thurik, 2000) (Walker & Brown, 2004) (Bognanno, 2012). The Deloitte-CII Report on SMEs in India (2008) reports that SMEs are incapable of integrating environmental management and corporate responsibility into business strategy. Although it may be more difficult for SMEs to recognize gains given their smaller size and scale (Millard, 2011), SMEs will be better able to take advantage of green opportunities due to their flexibility (Von Weltzien Heivik, 2010).

Among the influencers, compliance and cost reduction are the major ones for SMEs. Since competitiveness is a business imperative green practices with economic benefits are pursued by SMEs (Bansal & Roth, 2000). Thus practices of reducing material consumption, energy and waste, which lower costs and benefit the environment, are prevalent. However, investments which do not offer cost or business benefits are ignored (Esty & Winston, 2009) (Gadenne, Kennedy, & McKeiver, 2009). Clean technologies are unattractive when their pay back is longer than conventional technologies. Some studies suggest

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

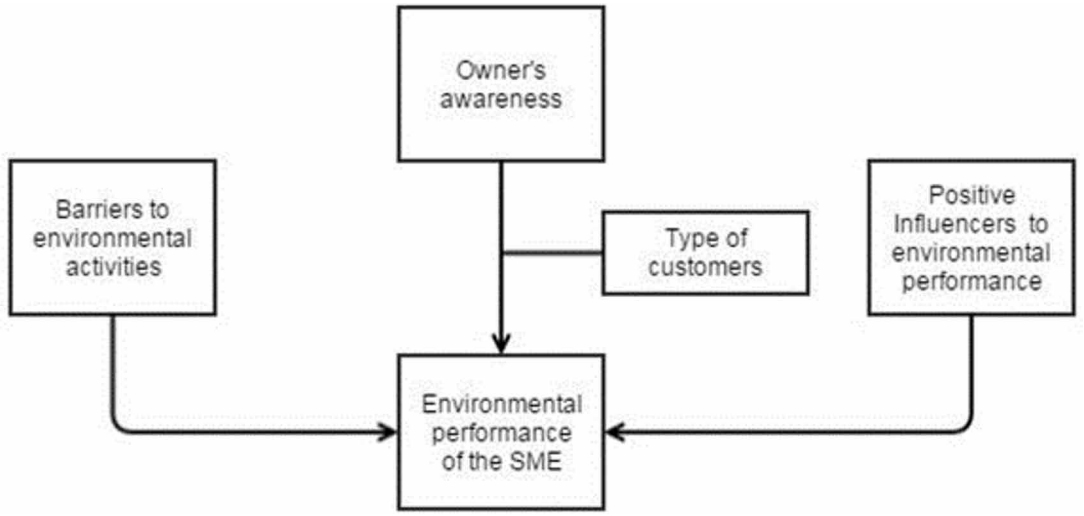
that eenvironmental performance imposes financial burden on SMEs (Williamson & Lynch-Wood, 2006) (Simpson, Taylor, & Barker, 2004) which can be set off if demanded by customers (Lewis & Cassells, 2010). When customers do not ask for it, environmental performance turns into an unnecessary cost (Hillary, 2004).

Many studies show that improving environmental performance in SMEs may provide greater overall benefits than other measures aimed at fewer, but larger, businesses (Robinson & Stubberud, 2013). Several studies highlight the role of governance on healthy SMEs. A study from Venezuela (Fernandez-Vine, Gomez-Navarro, & Capuz-Rizo, 2010) shows that Public Administration is a key stakeholder and they should improve its tools to facilitate greener SMEs. An interesting finding from Philippines suggests that if the entrepreneur has a large asset size at stake or is advanced in age, he or she is more inclined to undertake environmental initiatives in the enterprise (Rao, 2008).

Even as studies from several countries are available (Chen & Lai, 2006) (OECD, 2007) (Megacom, 2008) (Ortiz Avram & Kühne, 2008) (Lee, 2009) (Lewis & Cassells, 2010) (Weerasiri & Zhengang, 2012) across various industries, literature on green SMEs in India is sparse. The ones available in India focus more on the technology aspects or study practices like energy efficiency, waste reduction (Gopichandran, Shah, & Patel, 2013), clean technologies (Sangwan, 2011) and supply chain (Raghavendran, Xavier, & Israel, 2012). Raju (2002) argues that SMEs in India require globally compatible facilitation in order to be competitive both domestically and internationally, suggesting stakeholder participation for environmental management within them.

OBJECTIVES

The primary objective of this research was to improve the knowledge on environmental practices within engineering SMEs in India. To gain these insights, the research set out to:



1. Study the environmental activities within each stage of the product life cycle;
2. Understand the influencers and barriers to green activities for SMEs;
3. Understand the role of owner awareness in the green performance of the firm.

METHODS

Starting with an exploratory study, interviews were conducted with eight SME owners and five sustainability managers in large companies. The large companies were customers of SMEs and provided insights from this perspective. Based on findings from the exploratory phase, a conceptual framework was developed and questionnaire prepared for data collection. The questionnaire comprised of five sections each with questions on environmental activities within the product life cycle. It was sent out to over 500 firms, drawn from three sampling frames. Respondents could answer it on-line, on a printed copy or over email. From the responses, those with over 33% unanswered questions were removed. This left 60 responses which were taken up for further analysis. The data were analyzed with a statistical computer application.

Figure 1. Conceptual framework

SAMPLE SELECTION

The respondents were drawn from the Pune industrial region based on three qualification criteria. The respondents must be (i) engineering firms with manufacturing as a principal activity (ii) primarily serving industrial markets (b2b) (iii) in current business for over 5 years. This disqualified SMEs engaged mainly in trading, services or consumer businesses. The sample thus represented SMEs that operate in global supply chains of large corporations.

CONCEPTUAL FRAMEWORK AND HYPOTHESES

A conceptual framework was developed based on the exploratory interviews and survey of literature (see Figure 1). This suggested that various barriers hamper an SME's immersion in environmental practices while on the other hand some factors could encourage them. Studies show that the owner's awareness is an independent variable affecting the green activities. The conceptual framework estimates a relation between the green performance for a firm and the barriers, influencers and owner awareness. Two hypotheses are proposed in the framework. The first being that owner's level of environmental awareness and the firm's Green performance are correlated.

The second hypothesis was based on exploratory interviews which suggested that the type of customers served can affect the green performance. The hypothesis proposes that SMEs serving mainly large customers are likely to have a higher level of Green Performance.

The questionnaire had 32 sets of questions grouped on the generic product life cycle. It included questions on environmental practices within each stage of the product life cycle. Thus questions spanned the design, sourcing, manufacture, distribution, sales and consumption stages of the product. A GreenScore was computed for the firm based on the responses. Respondents were asked to rate the barriers and influencers in their adoption of green practices. The barriers and influencers were prepared based on studies from other countries and from insights gained from the exploratory interviews.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

RESULTS AND DISCUSSION

The 60 respondents drawn were from engineering, electrical and electronics, plastics and packaging, chemical and other industries. The number of firms from each industry is shown in Table 1.

As regulation is specific to the nature of industry, this was considered important. The respondents were grouped according to the type of customers they served (Table 2).

SMEs cluster around large manufacturing companies and operate within the supply chain of large enterprises. Pune is the manufacturing base for many large multinational firms, including major automobile manufacturers. Many SMEs are suppliers to these firms directly or through another supplier. The region has very few government companies and only 8.3% respondents served traders or government organizations.

A firm's level of awareness was computed from responses to one set of questions. The owner's awareness of environment terms, practices and impacts of industry on environment and knowledge of clean-tech, GRI etc were asked and scored. The scores ranged from 0 to 19, 0 being the lowest awareness. These were clubbed into three Levels of Awareness. Majority of the SMEs (51.7%) had a moderate level of awareness (Table 3).

Table 1. Respondents by industry

Industry	Percentage of Respondents
Engineering – mechanical, automotive	55
Electrical, Electronics	17
Plastics, Packaging	12
Chemical	8
Others	8
Total	**100**

Table 2. Grouping by customer type

Grouping Respondents by Type of Customers	Percentage of Firms
Cust_Type A: Serving mainly large customers	63.3
Cust_Type B: Serving mainly small and medium customers	28.3
Cust_Type C: Serving traders or government customers	8.3
Total	**100**

Table 3. Grouping by level of awareness of the environment

Grouping Respondents by Level of Awareness	Percent
High awareness	20
Moderate awareness	51.7
Low awareness	28.3
Total	**100**

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Five sets of questions checked the green practices within the product life cycle. Each stage was given marks and the total of all stages was computed to yield the GreenScore. A high GreenScore indicated more environmental activities. The GreenScores had a mean = 15.93 and $\sigma = 12.463$.

HYPOTHESES TESTED

The first hypothesis which proposes that SMEs serving mainly large customers are likely to have higher GreenScores was tested statistically. Since the GreenScores were not normally distributed, the Kruskal-Wallis non-parametric ANOVA conducted on the GreenScores and customer type. Table 4 shows the mean and median GreenScores of respondents by their customer types. In this case the null hypothesis was that the median GreenScores are not different between the three Cust_Types A, B and C. The test rejected the hypothesis with a $\chi^2 = 4.095$, p= .129 suggesting that GreenScores do not vary significantly between the types of customers (Table 4).

This shows that SMEs serving small, large or other customers are not likely to have different Green-Scores. The explanation suggested for this is that SMEs are usually a part of the supply chain of a large customer, even if they directly supply small customers. Since they are expected to meet the requirements of the end customer, this imposes similar conditions on them, as large customers. Therefore, irrespective of the type of customers they serve the mean GreenScores do not vary significantly. For example, one firm making electrical transformers supplied transformers to SME clients. These SMEs made sub-assemblies and supplied them to a large manufacturer of microwave ovens and washing machines. Because of this, the transformer manufacturer had to operate at standards specified by the end customer.

The second hypothesis proposed that the owner's level of environmental awareness and the firm's GreenScores are correlated. The hypothesis was tested with the Kruskal-Wallis non-parametric ANOVA. The mean and median GreenScores are shown in Table 5 for the three levels of awareness.

Table 4. Cross tabulation of GreenScores for each customer type grouping

Cust_Type	GreenScore	
	Mean	Median
Cust_Type A: Mainly Large	21.29	21.5
Cust_Type B: Mainly Small	14.88	18
Cust_Type C: Traders or government	14.8	14

Table 5. GreenScores shown for each level of awareness grouping

Level of Awareness	GreenScore	
	Mean	Median
High	35.67	35.5
Moderate	22.96	23
Low	7.2	9

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

The test showed a highly significant difference in the median GreenScores between the three levels of awareness, with $\chi 2$ of 19.728 and the p value .000. This accepts the hypothesis proposed that GreenScores of SMEs with varying owner awareness are different. This reinforces the findings in another section, where 60% of the owners felt (strongly or somewhat) that their own awareness about the environment had influenced them in environmental practices. The author suggests that this is an important correlation, especially for regulators and policy makers. For Indian SMEs to improve environmental sustainability practices, increasing the owner's awareness must be addressed. Upon a cursory check in the marketplace for SME specific environmental education or training programs, the author did not find any being currently offered or conducted in the past. Many training firms offer EMS training, but these are suited towards large organizational requirements and can get too resource intensive or complex for small firms.

BARRIERS TO ENVIRONMENTAL MANAGEMENT IN SMEs

The diversity within SMEs makes it difficult to identify common barriers to green performance. From prior research and exploratory interviews, eight barriers were identified. These were categorized as internal and external. This is considered important since the SME would have some control on the internal barriers, while external ones would need a response from the SME. The respondents were asked to rate them on a four point Likert scale. Table 6 shows the responses in percentage of firms.

Among the internal barriers, finance availability ranked first. Further questions pointed to long cash cycles which discourage spending on non-productive activities. In India, SMEs have various financial challenges of access, high borrowing rates, high transaction costs etc. (Thampy, 2010) (InfoDev, 2012). This is a key issue for SMEs which is responsible for adoption of environmental practices. This also suggests an explanation why high awareness may not result into positive behaviour for the environment. Knowledge and awareness ranked second which showed that there is an awareness of non-awareness. In other sets of questions too awareness ranked high. All the internal barriers can be remedied by the SMEs themselves, when they are able to identify and acknowledge their presence.

Table 6. Barriers to green practices

Barriers		Strongly Responsible	Somewhat Responsible	May have been Responsible	Not Responsible
Internal	Finances are locked up in business activities	**29.3**	**29.3**	12.1	**29.3**
	Lack of knowledge, awareness	17.5	**42.1**	19.3	21.1
	Lack of required skills	17.5	**35.1**	21.1	26.3
	Lack of time	13.8	31.0	8.6	**46.6**
External	Lack of government support	29.8	**33.3**	7.0	31.6
	Unattractive Return on Investment	22.4	**37.9**	10.3	29.3
	Lack of industry support	21.1	**35.1**	12.3	33.3
	Competitive pressures	17.5	**43.9**	7.0	31.6

Note: Responses shown in percent of firms

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Among the external ones, 52% agreed (strongly or somewhat) that they wanted more government support. When asked about the nature or form of support, responses ranged from helping understand laws and rules to identifying technologies, preferential financing, subsidies and making enforcement stricter. In one question 87% firms felt their competitors do not strictly comply with regulations. This meant that they paid less costs of prevention effectively reducing motivation of those who complied. This was corroborated in the interviews, one respondent was said that SPCB employees had low awareness. The findings point to the government's role in making SME specific regulations and in incentivizing performance. This may still be an 'end of pipe' approach but can lead to an improvement. The next external barrier of unattractive return on investment too, can be remedied by policy interventions. Most respondents felt that at current rates of financing, spending on non-productive activities is not attractive. Green financing was suggested by some respondents which will help improve the return on investment.

There is consensus on industry support – the role of regional trade associations and chambers of commerce. A large number of SMEs are members of local associations. Such organizations undertake training programs, share best practices and make representations to government on taxation or similar issues. In Pune, the local chamber of commerce is a widely recognized and has been a special SME cell to address their problems. However, they have not been active in environmental issues of SMEs, which is reflected in 56% respondents agreeing to it.

INFLUENCERS OF ENVIRONMENTAL MANAGEMENT IN SMEs

The potential to save costs is a strong influencer for green practices. Energy saving, waste reduction and pollution prevention reduce costs and are popular practices with SMEs. To establish the other factors which have the potential to influence green behaviour, questions pertaining to internal and external influencers were asked. Responses were on a four point Likert scale and are shown in Table 7.

Personal awareness stood out as the strongest influencer among the respondents. Over 60% of the owners felt (strongly or somewhat) that their own awareness about the environment had influenced them

Table 7. Influencers of green practices

	Influencers	Strongly Influenced	Somewhat Influenced	May have Influenced	No Influence
Internal	Personal awareness	24.6	**35.1**	21.1	22.8
	Employees	1.7	15.3	13.6	**69.5**
External	Regulatory Bodies (PCBs)	15.5	22.4	13.8	**50.0**
	Customers	13.8	22.4	17.2	**48.3**
	Investors	3.5	1.8	1.8	**96.5**
	Society/community	1.7	10.3	22.4	**67.2**
	Suppliers	1.7	10.2	5.1	**83.1**
	Joint venture partners	1.7	3.4	6.9	**87.9**
	Insurance firms	0.0	1.7	5.1	**93.2**
	Bankers	0.0	5.1	3.4	**91.5**

Note: Responses shown in percent of firms

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

in environmental practices. This supports the earlier response of low awareness as a barrier. The second influencer is customers. As discussed earlier as SMEs form a part of the supply chain of large firms, their environmental targets need support from their suppliers. Many companies thus qualify vendors on quality and environmental measures. The responses showed that employees too influence green practices. They are part of society which affects their choices and preferences.

Among external influencers, it is interesting to note that currently, insurers have little influence. Lower environmental risks of clients will be beneficial for insurers and could be incentivized. This suggests that very few SMEs insure themselves against environmental risks. There is no information available currently on this and could be basis for further research. For large project financing, many banks require environmental impact assessment of projects. This has influenced large firms to conduct them and also to choose environmentally favourable technologies. Similar conditions appropriately scaled for SMEs could be useful for banks for SME funding.

CONCLUSION AND RECOMMENDATIONS

SMEs by their sheer number have a huge potential of reducing environmental impacts. Much of the potential is not yet realized. In India, with the enforcement agencies understaffed and under skilled (Sahu, 2010), regulators alone cannot be expected to make a transformation. A favourable ecosystem specifically considering the challenges and constraints in which small firms operate, would facilitate the change. From the analysis and various responses and suggestions received in the personal interviews, some points for policy makers are suggested, as follows:

1. **Regulators & SMEs:** 53% respondents strongly agreed that environmental regulations and SPCB working must be tailored for SMEs. Further, some responded that the staff and officials themselves need to be more aware of industry specific regulation and environment. 47% strongly felt that SPCBS have the most important role to play for SMEs. Given the number of SMEs and the potential for them to collectively improve environment, the following recommendations are made:
    a. Greening the huge number of SMEs in India requires a significant commitment, resources and a top down approach. The MoEF must strategically address SMEs within the system. As the findings show, SMEs are not happy being clubbed with large organizations. While regulating the SMEs, the MoEF must consider the constraints they face to build a separate framework. The monitoring agencies and state authorities must be directed to deal with SME compliance in a facilitative manner;
    b. The SPCB employees require training and need to be empowered with tools and techniques for dealing with SMEs. Many respondents complained of the lack of expertise of the officers who visit them. It is imperative that they improve their credibility since SMEs often lack the requisite capabilities. Substantial investment in laboratories and infrastructure is required to cater to the large numbers. Moreover, SPCBs must increase their presence in SME clusters;
2. **Encouraging Green practices through financial institutions:** Financial issues within SMEs are well researched in most countries. The responses in this study suggest that access to finance is a major barrier for greening. The Reserve Bank of India has mandated Indian banks to treat this as a "priority sector" (RBI, 2012). Taking these initiatives further, the following recommendations are made:

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

a. Lack of sources of green finance was a concern raised by some respondents and industry experts. Green financing for SMEs can be offered through lower interest rates or longer repayment periods. Investments in pollution control equipment, clean technologies and green projects can be encouraged through such schemes;
b. A majority of engineering SMEs undertake debt financing for their business. Banks and lending institutions are thus in a unique position to divert their attention to environmental performance. While evaluating funding applications, they could make it mandatory to submit an environmental report. This will help bring into perspective a hitherto ignored aspect of business. This would be beneficial for banks too since they can evaluate the environmental risks that their potential client is being exposed to;
c. Insurance Regulatory and Development Authority, a body constituted by an act of the parliament, can mandate setting lower insurance premium for lower environmental risks. The penetration of insurance is low in India (India Brand Equity Foundation, 2015), most lending institutions make it a requirement. Lower premia can encourage green practices since SMEs are seeking ways to lower costs;

3. **Certification incentives:** Like the subsidy for ISO 9000 certification some years back, environmental certification needs to be subsidized. The certifications ISO 14001, are challenging and can potentially disrupt an SME's day to day operations. Subsidies can offer a financial incentive to undertake it. SMEs exporting to the European Union (EU) have realized the need of being certified. The EU's Eco-Management and Audit Scheme (EMAS, 2013), will require compliance from SME exporters. The unprepared SMEs can stand to lose export opportunities;
4. **Environmental Facilitation Cells:** Various industry associations in India have been active and influential in improving productivity and safety in India. In particular, CII (Confederation of Indian Industries) and FICCI (Federation of Indian Chambers of Commerce and Industry) have played exemplary roles. They comprise of most of Indian business houses and it is in their interest when their suppliers go green. Such organizations can take up the establishment of facilitation cells to be put up in SME clusters. The primary role of such cells would be to impart environmental awareness and training programs and provide support in compliance. Paid services can be offered to SMEs for identifying areas of improvement, technologies to mitigate environmental risks and securing business benefits from voluntary practices. Moreover, such cells can provide employment to environmental engineers and can help undertake research.

As improvements in environmental performance may not necessarily hold business benefits, SMEs tend to overlook them. This would leave out an immense opportunity to improve the environment for India. With the 'Make in India' campaign attracting new investments, it is time for Indian SMEs to focus attention on their environmental practices. If they do not do so now, they may lose the new business opportunities. India's GDP will benefit from the increased business as would her environment from the improved practices.

Chapter 73
Coping Better with the Project´s Unknown Unknowns:
New Competences for Overcoming Uncertainty in Projects

Yvonne-Gabriele Schoper
HTW Berlin, Germany

Fritz Böhle
ISF München, Germany

Eckhard Heidling
ISF München, Germany

ABSTRACT

It is the goal of management to overcome and delete uncertainty. Uncertainty is seen as an obstacle and threat for successful management. However projects are full of uncertainty. Successful project management therefore aims to overcome and ideally delete uncertainty as far as possible. In project management, uncertainty and risk are often used synonymously. Current project management methodology contains only technics how to manage risk in projects. The assessment of risks is based on the precondition of stable conditions and the idea that the influencing parameters are known, assessable and calculable. Since more than 2,000 years it is the aim of the Western cultures to master the nature by natural sciences and mathematics. In the last three centuries of Modern Philosophy the perspective developed that analytical scientific know how (episteme) and technical skills (techne) can master any kind of complexity and risk. The third traditional Aristotelian competence, the practical wisdom (phronesis) however was perceived as not acknowledgeable.

INTRODUCTION

Management is defined as the organization, co-ordination, planning and control of activities in order to achieve defined objectives. It is the aim of the management of organizations to build and keep continuity and stability. This is done by objectives, and with the standardization of stable processes, with fixed procedures and pre-defined resources. Herewith the management aims to avoid uncertainty, as uncertainty is perceived as a threat for management as it could endanger the planning and steering of stability. This conceptual approach is also valid for the management of projects. Project management practice however shows that projects are full of uncertainty and that overcoming this uncertainty is nearly impossible.

A project is a temporary endeavor undertaken to create a unique product, service or result. However this uniqueness - in contrast to routine processes - leads to the fact that projects are full of uncertainty (e.g. developing a new product that is to be launched far in the future, a new constellation of team members or a lack experience in a new business segment). As a consequence uncertainty is an inevitable, typical characteristic of projects. The management of project aims to overcome and delete this uncertainty as far as possible. With the help of pre-defined project phases, standardized tools and good-practice methods the project processes shall be made predictable, plannable and calculable. This strategy of elimination of uncertainty is also applied when it comes to tasks that are not completely plannable as it is the case in projects.

Since the global increase of volatility, uncertainty, complexity and ambiguity (described with the acronym VUCA in the 1990s) of the general conditions, uncertainties in projects and their impact on the project results get increasingly in the light of the awareness of the senior management. These uncertainties demand for a new type of project manager who not only minimizes the upcoming uncertainties in the project but who also foresees and realizes the opportunities that derive out of the project uncertainties (Lechler, 2013; Dalcher, 2014). This new connotation of uncertainty containing both the chance for opportunity as well as for risk demands for a new attitude towards uncertainty.

The following chapter first examines the concept of uncertainty and of risk. It lays down the current risk management approach in project management and explores the potential for professional uncertainty management in projects. The analysis of Aristotle´s classification of knowledge and evolution of his concept in the West in the last 2,000 years shows that one of the three competences, namely phronesis was abolished in the last 300 years. In addition the concept of dealing with uncertainty in the Eastern societies as well as in current business management is analysed concening their management of uncertainty. The comparison shows the need for a new competence of opportunity management in addition to risk management in projects.

It is the aim of this chapter to raise the awareness for a new, so far disregarded competence of project managers, namely the capability to differentiate between uncertainty and risk. This is the basis to develop a further competence, namely to turn uncertainty into a potential opportunity. The significance of these new competences is that they lead to a redefinition of the project managers´ role from the one of passive execution of the corporate strategy to the active formation of the future of the organisation. This has consequences in the education, qualification and long-term career development of project managers in organisations as well as of those responsible for the governance of projects.

UNCERTAINTY MANAGEMENT IN PROJECTS

Differentiation between Uncertainty and Risk

Generally, uncertainty and risk are often used synonymously in project management as both terms are often used interchangeably. However, both concepts have a different meaning.

In a news briefing in 2002 the US Secretary of Defense Donald Rumsfeld said about the lack of evidence by supplying weapons for the mass destruction to terrorist groups in Iraque: "Reports that say that something hasn't happened are always interesting to me, because as we know, there are known knowns; there are things we know we know. We also know there are known unknowns; that is to say we know there are some things we do not know. But there are also unknown unknowns – the ones we don't know we don't know. And if one looks throughout the history of our country and other free countries, it is the latter category that tend to be the difficult ones. (US Defense Government, 2002)

From this speech in 2002 the terms "known knowns", "known unknowns", "unknown knowns" and "unknown unknowns" arised in the management theory (De Meyer., Loch, & Pich, 2002; Cleden, 2009; Winch & Maytorena, 2012; Sanderson, 2012). However this theoretical differentiation between the four different qualities of risk does not have an impact on project risk management in practice.

In the 1920s and 1930s the management theorists Frank Knight ("Risk, Uncertainty and Profit" 1921) and the economist John Maynard Keynes ("General Theory of Employment, Interest and Money" 1936 and "General Theory of Employment" 1937) differenciated between the two concepts of uncertainty and risk.

"The essential fact is that 'risk' means in some cases a quantity susceptible of measurement" (Knight, 1921). This quantifyable measurement can be expressed by mathematical statistical probabilities "[…] risks […] were supposed to be capable of an exact actuarial computation" (Keynes 1937). In comparison to uncertainty that has no scientific basis to calculate a probability. "We simply do not know" (Keynes, 1937). Knight recommends to restrict the term 'uncertainty' to cases of the non-quantitative type (Knight, 1921). Further on Knight forecasted the dispute on the forms and consequences of uncertainty as an important task of economic scientific development. He warned that it is the *true uncertainty* that prevents the theoretically perfect outworking of economic success (Knight, 1921). The authors indicated already in the 1920s the great meaning of uncertainty on economic decisions.

In today's project management literature risk is defined as an "uncertain event or condition that, if it occurs, causes a significant positive or negative effect on the project objective" (Project Management Institute, 2008). Risks are events, circumstances, situations or conditions that might occur with a specific probability and have a potential negative impact on meeting predefined project objectives. Risks are the so-called "known unknowns" and can be separated from uncertainty if they are measurable, calculable and predictable for the course of the project (Cleden, 2012; Lechler, 2013).

In comparison to uncertainty in project management: Uncertainty can be defined as all unknown or unexpected project situations with a potential significant impact on the project. Uncertainties are unknown, not foreseeable and not predictable with the set of tools and instruments for the course of the project, with other words the so-called "unknown unknowns" or "black swans".

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

As project reality shows unexpected events often occur during a project (Pinto, 2007). Risk management limits the impact of the unexpected events and prevents these events from happening. Accordingly, it is generally assumed that risk management contributes to the success of the project (Olsson, 2007).

The standardized project management processes contain the aspect of risk management: Project risk management holds a strong position in the project management theory and methodology (APM, 2006; ICB 3.0 of IPMA; PMBok by PMI, 2008). Also the academic studies on project management concentrate on managing and avoiding risks. None of the project management standards copes with the aspect of uncertainty.

The analytical methods applied provide the backbone for the risk management approaches, and have the benefit of producing an assessment of a known risk situation relatively quickly, including economic measures of gains or losses (Thamhain, 2013).

In a survey of 171 articles in project management published between 2000 and 2010 Zhang summarizes that "risk is epistemologically probabilistic (...). A basic epistemological model in the analysis of project risk is the risk events-consequence link. Risk events stand forall possible events, situations, or circumstances whose occurrence can logically lead to the materialization of a certain consequences. This logic is universal and recognized, and objective and leads to the design of quantitative or semi-quantitative techniques to improve the efficiency and effectiveness of risk analysis" (Zhang, 2011). He states that "identifying and analyzing risks … could negatively influence the process of the actualization" (Zhang, 2011, p. 9).

New information technology systems support project managers in becoming more effective in identying and describing risks analytically (like critical path analysis, earned value analysis, risk-impact matrices, online databases for categorizing and sorting risks, Monte Carlo analysis) all designed to make project-based results more predictable (Thamhain, 2013). Concluding it can be stated that the paradigm of systematic RM is predominantly focused on anticipated risks (Lehtiranta, 2014).

The objective of project risk management is to transfer the uncertainties into project risks in order to make them plannable and controllable (Korhonen et al., 2014; Howell et al., 2010; Yang et al., 2014; Creasy, Anatatmula 2013; Zwikael et al., 2014; Ghapanchi et al., 2012; Krane et al., 2010). To incorporate the uncertainties in project modeling this is done by stochastic networks where activity costs and durations are not deterministic but follow certain probability distributions (Acebes et al., 2014; Jani, 2011).

García-Fernández and Garijo highlight the limits of this approach in dealing with uncertainty. The traditional capital budgeting tools such as NPV or ROI have proven to be suitable enough to value the profitability of projects without uncertainty. The strategy for implementing such projects is completely defined before the start up. "However, these methods fail when they are used to evaluate projects that are subject to significant uncertainties, such as demand, costs and prices, or unexpected events, which can change the course of the project" (García-Fernández, Garijo 2010, p. 464).

Thamhain and Zhang demand a more professional approach in dealing with the hidden, less-obvious aspects of uncertainty, and in proactively coping with risks in the early stages. Uncertainties, ambiguities and risk factors that are often connected. They are non-linear and can develop into issues that ultimately affect the project performance (Thamhain 2013; Zhang, 2014; Fan 2014).

This chapter shows that in the economic theory there is a differentiation between uncertainty and risk, but that there is no differentiation between risk and uncertainty in project management theory. Today´s project management standards offer tools and techniques for risk management. But these methods fail when a project manager is confronted with uncertainty in projects. Therefore today´s risk management in projects is critized as the next chapter shows.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Risk Management in Today´s Project Management Practice

Critique on today´s application of project risk management is formulated as follows: "We suggest that the inappropriate use of project risk management techniques may be part of the problem rather than part of the solution here, and that we need to rethink project risk management from first principles" (Winch & Maytorena 2012, p. 355; Lenfle 2011; Cleden 2009). They critize the strong focus on risks in projects and the neglect of uncertainties. It can be stated that there is no differentation between uncertainty and risk in projects. "There is a tendency to conflate these terms and to use them interchangeably, which in effect means that uncertainty is either treated in the same way as risk or ignored" (Sanderson, 2012, p. 434; Hartono et al., 2014). In addition it is not clear how to manage these unknown-unknowns (Lechler et al., 2012, p. 60).

The main critique is that the positive potentials lying in the uncertainties are not seen with the currently existing approach. Situations of uncertainty are not negative per se. They definitely lead to project changes, but could even to improve the initial value proposition of a project. The potential possibility to improve the value of a project is called 'opportunity'. However the management of opportunities differs from the management of risks. The exploitation of an opportunity requires significant changes that go beyond modifications of a baseline" (Lechler et al., 2013, p. 18; Lehtiranta, 2014; Sanderson, 2012; Perminova, 2008; De Meyer et al., 2002).

The sources of uncertainty can be issues as contextual dynamics, the business or geographic context of the company or its subsidiaries, technical innovations, new norms, laws or regulations, cooperation and contracts with suppliers or third parties, market turbulence, all these are examples of uncertainty sources arising from the broader business and societal environment in which the organization operates (Martinsuo, 2014; Petit 2012). The management of theses contextual uncertainties has an important meaning for the success of a project, which is even more true for the management of megaprojects (Sanderson, 2012).

In reality projects are often separated from the remaining organisation. They are seen as a "lonely phenomenon, with neither history nor future […].The perspective is from the inside […]. In this perspective, the players and actions of the environment do not appear in their own right, rather through their relationship with the project in question. The historical and organizational contexts of the project are taken for granted, or simply not included in the analysis" (Engwall, 2003, p. 793).

Today´s paradigma in Western project management is: the more detailed a project plan the better the control of the project. However, the intense preoccupation with planning is linked to the project failure as detailed, rigid plans are limiting the freedom to make important decisions in projects. In addition it encouraging an attitude "where low level products become ends in themselves, instead of contributing to a greater goal" (Pollack, 2007, p. 271; Eschenbruch, 2013; Grösser, 2011).

This leads to "future outcomes as statistical shadows of the past" (Sanderson, 2012, p. 435; Scheurer & Ribeiro, 2012). Future developments are seen in the light of the past. Uncertainty arises often during the course of the project and not at its beginning. In addition to the traditional approach of project management to put emphasis on assuring conformance to time, budget and scope constraints. Continuous improvement, customer-oriented thinking or reflective learning are often left behind. "This leads to the fact that project companies become less flexible, unable to accumulate knowledge and experience necessary for coping with uncertainty" (Perminova et al., 2008, p.74).

Futher complexity is caused by the contingencies occurring in a project. "Unchecked contingencies tend to cascade and penetrate wider project areas. Contingencies occurring anywhere in a project have

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

the tendency to penetrate into multiple subsystems (domino effect) and eventually affect over-all project performance" (Thamhain, 2013, p. 31; Scheurer & Ribeiro, 2012).

Concluding it can be stated that the straight application of the risk management techniques is not sufficient for adaquately dealing with today´s uncertain project environments.

Exploring the Potential of Uncertainty Management in Project Practice

A stronger focus on the management of uncertainties by the project managers might function as a lens through which one can gain new and important insights (Munthe et al., 2014; p. 214).

However, there is only few research that focuses on the analysis of the potential that lies in uncertainty in projects. Lechler at al. analysed 42 qualitative case studies concerning the potentials of uncertainty in projects.

They show that:

- The opportunities to create additional value for the projects by uncertainty become obvious in the project execution phase;
- Project managers who are able to differentiate between uncertainty and risk in projects will be able to identify new potentials in their projects with a higher probability;
- Project managers with a business perspective are more capable to classify uncertainty appropriately and the potential for increasing the value for a project (Lechler et al., 2013).

As a consequence Lechler demands a new set of business competences for project managers. These competences contain a fundamental understanding of the specific industry branch and the company´s competitive situation to be able to realize new opportunities that emerge in the course of the project. As a consequence the senior management has to give to the project managers more power, to enlarge the capabilities and competences of their project managers and to strengthen the interactions between corporate strategy and project management (Lechler, 2013, p. 102).

Several researchers see the capability to successfully cope with unexpected events as the ability to cope with changes. These project managers seem to exercise the art of 'managing the unexpected' parallel to executing the plan (Söderholm, 2008, p. 81; Thamhain, 2013, p. 29). This corresponds to a set of personality traits of project managers that are able to act both formal and intuitive. These managers are able to lead projects with less data and to rely more on their intuition. (Cohen et al., 2013, p. 83).

Judging the relevance of information is an intuitive process rather than a rational one (Perminova et al., 2008, p. 77) and confirms the need for 'gut-feeling' approaches that can capture weak signals without having a specific focus in mind (Williams et al., 2012, p. 47).

The results demand for a higher appretiation of practical knowledge in dealing with uncertainty in projects. Professional experience is defined as the familiarity with circumstances and procedures. Experience cannot prevent the upcoming of an unexpected event, but can support the appropriate reaction" (Syben, 2014, p. 83).

This capability of identifying new opportunities in uncertainty demands for a different personality of project managers, different competences, organizational flexibility and freedom. Risk managers in projects are typically risk avoidant, conservative, precise and careful. These characteristics are not required when it comes to the management of opportunities. An opportunity manager should typically be open-minded, visionary, innovative, flexible and fast. By comparing these personality types it can be stated

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

that the roles of the risk and the opportunity manager should be carried out by two different individuals in a project. Particularly the opportunity manager should have strong links into the organisation and a deep understand of the corporate strategy and its competitive situation.

This chapter showed that the role of the opportunity manager who identifies the potential lying in project´s uncertainty was so far neglected in project management. The capability to successfully cope with the unexpected corresponds to project managers that are able to act both formal and intuitive and shows the need for 'gut-feeling' approaches.

HISTORICAL EVOLUTION OF KNOWLEDGE

The following chapter shall analyse how the classic concept of knowledge developed and changed its meaning in the course of the last 2,500 years in the Western culture.

Aristotle´s Classification to Knowledge

In ancient Greece it was the aim of the researchers to understand the fundamental laws of nature by mathematics, natural sciences and philosophy.

The ancient Greek formular *panta rhei* ("everything flows") describes the mental attitude of the mindset, first defined by the Greek Heraclitus (535 – 475 BC). The following sentence demonstrates the idea of continuous change: "Everything changes and nothing remains still ... and ... you cannot step twice into the same stream."

This sentence expresses the attitude that everything is always changing following the course of nature. The ideal is to create a mental attitude to cope with the changes. This attitude is very similar to the concept of the Chinese *I Ging* and the Japanese *Hōjōki* which will be explained in a later chapter. However it can be stated that in ancient Greece the people were aware of the continuous change and the resulting uncertainties in life as the logical consequence of the change.

The Greek philosopher and scientist Aristotle (384 – 322 BC) researched in nearly all fields of science as physics, biology, zoology, metaphysics, logic, ethics, aesthetics, poetry, theater, music, rhetoric, linguistics, politics and government and constituted the first comprehensive system of Western philosophy. One of the questions Aristotle tried to answer is the classification in general and of knowledge. In the Nicomachean Ethics Aristotle differentiates between three fundamental approaches to knowledge: *episteme, techné and phrónēsis*.

Episteme means "to know" in Greek. It is related to the scientific knowledge and is universal, invariable, context-independent and based on general analytical rationality.

Techné is the Greek word for craftsmanship, craft, or art. It is the set of principles, or rational methods involved in the production of an object or the accomplishment of an end. Techné resembles episteme in implying knowledge of principles, but differs in that its aim is making or doing, not disinterested understanding. Its characteristic is pragmatic, variable, context-dependent and production oriented. For the ancient Greeks techné was looked at negative when it appeared in art, whereas when used as craftmanship it was regarded positive. Aristotle regarded techné as an imperfect human representation of nature. According to Eikeland, in human relations techné is the mastery of influencing, manipulating, and using other human beings (Eikeland, 2008, p. 98).

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Phrónēsis means prudence, practical wisdom or judgement in English. It´s quality is pragmatic, context dependent, action-oriented and assigned to praxis, or doing. Phrónēsis deals with particulars. According to Eikeland phrónēsis can be defined as an intellectual virtue, being prescriptive, and deliberate (Eikeland, 2008, pp. 97-101). Eikeland sees in phrónēsis aspects of deliberate excellence, critical and situational understanding, quicknesss of mind and cleverness (Eikeland, 2008, p. 103).

Phrónēsis goes beyond both analytical, scientific acknowledge (episteme) and technical knowledge or know-how (techne) as it involves the capability of judgments and decisions made in the manner of a virtuous social and political actor (Flyvbjerg, 2001). He argues that Phrónēsis is an important part of social practice and that the attempts to reduce social sciences to episteme or techne, or to comprehend them in those terms, are misguiding.

Phrónēsis is an intellectual virtue that concerns values and is commonly involved in practices of planning. Therefore, that any attempts to reduce planning research to episteme or techne or to comprehend planning practices in those terms are misguided (Flyvbjerg, 2004).

For the reason of completeness it must be added that Aristotle defined two more competences: sophia (philosophical wisdom) and nous (intuitive mind; rationality). He distinguished sophia and phrónēsis in the way that sophia involves the reasoning concerning universal truths, while phrónēsis includes rational thinking.

In summary it can be stated Aristotle differenciated three fundamental forms of knowledge: episteme (the theoretical know why), techné (the technical know how) and phrónēsis (the practical knowledge).

Evolution of Aristotle´s Concept of Knowledge in the Western Societies

Already since Plato the Western philosophers and scientists are unified by the aspiration to detect the universal truth, where the concept of Absolutism derived from. The emphasis on universality of the modern science and the philosophers' "quest for certainty" however ignored the practical issues in preference for theoretical issues. The pursuit of absolutism and theoretical arguments that lack practicality is one of the main defects of modern philosophy (Toulmin, 1990).

The guiding principle in the West is the mastery of nature, accompanied by the conviction that one can, in principle "master all things by calculation" (Weber, 1919/1988). Thus, the "maturity of mankind" advocated in the enlightenment era, the "disenchantment" of the world (Weber, 1919/1988) was mainly directed to the disenchantment of nature by calculation. Therefore the natural sciences became the model for all sciences.

This development led to the fact that Aristotle´s third principle of practical knowledge *phrónēsis* was neglected and forgotten after more than 2,000 years. The concept of phrónēsis plays no role in today´s social sciences. The core of phrónēsis is the reflexive analysis and discussion of values and interests, which is the prerequisite for an enlightened political, economical and cultural development in any society (Flybjerg, 2012). The concept of episteme is found in the words 'epistemology' and techne in 'technology' and ´technical'. However the concept phrónēsis was neglected as the lack of the word already shows. It can be stated that the modern Western societies do not show sufficient appreciation for practical knowledge. Since the raise of the industrialisation in Europe the third Aristotle competence practical knowledge was delegated to the low appreciated profession of craftsmen. Today practical knowledge is not part of academic education or training.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Summarized it can be stated that Aristotle´s concept of phrónēsis as practical knowledge was neglected by the Western cultures in the last 300 years. This leads to an imbalance between the three classic intellectual virtues in favour of the two knowledge concepts episteme and techne.

COMPARISON OF THE WESTERN AND EASTERN APPROACH TO UNCERTAINTY

The following chapter analyses the differences between the Western and the Eastern cultures in their approaches towards dealing with uncertainty.

Western Approach to Uncertainty

The concept of the Western philosophy can be well described with Aristotle who noted: "But we only deliberate about things which seem to admit of issuing in two ways; as for those things which cannot in the past, present, or future be otherwise, no one deliberate about them, if he supposes that they are such; for nothing would be gained by it." (Aristotle, 1357). It is therefore the "issuing in two ways" or in other words: the uncertainty of the outcome, that challenges philosophers and scientists ever since.

The evolution from the traditional agrarian society to the modern industrial society can be described as the transition from stability and certainty into change and uncertainty. Hallmark of modern societies is the "destruction of the old certainties" (Bonß, 2010) by dissolving traditional communitization, experiences of agricultural and handcraft work (Giddens, 1995; Joas & Knöbl, 2004; Nassehi, 2006; Wehling, 1992).

In Europe, this perspective became the guideline for the behavioral demands of the individuals (Weber, 1919/1988). Economic action particularly relies on the calculation of future developments, thus requiring computability of opportunities and risks on the market. The postulatation of rationality in conduct has a long tradition in the modern social sciences, particularly with regard to dealing with uncertainty. In the economic sciences in particular the researchers focused this aspect with the decision theory under uncertainty. It can be stated that the established theories rally around the poles "mastering uncertainty" and "powerlessness against uncertainty" (Neumer, 2009). However it is the aim of mankind to reach the status of "coping with uncertainty in acting". Whereas the guiding principles of "mastery of nature" and "production of certainty" connected to it have been valued as the comprehensive signum for economically successful human action. Uncertainty received the signum of powerlessness and was interpreted as the consequence of individual resp. collective failure to control the environment.

The industrial societies have developed a great repertoire of strategies to overcome uncertainty. Among the most important are science, technology, and organization. Especially the natural sciences became the epitome of the ability to progressively master the nature's secrets. Technological progress was seen as proof that it is possible to systematically master the given conditions of nature. This is evident in technological developments geared to seal themselves off to a large extent from the potential "risk factor man" (e.g. the autonomous self-driving car). In organizations, companies still follow the guiding principles of Taylorism to largely eliminate the subjective side of the workforce. In this context, uncertainty appears as a deficiency and a disturbing factor that should be eliminated. This can best be effected if the technical and organizational processes are stable and if the internal and external influences are known and can be controlled.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Uncertainty as the lack of security causes a feeling of fear in human beings. Both uncertainty and fear are indefinite feelings without reference to an object or situation. In comparison to anxiety and risk, which both refer to a defined situation (e.g. to fly in an airplane) or a precise object (e.g. dogs) (Hofstede, 2001). Uncertainty is not linked to probability, but risk is linked to probablility. Uncertainty refers to situations where everything could happen. As soon as uncertainty turns into a risk by becoming more concrete and precise and calculable, people lose their fear. Now it is the risk that can become the source for a negative feeling, now called anxiety. Dealing with this anxiety can be trained in routines like driving a motorbike or sporty activities like climbing montains (Hofstede, 2001). Routines are the basis to build up established practices in normal situations (see the checklist procedure of pilotes in airplanes before taking-off). More important routines help people to familiarize with critical incidents (e.g. fire or earthquake alarm) and to react in an appropriate, good-practice standard procedure in critical situations (e.g. Man-Over-Board training in off-shore sailing). This training of routines gives people, and particularly the employees, customers and the senior management of the organisation the certainty to react in the appropriate way in critical situations.

Eastern Approach of Dealing with Uncertainty

One of the pioneers in examining the intercultural differences between societies, the Dutch Geert Hofstede, was the first who defined uncertainty avoidance as one so-called cultural standards. Although his approach is critized as being related to the company IBM, as old-fashioned in its wording and in stereotyping the national cultures, the cultural dimension “uncertainty avoidance” is used also within other cultural theories.

The GLOBE study from 2004 elaborated nine cultural dimensions, one of them named also “uncertainty avoidance”. In this study uncertainty avoidance is defined as “the extent to which a society, organization, or group relies on social norms, rules, and procedures to alleviate the unpredictability of future events” (House, 2004).

The Globe study differentiates between societies that have a high uncertainty avoidance orientation as Germanic cultures, who tend to prevent all sorts of uncertainty in private and business life. In comparison to the Arabian, Chinese and Latin American cultures that tend to be more relaxed towards uncertainty in life as well as in business. This positive attitude towards uncertainty in the Eastern cultures encourages to analyse how the different approaches to uncertainty could develop in the different cultures in the past centuries.

The concept of uncertainty in China is directly linked to ”I Ging - Book of Changes“, a 3,000 year old ancient text and the oldest and most important book of the Chinese classics, also called the “Chinese Bible”. Its fundamental principle is the law of Changes which says that everything is always changing. Influenced by the observation of the course of nature the unknown authors of the I Ging detected that change follows a specific structure. The I Ging is a collection of 64 oracle signs and describes the 64 stages of change between Yin and Yang. In the course of the times the I Ging turned from an oracle book into the book of wisdom as it contains all stages of human life. In detecting the own situation in one of the signs the reader of the I Ging could derive his action and therefore master the specific situation (I Gin, 2006, p. 12). Translated for first time into a foreign language in 1924 by the German missioner R. Wilhelm he stated “what makes the system of thought of this book so interesting is the fact that it takes the fundamental principal from a primitive concept – without being primitive - and developed them

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

further, that is what we Europeans seem to have lost in the course of development." The I Ging had influence on several European philosophers like C.G. Jung and H. Hesse who used it as a guidebook.

The I Ging had a great influence on the two main Chinese philosophies, the Confucianism and the Taoism, both created around 500 BC in China. These two philosophical concepts still represent the basis of Chinese thinking until today. On the basis of the I Ging the Chinese developed a contrary approach in comparison to the Western concept of strategy making: the attitude to take a long view on an opportunity, to carefully observe the environment and the situation, and then to use the appropriate moment (Sun Tzu, 2010; Jullien, 2006).

To better understand the nature of change the Chinese started to observe the changes in nature as shown e.g. in the seasons. On this basis they derived a concept of the patterns of change. This was further developed into a general applicable concept, the so-called Five Elements. The Five Elements is a conceptual scheme developed in the first century to explain the interactions between phenomena. The Five Elements represent a good example for the Chinese approach to dealing with uncertainty by trying to understand the concept that stands behind the changes and deriving a general model. It finds its application in various fields like architecture or medicine which underline the universal concept of the model. It can be stated that the two thousand years of experience give the Chinese people a feeling of security in dealing with uncertainty.

In his "speech in front of managers about the effectiveness and efficiency in China and the West" Jullien describes this approach as thousands of years of experience of dealing with uncertainty, ambiguity, and risk (Jullien, 2006). He states the difference between the East and the West in the way that the ancient Greeks first defined a model, on this basis they defined an objective and then planned to realize the plan. First the model, then the realization of the model, which corresponds to the Western concept of a strong mind to create a plan followed by a strong will to realize this ideal. Whereas the Chinese general approach is to judge and assess a situation particularly concerning its potentials and then to determine what to do next. This approach is by far more variable as the situation can steadily change as well as the environmental factors and the goal that can be reached in the situation. This circumstantial Chinese approach is often misunderstood and misinterpreted by Westerners as being passive and without a specific objective (Jullien, 1999; Jullien, 2006).

As a consequence Qi states in his "Anbang Qi's reflections on David Hillson's Risk Doctor briefing" that Chinese project managers pay more attention to risk management in projects as projects in their nature are uncertain. They put more focus on reviews and the re-planning of the project. It is perceived as the main task of the project manager to manage the changes that originate from uncertainty in order to prevent that they become risks. In Chinese thinking it is the main task of a manager to turn bad external events into good, positive things (and vice versa). According to this idea, all project objectives, project scope, time, quality and cost, are modifiable in the course of the project process. Therefore it is the main task of a project manager to concentrate on the change management to cope with these modifications. In fact Qi states that a project manager should mainly focus on managing the uncertainties, changes and risks. In comparison to the certainties as they do not need to be managed (Qi, 2011).

A further competence in dealing with uncertainty that is more developed in the Eastern cultures than in the Western societies is the capability to cope with ambiguity. The ambivalence of the contrary and the dialectic of the thinking led to the well-developed ambiguity tolerance of the people in China but also in India. Chauhan shows in a study between managers in India and Fiji that the Indian managers demonstrated a higher level of tolerance of ambiguity and greater adaptability to deal with ambiguity and had a greater managerial effectiveness (Chauhan, 2014). First research started in 1995 by analysing

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

the correlation between managerial effectiveness and their level of tolerance of ambiguity (Furnham 1995). These findings could have relevance for human resource managers, particularly in designing training programs for project managers.

The Japanese equivalent to the ancient Greek principle of panta rhei is Hōjōki, an important work by Kamo no Chōmei. Written in 1212, it displays the Buddhist concept of impermanence through the description of various disasters that befall the people of Kyoto. Considered as a Japanese literary classic, the work is part of the Japanese school curriculum. The opening sentence of Hōjōki is famous as an expression of mujō, the transience of things:

The current of the flowing river does not cease, and yet the water is not the same water as before. The foam that floats on stagnant pools, now vanishing, now forming, never stays the same for long. So, too, it is with the people and dwellings of the world.

The similarity to the Greek concept of *penta rhei* and the picture of the river as symbol for change are striving. However it is wrong to derive from the flow of nature the acceptance of uncertainty in the case of the Japanese culture. Japan displays in this concern an exception in the Eastern cultures. Measured in the cultural dimension uncertainty avoidance, the majority of Japanese people show a very high tendency to avoid uncertain situations.

Indicators of this tendency can be seen in the life-long employment policy at the professional level (so-called "shuushin koyou"), in the long-term relationship networks between customer and suppliers (so-called "keiretsu") or in the transfer of employees to the suppliers or to subsidiaries (Berger, 2009). The Japanese society consists of a wide set of complex rules, formal structures and defined rituals in language, behaviour and values, with great impact on business and private life. The reasons for the creation of these strictly ritualized behaviours can only be assumed. Hypotheses say that it could lie in the local hostile environmental conditions like earthquakes, tsunamis and volcano eruptions that created over the centuries the feeling of fear and uncertainty in the people. To survive in this natural environment the people had to co-operate and build up networks to support each other.

However the success of the Japanese motor company Toyota in the competitive global automotive industry shows that it is possible to build up managerial effectiveness and strengths despite a high level of uncertainty avoidance in the national culture. In the 1990s the global benchmark study by the MIT published in the book "the machine that changed the world" (Womack, Jones, Ross 1991) showed the differences in the key performance indicators between the US-American, European and Japanese car manufacturers.

The deeper analysis of Toyota´s production and management system shows that the company´s management puts a lot of effort in its knowledge assets, the so-called Toyota "kata" (translated with "pattern" or "way of doing things"). The kata consist of a set of routines that are daily practiced to improve the corporate quality and efficiency and routines in the dialogue between manager and employee. Toyota´s management stresses the importance of the improvement kata routines for the firm's corporate development as they enable the continuous improvement process and knowledge creation by preserving efficiency and fostering creativity (Rother, 2009; Ichijo et al., 2006). The second element is the so-called "Coaching-Kata". As in sports or music practicing should be done under periodic observation and correction by an experienced coach, who spots old behavior and helps the learner to practice the desired behaviors. Without coaching the learner would not practice the right pattern, or practice ineffectively.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Without coaching, a change of mindset is unlikely to occur. Toyota developed the Coaching Kata is a practice routine for teaching the scientific working patterns like its Improvement Kata (Rother, 2009).

The two katas of Toyota are symbols of the high level of uncertainty avoidance in the Japanese culture. However in comparison to the standardization of the business processes of the Western companies who aim as well to manage the uncertainty in their operations, Toyota developed an approach of standardized routines in solving the daily problems in business operations and in coaching its employees. With these two routines Toyota established a strong organizational culture of improvement, adaptiveness and innovation. With that Toyota built an ongoing, sustainable process of developing scientific skills and mindsets in their people, through the work itself.

Referring to the model of routines to cope with uncertainty it seems that Toyota build a successful approach to turn its cultural weakness of uncertainty avoidance into corporate strengths. By continuously optimizing its two kata routines Toyota developed a unique strategy of leading the employees and solving problems. Since 2008 Toyota is the biggest car manufacturer worldwide in terms of volume and turnover.

This chapter showed that uncertainty is interpreted in Western societies as a lack of security which causes fear. Routines to teach people how to deal with calculable risks and give people the feeling of certainty. In comparison the eastern cultures perceive uncertainty as part of life and therefore developed an attitude and specific strategies to cope with it.

CURRENT TRENDS OF UNCERTAINTY MANAGEMENT IN BUSINESS

The last 15 years since the late 1990s are characterized by the sudden decline of large established companies like Kodak, Nokia or Sony. These multinational corporations failed although they managed their business with all up-to date management tools. Reason for their failure is the sudden success of the so-called "disruptive innovations" of new high-tech products like the digital camera, the smartphone or the MP3 player (Christensen, 2011). A disruptive innovation creates a new need and disrupts the existing market by displacing the earlier technology. These are products or services that the market does not expect. In many cases the disruptive innovations derive from new competitors like Apple or LG or start-up companies that inhabit different internal value networks.

This unexpected success of the disruptive innovations increases the level of uncertainty in the business world. The management style and techniques of the 20th century seem to have reached their limits. The new type of manager that is able to cope with these new uncertainties is the entrepreneur who intuitively applies a new of way of thinking.

Sarasvathy interviewed 27 entrepreneurs and let them solve cases. In this research he detected a new business approach that he called effectuation. Effectuation is a way of thinking that supports the process of opportunity identification and new venture creation. It includes decision-making principles that these entrepreneurs employ in situations of uncertainty, whereas causal reasoning is used when the future is predictable. He defined the following principles of effectuation that are:

- Entrepreneurs start with what they have. They look at who they are, what they know and who they know. They look at the 3F's friends, family and fools. From this point they look at their abilities. The entrepreneur does not start with a given goal, but with the tools he or she has.
- An entrepreneur does not focus on possible profits, but on the possible losses and how to minimize the loss.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

- Entrepreneurs cooperate with parties they can trust. These parties can limit the affordable loss by giving pre-commitment.
- Entrepreneurs look at how to leverage contingencies. Surprises are not necessarily seen as something bad, but as opportunities to find new markets.
- Here all the previous principles are put together. The future cannot be predicted, but the entrepreneur tries to control some of the factors which determine the future (Savasvathy 2001).

It can be stated that the key competence of this new type of entrepreneur is the competence to cope with uncertainty in the way that they seek for the opportunities in situations and have a stepwise, flexible, resource-based, loss-reducing approach. These principles are similar to the attitude of Chinese management described above.

CALL FOR NEW COMPETENCES IN RISK MANAGEMENT

Since the 1980s, a change in dealing with uncertainty is taking shape in the Western societies. Uncertainty is emerging in a new form in those areas where the strategy of elimination of uncertainty had been eminently successful in the past.

Increasingly complex and interconnected technological systems give rise to new imponderabilities due to a great number of internal and external influence factors that are not completely predictable and controllable (Böhle & Rose, 1992; Pfeiffer, 2007; Weyer & Grote, 2012). New models of organization, particularly the decentralization of enterprises, not only lead to a heightened flexibility but also boost the internal dynamics and self-organization. Moreover, with the expansion of services the interface between organization and market becomes fluent, there is a blurring of boundaries and imponderabilities originating from market and customer relations are imported into the organization (Heidling, 2011). Particularly service work with direct contact to customers implies fundamental uncertainties, much more so than production and administration work (Böhle, 2011; Dunkel & Weihrich, 2012).

These trends are apparent in project work as a whole: the more projects differ from a reproduction of the known, in terms of their contents and targets, their procedures, their personal and material resources, their participating partners and the preconditions of their environment and application, the more uncertainty becomes a substantial parameter of project work (Løwendahl, 1995; Shenhar & Dvir, 1996; De Meyer et al., 2002; Sommer & Loch, 2004; Söderlund, 2011). The methods of planning and measurement to evaluate the results seem to be successful if the targets, procedures and the end product can be defined exactly in advance, before the project starts. However, the projects are often very different from its planning because the projects turn out to be much more complex, unpredictable and multidimensional than its planning (Winter et al., 2006). The differences between planning and the realization are most apparent if the project targets are only roughly defined, if the project results are not material artifacts but rather concepts or models comprising different variations, if the measurement of project success has qualitative criteria, and if partners from different cultures participate in the project whose cooperation has to be established mainly by discursive procedures (Atkinson et al., 2006). In these projects, the project management is challenged to develop adequate management forms for dealing with the information gaps and the participants' different points of view and interpretations. Project management prefers the dimension of risk ("known unknowns") to the dimension of uncertainty ("unknown unknowns"). This

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

is often accompanied by an intermingling of the two dimensions, both in project management textbooks and in the project managers' practical action (Lechler, 2013). An important consequence is: since risks are mostly connected to negative outcomes, the positive potential of uncertainties is often neglected (Lechler, 2013). More critical objections to the formally oriented methods of risk management are linked to this observation.

- Because of its strong affinity to planning, project management tends to lean towards routines (risk identification and analysis, monitoring, control) (Geraldi et al., 2010).
- Standardized routines of planning are strongly tied to states known from the past in their scenario drafts, which reduces their prognostic value ("future outcomes as statistical shadows of the past" (Sanderson, 2012, p. 435)).
- Reflexive modes of action are insufficiently developed on the project participants, although these modes of action are especially able to improve the coping with uncertain situations in the course of the project (Perminova, 2007).

Empirical research has shown that purposeful utilization of uncertainty during the implementation of projects can contribute to an enhancement in value compared to the original planning. According to the results, project managers who are able to differentiate between risk and uncertainty will also be capable to identify such positive potentials in projects with a higher probability (Lechler, 2013). In order to make use of these potentials, especially context-related competencies and correspondent problem-oriented modes of action are of vital significance (Lechler et al., 2013; Perminova et al., 2008; Söderholm, 2008; Jaafari, 2003).

Analyses of project managers show that those being capable to integrate the diverse perspectives into their project conception, repeatedly establish shared viewpoints of all project participants in the different stages of the project, "read" situations occurring in the course of the project, deal with the respective preconditions of the political environment, and develop qualitative valuation standards are those to complement the conventional quantitative ones (Winter et al., 2006; Atkinson et al., 2006; Pollack, 2007). In this context a fundamental change of perspectives in project management is called for: from the common "triple constraint management" to a "business value optimization" (Lechler et al., 2013, p. 102).

Empirical findings come from several research projects about the work action of project leaders and project team members (Böhle, 2013; Heidling, 2012; Meil et al., 2004). The statements of the project members (mechanical engineers, electrical engineers) were gathered in two research projects conducted between 2008 and 2015. Among others, the research projects also covered two small and medium-size enterprises in Germany. These SMEs are producing technological goods and services in joint projects with big companies from plant engineering, iron and steel industry, automotive industry and aerospace industry. The empirical results were gained with methods of qualitative social research, with the concept of experience-based action as heuristic instrument. 35 guideline-based qualitative interviews were conducted in addition to several feedback workshops and group discussions.

According to this research project actors are able to cope with uncertainties by means of an experience-based subjectifying mode of action (as opposed to a planned objectifying mode of action). Experience-based subjectifying work action includes the following four dimensions and is illustrated by citations of project managers participating in the reseach (Böhle, 2009; Böhle, 2013):

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

1. *Dialogical-exploratory proceeding* makes it possible to gradually feel one's way and make discoveries within the concrete work process. "In the best case you can just set project milestones [...]. In our case where specific physical conditions must be reached no other proceeding would be possible. There are so many little side conditions that nobody can foresee in advance, no chance".
2. This is accompanied by an *associative metaphorical thinking*: an event evokes associations, images and ideas that show the way to new solutions. "I see it as in a film" or "I not only go through it in my thought, but I put myself in the situation and see things from this perspective"
3. A kind of *sensual perception* related to feeling and sensation permits to integrate sensory impressions as noise, vibrations, atmospheres and moods into the processing of information. This perception comprises all senses and also includes physical sensations: "[...] you have your idea how the production should run. Basically all business processes are the same in all companies, but every company is a little different. This you mus see. You must smell the specific procedures in a company".
4. Finally, a specific *relation to environment* characterized by closeness, attachment and unity. The central feature is the ‚joint action' which includes co-operation with or referring to material objects: "there is a meeting every morning at 9 a.m. No tools. Just: what was finished yesterday? What new problems appeared? There is technical discussion. […] No specific scheme. The discussion is defined by the previous day – what was good, what was bad, what needs improvement? […] This works well for me as I can handle the situation. This is in my head. There is nothing to cross in a paper, no list to check. Just on the basis of the situation which we try to handle".

As a complement to planned rational action which is suitable for successful use in foreseeable tasks, experience-based subjectifying action is particularly suited to deal with unforeseeable situations. This does not mean that the model of instrumental planned rational action is invalidated, but should be complemented by the experience-based subjectifying action.

The authors' empirical findings show that an important competency of successful project leaders is to "see the picture" of the course and results of the project and to "foresee the developments". They typically remark that they "see it like a movie running" or that they "not only play it through in thought but really get immersed in the situation". If customers' requests change during the project, they don't see this as a disturbing factor; they rather say that this is the "nature of things". They have the attitude that what is really needed or suited is often not known beforehand but will transpire in the course of the practical execution of the project. They do not classify deviations from the original project target *per se* as a lack of reliability or deficiency of planning, rather they will check whether there are also positive effects of it. This may refer to the contents but also to the temporal and the financial aspects. Of course, this is never a carte blanche for desultoriness or arbitrariness. Project success can be met by means of conventional planned action, but they may require other procedures and competencies, as shown above (Meil et al., 2004; Heidling, 2012; Pander, 2010; Pommeranz, 2011).

SUMMARY

The aim of management is to build and keep stability in the organisation and herewith to overcome uncertainty. This is done by objectives, standarized procedures and control, which is also applied in project management. The concept of planning and standardization is based on past experience however

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

it reaches its limits by coping with uncertainties in projects. The focus on planning and controlling prevents flexibility to handle the changing circumstances in the course projects which lead to uncertainty. These uncertainties demand for a new type of project manager who not only sees the risks but also the opportunities that derive from uncertainty which demands for a new attitude towards uncertainty.

Project managers are not educated in differentiating uncertainty from risk, neither in using uncertainty and turning it into a project benefit and herewith to increase the project value.

A retrospective view to Aristotle knowledge areas shows that he distiguished between the three main knowledge areas: *episteme* (know why), *techné* (know how) and *phrónesis* (practical knowledge). Where the first two built the basis for today´s education in social, technical and natural sciences, the third competence was neglected in the Western societies. The destruction of the old certainties through the modern industrial societies led to the focus on rationality in mastering the nature and therefore recreating the feeling of certainty.

In comparison to the Eastern cultures that remained in their tradition of coping with uncertainty by accepting the principle of continuous change, observing it and creating a general applicable model of change. Both the Chinese and the Indian societies developed cultural strategies that lead to an uncertainty accepting attitude. Whereas the Japanese society shows high uncertainty avoidance tendency which in the case of the motor company Toyota led to a management routine-based corporate culture of problem solution and continuous improvement.

The rapid technological change of the last 20 years caused by the fast success of disruptive innovations lead to the search for a new entrepreneurial management style that is able to cope with change. This new competence called effectuation enables to deal with uncertainties by seeing the opportunities and approaching them step-wise. This proceeding is similar to the Chinese management tradition.

According to the findings of the authors experience-based subjectifying work proves to be an important strategy for dealing with uncertainty in projects. The four aspects are: dialogical-exploratory proceeding, associative metaphorical thinking, sensual perception and relation to environment. This experience-based subjectifying work competence can be compared with the third traditional Aristotelian competence *phrónesis* (practical knowledge), which was neglected in the Western societies in last centuries.

The authors demand for a holistic approach to deal with uncertainty by referring to strengthening the practical capabilities of awareness, intuition, perception of weak signals and associated intuitive thinking. These capabilities could be interpreted as the third competence category *phrónesis* and should have high relevance for the selection of personnel in project management and designing training programs for project managers.

KEY TERMS AND DEFINITIONS

Episteme: Means "to know" in ancient Greek. It is related to the scientific knowledge and is universal, invariable, context-independent and based on general analytical rationality.

Opportunity: Events, circumstances, situations or conditions that might occur in the course of a project and have a favorable or advantageous impact on a project.

Opportunity Management: The identification, analysis, assessment, planning, monitoring and controlling of opportunites related to a project.

Phrónēsis: Ancient Greek, can be translated with practical wisdom, judgement, or the virtue of practical thought.

Risk: Events, circumstances, situations or conditions that might occur with a specific probability and have a potential negative impact on meeting the predefined project objectives. Risks are to be separated from uncertainty if they are measurable, calculable and predictable.

Risk Management: The identification, analysis, assessment, planning, monitoring and controlling of risks related to a project. Risk management limits the impact of the unexpected events and prevents these events from happening. It is generally assumed that risk management contributes to the success of an undertaking.

Techne: The ancient Greek word for craftsmanship, or technical skills. It is the set of principles or rational methods involved in the production of an object or the accomplishment of an end.

Uncertainty: All unknown or unexpected situations with a potential significant impact on the project. Uncertainties are unknown, not foreseeable and not predictable with the existing set of tools and instruments. Uncertainty has no scientific basis to calculate its probability.

Unknown Unknowns: The not identified facts that a person is not aware of not knowing.

Chapter 74
Entrepreneurial Action as Metaphorical Process and its Metaphorics

Alexey A. Baryshev
Tomsk State University, Russian Federation

ABSTRACT

The objective of this paper is to formulate new approach to entrepreneurship and its result that is challenged by appearance of novel spheres of entrepreneurial activity related to social innovations, social networks, solution for corporate management and people`s wellbeing, production of gadget for precarious wants. These items inspire the study of axiological bases of value created by entrepreneurs. This purpose suggests addressing and revisiting the notions of entrepreneurial action and value. Their complete conceptualization applying to nascent new economy is unlikely to be possible. With this in mind, we focused on searching for metaphors that can cast light on the specifics of newly-emerging phenomena related to entrepreneurial action and value created by it. Using the theory of metaphor, we find that entrepreneurial action is of metaphorical nature itself. In the article, the creation of value is described by means of the transferal of enterprising constituents of entrepreneur's identity onto produced things. We specify these constituents as referred to the different periods of entrepreneurial history. The identification of the constituents was based on the theory of pillars and carriers of institutions by W. R. Scott. The metaphors of appropriateness, utility and wellbeing were proposed for the different periods of the development of value. The metaphor of rhetoric was defined as a root metaphor for all moduses of entrepreneurial action considered as a process of convincing on the value of things produced. Special metaphors for entrepreneurial action for each period of value development were also proposed. The metaphor of performative rhetoric was considered as shedding light on dominant modus of entrepreneurial action and modus of value under conditions of knowledge society.

INTRODUCTION

Entrepreneurship is a phenomenon that is difficult to describe with terms of static reality so it must be treated as a dynamic process. With this in mind, the use of the movement metaphor with its well-known aporias is also relevant. In fact, viewing the entrepreneurial process as a manifestation of movement of economy underlies the most prominent twentieth century achievements in comprehending both entrepreneurship and economics as a whole.

Considered metaphorically, movement means communication of the present and future. The entrepreneur causes a new reality to emerge. This reality represents a modification of the former reality performed by selecting and implementing one of the numerous opportunities. Most definitions of entrepreneurship aimed at capturing the essence of entrepreneurial movement are confined to revealing these alternatives. The essential divergences in authors' views are found in their approaches to identifying the nature of opportunities and the mechanism of communication of the present reality with the future reality, which is created as a result of employing one of the opportunities.

Two basic concepts have been developed to address the nature of opportunities, viz. the objectivist and subjectivist concepts. Advocates of the objectivist concept claim that the role of the entrepreneur is to reveal the available but still unnoticed opportunities (Shane & Venkataraman 2000, p. 220), which is possible due to the entrepreneur's distinctive feature, i.e. alertness (Kirtzner, 1973, p. 67; Foss & Klein, 2010). Representatives of the subjectivist concept are focused on the subjective nature of opportunities, which are created by the entrepreneur (Alvarez & Barney, 2007).

The issue of connection of the future and present realities is raised with two essentially different approaches (Burrell & Morgan, 1979, pp. 10-20), which can be defined as constructivist and regulative approaches. According to the constructivist approach, the image of the future is exogenous in relation to the present. It is obvious that creation of such future requires searching for relevant resources. In this context, an objective, which determines the process of resource supply and impact the process as a cause, emerges. S. Sarasvathy employs the term "causation" to define this type of relation (2001).

In fact, causation is typical of the bureaucratized mechanism of business planning that functions and reproduces itself in a certain institutional environment of corporate capitalism. However, the logic is also inherent to entrepreneurs, especially those of them who developed in such an environment. This situation confirms the principles of institutional isomorphism (DiMaggio & Powell, 1983).

The logic of causation is based on "…fantasy that entrepreneurship — and, more broadly, creativity — can be systematized... that success in the startup game can be not only taught but rationalized, made predictable…" (Lewis-Kraus & Gideon, 2014).

In this paper, we do not provide a detailed analysis of the technological, social, economic, and political conditions that justify and facilitate the emergence and distribution of the stated logic; however, we should emphasize the fact that in the framework of this logic, opportunities are secondary in relation to a particular objective embodied in a project of obviously constructivist nature.

Another logic, i.e. the regulative approach is endogenous in relation to the present reality and driven by abstract idea (viz. the idea of profit that is made from what is available at the moment) rather than by particularly imagery of the desirable future. In this case, any new properties of the available resources or new properties of the available elements of the external environment metamorphose into opportunities. If the focusing on discovery of new properties of capital facilitated the achievements of the modern Austrian economic theory followers, then focusing on market environment is typical of both early Austrians and most of entrepreneurial theories that consider capital as an inherent market economy phenomenon. The

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

marketing practical orientation of economics also permeate the works of sociologists whose studies lie in the framework of the environmentalist and especially populationist approach (Hannan & Freeman, 1977).

Accounting for all the differences in focusing, in the first case on heterogeneous resources in the entrepreneurial organization, and on parameters of the market environment – on the second case, the focal points have one common feature, which is the fact that entrepreneurial activity is considered as routine work on constant redefinition of properties of the internal and external resources as well as updating new ones (previously neglected). Put in other terms, this is a work on constant reshuffling (Lachmann, 1956: 13) of resources and producing of subjective judgments (Foss, Foss & Klein, 2007; Foss et al., 2006). The logic, objectives and images of the future are extracted from the present reality by the entrepreneur and defined as "effectuation" by S. Sarasvathy. The directions of activity are identified by means of routine practices of searching for prospects with the present reality. This approach, based on a continuous flow of practices, appears to be prospective, especially if it is focused not on external or internal conditions of entrepreneurial activity, but on its product regarded as the outcome of the functioning of the entire network locked into this product. This view was proposed by M. Callon and his colleagues and is being developed by them within the economics of qualities (Callon, Meadel, & Rabeharisoa, 2000). However, it vests the entire network and all its heterogeneous participants with agency, which makes it impossible to overcome uncertainty of such a personage as the entrepreneur and to solve the classical problems related to domain of entrepreneurial studies. Yet we assume that endowing the whole network with properties (e.g. an ability to create value), traditionally ascribed to the entrepreneur, is the most interesting aspect of the concept and forestalling for subsequent definitions of entrepreneurship.

Thus, the constructivist and regulative approaches demonstrate opposing views on the entrepreneur and his function. Under the constructivist approach, the entrepreneur is perceived as a hero, demiurge, and star personage, who can withdraw from business and delegate the current operations to hired managers soon after launching the project. Conversely, the regulative approach based on effectuation makes the implementation of the entrepreneurial function an integral and permanent component of the narrative regarding the operating business. It is important that this function is not rigidly bound with the nominal entrepreneur as it occurs in the constructivist interpretation. The regulative interpretation reveals the endogeneity of entrepreneurship in relation to an operating enterprise as well as the embeddedness of entrepreneurship in the organizational body of business. The former and the latter contribute to expanding the subject scope of research problems of entrepreneurial studies and enhance their relevance to the actual needs of business community and society. Consequently, scientific discourse is complemented with issues regarding the nature and formation of the entrepreneurial team, unproductive entrepreneurial activity of members of the entrepreneurial organization, intrapreneurship, searching for hidden and unused resources, etc.

The literature review carried out reveals that emphasis on the dynamic nature of entrepreneurship, incorporating the expressed and implied metaphor of movement, makes it possible to identify essential distinctions within the phenomenon of entrepreneurship. These distinctions are related to discovery and creation of entrepreneurial opportunities (Casson & Wadeson, 2007), effectuation and causation as styles of the behavior of entrepreneurs in different conditions (Dew et al., 2015; Brettel et al., 2011), the role of risk and uncertainty in business (Klein, 2008) and led to appearance of numerous scientific schools developing the Austrian economic theory (especially, its latest radical subjectivist version), the strategic theory of the firm, the population and selection theory and many others appeared on the basis of these distinctions.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Referring to entrepreneurship as a crucial factor for economic growth and change, the metaphor of movement creates grounds for researchers to study the "windows of opportunities", through which resources and activities are allotted and which impact the rates and meanings of made transformations. However, the metaphor of movement, being a means of connecting the present reality with the future, cannot extend investigation beyond the frames of the metaphorical level of cognition. The reason for this is linked to the fact that one of the poles of such a connection (viz. the future) is not reality and, in fact, appears to be a metaphor because endowing the future with ontology is metaphorical ipso facto. Furthermore, this cyclic metaphorics results in a metaphor again. In this case, it is the metaphor of creativity. Entrepreneurship based on the metaphor of movement is endowed with the power to create a new reality. Studying entrepreneurship in framework of creativity terms leads to the fusion of categories of entrepreneurial activity with definitions of human activity *in abstracto*. Consequently, the phenomenon, which is responsible for social and economic dynamics, is deprived of its sociohistorical distinctive features and works as a special extra-historical and extra-social force, steered by overall principles of creativity and activity as such. This situation requires deploying metaphors of entrepreneurship, which (at the pre-theoretical stage) would manifest the general image of entrepreneurship as a unique dynamic social phenomenon and characterized not only by uniform differentiation between the present and future, but also by ontological and structural differentiation, which accentuates its properties as a special type of social action.

Hence in next sections of the paper we address the following questions:

1. What metaphors constitute the general image of entrepreneurship?
2. What metaphors can identify modes and means of activity of the entrepreneur as special social actor?
3. What metaphors of entrepreneurship and methods of achieving its goals can facilitate the conceptualization of the modern distinctive features of entrepreneurship?

Due to their rhetorical nature, metaphors maintain a certain perception of a subject under study and conceal its properties that do not belong to the created zone of clarity (Lakoff & Johnsen, 1980: 13-15). Therefore, not appropriately chosen metaphors can deprive a phenomenon under study of its specific features, which are currently important. Other metaphors can serve as "ontological windows" (Mäki, 2001) that make it possible to objectify a phenomenon, denoted by contemporary discourse, or to frame the perception of this phenomenon due to the discovery of the structural similarity of internal properties of the studied object and properties of already known objects.

This paper considers the metaphorical nature of entrepreneurial action, i.e. the orientational, ontological and structural metaphors of entrepreneurship and metaphors for value created by entrepreneurs under different historical conditions. The study of these metaphors is timely in the context of the obvious need for comprehending the conceptually new forms of entrepreneurship emerging these days.

METAPHORICITY OF ENTREPRENEURIAL ACTION FROM PRAGMATIC PERSPECTIVE

As it was previously stated, the cluster of pre-theoretical representations of entrepreneurship, composed of metaphors of movement, creativity, invention, etc., instills the creation of concepts that are deprived

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

of any social content. In fact, this social content is reduced to human activity in general. L. Von Mises, for example, considered this reduction not to be a disadvantage but an advantage within his understanding of entrepreneurship (Mises L., 1998, pp. 1-3).

It is necessary to note that the reduction of the essence of entrepreneurship to universal definitions of human activity is often performed ahead of the definitions of human activity, which are derived from the multitude of realia, actually existing at the given stage of the history of human society. For example, the popular contemporary metaphors of creativity such as "creative destruction" (Schumpeter, 1994), "imagination" (Shackle, 1979), "empathy" (Chiles et al., 2010), "team work" (Alchian & Demsetz, 1972) had been adopted for scientific use before the entrepreneurial realia started to universally correspond to the phenomena, denoted by those metaphors. This predictive ascription of features becoming attributes of any human activity to entrepreneurship is manifested through heroisation of entrepreneur and endowing him with special cognitive abilities, which are not so conspicuous in the activity of other professionals (Foss & Garzarelli, 2007). However, in any case reductionism deprives entrepreneurship of its social content, turning the categories of entrepreneurial action into anticipations of new definitions of the essence of human activity per se.

Analyzing the dialectics of equating entrepreneurship with human activity, it is possible to note two opposing methods of implementation of this process in various social and historical conditions. The methods are based on the fact that metaphors are capable of successful migration between the definiendum and definiens. At the beginning of the capitalist era naturalization of entrepreneurship was based on applying the metaphor of human activity to it, then, in the course of transformation of entrepreneurship into a regular phenomenon - i.e. the "common sense" of the contemporary society, the reduction assumes an opposite character, viz. entrepreneurship itself turns into a common metaphor encompassing any activity (Szeman, 2015). This is another example of the "cyclic" metaphorics, where the poor choice of metaphor brings the researcher not to the trace of concepts, but to the further metaphorical representation.

In fact, the classical theory of metaphor does not sufficiently serve the purpose of breaking this circle and distinguishing metaphors, leading to conceptualization of an object, from metaphors, generating circles of autoreference (MacCormac, 1985, pp. 46-50). For this purpose, it is required to resort to metatheory, which is, according to MacCormac, is semantic theory (1985, p. 50) that appeals to objects themselves and interactions among people related to those objects. According to Ch. W. Morris, this theory, which extends beyond semantics as relation of the sign (in our case, metaphors) to the object, including relation of these signs to the activity of subjects interpreting them, appears to be pragmatics (Morris, 1938). Pragmatics implies research of signs with regard to their involvement into the world of human values, in which human activity evolves. Here, the frames of the theory of metaphor cease to work because it developed as a linguistic theory with the cognitive science and computer science as being its adjacent areas and scope of implementation. Areas, close to metaphor research - such as the theory of frames - also have their origins within linguistics, cognitive psychology, and research of artificial intelligence. However, theorists of metaphorics highlight the metaphorical character of not only the language and consciousness but also of the action. For instance, Lakoff and Johnson specify that "… since metaphorical expressions in our language are tied to metaphorical concepts in a systematic way, we can use metaphorical linguistic expressions to study the nature of metaphorical concepts and to gain an understanding of the metaphorical nature of our activities…" (1980, p. 8).

Unfortunately, the capacity of those areas of knowledge, which are engaged in the theory of metaphor, is insufficient to analyze the "metaphorical nature of our activities". Therefore, this "nature" (under another label) is studied by other sciences, where human action and related meanings are a special object

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

of the analysis. Here we mean the research on practices that include daily routine activities, and where the main focus of researcher is on the transfer of the sense (literal meaning of the word "metaphor") of one action onto another action and simultaneous creation of a new sense. Here, we again arrive at the theory of frames, theory of practices, phenomenology, and actor-network theory that ensures the "action by network" by means of action translation from one actant to another.

Thus, entrepreneurship cannot be comprehended on the basis of syntactic sciences (studying relations between signs), nor can it be comprehended within semantics (relation of signs to objects, which are isolated from human activity and values generated by it. The first generates tautologies; the second breaks the perception of an object into a set of metaphors (for example, entrepreneurship "as" an occupation, entrepreneurship as a social group, etc.), which are applicable to nearly any activity. Respectively, entrepreneurship cannot be comprehended out of its pragmatics that demands transition from the abstractions of "entrepreneur" and "entrepreneurship" to the action behind them. For this reason, the term "entrepreneurial action" has been actively incorporated into the recent studies (Forsell & Paloniemi, 2010; Johannisson, 1989; McMullen & Shepperd, 2006; Berglund, 2005; Klein, 2008; Kato & Wiklund, 2011).

In the rest of this section we will limit ourselves with the case of contemporary Austrian economic theory. Dissatisfaction with the description of entrepreneurship through its functions without due understanding of how these functions are implemented has led representatives of this school to the need for a definition of what encompasses every-day entrepreneurial practices in comparison to projection, management, calculation practices, etc. Without this, the entrepreneur would act as an incidental character responsible only for launching an enterprise, after which the entrepreneur is dissolved in the figures of the manager or the owner. L. Lachman brought the entrepreneur back to the everyday life of the enterprise using metaphor of reshuffling to designate his routine actions (Lachmann, 1956: 13; Chiles et al., 2010, pp. 22-26). Subsequent Austrian studies developed this metaphor by linking it to the heterogeneity of properties of the capital exploited in business (Foss et al., 2007; Agarwal et al., 2009).

According to the Austrian approach, the concept of capital does not reflect physical properties of things, but rather shows various alternative areas of their profitable use (Foss et al., 2007, pp. 1169-1171). Discovery of a new line of business in the course of the enterprise's current activity and introduction of this line into production process affects the relations of property and related contracts. Revision and change of these relations and contracts, which lead to emergence of a new combination of resources, is beyond the management scope and requires an entrepreneurial solution. Therefore, perpetual reshuffling and subjective judgement linked to discovery of new properties of capital and their constant recombination are the entrepreneur's constant and routine operations. If they are performed by the manager, it means that the manager does the work of the entrepreneur.

The disadvantage of the approach to entrepreneurial action based on the metaphors of judgement and reshuffling lies in the fact that they remain within syntax and semantics, disregarding the valuable specifics of this action. Implementation of the pragmatic approach with its inherent axiological methodology, compared to the typical of the Austrian school praxeological methodology, arrives at the paradox that considering entrepreneurial action in the light of value metaphorics metamorphoses this action into a metaphor itself. In other words, entrepreneurial action is metaphoric because it itself is a process of transferring properties of some unclear objects ("reshuffling", "subjective judgement", "discovery", "creative disruption"," entrepreneurial organization of heterogeneous capital, etc.) to other equally fuzzy objects (viz. prices, profit, cost, interest rates and so forth).

With this in mind, understanding the essence of this transfer is impossible without new metaphors. The same difficulty, which Lakoff G. and Johnsen M. connected with the paradoxical definition of the

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

concept of metaphor occurs "…when the scientific subject matter is metaphor itself, it should be no surprise that such an enterprise has to make use of metaphor, as it is embodied in the mind, to construct a scientific understanding of what metaphor is" (Lakoff and Johnsen 1980). The situation, confronted in the course of implementation of pragmatics in the research of entrepreneurial action, differs from the regular autoreference that is commonplace for its description within the framework of syntax and semantics.

In this case, the "entrepreneurial action" as a metaphor is not just an image or designation of some object, but a "practical metaphor" or expression of the real process of transferring properties from one object onto another. This situation can be defined as internal metaphoricity of entrepreneurial action. This is an important provision, which is reflected in the currently experienced linguistic and phenomenological turns of the economics and studies of entrepreneurship (Berglund, 2005; Klamer, 2007; Klamer & Leonard, 1994; Steyaert, 2004; McCloskey, 1998; Felin & Zenger, 2009).

One of the initiators of this turn D. McCloskey notes that the language of the theorists of economy and entrepreneurship is metaphorical (the human capital, for example) as well as the language of actors involved, by means of which they prove, formulate, and put into practice their actions (McCloskey, 2007: 1-3). The second situation, which should be especially emphasized with regard to the metaphorical essence of entrepreneurial action and expanding our idea of metaphor in general, consists in the fact that the metaphor represents something third in relation to both the considered object, and an object, whose properties are transferred onto the considered object. Metaphor is not an object serving as the starting point for research, but rather its image – from the perspective of metaphor as a linguistic phenomenon – and a cognitive action of transferring this image for the purpose of cognizing the studied object – from the point of view of metaphor as a cognitive instrument of knowledge.

This provides us with a new view on entrepreneurial action as a metaphorical action, which, alongside the cognitive action, represents the process of transferring properties from one object onto a new object and thereby gaining new properties. We will lay aside for a while the arising difficulty related to defining the poles, between which this action revolves. However, we will concentrate on the action itself, assuming that detection of these poles is part of the disclosure of the metaphorical nature of action. In this regard, first of all, we will remember that from the pragmatic perspective, any action of man is connected not merely with meanings and notions but also with values. The axiological nature of this approach (compared to the syntactic and semantic approaches) means that it is impossible to completely encompass entrepreneurial action in terms of purpose-driven rationality. The latter approach actually treats entrepreneurial action as action subordinated to a definite purpose, that is to say, gaining profit. However, it forgets that profit is a value, and it is not endowed by nature; on the contrary, it can only be generated in the process of transferring properties, which does prove to be entrepreneurial action itself. It turns out that according to its metaphorical logic, entrepreneurial action is simultaneously the process transferring properties and the process of creating a new value. This is an obvious contradiction and relevant metaphors are required for conveying this. So, from a large realm of metaphors related to entrepreneurship we ought to select and formulate those with axiological nature and that are able to reflect the intrinsic process of sense-making as universal base for value-creation.

All metaphors grasp and represent - as an object (objectivize) - the properties, which are due to be cognized with help of an image of the object, which has already been predefined and used as a template. There are three types of metaphors appropriate to our search. They are orientational, ontological and structural metaphors according to Lakoff G. and Johnsen (1980). The orientational metaphors illuminate spatio-temporal characteristics of an object. The ontological metaphors grasp objects, events, actions, or states as entities thus isolating object under consideration and familiarize with them within a certain

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

frame designated by predefined object as a ready cognitive pattern. The structural metaphors focus on design of an object. If this object presents a process the metaphor shows its stages and the transformations of a content caused by it from the perspective of the template.

The specific of use of metaphors as pre-theoretical instrument of cognition is in that they often are not objects as such, but their concepts from various sciences. For example, G. Morgan considers sociological, philosophical and psychological concepts of accomplishment, enactment, sense-making, instrument of domination, reification, alienation as metaphors for organization (Morgan, 1980). Having this in mind, we can come over to the metaphorics of entrepreneurship which shall correspond, we hope, to its value and pragmatic paradigm. This metaphorics we designated could be named for brevity as *where-mephafors* for ontological metaphorics and *what- and how- mephafors* for ontological and structural metaphorics correspondingly.

WHERE-METAPHORS: ENTREPRENEURIAL ACTION AS THE PRACTICAL METAPHORICAL PROCESS OF SPATIOTEMPORAL TRANSITION

The holistic image of entrepreneurship developed gradually, beginning with simple metaphors related to the focus and location of actions to be performed. Metaphors of this type still form the basis of business terminology. Before metamorphosing into the regular terms, the words "adventure", "expedition," campaign", and similar ones were intended for the spatial and temporal separation of the source of the merchant's profit from the place of life, customary for people of traditional society, and the expression of the principle mediation of the process of gaining profit (for example, by designing a plan, or a project). The contemporary words "enterprise" and "entrepreneur" are also etymologically related to relocating the action into some future reality. The metaphors underlying them are not yet capable of expressing the own ontology of entrepreneurship and are focused on the distinctions of this phenomenon from its predecessors.

The distinctive feature of the first group of metaphors, within which any new social phenomenon manifests itself, usually refers to the class of orientational metaphors (Lakoff & Johnsen, 1980). These metaphors indicate the position of the given phenomenon in relation to the understandable and customary and include such metaphors as "post-Fordist worker", "higher education", "political superstructure". Despite their superficial nature, the orientational metaphors of entrepreneurship helped to form the first fundamental concepts of economy based on entrepreneurship.

Among these phenomena, it is important to mention the concept of comparative advantages and the concept of the different time value of goods. According to these theories, the source of surplus value is discrepancy in productivity under different technological or geographic conditions (spatial transition) and abstinence from consumption and roundaboutness of production (temporal transition). Consequently, we observe here the "weak" interpretation of entrepreneurial action, which is typical of these theories. The function of entrepreneurial action here is restricted to transferring what has already been potentially created to a place in time or space where it is more valuable. Time and space themselves are endowed with value-creating properties. The entrepreneur – through his action – merely facilitates these properties to come into practice.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

WHAT-METAPHORS AND THEIR EVOLUTION

A more profound entrepreneurship metaphor is the metaphor of "mistery"[1] which was applied to occupations based on special professional skills (smithcraft, gold-work, fictile craft, etc.). Under conditions of dominance of recipe knowledge, creation of a higher value as a result of performing routine actions in accordance with carefully prescribed rules were perceived as a miraculous action with mystic rites and ceremonies. Here, it is important to emphasize that the metaphor "mistery" endows the process of creating value with its own ontology; in contrast to the widespread orientational metaphors associated with the movement "out of", "forwards" or "towards", the process of creating value is enclosed here within the action itself, and not within the circumstances of its place and time. Transition from recipe to scientific knowledge does not abolish the mystical nature of value creation; on the contrary, it strengthens this nature. For instance, now these are the engineering activities that are understandable, not even ritually related to the world of values, and performed according to the laws of science; but they result in something that has nothing to do with science, viz. value, which has no matter of nature or engineering. This metaphor appears to be especially relevant under conditions of knowledge society; when entrepreneurship, dealing with high technologies, creates high value of the produced things based on their increased complexity. However, technical complexity and value still remain heterogeneous entities.

Now then, things (and the special features of such things as business plans, financial reports and calculations, marketing questionnaires, bank accounts, etc.) do not disable the fact that they are simply things and instrumental manipulations with them, being involved in entrepreneurial action, become intermediaries in the process of creating a completely different phenomenon, i.e. value. Using objects of the physical world in order to obtain a supernatural effect is a characteristic feature of magic. From this point of view, entrepreneurship acts as an everyday practical magic, creating this pretersensual thing termed "value".

The ontological metaphor of magic introduces entrepreneurial action into the discourse of axiology. It opposes the world of values to the world of physical actions and things, and points to the existence of a special transition between them, through which entrepreneurial action translates natural properties of the goods involved into social properties, such as the value categories of economy (Baryshev & Barysheva, 2016a).

From the ontological perspective, this metaphorics is far from analogizing entrepreneurship to a dangerous journey in a hostile environment with the key metaphor of risk being engaged – a metaphor included in the cluster of orientational "adventurous" metaphors of entrepreneurship. The difference here consists in the fact that "magic" focuses on discovery of significant definitions of entrepreneurship within the action itself, whereas "risk" tends to search for outside the action. Undoubtedly, risk is present in entrepreneurial activity but, under the contemporary conditions of knowledge society as society of total risk, the amount of risk in entrepreneurial activity is not higher than in any other human activity. A special right for the risk of entrepreneurs of the era of a rise of contemporary economy was absolutized by writers and theorists of the contemporary economy, predominantly with the aim of glorifying its main character, who ran his business in the environment of adverse relics of traditional institutions and still absent market institutions designed to guarantee contracts and ensure business protection.

In the light of the metaphor of magic, the entrepreneur is deprived of direct contact with the external environment and does not have the ability to directly create value. The risk accompanying entrepreneurial action lies specifically in the principled mediation of the process of creating a new or additional value by means of perfectly controlled things. However, any mundane and seemingly dependable thing, acting as a

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

"representative" of the entrepreneur in the creation of value, appears to be a "traitor" a la Latour. As part of entrepreneurial action, the following three similar mediations can be distinguished. First, "interface" in the form of mental (verbal) or - under contemporary conditions - mathematical and computer models of the process of profit-making. Second, these are procedures and operations, the rule-based application of which should ensure real value creation with help of the existing "interface". These two mediations were characteristic features of all the periods of entrepreneurial activity development. However, under modern conditions, they have been significantly modified by a new mediation, which is associated with the effect of an "interpretative loop" (Baryshev & Kashpur, 2017). This phenomenon consists in fact that the entrepreneur does not deal with things and procedures directly, but predominantly with their interpretations created by his employees.

Subjected to the effect of an "interpretative loop", the entrepreneur increasingly deals with mental abilities of his employees, who now discover and interpret properties of the elements of capital themselves. As a result, instead of the former physical reality of his enterprise, which he exclusively interpreted for the purpose of generating his subjective judgments and performing reshufflings, the entrepreneur now faces its numerous interpretations performed by his intellectual workers such as programmers, financial analysts, designers, marketing managers, HR-specialists, employee advocates, quality control analysts, and others. Representing the subjective judgments of the modern enterprise employees, these interpretations are transfixed with personal intentions of these creative workers with their new personal qualities, viz. nihilism, opportunism, cynicism, idle talk and curiosity, which entered into production, became a professional qualification, and were put to work (Virno 2004, pp. 85-93). As we see, the risk of uncertainty becomes an internal property of entrepreneurial activity. All this has far-reaching consequences, which we do not study in the framework of this paper. We can only note that the effect of the interpretive loop significantly changes the metaphor of magic. Now the entrepreneur is a magician who finds himself inside the magical reality he created. This magic of the magic or double magic compels us to search for new metaphors of entrepreneurial action, which appear to be a further development of the idea of the dual nature of the reality operated by the entrepreneur.

This duality (the up-to-date version) is that now "dependable resources" are becoming rather independent and manipulations involving them are increasingly unpredictable in terms of their value effect. This situation changes the very image of value, at which the entrepreneurial action is aimed. In the period of physical capitalism (Lash, 2007) this value was economic value a la economic determinism by Polanyi (1947a; 1947b) and the social relations generated during its creation were of instrumental and secondary character. This is how capitalism worked and works as a system of production of economic value. In modern capitalism "relations" move forward from background increasingly becoming the object of the entrepreneurial activity. It is this that made capitalism metaphysical (Lash, 2007).

Currently, in order to avoid being strangled by the interpretative loop, the entrepreneur must, firstly, create a new value of his intellectual resources by ensuring their compatibility and designing unique combinations (networks) integrating these intellectual resources (the brightest examples are networks created by Steve Jobs, Bill Gates and other founders of intellect-based enterprises). Then, enterprises become the holders of "sustainable competitive advantages" (SCA) (Srivastava, Franklin & Martinette, 2013; Peteraf, 1993), which sources are defined as so-called VRIN-resources (Barney, 1991; Kozlenkova, Samaha & Palmatier, 2014). "VRIN" implies valuable, rare, inimitable, and non-substitutable properties, which can characterize only unique combinations of human mental models. (Foss et al., 2008). Copying these combinations is impossible for rival companies at a particular moment.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Being a participant of a network that he has created, the entrepreneur becomes a subject of the processes of self-creation as well as creation ex nihil (virtually, from "relations" or "networks"). Thus, self-creation and network creation of value are transformed into the new ontological metaphor of entrepreneurship. The role of one of the poles of this process from the value side is assumed by social value ("social entrepreneurship"[2]), and on the part of disposable things and direct manipulation of these things, the role of the other pole is performed by "auto entrepreneurship" as an activity of investing personal qualities in a business project as a self-increasing network. New axiological meaning of this kind of networks and their historical specifity is the domain of the how-metaphors of entrepreneurial action to be considered below.

HOW-METAPHORS OF ENTREPRENEURIAL ACTION AND VALUE GENERATED BY IT

In order to approach to conceptualization of entrepreneurial action it is not enough to analyze it as process of value-creation even though we have grasped all material instruments and procedures of these processes. Callon and Muniesa consider value-creation as result of the work of calculative devices (2003). The study of idiographic practices of calculation in this context is very important for the comprehension of certain form of value, but we are interested in historical distinction of this axiological phenomenon. We strive to understand what namely is subjected to the process of metaphorical transferal and how this transferal is carried out rather than what is used for making value-formation visible and how it is applied. Therefore, it is the axiological nature of value, the track of which we hope to get on with the help of how-metaphors for entrepreneurial action. These structural metaphors ought to be found for main structural components of entrepreneurial action. So, this metaphorics is focused on the core enterprising property of entrepreneur, the immediate process of this property`s agency, the result of this agency and the process as a whole unifying these components. All these elements are characterized by how-specifics, viz, what property of entrepreneur does make him able to create value? How does entrepreneur perceive conditions, which he is immersed in? What is the meaning of his activity in certain social circumstances? How do the results of this activity behave or what is the modus of their agency?

For the sake of brevity, we put the following provisions as axioms. First, the social properties of product cannot help bearing the traces of its creator`s social traits. Second, taking into account that society functions by virtue of distributed knowledge, to which axiological knowledge of values also belongs, value-creation cannot be merely the process of transferring properties of a creator, but a process of convincing the receivers (customers and clients) of a thing he has produced of its value. "To convince and to prove" turns to be the main motto of a value-creation action. Third, from axiological point of view, the process of value-creation has different forms depending on each society's specific ways of convincing people of the value of a good or service.

In compliance with these provisions, we address firstly the working properties of entrepreneur. Ordinarily, in the early modern period, entrepreneurship is an institutionalized phenomenon. So, the social identity of entrepreneur can be analyzed in the context of the institutional theory which singles out the regulative, normative and cognitive bases (pillars) of institutions (W.R. Scott, 2008, p. 51). It allows identifying the corresponding properties of entrepreneurial identity. Thus, the regulative basis, represented by coercive mechanisms (laws, rules, assignments and sanctions), determines the status distinctions of economic actors. Hence, entrepreneurs' status is a regulative property of their identity. The normative

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

basis shapes in general economic actor as a bearer of a social role which personifies for entrepreneur in particular economic norms (interest rates, prices, etc.) and determines his behavior in market, i.e. normative, environment. Except his status and role, entrepreneurs have their inherent self (Berglund, 2005, pp. 35-36) or subjectivity (Szeman, 2015, pp. 475–476.), which provides the implementation of status assignments and runs role behavior. With the cognitive base of institutions playing the dominant role, subjectivity can become an autonomous feature of the entrepreneur's identity whose activity unfolds loosely in networking with subjectivity of other actors passing by regulative assignments and market norms. Being particular constituents of entrepreneurial identity, subjectivity, role, and status co-habit within it simultaneously, but in different rates depending on the certain social conditions. From here, the variety of metaphors for an entrepreneur belonging to the clusters of role, status and subjectivity or personality arise, e. g. innovator, merchant in the First Guild, charismatic leader, correspondingly.

As for the functioning of immediate process of an entrepreneurial action and the result of it, they can be described with different modi of rhetoric stemming from verbal rhetoric as their common root. Thus, a status-based entrepreneurial action creates authorized value by convincing consumers of the fact that goods comply with regulations establishing what a good befits their state. In addition, all price proportions are kept in place in accordance with the stable order of goods which is sacralized and sustained by secular and ecclesiastical authorities. So, the most suitable metaphor for value in these circumstances is appropriateness. It illuminates the axiological properties of traditional values and does not allow to extrapolate views engendered by industrial society beyond its boundaries. Further, metaphors for an immediate activity under these conditions turn out to be the verbal rhetoric (literally proving that thing is befitting one`s state by words) and institutional rhetoric (that refers to authority and commanding assignment that is habitual up to now in industries under the strict control of a government, e.g. pharmacy).

When driven by the normative pillars, role-based entrepreneurial actions create a type of value known as market (economic) value through convincing buyers of the utility of offered things. It is obviously that utility is a metaphor and even a synonym for value here. Utility becomes to play this metaphorical role when traditional order of the social world ruins and status absence of the alternativeness of goods disappears. The new society requires complex means making possible to produce equivalent replacements of some goods to others or their combinations within the relatively stable continuum of wants and needs. Comprehensive commodity exchangeability obtains its metaphorical substantiation in utility. The functioning of utility as a base and measure for value supposes possibility of single space for commensuration of all goods simultaneously which implies at least preservation of their qualities unchanged during the time sufficient for this commensuration[2]. It is possible to be under conditions of the relatively slow rates of requalification a la Michel Callon. A metaphor for the immediate activity in the case of the entrepreneurial action under these conditions is the reified technological rhetoric which substantiates value (and utility that is the same here) of goods with the help of arguments embodied in technical matching and affordance of things (Baryshev, 2017) in processes of production and consumption and by means of the persuasiveness of calculative devices (Callon & Muniesa, 2003).

Entrepreneurial actions, based on the cognitive "pillar" which includes personal knowledge, preferences, tastes, life styles are totally driven by subjective constituent of entrepreneurs` identity and addresses outright other people`s subjectivity. In this case value generated by such entrepreneurs ceases to have its axiological meaning as means for the maintenance of humans` life but is aimed to their lifeworld directly.

So, [in the late capitalism] the very humans` lifeworld commences to be the object of entrepreneurial constructionist activity. The most appropriate metaphor for value generated in this context is wellbeing[4]. It permits to gain much broader comprehension of humans` identity than above mentioned metaphors of

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

appropriateness and utility because the very base of these notions (appropriateness to what? utility for what?) is open for transformations put into practice by entrepreneurs now. This makes impossible to use appropriateness and utility as meaningful metaphors for value. This axiological shift of entrepreneurial action`s objective from the production of means of living to creation ways of life shapes new views for economy, e.g. economics of meaning (Karlsson, Loewenstein & McCafferty, 2004), economics of happiness (Weimann, Knabe & Schöb, 2015).

The cognitive base of this economy emancipating subjectivity from role and status limitations allows to create any network configurations of mental models of creators in the process of entrepreneurial action and thus generate the perpetual flow of innovations which in turn engenders new configurations of people`s subjectivities within their new lifeworlds and lifestyles. In this economy entrepreneurs convince of value of their results such as "solutions" for unfolding new lifestyles on the base of new devices or digital platforms for unwinding social networks by performative properties of their social action.

Thus, the immediate entrepreneurial action is metaphorized as performative rhetoric that can be understood as convincing of value of new social object by self-involvement into it[5]. Otherwise stated, entrepreneurial action convinces people to assume a certain lifestyle as a part of their lifeworld by constant support of the proposed lifestyle on the base of the unique network of entrepreneurs` team which is enacted into the total network of new lifestyle due to the "locking dog" ("device", "platform", or other solution as algorithm PageRank in the case of Google) that underpins the lifestyle considered and locks its total network. However, it is not the "locking dog" itself that endues networks with social value. It can merely be something that is social value *in potentia* as, for example, man power is economic value *in potentia* as in the case of "physical" capitalism. In a similar vein, for the conditions of cognitive capitalism desired *proto-value* is the unique primordial network of subjectivities (mental models of initial creators and their successors) created by the entrepreneur. So, the secret of a perfomative rhetoric is in that primary entrepreneurial network functions within the total network of generated lifeworld, i.e. value *in potentia* unfolds into a reliable social network object, which exhibits real social value for all the participant of the network as well as outer beneficiaries.

Aforesaid allows to identify how-metaphors for wholeness of entrepreneurial action under domination of the considered institutional bases. They are implementation – for regulative base, reification and alienation – for normative one and enactment for the condition of social life based on entrepreneurial subjectivity.

CONCLUSION

New phenomena in entrepreneurship and social properties of products they deliver go beyond the terms of utilitarian logic which served a reliable ground for economic thought and entrepreneurial studies since the rise of industrial society. Now it is necessary to find new metaphors and built concepts on their base in order to describe and comprehend knowledge society with its gadgets and social network which are precarious in the terms of utility. Thus, in the first place these metaphors and concepts are meant to express axiological nature of the nascent world and its habitant including entrepreneurs who during last 200-300 years were responsible for creation not only economic value, but also moral values.

Inspired with this challenge, we addressed the metaphorics of entrepreneurial action and have found that it is of metaphorical nature itself. It creates value by transferring sense and enterprising properties of entrepreneur`s identity onto produced things. It is an answer the question about the specific instruments

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

of entrepreneurs` job. Entrepreneurial status, role and personal subjectivity are those instruments. By means of each instrument one can create only particular modus of value. So, status facilitates to produce value that can be metaphorically grasped as appropriateness; role is meant for making utility; subjectivity, when it acts beyond status and role restriction, engenders network of lifeworlds and can be metaphorized as wellbeing. Corresponding metaphors for agency of enterprising properties of entrepreneur as instruments of his action are implementation (of assignments) and verbal justification (rhetoric) of the appropriateness of goods to the status of buyers; reification and the use of things` rhetorical power of persuasion of utility; performativity and conviction of wellbeing ensured by complex network objects supported by constant entrepreneur`s involvement into it.

This metaphorics of entrepreneurial action sheds light on specificity of entrepreneurships under the condition of arising knowledge economy and of the forms of value relevant to it. However, knowing that all constituents of entrepreneurial identity co-exit side by side, but in different proportions, we must be aware of axiological complexity of this economy and variety of the moduses of entrepreneurship within it.

Chapter 75
Knowledge Leakage when SMEs Participate in Supply Chains:
What Is It About and How Can It Occur?

Lena Aggestam
University of Skövde, Sweden

ABSTRACT

The advantages of sharing knowledge when participating in a Supply Chain (SC) are well established in the literature, but the challenge of knowledge leakage, and how to manage it, is still in its infancy. In order to increase the understanding of knowledge leakage, when SMEs participate in SCs, this study describes types of knowledge that may leak away, how they are valued, and how knowledge leakage can occur. The result includes two frameworks that also have shown to be potentially useful for examining the maturity of a specific SME with regard to knowledge leakages when participating in the SC.

INTRODUCTION

In order to remain competitive, knowledge is a critical resource for all types of companies, not least for small and medium-sized enterprises (SMEs) (e.g. Blomqvist, Hurmelina and Seppänen, 2005; Nunes, Annansingh and Eaglestone, 2006; Annansingh, 2012). Modern organizations must be proficient learners in order to survive. "The ability to learn faster than your competitors is your only lasting competitive advantage" as put by a HR manager in Sweden. Knowledge Management (KM) and Supply Chain Management (SCM) are two management concepts that aim to support the company in its efforts to efficiently meet the requirements of a fast changing world, in order to be competitive.

Creating value through supply chain integration has become a potential way to improve and secure a competitive advantage (Li, Ragu-Nathan, Ragu-Nathan and Rao, 2006). A Supply Chain (SC) includes tangible resources and assets, as well as intangibles, such as knowledge (Wu, 2008). The consequences of knowledge sharing and knowledge creation are tangible and include improved employee and customer satisfaction, as well as an enhanced image and increased share valuation (Coulson-Thomas, 2004). "Knowledge is becoming the only resource capable of offering competitive advantage and continued

growth and prosperity for supply chain partners" (Wu, 2008, p. 241). This means that to achieve the goals associated with collaboration, for example, in SC, knowledge sharing is needed (Ritala, Olander Michailova and Husted, 2015). When working in a SC "… knowledge or experience leaking away from its origin may lead to a loss of competitive advantage for an organization" (Mohamed, Coles, Mynors, Chan, Grantham and Walsh, 2007, p. 456), but it can also be positive, in the form of knowledge spillover between cooperation partners (Ferdinand and Simm, 2007). Accordingly, organizations that are parts of SCs need to be aware of and prepared for knowledge leakage and its consequences for the collaboration and the business. This takes us back to KM.

Successful KM that contributes to improved organizational effectiveness requires that the appropriate knowledge is provided to those that need it, at the right time (Jennex, Smolni and Croasdell, 2007), and includes knowledge reuse and learning, i.e., knowledge creation. Accordingly, KM work in SMEs concerns "… the processes and structures provided in SMEs to support different knowledge processes, such as transfer, storage and creation." (Durst and Edvardsson, 2012, pp. 879-880). Already in 2001, McAdam and Reid (2001) stated that KM was developed in and for large organizations to be subsequently applied in SMEs. Eleven years later, Durst and Edvardsson (2012) conclude that little has happened and that there is still a strong need for more research on KM in SMEs. However, despite the need of KM processes related to knowledge leakage and the fact that KM processes have intensively been studied, the study of knowledge leakage appears to be underdeveloped (Parker, 2012; Ahmad, Bousa and Scheepers, 2014; Durst, Aggestam and Aisenberg Ferenhof, 2015).

The goal of this study is to spread further light on knowledge leakage when SMEs participate in SCs or, more precisely, *what types of knowledge may leak away, how they are valued, and how knowledge leakage can occur*. From the perspective of the framework, proposed by Durst et al. (2015), to organize knowledge leakage research, this paper contributes to the conceptual "Interaction" domain. Furthermore, the paper´s scope is in line with the research directions proposed by Durst and Edvardsson (2012), in order to develop a greater understanding of knowledge management in SMEs. The paper uses the recommendation of the European Commission and defines a SME as a company that employs fewer than 250 persons and has an annual turnover not exceeding 50 million euros or an annual balance sheet not exceeding 43 million euros (the European Commission, 2003).

This paper aims to further increase the understanding of knowledge leakage when SMEs participate in SCs, and hence contributes to more efficient SCM as well as increased knowledge concerning knowledge leakage. To achieve this goal, an extensive literature review and an empirical study have been conducted. The empirical study included five SMEs and was performed as qualitative deep interviews. The results of this paper are

- A framework describing what types of knowledge have the potential to leak away when a SME participates in a SC and how SMEs value these different types of knowledge leakage
- A framework describing how knowledge leakage can occur from a SME when participating in a SC.

The work also shows the potentials for using the developed frameworks as analysis tools for examining the maturity of a specific SME concerning knowledge leakage when participating in a SC.

The paper is organized as follows; the next section briefly discussed the related literature. Then the method is described, followed by a section where the results are included. Finally, we present the conclusions as well as the theoretical and practical implications.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

SETTING THE SCENE

This paper aims to spread further light on knowledge leakage when SMEs participate in SCs. In this section, we briefly set the scene with a short introduction to SCM and knowledge leakage, and characterize SMEs in order to further explain why they cannot be considered as "little big firms."

Supply Chain Management (SCM)

The management concept Supply Chain Management (SCM) aims to increase collaboration in which the sharing of knowledge is critical. Companies that cooperate through the sharing of knowledge can achieve advantages, such as increased innovation possibilities (Brusoni, Prencipe and Pavitt, 2001). SCM concerns steering supply chains from a holistic approach that includes the material and information flows between companies (Mattson, 2012). SCM is based on partners working together to streamline and improve their supply chains' competitiveness (Fawcett, Ellram and Ogdene, 2007) and emphasizes the importance of integrating the own company flows with partners in the SC. Today, the competitive situation is more about competition between supply chains rather than between companies (Björklund, 2012 and Singh, 2011). Therefore, companies must develop deeper relations with both suppliers and customers (Hadaya and Cassivi, 2009; Mattson, 2012). "This implies that the SC strategy needs to incorporate several solutions each appropriate to a specific product or market condition and this concern both the supply, operating and distribution parts of the SC strategy." (Hilletoft, 2009, p. 17). Hence, knowledge about customers' needs and satisfaction, the market and the suppliers is critical. The driving force behind this is to improve capacity and to be more competitive, in order to meet increased market demands, such as those posed by global competition, outsourcing and the increased level of customer-specific products (Hadaya and Cassivi, 2009). Hadaya and Cassivi (2009) describe knowledge sharing as a possibility to route and steer SC processes and hence achieve a better position. Sufficient knowledge sharing is the most critical success factor for SCM (Hadaya and Cassivi, 2009; Ke and Wei, 2007).

Knowledge Leakage

Knowledge leakage is closely related to knowledge sharing, which concerns an individual´s willingness to share with others his/her created or acquired knowledge (Bock, Zmud, Kim and Lee, 2005). Accordingly, in sharing knowledge intentionally, there is also a risk for unintentional knowledge sharing, i.e., knowledge leakage. Knowledge sharing concerns sharing knowledge strategically and deliberately, while knowledge leakage is an unintentional activity (Ritala et al., 2015) not sanctioned from the strategic level. Frishammar, Ericsson and Patel, (2015) define knowledge as "…the loss of knowledge intended to stay within a firm´s boundaries" (Frishammar et al., 2015, p. 85), which also emphasizes the unintentional aspect. This definition suggests that knowledge leakage can comprise both the core knowledge and the non-core knowledge of a firm. Anand and Goyal (2009) stress that the difference between knowledge leakage and information leakage is primarily that the former puts a stronger emphasis on the core resources of companies. As mentioned above, knowledge leakage, in the sense of knowledge leaking away from its origin, can occur in different situations and be positive, when the organization benefits from it, or negative, when it is detrimental to the organization (Mohamed et al., 2007). This clarifies that knowledge leakage does not necessarily have a negative connotation. In collaboration, for instance, positive knowledge leakage can occur in the form of knowledge spillover between cooperation

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

partners (Ferdinand and Simm, 2007). On the other hand, negative knowledge leakage can occur when, for example, an actor, intentionally or not, leaks knowledge about the local firm to another firm/ actor.

Two types of knowledge leakage can be identified (Durst and Aisenberg Ferenhof, 2014):

- When an employee resigns or is dismissed from a company and takes certain knowledge with him/ her,
- When knowledge is shared/leaked to others, but also still remains in the firm.

The second type is the focus of this paper. From the perspective of SMEs participating in SCs, we define knowledge leakage as "… the extent to which the focal firm's private knowledge is intentionally appropriated by or unintentionally transferred to partners" (Jiang, Bao and Jiang, 2013, p. 984). It concerns the interactions between SMEs and their suppliers and customers, through whom knowledge can also be spread outside the supply chain (Coles, Walsh, Mynors, Grantham, Chan and Mohamed 2006). Similar to large companies, SMEs need to achieve efficiency in their supply chain collaborations. Since how well suppliers and customers are performing affect a company's competitiveness, there is a need to create efficiency through coordination (Singh, 2011). Valkokari and Helander (2007) argue that supply chains, through which SMEs often interact, are hierarchical with a large global company that sets the terms. This illustrates that SMEs have less room to maneuver, compared to larger companies, and therefore also have other prerequisites.

SMEs

SMEs cannot be considered as "little big firms", since they differ from large companies in ways other than size (Coyote, Ricceri and Guthrie, 2012). For example, aspects such as the way in which knowledge resources are managed (Hutchison and Quintas, 2008) and how they work with performance measurements (Hudson, Smart and Bourne, 2001) are different, compared to larger companies. Furthermore, there are also differences regarding innovation; SMEs tend to focus more on incremental rather than progressive innovations (Oke, Burke and Myers, 2007). To sum up aspects that distinguish SMEs from larger companies we use the list from Hudson et al., (2001, p. 1105):

- Personalized management with little devolution of authority;
- Severe resource limitations in terms of management and manpower, as well as finance;
- Reliance on a small number of customers, and operating in limited markets;
- Flat, flexible structures;
- High innovatory potential;
- Reactive, fire-fighting mentality;
- Informal, dynamics strategies

Furthermore, McAdam and Reid (2001) argue that SMEs generally do not focus on achieving organizational improvement through strategic planning, but choose to concentrate their resources on their customer markets. The approach taken is the result of informal and dynamic processes in which decisions and actions are integrated (Coyte et al., 2012) and that control is achieved through informal and frequent interactions (Davila, 2005). KM work and processes are no exception. The lack of KM processes in SMEs makes them more sensitive to knowledge leakage. In addition, both management and employees

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

do not adequately understand the importance of knowledge for maintaining competitiveness, as well as for development and survival in the market place (Nunes et al., 2006). Furthermore, companies do not apply any systematic effort to identify and protect their knowledge (Ahmad et al., 2014). Compared to larger companies, SMEs are more exposed to knowledge leakage and are also more vulnerable to the negative effects that can occur (Nunes et al., 2006). This is not surprising, since SMEs are characterized by having more limited resources (O´Gorman, 2006; McAdam and Reid, 2001). Hence, it is especially critical for SMEs to work with knowledge retention (Durst and Aisenberg Ferenhof, 2014). Furthermore, Nunes et al., (2006) argue that the vulnerability of SMEs is due to the fact that they generally do not work with knowledge retention processes, or use KM-strategies, and that they also have a high staff turnover. The need for SMEs to have a KM-strategy, in order to manage knowledge leakage, is clear (Annansingh, 2012).

RESEARCH METHOD

To achieve the aim of further increasing the understanding of knowledge leakage when SMEs participate in SCs, we have conducted a qualitative study that includes both theoretical and empirical data. A literature review creates a firm foundation for theory development (Webster and Watson, 2002; Forsberg and Wengström, 2013). Hence, the result from the literature review formed the basis for the empirical study.

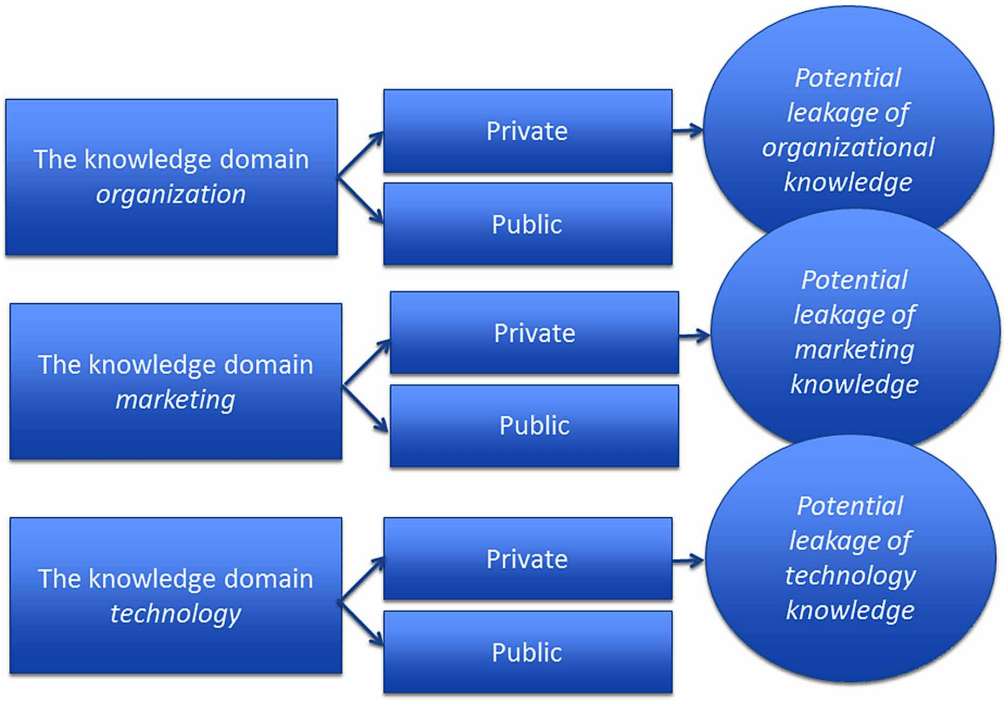
The analysis tools, evolved from the literature review and used when analyzing the empirical data, are described below. After that, a short description of the empirical study, and the included respondents and companies, is given.

The Analysis Tools Developed from the Theory

Based on the literature review, two analysis tools, for use in the empirical analysis, were developed. The aim of the first tool was to examine types of knowledge leakage when SMEs participate in SCs and the aim of the second tool was to examine how knowledge leakage may occur when SMEs participate in SCs.

Analysis Tool 1: Examine Types of Knowledge Leakage

Previous research shows that SMEs are more sensitive to the negative effects of knowledge leakages than large companies (e.g. Nunes et al., 2006). The negative effects of leakages can result in reduced opportunities for innovation, loss of competitive advantage and revenue, damaged reputation, and reduced productivity and efficiency (Hamel, 1991; Heiman and Nickerson, 2004; Ahmad et al., 2014).



In strategic alliances, such as SCs, knowledge sharing includes both public knowledge, which is non-exclusive, meaning that both partners can access and use it, and private knowledge, which is exclusively owned by the focal firm (Jiang et al., 2013). Knowledge sharing in SCs includes both explicit and tacit knowledge and "… the sharing of such tacit knowledge across organizations becomes an important activity." (Wu and Lin, 2013, p. 672). However, based on the definition of knowledge leakage in this paper, the focus here is on leakages of private knowledge. Today, private knowledge is the most important strategic source of competitive advantages (e.g. Grant 1996; Grant and Baden-Fulle, 2004; Jiang et al., 2013). Therefore, to achieve sustainable competitive advantage from sharing tacit knowledge, "…

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

organizations should intensify their search for ways to achieve effective knowledge sharing and to prevent the loss of knowledge during the sharing process." (Wu and Lin, 2013, p.681).

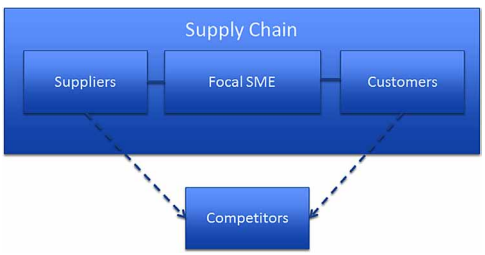
Based on existing research, we have developed an analysis tool (Figure 1) for use in the analysis of the empirical data, in order to examine what types of knowledge leakage SMEs participating in SCs experience and how they value them. "Obviously it is important to examine what knowledge can relate to in an organization." (Beijerse, 2000, p. 166). From this perspective, Beijerse (2000) shows the usefulness of the three knowledge domains: organization, marketing, and technology (Nonaka and Takeuchi, 1997). The knowledge domain *organization* concerns aspects such as management, policy, culture, personnel, internal processes, alliances and teamwork; the knowledge domain *marketing* focuses on competition, suppliers, customers, markets, target groups, consumers, clients, users, interested parties, sales, after sales, trade and distribution, and relations management; and the third knowledge domain *technology* concerns knowledge of products, research and development, core competencies, technological development, information and communications technology, as well as product development and assembly (Beijerse, 2000). From a SCM perspective, these knowledge domains cover the whole SC and its management, where the marketing domain focuses on the SC, the technology domain on the enablers and the organization domain on the management perspective. Hence, these knowledge domains have been used as a base when developing the tool. Further reasons for choosing these domains are that they embody the type of knowledge leakage that can occur in this context, without being too detailed, and that they are based on Nonaka and Takeuchi (1997), who are often referred to in the KM area and have shown potential for being useful (Beijerse, 2000). Since the focus is on leakages of private knowledge, the analysis tool must admit to separate between private and public knowledge and accordingly this perspective is included. The developed analysis tool is presented in Figure 1.

Figure 1. Analysis tool for examining types of knowledge leakage when SMEs participate in SCs

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

This analysis tool was used when the empirical data was qualitative analyzed in order to examine and understand what types of knowledge have the potential to leak away when a SME participates in a SC and how SMEs value these different types of knowledge leakage.

Analysis Tool 2: Examine How Knowledge Leakage can Occur



Knowledge leakage can occur from a company to its suppliers and customers, as well as to the company's competitors (Cole et al., 2006). This can happen through informal meetings or when staff feels pride and enthusiasm in a new idea or product (Ritala et al., 2015). The risk of knowledge leakage increases, for example, when a strategy for knowledge sharing is missing (Ritala et al., 2015) or if the knowledge management strategies are not anchored among the company's employees (Annansingh, 2012). Unclear or overlapping organizational boundaries, as well as ICT tools, are other reasons for knowledge leakage (Annansingh, 2012). The increasing use of Internet-based applications in the form of social media also increases the risk of knowledge leakage. With respect to knowledge type, IT has different capabilities (e.g. Blodgood and Salisbury, 2001; Nonaka and Takeuchi, 1995) and two generic capabilities can be identified (Hansen, Ireland an d Hoskisson, 1999):

- Codification of knowledge, and
- Network creation.

Knowledge codification and storage is more appropriate for explicit knowledge, while network creation, as a means of enabling people to share their knowledge directly, is more appropriate for tacit knowledge (e.g. Davenport and Prusak 1998; Blodgood and Salisbury 2001). From the perspective of sharing tacit knowledge through ICT, a key is the degree to which tacit knowledge can be captured and transformed into explicit knowledge (Gore & Gore, 1999). This can be compared to one of the knowledge conversion modes in the learning spiral of Nonaka and Takeuchi (1995). However, in the effort to codify tacit knowledge, its critical components can be lost, and actual knowledge can also be more easily imitated by external entities/organizations (Blodgood and Salisbury, 2001). This means that potential knowledge leakage through ICT tools is more relevant for some types of knowledge.

SCM concerns steering supply chains from a holistic approach that includes the material and information flows between companies (Mattson, 2012) and the importance of developing deep relations with both suppliers and customers is clear. Potential situations illustrating how knowledge leakage may occur when SMEs participate in SCs, as described in the literature, are analyzed and summarized in a conceptual model (Figure 2). This model is used as an analysis tool in the empirical study.

Figure 2. Analysis tool for examining how knowledge leakage can occur when SMEs participate in SCs

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

This analysis tool was used when the empirical data was analyzed in order to examine and understand how knowledge leakage can occur from a SME when participating in a SC.

The Empirical Study

The empirical study consists of five in-depth interviews with four CEOs and one Site Manager from five different Swedish companies. The work with developing the interview guide was based on the literature review and our aim to examine what types of knowledge may leak away, how they are valued, and how knowledge leakage can occur. The interviews were semi-structured to allow for in-depth supplementary questions to the answers (Lantz, 2013). Therefore, the interview guide was structured into five question areas: Introduction, Collaboration in SCs, Knowledge, Knowledge sharing, and Potential risks with knowledge sharing. The interviews, which were performed in March 2015, were recorded and the relevant parts, from the perspective of the goal, were transcribed and sent back to the respondents, in order to validate their correctness.

The following five companies and respondents were included in the empirical study:

- Company 1 is a furniture manufacturer in a small Swedish town. The company produces custom-adapted office furniture and its headquarters and production facility are situated in the town of origin. Besides office furniture, the company also manufactures furnishings for reception areas, conference environments and lounge rooms. The company is a family-owned business with approximately 70 employees and an annual turnover of approx. 100 million SEK. The objective is to triple its turnover within three years, by investing in and developing three market areas:
    - The domestic market (Scandinavia)
    - The European market
    - The Asian market.

The company has recently invested in a new factory in the same town and expects to increase the number of employees to 100 at the end of the year. The respondent is the company´s CEO who has also been an owner since 1983. The interview was conducted in the company´s main office.

- Company 2 is a furniture manufacturer in a small Swedish town. It has always been family-owned and is now being run by the third generation. The company's offices and production facility are situated in the town of origin. Their focus is manufacturing tables and chairs using wood as the core material. The company's products are mainly oriented towards domestic environments, but during the past few years, it has worked towards public environments. Its markets are in Sweden, Norway and Finland. The company has approximately 20 employees and an annual turnover of approx. 32 million SEK. The respondent is the company´s CEO, a position held since 1995. The interview was conducted in the company´s main office.
- Company 3 operates in two small Swedish towns. Its production consists of making metal cuttings in cast iron, steel and aluminum and includes, for example, links to 4-wheel drives, main bearings, engine manifolds and industrial robot parts. In one of the towns, the company also does prototyping. Its customers are in the automotive as well as telecommunications industries, amongst others. The company has approximately 120 employees and an annual turnover of approx. 392 million

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

SEK. The company is part of a concern, which has 1200 employees and an annual turnover of approx. 1,5 milliards SEK. The respondent is the company´s site manager, a position held since September 2014. The interview was conducted in the company´s main office.

- Company 4 is a family-owned business in a Swedish town. Initially, production consisted of copper jugs, kettles, buckets, etc. Since the 1920s, the company has manufactured stainless steel products and is today an expert in this field. Its product line consists of customized ventilation, heating and sanitation items, but also handles subcontracted parts for industrial use, as well as large kitchen fittings. Two thirds of the company´s production consists of its own products. Its largest customers are in the food and pharmaceutical industries. The company has approximately 100 employees and an annual turnover of approx. 145 million SEK. The respondent is the company´s CEO, a position held since taking over from his father in1989. The interview was conducted in the company´s main office.
- Company 5 was founded in a Swedish town. As part of a global group, which has 18 sales offices and five production plants worldwide, the company develops and produces quick coupling solutions. The total number of employees for the group is approximately 550, of which approximately 280 are based in the Swedish town where the company was founded. The company has five main production areas: hydraulics, high-pressure hydraulics, fluids, medium pressure, breathing air and multi-couplers. In addition, the company is quality and environmentally certified according to ISO 9001 and ISO 14001 and has an annual turnover of approx. 575 million SEK. The respondent, whose grandfather started the company, is the firm´s CEO, a position held since 2011. The respondent is the third generation leading the company. The interview was conducted in the company´s main office. The reason for including this company in the study, despite it having 280 employees and an annual turnover of approx. 575 million SEK, is that its growth has occurred relatively recently.

RESULTS

The empirical study confirms the theory embedded in the analysis tools and has added some new aspects. First we describe what the qualitative analysis of the empirical data has shown for each company, and secondly we describe types of knowledge that may leak away, how they are valued, and how knowledge leakage can occur. The descriptions also include the first versions of the two frameworks in the form of the accordingly updated analysis tools.

The Empirical Result

The following section presents the results for each company. Citations from the respondents have been translated from Swedish and are written in italics.

- Company 1 collaborates with suppliers in joint product development and in outsourcing elements and parts to collaborative specialist partners. The company has experienced knowledge leakage several times, both through suppliers and customers. The respondent also highlights that the potential negative effects of such leakage are the loss of competitive advantages and revenue. As a concrete example, the respondent describes how the company shared product drawings with one

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

of its suppliers, who in turn sent them to competing companies, in order to acquire new customers and thereby increase its own revenues. Another example, not limited to its collaboration in a SC, is in connection with an exhibition abroad. A competing company took pictures of the company´s furniture, despite it being forbidden, and started to produce copies of the furniture. The competitor located production in low-wage countries, which meant the copied products could be sold for a lower price. Consequently, the competing company gained customers that Company 1 had hoped to obtain. Although aware that knowledge leakage can occur in collaborative relationships, the company does not use formal agreements when it collaborates with others. This is because developing these agreements is time and resource intensive. The respondent instead means that both his company and the cooperating enterprise benefit from and are thus dependent on such cooperation continuing. However, there are exceptions. For example, it happens that the company uses formal agreements when customer orders are of considerable value or highly complex. The company is open about the design and construction of its products, since it is necessary for the marketing process, but has chosen to blur details of the products before posting pictures and drawings on its website. The respondent believes that this will hamper plagiarism. Product development and product knowledge are critical for the company, i.e., the technological domain (our remark). However, from the perspective of the technological domain, the machines used are not unique in the furniture industry; instead it concerns the skills and knowledge of the employees. "*It would be devastating if they stop.*" From the perspective of the company´s ability to grow and develop, the aspects of customer contacts and marketing have also increased in value. The respondent values technological knowledge leakage as the most critical one to protect against.

- Company 2 has widespread collaboration with suppliers and customers. A current example is the interaction with a large retailer to establish the look of the range in 2020. Knowledge is crucial for the company and the preservation of employees' knowledge is "*…a key issue for survival*". Culture and employees are highlighted as being very important. The company's core competence resides in its knowledge about the manufacture of wooden furniture and its unique knowledge concerning a special surface treatment and the manufacture of specially designed fittings. This knowledge makes the company competitive and is something it does not share outside the company. As such, this knowledge can be compared with private knowledge in the technological domain (our remark) and is also the type of knowledge that the respondent, together with organizational knowledge, values as the most critical to protect. The company does not consider knowledge leakage as a risk and, consequently, there are no discussions concerning what knowledge to share and what knowledge to protect. The respondent considers that he is a person with an open attitude, which is also reflected in the company and its collaborative relationships. This means that the company does not conceal any knowledge or information from its partners in the supply chain. However, during the interview, it became obvious that there is critical knowledge, which gives the company competitive advantages, that the respondent does not want to share, or lose through leakage. Our interpretation is that the company has not previously, to any great extent, considered the potential risks with knowledge leakage. The respondent also explains that he sees it as a matter of course that the company's subcontractors resell solutions they have developed together. However, with respect to a surface treatment for a linoleum table that the company is trying to develop in cooperation with a subcontractor, the respondent explains that this would mean a competitive advantage and, consequently, does not want it spread. The company has not experienced any adverse effects linked to knowledge sharing and cannot speculate on what it would mean if the company

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

were exposed to knowledge leakage. Based on the respondent's answers to other questions, our interpretation is that knowledge leakage of the company's technological expertise could result in negative effects, such as loss of competitive advantage and revenue.

- Company 3 interacts with both suppliers and customers. It also has bigger customers that require the company to use subcontractors assigned by the customer. In such cases, the customer assists the company in establishing a cooperative relationship. Such cooperation may involve reducing processing times and streamlining manufacturing together with the customer and supplier. The company also has some collaboration with other suppliers, in addition to those specified by the customer. The respondent explains that the company has not experienced knowledge leakage. Notably, the respondent has only been the company´s site manager since September 2014. The respondent elaborated explaining that the leakage of the technological knowledge of metal spraying would be very undesirable. Speculating on the negative effects this would mean for the company, the respondent acknowledged; "*…it would mean the nail in the coffin here*", since the company would probably lose more business and thus revenue and competitiveness, which, according to e.g., Hamel (1991), Heiman and Nickerson (2004) and Ahmad et al., (2014) are two of the negative effects of knowledge leakage. However, the respondent argued that the financial requirements in themselves are a protection against plagiarism of the plant, since it will require an investment of approx. 35 million SEK. Knowledge of the company's core machining and metal spraying process is of great importance. The metallic spraying process is invaluable for the company because it makes the company unique and contributes to competitiveness. Hence, the respondent considers technological knowledge as the one most critical to protect. Regarding the other two domains, organizational and market-oriented knowledge, the company, according to the respondent, does not have any unique knowledge and thus protecting these domains is not important. The company´s organization is not formed in any unique way and its market is open and mainly consigned to the Internet.
- Company 4 collaborates with both suppliers and customers in SCs. "*If companies do not cooperate today, it is devastating*", according to the respondent. In the collaboration, the respondent emphasized the importance of mutual trust and transparency and, for example, their use of the concept "co-supplier" instead of "subcontractor". For the company, knowledge of all the three domains, organization, marketing and technology, is critically important. The respondent argued that employees, customers and production are needed in the right combination for the business to be unique and successful. It is important to protect all knowledge that is coupled to these areas against leakage. The respondent regards knowledge leakage as a risk. If knowledge of the company's customers and products were distributed to another similar firm, it would mean devastating consequences for the company. Company 4 both produces its own products and outsources its capacity to other manufacturers, i.e., acts as a subcontractor. This means that the company can share its production knowledge with these manufacturers and at the same time become inspired and "steal" smart solutions that are embedded in the customers´ products. This is something the respondent emphasizes as a concrete advantage when cooperating in SCs, "*a win win relationship*", and "*Steel with pride, steal with pride*" is an expression applied in the company. For some big customers, Company 4 is also known as a "preferred supplier" in their SCM and, hence, more involved in customers' processes, e.g., product development. Collaboration in SCs makes it possible for both parties to share advice and knowledge, in order to improve products and processes. Although the company is positive to collaboration, the respondent mentioned that

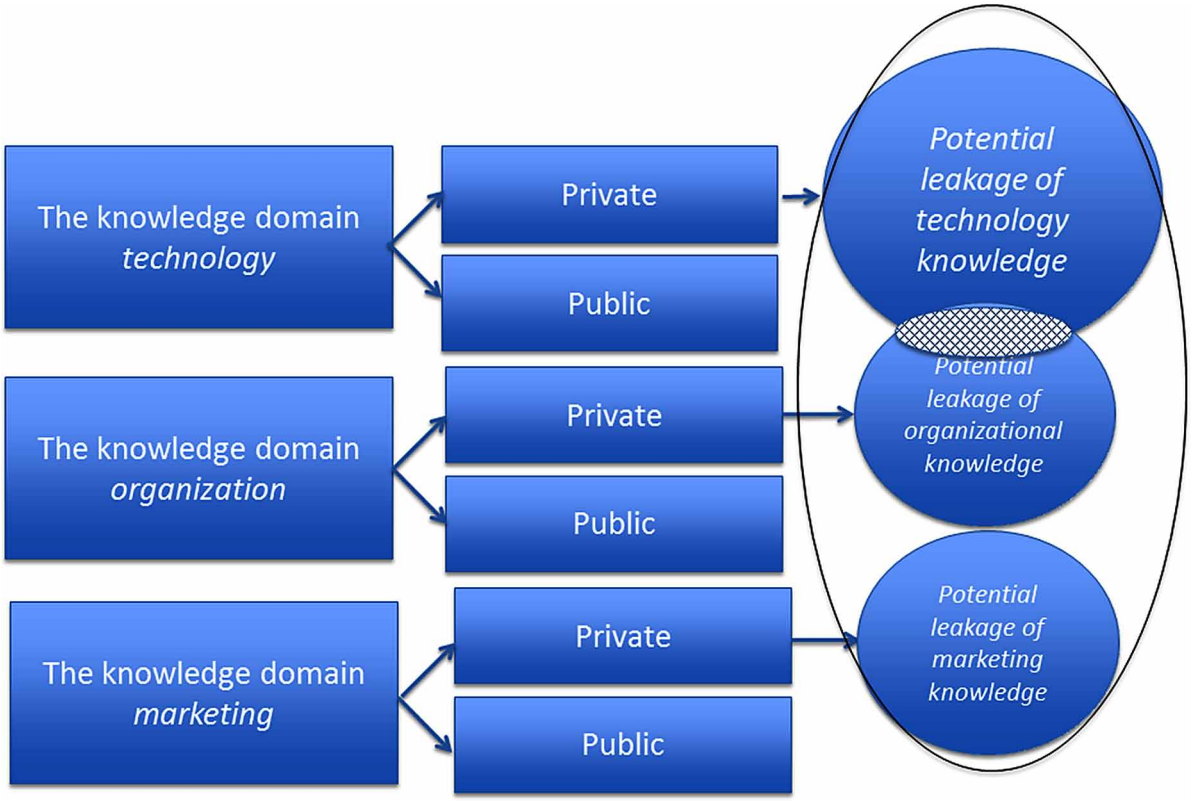
EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

employees could be a potential channel of knowledge leakage. This has already occurred in the company when employees contacted the company's customers and offered the same products at a lower price. However, since this incident was revealed early enough and those responsible were confronted, no devastating consequences resulted. Nonetheless, such an incident gives a frivolous impression and obviously risks creating a bad reputation for the company. Notably, the customer in the example was a new one, thus, there was really a great risk that the customer would decide not to buy products from the company.

- Company 5 collaborates to a relatively large extent, particularly for larger projects, with both suppliers and customers in the supply chain. The company works extensively with patent protection, in order to hinder competing companies from copying its products. Company 5 is active on the international marketplace where the culture of copying is different. "*They have no understanding of whether you have a patent*", as the respondent put it, instead they feel a sense of pride in copying products exactly. The company has been exposed to knowledge leakage and has also experienced negative consequences. According to the respondent, knowledge leakage occurred through both suppliers and customers. One concrete example the company has experienced was when employees, at an informal dinner, shared knowledge with one of the company´s customers. The customer in this example then utilized the newfound knowledge to their advantage and began producing the component themselves. Previously, the customer had purchased it from Company 5. Here, the knowledge leakage resulted in the loss of a customer and thus the loss of revenue for the company. The respondent emphasized that this incident "… *when the knowledge disseminated* (leaked, our comment) *via the customer had been taken with the greatest seriousness*", since it had resulted in the loss of customers for the company. It thus confirms Hamel (1991), Heiman and Nickerson (2004) and Ahmad et al., (2014) who argue that the loss of revenue is one of the negative effects knowledge leakages can cause. Technological knowledge, in particular the optimization of products, together with market-oriented knowledge, is essential for business success, since the company operates in a global market. Hence, the respondent ranks the domain technological knowledge as the most critical followed by market-oriented knowledge. In the company, market-oriented knowledge is treated with "*great secrecy*", and the respondent emphasized the importance of marketing and strategy plans for the coming years not being leaked to parties outside the organization. From the perspective of private and public knowledge, this concerns the company´s private knowledge.

Knowledge Leakage When SMES Participate in SCs: What is it About and How Can it Occur?

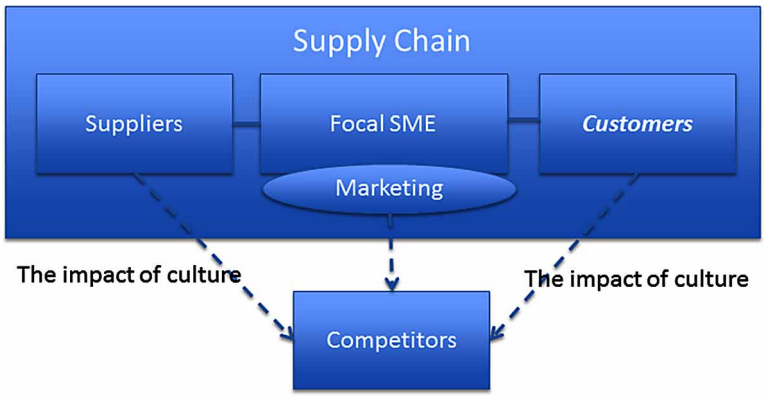
This work has resulted in two frameworks (Figure 3, Figure 4) visualizing what types of knowledge may leak away and how they are valued, when SMEs participate in SCs, as well as how the knowledge leakage can occur. The frameworks are based on the analysis tools (Figure 1, Figure 2) that have been revised in accordance with the results from the empirical study.



Types of Knowledge Leakage and How They are Valued

That the ability to manage knowledge is crucial for SMEs to achieve success (e.g. Coyte et al., 2012) is confirmed by the empirical study. The companies involved in the study regard knowledge leakage

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use



as a risk, and potential positive effects were not discussed. Comparing the three knowledge domains (organizational, technological, marketing), all the companies value technological knowledge as the type of knowledge that is critical to protect from knowledge leakage, since this type of "… knowledge or experience leaking away from its origin may lead to a loss of competitive advantage for an organization" (Mohammed et al, 2007, p. 456). Also, here the risk perspective is obvious. Two of the companies value technological knowledge as the most critical knowledge domain to protect. The knowledge domain technology concerns knowledge of products, research and development, core competencies, technological development, information and communications technology, product development and assembly (Beijerse, 2000). In the empirical study, all the respondents emphasized the importance of product and technological development; even if some of the respondents highlighted that they are not unique in their manufacturing process and use the same machines as others. Accordingly, from the perspective of the technological domain, it is not about the machines being used, it is about the employees´ skills and knowledge. "It would be devastating if they stop." This means that a critical type of knowledge leakage is in the intersection between the two domains technological and organizational. Notably, one respondent argued that it requires the right combination of employees, customers and production for the business to be unique and successful.

Figure 3. A framework showing what types of knowledge may leak away when SMEs participate in SCs and how they are valued

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 4. A framework showing where knowledge leakage can occur when SMEs participate in SCs

From the perspective of the analysis tool for examining types of knowledge leakage when SMEs collaborate in SCs (Figure 1), we can conclude that all of the three domains are represented and that it concerns private knowledge. The analysis also reveals that the technological domain is valued as the most critical one. In order to capture and visualize this, the analysis tool has been revised accordingly, meaning this domain is placed on top and is bigger compared to the other two. Our study also shows that it is the technological knowledge owned by the employees, not the knowledge embedded, for example, in machines, which the respondents refer to. Hence, one type of potential knowledge leakage that can lead to a loss of competitive advantage for an organization belongs in the intersection between the technological and organizational domains, which accordingly has been visualized in the analysis tool. The revised analysis tool, a first version of a framework describing what types of knowledge may leak away when SMEs participate in SCs and how they are valued, is presented in Figure 3.

How the Knowledge Leakage can Occur

The empirical study confirms that suppliers and customers are potential channels of knowledge leakage when collaborating in SCs. However, one respondent argued that it was worse if the knowledge was leaked through customers compared to suppliers. The empirical study also confirms that employees may share too much knowledge when they, e.g., feel pride and joy in improvements (Ritala et al., 2015). In addition, the empirical study reveals the importance of different cultures and how existing cultural attitudes and opinions concerning plagiarism can increase or decrease the risk of knowledge leakage. Another perspective that is revealed in the study is how marketing and exhibitions in themselves include possibilities for knowledge leakage. The analysis tool has been updated accordingly to capture these aspects as well as visualize it. The result, the first version of a framework visualizing how knowledge leakage from a SME participating in a SC may occur, is presented in Figure 4.

CONCLUSION

The empirical study confirms existing theory and reveals some new perspectives and issues. The theoretically-based analysis tools have been revised accordingly and two initial versions of frameworks

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

(Figure 3, Figure 4) have been developed visualizing what types of knowledge may leak away when SMEs participate in SCs, how they are valued, and how knowledge can leak away from a SME when participating in a SC. These frameworks, together with the descriptions of each of the five SMEs, are the result of this study. Hence, the study has achieved its aim. Additionally, the work has also shown the potential usefulness of the frameworks for examining the maturity of a specific SME concerning knowledge leakages when participating in a SC.

The advantages of sharing knowledge in SCs is well established in the literature (e.g. Brusoni et al., 2001; Ke and Wei, 2007; Wung, 2008; Hadaya and Cassivi, 2009), and also confirmed in our study. Concerning potential knowledge leakage in SCs, the study indicates that SMEs interpret this as a risk, where potential leakage of technological knowledge is deemed the most critical one, according to this study. Hence, taking a risk management perspective, when studying knowledge leakage in SCs, can potentially further reveal how to manage knowledge leakage in SCs.

The study has also spread some light concerning why knowledge leakage may occur when SMEs collaborate in SCs, e.g., informal meetings and employee pride in new products/ideas; however, to the best of our knowledge, this research is in its infancy. In this area, one potential research approach is to identify and describe Critical Success Factors (CSFs) for a SME when participating in SCs, in order to manage knowledge leakage. CSFs can be described as "the conditions that need to be met to assure success of the system" (Poon and Wagner, 2001, p. 395) and should consist of a limited number of factors (Rockart, 1979). There are numerous ex tensive literature studies that present overviews of CSFs (e.g. Aggestam and van Laere, 2012; Shaul and Tauber, 2013; MunirAhmad and PinedoCuenca, 2013; Leyh and Sander, 2015); however, to the best of our knowledge, not from a knowledge leakage perspective.

For practitioners, this study can serve as an "eye-opener" and contribute to increased awareness of the potential risk of knowledge leakage when participating in a SC. Furthermore, we believe that the developed frameworks can function as guidance and help practitioners to grasp what types of knowledge are most critical for us to protect when SMEs participate in SCs (Figure 3) and where, most likely, the leakage can occur (Figure 4).

We are aware that the present study is not without limitations. The empirical data consist of a limited number of Swedish SMEs represented by one respondent each. However, the result is based on existing research and the aspects added from the empirical study are some initial steps to spread further light on knowledge leakage when SMEs participate in SCs; they are not meant to be exhaustive. Finally, this research area is in its infancy and, when conducting future research, we believe that the results from this study and the proposed research directions can be helpful.

ACKNOWLEDGMENT

I wish to thank Clara Möller and Emma Svensson for very good work with their Bachelor Thesis, which has made this paper possible.

Chapter 76
Strategic IT Alignment in Service Sector

Abrar Haider
University of South Australia, Australia

Sureerat Saetang
University of South Australia, Australia

ABSTRACT

Effective management and governance is key to the business and information technology alignment. Just as business organisations have to be responsive to the changes in their operating environment to remain competitive, they also have to be proactive in leveraging technological resources to sense these changes and take appropriate strategic and operational decisions. Governance of information technologies is not the job of technology administrators; in fact, it is everybody's responsibility. With this recognition and understanding, technology stakeholders are able to assume responsibilities and accountabilities to execute and achieve desirable behaviour in the use of information technologies. This paper presents a case study of a bank in Thailand on how it has embedded governance practices in its social, operational, structural, and technical environment. It concludes that maximization of value from information technologies is dependent upon the technical, cultural, and organisational endorsement of business practices relating to their governance.

INTRODUCTION

In the contemporary business environment, information technologies (IT) act as strategic enablers as well as strategic advisors. These technologies enable business workflow, and at the same time allow for informed decision support that enhances internal and external responsiveness of the organisation. The impact of IT is particularly significant for service organisations, since they strengthen, support, improve and expedite operations along the service value chain. In these organisations, IT assume a variety of roles and serve as the main conduit to understanding and providing a sustained level of service and value to the organisational stakeholders. The value of IT, however, is dependent on the context within which they

are implemented, as context shapes their use through the interaction and relationships between various social, human, and organisational, and technical systems. In order to maximise value from IT, service organisations have to understand these interactions, and the internal and external forces that influence the operating environment of the business.

Literature review suggests that technology managers take a deterministic approach to technology implementation (see for example, Haider 2013), whereby they focus on the promises associated with technology rather than the cause and effect relationship, and the contextual intricacies that realise those benefits. As a result, the information technology environment in the contemporary business landscape is replete with vulnerabilities, like lack of fit between technical infrastructure with strategic business considerations, incompatible technology, lack of information ownership, overdependence on outsourcing, inability of the organisation to assign responsibility and accountability, budget blowouts, and ineffective risk assessment and mitigation. As a result, employees in large sized service organisations maybe technically competent, yet they cannot fully appreciate the soft and hard role of information technologies in the organisation, and cannot fully apply their knowledge and skills for the optimum advantage of the organisation.

Managing value from information technology infrastructure is the core tenet of IT governance. It provides the decision rights and accountability framework that encouraging desirable behaviours in the use of information technologies within the organisation. These behaviours are shaped through the mutual interaction of cultural, social, technical, and organisational environments prevailing in the operating context of the organisation. IT governance, therefore, is not the job of a few individuals in the organisation or the information technology department; it is everybody's responsibility. At the same time, the Thai service industry is a complex environment, which consistently struggles to work within the established norms of Thai culture—particularly large sized service organisations, which are forced to have a reactive rather than proactive approach to information technology infrastructure development and use. It is, therefore, important to assess how these organisations institutionalise governance of their information technologies within their operating environment, such that it becomes an integral part of the business workflow embedded through organisational values.

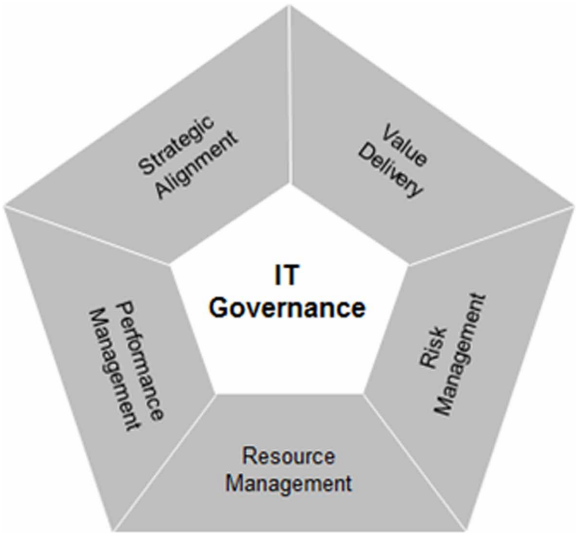
This paper starts with conceptual explanation of IT governance and explains its significance for service organisations. It then discusses the institutional theory and highlights the social, organisational, and technical factors that help institutionalise a system or a phenomenon in an organisation. This is followed by a detailed case study of a Thai bank and its experience with IT governance, using the theoretical frame of references developed in the earlier sections of this paper.

CONCEPT OF IT GOVERNANCE

Different scholars have defined IT governance from different angles. The generally accepted definition of IT governance is about IT responsibilities. This definition, however, takes a very narrow approach of IT governance, whereby the authors only talk about the responsibilities of different managers or employees in the organisation to manage IT. Grembergen (2004) takes a strategic view of IT governance and suggests that IT governance is the organisational capacity exercised by the Board, executive management and IT management to control the formulation and implementation of IT strategy and in this way ensure the fusion of business and IT. The author suggests that in order for IT to function properly in the organisation, alignment between IT strategic business orientation is a must.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

The IT Governance Institute (2003) argues that, IT governance is the responsibility of the Board of Directors and executive management. It is an integral part of enterprise governance and consists of the leadership and organisational structures and processes that ensure that the organisation's IT sustains and extends the organisation's strategy and objectives. This is by far the most comprehensive definition because it not only talks about who is responsible for IT governance, but also explains why it is necessary and how it is related to other strategies and plans. Weill and Ross (2004) suggest that IT Governance is the decision rights and accountability framework for encouraging desirable behaviours in the use of IT. This paper adopts this definition because different organisations use IT differently. And even in one organisation, different employees use IT differently. Therefore, IT governance is not just about how resources are allocated and managed and how resource capability and capacity of the organisation is developed. IT governance is about how resources should be changed, who is responsible for this management and development and who is responsible if things do not go according to plan. This means that simply assigning roles and responsibilities is not enough. Employees in the organisation have to be encouraged, coerced, motivated, and trained to operate and manage IT in a way that helps an organisation achieve its objectives.



IT governance leads IT to move an organisation forward in different ways. However, it is important for the board of directors, with its decision-making powers, to be involved, and business and IT managers of different business areas to attend the meetings to discuss different issues on the IT agenda: business initiatives, IT-enabled business processes, project approvals, business performance, and the process of technology implementation, deliverables and benefits. These leaders are well-aware and conscious of the value of business performance that involves business transformation, risk management, accountability and responsibility, business continuity and performance measurement (Brown 2006; Aguilera and Jackson 2003). They are keen to acknowledge the type of requirements, resources and people to involve in different projects to make them succeed (Nolan & McFarlan 2005). Likewise, communication strengthens their relationships and collaboration to achieve effective implementation of IT governance (Johnson & Lederer 2005). Hence, communication and decision-making are the first priorities of IT governance to operate a business productively and responsively. This means meeting outcomes involving decision-making and consensus agreement, accountability and of IT managers to ensure the organisation does not encounter survival difficulties in the competitive business market.

IT governance requires considerable information from business and IT strategies to create an understanding of an organisation and form strong relationships between the business and IT arms of the organisation (Bowen, Cheung & Rohde 2007). IT governance aims to support senior managers to make decisions to allocate organisational resources carefully by ensuring they align properly with business and IT strategies (Brown 2006; Grembergen 2004). Subordinates then become aware of scarce resources, and use them wisely and responsibly. IT governance focuses on planning organisational strategies, controlling system reliability and mitigating risk (O'Donnell 2004). This means IT governance primarily focuses on business strategy with attention to the adoption and alignment of technology with business initiatives. Thus, it is important to understand that strong business knowledge and effective IT skills are required to implement IT governance effectively (Liu et. al. 2008).

Figure 1 illustrates the scope of IT governance. It focuses on five domains, i.e., strategic alignment, value delivery, risk management, resource management, and performance measurement. The most significant and fundamental domain of IT governance, i.e., strategic alignment calls for establishing

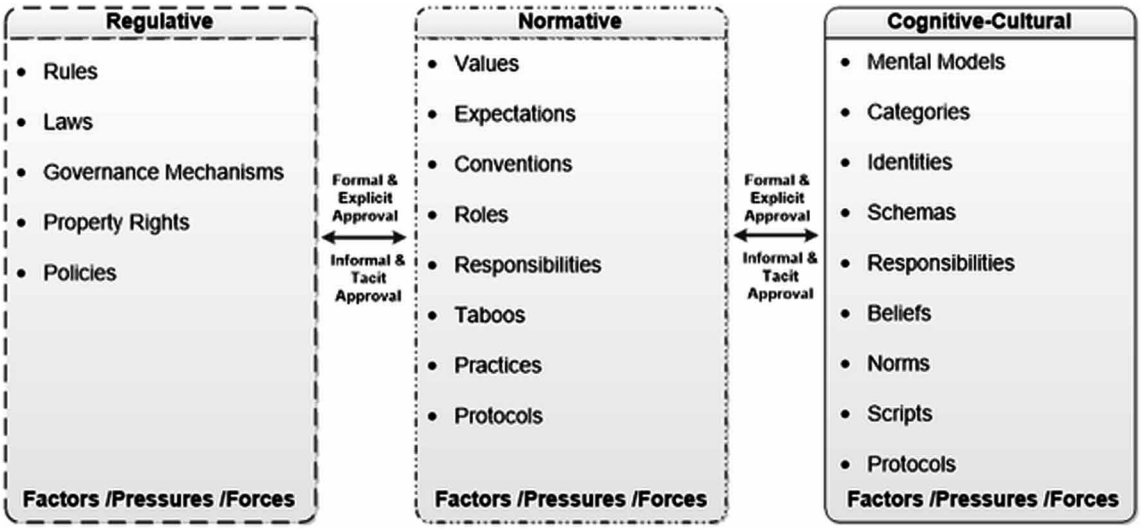
EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 1. IT governance scope
Source: Adapted from (IT Governance Institute 2007)

the relationship between business and IT planning, thereby ensuring that IT operations are aligned with business operations. This means that all IT implementations in the organisation must be fully mapped with the organisational information requirements, such that the collectively the IT infrastructure works as the enabler of organisation's strategic and operational information requirements. Therefore, the value delivery domain calls for practices that ensure that IT does deliver the perceived benefits against business strategy, while at the same time optimizing costs and enabling tacit as well as explicit value of technology. This, in return, requires the organisation to make sure that IT stakeholders comply with business requirements and that risks posed to information and information managing resources are properly identified and managed; hence the third domain, i.e., risk management. The fourth domain, performance management, contributes to other domains and calls for monitoring organisational IT performance on various accounts, such as, strategy implementation of IT and project management, monitoring compliance completion and usage of IT, and measuring process performance in terms of service delivery and achievement of business objectives. The firth domain certifies proper management of IT resources (both technology and human) and managing investments in infrastructure and people.

The effectiveness of IT governance is compromised if relevant change management strategies are not put in place. Organisations, therefore, need to blend execution of IT governance practices and learning together to bring about learning and innovation in an organisation. IT governance is, therefore, not a one off endorsement of some business activities, processes, and controls. It should be treated as a governance mechanism of continuous learning aimed at the evolving use of IT, shaped through alignment between the organization's strategy and diffusion and application of IT within the organisation, guided by the value profile that stakeholders attach to it. IT governance is, therefore, not just a managerial concept, and requires commitment and understanding of every employee in the organisation. Its effectiveness, however, depends on the way it practices, controls, and processes have been institutionalised in the organisation.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use



INSTITUTIONAL THEORY

In institutional theory, there are five key concepts, i.e., isomorphism, organisational fields, institutional logics, institutionalisation/legitimacy, and organisational and institutional change (Washington & Patterson 2011). These concepts are shapped by three types of social forces in an institution, i.e. regulations, assumptions and expectations, and cultural cognition (Macfarlane et al. 2013; Scott et al. 2000). An organisation, thus, integrates and aligns different and similar variables to create organisational value (Washington & Patterson 2011) by systemising all processes, practices and ideas. In other words, these interactions help an organisations evolve and institutionalise various concepts, such as technology use, across the organisation through the processes of facilitating and sharing, which leads people understand and make sense of their roles, jobs, and activities by enabling them to practice, communicate, and co-operate collaboratively.

Figure 2 summarises a view of institutional theory, integrated with its pressures, forces and factors. It shows that institutional theory focuses on paying high attention to holistic assessment of dynamic operational processes to gain better alignment with more internal process synergies. External variables concern competition, social regulations, technological change, and the economic and political environment, all of which impact organisational capabilities in meeting organisational objectives. Dynamic relationships in the organisation are built through the organisational structure, which allows people to understand their roles and responsibilities to deliver effective organisation performance (Greenwood & Suddaby 2006). In other words, everyone being aware of the structural change within an organisation (Dorado 2005) aids understanding of clear organisational strategies and policies (Battilana 2006).

People make sense of what they have to follow to manage organisational change and consequent organisational development (Lawrence & Suddaby 2006). Best practices are implemented to assess institutional change and gain institutional stability, while supervising people so they learn from past

Figure 2. Institutional theory
Source: Adapted from (Scott 2001)

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

mistakes (Mutch, Delbridge & Ventrescu 2006) and leading them to understand all institutional domains vertically (Chizema & Buck 2006).

Institutionalisation is achieved when a phenomenon is embedded in organisational life in such a way that it becomes an integral part of organisational life. This integration means that business cannot be executed legitimately (in economic, social, and technical terms) without it. Institutional isomorphism means that the whole organisation conforms to the same set of principles, rules, and norms regarding a particular phenomenon. It occurs through three factors—coercive, normative and mimetic. Coercive isomorphism is the result of presses from internal and external forces that force the organisation to exhibit specific behaviour. These social, cultural, regulator, economic, technical and political forces are exerted on an organisation such that it conforms to the rules and desires of a dominating party. For example, rules and regulations regarding taxation and employee relations, set forth by the government, are examples of external coercive forces. Another example of external coercive pressure is making a trading partner conform to a specific technology standard because that will make it easy for the dominating business in the supply chain to transact business. These pressures emerge from legal mandates, or are influenced by political structures and power relations in organisations, involving authority and approval to meet requirements or expectations.

Normative isomorphism refers to the collective effort of employees to evolve a social, cultural, economic and technical environment that breeds a desired behaviour as well as controlling it. It arises from resources (training, knowledge, technologies and related areas), which are adopted to gain professional practice and achieve effective and productive outcomes (Macfarlane et al. 2013; Washington & Patterson 2011). Thereafter, effective organisational change management and organisational relationships certainly embrace the organisational environment, which gains effective cooperation internally and externally. This isomorphism is achieved through management policies, education and training of employees, job descriptions and experiences, and networking through professional associations. Norms and values thus evolved in the organisation increase the similarity of knowledge, skills, and attitudes of employees in a specific work environment. Mimetic isomorphism calls for deploying successful best practices, solutions or remedies of other organisations (Washington & Patterson 2011) to empower employees in uncertain situations (Macfarlane et al. 2013). When organisational technologies are poorly understood, when goals are ambiguous, or when the environment creates symbolic uncertainty, organisations may model themselves on successful organisations, within the same industry or outside of it (DiMaggio & Powell 1983). For example, a technology platform adopted by a competitor may be considered by an organisation to address uncertainties occurring due to changes in the business environment.

Applying institutional theory to IT governance means that unexpected situations are avoided and risks mitigated. People are encouraged to improve their individual skills learn to gain more knowledge to support and remedy IT governance and related domains in the organisation by sharpening their technical efficiency or organisational performance to meet organisational/stakeholders' expectations. It thus, aims for responsive behaviours under the institutional forces in an organisation.

RESEARCH METHODOLOGY

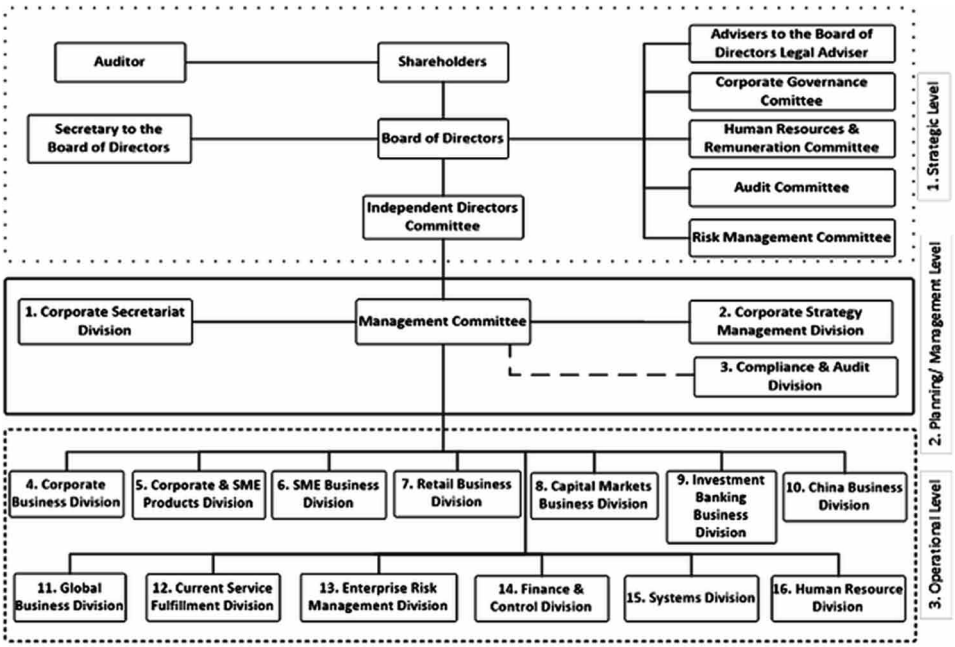
This research employs an interpretive epistemology with a qualitative perspective. The aim of this research is to explore how large sized Thai service organisations institutionalize IT governance practices. In order to address the research question for this study, 17 middle to senior managers representing various roles in

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

the organisation were interviewed and a further 141 surveys were completed among the staff of Company A. were selected The interviews were conducted over a one to one and half hours period and included a cross section of job descriptions that participate in IT governance practices at various levels. This cross section includes staff involved with development, implementation, supervision, management, and use of technical as well as non-technical practices and processes relating to IT governance in company A. The interview questions were open-ended and interviewees had freedom to describe their experiences and problems beyond the scope of the questions. In addition, researchers were provided access to all documentation as well as access to sites of concerning IT governance. The interviews were transcribed and data from all sources were analyzed using NVivo software using its features of themes, descriptions and assertions. Survey data was categorized through various visual descriptions. The conclusions drawn in the following case, thus, represent interpretations of the evidence as understood by the author. To comply with confidentially agreements with the case study participants; theirs as well as their organization's identity has been suppressed.

CASE STUDY

Company A was established in 1945 with a registered capital of THB5 million (USD156, 885) and 21 employees. It has been one of the major local commercial banks in Thailand since 1976, and is listed with the Stock Exchange of Thailand. It is indexed with the bank of Thailand, which operates as the central bank—designating monetary policy, examining financial systems, supporting banking assistance to the government and financial institutions, releasing securities and new prints of banknotes, and controlling the foreign exchange rate in Thailand. Company A is one of the five largest commercial banks in Thailand as determined by its total assets, loans and deposits.



Company A's services include personal saving and investments, fund transfers and bill payments, foreign currency services, personal loans, international trade services, bank guarantees, credit and debit card services, cash management, domestic credit, international banking, investment banking and securities. Currently, it has a registered capital of THB30,486 million (US958 million) with total revenue in 2013 of approximately THB1.43 billion (US44,966 million). There are over 19,000 employees who

Location	Across Thailand with designated countries
Total revenues 2013	Approximately THB1.43 billion (USD44,903 million)
Registered capital	Approximately THB30,486 million (USD958 million)
Total branches	Over 900
Total overseas offices	11
Total employees	Over 19,000

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

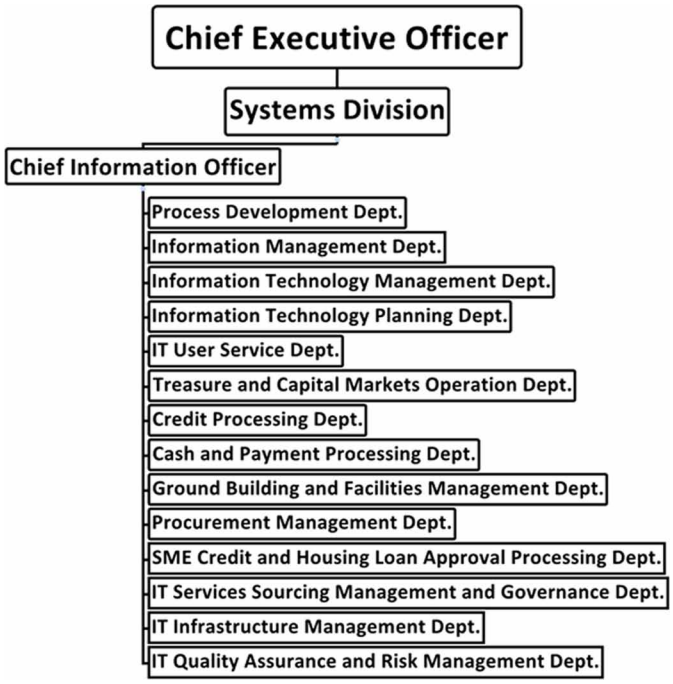
Figure 3. Organizational chart of Company A

work in over 900 branches across Thailand, with 11 overseas offices in the US, Hong Kong, Cayman Islands, China, Japan and Myanmar, with trade partners worldwide. Table 1 summarises Company A's key information.

Organisational Structure

Company A is a large organisation with significant involvement in Thai monetary policy and operations.

As Figure 3 shows, there are 13 core business divisions with numerous smaller departments, sections and teams. The top management in the organisation represents four major components—shareholders, board of directors, independent directors' committee, and the management committee. In addition, the board of directors is advised by a range of directors and committees. The executive management team governs and controls the operational divisions and provides directions and guidelines for the business. Individual divisions collaborate closely across different product areas. The organization has decentralized formal management, thereby, individual divisions have extensive authority to run business activities.



Information Technology Organization at Company A

In Company A, IT is in the systems division, with 14 key IT operating subordinate departments (see Figure 4). The CIO is the manager of the systems division, and is responsible for executing and controlling all IT functions related to all business activities in every business division and each subordinate department throughout Company A.

IT operational services are divided into two areas of responsibility—corporate and divisional IT. Corporate IT operates under the IT planning department in relation to the use of IT at the strategic level

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 4. Organizational structure of IT at Company A

only. Divisional IT focuses on IT operations, and maintains all IT activities and services in the business division levels, including all subsidiary departments and branches. Therefore, the systems division handles all IT concerns and operates all IT activities in relation to all business transactions. The systems division is located at head office in Bangkok, leading all in-house and outsourced IT operations within head office and throughout the branches all over Thailand.

Major Technologies at Company A

Table 2 lists the various IT systems and applications that are implemented and operated to meet the business requirements of Company A. It classifies six business programs: (1) marketing, (2) personal online banking, (3) business online banking, (4) electronic funds transfer, (5) IT security and (6) banking operations.

The core banking system delivers all financial and banking data integration in real time: transaction banking, lending, mortgages, deposits, and online and mobile access. The credit management administration system controls credit transactions by integrating the selected vendors to facilitate data exchange with corporate and retail customers. Moreover, the credit management administration system enables the loan origination system to control and monitor all steps in loan application processing. With over 900 branches across Thailand, Company A facilitates customer service by implementing a queue system, a document imaging system and related banking systems.

Company A originally implemented data security and branch service systems. However, data protection issues arise from the different business processes, business applications and record management systems implemented on servers. Thus, a virtual server and storage was introduced to strengthen safety

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Table 2. IT and operational technologies infrastructure at Company A

IT Infrastructure	
Marketing:	Social networking service
	Customer relationship management
	Sales force automation system
	Campaign management system
Personal online banking	Verified by Visa and MasterCard SecurityCode

	Short message service and email notifications
	Online virus scanner
	Security software
	Mobile banking
Business online banking	Electronic data capture system
	Near field communication technology
	Mobile banking
Electronic funds transfer	Dynamic currency conversion system
	Payroll systems
	Real time exchange rate trading system
	Bulk payment system
IT security	Data security and branch service systems
	Virtual server and storage
	Key risk indictors
	Risk event database
	Record management systems: financial data, accounting and Payroll, operations, compliance, data security, policies, compliance, standards and regulations
Banking operations	Core banking system: transaction banking, lending, mortgages, deposits, and online and mobile access
	Credit management administration system
	Loan origination system
	Queue system
	Document imaging system

and protect data from attacks or risks from viruses and malicious intrusions. Risk-management tools, such as key risk indictors, risk event databases and related systems, monitor and control risks. Record management systems are the key applications that manage and interact with different business activities and systems, for instance, financial data, accounting and payroll, operations, compliance, data security, policies, compliance, standards and regulations. For business online banking, an electronic data capture system validates online credit card transactions over e-commerce websites for safe online payments. It detects fraudulent credit cards trying to make online transactions. This process focuses on strengthening the safety and accuracy of online financial data to support merchants that are business customers of Company A. NFC technology has been employed and developed for mobile banking. Customers can

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

easily check their balance, transfer funds, top-up savings and make payments via their mobile phone. A dynamic currency conversion system allows electronic funds transfer so credit card holders can make payments converted into local currency from 35 different currencies. In addition, a real time exchange rate trading system is available over Company A's website. The bulk payment system allows transfer of large transaction payments.

In terms of personal online banking, Company A focuses on safer online financial transactions. Verified by Visa and MasterCard SecurityCodes are used to deliver fraud detection systems to strengthen customer shields. One-Time Password is a unique password notified by Short Message Service (SMS) over customers' mobile phones and email to immediately update and confirm transactions. Company A was the first bank in the Southeast Asian region to bring this technology to the banking industry. This service encourages and supports customers shopping over the internet and making payments through online transactions. Online security is vital for business online banking. Customers can easily access Company A's website to scan for viruses online and download security software products to help increase online protection.

Company A considers that IT infrastructure is vital to its business. It is implemented in different functional areas of the business divisions to ensure its products and services deliver value. A social networking service is also a key marketing channel that connects customers easily and interactively, possible as a result of strong growth in the use of social media. It markets new business products and services. A CRM system is implemented in both retail and corporate business divisions to ensure good relationships using technology to cooperatively manage and automate sales, marketing, customer service and technical support. A sales-force automation system is adopted to collaborate with CRM to drive and increase performance and profitability. Company A adopts a campaign management system to design and promote multichannel marketing initiatives and follow up their effects by analysing customer classification.

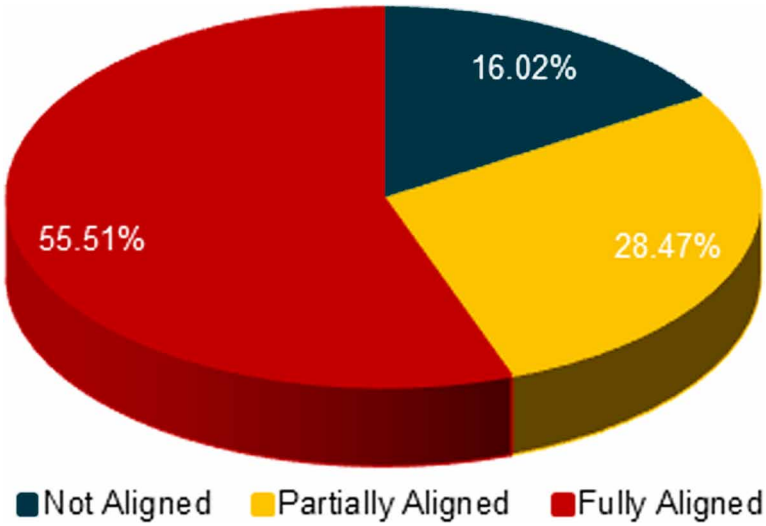
Information Technology Operations and Management

Company A mainly focuses on two areas of IT performance—management of outsourcing and vendors and business-IT strategic alignment. The SLAs focus on measuring performance and processes of different outsourcing activities and vendors. In addition, the BSC measures IT performance against alignment with business models, processes and strategies in response to profitability. Company A adopts a back-office centralisation solution to increase productivity and decrease expenses and staffing levels throughout all branches in metropolitan areas. All the non-core business functions are centralised in a shared environment.

Implementation of IT infrastructure routinely involves IT service management. The ITIL is adopted to support the IT planning department configure management, focus on organisational strategies and projects, and coordinate other teams and departments vertically and collaboratively. ITIL was adopted to create a master plan by allowing the IT planning department to manage all IT projects thoroughly, transform them properly and assign the responsible people correctly.

Strategic Alignment

Company A has a well-established procedure for technology implementation. Each new technology is introduced in the organisation in response to some strategic considerations. The organisation follows an



EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

extensive process of performance audit, whereby performance of processes as well as technologies is measured periodically. This evaluation provides management with feedback on the efficiency of processes as well as technologies. This assessment helps in identifying the technology and process gaps, which helps technology implementers identify the right kind of technologies that suit the business. Once they understand what technology is right for the business, proposals or quotations are sought from technology vendors. Doing so, not only organisational managers know what type of technologies is right for the business but at the same time they also know the limitations and capabilities of technology, which helps them with change management. The head of software quality assurance summarises the process:

We list all priorities from each business improvement initiative. We check the most useful technologies and methodologies that match the business requirements. The various committees that we have then meet on this IT agenda and take decisions on technology developments/procurements/improvement. These are thus able to indicate project stakeholders as well as resources required to undertake the projects.

Figure 5 shows that most respondents in Company A (55.51%) believe that IT is fully aligned with business model. On the other hand, 28.47% of the respondents believe that IT is partially aligned with business model, and relatively low number of the respondents (16.02%) believes that it is not aligned with the business model. This shows that Company A has a relatively low number of employees in the organisation who do not understand and interpret business requirements properly, and are not able to understand how technology is used to address these business requirements. Company A takes a closer look at IT-based enterprise architecture and business processes to investigate where the business needs are and adopts the right solutions to improve performance and mitigate risks related to IT infrastructure. Conformance to enterprise architecture not only helps with better performance, but also identifies root causes of the issues and loopholes that contribute to problems and issues with business processes.

Figure 5. IT alignment with business model

Strategic Information Technology Implementation

Company A is a technology savvy organisation. Top management supports technology introduction, operation, and management at various levels in the organisation. There is fair bit of confluence between top management and the CIO. Once the top executive provides clear directions and visions on where the business is heading, the CIO is able to map business requirements with technology. The close association between the CIO and the CEO helps the organisation grow in synchronisation with technology. In this way, technology becomes an integral part of organisational growth. The head of IT strategy and policy further explains:

I think the most important is sponsorship from top management. It can improve IT systems, processes and the methodological thinking of people. It would be much simpler if the board of directors agree and support the intention to keep moving using technology. Their strong lead can support IT implementation to minimise difficulties in the business processes and achieve better results. Once this is done, the rest is easy because we provide education and training along with clear communication to involved people. They will clearly understand benefits of IT in the business.

External influences from both local and global environments impact the business of Company A, especially political factors. It is important for Company A to be aware of changes that directly and indirectly affect the ability of business and investment to meet organisational strategies and achieve business objectives. Company A focuses on government factors and legal concerns by anticipating and influencing public policy actions. In doing so, Company A complies with the bank of Thailand as mandated by the Thai Government. Senior managers take into account major political realities, such as, government-driven tax laws, trade quotas and restraints, regulatory frameworks, industry subsidies, investment incentives, local content manufacturing requirements, regulated pricing, trade agreements, economic treaties and bureaucratic processes. Since political developments and changes control business direction, Company A follows and updates practices according to directions from the bank of Thailand. This approach helps Company A to avoid problems and issues emanating from noncompliance and financial malpractices. A senior IT architect specialist provides insight in to this:

The regulatory team is responsible for working with the latest guidelines and policy from the bank of Thailand. These changes directly affect all banks in Thailand. The regulatory team is always aware of changes and understands what to change and improve. It also updates the latest information and reports to the participating people in the organisation, including our internal and external stakeholders.

To keep up with the changes, Company A relies heavily on IT. It is not only proactive in implementing new technologies, refurbishing and upgrading existing ones, but also keenly peruses BPR for continuous improvement. IT governance is the cornerstone of these strategies, whereby the company adopts and customises only reliable and trustworthy existing IT governance frameworks to meet its business considerations. The expected benefits of these existing frameworks meet the business objectives of Company A. The guidelines available through these frameworks help Company A to cope with its business effectively and proficiently. A senior IS auditor states:

We adopted and customised CobiT and ITIL in some areas. These methodologies support monitoring of different workflow processes relating to project management, quality assurance, capacity management,

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

and customer relationship management. These help us mitigate risks and incidents from unexpected situations. They also reduce controlling processes and minimise costs for long-term management of processes.

Information Technology Investment

In Company A, the IT department works closely with other business functions. This collaboration helps IT people recommend solutions in terms of returns on investment and benefits expected in the future. For example, the senior IT strategy and policy specialist comments:

We acknowledge what kind of problems the business department has and encounters daily. We know what type of IT solutions to adopt and support them. This knowledge helps us understand the requirements and propose a variety of solutions for the end users to select from.

In Company A, a steering committee manages IT investment decisions. The committee pays attention to details in project scope, goals, plans, schedules, timelines, costs, quality expectations, tools and deliverables. They focus on reporting of project progress, and project changes and results of measurement. The senior software quality assurance specialist explains:

The committee highly focuses on making decisions on IT investments. They always inquire about the problems in the business departments that are related to the use of IT and the IT department always gets involved. They support the need to align business and IT and achieve better relationships.

Value Delivery

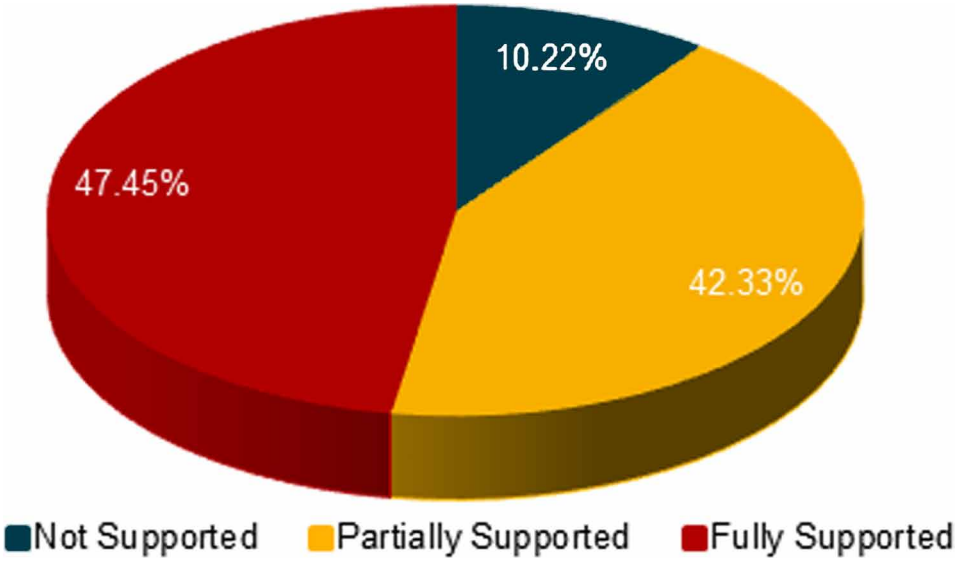

Figure 6 shows that 47.45% of the respondents in Company A believe that IT system fully support business services, with an almost equal number of employees suggesting that they partially provide support. This shows that Company A spends significant effort in taking care of the vulnerabilities and technology as well as the processes enabled by technology. Otherwise, the IT support systems can be a burden that can slow down the business. However, since the bank also involves third party technology services, it requires the IT department to continuously monitor and check the progress against value profile required of IT and related processes and procedures, and SLAs.

Company A operates in a highly volatile environment. However, its internal workflow and procedures are fairly stable. This helps the organisation to not only focus on an acceptable level of service to accelerate value for customers, but also helps it to continuously innovate and transform its business to meet and exceed internal and external customer expectations. This has led to very high level of employee turnover. As a result, retention of expertise is an issue with the bank. Company A has limited number of experience skilled employees who have in-depth knowledge of IT related to backend banking processes. IT also has a fairly large number of new or relatively newer employees who are not fully trained and do not possess the same level of expertise. The head of software quality assurance confirms this:

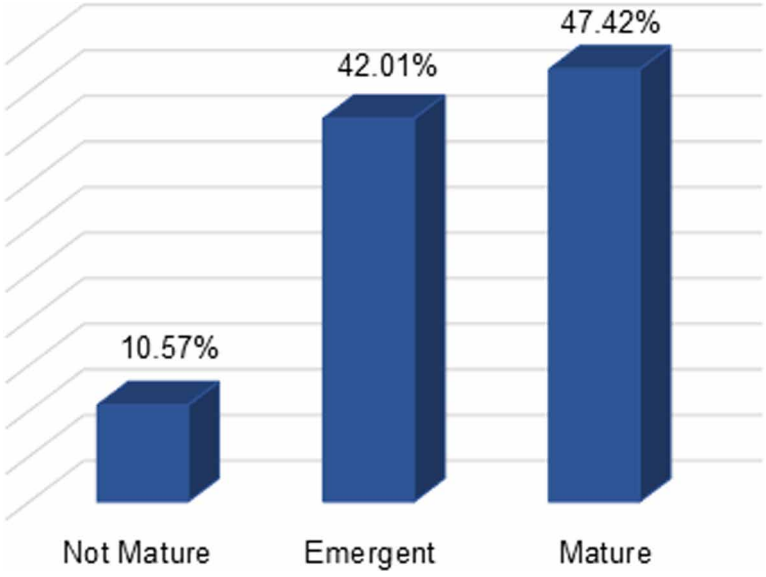
It is essential to have people who are ready and information well-prepared in advance to gain high productivity or high efficiency in a banking environment. Otherwise, I will say that we would waste time. I would like my department spend less time in preparing the department to provide the required level of surveys and more timing actually providing that surveys.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 6. IT and business service support

It is understandable why most respondents (25.07%) believe that ineffective change management is the main cause of failure to achieve expected value from IT (see Figure 7). Other major impediments to achieving value from IT as reported by the respondents include high costs of implementation and lack of planning. It is important to note that 15.42% of employees believe that there is a lack of expertise. This is because employees in Company A are fairly proactive in learning new technologies and employees feel a little less confident to claim expertise in the operations and use of technologies.

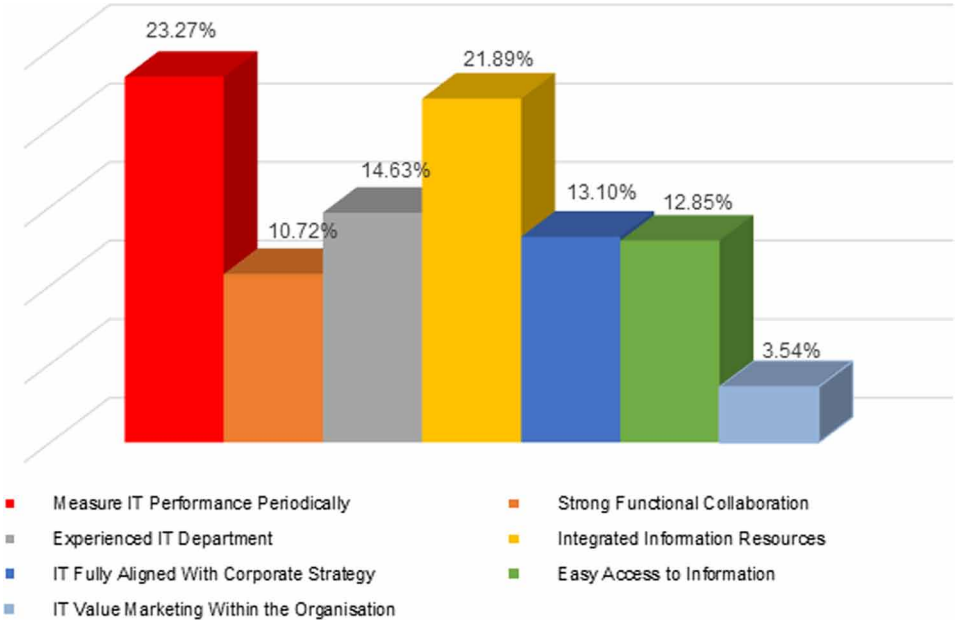
Figure 7. Causes of failure of IT to deliver expected value



EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 8 shows that 47.42% of respondents believe that the organisation's IT infrastructure's value delivery is mature whereas 42.01% of the respondents believe that value of IT service delivery is emergent, which means that the existing IT infrastructure is effective in providing required results. It also shows that IT is aligned with the business model, and IT support services are fully supported for business processes. The existing technologies are up-to-date and are not a hindrance to specialists. The existing technologies are contemporary and add value to the work of employees in the organisation. In other words, IT infrastructure fulfils the demand of higher workload and capacity to meet the rapid work of business, such that mistakes are avoided and delays in business processes and delivery of transactions are minimised.

Since Company A is a financial institution, it has a propensity for measuring performance in financial terms. For this reason, most respondents (23.27%) agree that measure IT performance periodically is the key strategy to improve the perception of value delivery (see Figure 9).



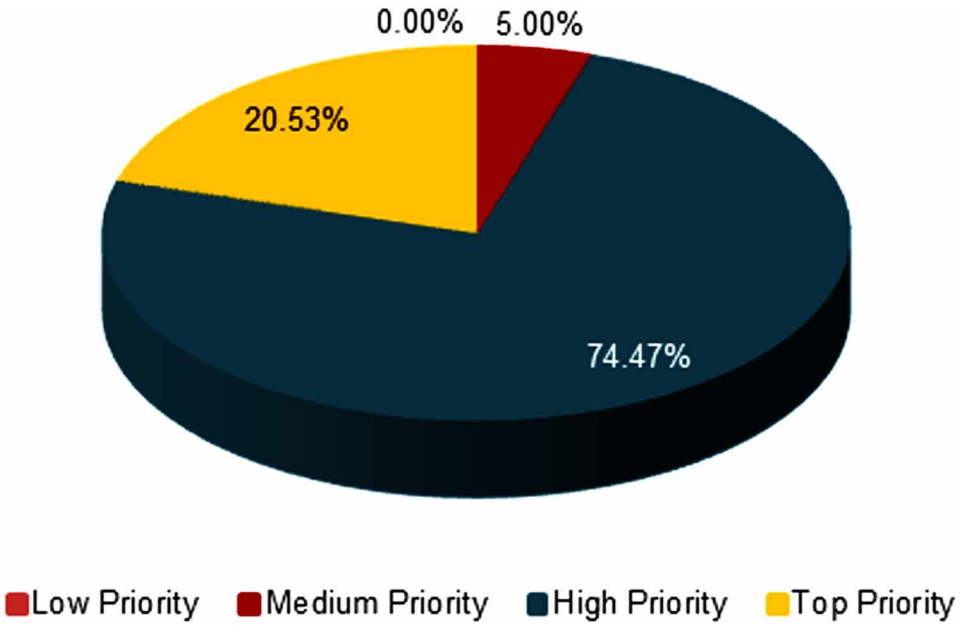
Integrated information resources is rated by 21.89%. This reaffirms that the organisation is fully programmed to view IT as means to developing a robust CRM infrastructure. The fairly even response rate in other categories indicates that the role of IT is well-established in the organisation. Considering Company A's business, the results are not surprising. It shows that employees understand the business well and know how to maximise value from IT. It also shows that Company A considers performance measurement in a variety of business areas and utilises resources to ensure that employees understand the value of IT. Company A regularly monitors contractors and vendors and accesses the SLAs to mitigate risks and unexpected situations. The capability and capacity of IT infrastructure is used to support business growth.

Figure 8. Value of IT service delivery

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 9. Key strategies to improve value delivery perception

Resource Management



Being a financial institution operating in a highly competitive and technology intensive industry, Company A is quite keen on managing its critical IT resources. In terms of resources, it not only proactively manages the critical technology resources, such as hardware and software, but also the HR related to IT. A senior IT strategy specialist provides a statement about the organisation in terms of resource acquisition and management:

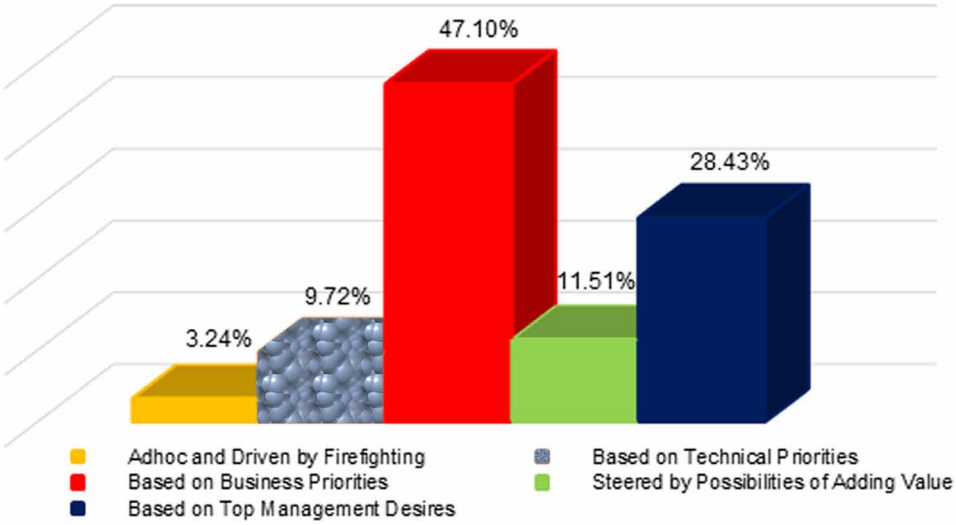
The planning team follows strategic directions from top management and update their plans with regards to ITIL change and configuration management. This team receives a master project plan that integrates other plans together and ascertains technologies required and assigns the responsibilities to people according to their experience and expertise. Senior management thus ensure that work is high quality, knowledge of employees is utilised properly and other employees learn from their expertise.

In Company A, there is a high turnover of technically qualified HR, therefore, it relies on well-thought out plans for employee retention, knowledge sharing, and peer based learning. Company A also lays equal importance on investing in existing hardware and software resources to upgrade and/or re-furbish them to gain continued and sustained value from them. This explains why 74.47% of employees in Company A believe that the organisation uses resources wisely and effectively (Figure 10). This shows that employees are trained to not waste resources and help organisation to reduce costs. Company A thus gains savings and is able to channel resources where required. Company A employs this technique to capitalise on opportunities in cautiously applying IT resources and strategically preparing itself for improved economic conditions. The response to the survey also indicates that employees in the organisation understand the criticality of IT resources and can relate to their efficient use for the overall competitiveness of the organisation.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 10. Efficient use of IT resources

At Company A, top management has made IT an integral part of organizational life—employees cannot think of doing their job without technology. Company A encourages multiskilling of employees, which enables employees to build and strengthen their skills across various functions and platforms. Apart from technical and operational skills, they also learn particular banking skills specific to Company A's business. The organization also provides ongoing support to employees, they become proficient in technology use within the organization. The business analyst explains the support available to employees, so that they are trained to handle different aspects of IT based business execution:



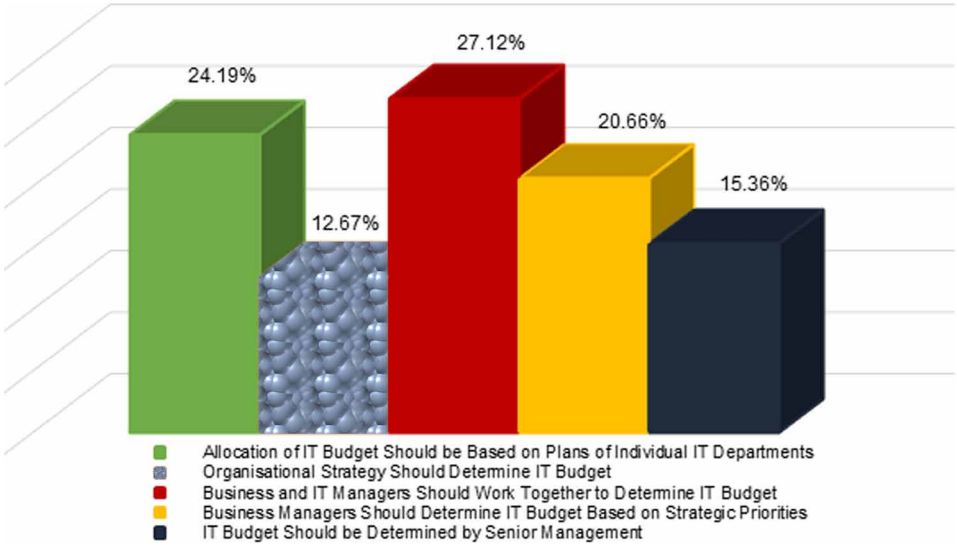
We have a team that provides training and service support to internal staff. They are technically sound and picked from various departments. This cross-functional collaboration helps them create all inclusive training programs, which I think would be pretty expensive if commercial trainers were hired. In our case, this team is able to give a thorough perspective of critical technologies to employees in a much friendlier and close to home environment.

In addition, Company A also utilises vendor-based training and support. External vendors provide support services to the organization on an as-required and where-needed basis. A senior software quality assurance employee explains the overall training paradigm:

We have external IT specialists from IBM to organise IT service support, in terms of applications and servers at headquarters and branches. We hardly get IT problems. Vendors are required to follow all IT infrastructure master plans that have been created and directed by IT architecture team. If there are new policies, new guidelines, new processes and new designs, organisation will pass them on to vendors, so they update their training programs.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 11. Allocation of resources



At Company A, top management is proactively involved in IT resource acquisition, allocation and management. At the same time, their technology implementation is derived from strategic business considerations, such that employees understand the rationale of technology, its utilisation, and how it contributes to individual efficiency as well as the overall business's profitability. It is, therefore, not surprising to note that 47.10% of respondents believe that resources allocation should be based on business priorities and 28.43% are of the view that it should be steered by possibilities of adding value (see Figure 11).

Budget Allocation

As explained earlier, Company A is a technology savvy organisation and allocates substantial budget for IT related infrastructure. The organisation has a fairly supportive CEO, who supports IT implementation at various levels in the organisation. It is, therefore, not surprising to note that majority of the survey respondents (27.12%) believe that business and IT managers should work together to determine IT budget (see Figure 12). This is because they have faith in, and trust top management that they will allocate funds when required. It is equally important to note that 20.66% of respondents believe that business managers should participate in IT planning and approval of budgets based on strategic priorities, whereas this organisation has IT infrastructure which is well aligned with its strategic business model. Similarly, there are only 12.67% of respondents who believe that organisational strategy should determine IT budget. It could be argued that these responses are somewhat biased because of continuing support and heavy involvement of the top management in Company A with IT related initiatives. In any organisation with similar characteristics and a non-supportive CEO, responses in these two categories maybe higher. Nevertheless, in Company A budgets are granted for approved projects only where business opportunities are evident. Budgets are monitored and controlled to make sure that they are spent wisely and effectively.

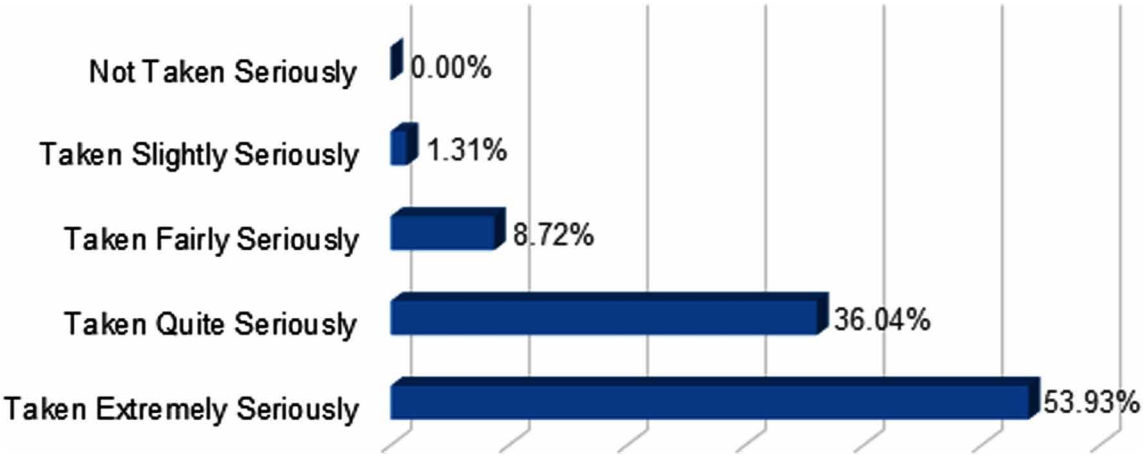
EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 12. IT budget allocation

Risk Management

Risk management is perhaps the most important concern of Company A. It has put in place various technologies to monitor and manage risks related to information as well as the systems that create/capture, exchange and store it. These initiatives are complemented with policy and procedural controls to monitor vulnerabilities and develop effective risk mitigation and management plans. The head of IT strategy and policy notes:

We focus on the efficiency of security systems by considering the type of security vulnerabilities, importance of system, and priority of information service. We classify results in different categories: type of incidents, level of severity and weakness. The results are used to develop an estimation plan that ascertains level and severity of risks, which is then used to allocate resources and develop assessment techniques, and risk mitigation and/or risk management plans, procedures and technologies.



The risk estimation process at Company A ascertains the probability or the likelihood of the risk occurrence. This exercise helps the organisation establish the criticality, interconnectivity, and the likelihood of risk occurrence. The systems administrator explains:

Once we conduct risk assessment, we create the improvement plan by checking the level of risks. Then, we create action plans by concentrating on the issues in action plans to manage the risks. The action plan is about the necessary steps to be taken, to avoid the risk as well as to initiate resources and raise alarms. So that, other departments can take defensive measures.

Figure 13 illustrates that 53.93% of respondents indicate that IT risk management in Company A is taken extremely seriously. It is unsurprising and understandable that senior management considers risk as the most important element of IT infrastructure in a banking environment. It is for the same

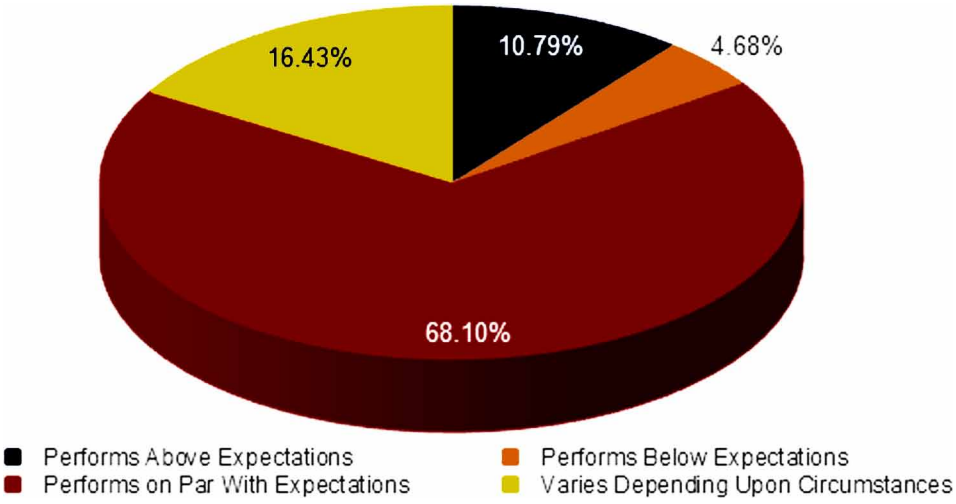
EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 13. Technology risk management

reason that senior management pays close attention to IT risk management while considering business priorities and new and attractive business initiatives. It is also not surprising to note that none of the respondents believe that the organisation takes IT risk management slightly seriously or does not take IT risk management seriously at all.

At Company A, all departments have their own tools to investigate and monitor risks. Experts who work within their departments develop risk assessment reports. These risk reports are then shared among all functional areas of the business, thus employees in different functions understand vulnerabilities are coming from other functions. This not only helps senior management to develop all-encompassing IT risk management plans and processes but also helps in educating employees on different risks emerging from their own department as well as from other departments affecting their work. In the same way, the organisation also lays maximum emphasis on external risk sources. For example, the head of software quality assurance comments:

We always conduct risk analysis and assessment for outsourced work. Although we do not outsource any critical information, still risk assessment from external sources is a critical component of the overall risk management process in all departments.



Performance Measurement

Company A has a fairly well-established performance measurement regime. It utilises frameworks such as Balanced Scorecard to measure the overall performance as well as functional performance in different areas of the business. For example, for IT performance measurement the head of software quality assurance asserts:

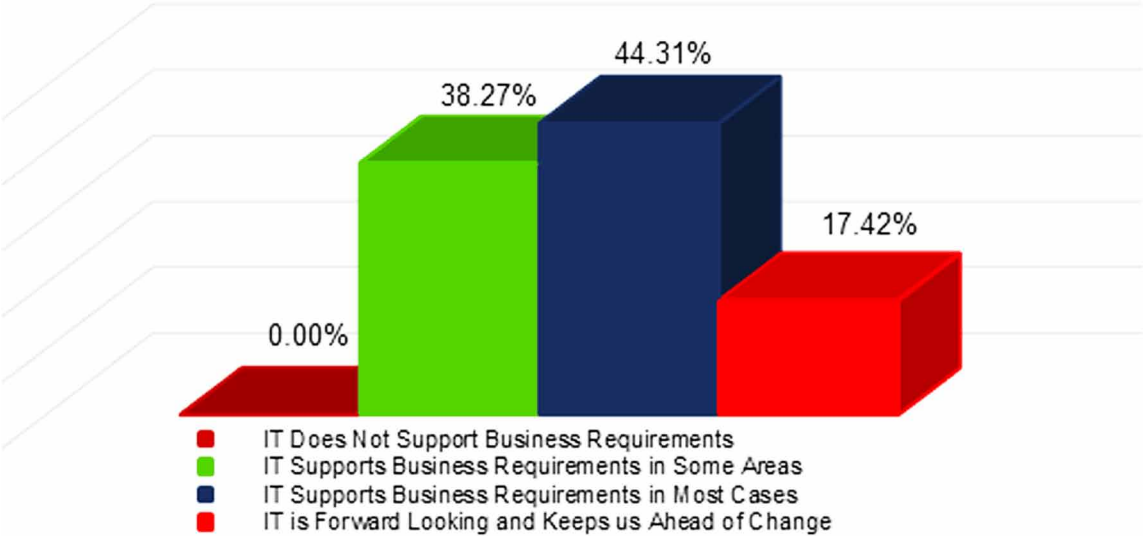
We adopt balanced scorecard to measure IT in a detailed way in different units. This gives us an in-depth analysis on the value assessment of IT to the stakeholders, customer service, and development of organisational capability. We couple this assessment with other assessments, such as; information quality, system reliability and availability, incident management, etc. to prepare detail analysis of IT infrastructure performance in the organisation.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 14. IT performance

Company A also continuously measures the performance of SLAs with the third parties. This complements the organisational effort in measuring performance of IT hardware. For example, the business analyst states:

We regularly measure performance of IT infrastructure, i.e., servers and networks. When we use this information along with the SLAs that we have with our major technology vendors, we can forecast future technology requirements and capacity planning. For example, IBM always reports us the capacity of hard drives and we make decision whether to invest more.



Performance measurement and management is not just an IT department function. It should be a critical component of every department's work agenda. This sentiment is reflected in the survey result illustrated in in Figure 14. Most respondents (68.10%) believe IT performance performs on par with expectations. They realise that the existing technologies can handle and support requirements of all business cases. This means most problems are responded and solved on spot with the right IT services and supports. This indicates that technology solutions and practices in Company A are well-suited to main business areas that are set in the business priorities. So, they deliver effective results.

Company A acknowledges that IT infrastructure is the primary organisational foundation to an agile business. It is vital to routinely investigate the capability and performance of IT infrastructure. Thus IT internal auditors or analysts collate monthly performance scorecards and provide cross-functional reporting for all operational areas. The performance is addressed in a report with recommendations for improvement to stakeholders and leadership team members. At Company A, performance measurement also focuses on measuring vendor performance in meeting SLAs. This signifies that the organisation understands that IT depends on internal as well as external support, and business departments can only access service attributes of technical infrastructure as available at any given time. Therefore, in order to get the full value of IT infrastructure performance, both these perspectives have to be accounted for.

Figure 15 specifies that most respondents (44.31%) believe that Company A has an effective IT infrastructure, which supports business requirements in most cases. However, it is interesting to note that

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 15. IT capability

38.27% of respondents are of the view that IT supports business requirements only in some areas. This means that in some business areas existing technologies and practices are not well-designed, incompatible, and unqualified to support business requirements.

Information Technologies Governance at Company A

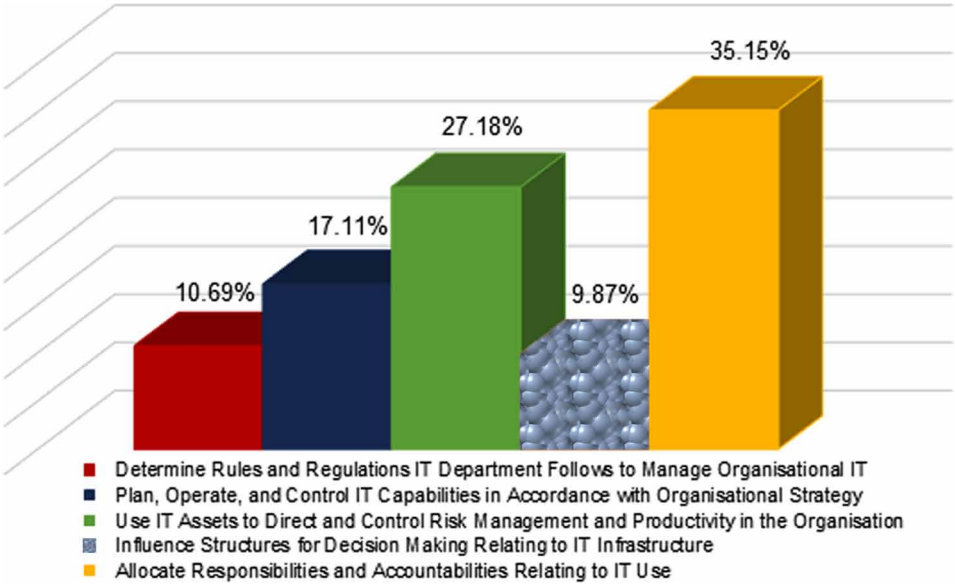
As Company A heavily uses IT in its business, it is unsurprising that most respondents (35.50%) believe IT governance allocates responsibilities and accountabilities relating to IT use (see Figure 16). This means that employees clearly understand their roles, rights and tasks about how to use IT properly and responsibly on all IT operations with the desired behaviour and actions. They realise that IT governance is embedded in their routine jobs, daily systems and working lives. Some (27.18%) believe that IT governance allows them to use IT assets to direct and control risk management and productivity in the organisation. This signifies that the boards focus on how to use resources wisely. They are the responsible people who decide to approve and allocate plans and budgets. Budgets are granted only for approved projects that provide opportunities, and are transparent. The boards monitor and control budgets to make sure that they are spent wisely, smartly and effectively.

It is not only employees who are required to utilise resources wisely, but contractors and vendors are also monitored and assessed. Training in different techniques occurs so consumables and resources are not wasted, and to capitalise on opportunities by cautiously applying IT resources and strategically preparing for improved economic conditions. Hence, Company A minimises unnecessary costs, has fewer expenses and limited possibilities to encounter unexpected large payments. This means Company A gains more savings and more earnings in the meantime. Particularly impressive, Company A employs this technique to capitalise on opportunities in cautiously applying IT resources and strategically preparing itself for improved economic conditions.

Figure 17 shows that most respondents (55.3%) believe that Company A has active involvement of people at all levels of IT governance. The boards and senior managers are careful and conscious of what

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 16. Expectations from IT governance



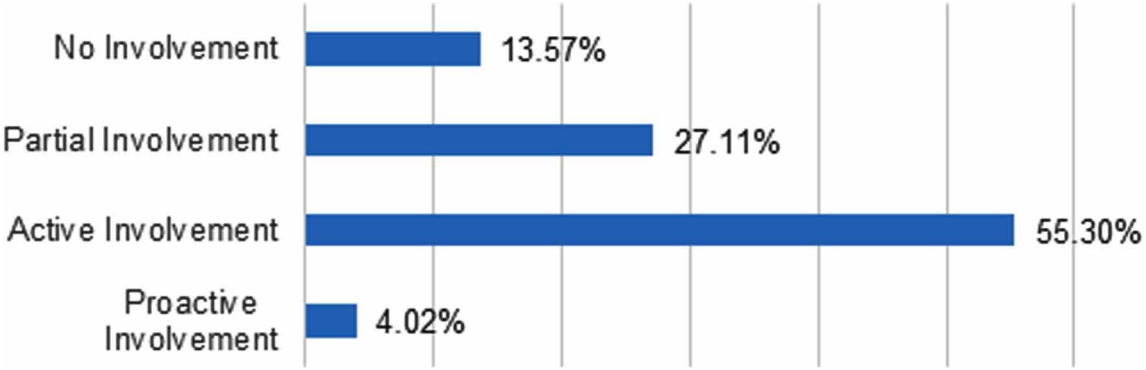


Figure 17. Involvement of all levels of the organization in IT governance

is working. The hidden issues, the unforeseen problems and the benefits are predicted and expected. It is unsurprising that their subordinates are well trained and work hard. Moreover, effective communication is the golden key in this shared environment where the boards, the CEO, the CIO and subordinates routinely collaborate. Everyone understands their responsibilities and scope of decision rights. Therefore, everyone in all levels of Company A is eager to be involved in decision-making to achieve desirable behaviour in the use of IT and expected performance.

DISCUSSION

Company A, being a financial institution, has security of information at the top of its strategic agenda. It is also evident in its philosophy towards the way it has institutionalised technology. Company A treats

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

IT as a strategic asset, though the overall scope of technology is limiting and has a passive stance. Implementation and utilisation of technology is policy driven and follows directions set by top management. Utilisation of technology is more focused on risk monitoring and management for known or detected risks. At Company A, proactive and pre-emptive risk aversion, however, is not associated with the value profile of technology. In certain areas of the business, there is complete alignment with technology, such that employees understand its rationale and show a positive attitude towards its use as well as gaining expertise. At the same time, there are other areas, where employees do not understand the justification for technology use, and work with it purely because it is supposed to be used. In these circumstances, it is difficult to assign or assume information ownership, which leads to bigger issues like assigning responsibility and accountability for inept and inadequate understanding and use of technology. The end result is that there is no single 'definition' or 'explanation' of technology use in Company A. The definition or explanation as intended by the top management is not followed by the entire operational level. Although, the top management is technology savvy and has been very actively acquiring and managing technology resources, yet their focus or obsession with security and risk management has resulted in divided opinions. It is just like citizens are required to pay taxes in most economies around the world; however, there are a relatively low number of economies where the results of taxation are evident through public emancipation. In the rest, although people pay taxes they do not see that money being reinvested in their social uplift. That may be due to government corruption or inability of the government to comprehend or prioritise what is important for the public. Whatever the case may be, the general public loses faith in taxation, even though, in theory, it is understood that the government is charging these taxes in return for safeguarding individual and collective interests of the public. Hence, there are issues like tax evasion and frauds. In the same way, the intent of Company A's top management is evident through the active agenda of implementing contemporary technologies, allocation of resources for their use and management, and training employees on the same. However, due to focusing on specific functions, lack of proper education of employees about the utility of technology, and inability of planners and managers to take the 'value chain' perspective of the entire organisation, technology use is treated differently in different functions.

In terms of mimetic pressure, the organisation draws from contextual forces that shape banking or service industry. In doing so, it has implemented best practices for CRM and those relating to backend financial transactions. It is further supported by Company A's keenness to follow alignment of the business model with technology, which helps employees to increase their capacity to understand the causal relationships between technology and business execution. Company A's upskilling and reskilling agenda helps employees to learn from peers within the organisation as well as from within the industry. This helps Company A with a better understanding of why, how, and what organisational aspects are to be focused in various types of change processes.

In terms of coercive pressure, there are three factors acting on Company A. First and foremost, pressure comes from the Bank of Thailand, which sets the legal, operational, and social direction as mandated by the Thai Government. In response to these guidelines, Company A deigns its products and services, business processes and their enabling and support infrastructure like IT, regulatory frameworks, investment incentives, and controls. The second factor is the pressure coming from within the banking industry, which is evolving technologically on a continuous basis. Company A has to change technologically continuously to remain relevant within its industry as well as to utilise the technological innovation relevant to the banking industry. The third type of pressure comes from the customers of Company A, such as commercial organisations as well as the general public. With growing automation of human life and connectivity among the general public, there are increasing demands for availability,

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

security, confidentiality, and completeness of information. This forces an organisation like Company A to continuously update its technical infrastructure to keep in sync with the technological changes in the operating environment well as the changing information needs and demands of the public.

Normatively, Company A has developed a culture that works as a well-oiled machine. Company A's CEO is committed to developing a robust technological infrastructure. The CIO of the organisation has significant input into strategic and policy direction of the company. Top management is, thus, quite liberal with financial and non-financial resource allocation. The company actively embraces new technologies, refurbishes existing technologies, and upskills its knowledge workers on contemporary technologies. Company A has a centralized structure, whereby technology implementation and management decisions are made by head office. However, top management also believes in delegation, and has delegated technology lifecycle management and majority of training to branch offices. This helps with the empowerment of middle management. Culturally, the organisation is security conscious and allocates a lot of resources and efforts in risk monitoring, mitigation and management. This has resulted in intensive internal competition between various functions on risk management. It helps employees in different functions understand technical and non-technical vulnerabilities originating from other functions of the business. This allows planners and managers to develop well-rounded IT risk management controls and plans, and in educating employees about the various types of risks posed to the organisation. However, the organisation seems overtly focused on security and risk, and often at the peril of improvement and innovation in other areas of the business. Company A also routinely conducts performance audits, where it assesses the value of the existing technical infrastructure, IT skilled HR, technology vendors, and SLAs, to the business. This evaluation is an ongoing activity in the organisation and the feedback is acted upon as and when deemed appropriate by the management.

CONCLUSION

This study presents a view of the institutionalisation of IT governance in large sized organisations. It contributes to theoretical research, as well as practice, in the field of IT diffusion and management and business management. There have been many research studies in IT governance; however, they have been focused on implementation diffusion and management aspects of IT governance. This study assesses how the case organisation has made IT governance an essential component of its organisational life. The findings from this study provide critical understandings about the organisation's view of technologies, as well as the psychology behind implementation of IT governance practices, as conceptualised and implemented in the organisation. This understanding helps understand how technology is viewed and absorbed within the social, cultural, organisational and technical environment of the organisation. At the same time, this understanding provides foundational knowledge for the development of more research to review further intricacies of IT governance practices and their interaction with the difference organisational, social, culture and technical systems within the organisation.

Chapter 77
Technological Change Perspective for ERP Implementation in Small and Medium Enterprises

Jessy Nair
PES University, India

Aarthy Chellasamy
PES University, India

ABSTRACT

Small and medium-sized enterprises (SMEs) trail large organizations in leveraging IT systems. SMEs are beginning to understand the significance of implementing IT systems like ERP for improving their preparedness in business processes. Hence the objective of this research article is to develop a framework to analyse SME's organizational preparedness for implementing the technology. This research applies a General Morphological Analysis (GMA) framework to explore suitable models and variables for IT change preparedness to realize the benefits of ERP implementation in SMEs. An SMEs drawback in implementing IT tools is specifically due to a lack of knowledge and an acute shortage of resources like investment and manpower. The review of literature in this article using general morphological analysis is novel for ERP implementation in the SME sector. Based on the review of articles, a morphology with a technology organization framework and environment (TOE) framework which evaluates technological, organizational and environment is most adequate to understand the IT readiness for ERP among SMEs.

INTRODUCTION

In recent times Information Technology (IT) has become a vital component for organizational preparedness in the business environment. The volatile pace technologies are growing at, it makes it essential to facilitate organizations in implementing strategic IT systems since they are determinants of organizational

effectiveness and competitiveness (Singh, 1993). One such transformation that requires special mention is an Information Technology (IT) component, Enterprise Resource Planning (ERP) system. ERP, a software commodity, is an enabler of such a change from functional to process enterprises by way of seamless information flow to stakeholders across the organization. In the 1990s ERP systems became the "de-facto standard" (Parr & Shanks, 2000) for replacing legacy systems in large organizations (Ross, 1998; Robey, Ross & Boudreau, 2000). ERP systems are organized around the basic economic rationale of enterprise value chain. They are designed around a process view of the business. The major advantage of ERP over application software suites is that the enterprise wide applications promise seamless integration of information flowing through the company: accounting and financial information, human resource information, supply chain information and customer information. However, the most crucial factor in the whole system of ERP is the implementation aspect (Ahmad & Cuenca, 2013; Jha, Hoda & Saini, 2008). On the contrary, when the ERP implementation is a failure, there is no framework available to the organization to indicate what parameters cause failure and what the quantitative loss to the organization is. The consequence of organizational change due to ERP system implementation results in tangible and intangible benefits to the organizations. Because ERP promises such potential benefits, understanding the costs and how to avoid them should be a research priority (Gattiker & Goodhue, 2000). It becomes essential for organizations and decision makers to identify, measure, and increment these benefits of ERP implementation (Ross, 1998).

Large and small-scale organizations are implementing technologies to stay competitive while expanding globally. Small and Medium sized Enterprises (SMEs) trail large organizations in leveraging IT systems (Thong & Yap, 1995). Globally, SMEs are a major source of employment for a nation's economy and play a very important role in the socio-economic development of the country (Sharma, Gray & Daniel, 2007). SMEs are beginning to understand the significance of implementing IT systems like Enterprise Resource Planning (ERP) (Sharma, Gray & Daniel, 2007) for improving their business processes. ERP is defined as an application system software that centralizes an organization's database and brings about organizational change during its implementation to achieve organization goals (Nair, Reddy & Samuel, 2015). This necessitates the research question, the need for a research framework to analyse an SMEs organizational preparedness for implementing the technology and realizing its benefits from an organizational perspective. Love and Irani (2004) point that limited research attention has been given with regard to analysing the benefits of ERP implementation in SMEs (Saini, Nigam & Misra, 2010). Unlike large organizations, SMEs are often "cash poor", lacking in resources and expertise in implementing IT (Dyerson, Harindranath, & Barnes, 2009). ERP intervention results in an organizational change as its implementation is not only a technical system imperative but has to synergize with the social system of the organization (Nair, Reddy & Samuel, 2015). While large organizations have reached an assimilation stage of ERP implementation, SMEs are still in an emergent state. Hence it is essential for SMEs to build readiness at the firm level for ERP implementation. ERP intervention in an SME results in an organizational change (Sharma, Gray, & Daniel, 2007; Cui & Liu, 2010) necessitating organizational readiness from SME owners to deliberate on the antecedents for an IT implementation such as ERP. Singh (1993) argues that the inclination of SMEs to use IT systems requires preparation due to the socio-technical parameters influencing the organization internally as well as externally and hence preparedness for the consequent change "is thought to be a critical precursor to successful organizational change (Weiner, Amick & Lee, 2008, p.380)." This chapter applies a General Morphological Analysis (GMA) framework to explore suitable models and variables for IT change preparedness to realize the benefits of ERP

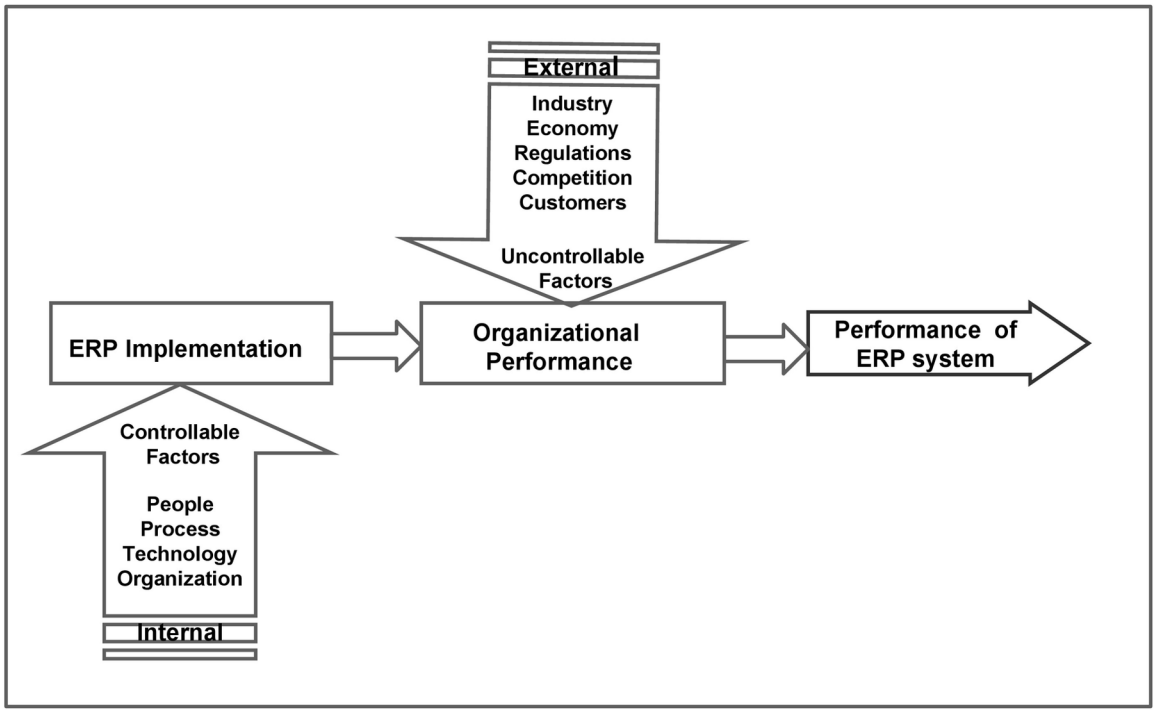
implementation in SMEs. Literature is compiled based on the GMA framework to identify a suitable morphology for further research.

The following section describes the ERP deployment methods adopted by organizations and the implementation issues in SME sectors. The next section describes the technological preparedness demanded by SMEs as an outcome of ERP intervention. It also explains the actions necessitated for ERP implementation from an organization's side in the current climate of a business environment. In this section, the technological preparedness for small and medium enterprise (SME) sector is reviewed by applying a framework. The section discusses ERP as a technology and its significance towards technological change preparedness is emphasized. The section following, applies a GMA to decide on a suitable morphology for the SME sector and discusses the significance of the selected morphology. The final section of the chapter discusses implications for future research and draw conclusions.



BACKGROUND: ERP IMPLEMENTATION IN SME SECTORS

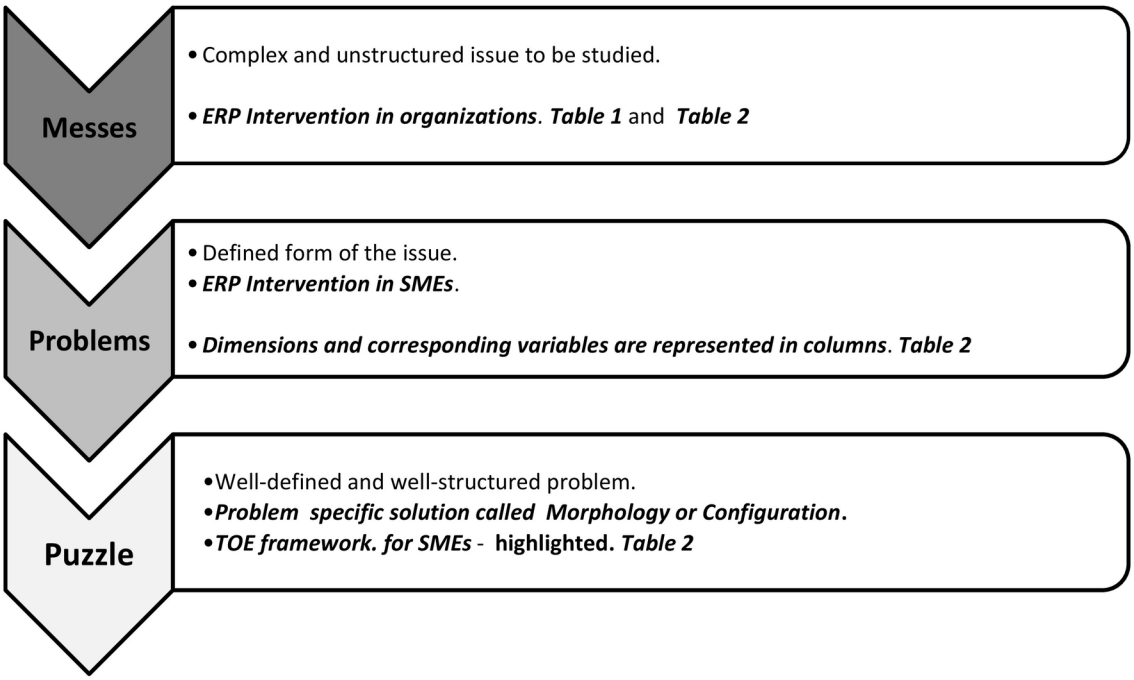
Once an organization (large or small and medium business) selects ERP as a technology infrastructure to be implemented, the deployment method is planned by the organization. Parr and Shanks' (2000) comprehensive literature has detailed ERP implementation approaches as comprehensive, middle road and vanilla. Koch (2007) categorizes these approaches as; big bang, franchising and slam dunk respectively and define these concepts as follows: Big Bang method of installation involves swapping legacy systems with ERP system installed for the entire organization. This method of organizing projects requires tremendous resources from the organization in terms of investment, people and time. Adopting new standard processes and adaptation to the new software system by the entire organization has never been a success story for most organizations. In the Franchising strategy, ERP systems are independent and only common processes are linked across the organization. The merit of this category of ERP deployment is that core businesses of the organization are not affected during the course of the project since pilot installation happens at units where such a project would not disrupt routine processes. Finally, the slam dunk method is where a few key processes are bought under the purview of the ERP system. This strategy of ERP project is adopted by small organizations which prefer to see their systems up and running to avoid the radical reengineering of processes in the organization.

Organizations are scaling their technologies to stay connected with their stakeholders. Though large-scale organizations have adopted IT systems such as ERP, vendors consider this market as close to saturation and are focusing on ERP systems for SMEs (Haddara & Zach, 2011) who are trailing in adopting technology innovations (Thong, 1999a). In the present business context, ERP is a tool for competitive advantage and enables organizations to improve their efficiency and effectiveness. SMEs are to yet to reap the benefits of this IT tool. Issues related to SME context are different from those faced by large organizations (Thong, 2000b; Kale, Banwait & Laroiya, 2010; Haddara & Zach, 2011). Though Small and Medium enterprises (SMEs) all over the world have various definitions, a hindrance common to all of them is their inability to structure their resources from an IT perspective to increase their efficiency and competitiveness. Severe resource crunches among SMEs in Indian context have been stated by Kale, Banwait, and Laroiya (2010) in their empirical research conducted among 130 SMEs in the most industrially advanced cities of India. Lack of evaluation of costs and benefits of IT implementation among SMEs in Australia is analysed by Love and Irani (2004). Resources in terms of IT users, IT experts, finance, and time are some of the resource constraints identified by Thong (2001b) in their study of

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 1. Influence of Endogenous and Exogenous factors on Performance of ERP System

SMEs in Singapore. Scaling up their business to the next stage requires implementation of technology like ERP (Saini, Nigam & Misra, 2010). Almost all SMEs are implementing cheaper, simplified, compact and customized ERP solutions at flexible prices provided by vendors (Kale, Banwait & Laroiya, 2010). Welsh and White (1981) in their highly refereed article distinguish large and small enterprises and point that they cannot be deliberated on same dimensions. Furthermore, they refer to the SMEs condition as "resource poverty" implying that a large share of revenues is reinvested into internal factors and due to the highly competitive exogenous environment factors in SMEs, their expenses are on the rise.



Variables within a SME can be consolidated with a framework that represents an enterprise from an organizational change perspective. Internal variables for ERP implementation are factors within the scope of the organization's control and external factors are those that are beyond the control of the organization (Figure 1). The stakeholders and practitioners who undertake such a change may be able to assimilate one change brought about by ERP intervention. Nonetheless, a framework with dimensions that represent an endogenous organization from an organizational change perspective is lacking. Hence in the following section, the authors discuss the significance of preparedness among SMEs to ready the organization for the challenges of a technological intervention such as ERP. Nair, Reddy, and Samuel (2015) analysed the consequences of ERP intervention in large sectors through a General Morphological Analysis (GMA) framework in an earlier version of their article in a chapter. Here the authors use GMA (Ritchy, 2006) to analyse a suitable morphology for ERP intervention on SMEs in Indian context.

ERP INTERVENTION IN SMEs: A GENERAL MORPHOLOGICAL ANALYSIS FRAMEWORK

To identify the themes for ERP research, a General Morphological Analysis (GMA) is used. GMA is a generalized framework that can accommodate and facilitate the study of various aspects of ERP implementation in a multi-dimensional space. It structures and investigates the total set of relationships contained in multidimensional, usually non-quantifiable, complex problems (Ritchey, 2006). The dimensions identified form column headers and the variables of each dimension are clustered under the associated dimension in columns. This visual relationship is called as a morphological field (Ritchey, 2006) and a combination of variables from each dimension is called a configuration or a morphotype. Three broad steps of developing a morphological framework are: messes- complex and unstructured issue in hand to be studied, problems-here the issue has a defined form and therefore, its dimensions and its corresponding variables are identified and represented in columns and the last level is called a *puzzle*- a well-defined and well-structured problem with a specific solution that somebody can work out (as cited in Ritchey, 2002). There have been attempted studies in areas of modelling complex socio-technical systems (Ritchey, 2002), accountability in life cycle of products and packaging introduced in the market (Ritchey, 2006), virtual organization contexts (Shekar & Ganesh, 2007) and knowledge transfer research (Kumar & Ganesh, 2009). The visual tool allows a researcher to map specific variables under each dimension and work on a specific morphology. The steps of developing a morphological framework are illustrated in Figure 2.

Figure 2. Steps of Developing a Morphological Framework (Ritchey, 2006)

Technological readiness is believed to enhance efficiency and is regarded as one of the parameters of competitiveness in the world economic forum's global competitiveness report (Schwab, 2014). The report argues the need for organizations to adopt technologies for daily activities and production processes. An SMEs drawback in implementing IT tools is specifically due to lack of knowledge and acute shortage resources like investment and manpower (Kadadevaramath, Chen, Sangli, Raj, & Vardhan, 2014) review of IT tools for SME. The review results are classified based on two central themes or messes of ERP implementation research; ERP deployment and ERP intervention as demonstrated in Tables 1 and 2 respectively. A representative list of variables drawn from literature are listed in columns and clustered under their respective dimensions (see Table 1 and 2). ERP deployment as detailed in the earlier section of the chapter calls for an organization to plan for ERP implementation based on the size of the organization, type of module, method of deployment and implementation strategy. GMA for ERP deployment will be of scope to practitioners to develop themes for future research for effective deployment of ERP. However, ERP intervention analysis for SMEs (see Table 2) is a highly researched area by academics and benefits the top-management in anticipating the risks associated with ERP implementation. Most SMEs purchase stand-alone modules of ERP systems for certain core functions of the organization and get them implemented by the vendor (Table 1). However, literature review points the need for a research framework that analyses the organizational characteristics of SME be evaluated. Zach, Munkvold and Olsen (2012) point the need to analyse the contextual influences of the organization to adopt ERP and according to Ram, Corkindale, and Wu (2015) requires an antecedent such as organizational readiness. However, research in the area of IT readiness with reference to ERP as a tool in the SME sector is lacking (Zach, Munkvold, & Olsen, 2012). Organizational readiness or preparedness focuses on the micro or organizational level (Lalic & Marjanovic, 2011) since small businesses are under increasing pressure to implement IT for survival (Thong, 2001b). The preparedness of an organization can be broadly categorized into an endogenous a component; within the organization context and an exogenous component; variables originating from outside the organization. Although the endogenous environment refers to a micro organizational perspective, the consequence of IT intervention has to be reflected and premeditated by the SME owners. Therefore, the following sections review the preparedness of SMEs form an IT perspective due to ERP intervention.

Table 1. General Morphological Analysis Framework for ERP Deployment

Industry	Modules or IT Tools	Method of Deployment	Deployment Strategies
Large Scale Enterprises	Customer Relationship Management	Big Bang	Customized Packages
	Sales Order Processing		
	Procurement		Stand-Alone Modules
	Financials	Phased (by function or location)	
Small & Medium Scale Enterprises	Automated Billing Systems		
	Content Management Systems		Cloud Model
	Human Resource Management System	Modular	
	Office Production tools	Hybrid	On-Demand/Software as a Service (SaaS)

ORGANIZATIONAL CHANGE: A CONSEQUENT OF TECHNOLOGICAL INTERVENTION IN SMEs

Organizational intervention while implementing technology leads to change (Cui & Liu, 2010). Orlikowski and Gash (1994) state this process as "sense making". They explain that in order to understand the organizational impact of new technology, it is essential for actors in the organization to "develop particular assumptions, expectations and knowledge of the technology" (p. 175). This "sense making" will act as an enabler for SMEs while implementing IT systems such as ERP. Fostering an organizational environment such as this for IT implementation requires an organizational change process by way of "preparedness" or "readiness" among the actors.

Ongoing research case study by Cui and Liu (2010) to comprehend the technical processes of an ERP system at a physician's workstation in a hospital to examine its current level of preparedness, points towards the need to analyse organizational and actors' perspectives while measuring IT readiness. Though results of the study may not be conclusive to validate the results, the antecedents to preparedness for ERP system implementation can be identified. Singh's (1993) comprehensive review of several IT systems preparedness models points to the increasing need for organizations to plan tactically and strategically and adapt their IT systems to meet the needs of organizational and environmental contexts. Discussing the significance of ERP in SMEs, Singh, Singh and Pereira (2010) discuss the narrow scope of IT usage for correspondence and internal communication by top management and supervisory staff. Their case study discusses the antecedent role of actors, specifically a strong leadership of the management to bring about the technological change. Raymond (1985) studied the role of top management in implementation of information systems in small organizations and recommends the significance of the role of top management in understanding the implication of IT. Vasudevan and Chawan's (2014) case study identifies factors of preparedness in implementing knowledge management module in the SME sector in an Indian context. Some factors identified were individual user barriers and lack of training in using their knowledge in various roles in the SME.

ERP PREPAREDNESS: AN ESSENTIAL ANTECEDENT FOR SMEs

The morphology-based framework provides a holistic map and is a tool used by researchers to identify various instances of ERP intervention (Nair, Reddy, & Samuel, 2015). Several *puzzles* for the researcher or practitioner are illustrated in Table 2. A combination of 3*8*4*6 = 576 morphotypes as themes for research are available to researchers and practitioners to decide upon a suitable morphology for research. A sample morphotype is highlighted (see Table 2) under the columns representing the dimensions of ERP intervention in SMEs: stages, perspectives, frameworks and contexts. A study choosing such a morphotype will have the variables: project readiness, IT readiness, IT preparedness, Technology Organization Framework (TOE) framework and the context for study is organizational change and organizational environment. Therefore, ERP intervention in SMEs results in organizational change internal to the organizational environment context.

The review of literature in this chapter using General Morphological Analysis is novel for ERP implementation in the SME sector. Based on the review of articles, a morphology with a Technology Organization Environment (TOE) framework which evaluates technological, organizational and environment is most adequate to understand the IT readiness for ERP among SMEs. Uncertainty of the business

Project Assimilation	Structuration	Technology Acceptance Model (TAM)	Stakeholders Role - Internal & External
	Socio-Technical System		

environment and ever-increasing competition requires SMEs to look at their internal context and measure the determinants in an organizational environment context. This will enable the top management and practitioners in the SME industry to look at readiness by analysing the organization's capability for the imperative technological change.

FUTURE RESEARCH DIRECTIONS

Organizations in developed and developing economies are increasingly adopting technology as an innovation to create profits and simultaneously increase job opportunities. Small and medium enterprises play a special role in developing the economy of the nation. Hence a study of technology innovation such as ERP intervention on SMEs is a challenge. Furthermore, refining the variables or adopting novel research models from other interdisciplinary areas of research can add more variables for further research. An organization environment variable can include the external environment and several stakeholders of the organization. Deployment models for cloud ERP implementation in SMEs can provide further scope for research.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

CONCLUSION

Information Technology intervention on organizations initiates technological change in organizations. An IT innovation such as ERP brings competitive advantage to organizations. While its implementation has not been successful in many organizations, the market for ERP in large organizations is weaning. Hence the scope for research in ERP implementation in the SME sector requires a structured micro level framework to prepare the organization to cope with competitive pressure. SMEs of today are large organizations of tomorrow; hence it is inevitable they get prepared for such an IT infrastructure. The aim of this chapter is to use a General Morphological Analysis framework to draw up the most suitable morphology through a comprehensive literature review. To a researcher and a practitioner, the GMA framework enables identifying a suitable morphotype for ERP intervention in SMEs.

Chapter 78
Using Marketing to Implement a Strategic Plan:
Reflection of Practiced Literature

Brian J. Galli
Long Island University, USA

ABSTRACT

Close to 75% of marketing and promotional campaigns globally fail to meet their purpose. Marketing campaigns fail due to pitfalls, which sink promotional projects. Strategic planning is significant in overcoming these pitfalls hence increasing the chances of business being successful in their promotional campaigns. However, a lot of businesses are experiencing issues with integrating strategic planning into their daily operations and promotional campaigns. This article is intended at discussing the pitfalls, which may sink a promotional campaign and suggests how strategic planning can solve these issues. In addition, this article also discusses approaches which can be adopted by organizations to enable them to successfully integrate strategic planning into the marketing projects. In conclusion, it suggests some approaches that organizations may adopt to ensure that they are successful in their future projects.

1. INTRODUCTION

The current business environment is very competitive which makes it problematic for businesses to attract, retain, and grow a customer base. The business environment is characterized by high profitably, which attracts new entrants to share profits leading, to stiff competition. Businesses also increasingly invest resources in marketing for the purpose of communicating and promoting their product/service. For example, the global marketing spending on media alone rose to $2.1 trillion in 2015 (Scott, 2015). Scott (2015) adds that digital or internet advertising is the fastest growing marketing segment as businesses look to leverage on more than 1 billion daily users on social media. Experts believe that global spending on marketing won't decline soon as more businesses increasingly rely on marketing to attain a superior advantage.

Marketing and promotional campaigns are intended to communicate products/services and sell them to the intended audience. Scott (2015) argues that despite the increase in spending on global marketing, not all businesses attain their desired outcomes. Close to 75% of marketing and promotional campaigns globally fail. These projects not only overrun their costs but also their time/schedule. Failed marketing projects cost the U.S economy between $100 and $150 billion annually. Project management experts project that more marketing campaigns will fail if businesses do not integrate the projects with strategic planning.

1.1. Background to Strategic Planning

Strategic planning involves setting a goal that a business wants to achieve (Johnson, 2015). In addition, plans of action or activities are designed to facilitate success. Top management also sets frameworks, such as regulations, to support the activities and influence the organization to attain the goal through leading by example. Johnson (2015) argues that strategic planning is concerned with all aspects of an organization. The main purpose of an organization is to maximize shareholder's wealth by realizing superior profits (Johnson, 2015). To attain this goal, a business may identify intensive marketing as the most effective approach. Therefore, the business will allocate adequate personnel and financial resources to enable successful marketing campaigns (Kaoud, 2017).

1.2. Study Hypothesis

Strategic planning is crucial to promotional campaigns success. This is because it provides a sense of direction and measurable goals. In addition, it guides in effective allocation of resources while conducting marketing programs that lead to success.

2. RESEARCH METHODOLOGY

This paper organizes existing literature pertaining to the relationship between strategic planning and marketing at the micro-level. The following approach was adopted: conducting a meta-analysis instead of a narrative literature review. A traditional literature review was not implemented because it is a qualitative approach that does not permit quantitative assessment of interest effects. Furthermore, this approach does not facilitate standardization of methods that are applied in differing studies. When researchers lack the ability to compare estimates, substantial bias may arise. That is why meta-analytics is implemented instead.

The study focuses on 1 effect: the impact of strategic planning on marketing. We conducted an overview of research literature concerning Europe, US, Canada, Middle East, and Australia. When discussing the results, we focus on the differences in the studied effects across various institutional settings.

2.1. Meta-Analysis as a Quantitative Literature Overview

There are several advantages to utilizing meta-analysis instead of a standard literature review (see e.g. Stanley, 2001). The primary reason is its quantitative nature. A standard narrative literature review does not quantitatively assess the effect of interest. It merely provides a higher-level commentary of the find-

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

ings in the varying studies. Another advantage of meta-analysis is that it offers researchers a new way to standardize studied effects, method of analysis applied, control variables, and sample selected. As a result, researchers can better understand why there are gaps or variation. Furthermore, meta-analysis facilitates merit evaluation in different research methods, designs, data, and country specific contexts. A third advantage is that a meta-analysis can be conducted over all papers available based off priori defined criteria. This deters selection bias from occurring.

Despite such advantages, meta-analysis has its limitations. Unfortunately, it returns a narrower range than a traditional review. The traditional approach covers a broader range of studies without compensating for a priori defined criteria. For example, a traditional literature review can encompass studies that are only marginally related to the topic of interest. Another limitation is that it might prevent researchers from locating relevant studies. This is because publishers accept studies that report significant results, but the researchers might want studies that are more discrete in their findings. When a meta-analysis cannot unearth relevant studies, it is coined the "file-drawer" problem. This limitation can be avoided, since many new ways are developed to test and eliminate it (Rosenthal, 1979; Card & Krueger 1995; Begg & Mazumdar 1994). A final limitation is that researchers make more assumptions. When using a meta-analysis, researchers do not report the results required to conduct the analysis. Such results can include standard errors or t-statistics. Researchers are presented with a lack of information, therefore making more assumptions than they ought to.

2.2. Selection of Studies

Before pursuing a meta-analysis, one must construct his meta-data. To ensure that we collected a representative sample of high quality studies, we focused on reviewed articles and chapters in books and Monographs. Thus, we disregarded working papers and internal research reports. Our systematic search used a combination of selected keywords (including: Strategic Planning; Marketing; Project Management). A systematic literature search (traditional narrative review) was performed in the initial phase. This approach synthesizes primary literature and explores potential heterogeneity within it.

In this study, the traditional narrative review performed a literature review on current fields of study to identify potentially important literature. The following databases were used to obtain literature: EBSCO Host, Elsevier's Scirus, Scopus, ISI, Academy of Management, Google Scholar, Intute: Social Sciences, PROQUEST, ProQuest Digital Thesis, Blackwell Publishing, Networked Digital Library of Theses & Dissertations, FirstSearch, Emerald Full Text Database, Academy of Management Perspectives, Executive Development, Journal of Management, and The Sociological Review.

Keywords and phrases helped query the online databases (note: no filters were used and all combinations of these keywords and phrases were considered). As a result, 60 pieces of literatures ($N = 60$) were returned. To filter this abundance, a meta-analysis was used. It helped identify the critical pieces of literature and potential research gaps. Articles in English and non-English languages were considered. Omitting studies in foreign languages may cause an under-representation of some countries. This is a common issue in existing literature reviews.

The search was terminated once we reached the saturation point. In other words, by combining keywords and incorporating new ones, we gathered evidence that was already attained. Search filters refined the meta-analysis. A simple filter consists of single or combined words entered into database search parameters. Within many search parameters, Boolean algebra is implemented to form relationships

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

between words. This helps further refine query requests. The most commonly used Boolean functions are "AND", "OR," and "NOT."

When developing a search filter, sensitivity and precision are considered and balanced Sensitivity is the ability of a filter to find all relevant material. Precision is its ability to reject irrelevant material. A filter with a high emphasis on sensitivity will include less and irrelevant material, whereas higher precision will reject potentially relevant information. In this study, a filter was initially developed with a high level of sensitivity. Additional adjustments were made to reach a desirable level of precision. In fact, crucial material search listings obtained from prior versions of the filter could be examined so that common terms could be incorporated to develop and refine the sensitivity. Several wildcard terms were introduced into the filter. By reviewing common categories of irrelevant material, the filter's precision could be further adjusted. The best adjustments were made by changing the structure, including usage and placement of AND and bracketing of the OR. Therefore, such a combination linked by the AND operator excluded irrelevant material.

The filter was then applied to the search parameters of each database from the initial search. The reference sections from literature identified in the initial queries were closely examined with the filter. As a final measure for robustness, this study incorporated direct correspondence with authors.

In one respect, filter results were less successful than anticipated when identifying material in the wider gray literature. Gray literature is material that is not commercially published. It may include working papers, business documents, government reports, educational reports, institutional reports, dissertations, technical reports, and conference proceedings. Gray literature is more commonly identified via manual searching. Employing the systematic search strategy helped us reduce the N of 60 studies to 30 (n=30). This is 50.00% of total literature identified, and served as the basis for performing the subsequent analysis into research objectives and hypotheses. Textual analysis was implemented to identify common themes and concepts.

Textual analysis is beneficial to comprehend all themes identified in the literature. As a result, researchers map and describe the content, functions, and structure of the literature. One common method of textual analysis is content analysis, which is when a researcher identifies, processes, enumerates, and analyses specific themes, messages, and characteristics in the text. This study implemented qualitative and quantitative content analysis. Qualitative content analysis suggests that meanings are associated with messages based on the frequency by which message factors occur. The quantitative content analysis is a systematic and step-by-step procedure that addresses key research questions. Then, results were categorized into themes and via affinity diagramming. The results of the affinity diagram served as the basis for the sections of this paper. As a result of filtering and diagramming, 23 articles were selected.

We limited the study selection to works that clearly explored the relationship between strategic planning and marketing. Thus, we restricted the search to longitudinal studies. Some identified authors presented an analysis of more than one independent sample, or studied more than one transition. These estimates were independent from another, and were included in our analysis. We accepted estimates from final models only. With thorough review of the 23, it was found that the results varied in focus and depth pertaining to strategic planning and marketing. From a descriptive and trait perspective, these papers indicated that the relation of ethics in strategic planning and marketing involve four themes, including: "Reasons why marketing campaigns fail," "Significance of strategic planning in marketing campaigns/projects," "Challenges to strategic planning," and "How to integrate strategic planning in promotional campaigns." The 23 studies are categorized based on theme, as depicted in Table 1 (note: some studies

5	2 (15.4% of total articles)	Scott (2015) Johnson (2015)
6	2 (15.4% of total articles)	Vemer et al. (1989) Waldorf and Byrun (2005)

overlapped in more than one category based on the research it pursued, but each study was categorized into 1 theme best describing the study).

From a relational and causal perspective, review of the 23 demonstrates that these literature analysed strategic planning and marketing by employing different statistical methods. The use of statistical analysis and exploration of different variables/factors helps add value and depth to the conclusions drawn. Table 2 presents a summary of the statistical methods that the 23 studies used. Table 3 presents a summary of number variables/factors studied in each.

The next section presents the findings of the research methods in the scope of these four themes. The collected studies, apart from one, treat each keyword as exogenous. This is the most common way to investigate the relationship between the two variables. The studies that consider the variables' endogeneity are rare and often based on instrumental variable methodology. After collected the articles, we proceeded with the construction of one dataset for the association between strategic planning and marketing. Next, the dataset reliability was verified.

2.3. Meta-Analytic Techniques

2.3.1. Calculation of Effect Sizes

Our effect sizes are the log odds ratios, the log relative risks, and the estimates of the OLS regressions weighted by the inverse of their variances. They originate from the models, where the dependent variable is defined as the hazard of X (for each outcome of X), the hazard of Y (for each outcome of Y) or, in the

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

case of the fixed-effects OLS regressions, deviation from the factor-specific mean. The variance of the effect size is defined as a sum of the squared standard error and the between-study variation. In order to study the influence of strategic planning and marketing, we selected the estimates for each potential outcome for each variable in the study. This was the most standard way of reporting the influence of strategic planning and marketing. Sometimes, however, the original reference category was different for each sample and each factor; in those cases, the coefficients then were recalculated according to the standard statistical procedures.

The last issue we encountered while calculating the effect sizes was the lack of standard errors or other statistics allowing a direct calculation of standard errors (e.g. t-statistics or at least p-values). Following the literature on meta-analysis, we made the following assumptions. When the result was marked to be significant and no other details were available, we set the p-value equal to 0.05. When the result was not significant and the upper limit for significance assumed by the author was 0.1, we set the p-value at 0.45, and when the upper limit was 0.05, we used a p-value equal to 0.475. When the significance was marked with stars only, we assumed the p-value to be equal to the mid-point of its interval.

2.3.2. Testing for Homogeneity

The estimated effect sizes were tested for homogeneity by using the homogeneity test proposed by Hedges & Olkin (1985). The test statistic Q measures the extent to which individual effect sizes vary around the mean effect size. Significant values of Q require an application of further procedures.

We expected large variation in the estimated effect sizes. The source of the variation lies in the differences in the institutional context, in which the outcomes for strategic planning and outcomes for marketing are taken, as well as in the peculiarities of the original studies in terms of the methods applied, the data looked at, sample restrictions, the types of the transition studied, the definitions of the reference category of the investigated coefficient, or any other variations in the effect measurements. Significant heterogeneity in the mean effect sizes was tackled with by estimating meta- regressions.

2.3.3. Meta-Regression

Our meta-regressions take the following form:

$$Yj = \Sigma\alpha\, wj + \Sigma\beta\, cj + \Sigma\vartheta\, vj + \Sigma\theta\, sj + \Sigma\delta\, mj + \Sigma\gamma\, xj + \xi\, j,\ j = 1, 2, \ldots, n \quad (1)$$

where Yj is the effect size of study j, wj are a set of dummies for the welfare regime, and cj for the cohorts covered, vj represent the control variables for the type of the transition and measurement of the studied effect (e.g. type of model/outcome used for strategic planning, type of model/outcome used for marketing, definition of the reference category), sj stand for dummies controlling for the sample selection (taking value 1 if the sample was restricted only to a specific outcome for strategic planning or marketing), mj denote variables standardizing for the method and type of the data, and xj are implemented to standardize for the covariates incorporated as controls in the original studies. The parameters α, β, ϑ, θ, δ, γ were estimated stepwise, using the standard maximum likelihood. First, we introduced control factors into the model including: type of environment, type of project, and cohort variables. They were followed by controls for the type of industry, the type of the reference category, the sample selected, the method applied, and the type of the data and the control variables employed in the original studies. The

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

robustness of the meta-regression estimates was verified by conducting a sensitivity analysis. Namely, we estimated the same models on the samples reduced randomly by 10%. Minor differences in the estimates prove that the outcomes are reliable.

3. FINDINGS

3.1. Reasons Why Marketing Campaigns Fail

Each year, companies spend millions in market research to capture customers' attention and leave a lasting impression on them through various innovative methods (Bryson, 2011). However, some companies still fail in their marketing campaign, which leads to astronomical losses and, in some instances, irreversible damage. These losses are represented in funds spent on market research and running intense promotional campaigns (Bryson, 2011).

The Project Management Institute Inc. (PMI) offers more insight on the factors contributing to project failure. Khan & Khalique (2014) adds that each organization performs two types of work: operational work and projects. Operational work involves day-to-day activities that are repetitive and systemized (Khan & Khalique, 2014). Projects, such as promotional campaigns, have clear start and end dates, are unique in nature, and involve various personalities. These attributes make it challenging to systemize and develop efficient approaches to undertake them (Khan & Khalique, 2014).

Businesses funding campaigns experience projects that don't end on time, were changed in scope, or were over-budget (Bryson, 2011). These issues result from several pitfalls. Bryson (2011) notes the first pitfall is lack of visibility across a project team. The team comprises the sponsor, executive team/senior management, project manager, experts/consultants and support staff. All individuals require access to accurate and timely information. Visibility is significant in tracking progress of a marketing campaign, identifying early warning signs, identifying points of success, and sound decision-making to fix issues (Bryson, 2011). When there is lack of visibility in a marketing campaign, unidentified issues may escalate dramatically. The performance of support staff will be negatively impacted because they don't know how to handle delays in time, out-of-scope changes, and over-budgeting (Trump, 2016).

The second pitfall is unclear objectives (Johnson, 2015). Businesses are engaged in numerous projects in limited time. Even though all initiatives are crucial to optimal organizational performance, they should be undertaken systematically to not overwork project teams. Overwhelming employees is associated with exhaustion and unhappiness, which results in poor performance and high turnover especially (Johnson, 2015). Lack of visibility in resource workload is the third pitfall (Johnson, 2015). In the event that the project's management lack visibility in tasks required to successfully undertaking a promotional campaign, there will be losses in valuable resources and time. The project may also fail completely. Project tasks heavily influence the amount of resources required for a particular project, and project management must be able to gauge and address resource allocation.

In the event that the resources are scarce, performance of a project team may be hindered since it would be forced to operate with limited resources. On the other hand, a lot of resources also create room for mismanagement and wastage. This scenario also leads to losses.

Lastly, communication gaps across a project team may sink a marketing project (Suklev & Debarliev, 2012). Communication is crucial for success in any project. It informs team members about the goal/purpose of the campaign, their roles and contribution to success, and issues that may hinder success

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

(Suklev & Debarliev, 2012). The fact that members are comprised of different personalities dispersed across geographical regions may negatively impact communication efforts. Finally, some teams are very large which increases the challenge in communicating effectively with everyone on the team.

3.2. Significance of Strategic Planning in Marketing Campaigns/Projects

Strategic planning is significant to overcome pitfalls (Porter, Kim & Mauborgne, 2011). It is aimed at improving visibility of all aspects in a promotional campaign. Strategic planning works because it publishes marketing projects to a visible location (Porter et al., 2011). Various tools and people-based alterations are useful to boost project visibility. For example, the Internet can be used as a central location/storage of project information and communication. For this approach to be successful, project leadership should require team members to effectively utilize this central location (Porter et al., 2011). The information should be updated continuously and reflected to every user, regardless of geographical location. Resistance to certain change, especially when members can't see the changes, may lead to lack of visibility and eventual project failure.

Secondly, strategic planning is essential in ranking project initiatives (Fairholm, 2009). Ranking eliminates the issue of unclear project objectives. In strategic planning, top management determines the main purpose of the campaign. Then, they identify the initiatives that will enable the organization to attain the goal(s). These initiatives are prioritized (ranked) in order of importance to achieving the overall goal (Fairholm, 2009). Prioritization is important in ensuring that resources are allocated adequately based on initiative importance.

Thirdly, strategic planning is crucial to the development of a resource management grid (Fairholm, 2009). Fairholm (2009) argues that a resource management grid enhances visibility into resource workload. The PMI emphasizes the importance of planning and managing resources effectively. A resource management grid should be used on a daily basis to indicate the total resources assigned, activities to be conducted, activity durations, status of each activity, and completion/success rate. The grid issues early warning signs about resource usage, thus creating an opportunity for corrective action (Fairholm, 2009). It also communicates success regarding resource usage. Finally, the grid can be used to forecast future resource allocation.

Lastly, strategic planning is beneficial for the creation of a centralized communication location (Fairholm, 2009). Normally, in marketing campaigns, different personnel and resources are employed. There are events in which new members are required and incorporated. Establishing and maintaining a central location for communication enables the new members to join the campaign mid-stream, review the historic data, and get up to speed enough to be instrumental and effective (Fairholm, 2009). The organization's network is the lowest denominator in the creation of a centralized location. Therefore, businesses ought to acquire the right infrastructure and train employees about efficient communication (Ayed, 2017).

3.3. Challenges to Strategic Planning

Even though strategic planning is essential, organizations utilizing principles of strategic planning may also fail. This is because challenges are associated with strategic planning, including the lack of leadership. Porter et al., (2011) explain that leadership is essential for success of a promotional campaign. The leaders are responsible for key decision-making regarding the nature of the campaign, the message,

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

target audience, budget, and personnel. When leadership is present and actively engaged, the project is more likely to succeed (Porter et al., 2011). This is because leaders offer direction, help in identifying issues and solving them immediately, enforcing regulations, and approving new funds. When leadership is not engaged, the campaign lacks direction and unresolved issues will escalate, thus leading to wastage of time and resources.

For example, Coca-Cola introduced the New Coke campaign to inform consumers of its new formula. This campaign failed due to lack of leadership throughout the project life cycle. The leadership was not involved, especially during market research. As a result, New Coke did not meet the demands of consumers. This was evidenced by the fact that consumers did not like the product nor its taste (Porter et al., 2011).

The second reason promotional projects fail is lack of consensus. Reaching a consensus is crucial to ensure the team functions in harmony. If in harmony, team members will deliver their best performance to achieve a common goal. In the event that the team fails to reach an agreement, conflicts of interest may hinder project success (Suklev & Debarliev, 2012). Suklev & Debarliev (2012) adds the primary reason marketing teams fail to get consensus is because leadership doesn't involve all team members in decision-making. Involvement in decision-making process develops a sense of ownership, hence improving the chance that all members deliver high performance for optimal success (Suklev & Debarliev, 2012).

Fairholm (2009) argues that being overambitious can also hinder marketing campaign success. Ambition is important in planning for and enhancing the likeliness of future success. Ambitious ideas lead to the design of appealing campaigns, which leave lasting impressions on target consumers. However, being overambitious may lead to the development of complex ideas which consumers are not prepared for (Kainth & Verma, 2013).

Furthermore, ideas can be completely misinterpreted. For example, Malaysia Airlines initiated the *My Ultimate Bucket List* campaign in 2014 (Errera, 2014). This failed because a bucket list usually refers to activities an individual desires to complete before death. Even though the idea was creative, the timing was bad. At that time, two Malaysia Airlines planes were involved in fatal incidents. Errera (2014) adds that after the disappearance of Malaysia Airlines MH370 and the crash of flight MH17 after a missile hit, the bucket list was not a good idea. The message was misinterpreted by the target consumers, which led to a drastic loss in business (Errera, 2014).

Failure to integrate the marketing campaign into the culture and operations of the business also leads to failure (Fairholm, 2009). Organizational culture involves the behaviour of employees as individuals or in working groups. Their behaviour is significant for the organization because it affects the attitude and morale of all employees. Fairholm (2009) argues that good behaviour promotes positive attitude and high morale, thus encouraging employees to deliver their best. Furthermore, when a marketing campaign is integrated into the organizational behaviour and business operations, the chances of success are enhanced because it promotes good behaviour among all members and enable the organization to effectively utilize limited resources to attain success (Fairholm, 2009).

3.4. How to Integrate Strategic Planning in Promotional Campaigns

Pham & Richards (2015) argues that it is difficult to attain anything without a strategic plan. A strategic plan considers everything that an organization can do, then narrows down on those that it is best at accomplishing (Pham & Richards, 2015). This helps leaders determine where to allocate the organization's funds, human capital, and time. However, strategic planning is an overwhelming process to some.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Breaking the process into small and easy-to-tackle activities is the best approach to integrate strategic planning into a promotional campaign (Pham & Richards, 2015).

The first step to strategic planning involves determining the current state and position of the organization. Pham & Richards (2015) argues that it may be problematic for an organization to determine its position because of existing bias. Many leaders want to see the organization as they want to, as opposed to how it appears to others. Determining the position of the organization is significant in identifying its strengths and weaknesses (Pham & Richards, 2015). As a result, the organization can design a plan that maximizes the strengths while minimizing the weaknesses.

Furthermore, the organization can determine the opportunities and risks associated with its operations. This enables it to leverage the opportunities while protecting against potential risks (Pham & Richards, 2015). The best approach to determine the organization's position is through a situation analysis, which considers the internal and external environments. During this process, the business should only consider real as opposed to perceived information. The business should also determine how its target market perceives its products/services. The business should go further to determine consumers' perceptions about rival companies. Then, the business can determine strengths and weaknesses associated with its product/service in comparison to that of its competitors (Felfel et al., 2017).

The next step involves identifying what is important to the business (Dawra, Katyal & Gupta, 2015). This involves focusing on the direction that the organization wants to pursue over time. This enables the organization to determine priority issues—those most significant to the overall wellbeing of the business. The organization's strategic plan should focus on these issues. For example, it is the desire and mission of businesses to maximize on profits, thereby increasing shareholders' wealth (Dawra et al., 2015). The organization may determine the priority issue is intensive marketing program. Therefore, the focus of the management team should be promotional campaigns while enforcing regulations and allocating resource to ensure success in intensive marketing (Agarwal & Ahuja, 2014). The proceeding step involves what the organization has to achieve. These are activities that must be undertaken within a specified timeframe. In the context of a marketing campaign, some required activities include raising brand awareness, customer sensitization and education, reaching out to customers in a specific geographical region, offering target consumers free samples, and rewarding consumers (Dawra et al., 2015). These activities determine an organization's performance. Successful completion of all or most activities indicates the organization is successful.

The fourth step involves identifying the individuals responsible for priority issues (Gillison & Reynolds, 2016). Human capital is the most important resource because they implement the strategic plan. After determining priority issues, individuals should be assigned and held accountable for their undertaking (Gillison & Reynolds, 2016). Assigning priority issues makes it easier for the organization to allocate resources and monitor progress. These individuals act as the focal personnel who will communicate with top management and team members. They influence the successful implementation of activities. Therefore, top management should carefully select these individuals.

In the context of a promotional campaign, the project manager is responsible for priority issues. The project manager should be a firm believer and a champion of the marketing campaign. He/she will manage communication between top management and team members. He/she will also assign and supervise team members during tasks.

Lastly, it is important to review the implementation of priority issues. Reviewing is crucial to ensure that activities are performed as designed, within the target and specified time (Gillison & Reynolds, 2016). Review should be continuous and timely to enable the business to identify issues and fix them

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

immediately. The project manager should consistently review the progress and campaign impact to ensure that the overall goals are achieved (Abou-Warda, 2015).

4. CONCLUSION

Strategic planning is crucial to the success of promotional campaigns. Strategic planning provides a sense of direction and measurable goals for the undertaking. In addition, it is a guide in effective allocation of resources while conducting marketing programs that all lead to success. Each year, companies spend resources in marketing campaigns that fail (Khan & Khalique, 2014). Khan & Khalique (2014) adds that companies fail because of the unique nature of such projects. These projects have clear start and end dates, are unique in nature, and involve various personalities. These attributes make it challenging to systemize and develop efficient approaches (Khan & Khalique, 2014). Some reasons contributing to failure include lack of visibility across the entire team, unclear objectives, lack of visibility of resource workload, and communication gaps across teams. Strategic planning is helpful in overcoming pitfalls that can sink promotional campaigns (Porter et al., 2011). Strategic planning improves visibility, is essential in ranking project initiatives, is crucial to the development of a resource management grid, and is beneficial for the creation of a centralized location for communication (Gera et al., 2017).

Even though strategic planning is essential to the success of a marketing campaign, organizations utilizing principles of strategic planning may also fail because of challenges associated with strategic planning. These challenges include lack of leadership, lack of consensus, being overambitious, and failure to integrate the marketing campaign into the culture and operations of the business (Fairholm, 2009). In conclusion, by breaking strategic planning into small, easy-to-implement tasks and assigning them under a team with an effective project leader, the threat of failure in accomplishing promotional marketing campaign projects will be greatly diminished (Agarwak & Ahuja, 2014).

The study and results are somewhat limited due to a few research limitations that should be discussed. The main limitation was the fact that the study had a limited sample size and it only studied key factors from this limited sample size. The limitation of sample size introduces some potential bias and validity behind the findings and conclusions identified in the study, all of which could be alleviated by executing the study with a larger sample. Another limitation was that this study only examined the key factors and their relationship in terms of a project environment; therefore, the conclusions and analysis are specific to project environments and the findings cannot necessarily be extrapolated to other arenas such as supply chain management, operations management, or strategic management. This is a limitation since the conclusions and analysis are specific; this limitation makes it difficult to argue that the findings from this study could be deployed and used in other industries or managerial settings.

4.1. Originality/Contribution

Though extant literature has been devoted to studying this subject, attention has not been paid to the relationship between strategic planning and marketing. Review of the literature showed that there is limited amount of research that explored the variables. Therefore, this study sought to fill a void in existing research.

The results of this research contribute to the strategic planning and marketing bodies of knowledge. By performing this study, the results help enhance and evolve these bodies of knowledge. Because of

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

this research, we can better see the advantages and disadvantages of incorporating strategic planning processes into a business marketing campaign. Thus, this research ought to help businesses understand that they do not need to fear failure so long as they attempt the inclusion of strategic planning into their promotional campaigning.

This study also contributes since it introduces new ideas and avenues for future research. Future research can be done concerning the actual application and implementation of strategic planning in a case study. Results can be documented and compared against a business undergoing a campaign without the inclusion of strategic planning. Other research can be conducted to see what industries and/or types of promotional campaigns would reap the most benefit from incorporation of strategic planning into business initiatives.

Finally, this research shed light on the relationship between strategic planning and business marketing, as well as the implications of pursuing strategic planning in any organizational structure. It notifies and prepares businesses that are interested or sceptical about incorporating strategic planning into their promotional campaign initiatives about the various pitfalls of strategic planning, but also how it can help avoid the pitfalls inherent in new marketing campaigns.

Future research should explore a few different arenas. For example, future research could investigate these factors and the relationship but in the context of other industries and managerial settings. In these settings or contexts, it would be interesting to study the strength of these variables and the relationship as well as the factors that impact these factors and their relationship. Another avenue of research could be to explore these factors and their relationship but from different perspectives, such as from an organizational, strategic, or cultural point of view. This would shed further light into the how this relationship is perceived across many different views and further understand the degree of impact that factors such as culture, strategy, human resources, operations have on the key variables and their relationship.

Chapter 79
Startup Success Trends in Small Business Beyond Five-Years:
A Qualitative Research Study

Alvin Perry
Claremont Lincoln University, USA

Emad Rahim
Bellevue University, USA

Bill Davis
Ashford University, USA

ABSTRACT

While entrepreneurs help to drive venture growth through business development in their respective cities, approximately 50% of new business ventures fail within the first 5 years of operation. Boss concluded that over 60% of entrepreneurs and small business owners fail within the first 6 years of doing business. This article examines some of the main factors that support early growth stage entrepreneurial sustainability for small business startups. In this article, entrepreneurship success factors, failure rates and sustainability are examined through qualitative research, expanding on factors identified in previous studies and applying them to different geographical areas. The results of this study can help reduce the number of small business failures by providing actionable knowledge to entrepreneurs in the start-up and early growth stages of business development.

INTRODUCTION

Entrepreneurs recognize opportunities and work to commercialize their ideas for new products and services. In doing so, they create hundreds of thousands of new business startups every year. According to the U.S. Small Business Administration (2008), while there were 597,000 small business startups in 2008, 641,000 small businesses closed that same year. Further, there is a recurring trend of small businesses

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

opening and closing in the same year (U.S. Small Business Administration, 2008). This study examined entrepreneurship success factors, sustainability, failures, and new knowledge gained through qualitative research. What are some factors that create successful entrepreneurs? How does an entrepreneur sustain their success over a period of five years? Why do some entrepreneurs fail in the first year? In this paper, questions such as these and others are explored.

FOUNDATION OF THE STUDY

The driver of commerce in the United States is entrepreneurship (U.S. Department of Commerce, 2009). Entrepreneurs create small businesses and drive venture growth, which is vital for developing a strong and growing economy (U.S. Department of Commerce, 2009). One major challenge that entrepreneurs still face in the United States is a high failure rate.

Approximately 50% of new businesses fail within the first 5 years of operation (U.S. Department of Commerce, 2009). Boss (2010) concluded that over 60% of entrepreneurs fail within the first 6 years of doing business. This study used qualitative methods to examine factors that contribute to sustaining a business from startup through the growth stage. Few researchers have conducted studies on entrepreneurship failure, as most available studies have focused on success (see, for example, Byrd, 2010; Chupp, 2010; Johnson, 2010; Osbourne, 2009; Reaves, 2008; Schorr, 2008; Valdez, 2009; Weinberger, 2009; and Busenitz, Page West, Shepherd, Nelson., Chandler, & Andrew, 2003). As a follow-up to previous studies, this study addresses how some entrepreneurs are able to sustain their businesses beyond the first 5 years.

The target group for this study consisted of 20 hair salon owners in the state of New Jersey who had been in business for a minimum of 5 years. This research was necessary to expand sustainability knowledge derived from previous studies to different geographical areas. The results of this study may support entrepreneurs in the startup and growth stages of development in New Jersey.

BACKGROUND

The United States is currently recovering from the largest economic downturn since the Great Depression (Semoon, 2010). The government has had to step in and provide public funds to save big banks (Verschoor, 2010). The current and future economic environment may present a great opportunity for entrepreneurs to start businesses and sustain them, as there are always business problems to solve.

The issue addressed in this qualitative, phenomenological study is the high failure rate of small business entrepreneurs. All of the factors needed for success after 5 years in business was investigated. According to a report issued by the U.S. Department of Commerce (2009), 30% of startups fail in the first 2 years. Despite favorable research that may have supported small business success, the rate of failure is still rather high. Similarly, Boden and Headd (2002) noted that businesses fail 50% of the time after the fourth year of operations. The problem of small business failure has negatively affected the U.S. economy. This study may help to remedy the situation by providing new knowledge on sustainability that can reduce the number of small business failures.

The U.S. Department of Commerce (2009) found that the rate of small business failure at the 5-year mark was 49%. According to Song, Podoynitsyna, van der Bij, & Halman (2008), failure beyond the

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

fifth year in business was at 68%. The U.S. Small Business Administration (2007) indicated that small business owners account for 99% of all employers, employ approximately 50% of the private workforce, and provide over 40% of private sales in the United States. The U.S. Small Business Administration (2008) also noted that small business creates 75% of new jobs. A knowledge gap in sustainability exists between small business startups and sustainable small businesses beyond the first 5 years.

NATURE OF THE STUDY

Qualitative method was used to gain understanding from the lived experiences of the participants. Creswell (2009) described a qualitative method research study as understanding the meaning individuals or groups ascribe to a social or human problem. Schorr (2008) noted that the qualitative approach requires in-depth involvement by the researcher with each participant, in order to hear his or her unique voice.

The direct perspectives of small business owners operating within the targeted industry provided a deeper understanding of the common characteristics and attributes of the hair salon business and its owners/entrepreneurs. Ethnography, grounded theory, and case study design were methods that were all considered, as they involve face-to-face interviews, onsite data collection, and long periods of observation. However, due to limitations of time and resources, those strategies did not align with this study. Instead, the data included the lived experiences of the participants, collected by use of surveys with open-ended questions.

ASSUMPTIONS, LIMITATIONS, AND DELIMITATIONS

Assumptions

Hamel and Prahalad (2005) noted that developing a competitive advantage might not be achievable with traditional business strategies. The first of several assumptions was that this study may contribute to social change by identifying proven competitive advantage opportunities for entrepreneurs. The second assumption was that a qualitative research method provided the best possible vehicle for researching the phenomenon of small business success and failure rates. The third assumption was that the participants chosen provided valuable insight into the requirements needed for this doctoral study to be actionable for a scholar-practitioner. The fourth assumption was that New Jersey was a large enough geographical area to provide useful data for the study. The last assumption was that the participants were open and honest with the information they provided.

Limitations

The results of any phenomenological study depend on the ability of the participants to recall and articulate events that may not be communicated as accurately as when they originally occurred. Open-ended surveys may not have provided as much quality information as a face-to-face interview. However, personal finances did not allow for the use of interviewing and transcription as an option.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Delimitations

The delimitations of the study related to the participants, questions, and geographical area. The number of participants was 20, which provided a broad enough view of the phenomenon. The questions used in the survey are from a previous study and, as such, provided the scope of researchable information to support the goal of producing work for entrepreneurial scholar-practitioners. Finally, the geographical area of the state of New Jersey was a large enough area to provide insight into other similar areas across the United States.

Significance of the Study

As noted by the U.S. Small Business Administration (2007), small businesses owners account for 99% of all employers, hire 50% of the private workforce, and provide over 40% of private sales. Statistical data indicate that small business is important to the U.S. economy. The challenge that this study tackled was to affect the way small business owners perform in a positive manner. Previously, key factors contributing to entrepreneurial sustainability for New Jersey hair salon owners were not known. This study contributes to resolving the larger scale issue of a general high failure rate for entrepreneurs. The U.S. Department of Commerce (2009) noted that 49% of new businesses fail within the first 5 years of being in business. New knowledge from this study could have an impact on entrepreneurship and increase the number of successes beyond the first 5 years.

Participants

Ideal participants for this study were small business owners in the hair salon industry in New Jersey who had been in business for at least 5 years. To identify prospective participants, a database of active hair salons within the state of New Jersey was developed. The database is public information and no costs were associated with procuring the information. The database included business owner name, address, city, county, phone number, and year established. Five thousand hair salon owners who had established their businesses before 2006 were listed in the database. 20 prospects were randomly selected from this list. Random selection was conducted by sorting the list by county and reaching out to the first five names in each county until the required number of participants was reached. Candidates were contacted by phone to secure their e-mail addresses for the purpose of providing the business owners with information regarding the study. The prospective participants were provided with consent information in the following e-mail that allowed them to withdraw from the study at any time. Participants had access to the research survey through a link in the e-mail. The participants' identification was not obtained through the collection of data, as their participation in the study was anonymous. The process of contacting potential participants continued until the final participant completed the last survey during the summer of 2012.

Rudestam and Newton (2001) suggested that the number of participants for a phenomenological research study should be 10 because of the time involvement with each participant and each participant's data analysis. Twenty participants were chosen for this study, because using surveys was not as time consuming as face-to-face interviewing and transcription. This provided the researcher with an opportunity to gain access to a potentially plentiful amount of data.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

POPULATION AND SAMPLING

This study included open-ended interview questions in a survey targeting 20 entrepreneurs who were licensed hair salon owners. All participants received a salon business license before 2006. The study required sampling of this population pool to obtain data from entrepreneurs who have crossed the 5-year mark in business operation. This research was an attempt to determine the common attributes associated with entrepreneurial success displayed by the sampled population.

Schorr (2008) interviewed 10 entrepreneurs and suggested increasing the population size in future research. The current study expanded the participant population to 20 participants and included open-ended interview questions compiled in a survey used to collect the data. The sampling of 20 hair salon owners out of a potential pool of 5,000 throughout the state of New Jersey provided greater insights for this study.

Stratified sampling strategy was selected based on the research approach. Simon (2010) described stratified sampling as subdividing a population into at least two subpopulations or strata. Our sample of business owners licensed before 2006 was further subdivided by county in the state of New Jersey. Creswell (2009) described qualitative sample sizes as ranging from one to 300 participants. The sample size for this study was 20 participants. An open-ended electronic survey format, which is still a form of interviewing, was used in the study. However, results allowed for written participation, as opposed to spoken words (Creswell, 2009).

DATA COLLECTION

To understand the phenomenon of entrepreneurial success beyond the first 5 years, a survey containing open-ended questions to collect data was used. The survey was an electronic vehicle to obtain written feelings and experiences directly from participants (Simon, 2010) concerning entrepreneurial success beyond the first 5 years. The selected form of data collection allowed information to be collected quickly and provided stronger qualitative data from the pool of participants (Creswell, 2009). Providing the respondents with the right tools enhanced their willingness to respond to research questions more than if asked in a face-to-face interview or phone conversation (McCoyd & Kerson, 2006). McCoyd and Kerson (2006) also noted that an electronic open-ended survey allows for more convenience for participants, but is just as reliable and accurate as face-to-face interviews. The primary reason for using an electronic interview format was to capitalize on the speed and accuracy in the data collection. To ensure accurate identification and analysis, the collected data was loaded into NVivo, version 10, and looked for themes and threads of related information in participants' responses.

DATA COLLECTION TECHNIQUE

An open-ended survey served as the vehicle for collecting information from study participants. The participants received an e-mail containing informed consent information and a link to survey questions. The participants typed in their responses to the six questions and submitted the data to the Survey Monkey database. The completed survey data was downloaded and provided the information to the research as-

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

sistant in a word document. There was no transcription required as the participants provided information via the web through written responses.

The social constructivist perspective assumes that individuals seek understanding of the world in which they live and work (Creswell, 2009). To parse out the study participants' understandings, qualitative study using a phenomenological approach was conducted. Creswell (2009) described the phenomenological approach as a strategy of inquiry by which researchers identify the essence of the human experience described by participants. The method of data collection that was selected for the study allowed us to collect data and identify themes, related data, and the worldview of the participants (Creswell, 2009). Permission was obtained to use the instrument from Schorr (2008).

Participants answered the following questions:

- Tell me about your (professional) path. How did you move into entrepreneurship?
- When did you feel like a successful entrepreneur for the first time? Please describe specific situations and experiences you tie to this moment.
- How would you describe your experience of getting where you are now?
- What did you expect from becoming a successful entrepreneur?
- What has becoming a successful entrepreneur brought into your life? What are the gains? What are the losses?
- What else would you like to share about your experiences of becoming a successful entrepreneur?

DATA ANALYSIS TECHNIQUE

The analysis involved three components: inductive analysis, software analysis, and coding for theme identification. In addition, hiring an NVivo consultant helped to ensure the data were properly loaded to generate quality results.

Following the process used by Schorr (2008), the survey data using the modified Van Kaam method were analyzed. This modification of the method developed by Moustakas (1994) involved grouping expressions, reducing and eliminating repetitive irrelevant data, and determining the invariant constituents.

FINDINGS

The general problem addressed in this study was the high rate of small business failure within the first 5 years. In this study, the lived experiences of participants were collected to shed light on how some business owners are able to sustain their business beyond the first 5 years. Tilley and Young (2009) described sustainability as being comprised of social forms of wealth, as well as traditional economic wealth. Open-ended survey questions were delivered via e-mail, which provided deeper insight into the phenomenon and some emergent themes.

The themes that developed from the study were as follows:

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

1. Need for professionalism
2. Relationship development is important
3. Financial rewards are appreciated
4. Experience provided a sense of accomplishments
5. Regret with the loss of time with family
6. Sacrifices were worth it

Cassar (2009) wrote that nascent entrepreneurs have high expectations of success. The data collected showed that the hair salon owners surveyed have a drive and passion to be successful. Participants described three primary routes to entering the hair salon industry: (a) a traditional route of going to cosmetology school, (b) entering the trade in a family-owned hair salon, and (c) entering the industry after working at other jobs and/or earning a business degree. Participants reported that developing and maintaining a loyal client base was an indicator to participants that they were ready to start their own hair salons, as well as a measure of their success in the business. Cha and Bae (2010) noted that the entrepreneurship process starts with the recognition of opportunity and then the creation of a new business. Several participants described client growth before moving forward with their own businesses and others said that their repeat client base and referrals from their clients have made them feel successful in their new business.

Participants stated that relationships with colleagues and clients enriched their experiences. Participants described several positive aspects of their business relationships, including the excitement of having powerful clients and the everyday satisfaction of helping people and hearing about their lives.

Fillis and Rentschler (2010) described one aspect of entrepreneurship as bringing together resources for economic change. According to this study's participants, the ability to provide financially for family and maintain a comfortable lifestyle were the most often cited benefits of owning a business, as well as the most common motivators to starting one's own business. While some participants focused on the secure and even affluent lifestyles their businesses have afforded them, others cited being able to provide college education for their children and help other family members as the main benefit. However, two participants mentioned that the vulnerability of being self-employed is a drawback. Hair salons are subject to seasonal fluctuations in business and may suffer more when the economic climate sours.

Participants commonly cited a sense of pride, power, and accomplishment that business owners feel because of their success. Specifically, participants described a sense of self-confidence, a sense that no one can take away their accomplishments, and a feeling that they have come a long way. Hooks (2010) noted that novice entrepreneurs seemed to be happier and more satisfied. Several participants also mentioned that being an accomplished business owner puts them in a position to inspire, provide an example to, and teach other potential entrepreneurs. The most common drawback to being a business owner mentioned by participants was the loss of time they could have spent with their families. Some expressed regret, while others stated that it is a trade-off necessary for their businesses to be successful. One individual shared that they believe it would have been good to work smarter, because of wasted time and money.

Finally, despite the loss of time with family, the majority of the participants said that the rewards reaped from the hard work and sacrifice of owning a business have been worth it to them. While several mentioned the long hours involved and the challenging road to becoming a successful business owner, several expressed that they would not change anything about their journey. Cardon, Stevens, & Potter (2009) noted that passion is deeply rooted in entrepreneurship. The most common experience was one of satisfaction, accomplishment, and the knowledge that their hard work has paid off.

APPLICATIONS TO PROFESSIONAL PRACTICE

Small business owners are key contributors to the United States economy, but face a high rate of failure within the first 5 years of operation. This research seeks to identify success factors that lead to greater business sustainability among small business entrepreneurs by surveying 20 hair salon owners from the state of New Jersey who had been in business a minimum of 5 years.

This study provided new researchable information for hair salon owners who desire to start sustainable businesses in New Jersey in the future. Participants identified some areas that contributed to the success of their businesses and made the following recommendations: (a) build clientele by working in another business before starting out on their own, (b) develop good relationships with other entrepreneurs/business owners, (c) learn lessons from the experience, (d) be determined, and (e) keep financial matters in order (e.g., pay taxes and maintain good credit). This information may have remained unavailable for new entrepreneurs, but now the knowledge gained from this study can be shared with those seeking entry or who have newly formed businesses within the hair salon industry.

Further, this study has added to the body of knowledge in the field of entrepreneurship theory by researching small business success within the hair salon industry. A search of the literature identified studies that focused on entrepreneurship success (Bates, 1990; Byrd, 2010; Chupp, 2010; Johnson, 2010; Osbourne, 2009; Reaves, 2008; Schorr, 2008; Valdez, 2009; Weinberger, 2009). This study has added to this specific area of knowledge by extending Schorr's (2008) and Bates (1990) studies to a different geographical area of the country, as well as to a different industry from what has been covered before.

None of the participants were able to identify any available research-based data that might provide some insight into success factors that may have led to sustainability. Now, this research has filled a gap in knowledge pertaining to success factors associated with sustaining a hair salon in New Jersey beyond its first 5 years.

CONCLUSION

The pursuit of this study was an effort to extend the initial research conducted by Schorr (2008). This study expands the knowledge associated with small business and entrepreneurship sustainability within the first 5 years of starting a business. Small business failure continues to be an issue, with the number of failures exceeding the number of startups (U.S. Small Business Administration, 2007). There is a need for small businesses to deliver a greater rate of success to assist in strengthening the economy by supporting job creation and private sales activity.

Further research on small business success will continue to expand the knowledge in this area. This study employed a qualitative phenomenological approach, which explored the phenomenon from the lived experiences of the participants (Creswell, 2009). A quantitative study may provide more information in support of small business success by increasing the amount of data collected. The total number of participants for this study was 20 and an increase in participants may provide better data for research. Collecting more data provide stronger evidence in support of understanding small business success beyond the first 5 years of operation.

While this study focused on the hair salon industry, conducting research on industries that are contributing the greatest amount to the economy in terms of jobs and private sales may yield more information on small business trends. By seeking a forward-looking view of small business activity,

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

further research in a more targeted area of economic contribution by specific industries may provide more valuable research data.

Finally, the geographical area used for this study was the state of New Jersey. By expanding the study to include the northeastern portion of the United States or other areas larger than a single state, a new study may produce stronger data in support of small business success.

APPENDIX

Section 3: Application to Professional Practice and Implications for Change
The purpose of this qualitative study was to understand entrepreneurship, providing insight into the needs contributing to sustainability during the first 5 years in business. The issue was the high failure rate of entrepreneurs. The issue was the high failure rate of entrepreneurs. One research question guided the study: *How are some entrepreneurs able to sustain their business beyond the first 5 years?*
The instrument used in the study consisted of six questions:

1. Tell me about your (professional) path. How did you move into entrepreneurship?
2. When did you feel like a successful entrepreneur for the first time? Please describe specific situations and experiences you tie to this moment.
3. How would you describe your experience of getting where you are now?
4. What did you expect from becoming a successful entrepreneur?
5. What has becoming a successful entrepreneur brought into your life? What are the gains? What are the losses?
6. What else would you like to share about your experiences of becoming a successful entrepreneur?

The target group for this study consisted of 20 hair salon owners from the state of New Jersey who had been in business for a minimum of 5 years. Surveys represented the data collection tool. NVivo software provided the tool to analyze the data according to the modified Van Kaam method.

Interview Question 1: Professional Path

Tell me about your (professional) path. How did you move into entrepreneurship?

There was a desire to gain insight into the path that each participant took to get into entrepreneurship. Each participant took a specific path into becoming a hair salon owner and the researcher was seeking to identify a specific theme. In addition, the researcher was looking to identify if there was a specific path that was more prevalent in terms of entry into the hair salon industry.

All participants surveyed were cosmetologists who are in business for themselves. The participants described two primary routes to entering the cosmetology industry: *starting their own business after building clientele* (20%) and *beginning a family business* (15%).

Interview Question 2: Feeling Like a Successful Entrepreneur

When did you feel like a successful entrepreneur for the first time? Please describe specific situations and experiences you tie to this moment.

Entrepreneurs set specific goals that provide the foundation for the feeling of success experienced in a venture. This section identified the goals set by each of the entrepreneurs in this study. There were three primary research results provided by the participants that led to the feeling of success, which was:

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

when I moved and clients followed (25%), when my business became profitable (10%), and when I opened my own hair salon (10%).

Question 3: Describe Your Experience

How would you describe your experience of getting where you are now?

Participants have different aspects of the experience when describing the current level of accomplishments. There are two primary items described in the data by the participants, namely: challenging/experienced difficulties, learned lessons from experiences (20%), and hard work and determination (20%).

Interview Question 4: Expectation From Becoming Successful

What did you expect from becoming a successful entrepreneur?

There are expectations that an entrepreneur may have when attempting to go into business when starting a successful new venture. There were three main expected outcomes identified by participants, which were: the ability to have financial freedom, better income, and a chosen lifestyle (50%), autonomy, freedom, and control of my life (30%), and the enjoyment of work and the happiness that were felt from working in the salon business (15%).

Interview Question 5: Gains and Losses

What has becoming a successful entrepreneur brought into your life? What are the gains? What are the losses?

In business, there are gains and losses and entrepreneurs may have some since of those expectations. Participants commonly cited: financial freedom, lifestyle, and ability to provide for family (50%), the relationships and people met along the way (25%), self-confidence (15%), being their own boss (15%), and the experience, knowledge, and wisdom gained as key accomplishments.

The most common drawback to being a business owner mentioned by participants was: the loss of time they could have spent with their families (40%) and long hours (15%). Some participants expressed regret with lost family time, while others stated the trade-off contributed to their business success.

Interview Question 6: Share Experiences

What else would you like to share about your experiences of becoming a successful entrepreneur?

The qualitative method provided the foundation for this research study. Entrepreneurs provided insight into their lived experiences. The final question provided the participants with an opportunity to provide any specific information that may prove beneficial to readers of this study who want to go into the hair salon business. The main points identified by the participants were that: owning a business has been worth it to them (20%), it takes hard work and sacrifice (15%), keeping finances in order to include paying taxes and maintaining good credit (15%), and the autonomy of being your own boss is great (15%).

Chapter 80
Exploring the Spheres of Crowdfunding

Bernard Owens Imarhiagbe
Kingston University, UK

ABSTRACT

This chapter reviews research and policy literatures on the spheres of crowdfunding. It identifies reward-based, donation-based, equity-based and credit-based crowdfunding with a view to collate relevant information to support crowdfunding knowledgebase and further research. As crowdfunding is a new concept in research literature, it is increasing in popularity in social media, business and research communities. Academic research in crowdfunding is limited and the subject is still evolving as a way of access to finance for seed capital, entrepreneurial projects and other early stage projects. Advanced countries in Europe and North America have recognised the relevance of crowdfunding in varying proportion from one country to another for project fundraising. However, the World Bank confirmed that developing countries are at different stages of recognition of crowdfunding in their policy framework. Although the UK financial regulator, Financial Conduct Authority, has produced a policy statement for crowdfunding and approved some service providers such as crowdfunding platforms, it is still interacting with stakeholders and providing guidance to potential entrepreneurs on the operational models. Crowdfunding is a way of raising small amounts of money from different contributors over the internet for different types of projects. There are huge management implications in the spheres of crowdfunding.

INTRODUCTION

Crowdfunding is a method of fundraising directly from members of the public with small individual contributions using the internet (European Crowdfunding Network, 2014). The spheres or types of crowdfunding are reward-based, equity-based, donation-based and credit-based. These spheres were discussed in FCA (2014a) and Bradford (2012) because the need for regulation in crowdfunding has become apparent. Apart from the UK, the USA has recognised crowdfunding as a way of funding entrepreneurial projects and this initiated the Jumpstart Our Business Start-ups Act (JOBS Act) (Stemler, 2013). Prior to the JOBS Act in the USA, researchers (Burkett, 2011; Hemingway, & Hoffman, 2012)

DOI: 10.4018/978-1-7998-1760-4.ch080

Copyright © 2020, IGI Global. Copying or distributing in print or electronic forms without written permission of IGI Global is prohibited.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

disclosed the conflict between equity-based crowdfunding and the existing United States securities laws. Therefore, for crowdfunding to be operated lawfully in the USA, changes had to be made to existing securities laws. Accordingly, the President of USA, Barak Obama, stated in one of his speeches that the provisions of the JOBS Act are a potential game changer in the USA as businesses will have the opportunity for start-up and growth to the next level (Thompson, 2012). Apart from business reliance on personal savings, loans, private equity, venture capital and angel capital, crowdfunding is a new concept in access to business finance.

Venture capitalists left a funding gap in the early stage of new business development and crowdfunding is quite capable of filling that gap (Ley, & Weaven, 2011). Thus, crowdfunding is a new, alternative and additional method of access to finance for small and medium-sized enterprises (SMEs) and other early stage projects. As crowdfunding is increasing in popularity in social media, business and research community, it is beginning to make impact as a seed and start-up fund for new firms. Crowdfunding has been identified as one of the alternative finance mechanisms for individuals and businesses to explore for their capital needs (Collins, Swart, & Zhang, 2013). Therefore, members of the public can fund a project with little individual financial contribution in collaboration with others through the internet.

As crowd funders or investors are distributed all over the world, different regulatory provisions are being introduced from one country to another. Developed countries have introduced crowdfunding associations. One of these is the UK crowdfunding association (UKCFA, 2014) which was formed by fourteen crowdfunding businesses in 2012 and the membership has since grown to forty-three in December 2014; being 250% increase in membership over two years. Other crowdfunding related associations include National Crowdfunding Association in USA (NLCFA, 2014), National Crowdfunding Association of Canada (NCFA, 2014), Crowdfunding Professional Association in USA (CFPA, 2014) and Crowdfund Intermediary Regulatory Advocates in USA (CFIRA, 2014).

Web technology is the key driver of all the spheres of crowdfunding (European Crowdfunding Network, 2014; InfoDev, 2013). Entrepreneurial access to crowdfund platform is a globalisation phenomenon (Agrawal et al., 2011). As web technologies provide the enabling platform for many business successes, crowdfunding is being propelled using the internet (European Crowdfunding Network, 2014). Greater levels of crowdfunding campaign are initiated by creative individuals and within metropolitan areas (Antonenko, Lee, & Kleinheksel, 2014). This shows an evidence of spatial proximity in crowdfunding.

Advanced countries in Europe and North America have recognised the relevance of crowdfunding in varying proportion from one country to another for project fundraising. However, a World Bank research confirmed that developing economies are at different stages of recognising crowdfunding in their policy framework with South Africa leading with four crowdfunding platforms (InfoDev, 2013). Although the UK financial regulator, Financial Conduct Authority, has produced a policy statement for crowdfunding and approved some providers, it is still interacting with stakeholders and providing guidance to potential entrepreneurs on the operational models (FCA, 2014a).

According to Danmayr (2014), North America and Europe represent 98% of the worldwide crowdfunding industry and the crowdfunding industry has grown periodically from 64% in 2011 to 81% in 2012 and the growth has continued unabated. Thus, the growth of crowdfunding has become astronomical over a few years and the future potential of growth is unimaginable. There is a strong positive signal of better access to crowdfunding money and this could lead to improved access to other forms of finance such as venture capitalists and business angel (Lehner, & Nicholls, 2014). It is now confirmed that crowdfunding is helping to raise money for scientific research and success factors abound (Wheat, Wang, Byrnes, & Ranganathan, 2013).

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Successful crowdfunded projects show the value of small contributions in access to finance for entrepreneurial projects (Firth, 2012). Siva (2014) also report a success story of a science based crowdfunded project. In the UK, equity-based crowdfunding increased 618% and reward-based crowdfunding increased 387% from 2012 to 2013 (Collins et al., 2013).

There are huge management implications in the spheres of crowdfunding. These are summarised as follows:

- **A New Phenomenon:** As a new manifestation, crowdfunding is a growing business area for expansion.
- **Lack Maturity and Increasingly Popular:** Crowdfunding lack maturity but it is increasing in popularity and some projects exhibit competitive advantage.
- **Subject to Regulation:** Equity-based and credit-based crowdfunding will be subject to regulation to protect participants and system integrity, especially the protection of consumers, vulnerable members of the society and investors.
- **Trusting Relationship Yield Reward:** Project initiators such as business owners or entrepreneurs will reap reward from the crowd if their initial crowdfunding engagement is a trusting relationship.
- **Community Support Agenda:** Some crowd contributors and platforms are targeted for community support only.
- **Crowd Investor Portfolio Mix:** The spheres of crowdfunding and the relative small size of fund contribution provide opportunities for investor portfolio mix likened to a mini venture capitalist.
- **Stakeholder Management:** Crowdfunding participants must be managed within strategic stakeholder engagement.
- **Project Planning Is Necessary:** Crowdfunding projects and their associated activities must be planned to ensure success.
- **Feature Rich Platforms:** Different crowdfunding platforms have different features for the entrepreneur to explore before making request for fund to ensure project funding success.
- **Improve Crowd Profile and Support Others:** Entrepreneurs should back other entrepreneurs to increase their community profile and participation.
- **Crowdfund Training Required:** There is need for crowdfunding training for non-technology savvy entrepreneurs and investors.
- **Increasing Entrepreneurial Innovation:** There is a bandwagon effect of new innovative firms relying on crowdfunding activities.

BACKGROUND

The global financial crisis of 2007 caused a huge reduction in the availability of business finance for early stage and existing businesses (Smallbone, Deakins, Battisti, & Kitching, 2012; Saridakis, Mole, & Storey, 2008). Following the crisis and in the absence of adequate access to finance, start-up and existing businesses had financial constraints. Although different businesses explored personal savings, private equity/venture capital funding, invoice finance, loans and overdraft in their attempt at resolving access to finance issues, it was difficult to access the fund required for their survival and innovation. Crowdfunding came into the limelight in the business environment during the financial crisis of 2007 in the midst of financial constraints in small firms (InfoDev, 2013).

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

It is possible to think that crowdfunding is in existence to resolve the inherent financial constraints of the time among early stage businesses. However, although the financial crisis caused financial constraints for all levels of businesses, there was greater financial constraint for small and start-up firms (Saridakis et al., 2008; Smallbone et al., 2012). However, some researchers (Belleflamme, Lambert, & Schwienbacher, 2014; Danmayr, 2014; Zheng, Li, Wu, & Xu, 2014; Gerber, & Hui, 2013) believe crowdfunding existed prior to the financial crisis of 2007 as a way of funding creative projects in the arts, music, film and other specialist terrain. Crowdfunding originated from crowdsourcing, which is a way of getting support from online collaborators towards gaining new ideas, resolving problems and proffering solutions (Hazen, 2012). Moreover, it can be argued that the financial crisis of 2007 and the financial constraints on small firms created the opportunity for the online community to seek to extend funding for creative projects to entrepreneurial projects among online friends and like-minded people (InfoDev, 2013).

The spheres or types of crowdfunding are different as contained in literature (Bradford, 2012; FCA, 2014a; U.S. Securities and Exchange Commission, 2013). Equity-based crowdfunding (Barnett, 2013) is a subset of investment-based crowdfunding and it involves sharing in the equity ownership of a business by contributing small amount of money in internet collaboration with other contributors. Donation-based and reward-based crowdfunding are not regulated in the UK because they are classed as not-for-profit (FCA, 2014a). According to Rossi (2014), the proportion of different spheres of crowdfunding in 2012 was: reward-based (43.5%), credit-based (14.5%), donation-based (28%) and equity investment-based (14%). As different countries begin to apply different regulations locally, it can restrict the size of private investors for crowdfunding projects (Schwienbacher, & Larralde, 2012). This is particularly relevant to the investment-based crowdfunding because sharing in the equity ownership of firms still apply old regulatory rules to check unwholesome practices. The United States regulatory authorities went through a period of checks and balances in promulgating the JOBS Act regulation and amending current securities laws aimed at supporting equity-based crowdfunding (Clifford, 2013). Therefore, while reward-based and donation-based crowdfunding will not be regulated through securities laws, credit-based and investment-based crowdfunding will be regulated. The World Bank reported in a recent research that reward-based crowdfunding has a compound annual growth rate of 524% from 2009 through 2012 followed by equity (114%), lending (78%) and donation-based (43%) (InfoDev, 2013).

THEORIES RELEVANT TO CROWDFUNDING

The key theories that impact access to finance in small and medium-sized enterprises (SMEs) are also systematically relevant to crowdfunding. These key theories include agency cost (Jensen, & Meckling, 1976; Ross, 1973), signalling (Ross, 1977; Spence, 1973; Weiss, 1995), credit rationing (Stiglitz, & Weiss, 1981), pecking order (Frank, & Goyal, 2003; Myers, 1984), discouraged borrower (Kon, & Storey, 2003), stakeholder (Ackermann, & Eden, 2011; Freeman, 1984), social capital (Zheng et al., 2014) and network exchange (Zvilichovsky, Inbar, & Barzilay, 2014) theories.

The agency cost theory identifies information asymmetry, moral hazard and adverse selection (Jensen, & Meckling, 1976). They define agency cost as the sum of monitoring costs, bonding costs and residual loss. Giudici et al. (2012) and Agrawal, Catalini, & Goldfarb (2013) believe that information asymmetry, moral hazard and adverse selection represent major issues in crowdfunding. In agency cost theory, members

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

of the public are unable to determine adequate due diligence of the project before crowdfunding commitment. Making financial contribution without due diligence can be astounding (Agrawal et al., 2013). Therefore, in each crowd project, the entrepreneur or project initiator has the superior information which may not be known to the crowd funders or contributors. There will be cost implications for contributors if they engage third party agency as a way to gather more information about the entrepreneur and the viability of the project for funding. In this case, the actual sum contributed may be too small to warrant monitoring and screening of the project. However, the entrepreneur or project initiator could provide detailed and relevant information about the project to enable contributors to make informed decision.

Signalling theory provides an indicator to inform lenders of the credulity and potential viability of the entrepreneurial project. Whilst Weiss (1995) discussed the relevance of human capital as a signalling effect in labor economics, Ross (1977) revealed the role of incentive-signalling in the determination of corporate financial structure. The experience and education of the entrepreneur or project initiator can act as a positive signal on lenders, crowd contributors (Gruber, MacMillan, & Thompson, 2012). Signalling theory provides crowd contributors with an indicator of the project initiator to inform their funding decision. According to La Porta et al. (1998), a good legal system can act as a signal of an improved financial sector development. It follows that signalling theory is directly relevant to crowdfunding transactions as the strength of the legal system can determine the efficiency and effectiveness of crowdfunding. However, crowdfunding platforms currently rely on their legal jurisdiction to resolve disputes. Therefore, if the legal system is unable to sustain crowdfunding transactions, there could be unforeseen transaction limitations as investors gain awareness through online due diligence.

Stakeholder theory (Freeman, 1984) in relation to crowdfunding places a responsibility on the entrepreneur or project initiator to manage the affairs of the project diligently with a view to create value ethically for its crowd investors. According to the stakeholder theory, in managing the affairs of any business, there must be interface between multiple stakeholders and the business. A good entrepreneur and business owner should be able to manage the affairs of multiple stakeholders efficiently and effectively (Freeman, 1984). Ackermann, & Eden (2011) advocate the need for a strategic management of stakeholders to ensure business success. Therefore, the project initiator in crowdfunding has a responsibility to all stakeholders to ensure project success.

Pecking order theory (Frank, & Goyal, 2003) shows the hierarchy of methods of access to finance that an entrepreneur use in the process of seeking project fund. In pecking order principles, owner managers of small firms prefer internal sources of business financing over external sources, hence, they prefer debt finance over equity (Myers, 1984). Businesses in the small firm sector prefer the pecking order approach because it allows them to select their funding option while maintaining full control of their business (Holmes, & Kent, 1991). Thus, the application of pecking order theory depends on the sphere of crowdfunding because different rules apply to reward, donation, equity and credit.

Stiglitz, & Weiss (1981) introduced the concept of credit rationing as a way for lenders to reduce the risk associated with borrowers in an uncertain times and in the absence of collateral. Hence, credit rationing reduces the amount of credit finance available for entrepreneurial projects and reduces access to finance for SMEs. Crowd funders may withdraw or reduce their funding support if the entrepreneurial project is not adequately defined with due diligence to reduce information asymmetry and eliminate information distortion. Therefore, as a way to eliminate credit rationing, the entrepreneur or project initiator has a responsibility to provide adequate information about the project to inform the decision making of crowd contributors.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

The discouraged borrower theory points to self-rationing credit approach where the entrepreneur may be discouraged from seeking fund for fear of being rejected (Kon, & Storey, 2003). As an example of self-rationing, Mijid, & Bernasek (2013) find that women are self-rationing themselves in the capital market rather than being rejected by the bank for credit facilities. Kickstater (2014) shows that high number of rejections and successes are recorded for projects in its crowdfunding platform. It follows that crowd contributors may withdraw from funding entrepreneurial projects with inadequate prospect and reduced due diligence. Although crowd contributors are not skilled in screening the crowd projects, they have access to online information sources to inform their funding decision (Indiegogo, 2014). Therefore, entrepreneurs who fail to meet their funding target for their project may become discouraged.

Social capital theory is a valuable asset as it allows common problems to be resolved easily with combined effort. Following social capital theory, the online social media environment is an efficient place to develop and nurture social networks that can help to expand social capital. The social network perspective of an entrepreneur helps to define their strategic intent (Aldrich, & Kim, 2007). Zheng et al. (2014) find that the social network of the entrepreneur impacts the crowdfunding of its project. They discussed a multidimensional aspect of social capital in crowdfunding and they believe that social capital is embedded in social network. It follows that social capital is a trusted network connection of like-minded people. However, the herding behaviour of social network participants suggests that the success of crowd projects can depend on the social leaning of network members (Kuppuswamy, & Bayus, 2014).

Zvilichovsky et al. (2014) discuss the network exchange theory and find the principle of reciprocity to be applicable in the crowdfunding environment. They find that the entrepreneurs who double as backers have funding advantage and higher success rate. This is particularly relevant to a project entrepreneur or initiator who also acts as crowd contributor, a double-sided active participant in the crowdfunding market.

MAIN FOCUS OF THE CHAPTER

The contribution of this chapter is a systematic review of the different spheres of crowdfunding literature, identifying key relevant theories, support further research and a conclusion. This review is pertinent in understanding the spheres of crowdfunding around the world. Although there is an increasing popularity of traditional methods of access to finance, crowdfunding is innovative, new and a growing phenomenon (Tomczak, & Brem, 2013). Academic research about crowdfunding is limited and the phenomenon is still evolving as a way of access to finance for entrepreneurial projects (Lehner, & Nicholls, 2014; Lehner, 2013; Giudici, Nava, Lamastra, & Verecondo, 2012) and other fundraising projects (FCA, 2014a). As a result, there are limited academic research outputs on the subject as shown in Table 1.

To achieve our aim, electronic databases (ScienceDirect, Google Scholar, EBSCO and Emerald) were interrogated using keyword search method. It was also necessary to perform a keyword search of relevant reports published by government bodies and international organisations. In the keyword searches, ‘crowdfunding’, ‘crowdfund’, ‘credit crowdfund’, ‘lending crowdfund’, ‘donation crowdfund’, ‘equity crowdfund’, ‘investment crowdfund’ and ‘reward crowdfund’ were the keywords used.

The remainder of this chapter is presented thus. It examine investment or equity-based crowdfunding; credit-based crowdfunding; reward-based crowdfunding; and donation-based crowdfunding. Further discussion provides recommendations as well as conclusion and further research directions.

Note: This list represents the key research and policy based literatures relevant to different spheres of crowdfunding since the inception of the phenomenon. This table indicates a chronological list of crowdfunding literatures from 2011 to 2014, compiled from crowdfunding research and policy based sources only.

1. Investment or Equity-Based Crowdfunding

[Investment-based crowdfunding]… *people invest directly or indirectly in new or established businesses by buying shares or debt securities, or units in an unregulated collective investment scheme* (FCA, 2014a, p. 11). Equity-based crowdfunding (Barnett, 2013) is a subset of investment-based crowdfunding and it involves sharing in the equity ownership of a business by contributing small amount of money. For example, according to Symbid (2014), there is a minimum investment of €20 for each crowdfunding investor and there are many entrepreneurial projects to be funded. The greatest obstacle to equity-based crowdfunding is regulation (Collins, & Pierrakis, 2012). The regulatory authorities in the UK (FCA, 2014a) and USA (Barnett, 2013; U.S. Securities and Exchange Commission, 2013; Cohn, 2012) believe in the regulation of investment or equity-based crowdfunding to protect investors or contributors. Yeoh (2014) discovered that the fine tuning of the regulatory framework in the UK and USA will lead to better crowdfunding provisions for all stakeholders. The regulatory provisions in Canada are targeting equity-based crowdfunding and many securities laws are earmarked for amendment to meet general crowdfunding needs (Canadian Regulators, 2014).

Apart from Symbid crowdfunding platform based in Rotterdam in the Netherlands, other examples of investment or equity-based crowdfunding are VentureCrowd (Melbourne, Australia), Crowdonomic (Singapore), CrowdCube (Exeter, UK) and Seedrs (London, UK). Although these example crowdfunding platforms currently pursue investment or equity fundraising approach, their operational strategies are different as a result of their regulatory origin and business choice.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Researchers are sceptical about the amendment to the securities laws of the USA (Hemingway, & Hoffman, 2012). In discussing the JOBS Act amendment of the USA, Cohn (2012) state that the plan was focused on supporting capital raising in small firms but it appears to be fraught with 'limitations, restrictions, obligations, transaction costs and innumerable liability traps' (p. 1445). In Canada, there was a demand-driven regulation of the equity-based crowdfunding environment following the speed of crowd investor acceptance of the phenomenon (Cumming, & Johan, 2013). It is possible to appropriately adopt crowdfunding to compensate for the gap in venture capital funding at early stage of project finance (Ley, & Weaven, 2011).

There is a quiet revolution associated with equity-based crowdfunding relating to the securities laws in the USA (Knight, Leo, & Ohmer, 2012). They argue that crowdfunding platforms would have to support project initiators in satisfying the requirements of equity-based regulatory provisions. Hence, entrepreneurs must be aware of regulation or potential regulation for investment or equity-based crowdfunding. Although different countries have varied regulatory systems, the regulatory provision for crowdfunding is also varied.

FCA (2014a, 2014b) disclosed that the investment-based crowdfunding will be subject to UK regulation to protect participants and system integrity, especially the protection of consumers and vulnerable members of the society. According to the FCA (2014a), investment-based and credit-based crowdfunding platforms are subject to the UK regulation and current approved operators are registered. Barnett (2013) and U.S. Securities and Exchange Commission (2013) report on the regulatory provisions to support crowdfunding in the USA. As much as the regulation for crowdfunding is encouraged, securities laws must not become ineffective for general investor protection (Stemler, 2013; Hazen, 2012).

European Crowdfunding Network (2014) revealed that there is no single European Union in terms of regulatory provisions in crowdfunding. According to them, there are uncoordinated regulatory actions from one country to another in Europe. There are differences in the spheres of crowdfunding and different operational rules apply from country to country. There are differences between investment and donation; hence, the regulatory provisions for investment-based crowdfunding do not include donation-based crowdfunding. De Buysere, Gajda, Kleverlaan, & Maron (2012) provide useful guidelines to inform regulators, crowdfunding platforms, their investors and the general public. According to Thomas (2014), the initial barrier to market entry in crowdfunding requires disclosure of important documents to the regulatory authorities. Therefore, businesses that are unable to action all the required disclosure could be dissuaded from operating crowdfunding projects.

The principle of mandatory disclosure for crowdfunding has been supported in the aftermath of the approval of the JOBS Act legislation because although it is good to provide funding facilities to support small businesses, it is very important to ensure adequate protection for investors (Hazen, 2012). However, it is important to note that the success and continuous growth of crowdfunding will depend on the efficiency and effectiveness of the regulatory provisions applicable to the given crowdfunding platform (Gelfond, & Foti, 2012). They disclosed that a lean and simplistic set of rules will encourage start-up and other early stage entrepreneurs. Although the JOBS Act has eased the securities regulation to support start-up and small companies, there could be investment scam and fraud associated with the change (Parrino, & Romeo, 2012). They confirmed that the JOBS Act reduces the regulatory burden on start-up and small companies to enable them to expand unimpeded.

The JOBS Act and the securities regulation of the USA is not a panacea against fraud and it is not intended to prevent fraud but an attempt to promote capital formation for new business (Bradford, 2012). Thus, the fact that there could be investment scam or fraud associated with crowdfunding is not an adequate reason to kick against crowdfunding activities. Crowdfunding has the potential to outperform

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

any type of business funding because the number of people involved in the crowd is enormous; being greater than any one country market.

Whilst investment-based and credit-based crowdfunding aim to make profit (e.g. shared equity and credit interest) for crowd contributors, donation-based and reward-based crowdfunding rely on personal non-monetary reward and community support (European Crowdfunding Network, 2014). The decline in major music industry labels following piracy and online music distribution has created an alternative avenue for artists to showcase their expertise and intellectual property through equity-based crowdfunding (Agrawal et al., 2011). The spheres of crowdfunding and the relative small size of fund contribution provide opportunities for investor portfolio mix. The crowdfunding investor portfolio mix could introduce a type of mini venture capitalists into an otherwise simplistic investment and capital raising terrain.

Crowdfunding has been described as an alternative to the traditional form of venture capital financing (Mollick, 2014). Whilst the traditional form of venture capital financing involves investment in high-valued entrepreneurial projects, crowdfunding investors contribute small amount in collaboration with many others to create a large crowd of small funders (Zheng et al., 2014). Therefore, there is a one-to-many relationship between one entrepreneurial project and a mix of crowd funders drawn from all over the internet world. In the UK, equity-based crowdfunding increased 618% from 2012 to 2013; a short period of just over one year (Collins et al., 2013). However, the making of financial contribution in the equity-based and non-equity-based crowdfunding platforms without due diligence can be shocking and susceptible to uncertainty (Agrawal et al., 2013).

Researchers produced an investment model with reward models to support crowd investors and investees in their funding decision process (Tomczak, & Brem, 2013). Case studies of three crowdfunding platforms including Sellaband, Trampoline and Kapipal were analysed to identify the variation in their risk factors and associated risk to guide investors and provide guidance on investment payoffs (Ordanini et al., 2011). They show that there are different levels of risk and returns associated with different spheres of crowdfunding. Ahlers et al. (2012) emphasised the significance of financial roadmaps, internal governance and risk factors in the success of fundraising through equity crowd funders.

In the same way that entrepreneurs learnt about other ways of accessing project funding, crowdfunding is not different. It is very easy to assume that all crowd participants such as entrepreneurs and investors are technology savvy. There is a clear need for training for entrepreneurs or project initiators to enable them present their ideas properly online for crowdfunding. Entrepreneurs and crowd investors need a deeper understanding of crowdfunding to enable them operate efficiently and effectively in the crowd environment (Valanciene, & Jegeleviciute, 2013). A trained entrepreneur will be able to articulate their ideas in the social media platform and failure to present the right information online could jeopardise the crowd funding application with a knock-on effect on the project. Siva (2014) suggests proposal review for entrepreneurial projects prior to submission for crowdfunding to weed out inappropriate and fraudulent ideas submitted for funding.

2. Credit-Based Crowdfunding

[Credit-based crowdfunding]… *people lend money to individuals or businesses in the hope of a financial return in the form of interest payments and a repayment of capital over time (this excludes some business-to-business loans)* (FCA, 2014a, p. 10). Entrepreneurs or business managers are able to establish a crowdfunding platform or setup an entrepreneurial project for crowdfunding (Greenwald, 2012; Rossi, 2014). Ordinary people are able to invest in credit-based crowdfunding with a view to make profit

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

through credit interest (Symbid, 2011). According to Collins et al. (2013), debt-based securities in the UK grew 170% from 2012 to 2013.

Lenders in the crowdfunding peer-to-peer lending market are not professional investors and they face high risk as no collateral is offered for microloans (Lee, & Lee, 2012). However, the high risk of lending has not dissuaded the increasing platform participation among contributors in the UK, USA and Korea. It follows that capital contribution can be lost totally without any remedy in the event of entrepreneurial project failure.

Notable examples of credit-based crowdfunding are the Prosper (www.proper.com), Zopa (www.zopa.com) and Lending Club (www.lendingclub.com), which are reported to be growing unrelenting. Although all crowdfunding platforms are experiencing phenomenal growth, credit-based crowdfunding has the lowest share of growth (Mitra, 2012). While Symbid (2011) show that contributors in its credit-based crowdfunding platform are paid interest and capital, it is confirmed that Kiva (www.kiva.org) credit-based crowdfunding platform do not pay interest to contributors. Instead, Kiva pays the capital to the contributor at the end of a successful project and the contributor may contribute again in another project.

Researchers confirm that the accrued interest in some of the projects in Kiva crowdfunding platform are used to cover operating cost of providing microfinance to projects across the world (Bradford, 2012; Mitra, 2012). These show that while some credit-based crowdfunded projects pay interest and capital on successful completion, others pay capital only and use interest as operating cost. However, contributors in unsuccessful projects on the Kiva credit-based crowdfunding platform do not get any payment. If contributors are promised interest in a credit-based crowdfunding platform, the investment instrument could be regarded as securities for regulatory purpose (Bradford, 2012).

3. Reward-Based Crowdfunding

[Reward-based crowdfunding]... *people give money to receive a reward, service or product (such as tickets for an event, an innovative product, a download of an e-book or a new computer game)* (FCA, 2014a, p. 10). Reward-based crowdfunding is not subject to regulation in the UK (FCA, 2014a). In the UK, reward-based crowdfunding grew 387% from 2012 to 2013 (Collins et al., 2013). A major determining factor for crowdfunding could be the level of community support and reward associated with the project (Gerber, & Hui, 2013). According to them, crowdfunding supporters are motivated by personal rewards and the support for other people as part of a community of like-minded people. Reward-based and donation-based crowdfunding are the largest operational models of crowdfunding (Antonenko, Lee, & Kleinheksel, 2014; Mitra, 2012).

Kickstater and Indiegogo are two important and global crowdfunding platforms offering rewards for contributions received from the crowd. According to Kickstater (2014), the highest successfully funded projects were in the music, film and video industry. Indiegogo (2014) disclose that there is a minimum of $500 fundraising requirement on its crowdfunding platform and contributors are rewarded with non-monetary incentives called ‘perks’. Kickstater has a funding model of all-or-nothing and this suggest that if entrepreneurs are unable to get their full targeted fund, the amount raised will be withdrawn and returned to the investors (Kickstater, 2014).

According to Dragojlovic, & Lynd (2014), crowdfunding is a big benefit for early stage projects with early proof of concept. Research projects are known to face difficulty in raising finance for their investigation and development of new ideas (Dragojlovic, & Lynd, 2014). Crowdfunding are emerging as a way of funding community support projects around the world (Grossman, 2012). Kickstarter

crowdfunding platform was started as a way to fund creative projects but this has grown extensively for funding technology start-up firms (Greenwald, 2012). A number of crowdfunding platforms use a tiered system of rewards for its contributors (Antonenko, Lee, & Kleinheksel, 2014). Contributors to crowdfunding campaigns expect reward and technology-based projects tend to give rewards such as software and performance tickets (Wheat et al., 2013). Although crowd contributors get rewards, their motivation may include social and intrinsic value (Collins, & Pierrakis, 2012).

Project initiators or entrepreneurs will reap reward from the crowd if their initial crowdfunding engagement is a trusting relationship. A lack of trust is one of the deterrents of crowdfunding among supporters (Gerber, & Hui, 2013). It is good practice to engage in an online prelaunch relationship prior to launching the crowdfunding campaign online (Helmer, 2014). The online prelaunch of the entrepreneurial project will introduce the idea to the social media environment and feedback can be systematically collected to guide the crowdfunding campaign towards supporting and building trusted crowd relationships. Zheng et al. (2014) confirmed that the social capital of the entrepreneur can improve access to crowdfunding investors.

Kickstater, a reward-based crowdfunding platform, is one example of a crowdfunding platform that could generate the social information required to better understand the behaviour of crowd funders (Kuppuswamy, & Bayus, 2014). They confirmed that social information can help to understand the behaviour of project backers. Hence, the success or failure of an entrepreneurial project can be dependent on the available social information. According to Zvilichovsky et al. (2014), backing the project of other entrepreneurs is a rewarding fundraising strategy because it introduces a sub-community of active backers. They find that backers who also operate as project initiators have positive funding outcomes.

4. Donation-Based Crowdfunding

[Donation-based crowdfunding]… *people give money to enterprises or organisations whose activities or purchases they want to support* (FCA, 2014a, p. 10). Similar to the reward-based crowdfunding system, donation-based crowdfunding is not subject to regulation in the UK (FCA, 2014a). According to Grossman (2012), there is a continuous increase in crowdfunding platforms around the world and local people in the UK are using community initiative to fund public projects through the crowd. Research show that non-profit project receive greater sum of money from each crowd funder and more likely to meet the project funding objective (Pitschner, & Pitschner-Finn, 2014). Also, non-profit initiatives in crowdfunding tend to be more successful at reaching fundraising goal (Belleflamme, Lambert, & Schwienbacher, 2013; Collins, & Pierrakis, 2012).

Donation-based crowdfunding is similar in some ways to reward-based crowdfunding. Notable examples of donation-based crowdfunding platform include CrowdRise (Delaware, USA), GoFundMe (San Diego, California, USA) and RocketHub (New York, USA). Although these example platforms are donation-based, it should be noted that different crowdfunding platforms have their operational strategy and subject to local laws.

In the UK, donation-based crowdfunding and peer-to-peer online fundraising constitute the largest fundraising market sector with £785million raised over a period of three years from 2011 to 2013 (Collins et al., 2013). Crowdfunding entrepreneurs should endeavour to contribute towards the fundraising of other entrepreneurs in the crowd community (Boeuf et al., 2014). They consider it advantageous for an entrepreneur to support the project of other entrepreneurs in the crowd environment.

Extending support to other entrepreneurs in the crowd increases the profile of the entrepreneur and shows full participation in the community and cohesion; hence, the entrepreneur will get increased sup-

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

port from the crowd (Boeuf et al., 2014). Mollick (2014) confirmed that personal networks and signal of project quality contribute to successful crowdfunding. This shows that the personal networks of the entrepreneur made up of other entrepreneurs and like-minded people can lead to successful fundraising. The price of giving a donation has an effect on the behaviour of crowd contributors and the higher the competition, the lower the likelihood of donation (Meer, 2014).

The availability of crowdfunding in the form of online donation has challenged traditional journalism and removed the revenue and profit making paradigm into a non-business model concept (Carvajal, García-Avilés, & González, 2012). Crowdfunding as a form of social enterprise fundraising can provide the positive signal of potential funding through mainstream sources such as venture capitalists and business angels (Lehner, & Nicholls, 2014). They assert that crowdfunding can provide the legitimacy and leverage to enable fundraising in a venture capitalist and business angel environment. Crowdfunding is useful in the social entrepreneurship context and a model is provided to guide crowdfunding platforms and contributors (Lehner, 2013). The forms of returns associated with donation-based crowdfunding are intangible and contributors are motivated by social and intrinsic value (Collins, & Pierrakis, 2012). The contributions received through donation-based crowdfunding are not classified as securities for regulatory purpose in the USA (Bradford, 2012).

RECOMMENDATIONS

Entrepreneurs and SMEs are gaining access to finance through crowdfunding but they must consistently maintain good relationship with the crowdfunding platform. As much as project initiators or entrepreneurs need access to project funding, they should adhere to the guidelines provided by the crowdfunding platform and country level regulation. The guidelines are generated as protection for all crowdfunding stakeholders including service providers, contributors and entrepreneurs.

Entrepreneurs should not be restricted by the geographical location of crowdfunding platform because crowdfunding opportunities abound all over the world. Globalisation has positively impacted the demand and supply of crowdfunding; and entrepreneurial projects are at an advantage. Although conventional wisdom associated with traditional ways of project funding attribute success to geographical co-location, crowdfunding has used online mechanisms to mostly eliminate spatial proximity. Although crowdfunding platforms are concentrated in North America and Europe, most of the available platforms (e.g. Crowdcube, Indiegogo, Kickstarter, Seedrs, Invesdor and Abundance Generation) are expanding internationally as they are beginning to allow global access to their crowdfunding platforms. However, the originating country of the crowdfunding platform will determine the applicable legal jurisdiction for mediating disputes.

Entrepreneurs or project initiators who act as backers for other crowdfunding projects are able to increase their crowd profile positively. As project initiators increase their positive profile among the crowd community, they will continue to have fundraising success with many willing backers. Therefore, entrepreneurs are encouraged to back the projects of other entrepreneurs.

Entrepreneurs and SMEs are encouraged to use this research as their crowdfunding knowledgebase and exploit the potentials identified. The potential of crowdfunding is huge and entrepreneurs seeking early stage business and project funding have the opportunity to gain adequate funding from the crowd. The acquisition of knowledge is to increase conventional wisdom and this chapter gives a wide understanding of crowdfunding and its different spheres.

CONCLUSION AND FUTURE RESEARCH DIRECTIONS

This investigation shows a systematic review of research and policy literature on the spheres of crowdfunding. Crowdfunding is a new, innovative, alternative and additional method of access to finance for seed, start-up and other early stage project fundraising from many small contributors via the internet. The existing economic and management theories (e.g. pecking order, signalling, stakeholder, social capital and agency cost) of SMEs are also applicable to crowdfunding. Globalisation and web technology has provided the driving force for a quicker expansion of crowdfunding all over the world. Regulation is also providing the necessary drive for the expansion of crowdfunding in developed countries and many developed countries in Europe and North America have recognised and approved the requisite regulatory support. However, regulatory authorities in developing countries are at different stages of the recognition of crowdfunding in their policy framework. The regulation of reward-based and donation-based crowdfunding can rely on existing rules on charitable giving and other existing social provisions in the UK and elsewhere. However, equity-based and credit-based crowdfunding require updated regulatory provisions with compliance monitoring.

As a new concept, crowdfunding is growing as a means of access to finance for entrepreneurs. There are opportunities for further research to advance crowdfunding, its knowledgebase and usefulness in meeting the needs of mostly seed and other early stage project funding. Crowdfunding is increasing in popularity in social media, business and research environments. It is very important that researchers explore crowdfunding widely with a view to broaden the knowledge of project initiators (such as entrepreneurs, business owners and managers). The necessity for further research is centred on the need for better information sharing and knowledge exchange to support new and existing entrepreneurs all over the world.

The period of the financial crisis which started in 2007 closed many businesses and many new businesses were born through crowdfunding with impact around the world. Crowdfunding has gained international recognition and approval from developed countries but less so in developing countries. Although regulatory authorities in the UK and USA have supported crowdfunding with the necessary regulation, many countries are still in their infancy in crowdfunding. Therefore, there is need for crowdfunding research in emerging and developing countries to expand the worldwide knowledgebase of crowdfunding.

Access to finance theories (e.g. pecking order, signalling, agency cost, credit rationing and discouraged borrower) have been explored widely in finance, economics and management research. Also, social capital, network exchange and stakeholder theories are relevant to crowdfunding but there are limited researches in these areas. There are limited researches that have explored crowdfunding as a method of access to finance for businesses with links to extant theories. As a result, there are limited research based literature associating crowdfunding and the theories. Hence, it is important that further research uncovers the impact of economics, management and finance theories on crowdfunding. This will allow adequate understanding of the various theories and how they relate to crowdfunding.

In agreement with other researchers, crowdfunding require more empirical study to share successes and failures across crowdfunding platforms and countries. Empirical study will provide research based knowledge to enhance existing provisions from all over the world. In the absence of clear empirical study, there will be continuous assumptions across the online news and opinion pages.

KEY TERMS AND DEFINITIONS

Business Angel: A rich person who provides funding for a business in exchange for share of ownership.
Constraint: Restriction.
Entrepreneur: A person who establishes a business and assumes responsibility for risks and returns.
Innovative: Applying new ideas.
Private Equity: An asset class of medium to long-term finance invested in the equity share of potentially high growth and private unquoted companies.
Spheres: Types.
Venture Capital: A professionally managed fund focussed on equity investments in private and potentially high growth unquoted companies.
Venture Capitalist: A professional fund manager focussed on equity investments in private and potentially high growth unquoted companies.

Chapter 81
A Framework for Research on Information Technology Governance in SMEs

ABSTRACT

The need to effectively manage IT resources such that they enhance the business value of firms makes IT Governance (ITG) an important issue for both IS researchers and practitioners. The purpose of this paper is to build a conceptual framework for ITG in small and Medium-Sized Enterprises (SMEs). The authors first analyze the main theories applied in ITG research, and confront them with the specificities of SMEs. The authors then highlight the limits of those theories in SMEs context and discuss adaptations needed or alternative theories in such context. The resulting framework is then applied to generate a set of six research propositions on ITG in SMEs.

1. INTRODUCTION

Given that some organizations achieve higher performance with their IT investments while others fail to do so (Gattiker & Goodhue, 2004), the issue that matters now is to know under which conditions organizations create value from their IT (Kohli & Grover, 2008).

It has been argued that IT governance (ITG), which "is about controlling the strategic impact of IT and its value delivery to the business" (Zarvić et al., 2012, p. 543) can make the difference (Nfuka, & Rusu, 2011; Devos, et al., 2012; Wilkin, 2012). The need to effectively manage IT resources so that they can enhance the business value of firms makes of ITG an important issue and yet an uneasy task (Weill & Ross, 2004; Van Grembergen & De Haes, 2010). Indeed, the most important IT challenges faced by organizations now and in the future are less related to technology than to governance (Nfuka, & Rusu, 2011).

The literature related to ITG in particular, and to corporate governance (CG) in general, has mobilized and proposed different theories and frameworks to explain the mechanisms of governance. However, most of those theories and frameworks are often criticized as being more appropriate for large enterprises (LEs) and less for small and medium-sized enterprises (SMEs), hence the call for revisiting existing theories and frameworks or for proposing alternative ones with in mind the specific realities of SMEs (Banham & He, 2010). This call is important, all the more so that studies on ITG in SMEs are rather rare (Vogt et al., 2011; Alves et al., 2013). This paucity of studies does not mean, however, that ITG does not exist in the context of SMEs. Previous studies have shown that SMEs use IT in their basic activities and are expanding IT usage in more advanced processes (Raymond & Croteau, 2006; Mardikyan, 2010; Ruivo, Oliveira & Neto, 2012; Sila & Dobni, 2012). As IT users, SMEs have to find ways to allocate IT-related responsibilities and to ensure IT-business alignment for increased business value, brief ways to practice ITG (Luftman et al., 2010). Given the important consequences IT can have on growth and survival of SMEs in a competitive market, we argue that ITG for SMEs is a necessity and must be researched.

The purpose of this theoretical study is to develop a framework for research on IT governance in SMEs. To do so, we proceed in three phases. First, we analyze theories generally applied in ITG literature with in mind the specificities of SMEs, and we bring out salient limits of these theories with regards to the realities of SMEs. Second, we identify adaptations necessary to these theories to account for the SME's realities, and alternative theories better suited to its context. Third, building on the results of the precedent analysis we propose a conceptual framework for ITG in SMEs and related propositions that can be used as hypotheses for future research.

2. THEORETICAL AND EMPIRICAL BACKGROUND

In the literature, corporate governance (CG) is generally conceptualized with reference to the rights and responsibilities of different stakeholders in the firm, to the relationships among stakeholders with regards to the decision-making process, resolution of possible conflicts, and control of organizational resources, and to the means for setting corporate objectives and monitoring performance (Turlea et al., 2010). The OECD has proposed the following definition of CG which seems to have gained widespread popularity (Mason & O'Mahony, 2008): "a set of relationships between a company's management, its board, its shareholders and other stakeholders [that] provides the structure through which the objectives of the company are set, and the means of attaining those objectives and monitoring performance are determined" (p. 32).

ITG has emerged since the 1990s as a conceptualization of steering the use of IT within a company (Zarvić et al., 2012). It is now acknowledged that ITG is the responsibility of top management and an integral part of corporate governance (De Haes et al., 2013). This view is integrated in frameworks such as CoBIT 5 that establish good practices for ITG.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Definitions of ITG in the literature refer implicitly to the principal-agent problem which is central in the dominant agency theory in CG literature. In this perspective, a parallel is made between the alignment of executives' decisions to the owners' interests in CG and the alignment of IT management practices to the firm's needs in ITG. We define ITG as follows: ITG, a responsibility of top-management and an integral part of corporate governance, encompasses the decision rights and the accountability framework for encouraging desirable behavior in the use of IT, and ensuring that IT goals and objectives are realized in an efficient and effective manner (De Haes et al., 2013).

2.1 SMEs' Specificity Regarding Corporate Governance and IT Governance

Early previous studies have pointed out SMEs' specificities (Jennings & Beaver, 1997; Raymond, Bergeron, & Rivard, 1998; Torrès, & Julien, 2005). Blili and Raymond (1993) grouped these specificities in five categories: environmental, organizational, decisional, psycho-sociological, and informational. Generally speaking, SMEs operate in local markets and exert little control over their environment, they rather bank on their flexibility to adapt to changing conditions in environment; they count on limited resources, financial and human, and they are characterized by a simple organic structure, developed around interests/abilities of key employees, and by a centralized management; their decision-making and strategic formulation processes are intuitive, adaptive, and short-term oriented; they are in almost all aspects overwhelmingly dominated by the owner-managers who cumulate the roles of entrepreneurship, ownership, and management; their internal and external information systems are generally simple and informal.

The specificity assumption of SMEs should, however, be cautiously considered. At least two cautions should be heeded. First, the statement of the specificities of SMEs does not mean that the group of SMEs is homogenous. The heterogeneity inside this group is a deep-seated phenomenon in the small business research field (Torrès & Julien, 2005). With regard to ITG for example, one would assume that SMEs pertaining to different categories such as local, transition, and world-class SMEs which are characterized by different IT adoption patterns (Raymond and Croteau, 2006) would adopt different ITG mechanisms.

As second caution, the assumption of specificity should not be transformed into a universal principle (such as *all SMEs are specific*) ignoring that "[a] small business may sometimes not be, or no longer be, specific" (Torrès & Julien, 2005, p. 360). Indeed, in some contexts, referred to as "denaturing contexts", the very characteristics that found the specificity of SMEs tend to disappear, giving place to an "anti-small business", that is a firm that, without growing in size, takes on all or most of the opposite features of small businesses (Messeghem, 2003; Torrès & Julien, 2005). These authors, considering the denaturing potential of some contexts, plead for a contingent approach to SMEs specificity. This is exactly what have done Brouard and Di Vito (2008) by putting SMEs with multiple external shareholders on the same footing as (big) public companies with widespread shareholding, considering that agency conflicts in both situations would be similar.

Does the specificity of SMEs hold in the context of CG and ITG respectively? Can a SME embrace CG and ITG mechanisms and then keep the distinctive features of SMEs? At first sight, CG and ITG would appear counterintuitive for SMEs, in such they push for more structuring, planning, and formalization. Acknowledging this fact, we propose a framework for research on ITG that takes into account the specificities of SMEs, showing that there would be ITG mechanisms that are compatible with the SME's nature. In this research we use the OECD definition of a SME which is any firm that falls under the upper limit of 250 employees, in both manufacturing and service sectors (OECD, 2005).

2.2 Theories Applied in Corporate Governance and IT Governance Research

Different theories applied into CG research have been applied in ITG research as well. The theories discussed in this study results from a literature review we conducted. We do not pretend in the completeness of the list of existing theories; nevertheless, we believe that the main and most referred to theories are covered. The main theories are agency theory, stakeholder theory, power perspective, stewardship theory, resource dependency theory, network governance theory, institutional theory, upper echelon theory, institutional trust theory (Al Mamun, Yasser, & Rahman, 2013).

In the following sub-sections we briefly present each theory and succinctly analyze its specific application in ITG empirical studies and its level of suitability to SMEs' realities. We begin with those that seem less applicable to ITG in the context of SMEs.

Agency Theory

This theory is the overwhelmingly dominant school of thought both in academic research and practice (Mason & O'Mahony, 2008). It focuses on problems arising from separation of ownership and control (Uhlaner et al., 2007). It embraces a narrow, shareholder-centric view of CG, which reflects the traditional finance paradigm of shareholder value maximization as the main (if not the sole) goal of corporate management (Turlea, et al., 2010). Following agency theory reasoning, studies in ITG have analyzed the relationships between ownership and control structures of the firm and the IT performance (Karake, 1995; Ferguson et al., 2013).

The problem of applying this reasoning in the context of SMEs, at least as it has been applied in ITG in LEs is threefold. First, this reasoning is based on the principal / agent problems that are less likely to happen in SMEs due to the overlapping of management and ownership in those firms (Banham & He, 2010; Brunninge et al., 2007). Second, structures that are referred to in proposed governance mechanisms inadequately mirror the ones found in LEs as if SMEs were just scaled down LEs (Uhlaner et al., 2007). Third, due to the small size of SMEs, the information asymmetry is very low (Brouard & Di Vito, 2008). Information asymmetry is at the basis of opportunistic behaviors that agency theory-related governance mechanisms seek to thwart. Therefore we consider that agency theory does not apply well to SMEs.

Stakeholder Theory

While agency theory focuses on the sole dual relationship between managers and shareholders, the stakeholder theory broadens constituencies, adding to managers and shareholders other groups of actors that may have a direct or indirect stake at the firm's operations (Talaulicar, 2010; Abraham, 2012). Stakeholder theory is inherently inscribed into ITG. Many ITG definitions "explicitly or implicitly refer to stakeholders either as ends of or as contributors to the ITG activities" (Messabia, & Elbekkali, 2010, p. 981).

The stakeholder theory has been criticized as a perspective that can lead SMEs to implement policies with sub-optimal outcomes (Abor, & Adjasi, 2007; Abor & Biekpe, 2007). The pursuit of divergent stakeholders' interests such as environmental versus financial is less of an issue in SMEs than in LEs. As a "definitive stakeholder", the SME owner-manager is the most salient among all stakeholders, that is, the one whose claims will be given priority in ITG (Mitchell et al., 1997). Therefore the stakeholder theory does not apply so well to the reality of SMEs with regards to ITG.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Table 1. Theories with lower applicability to IT governance in SMEs

Theories	Key Issues with Regard to ITG Mechanisms in SMEs	Reasons Why Lower Applicability to SMEs
Agency theory	Relationship management with external IT partners	• Principal / Agent problems less likely (Brunninge, et al., 2007; Banham & He, 2010) • Reference to unlikely structures (van Gils, 2005) • Low information asymmetry (Brouard & Di Vito, 2008)
Stakeholder theory	Predominant role of owner-manager	Suboptimal outcomes (Abor, & Adjasi, 2007; Banham & He, 2010)
Power perspective	Predominant role of owner-manager	Lower levels of power playing (Fiegener et al., 2004)

Power Perspective

The power perspective is used in corporate governance to analyze potential conflicts of interests that may arise among different stakeholders, notably among executives, directors, and shareholders (Chen, 2007). With regard to ITG, this perspective is referred to analyze the relative influence of IT function comparatively to the influence of other business units in IT-related decision processes (Xue et al., 2008; Weill & Ross, 2005).

The potential conflicts opposing executives, directors, and shareholders that are at the core of the power perspective theory (Daily et al., 2003) are less likely to be observed in SMEs. Thus, this theory does not capture well the reality of SMEs with regards to ITG. The above theories that we assess as less applicable to ITG in SMEs are summarized in Table 1.

Among alternative theories that can be mobilized to study ITG in SMEs, we propose the following ones as more appropriate: stewardship theory, resources dependency theory, network governance theory, institutional theory, upper echelon theory, and institutional trust theory (Brunninge et al., 2007; Devos et al., 2012). Here are their key characteristics and why they seem more applicable to ITG for SMEs. They are summarized in Table 2.

Stewardship Theory

This theory is based on an assumption opposite to the agency theory's premise of opportunistic behavior as inherent to human nature. According to the stewardship theory, managers are naturally trustworthy, and seek to be good stewards of the corporate assets (Uhlaner et al., 2007; Nicholson & Kiel, 2007; Del Baldo, 2012). With regard to ITG specifically, the stewardship theory may be more consistent with the nature of ITG because the managers' interests are perfectly aligned with the shareholders' interests, thanks to the overlapping of ownership and control in most SMEs (McGinnis et al., 2004; Brunninge et al., 2007).

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Resource Dependency Theory

This theory is used in CG to explain the role of board of directors as a link to access to further resources available in the firm's environment (Nicholson & Kiel, 2007). Board members extend the reach of an organization in its environment, and provide it with access to resources that would otherwise be out of reach or expensive (Daily et al., 2003). Research in this area focuses on the size and the composition of the boards as they may reflect the extent of exposure to external environments networks and access to various resources (Jackling & Johl, 2009). The resource-dependency theory can be and has been specifically applied to ITG (Rasheed & Geiger, 2001; Xue et al., 2008). The resource-dependency theory fits well to the context of SMEs, particularly because most SMEs depend on external IT expertise (Devos et al., 2012).

Network Governance Theory

This theory involves a select, persistent and structured set of private firms and non-profit agencies engaged in creating, manufacturing or distributing products or services, based on implicit and open-ended contracts designed to adapt to their environmental specificities and to coordinate and safeguard exchanges (adapted from Jones et al., 1997). Based on the network governance theory, research on interorganizational ITG unveiled the two profiles of interorganizational ITG: contractual and consensual (Croteau et al., 2013). These profiles take into account the ITG structure, the process followed to make decisions, and the roles of participants involved in setting and promoting interorganizational mechanisms (Croteau & Bergeron, 2009). Given the more informal structure of SMEs, they have a lower number of hierarchical levels, a lower ratio of managers/employees and they are at an earlier level (state) of interorganizational ITG maturity (Barthon & Jepsen, 1997; Croteau & Bergeron, 2009). It is therefore expected that SMEs will have a more informal and flatter interorganizational ITG structure, will be more dependent upon partners as to the choice and obligation of IT control processes, and the interorganizational participants to ITG will be less in number yet more involved into their IT-related decisions and actions. It is thus expected that the more a SME is involved in external networks, the more it will implement ITG mechanisms. It will be under pressure to conform itself to its partners' practices and will rely on the network capacity to compensate for its lack of internal resources and capabilities (Xiaobao et al., 2013).

Institutional Theory

This theory considers that organizations are not just economic systems motivated by the pursuit of economic efficiency and performance, but are also social and cultural systems that seek to gain legitimacy in their environment by adjusting themselves to regulations, norms and values (Al Mamun et al., 2013; DiMaggio & Powell, 1983). Institutional theory acknowledges the influence of an organization's environment on its IT structures and practices. More precisely, the intensity of institutional pressures will affect the IT department power, and will influence an organization's ITG patterns (Xue et al., 2008). Moreover, due to their size and to their limited resources, SMEs may be more influenced by their environment than LEs. Hence the institutional theory seems be suitable for analyzing the adoption of ITG practices in the SME's context (MacGregor, 2004; Mohnnak, 2007; Islamoglu & Liebenau, 2007; Raymond et al., 2012).

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Upper Echelon Theory

According to upper echelon theory, the characteristics of top-level managers play a crucial role in determining the strategic organizational outcomes and processes (Hambrick & Mason, 1984). The small size and the structural flexibility of SMEs intensify the involvement of top managers in almost all of the firm's activities, and their influence is thus stronger than it can be in LEs (Brunninge et al., 2007). The upper echelon theory offers new theoretical lens through which ITG mechanisms in SMEs can be analyzed. The focus shifts from agency-related levels of analysis (ownership structure, board of directors, incentive compensation) towards the SME's top management team (or key employees). The upper echelon theory has been mainly used to analyze the strategic changes in SMEs (Brunninge et al., 2007; Napoli, 2012), but it is quite appropriate for ITG as well. The values, norms, backgrounds, and interests of top-level managers of SMEs may explain their readiness and their predisposition to adopt certain forms of ITG mechanisms and to reject others.

Institutional Trust Theory

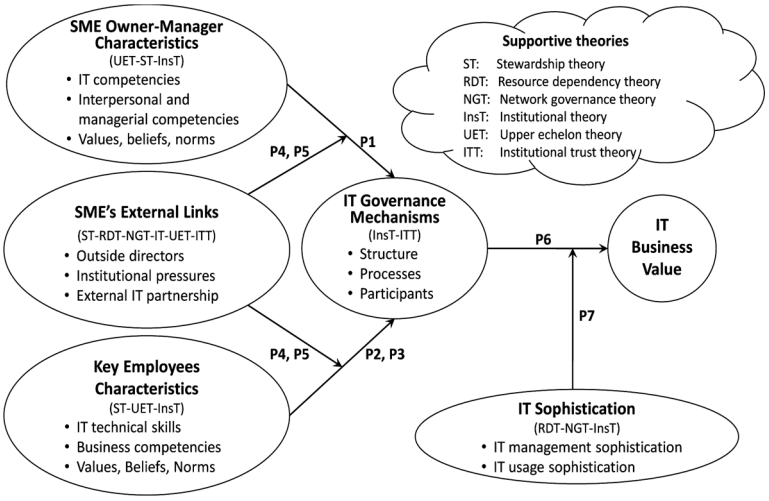
This theory is an interesting alternative theoretical perspective to agency theory and it is suitable to the context of SMEs as well. Instead of relying on agency-based control mechanisms to deter opportunistic behavior in IT collaboration relationships, SMEs may develop a partnership based on trust, which "can be seen as a coordinating mechanism, based on shared moral values and norms" (Devos et al., 2012, p. 210). Trust reduces the need to resort to structured controls, such as steering committees, management guidelines, policies and procedures, or to comprehensive outcome-based contracts, for which SMEs may not be well-equipped to deal with given their financial constraints and their limited capabilities in terms of internal IT-related human resources (Huang et al., 2010).

3. CONCEPTUAL FRAMEWORK

The preceding analysis shows that when analyzing ITG in SMEs, we need to take into account theories that are more appropriate for SMEs. Building on such theories as discussed in the precedent section, we propose a framework for research on ITG in SMEs with the corresponding supportive theories by constructs, as illustrated in Figure 1.

In this framework, the SME's owner-manager and key (internal) employees are the main actors. The inclusion of the SME's owner-manager characteristics in the conceptual framework of ITG in SMEs is based on the stewardship theory and the upper echelon theory, which both acknowledge the SME's owner-manager's tight grip on any major organizational activities and decisions. Besides, the primary role played by owner-managers in the context of SMEs is unanimously acknowledged in the small business literature.

The inclusion of the SME's key employees is based on the stewardship theory and the upper echelon theory as well: key employees' influence is inversely proportional to the size of their organization, so the role of key employees in any major decisions would be greater in SMEs than in LEs. Shared values, beliefs and norms of both the owner-manager and the key employees are based on the institutional theory.



The proposed framework also assumes that in their decision with regard to ITG mechanisms, the SME's owner-manager and key employees will be to some extent influenced by its external links. This

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Table 2. Theories with higher applicability to IT governance in SMEs

Theories	Key Issues with Regard to ITG Mechanisms	Reasons Why Higher Applicability to SMEs
Stewardship theory	• No need for agency-based control mechanisms • Empowerment of owner-managers and key employees	Convergence of ownership and management (Brunninge, et al., 2007)
Resource dependency theory	• Role of IT external partners • Role of outside and independent directors	Limited internal resources (Devos et al., 2012)
Network governance theory	• Pressures from partners to conform • Support from the network	• Pressure to formalize the network structure • Pressure to implement controls • Pressure to improve IT knowledge and communication • Need for partners' support
Institutional theory	Institutional pressures towards ITG mechanisms adoption	• Pressures towards IT innovations adoption from the SME's networks (MacGregor, 2004; Raymond et al., 2012) • Little capacity of SMEs to resist to pressures
Upper echelon theory	• IT-related roles and responsibilities for owner-manager • IT champion among key employees	• Predominance of owner-managers (Brunninge et al., 2007; Napoli, 2012) • Important role of key employees (Brunninge et al., 2007; Napoli, 2012)
Institutional trust theory	Moderating effect of institutional trust between SME and external IT partner on the adoption of ITG mechanisms.	• Partnership based on trust (Devos et al., 2012) • Limited resources for agency-based controls implementation (Huang et al., 2010)

Figure 1. Framework for research on IT governance in SMEs

assumption is based concurrently on the resource-dependency theory, the network governance theory, the institutional theory, and the institutional trust theory. In accordance with the resource-dependency theory and network governance theory, the access to external resources through either independent and outside directors or IT external partners would influence the SME's owner-manager and key employees with respect to their ITG decisions.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

The network governance theory and the literature on interorganizational governance of IT suggest that governance mechanisms related to structure, processes and participants lead to higher competitive advantage or IT business value. The network governance theory also suggests that SMEs involved in networks are likely to be influenced by their business partners in adopting ITG mechanisms. According to institutional theory, mimetic, normative, and coercive pressures would be exerted on the SME's main actors towards the implementation of the same ITG mechanisms adopted by organizations evolving in the SME's environment. As for the theory of institutional trust, it allows to take into account the moderating effect of trust between a SME and its IT external partners on the level of ITG mechanisms implementation: high levels of trust reduce the need for owner-managers and key employees to implement agency theory-inspired ITG mechanisms.

So, the proposed conceptual framework is essentially composed of six groups of factors. At the framework's core, there is the group of IT governance mechanisms. The adoption of such mechanisms by a SME is deemed to be directly or indirectly determined by three groups of factors: the SME's owner-manager's characteristics, its key employees' characteristics and the SME's external links. The SME's IT business value, as the outcome of its adoption of ITG mechanisms, constitutes the next element in the framework (discussed later in the section on the consequences of ITG mechanisms). The firm's IT sophistication constitutes the last exogenous element, and is meant to assure the presence of the IT function and the "IT artifact" within the conceptual framework (Orlikowski & Iacono, 2001; Akhlaghpour et al., 2013) (discussed later in the section on the moderating role of this element in the relationship between ITG mechanisms and IT business value).

3.1 IT Governance Mechanisms in SMEs

Having its roots in the network governance theory (Jones, 1997; Barthon et al., 1997), ITG and interorganizational ITG generally classifies ITG mechanisms into three dimensions: structures, processes, and participants (Croteau & Bergeron, 2009; Croteau et al., 2013; Ko & Fink, 2010). Sometimes, participants is also referred to as relational mechanisms (De Haes & Van Grembergen, 2006; Wilkin, 2012; Mohamed & Singh, 2012). The structure dimension emphasizes control and coordination and refers to the organization of IT function, to its roles and responsibilities, brief, to the formal and rational units and mechanisms put in place to carry out IT-related decisions and activities in organizations; structure refers to the locus of authority with regards to IT decision-making, in other words it determines who act and with which resources (Croteau & Bergeron, 2009). The processes dimension emphasizes control and sustainable capability, and refers to tools, techniques, frameworks or standards combined to ensure IT-business strategic alignment and to track IT performance achievements. The participants dimension refers to the persons at various levels and functions who take part in leadership, training and sharing, who actively participate, collaborate, communicate, and get involved in order to disseminate IT-related policies, principles and outcomes. ITG would be even more important in a network or interorganizational environment due to the partners requirements in terms of a minimum threshold of quality, uniformity and reciprocity of IT mechanisms needed to create value for all network members. In this situation, the network strength is as high as the weakest of its link. Much adaptation will therefore have to be made to SMEs specificities.

Some highly-formalized ITG mechanisms are less suitable to rather organic and loosely structured SMEs (Jennings & Beaver, 1997). Basic ITG mechanisms are likely to be found in SMEs. These ITG mechanisms are not necessarily denaturing. Structure-related ITG mechanisms such as CIO on board

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

and IT steering committee (De Haes & Van Grembergen, 2006) are less likely to be in place in SMEs, as their structural ITG capability is likely to be assumed by the owner-manager. Clear IT-related roles and responsibilities of the owner-manager are thus necessary as structural governance mechanism in this case (Wilkin, 2012). Instead of the formal CIO function, a SME is likely to rely on an IT champion, a much more informal role and yet a very important one for its IT-related activities (Pollard, 2003). SMEs may also rely on external expertise to compensate their lack of expertise internally. The IT champion will play a determinant role in the relationship between a SME and its IT external expert.

For process-related mechanisms such as externally developed standards, tools, techniques, or frameworks like COBIT, ITIL, ISO17799 which are highly formalized and certification oriented, SMEs are not either well equipped (Ko & Fink, 2010). Without necessary resorting to highly developed tools, SMEs have to find ways to align their IT projects to their strategic business and to track IT business value creation. Otherwise, overwhelmed by operational imperatives as they tend to be, SMEs may lose sight of long term and strategic imperatives in their IT decision-making. So, one would consider IT strategic alignment and IT performance tracking as key process-related ITG mechanisms in SMEs.

As for participants, relational mechanisms such as business/IT co-location and active participation and collaboration between key stakeholders do not need to be formally implemented in SMEs as they are naturally evident in such context (Wilkin, 2012). However, for an effective collaboration between participants (Peterson, 2004), people involved in ITG need to develop mutual understanding which can be reached through IT training, and proper communication for developing awareness and understanding of business/IT objectives.

3.2 Antecedents of IT Governance Mechanisms

In our framework, the adoption of ITG mechanisms is directly determined by both SME owner-manager's characteristics and key employees' characteristics, and indirectly affected by SME's external links. In other words, the relationship between, on one hand the owner-manager's characteristics and the key employees' characteristics, and on the other hand the adoption of ITG mechanisms is moderated by the SME's external links.

SME's Owner-Manager

Studies on SMEs have acknowledged the central role of the entrepreneur or owner-manager in shaping the firm. As the principal stakeholder concurrently assuming multiple roles, he/she is involved in almost if not all major decisions that affect the firm for better or worse. His/her characteristics will then be determinant. Banking on previous studies, we put these characteristics in three main categories: IT-related competencies (Caldeira & Ward, 2003; Wainwright et al., 2005; Scupola, 2008; Cragg et al., 2011), interpersonal and managerial competencies (Kraemmergaard & Rose, 2002; Bassellier & Benbasat, 2004) and personal values, beliefs, and norms (Ramdani, et al., 2009; Del Baldo, 2012).

IT-related competencies of an owner-manager are important in that they will shape not only his/her understanding of opportunities of IT usage in business activities, but also his or her expectations with regards to how IT activities should be managed. These understanding and expectations will lead to the IT adoption decision, and more important, to the creation of facilitating conditions for the actual IT implementation and use (Scupola, 2008). ITG mechanisms can be viewed as facilitating conditions meant to leverage IT for achieving business goals.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Interpersonal and managerial competencies will help the owner-manager to effectively communicate his/her vision of ITG mechanisms, motivate and get employees to adhere to that vision, overcome change resistance, and meet the scope, time, and goal objectives throughout the implementation phases of ITG mechanisms. Adapting Kraemmergaard and Rose's (2002) and Bassellier and Benbasat's (2004) definitions to the context of ITG, we retain leadership, interpersonal communication, human resource, change management, and project management as part of interpersonal and managerial competencies.

Another determinant factor that would sway an owner-manager's decision in favor or not of ITG mechanisms adoption is the level of compatibility between these mechanisms and his/her values, beliefs, and norms. The notion of compatibility, which refers to the perception of consistence of an innovation (ITG mechanisms in this case) with regards to values, experiences, beliefs, and needs of would-be adopters, is important, especially in small firms (Ramdani et al., 2009). Owner-managers will obviously willingly push for adoption of ITG mechanisms that are compatible with their values, beliefs, and norms. Considering the precedent considerations, the following proposition can be stated:

P1: Greater competencies (IT-related, interpersonal and managerial) of the SME's owner-manager and higher levels of perceived compatibility of his/her values, beliefs, and norms with ITG mechanisms will positively influence the implementation of ITG mechanisms in a SME.

SME's Key Employees

Notwithstanding the key role of the entrepreneur or the owner-manager in all major decisions, key employees' influence in SMEs is likely to be paramount. This major influence stems from the fact that small firms tend to be structured around key employees' abilities and interests (Jennings & Beaver, 1997). It is also due to the small size and organizational flexibility of SMEs (Brunninge et al., 2007) that do not restrict key employees in narrowly-defined roles. The paramount influence of the SMEs' key employees is in line with the upper echelon theory (Hambrick & Mason, 1984). The characteristics of a SME's key employees have to be taken into consideration in order to understand the adoption of ITG mechanisms in the firm. Based on previous studies (Kraemmergaard & Rose, 2002; Bassellier et al., 2003), these characteristics are grouped into three main categories:

1. IT technical skills,
2. Business competencies, and
3. Values, beliefs, and norms.

At the level of key employees, IT technical skills required are more than a certain level of comfort with IT as is the case for owner-manager's IT knowledge. IT technical skills of key employees are a reflection of their IT-related explicit knowledge with regards to technology, applications, system development, IT management, access to IT knowledge. IT technical skills also include their IT-related tacit knowledge, that is experience in IT projects and experience in the management of IT (Bassellier et al., 2003). While owner-manager's IT knowledge play a role in the decision to adopt IT, IT technical skills at the key employees level are indispensable for the actual implementation and effective use of IT (Raymond et al., 2012). We would here assume the same pattern applies to ITG mechanisms adoption and implementation.

So, for this study we define business competencies of key employees as the knowledge and skills of key employees of a SME related to their understanding the business domain and the specific organi-

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

zational context. The business domain-specific competencies refer to the knowledge of the production system of a firm's industry, the ability to recognize the firm's challenges and opportunities, including the potential of IT leverage for enhancing business processes. The organization-specific competencies are about the acute acquaintance of the firm's functioning (e.g. power distribution, structures), specificities (e.g. culture and history), and partnership. Key employees with stronger business competencies (business domain-specific and organizational-specific) are more likely to better understand the potential of IT usage in business activities and the necessity to adopt ITG mechanisms for achieving higher IT business value.

As in the case of owner-managers, values, beliefs, and norms of key employees of a SME will affect ITG mechanisms adoption. Shared cognitive characteristics (such as values, beliefs, and norms) will be conducive to consensus among team members which in turn will facilitate the introduction of strategic change in SMEs (Brunninge et al., 2007). This can be seen as a positive factor for ITG mechanisms adoption. But according to institutional trust theory, shared values and norms may reduce the need of formalized mechanisms (Devos et al., 2012). So, we would argue that shared values, beliefs, and norms among the SME's key employees will accelerate the process of ITG mechanisms adoption (pace) while reducing the diversity of ITG mechanisms adopted. We would also argue that the SME's key employees will favor the adoption of ITG mechanisms they deem compatible with their values, beliefs, and norms over others deemed less compatible. From the above developments, the two following propositions can be stated:

P2: Greater competencies (IT technical skills, business competencies) of the SME's key employees and higher levels of perceived compatibility of their values, beliefs, and norms with ITG mechanisms will positively influence the implementation of ITG mechanisms in a SME.

P3: The more the values, beliefs, and norms are shared among a SME's key employees, the more easily a SME will adopt and implement ITG mechanisms (quick pace), and the less diversified ITG mechanisms will be.

SME's External Links

In SMEs, decisions are mainly made by the owner-manager assisted by key employees. However, in their decision-making process, they may be swayed one way or another by external stakeholders. Following the literature review, we retained four sources of influence that can affect the decision to adopt ITG mechanisms: outside and independent directors, institutional pressures, IT external partnership and the network members.

We have already underscored that, in most SMEs, board of directors are either inexistent or purely formal, or sometimes used to serve the owner-manager's purposes (Fiegener et al., 2004; van Gils, 2005; Brouard & Di Vito, 2008). Yet, in accordance with the resource-dependency theory, having a board on which sit a number of external directors increases a firm's exposure to external environment networks and its convenient access to valuable resources (Jackling & Johl, 2009). The latter's independence vis-à-vis the owner-manager (and key employees) gives them much more latitude in their supervision role of the firm's management. So, SMEs are compelled to adopt boards with a great number of outside and independent directors (Abor & Adjasi, 2007). This would prevent them from developing "a myopic and narrow view" that stalls change (Brunninge et al., 2007, p. 299). Outside and independent directors would influence owner-managers and key employees towards ITG mechanisms adoption.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Institutional theory posits that changes in organizations are determined more by external or environmental pressures than "rational" decisions by internal actors (owner-managers and key employees) (DiMaggio & Powell, 1983). In accordance with the institutional perspective, it has been found that the diffusion of corporate social responsibilities in SMEs is linked to the extent at which these SMEs are embedded in a network of local socio-economic institutions (Del Baldo, 2012). Similarly, a SME's network ties will play a role in deciding the owner-manager and key employees to embrace ITG mechanisms that are in place in other organizations within the network. Besides, inter-organizational exchanges entail task and function interdependence that requires a great deal of coordination (Croteau & Bergeron, 2009). Challenges related to the coordination of business partners which are more or less different with regard to various organizational aspects (strategy, processes, structure, IT infrastructure and architecture) incite each other to put in place governance mechanisms (Croteau & Bergeron, 2009). In the same vein, compared to the local SMEs, world-class SMEs would need more ITG mechanisms due to their being involved in more extended networks (Raymond & Croteau, 2006).

It is almost a truism to say that most SMEs lack internal IT expertise. To compensate this, they mainly rely on IT external expertise. Somehow, this dependence put a SME in a situation of inter-organizational ITG. Studying profiles of inter-organizational ITG, Croteau et al. (2013) proposed a continuum with at one end the contractual profile, and at the other, the consensual profile: in contractual profiles, "organizations are involved in a legal relationship with their outsourcers", while consensual profiles are characterized by "a collaborative and cooperative approach" (p. 36). Potential opportunistic behaviors are fought mainly through the formalization of commitments in contractual profiles, and through mutual trust in consensual profiles. Contractual profiles are consistent with agency theory according to which, as previously stated, a SME would adopt ITG mechanisms to deter opportunistic behavior from the external expert. We have seen however, in accordance with the theory of institutional trust, that some SMEs, ill-equipped for developing structured controls or outcome-based contracts, will instead seek a partnership based on trust (Devos et al., 2012). So, an external partnership based on trust will reduce the need to resort to formalized ITG mechanisms in SMEs. All of these considerations related to the SME's external links lead to the following propositions:

P4: A SME's external links through outside and independent directors, networks, and IT partners will positively influence the owner-manager's and key employees' decision to adopt ITG mechanisms.

P5: The higher the level of institutional trust between a SME and its IT external partner, the less its owner-manager and key employees will be swayed towards ITG mechanisms adoption.

3.3 Consequences of IT Governance Mechanisms

It has been suggested that there may be a positive correlation between ITG mechanisms and different organizational performance measures as captured into Kaplan and Norton's balanced scorecard framework (Mohamed & Singh, 2012). Bradley et al. (2012) have established that ITG has a positive impact on different measures of hospital performance. The underlying assumption is that effective ITG would enhance IT impacts on the organizational performance.

The idea that the ultimate effectiveness of ITG mechanisms adopted in organizations should be appreciated in terms of IT contribution to business value (IT business value) seems to be a largely shared understanding in ITG literature (Zarvić et al., 2012). IT business value is defined as "the organizational performance impacts of information technology at both the intermediate process level and the organiza-

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

tion-wide level, and comprising both efficiency impacts and competitive impacts'' (Melville et al., 2004, p. 287). More precisely, Weill and Ross (2005) suggested assessing the ITG effectiveness against the achievement of four IT-enabled organizational objectives: "cost-effectiveness, asset utilization, business growth and business flexibility" (p. 26).

As the effectiveness of IT initiatives and investments is one of the priorities of ITG (Bradley et al., 2012), any failure with regards to IT initiatives hints to the failure of ITG. For example, failure of outsourced information systems may be seen as a failure of ITG (Devos et al., 2012). In the same way, the under-exploitation of IT business value in SMEs can be blamed on weaknesses of their ITG (Wilkin, 2012). Even a weak interorganizational ITG can lead to disastrous results in terms of competitiveness. So, the adoption of ITG mechanisms may have a positive impact on IT business value in SMEs, hence the following proposition:

P6: The adoption of ITG mechanisms in a SME will positively influence its IT business value.

3.4 Moderating Effect of IT Sophistication on IT Governance Mechanisms

The evolution of the strategic role of IT in SMEs, and thus the increasing need for IT governance, is closely linked to the *IT sophistication* of these firms, that is, to the way they manage and use IT in order to gain business value from their investment in the IT function and in IT artifacts (Philip & Booth, 2001; Bradley et al., 2012). IT sophistication was first defined, conceptualized and operationalized by Raymond, Paré and Bergeron (1995), this concept being later employed by other researchers (Chwelos et al., 2001; Paré & Sicotte, 2001; Pflughoest et al., 2003). IT sophistication "refers to the nature, complexity, and interdependence of the management and use of IT within an organization" (Raymond et al., 2011, p. 205). Now, the strategic role of IT sophistication in SMEs can best be understood by the extent to which the management and usage of IT by these firms are "aligned" with their strategic objectives (Dutot et al., 2014).

The form of IT governance adopted by an organization is one the key attributes used by researchers to characterize its IT function (Weill & Ross; 2005). Thus, forms of governance are differentiated by the extent to which the IT function is held accountable for the development of IT-enabled organizational capabilities (Reich & Nelson 2003), and for the ensuing contribution to organizational agility, innovation and IT business value (Guillemette and Paré, 2012). From a governance standpoint, the sophistication of the SMEs' IT function would thus affect the outcomes produced by ITG mechanisms such as the roles and responsibilities assigned to their owner-managers, external IT partners and key users with regard to IT-related issues and IT investments (Sambamurthy & Zmud, 1999). This presumed role of IT sophistication would be further supported by the resource dependence, network governance and institutional theories in particular, upon which "ideal" IT management and governance profiles can be founded (Ross, 2003; Willcocks et al., 2006). The delineation of such profiles would then imply that improvements in the SMEs' IT business value brought about by their increasing adoption of ITG mechanisms would be greater in firms whose level of IT sophistication is higher, that is, whose actual IT management and governance profile shows greater alignment or "fit" (Bergeron et al., 2004). The ITG research framework's final proposition follows:

P7: The greater the SME's IT sophistication, the greater the positive influence of its adoption of ITG mechanisms upon its IT business value.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Note that this last research proposition is based on the view of the SME's IT function as a moderator of its IT governance, moderation being conceptualised as the interaction between IT sophistication and ITG mechanisms (Baron & Kenney 1986). Thus, in line with Bharadwaj et al.'s (1995) perspective of IT alignment and with Venkatraman's (1989) "fit as moderation" perspective, IT sophistication is deemed to positively moderate the relationship between ITG mechanisms and IT business value.

3.5 Control Variables: The Firm's Size, Age, and Sector of Activity

We previously underscored the necessity of carefully considering the heterogeneous nature of SMEs. All of these enterprises share some particularities, but they may also present some differences due to their size (very small-, small-, medium-sized), industry sector, or their age. All these factors are taken into account in the proposed research framework as control variables.

The size of firms (in terms of the number of employees or in terms of revenues) is generally positively associated with the adoption of innovations (Ko et al., 2008; Pekovic, 2010). More precisely, in the field of ITG, it has been advanced that there may be a positive correlation between the firm's size and ITG effectiveness (Mohamed & Singh, 2012). The same authors posit that organizations operating in information intensive sectors or in sectors characterized by high levels of uncertainty are more likely to effectively implement ITG mechanisms than organizations in less information intensive sectors, or in less uncertain environments. The firm's age can also explain differences between SMEs with regard to ITG mechanisms adoption. After reporting mixed results in literature on this topic, Mohamed & Singh (2012) formulate the hypothesis that a firm's age would be negatively correlated with ITG effectiveness.

4. CONCLUSION

Theories and frameworks generally referred to in the field of CG in general, and in ITG in particular, have mainly been developed in the context of large enterprises. In this study we analyzed the main theories applied in CG and ITG research, and confronted them with the specificities of SMEs. This exercise allowed us to highlight the limits of these theories in the SME's context, and to discuss adaptations needed or alternative theories in such context. Building on these developments, we then proposed a conceptual framework of ITG in SMEs.

We have shown that the mainstream agency theory does not fare well when applied in the context of SMEs. So, the proposed ITG research framework is based on a combination of alternative theories: upper echelon theory, stakeholder theory, resource-dependence theory, the network governance theory, institutional theory, and the theory of institutional trust. In accordance with the now abundant literature on SMEs, the conceptual framework acknowledges the central role played by the owner-manager in all major decisions of the firm. In accordance with the upper echelon theory, the role of the SME's key employees (or the top-management team) is also acknowledged in the conceptual framework proposed. Together, resource-dependency theory, the network governance theory, the institutional theory and the theory of institutional trust have been referred to for propositions related to the role of the SME's external links in its decision towards ITG mechanisms adoption.

In taking the SME's specificities into account, we followed the previous research recommendation that size is one of the contingencies that must be heeded when designing a mix of structures, processes, and relational mechanisms for an ITG research framework (Pollard, 2003). The seven propositions pre-

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

sented in this study may thus serve as initial hypotheses for empirical verification. This theoretical study is a first step in our research. In the next step, case studies will be conducted to refine the conceptual framework, followed by a survey to test the framework.

Chapter 82
Understanding Knowledge Management Spectrum for SMEs in Global Scenario

Neeta Baporikar
Namibia University of Science and Technology, Namibia & University of Pune, India

ABSTRACT

Knowledge that exists within organization is a sustainable source of competitive advantage. Though enormous research on knowledge management (KM) has taken place, little focus has been on KM in Small and Medium Enterprises (SMEs). Globalization of supply chains, rapid technological advances, superior returns on intellectual capital, growing importance of knowledge-intensive industries would make KM a strategic tool in the growth and success of all, especially SMEs. KM-enabled SMEs are essential for competitive and sustainable growth. Hence a judicious approach for KM in SMEs is a must in current scenario. Done by an in-depth literature review and contextual analysis, the objective of this paper is twofold - to aid researchers in recognizing and understanding KM spectrum for SMEs in a globalized world and for SMEs to reckon that success and worth of businesses depend more on intellectual capital than physical assets merely.

INTRODUCTION

The velocity and dynamic nature of markets has created a competitive incentive among many companies to leverage their knowledge assets as a means of creating value and achieving a competitive edge. Thus the focus on knowledge management (KM) has become critical area for small and medium sized enterprises (SMEs). In particular, the management of knowledge assets may provide small firms new tools for survival, growth and maintaining a sustainable competitive advantage (Omerzel & Antoncic, 2008). There is a general consensus globally that SMEs fall behind large organizations in developing KM practices and exploiting fully the benefits thereof. This is also reflected in a literature gap as till date there is no dearth of literature describing large companies' successful KM practices. But the reasons why small firms show poor usage of KM tools are still unclear. In fact, little empirical studies have been

conducted to identify the factors influencing KM adoption in SMEs (Finkl & Ploder, 2009). In addition, there is a growing need for qualitative analysis of the effects of knowledge management practices of networked SMEs (Valkokari & Helander, 2007). The potential which KM offers in improving efficiency and innovation has been cited as a key source of competitive advantage (MacKinnon et al., 2002). Despite this pressing need, it is widely accepted that small companies – even the most knowledge-intensive ones – are characterized by a lack of uptake of KM initiatives (Nunes et al., 2006). This may be perhaps due to the reason that KM systems are expensive to purchase, use and maintain. The aim of this paper therefore is to understand the spectrum of knowledge management for SMEs in globalized world. The paper also intends to propose alternative approach to developing KM systems for SMEs in developing economies. Instead of usual approaches, where KM needs heavy financial and other resources, study suggests solution centric approach (Patrick & Dotsika, 2007).

LITERATURE REVIEW

Small and medium enterprises (SMEs) make substantial contributions to national economies and are estimated to account for 80 percent of global economic growth (Pavic et al., 2007). Today in the competitive business environment knowledge is thought to be the primary resource (Baporikar, 2016). The conventional factors of production have become secondary. It is straightforward to obtain them, provided there is knowledge (Chen et al., 2006). Davidson & Griffin (2003) pointed out small businesses have contributed many innovative ideas and technological breakthroughs to our society. In order to maintain and develop further their innovative skills SMEs need to develop their understanding of knowledge management (KM), as a key business driver rather than as a resource-intensive additional initiative (Zanjani et al., 2008). "KM has become the latest strategy in increasing organizational competitiveness" (DeTienne & Jackson, 2001). The critical assumption of KM is that organizations that manage organizational and individual knowledge better will deal more successfully with the challenges of the new business environment. KM is seen as a vital factor in realizing and sustaining organizational success for improved efficiency and innovation. Today, knowledge is the primary source of competitive advantage and the key to success for organizations in the knowledge economy (MacKinnon et al., 2002; Patriotta, 2003). This study analyzed different aspects of KM for SMEs with respect to developing countries and proposed strategies for better implementation of KM programs in developing countries.

Further globalization and regionalization of the global economy intensify competitive pressures on enterprises. The ability to compete on the domestic and international markets can be ensured by factors, which provide the foundations for the building of the knowledge-based economy (Dorożyński, et al 2016). Small and medium-sized enterprises (SMEs) face more serious challenges to their survival than do larger firms (Baporikar, 2013b). To succeed, SMEs must establish and maintain credibility in the marketplace to attract the resources required for survival (Winter, et al 2010). The nature of strategic intelligence and the challenges of systematically scanning and processing strategic information have changed. However, much of the intelligence is collected through informal and manual based systems. Turning data into analyzed, meaningful intelligence for action is limited to a few industry leaders and mostly owners in most of SMEs (Baporikar, 2016). Over the past decade, the strategic use of information systems has played an invaluable role in the explosion of information technology. However, adopting a strategic information system is rarely successful without the necessary care and attention and implementation of information systems is a high risk, high reward decision (Baporikar, 2014c). The impact

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

of a thorough understanding of all vital aspects, ranging from specific mechanics of a system to the theoretical impact and future development, cannot be underestimated when investing in an information system and more so for SMEs.

SMEs are an important part of all economies (Storey, 1994). First, SMEs employ the majority of workers (Levy & Powell, 2005). Second, SMEs also play an important role with respect to enhancing the competitiveness of economies through the processes of creation, elimination and restructuring of economic sectors (Bharati & Chaudbury, 2006). Third, in the majority of the world's emerging economies SMEs will be the predominant enterprise for the foreseeable future (Newberry, 2006). What is less clear is what exactly is considered as SMEs. Even the terminology used across the globe differs. The term small and medium enterprise (SMEs) is most commonly used in Europe whilst the term small and medium businesses (SMBs) are preferred in the USA. In Africa, micro-enterprises are added to the mix with micro, small and medium enterprise (MSMEs) and micro- and small enterprises (MSEs) used most often except in South Africa where terms SMEs and small, medium and micro-enterprises or SMMEs are used. Given the differing terms, it is not surprising that there is a lack of a consistent, universal definition for small and medium enterprises. There are two approaches to defining small and medium enterprises: The economic definition where enterprises must have a market share such that it does not significantly affect market prices or quantities sold nationally; or the number of employees (Dewhurst & Burns, 1993). Most definitions now classify enterprises as small or medium based on the number of employees in combination with the turnover and/or total assets. The employment thresholds, turnover and assets used in the definition of SMEs vary between countries. Even within countries there are different thresholds with manufacturing and labour-intensive sectors tending to higher thresholds than those for service and retail sectors. Furthermore, the thresholds, particularly with regard to turnover and total assets, differ significantly between developing and developed countries (Baporikar, 2013a).

Moreover, in developing countries, a vast majority of SMEs are suffering from market failures due to insufficient provision for integrated, reliable, relevant and solution-oriented business information. SMEs need support for effective linking with global markets both for their inputs and outputs. Businesses leveraging knowledge resources can make decisions faster and closer to point of action and help in mitigating risk, exploiting business opportunities and better understanding of market signals (Baporikar, 2013b). While various researchers and vendors have developed and implemented specialist Knowledge Management Strategy (KMS) for large organization, many small and medium enterprise (SME) organizations still face the challenge of selecting affordable frameworks including strategies, tools, and methods, which fit their objectives and needs as SMEs and then successfully implementing such frameworks. A successful KMS should not only impact a critical business process, but should also build the necessary momentum to create Innovation embedKMS (IeKMS)for SME enterprise - one where KMS contributes directly to innovations, organizational strategy, productivity, and bottom line. The study accessed the status of KM in SMEs and also examined the factors that influence the adoption of KM for SMEs with focus on developing countries. Many organizations have profited from KM because they recognize the importance of the KM in business growth and development. However, the study found SMEs in general and SMEs in developing countries in specific have not realized this importance and hence, still vulnerable. The study takes this factor into consideration and proposes a KM approach specific to SMEs. The study contributes on KM and SMEs literature and hopefully aids the researchers and practioners specially in developing economies in recognizing and understanding the knowledge management spectrum for small and medium enterprises in a globalized world.

DISCUSSION AND IMPLICATIONS

Knowledge has been defined in multiple ways. Davenport & Prusak (1988) defined knowledge as follows: 'Knowledge is a fluid mix of framed experience, values, contextual information, and expert insight that provides a framework for evaluating and incorporating new experiences and information. It originates and is applied in the minds of knower. In organizations, it often becomes embedded not only in documents or repositories but also in organizational routines, processes, practices, and norms.' Knowledge is the primary resource for individuals, organizations and the economy. Delahaye (2003) concluded that knowledge is a distinctive source as it has no law of diminishing returns, grows from sharing. Wiig (1997) argued that knowledge is not a new concept, from very early times people have transferred knowledge by succession to the next generation. In ancient cultures, this has taken the form of narratives and songs, which were intended to teach the new generation new skills and survival techniques.

Samuel (1775) wrote in his early dictionary "Knowledge is of two kinds: we know a subject ourselves, or we know where we can find information upon it". Knowledge can be divided into two categories: tacit and explicit. Explicit knowledge refers to the knowledge which can be articulated in formal language such as grammatical statements, mathematical expressions, specifications, manuals, and thus can be transmitted across individuals formally and easily. On the contrary, tacit knowledge refers to the knowledge which is hard to articulate with formal language, but is personal knowledge embedded in individual experience and involves intangible factors such as personal belief, perspective, and value systems (Nonaka & Takeuchi, 1995).

Knowledge Management

The field of knowledge management (KM) and its related discipline, intellectual capital (IC) have both contributed considerably to our understanding of the value of intangible assets of the firm. The general concept that intangibles are something worthwhile goes back at least to Schumpeter's (1934) work on innovation and has since included contributions from other high-profile writers such as Drucker, with his knowledge workers (1991). The idea that proper management of such intangibles might lead to competitive advantage was explored by scholars such as Nelson and Winter (1982) in their evolutionary theory of growth. Such competitive advantage fits well with the resource-based theory of the firm (Wernerfelt, 1984), specifically identifying knowledge as a potential key resource. As a result, we have the knowledge-based theory of the firm (Teece, 1998; Grant, 1996) and its suggestion that knowledge is not only a potentially important differentiator but perhaps the only differentiator for firms looking for sustainable competitive advantage. Patents, copyrights, and other intellectual property are valuable intangible assets, but intellectual capital extends recognition of value to additional, less well-defined intangibles such as know-how and expertise (knowledge). As a result, a clear distinction exists in the field between data, information, and knowledge. Formally, data are observations, information is data in context, and knowledge is information subjected to experience, reflection, or some similar analysis (Zack, 1999b). Within the field, knowledge is often referred to as know-how, effectively a sort of learning based on experience, learning, or insight. Such a perspective flows naturally out of the more general DIKW (data, information, knowledge, wisdom) hierarchy suggested by Ackoff (1989). KM involves knowledge identification, creation, acquisition, transfer, sharing and exploitation. KM is vital for efficiency and organizational competitiveness (Egbu, 2001). Boh (2007) described that KM is a systematic process for acquiring, organizing, sustaining, applying, sharing and renewing both the tacit and explicit knowledge

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

of employees to enhance organizational performance and create value. Menkhoff et al., (2002) defined KM as the task of developing and exploiting both tangible and intangible knowledge resources of an organization. Pillania (2006c) defined KM as "a systematic, organized, explicit and deliberate ongoing process of creating, disseminating, applying, renewing and updating the knowledge for achieving organizational objectives''. KM is a process which involves the management of explicit and tacit knowledge (Nonaka & Takeuchi, 1995). Research on knowledge and knowledge management spans the disciplines of economics, information systems, organizational behaviour and theory, psychology, strategic management, and sociology. This diversity has contributed to the rapid advance of research in specialized areas of inquiry that investigate different aspects of organizational learning and knowledge management. Knowledge management, like knowledge itself, is difficult to define as concepts and practices evolved quickly through the 1990s. Two main issues are evident in this evolving path: knowledge is a critical resource, rather than land, machines, or capital (Drucker, 1993), and organizations generally manage it poorly. If more attention were paid to creating, providing, sharing, using, and protecting knowledge, the promise was that organizational performance would improve (Earl, 2001).

An understanding of the concept of knowledge and knowledge taxonomies is important because theoretical developments in the knowledge management area are influenced by the distinction among the different types of knowledge (Baporikar, 2014a). The literature offers a number of different knowledge taxonomies. Drawing on the work of Polanyi (1962, 1967), Nonaka (1994) explicated the most cited classification of knowledge distinguishing tacit and explicit knowledge dimensions. The author also views knowledge as existing in the individual or the collective. Other classifications (Alavi & Leidner, 2001) refer to knowledge as declarative (know-about or knowledge by acquaintance (Nolan Norton 1998), procedural (know-how), causal (know-why), conditional (know-when), and relational (know-with) (Zack 1998). Likewise, research in the domain of knowledge management seems fragmented. According to Sveiby (1997) the expression "managing knowledge" appears for the first time in a context of artificial intelligence at the end of 1980s. Early research in the field of KM was interested on the possibility of using information technology to support the process of individual learning. Again, in the artificial intelligence community, Wiig (1993) was one of the first scholars to recognize the limits of a primarily technological approach and he defined KM in term of creation, learning, sharing (transferring), and using or leveraging knowledge as a set of social and dynamic processes that needed to be managed (Iandoli & Zollo, 2007). Almost at the same time, Nonaka and his research group conducted a number of studies on the management of innovation processes in large Japanese companies. These studies together with the total quality management movement and the concept of continuous improvement, re-evaluate the overall role that human resources play at all levels in organizations: the centrality of the individual in the knowledge creation process and the consequent need to recognize the person's necessary level of competence and autonomy (Nonaka & Takeuchi, 1995). Most of the contributions in the vast literature on KM can be summarized to one of these two approaches or attempts to integrate the two perspectives (Iandoli & Zollo, 2007). Bhatt, (2001) defined KM by identifying the different phases in the process: knowledge creation, validation, presentation, distribution, and application. In fact, these five phases allow an organization to learn, reflect, unlearn and relearn and are considered essential for building, maintaining, and replenishing of core-competencies. In a broad sense, Quintas et al. (1997) define knowledge management as the process of continually managing knowledge of all kinds to meet existing and emerging needs, to identify and exploit existing and acquired knowledge assets and to develop new opportunities.

However, the KM definition suggested by Iandoli & Zollo (2007) has been considered as the working definition herein as it simultaneously refers to objectives, knowledge involved, tools and phases of

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

KM. According to them, KM is the process of creating, capturing, and using knowledge to enhance organizational performance. As exemplified above, KM initiatives involve not only an implementation of ICT but also social and cultural facets. In this sense, according to Alavi & Leidner, (2001), knowledge management systems (KMS) refer to a class of information systems applied to managing organizational knowledge. That is, they are IT-based systems developed to support and enhance the organizational processes of knowledge creation, storage/retrieval, transfer, and application. In other words, the universal steps involved in KM are: knowledge capture, knowledge organization and knowledge preservation.

SMEs in Developing Countries

According to OECD (2000) SMEs make-up the largest proportion of businesses all over the world and play tremendous roles in employment generation, provision of goods and services, creating a better standard of living, as well as immensely contributing to the gross domestic products (GDPs) of many countries. The European Commission (2005) gave rise to the term SME in 1996.The term is defined as organizations employing fewer than 250 people (Burns, 2001). In developing countries, SMEs are defined differently for various countries. The term SME covers a heterogeneous group of businesses in a developing economy, ranging from a single artisan working in a small shop making handicrafts for a village market to sophisticated engineering firms selling in overseas markets (Fischer & Reuber, 2003). Generally, SMEs in developing countries have not more than 250 employees. SMEs are the backbone of the industrialization process of many developing countries and play a vital part in expanding a country's economy. In Nepal, SMEs constitute more than 98% of all establishments and contribute 63% of the value-added segment. In India, SMEs' contribution to GDP is 30% (Mahmood, 2008). SMEs' contain various advantages in income growth, entrepreneurial training, creation of technological capabilities, greater flexibility to changing market circumstances, job creation and lower wage inequality and dispersion of industry away from urban areas and regional development (Berry, 1998; Katrak & Strange, 2002). Thus, promoting SMEs would lead to: fostering an entrepreneurial culture, providing resilience in the economy, contribution to exports, employment generation, facilitate learning geographically, sectorial development, efficient resource allocation, reduction in inequalities, fair distribution of wealth and poverty reduction.

Significance of KM for SMEs

Both large and small firms, require continuous generation, sharing and implementation of knowledge in order to maximize their competitiveness and survival chances in the modern information society (Nunes et al., 2006; Pillania, 2008b). However, SMEs relatively need more focused approach towards KM as they face severe competition. Saloja et al., (2005) described that a more conscious and systematic approach to KM enhance SMEs performance and competitive advantage. KM also promotes innovation and business entrepreneurship, help manage change, and empower employees (Nonaka & Takeuchi, 1995). Zanjani et al., (2008) stated that SMEs need to make operational, tactical and strategic decisions and without accurate information they are unable to undertake this role. The knowledge of employees of an organization is an important asset and such knowledge should be garnered for the ultimate good of the company. Wong & Aspinwall (2004) described two complementary perspectives about KM importance in SMEs. "Pull" perspective, which identifies the potential benefits or improvements that are crucial for small businesses, include for example improved competency, efficiency, innovation, learning and

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

knowledge sharing. And "push" perspective, which deals with the external or environmental thrusts that push them to the forefront of KM, include amongst others, competitive pressure, globalization, movement of large companies toward knowledge based organizations (Davenport & Prusak, 1988). Thus the underlying reasons for which SMEs need to manage their knowledge resources are:

1. SMEs compete on the basis of their competencies and knowledge is an important resource to be competent, hence need to use knowledge more than traditional resources;
2. The owner of SMEs, usually are also managers who need to transfer knowledge to employees;
3. SMEs usually find it difficult to get or retain good minds; hence they must settle for less qualified but motivated human resources;
4. Key stake holders like lending institutions, investors, suppliers, and customers, judged SMEs on the basis of their knowledge and strategies to put knowledge in right use (Zanjani et al., 2008);
5. Continuous 'rightsizing' trend. Starting in the 1980s, corporate downsizing measures led to the loss of valuable information and knowledge resources and subsequently to the emergence of KM as strategic countermeasure.

The driving forces like globalization have lead individuals and organizations to appreciate the important role of knowledge in an increasingly competitive world market (Davenport & Prusak, 1988). SMEs as a part of business sectors are no different from any other business sector. KM plays an important role for many SME companies in gaining competitive advantage and business survival. By and large, SMEs have a set of distinctive needs as described earlier that call for the deployment of a KM system for generating, sharing, and refining organizational knowledge. However, in practice, SMEs are still very reluctant to take KM principles into their strategic thinking and daily routines (McAdam & Reid, 2001; Nunes et al., 2006). SMEs usually lack resources such as land, labor, and capital. Therefore, SMEs must do more with less (Desouza & Awazu, 2006). SMEs need to be creative in working in order to manage knowledge with limited resources (Zanjani et al., 2008). Though SMEs in developing countries, in comparison with large enterprises are on back step for the availability of resources to manage knowledge, yet they as SMEs do have certain advantages in KM practice like: flat structure and short decision making process, flexible culture, organic behaviour and higher incidence of innovativeness. Knowledge, if properly harnessed, enables SMEs to stand out in the competition and outperform their rivals, thus maintaining a competitive edge (Wong, 2005).

KM Challenges

Organizations have a wealth of knowledge which, is embedded in people's head, work practices, and systems. The challenge for organization is to be able to capture that knowledge and to leverage it throughout the organization. Spender (2002) asserts that the intangible nature of knowledge makes it harder to identify and manage; consequently, it cannot be treated in the same way as other organizational assets. SMEs in developing countries have to face many challenges regarding KM adoption. Many SME owner-managers lack even fundamental concepts about KM and are unaware about underlying benefits of KM. Cultural barriers such as distrust, lack of recognition and communication, knowledge is power mindsets, retrenchment concerns and so forth act as de-motivators with regard to effective knowledge sharing and utilization of 'what we know'. Von Krogh (1998) stated "high organizational care culture" as a key element in KM development as its helps people to share ideas, information and knowledge.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Developing KM competencies and visionary leadership is also challenging for SMEs. Other challenges SMEs face regarding KM are; i) SMEs rarely have a KM policy on strategic level; ii) Delegation of decision-making authority; iii) use of more sophisticated KM tools (Von Krogh, 1998). Handzic & Hasan (2003a) identify two major challenges for KM: achieving an objective picture of the field, based on formal and sound research, which integrates diverse perspectives of researchers and practitioners; and bridging the gap between theory and practice, thereby providing well-established KM strategies, tools and procedures for managers.

SME Paroxysms in Managing Knowledge

1. Deficit processes to convert tacit knowledge to explicit knowledge (Deshpande & Baporikar, 2014);
2. Defining knowledge for different audience;
3. Information sharing and information access (Motsenigos & Young, 2002);
4. Security issues (Motsenigos & Young, 2002);
5. The problem of capturing data (Nenov, 2005);
6. Creation of repositories without strategy to manage content (Baporikar, 2014b);
7. Failure to analyze and map knowledge management system to user's needs;
8. SME's inability to motivate employees by addressing their knowledge and learning needs;
9. Selection of right tools and technologies;
10. Failure to avoid re-invention of the wheel.

Knowledge Management in SMEs

Although introducing knowledge management systems into SME is a particular challenge because of the limited resources of these kinds of companies (Herrmann et al, 2007), the literature review on KM reveals that the mostly research in this field is focused on large companies. In fact, the understanding of the organizational theory and practice considerations of KM has mainly been derived from large company experiences. Consequently, the potential of KM seems not fully exploited by SMEs. In addition, research on KM in SMEs highlights some relevant different features (Pillania, 2006 & 2008). According to the review carried out by Thorpe et al (2005), research on KM in the SMEs context can be seen though three distinct fields: the knowledgeable SME manager/entrepreneur; knowledge systems and routines embedded and institutional and policy framework support. As asserted by Frey (2001), although major corporations have led the way in introducing and implementing KM, it is increasingly important for SMEs to manage their intellectual assets. In KM practices, issues that small businesses will face will not be simply a scaled-down replica of large-company experiences (Sparrow, 2001).

According to Desouza & Awazu (2006) key peculiarities that differentiate knowledge management practices in SMEs and larger companies are: lack of explicit knowledge repositories; deep and common knowledge possessed by members of the SMEs; deliberate mechanisms of avoiding pitfalls of knowledge loss; close social ties between SME members; aptitude for exploiting foreign sources of knowledge and the humanistic way of managing knowledge. Similarly, McAdam & Reid (2001) describe the key dimensions of KM (knowledge construction, knowledge embodiment, knowledge dissemination and knowledge use/benefit) and then, for each dimension, conduct a comparison between large firms and SMEs. Sparrow (2001) has also indicated four components that figure strongly in small firm knowledge projects: appreciation of personal and shared understanding; knowledge bases and knowledge systems;

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

integrated and contextualized action needed and knowledge and organizational learning processes in SMEs. Egbu et al. (2005) highlight that knowledge generated in SMEs is tacit in nature due to various reasons. Thus, existing factors are mainly large companies oriented, thereby reflecting their situations and needs. Directly applying these factors into the SMEs environment may not be sufficient without an understanding of their very own and specific conditions (Wong, 2005). By integrating the common factors and introducing some new ones, Wong (2005) and Wong & Aspinwall (2005), propose a more comprehensive model for implementing KM in SMEs based on the following factors: strategy and purpose; management leadership and support; culture; organizational infrastructure; IT, processes and activities; resources; measurement; human resources management, training and education and motivational aids. The above set of critical success factors is important because it can act as a list of items for SMEs to address and deal and ensure that essential issues and factors are taken into consideration when planning and developing a KM strategy. It can also provide a basis for them to evaluate their KM practices (Wong, 2005).

KM Strategy for SMEs

KM strategy depicts the general approach an organization aim to take to align its knowledge resources and capabilities to the intellectual requirements of its strategy, thus reducing the knowledge gap existing between what a company must know to perform its strategy and what it does know. (Zanjani et al., 2008)

Considering the nature and requirements of SMEs in developing countries, researchers proposed personalization strategy for KM. Personalization is a strategy to manage the knowledge that is formed via human communication. Personalization strategy focuses on dialogue between individuals, not knowledge objects in a database. It is a person-to-person approach where knowledge is shared not only face-to-face, but also by electronic communications, thus building networks of people (Cendan et al., 2007). Personalization, on the other hand, provides a rich medium for communication, as it is concerned with the use of people as a mechanism for sharing knowledge (Boh, 2007). If the business strategy focuses on generating new or customer specific solutions or product innovations the personalization strategy should be chosen rather than the codification strategy (Greiner et al., 2007). Personalization strategy is more suitable for SMEs conducting tasks that are more innovative in nature (Zanjani et al., 2008).

CASE STUDY: KM IMPLEMENTATION AND SMES IN INDIA

Background

India is in a period of challenge with effects of globalization and it is a time to rethink what is the purpose of SMEs, to focus on the competencies of the future, and to move towards a networked cluster based policy and organizations. The private sector has shown that KM is a key enabler in this transition to a leaner, more efficient and more focused way of working. SME sector, with support from the government, can also use knowledge management to deliver focused, networked and learning approaches in delivery of its key services (Baporikar, 2015a). There has never been a more pressing need for improved ways of working in the SMES as today and KM is a key tool to enable this. With this brief introduction to the emergence of KM in the globalized world and the need for it in SMES, this chapter has focused on

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

understanding and reviewing the concept application of KM to SME Sector in India. It delves into the meaning, need, process, steps and implementation approaches of KM.

Necessity of KM for SMEs

In India, this is reflected in poor financials of State Financial Corporations and steep decline in number of SSI accounts with public sector banks from 32 lakhs in mid-1990s to 17 lakhs in FY 2005. Main reasons assigned are lacuna in creating, managing and dissemination of knowledge among SMEs in specific and SME sector in general. These can be termed as 'Gap in KM'. The gaps in KM have resulted in both supply-side and demand-side constraints in growth of SSI.

Supply-side constraints include:

- Informational asymmetry relating to viability and return on investment in SME projects increases the risk of adverse selection for banks;
- Very often KM in banks is confined to compilation of data. Contextualising and converting these data into actionable-knowledge is required for evaluation of knowledge-intensive/ innovative/ new product oriented projects. Credit assessment in such ventures required to be knowledge-driven rather than tangible security-driven;
- Though banks have rating modules still their lending decisions are biased by availability of tangible security. Gaps in their KM system hamper objective assessment of an enterprise's worth and overall viability. Consequently, credit flows to knowledge-based SMEs remain tight.

Demand-side constraints which adversely affect investment by SMEs include:

- Informational infirmities and gaps aggravate the uncertainties about cost pattern and return on investment, choice of technology, scale of production and overall business viability which discourage capital investment by small entrepreneurs;
- Vast majority of SMEs do not have requisite resources and expertise to develop the infrastructure which is necessary to access and transform the vast amount of available information into intelligent insight;
- Some SMEs have the potential but lack of enabling environment hampers global connectivity for their products;
- Information available with different institutions being non-convergent, incomplete in many respects and generalised in nature restricts its utility to the sector.

LESSONS TO BE ADVOCATED

- Portugal's development of informational portal for SMEs envisages on-line access to SMEs for addressing their specific needs;
- Singapore's SME policy envisages realization of its vision of an "intelligent island" aimed at remaining relevant to the global knowledge-based economy;
- Working closely with MNCs generate positive impact for potential SME-suppliers in understanding supply chain requirements, identification of opportunities, improvement in operational efficiency and enhancing learning experience;

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

- Inflow of Foreign Direct Investment (FDI) can have beneficial developmental effect with more and better linkages between MNCs and SMEs, e.g., automobile component manufacturing SMEs in India;
- Well-developed SMEs attract FDI inflow which helps in strengthening MNC-SME linkages;
- Another instance is of large FDI inflows to China and progressive integration of SMEs there with international manufacturing system has greatly helped in transforming the country into a global manufacturing powerhouse.

Implication

Many countries have instituted KM strategy for their SMEs. Hence to move ahead, an integrated knowledge network and information super-highway for SMEs that links all relevant national and international information sources become basic necessity. To enable SMEs to keep pace and alignment with the dynamism of knowledge-based economy, promotional, developmental and financing institutions, industry associations, chamber of commerce etc. have to commit resources and assistance to make the KM strategy tangible and economically viable. World over it is the SMEs which play a major role in innovation, revitalization of economy and creation of new jobs (Baporikar, 2015b). The gaps in knowledge management are affecting investment in the sector. Low capital accumulation affects employment generation, long-term competitiveness, production capability and SMEs' access and integration into globalized supply chains. These require substantial investment. But propelling SME-growth in India requires a futuristic, sound and inclusive Knowledge Management strategy for the sector.

FUTURE RESEARCH DIRECTIONS

Apart from generic studies about KIM implementation and strategies for SMEs – sector wise studies need to be undertaken as world over the SMES are based on classified products and services. ICT enablement for better leveraging knowledge across clusters would be another interesting area to probe. Technologically, effective KM requires the efficient organization of a suitable communication and information infrastructure (e.g. intranet) based on suitable and relevant taxonomies and knowledge repositories (where applicable). In addition, methods and techniques to leverage tacit knowledge, lessons learnt, viable approaches to documentation of experiences, whether successful or unsuccessful so as to create new knowledge would go a long way. SME organizational level studies about the development of a visionary leadership and a sound organizational culture to ensure maximum sharing of innovative and creative knowledge would also benefit the future entrepreneurs. Chan & Mauborgne (2003) also suggested constructive leadership behavior and development of a healthy organizational culture as important enabler of KM.

Recommendations

This paper has attempted to understand and explore KM practices in SMEs. The study revealed that there is a significant need for KM. In addition, it has been observed that SMEs adopt predominantly internal KMSs using simple ICT tools. There is greater need for wider (external) KMSs enabling inter-firm collaboration in developing collaborative projects. For developing effective KM practices, SMEs should

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

adopt a three thronged approach which includes: management of market knowledge; management of technology knowledge and management of relational knowledge.

CONCLUSION

SMEs in developing countries have done very little for KM development in their organizations. It's not necessary that KM development will solve all the problems SMEs presently face. However SMEs will be in position to deal effectively with demands of present competitive era by managing individual and organizational knowledge. SMEs in developing countries need to make knowledge resources more productive with the help of proposed KM strategy. To conclude, the KM personalization approach is very relevant to SMEs in developing countries because this has the greatest potential for sharing of valuable tacit knowledge. The governments in developing countries also need to develop specific policy to help SMEs to build KM awareness. Collaborative approach is the way ahead and for that government agency, chambers of commerce and SMEs need to commit more resources and work collectively to make the KM more gainful. Finally, family owned businesses, owners, entrepreneurs and managers need mindset change too. Hence, embracing KM wholeheartedly by all the stakeholders of SMEs is a first step before embarking on the journey of KM.

NOTE

The case which forms the part of the chapter is based on secondary data and compiled from published sources.

Chapter 83
Exploring the Research Domain of IT Governance in the SME Context

Tim Huygh
University of Antwerp, Belgium

Steven De Haes
University of Antwerp, Belgium

ABSTRACT

This research aims to explore the research domain of IT governance in the SME context. To meet this objective, a small systematic literature review procedure is used. Results indicate that IT governance in the SME context has been researched previously, albeit not extensively. There seems to be consensus among authors that IT governance is important for SMEs as well as larger organizations. Additionally, many authors indicate that SME specificities will likely influence the nature and implementation of IT governance in the SME context. There also appears to be no great variety in research strategies used in this niche research domain. Regarding the contemporary state of IT governance in SMEs, authors seem to indicate that there is room for improvement. Finally, there is no published framework for IT governance that is tailored for SMEs, although the need for this is directly reported in the literature. This paper concludes by discussing some potential directions for future research, starting from the state-of-the-art of the research domain.

1. INTRODUCTION

IT (Information Technology) governance is concerned with the capability of an organization to turn IT investments into value for the business (Weill & Ross, 2004). While a shared definition is lacking within the field of IT governance, there is consensus on a few vital aspects of IT governance among scholars: (1) that it should be an integral part of the broader area of corporate governance; (2) that it is concerned with aligning the use of IT with strategic business objectives; and (3) that both business and IT people

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

should execute their responsibilities in the framework of IT governance. These considerations lead to the following definition, which is the current state-of-the-art position in the field of IT governance: *"Enterprise governance of IT is an integral part of corporate governance and addresses the definition and implementation of processes, structures, and relational mechanisms in the organization that enable both business and IT people to execute their responsibilities in support of business/IT alignment and the creation of business value from IT-enabled business investments"* (De Haes & Van Grembergen, 2015). Empirical research by Weill and Ross (2004) indicates that IT governance directly influences a firm's performance, stating: *"effective IT governance is the single most important predictor of value an organization generates from IT"*. Despite this recognized importance, IT governance mechanisms are not as frequently used in SMEs (Small –and Medium Enterprises) as in larger organizations (Huang, Zmud, & Price, 2010), indicating that SMEs are still struggling with getting IT governance up and running. Furthermore, scholars are starting to argue that there is a lack of SME-centered theories that can lead to inferences about how SMEs should govern their IT assets (Devos, Van Landeghem, & Deschoolmeester, 2012). Indeed, almost all of the extant literature on IT governance deals with large organizations. It should be clear that the basic premise of IT governance (i.e. generating business value through IT) is important for SMEs as well as larger organizations. However, discussion arises that the contemporary state-of-the-art of IT governance research fails to offer SME-tailored insights.

A common reason for undertaking a literature review is to provide background for new research activity (Kitchenham & Charters, 2007). The main goal of this research is to review what has already been done in the IT governance research area with a specific focus on the SME context. Specifically, we are interested in gauging the state-of-the-art of this niche research domain and detect research opportunities. Hence the following general research question was put forward: *"What is the state-of-the-art of the research domain of IT governance in the SME context?"* To guide the research process, some more specific research objectives were identified:

- What research strategies are used in IT governance research in the SME context?
- What SME specificities are discussed that (potentially) lead to differences in IT governance in the SME context?
- What theoretical foundations of IT governance in SMEs are discussed?
- What is the contemporary state of IT governance in SMEs?
- What insights/guidelines are provided for the implementation of IT governance in the SME context?

After gauging the state-of-the-art of the research domain, some inferences can be made about future research opportunities. Accordingly, some major research opportunities will be discussed in more depth, starting from the contemporary state of the research domain.

2. RESEARCH METHOD

Following Kitchenham and Charter's (2007) guidelines, a small systematic literature review procedure was designed to gauge the extent of the existing IT governance research with a specific SME context. This systematic literature review approach is displayed in Figure 1.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 1. Systematic literature review procedure

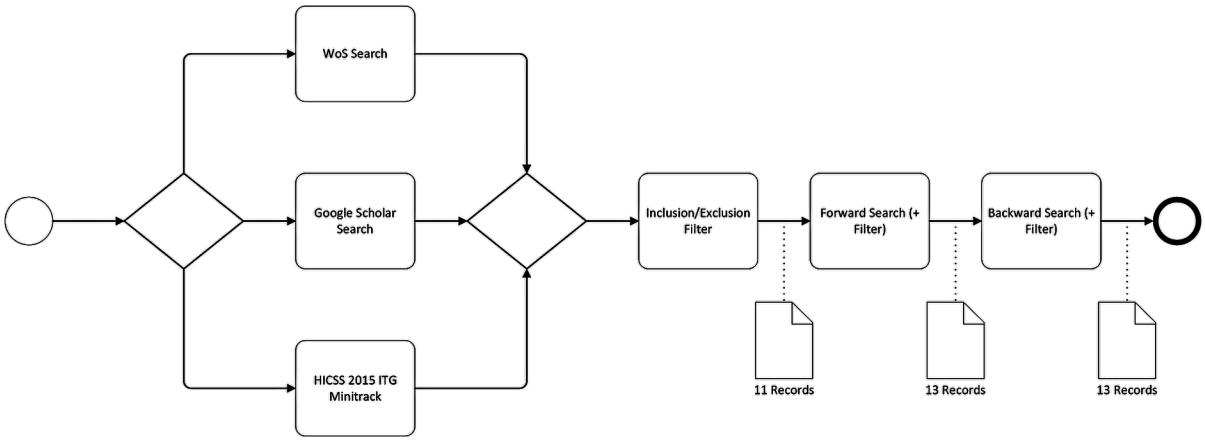

Table 1. Automatic search string for WoS

(TS=("IT governance" OR "information technology governance" OR "IS governance" OR "information systems governance" OR "enterprise governance of IT" OR "enterprise governance of information technology" OR "corporate governance of IT" OR "corporate governance of information technology" OR "ICT governance" OR "governance of IT" OR "governance of information technology") AND TS=(SME OR (small NEAR/5 organi?ation$) OR (medium NEAR/5 organi?ation$) OR (small NEAR/5 enterprise$) OR (medium NEAR/5 enterprise$)))* *AND **LANGUAGE:** (English)* *AND **DOCUMENT TYPES:** (Article OR Proceedings Paper)* ***Refined by: RESEARCH AREAS:** (COMPUTER SCIENCE OR BUSINESS ECONOMICS)* *Indexes=SCI-EXPANDED, SSCI, A&HCI, CPCI-S, CPCI-SSH Timespan=1990-2015*

As part of this search procedure, an automatic search was conducted in the WoS (Web of Science) using the search string shown in Table 1.

The 'TS' field tag ensures that appearances of the indicated terms in the title, abstract, and author-provided keywords of the research are captured. The first part of this search string aims to capture the IT governance concept as a whole, using a variety of different terms that are used to refer to this concept. The second part of the search string aims to capture the SME concept. Three options were considered for this second part: (1) to catch all possible ways of writing of the concept using exact phrase search (like with the IT governance concept), (2) provide less stringent terms that enable a wider capture, or (3) to simply use 'SME*' in this part of the search string. The second option was deemed best here, since a lot of "exact phrases" can be indicated that could possibly be used by authors to denote the SME concept (e.g. small and medium enterprises; small and medium-sized enterprises; small -and medium enterprises; etc.). In addition, it should be noted that the IT governance research domain in itself is not very large (which can be approached by running only the first part of the search string), hence the expected amount of false positives obtained using the second approach is on the low side. Additionally, it can be argued that false negatives are worse than false positives in a literature review. The third option in turn would indeed potentially lead to a number of false negatives (i.e. this option would only be good if one was certain that all authors only used the abbreviation SME, or SMEs, to refer to the concept). To control the amount of false positives, the option 'NEAR/5' was added between the terms. This ensures that only records are returned containing the indicated terms within 5 words of each other.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

The above-mentioned search string was run on February 24th, 2015 and returned 16 results that day. To filter the results (i.e. to ensure that only results remain that are relevant for the purpose of the literature review), inclusion/exclusion criteria need to be defined (Kitchenham & Charters, 2007). For the purpose of this literature review, the following simple inclusion and exclusion criteria were defined:

- **Inclusion:** The IT governance research is (at least partially) focused on the SME context;
- **Exclusion:** The IT governance research is not (at least partially) focused on the SME context.

These criteria are mutually exclusive and hence useful for decision-making/filtering. The search results for this search procedure are presented together with the inclusion/exclusion decision in Table 2.

Of the 16 initial search results, 12 are deemed initially appropriate for analysis. To give more insight in the filtering procedure, a specific example is provided in detail. The first search result (being the most recent research) after running the automated search procedure is (Leon et al., 2012). The title, abstract, and author keywords for this record are provided in Table 3.

Table 2. Search results for the WoS automated search

Reference	Decision

Table 3. Title, abstract, and keywords for (Leon et al., 2012)

Title	A spreadsheet life cycle analysis and the impact of Sarbanes-Oxley
Abstract	Past studies show that only a small percent of organizations implement and enforce formal rules or informal guidelines for the planning, design and development, usage, modification, and disposition stages of spreadsheet models. […]
Keywords	Spreadsheet; Spreadsheet life cycle; Controls; Sarbanes-Oxley; IT governance

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

The 'hits' are underlined. As expected, due to the design of the second part of the search string, any combination of e.g. "small" and "organization" or "enterprise" anywhere in title, abstract, or keywords is expected to return a search result (if they occur within 5 words from each other). In this example, due to the first part of the search string, "IT governance" was found in the keywords. Due to the second part of the search string, a combination of "small" and "organizations" was found in the abstract. When investigating this record, it can be concluded that this indeed seems to be a false positive. The abstract states *"[…] a small percent of organizations […]"*, i.e. not indicating something about the size of the organization. Following our exclusion criterion, this record is therefore excluded for further analysis.

Hence, at the end of this process we are left with 12 records that are deemed appropriate for analysis. Full-text versions were obtained for all of these results for closer investigation and information extraction (if appropriate). Upon closer investigation, some research was additionally excluded from information extraction:

- Niu & Zhu (2009) seems to be presenting the same research as Huang et al. (2009), but as 'research in progress'. It was therefore decided to drop the least developed version of this research;
- Devos et al. (2009b) and Devos et al. (2009a) seem to be reworked and integrated in Devos et al. (2012). It was therefore decided to only include the integrated version of this research.

Considering this, the final set of research deemed appropriate for information extraction obtained using WoS consists of 9 records.

It is important to understand that a single automatic search will not necessarily catch all relevant research that is out there. Hence, it makes sense to consider other search strategies as well (Kitchenham & Charters, 2007). First, keyword search was performed using Google Scholar. For this procedure, keywords were derived from the search string that was used in the WoS. It is possible to obtain different results, since Google Scholar and WoS are not using exactly the same search venues. This resulted in an additional research, Ayat, Masrom, Sahibuddin, & Sharifi (2011), that was decided to be useful for information extraction. Additionally, the set of presented papers at the 2015 HICSS conference IT governance mini track is scanned. At the moment of writing, these researches are not yet indexed (i.e. forthcoming). Considering the reputation of HICSS and the potential relevance of the papers in the IT governance mini track, this specific venue was also included in the search procedure. This resulted in one additional research that needs to be added to the list of relevant records, i.e. Bergeron, Croteau, Uwizeyemungu, & Raymond (2015). At this point, the relevant set of research for information extraction consists of 11 records.

On this set, forward and backward search was applied. Forward search was done on February 26th, 2015 using the digital library through which the research was found. The results of the forward search on the relevant researches is presented in Table 4.

Of all the results identified by the forward search, two were deemed relevant (using the same filtering approach as described earlier). Backward search on the list of records (currently containing 13 researches) yielded no new relevant results. However, some mutual referencing was found between the identified researches. While there is a potential wealth of information in the reference lists of these 13 papers, there are no references to new researches that are specifically dealing with IT governance in the SME context and are hence particularly relevant in the context of this exploratory literature review.

The final list of relevant researches is displayed in Table 5. The type of research is also presented in this table. Out of the 13 researches, 8 are articles and 5 are conference proceedings. The researches

were all published between 2008 and 2015, indicating that this subset of the IT governance research domain is still in its early stages and research activities are still emerging in the domain. Each of these researches was obtained as a full-text and will be discussed in the next section.

3. RESULTS

Wilkin (2012) uses the results of a survey among small enterprises in the Australian tourist accommodation industry to obtain new insights about IT governance practices for SMEs. Specifically, the author

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

uses survey results to propose alterations to an existing IT governance practices framework (containing structures, processes, and relational mechanisms) as proposed in De Haes & Van Grembergen (2009). Wilkin advocates that a different IT governance approach is needed for SMEs, due to SME specificities that separate them from larger organizations. Devos et al. (2012) use multiple case studies of outsourced information system projects where failures occurred to critically rethink the concepts and the theoretical foundations of IT governance in SMEs. Their results reveal that trust is slightly more important than control in IT governance for SMEs. Lin et al. (2011) use survey research to evaluate the contemporary state of IT governance in Taiwanese SMEs by specifically examining if the key components of effective IT governance are in place. Starting from the COBIT 4 process domains (i.e. plan & organize, acquire & implement, deliver & support, and monitor & evaluate), the authors use exploratory factor analysis to detect the core factors of IT governance from the survey participant's views. This study discusses no SME specificities or theoretical foundations. It is also not explicitly pointed out why SMEs are used as the unit of analysis. Huang et al. (2010) provide evidence on the influence of IT steering committees and IT-related communication policies (i.e. two specific IT governances practices) using three SME case studies. Specifically, differences in the enterprise's IT steering committees and IT-related communication policies were found and used to explain differences in the enterprise's IT-usage outcomes. The authors clearly state that the sample of SMEs was selected for convenience reasons (i.e. a lesser complexity in SMEs' structures and processes). They also express the belief that their findings can be extended to larger organizations as well. Cochran (2010) proposes an "operations department model" as an organizational model to facilitate IT governance in organizations that don't have an IT C-level executive, which the author argues to typically be the case in smaller organizations. The author emphasizes that SMEs are different from larger organizations in terms of resources that can be used to implement a dedicated IT department and/or high level IT executives (e.g. a CIO). Giraldo et al. (2010) investigate the contemporary state of IT governance in five Colombian pharmaceutical companies. Each of the five cases is described using an IT governance matrix, an operating model, an engagement model, and portfolio management. The publication was deemed relevant because one of the five cases is a medium-sized enterprise. The authors do not find different results for the SME compared to the larger organizations in the sample. Tan et al. (2011) use survey research based on 50 Malaysian SMEs to gain insight in their understanding of IT governance. Their survey results show that the majority of the surveyed SMEs do not implement IT governance, although they are interested in the (potential) benefits of IT governance. Huang et al. (2009) examine the nature and influence of IT governance in SMEs using case study research on three cases. The authors observed centralized IT decision authority in all three SMEs. Differences in the organization's IT-use were explained by observed differences in senior management involvement in IT governance and communication practices about IT governance. This research explicitly acknowledges that the understanding of IT governance in the SME context is limited. Furthermore, the authors state that SME specificities (i.e. SME organizational structure, IT endowments, and IT management posture) could potentially lead to the need for a SME-specific IT governance approach. Bernroider (2008) investigated the role of IT governance in ERP success. Using survey research on a sample consisting of SMEs and large enterprises, the author showed that ERP investments were more effective in organizations that had IT governance implemented. The results also indicated that large enterprises under-performed compared to SMEs and that they needed specific performance drivers in order to become effective as well. The author divides the survey sample in two groups according to the enterprise's size (small versus large), and motivates this by stating that SMEs are inherently different from larger enterprises. Ayat et al. (2011) discuss the issues related to IT governance implementation in SMEs at a conceptual level. They state that SMEs

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

have some specific characteristics that require specific IT governance frameworks and standards that are tailored to this context. Miyamoto & Kudo (2013) use survey research to examine the five IT governance domains as proposed by the IT governance institute (i.e. IT strategic alignment, IT value delivery, IT resource management, IT risk management, and IT performance management). The sample consists of SMEs located in the northern part of Japan. Using a structural equation model, they show that each of the five domains is significantly positively related to IT governance. Another interesting observation is that the vast majority (around 90%) of the SMEs does not have a dedicated IT manager or director responsible for IT (i.e. IT is not the sole responsibility). The authors provide no clear rationale as to why they specifically chose to investigate the SME context. Garbarino-Alberti (2013) provides an overview of the lessons learned and the issues that emerged in a single case study about the implementation of IT governance in a SME. The author focuses on human resource management issues. The research starts from the argument that IT governance frameworks for large organizations cannot simply be applied to SMEs, due to e.g. SMEs having less resources to implement such complex IT governance models. Finally, Bergeron et al. (2015) build a conceptual framework for IT governance in SMEs. The authors start by confronting the main theories that are used in IT governance research with the specificities of SMEs. The resulting conceptual framework is used to generate a set of six possible research propositions.

In the introduction, a few research objectives were presented to guide the research efforts. Specifically, this research investigates research strategies employed in IT governance research in the SME context, SME specificities as discussed in the IT governance SME literature, theoretical foundations of IT governance in SMEs, the contemporary state of IT governance in SMEs, and insights/guidance for IT governance implementation in an SME context. A summarizing table containing information regarding which researches contain information about each of these research objectives (except the research strategies that are employed) is presented in Table 6. Each of the research objectives is discussed in more detail over the following sections.

3.1. SME Specificities

Many researches discuss SME specificities to a certain extent (Ayat et al., 2011; Bergeron et al., 2015; Bernroider, 2008; Cochran, 2010; Devos et al., 2012; Garbarino-Alberti, 2013; Huang et al., 2009, 2010; Wilkin, 2012). There seems to be consensus in the set of indicated researches that these SME specificities will likely influence the way IT governance needs to be implemented in a SME context. When SME characteristics/specificities are discussed, they are almost always adopted from the more general business literature on SMEs. Specifically, the following SME specificities/characteristics are mentioned:

- SMEs tend to adopt a more operational than strategic view of business and hence tend to be more reactive in nature (Bernroider, 2008; Cochran, 2010; Huang et al., 2009; Wilkin, 2012);
- SMEs tend to have simpler organizational processes (Huang et al., 2009, 2010);
- SMEs commonly function without dedicated IT staff/specialists (Cochran, 2010; Devos et al., 2012; Huang et al., 2009, 2010; Wilkin, 2012);
- SMEs tend to exhibit flatter organizational structures (or lack of organizational structures) (Bergeron et al., 2015; Bernroider, 2008; Huang et al., 2009, 2010);
- Decision-making in a SME is centralized with the owner-manager, who has a lot of personal influence (Bergeron et al., 2015; Devos et al., 2012; Huang et al., 2009, 2010);
- SMEs tend to exhibit rich information networks, allowing coordination in the absence of formalized procedures (Ayat et al., 2011; Garbarino-Alberti, 2013; Huang et al., 2009, 2010);
- SMEs tend to have a high degree of internal transparency (Bergeron et al., 2015; Huang et al., 2009, 2010);
- SMEs tend to be more constrained in their (financial) resources (Bergeron et al., 2015; Cochran, 2010; Huang et al., 2009, 2010);
- Outsourced IT resources are more likely used in SMEs (Bergeron et al., 2015; Cochran, 2010; Devos et al., 2012; Huang et al., 2009);
- SMEs tend to be characterized by a more informal culture (Ayat et al., 2011; Garbarino-Alberti, 2013);
- SMEs tend to exhibit faster decision-making, i.e. high responsiveness (Ayat et al., 2011; Garbarino-Alberti, 2013);
- SMEs tend to be able to react to changes quickly, i.e. high flexibility (Ayat et al., 2011; Garbarino-Alberti, 2013);
- SMEs tend to rely more on a few important individuals, i.e. with a unique combination of skills and experience (Ayat et al., 2011; Garbarino-Alberti, 2013);
- SMEs tend to be characterized by fewer options for problem solving (Ayat et al., 2011; Garbarino-Alberti, 2013);
- SMEs' employees tend to be generalists rather than specialists (Ayat et al., 2011; Garbarino-Alberti, 2013; Huang et al., 2009);
- SMEs tend to be characterized by higher unit costs (Ayat et al., 2011; Garbarino-Alberti, 2013);
- SMEs are characterized by an overlapping of management and ownership (Bergeron et al., 2015);
- SMEs may be more influenced by their external environment than larger enterprises (Bergeron et al., 2015).

Table 7. Classification of SME specificities

Organizational processes
Adopt a more operational than strategic view of business and hence tend to be more reactive in nature (Bernroider, 2008; Cochran, 2010; Huang et al., 2009; Wilkin, 2012).
Simpler organizational processes (Huang et al., 2009, 2010).
Organizational structures
Flatter (or lack of) organizational structures (Bergeron et al., 2015; Bernroider, 2008; Huang et al., 2009, 2010).
Decision-making centralized with the owner-manager (Bergeron et al., 2015; Devos et al., 2012; Huang et al., 2009, 2010).
Overlap of management and ownership (Bergeron et al., 2015).
Organizational resources
No dedicated IT staff or specialists (Cochran, 2010; Devos et al., 2012; Huang et al., 2009, 2010; Wilkin, 2012).
More constrained in their (financial) resources (Bergeron et al., 2015; Cochran, 2010; Huang et al., 2009, 2010).
Outsourced IT resources are more likely used (Bergeron et al., 2015; Cochran, 2010; Devos et al., 2012; Huang et al., 2009).
Rely more on a few important individuals, i.e. with a unique combination of skills and experience (Ayat et al., 2011; Garbarino-Alberti, 2013).
Fewer options for problem solving (Ayat et al., 2011; Garbarino-Alberti, 2013).
Employees are generalists rather than specialists (Ayat et al., 2011; Garbarino-Alberti, 2013; Huang et al., 2009).
Organizational culture
Rich information networks, allowing coordination in the absence of formalized procedures (Ayat et al., 2011; Garbarino-Alberti, 2013; Huang et al., 2009, 2010).
High degree of internal transparency (Bergeron et al., 2015; Huang et al., 2009, 2010).
A more informal culture (Ayat et al., 2011; Garbarino-Alberti, 2013).
Faster decision-making, i.e. high responsiveness (Ayat et al., 2011; Garbarino-Alberti, 2013).
Ability to react to changes quickly, i.e. high flexibility (Ayat et al., 2011; Garbarino-Alberti, 2013).
Organizational environment
Higher unit costs (Ayat et al., 2011; Garbarino-Alberti, 2013).
More influenced by their external environment (Bergeron et al., 2015).

It should be clear that many of these characteristics are linked with each other. For instance, the fact that SMEs tend to be more constrained in their financial resources leads to the fact that SMEs commonly don't have dedicated IT staff/specialists, and hence are more likely to use outsourced IT resources. To provide a better overview of these SME specificities, we propose a classification in a number of categories: organizational processes, organizational structures, organizational resources, organizational culture, and organizational environment. Our proposed classification of the SME specificities in these categories is displayed in Table 7.

3.2. Theoretical Foundations of IT Governance in SMEs

The nature and applicability of theories regarding IT governance in SMEs is discussed in Devos et al. (2012) and Bergeron et al. (2015). Both authors argue that the theoretical underpinnings of IT governance as used for large organizations are not necessarily valid in SMEs, due to SME specificities. Devos et al.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

(2012) distinguish between agency theory and the theory of institutional trust. Their empirical research indicates that trust issues are slightly more important than agency-related (i.e. control) issues when it comes to the governance of IT assets in SMEs. Bergeron et al. (2015) in a way extend this, by considering more theories that are often used in corporate governance research in general, and IT governance research in specific. Specifically, they use indicated SME specificities to evaluate these theories in the SME context. At a conceptual level, they distinguish between theories that have low applicability to IT governance in SMEs (i.e. agency theory, stakeholder theory, and power perspective), and theories that have higher applicability (i.e. stewardship theory, resource dependency theory, institutional theory, upper echelon theory, and institutional trust theory). Both researches clearly indicate that, due to SME specificities, there is a strong need for revisiting existing theories and frameworks for IT governance or proposing alternative ones that acknowledge the specific nature of SMEs.

Table 8. Theories versus SME specificities

Theories	Main Premise	SME Specificities Pointing at Applicability of Theory
Stewardship theory	Managers are naturally trustworthy, and seek to be good stewards of the corporate assets (i.e. an alternative view of agency theory, in which managers are assumed to act in their own self-interests at the expense of shareholders) (Barney & Hesterly, 2015).	- Overlap of management and ownership. - Decision-making centralized with the owner-manager. - High degree of internal transparency.
Resource dependency theory	The external resources of organizations affect the behavior of the organization regarding the optimal divisional structure of organizations, recruitment of board members and employees, production strategies, contract structure, external organizational links, and many other aspects of organizational strategy (Pfeffer & Salancik, 2003).	- More constrained in their (financial) resources. - Outsourced IT resources are more likely used. - Rely more on a few important individuals, i.e. with a unique combination of skills and experience. - No dedicated IT staff or specialists. - Higher unit costs. - Fewer options for problem solving.
Institutional theory	Organizations are not just economic systems motivated by the pursuit of economic efficiency and performance, but are also social and cultural systems that seek to gain legitimacy in their environment by adjusting themselves to regulations, norms and values (Al Mamun, Rafique Yasser, & Ashikur Rahman, 2013).	- More influenced by their external environment.
Upper echelon theory	The characteristics of top-level managers play a crucial role in determining strategic organizational outcomes and processes (Hambrick & Mason, 1984).	- - Decision-making centralized with the owner-manager. - Rely more on a few important individuals, i.e. with a unique combination of skills and experience. - Flatter (or lack of) organizational structures.
Institutional trust theory	Developing a partnership based on trust, instead of relying on agency-based control mechanisms to deter opportunistic behavior (Devos et al., 2012).	- Rich information networks, allowing coordination in the absence of formalized procedures. - High degree of internal transparency. - A more informal culture.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Building on the work of Bergeron et al. (2015), we map the SME specificities that we identified in this research (see previous section) to the IT governance-related theories that they identified as having higher applicability in the SME-context, providing additional anchoring for these underlying theories. This is presented in Table 8.

3.3. Contemporary State of IT Governance in SMEs

A few of the indicated researches provide insights in the contemporary state of IT governance in SMEs (Giraldo et al., 2010; Huang et al., 2009, 2010; Lin et al., 2011; Miyamoto & Kudo, 2013; Tan et al., 2011; Wilkin, 2012). A few of the researches that provide such insights are based on a few cases only (Giraldo et al., 2010; Huang et al., 2009, 2010). The ones that involve survey research provide a more general view and are discussed here. Wilkin (2012) reports about the Australian tourist accommodation industry. Her major findings regarding the contemporary state of IT governance in this specific context are related to the fact that the organizations in the sample seem to miss opportunities for the maximization of business value from their IT investments. Lin et al. (2011) use survey research to examine whether the key components necessary for achieving effective IT governance (as defined by the COBIT 4 process domains) are in place. Results indicate that the COBIT 4 process domains are perceived to be important factors for effective IT governance by Taiwanese SMEs. Tan et al. (2011) report specifically on Malaysian SMEs in the state of Melaka. Their findings indicate that the vast majority of organizations is not using IT governance, while also showing that the organizations are interested in the (potential) benefits of IT governance. Miyamoto and Kudo (2013) provide insights regarding the contemporary state of IT governance in SMEs located in the northern part of Japan. Their results show a confirmation of the domains of which IT governance consists (i.e. IT strategic alignment, IT value delivery, IT resource management, IT risk management, and IT performance management). Their results also indicate that there is room for improvement of IT governance in the surveyed organizations, as indicated by the fact that around 90% of the organizations stated not having a dedicated IT manager or director responsible for IT. Overall, these sources seem to indicate that the maturity of IT governance is rather low in SMEs, i.e. there is definitely room for improvement of SMEs' IT governance.

3.4. Guidance for IT Governance Implementation in an SME Context

As expected, the majority of the collected set of researches provides some insights or guidance regarding the implementation of IT governance in the SME context (Bernroider, 2008; Cochran, 2010; Devos et al., 2012; Huang et al., 2009, 2010; Lin et al., 2011; Tan et al., 2011; Wilkin, 2012). However, the recommendations either remain at an abstract level (Devos et al., 2012; Lin et al., 2011), or are very case-specific (Huang et al., 2009, 2010). Wilkin (2012) provides the most detailed and comprehensive guidance for IT governance implementation in the SME context, starting from a well-established IT governance framework that was designed for large financial enterprises (De Haes & Van Grembergen, 2009). However, using the collected set of researches, we can conclude that there is no comprehensive framework for IT governance that is tailored for SMEs (i.e. that acknowledges SME specificities). The need for such a framework is directly reported in extant literature (Bergeron et al., 2015).

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

3.5. Research Strategies Employed

Using the final set of researches, three main research strategies are identified:

- Case study research (Devos et al., 2012; Garbarino-Alberti, 2013; Giraldo et al., 2010; Huang et al., 2009, 2010);
- Survey research (Bernroider, 2008; Lin et al., 2011; Miyamoto & Kudo, 2013; Tan et al., 2011; Wilkin, 2012);
- Conceptual research (Ayat et al., 2011; Bergeron et al., 2015; Cochran, 2010).

It should be noted that all of the researches that are classified as 'conceptual research' are "work-in-progress"-papers. All of them explicitly mention that empirical research will be conducted in a further stage of the research project.

3.6. A Framework for IT Governance Tailored to the SME-Context

Our literature review indicated that authors seem to agree on the importance of IT governance for SMEs. Another point of agreement seems to be that SME specificities will likely influence the nature of IT governance in this context. Accordingly, SMEs' IT governance might need to consider different theoretical underpinnings compared to IT governance for larger enterprises. This leads to the conclusion that there is a need for concrete, context-based insights in how SMEs can govern their IT assets. As previously discussed, some descriptive empirical studies exist, albeit a small amount. Hence, the research domain would certainly benefit of more descriptive research into "how SMEs are implementing IT governance".

Our literature review found no evidence of a SME-specific IT governance framework, despite the existence of such frameworks for large enterprises (e.g. De Haes & Van Grembergen (2009)). This endeavor might hence be an interesting research opportunity. In practice, organizations are often drawing upon the practical relevance of industry frameworks such as "Control Objectives for Information and Related Technology" (COBIT), currently in its fifth edition, and released by the "Information Systems Audit & Control Association" (ISACA). In COBIT 5, claims are made that the framework is generic and hence will be applicable for all organizations, regardless of its size or industry. Despite offering a wealth of potentially useful information for organizations that are considering IT governance, the COBIT framework is often perceived as being very complex (Pereira & da Silva, 2012). It makes sense that this would even more so be the case for SMEs. Additionally, COBIT 5 is not the result of following a rigorous methodology. Rather, it is a descriptive account of "good practices". It is our belief that the design of such a "SME-tailored IT governance framework", anchored in relevant theories, would entail a nice contribution to the body of knowledge.

4. CONCLUSION

The research presented in this paper used a systematic literature review to gauge the state-of-the-art of the IT governance research in the SME context. The analysis revealed several interesting points. First, IT governance in the SME context has been researched previously, albeit not extensively. This can be seen by the fact that the systematic search only yielded 13 relevant researches. Related with this is the

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

fact that the research in this specific area is still emerging. Indeed, all of the identified publications were published between 2008 and 2015. Second, IT governance is important for SMEs as well as larger organizations. This is especially true if the SME is critically dependent on IT. Despite this recognition, there are currently not many clear insights in how SMEs should govern their IT assets. Third, SME specificities will likely influence the nature and implementation of IT governance in the SME context. This is also indicated by the critique on the theoretical foundations of IT governance in general when approaching it using SME specificities. Using the fact that authors active in this niche research domain seem to agree on the importance of IT governance for SMEs, together with the fact that SME specificities will likely influence the nature of IT governance in SMEs, a need for concrete and comprehensive insights in how SMEs can govern their IT assets surfaces. Specifically, our literature review found no published framework for IT governance tailored to the SME context (i.e. acknowledging SME specificities). It is our belief that the research domain would greatly benefit from additional insights in IT governance in the SME context in general, and such a tailored framework in specific. Fourth, there is no great variety of research strategies used in the research domain of IT governance in the SME context. Our analysis indicates a mix of conceptual research and empirical research. In the case of empirical research, only survey research or case study research are employed as research strategies. The research domain would certainly benefit from a wider variety of employed research strategies, while gaining maturity. Finally, in general, there is room for improvement of SMEs' IT governance. This can be concluded using the researches that provide a view of the contemporary state of IT governance in SMEs. The research domain would certainly benefit from more insights in the contemporary state of IT governance in SMEs. While there is some empirical evidence available, there is not much, and a lot of contexts are still undiscovered.

5. LIMITATIONS

This research paper presented a systematic literature review in the research domain of IT governance in the SME context. Following guidelines for systematic literature reviews, the research approach was designed. An important part of the search strategy is the automated search procedure that was conducted using the WoS digital library. In general, it could be interesting to extend an automated search over multiple digital libraries. As a consequence, the search string will often need to be tailored to the specific digital library. For this research, we argued to limit the automated search procedure to a single digital library, i.e. the WoS, as it includes many high quality venues in the area of management information systems. To increase the reliability of the findings of the literature review, the automated search procedure was complemented by manual searches (i.e. forward and backward searches). Nevertheless, when conducting a systematic literature review, the researcher should consider the inclusion of multiple digital libraries if deemed appropriate.

Chapter 84
Critical Review of SME Regulation Optimization in Serbia:
A Reflection on Harmonization with the EU Acquis

Olgica Milošević
Faculty of Applied Management, Economics, and Finance in Belgrade, Serbia

ABSTRACT

The European Union (EU) and the Republic of Serbia have recognized the importance of SMEs and are developing accordingly the institutional framework of this sector. In the process of EU accession, Serbia has to fulfil political, economic and legal requirements by implementing systemic reforms of its legal system in order to align it with the EU acquis. Some of these requirements have a direct or indirect impact on SME regulations, to which our chapter has been dedicated within a series of our papers on developing the SME regulatory framework. This paper will try to present the importance of innovating legal development of these companies. Furthermore, modern concepts will be introduced together with very important tools of legal forms of SME organization. The intention is to clearly define specific legal goals of SMEs, expressed through targeted legal forms. The modern regulatory framework relating to SMEs should combine the existing solid theoretical base and innovative models from the practice.

INTRODUCTION

The purpose of this chapter is to comparably examine the institutional framework and process that optimizes company law through the adoption of more uniform regulatory models and laws compatible with a policy agreed at a multilateral level of the European Union (EU). The constituent premise is that development of small and medium enterprises (SMEs) can benefit from this process. Given that 99% of all forms of businesses in the EU are SMEs, which provide 67% of jobs and another 85% in newly

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

created businesses, the EU therefore strongly encourages entrepreneurship and SME development (European Commission, 2016a).

Many studies highlight the value of examining legal, regulatory and administrative environment deemed favorable for SMEs. For example OECD (2004) study, featured, *inter alia*, the following:

- Property rights are clearly recognized;
- Contracts are easily enforced;
- A simple, transparent and low-compliance-cost tax system is operational and it is perceived as fair;
- Businesses are able to register with authorities through a simple and inexpensive system, preferably by remote access through the Internet;
- Business licensing requirements are minimized, and when they are enforced, the objective is to safeguard health and safety of consumers and labor rather than only being a source of revenue for local and/or central government;
- Labor regulations are balanced and flexible, protecting the rights of labor and the firm equally;
- SMEs, whether they are exporting or importing, interact with a streamlined customs administration that is efficient, simple and transparent;
- Financial sector regulations (banking, insurance, leasing) recognize SME constraints and provide legal and regulatory instruments that enable commonly available SME assets to be used as collateral;
- Public administrators at local levels appreciate entrepreneurs as contributors to economic growth, treat them fairly and are committed to limiting corruption to a minimum;
- Legislation and regulation is gender insensitive, rule of law and rules of the game apply equally to men and women;
- SMEs can easily set up and join membership organizations;
- Bankruptcy legislation does not impose unduly high penalties on the entrepreneur or the SME.

Clearly, in the field of the administrative burdens such as registration costs, efficiency of commercial courts and required permits it is recommendable to reduce the paperwork and cost involved in setting up SMEs.

Following a brief presentation of the EU approach to SME development and Serbia's progress (European Commission, 2016c), in this field the main context of this chapter is to examine the impact of some unique important principles of company law on SME growth and development. Part of the author's approach is also to critically analyze the most significant facilitating and restrictive factors as challenges or concerns for SMEs in both EU and Serbia. Consequently, the chapter will examine rewards and challenges associated with SME regulatory optimization and harmonization. To enhance this chapter, the author uses the comparative scientific method coupled with logical-axiological research and normative theory of law.

Following the above described content, the chapter discussion will present future research directions and is followed with a conclusion.

BACKGROUND ON THE EU SME APPROACH AND REVIEW OF PROGRESS IN SERBIA

A typical internationally recognized SME country mapping consists of three sub-dimensions, analyzing these main aspects (OECD, 2012, pp.98-105) portrayed in Table 1.

As an example, let us consider the Republic of Serbia, which began its EU accession process in 2005. It is currently in the negotiation phase, involving 35 chapters. Serbia's task is to fulfill political, economic and legal requirements by implementing systemic reforms of its legal system in order to harmonize it with the EU *acquis* (European Integration Office, 2014). Some of these chapters have a direct / indirect impact on the development of entrepreneurship and SMEs, such as the Company Law, Taxation, Social Policy and Employment, Enterprise and Industrial Policy, Financial and Budgetary Provisions, etc. Although most of these chapters have not been officially "opened", the latest European Commission's Serbia 2015 Report unequivocally shows that Serbia has made a major step forward and is on the right track (European Commission, 2015a). In building SME development policy Serbia is harmonizing regulations by following Small Business Act (SBA) principles. According to (SBA) Fact Sheets, which present an assessment of progress in SBA implementation at national level, the European Commission stressed that administrative and regulatory requirements need to be reduced and simplified in Serbia. Further support is needed for the internationalization of SMEs, focusing on the sectors whose good performance stands out. Access to finance is still generally poor. Bank lending, crucial for SMEs, has become less available. Interest rates have lowered, but remain high. Therefore, alternative sources of financing should be developed. The methodology for the *'SME test'* exists, but needs to be applied systematically (European Commission, 2015b).

As jointly assessed by the Organization for Economic Cooperation and Development (OECD), European Commission and other relevant European institutions, Serbia's key priorities in 2016 are economic competitiveness and export-led grow (OECD, 2016, pp. 311-329). The key mid-term priorities are to establish a progress monitoring system, implement defined SME policy and measure its effectiveness in practice. Building on a well-developed institutional framework for strategic SME policy Serbia has improved its SME environment, especially regarding company registration and e-government, while focusing on the need to analyze results of numerous trainings held on SMEs. Significant progress is seen in promoting SME innovativeness so as to enable entrepreneurs to actively participate in international

cooperation programs, which is definitely a big step in the right direction. Access to funds is still a stumbling block for SME development and needs to be strengthened by expanding regulations in key areas such as permits and licenses. Another disadvantage is the fact that environmental policy in the SME area has not been implemented yet and is not considered to be an integral part of the environmental policy.

Obviously, many obstacles to SME development have been eliminated, but enormous work is yet to be done before full alignment of national legislation with the EU *acquis* in this area. In fact, results of focus group discussions and in-depth interviews conducted by the United States Agency for International Development (USAID) pointed out the following problems of Serbian SMEs regarding business environment, duties, taxes and contributions, as shown in the Table 2 (USAID Serbia, 2015).

In summary, fiscal levies need to be optimized and transparent support provided to the private sector by the government, with a focus on effective and horizontal objectives, such as SME support. It is also noted that SMEs mostly "suffer" from poor financial status and liquidity, as well as from regulatory unpredictability. SMEs have a limited access to different financing sources, especially at the beginning of their business operations when there is a lack of reliable data on financial and other features of the business and when company's credit solvency is weak (Beraha, 2016, p. 56).

In order to coordinate activities of various ministries and other organizations to promote entrepreneurship and develop SMEs, Serbian Government formed a Council for SMEs, Entrepreneurship and Competitiveness. This interim working body is composed of representatives of line ministries, businesses and research community. Furthermore, in March 2015 the government adopted the 2015-2020 Strategy to Support Development of SMEs, Entrepreneurship and Competitiveness and the Action Plan for its implementation, fully in line with the EU policy in this area i.e., the SBA for Europe from 2008 (Ćoćkalo, Đorđević, Sajfert & Bogetić, 2011. p. 450). The Strategy's firm baseline reflects information and recommendations from reports and analyses by international institutions and projects, the European Commission and national institutions. Its introduction emphasizes three reasons for its adoption: defining mid-term measures to promote entrepreneurship and competitiveness in Serbia in line with the state of affairs and real needs of the SME sector in Serbia; continuing and building upon the existing policy on developing entrepreneurship and competitiveness; and harmonization with the EU policy in this area. Six strategic goals – *Strategy pillars* – are clearly defined:

1. Boost business environment;
2. Improve access to financing sources;
3. Continuously develop human resources;
4. Build sustainability and competitiveness of SMEs;

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

5. Enhance access to new markets, and
6. Develop, promote entrepreneurial spirit, stimulate women, youth entrepreneurship and social entrepreneurship.

Table 3 illustrates how the Serbian strategic goals are linked with the *Small Business Act for Europe.*

Comprehensive regulatory reform is an ongoing process that has to take place at all government levels, and its success depends on effective implementation of adopted regulations. Obviously, the very process of passing regulations has to be enhanced by increasing transparency and predictability of regulatory activities, and by enabling businesses and citizens to participate more in the adoption of new regulations. For example, the SME definition (see key terms and definitions) used by the authorities is only partially in line with the definition recommended by the European Commission as it does not cover affiliated and partner companies. The SME definition that came into effect on 1 January 2005 is based on three criteria: number of employees, total annual revenue and total assets (balance-sheet assets), and a company needs to meet the criterion relating to the number of employees plus one or both other remaining criteria. Micro businesses also include entrepreneurs operating independently (Stamatović & Vemić, 2009, p. 882). It would, however, be beneficial for SMEs in Serbia if the EU recommendations would be fully implemented in a single legal act, because that would enable them to receive treatment by the authorities and EU programs, for which this definition is binding.

Table 3. Links between strategy to support development of SMEs, entrepreneurship and competitiveness (2015-2020) and the small business act for Europe

Small Business Act for Europe	Support Development of SMEs, Entrepreneurship, and Competitiveness
Principle 1 - Create an environment in which entrepreneurs and family businesses can thrive and entrepreneurship is rewarded	Pllar 3 - Continuously develop human resources Pillar 6 - Develop and promote entrepreneurial spirit and stimulate women and youth entrepreneurship and social entrepreneurship
Principle 2 - Ensure that honest entrepreneurs who have faced bankruptcy quickly get a second chance	Pillar1 - Boost business environment
Principle 3 - Design rules according to the "Think Small First" principle	Pillar 1 - Boost business environment
Principle 4 - Make public administrations responsive to SMEs' needs	Pillar 1 - Boost business environment
Principle 5 - Adapt public policy tools to SME needs: facilitate SMEs' participation in public procurement and better use State Aid possibilities for SMEs	Pillar 1 - Boost business environment Pillar 2 - Improve access to financing sources Pillar 4 - Build sustainability and competitiveness of SMEs
Principle 6 - Facilitate SMEs' access to finance and develop a legal and business environment supportive to timely payments in commercial transactions	Pillar 2 - Improve access to financing sources
Principle 7 - Help SMEs to benefit more from the opportunities offered by the Single Market	Pillar 5 - Enhance access to new markets
Principle 8 - Promote the upgrading of skills in SMEs and all forms of innovation	Pillar 4 - Build sustainability and competitiveness of SMEs
Principle 9 - Enable SMEs to turn environmental challenges into opportunities	Pillar 4 - Build sustainability and competitiveness of SMEs
Principle 10 - Encourage and support SMEs to benefit from the growth of markets	Pillar 4 - Build sustainability and competitiveness of SMEs Pillar 5 - Enhance access to new markets

Source: Adapted from USAID Business Enabling Project (2015b)

More recently, Serbia's progress in the process of alignment with the EU *acquis* has been demonstrated in several ways. The Executive Summary of Business Survey Serbia 2015 conducted by USAID shows results achieved in implementing the reforms but also a number of important issues remaining (see Table 4).

Serbia's progress is also reflected in conclusion of an agreement with the EU confirming Serbia's participation in the COSME Program for the Competitiveness of Enterprises and SMEs until 2020. This is an EU-funded program implemented in the period 2014-2020 with a budget of 2.3 billion Euros to support SMEs in improving access to financing sources, support in internationalization and accessing foreign markets, creating a stimulating business environment for development of competition, and encouraging the spirit of entrepreneurship. The Agreement with Serbia went into effect on 1 January 2016 (COSME, 2016).

In the next, central part, of the chapter the author will consider the impact of some key regulatory principles relevant for SME development in the EU, as well as in Serbia.

AN OVERVIEW OF SERBIAN COMPANY LAW IMPACT ON SME GROWTH AND DEVELOPMENT

This section focuses specifically on the use of key company law principles of relevance for SMEs. The author looks at the theory and practice of company law as well as the main benefits and threats associated with the treatment of SMEs.

The Principle of Completeness of All Forms of Companies

Serbia Company Law (Serbia Company Law, 2015) defines 4 legal forms of companies without leaving the possibility of incorporating a company in a form not regulated by the Law. The Law regulates companies' legal status, including in particular their incorporation, management, status changes, changes of legal form, dissolution and other issues relevant for their status, as well as the legal status of entre-

preneurs. Provisions relating to entrepreneurs, who do not have a company status i.e. legal entity status, but are, instead, natural persons, make an impression that they accidently got left out from this Law.

Companies are usually classified into two categories: partnership (general partnership (GP) and limited partnership (LP) and corporation (limited liability company (LLC) and joint stock company (JSC). Their characteristics are presented in Table 5.

As the above legal forms of companies are defined by the company law in line with the principle of completeness, they should as such have a facilitating effect on legal development of SMEs. One paradox is noticeable, however, that despite the generally accepted term "small and medium-sized enterprises" this law does not explicitly recognize the word "enterprise", although entrepreneurs are mentioned, which the author does consider inhibiting for entrepreneurship.

The Principle of Essentiality of Intention to Demarcate SMEs as Companies from Institutions

Serbian company law clearly defines the company as a legal entity engaged in an economic activity for the purpose of profit generation, which is also the aim of SME establishment. On the other side, there are also other forms of association into institutions and companies for the purpose of organizing public services. They pursue economic activities that fulfill the needs of citizens and organizations and other legally determined interests in certain areas, and are also regulated by the Law on Public Services (Serbia Law on Public Services, 2015). This way a clear distinction was made between different forms of potential organization based on the purpose they are incorporated for, which shows that optimization is the purpose of the principle of essentiality of the intention to demarcate SMEs as companies from the so-called institutions.

The Principle of Equality of Companies

The principle of equality derives from the constitutional principle of equality and independence of companies. It concerns organizational forms of all companies and enables property and management components of the ownership function, regardless of the ownership basis. This principle is of particular importance from the aspect of economic activity individual companies can engage in and is reflected in easier market access. Introduction and popularization of European business and labor ethic, coupled with legal equality of all companies, increase the chances of SMEs to position themselves better on the

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

market and distinguish them from other companies. This is facilitated by the well-known advantages of SMEs including, among others, better flexibility and dynamics in adjusting to demands of the market and new technologies, and their quick response to changes in demand (Ožegović & Pavlović, 2012, p. 75).

The Principle of Tripartite Interest of the Majority / Minority Owners, Creditors, and Employees

The tripartite principle embraces the modern thinking of comparative law and business practice, according to which in terms of interests a company belongs not only to its owners but to creditors and employees as well who all have certain specific rights set in the company's managing structure. In fact, in modern economy this concept grows from tripartition to multipartition. Therefore, along with the above interests included are also social interests such as the interest of clients and even the very society sociologically speaking, which all together strengthens SME organization.

The Principle of Compatibility of Legal Forms in Developed and Transition Countries

As mentioned earlier, Serbian legislation "knows" only 4 company forms regulated by the Company Law, which also embraces definition of the entrepreneur, as a physical person. This closed system of company forms, the so called *numerus clausus,* may in fact have a restrictive effect on SME development, because it fails to recognize some company forms present in the EU. Therefore, the principle of comparability of legal forms of companies in developed and some transition countries is not favorable enough for SMEs. At present this legislative approach does not have a major impact on SMEs in Serbia because most companies in the EU are also incorporated as limited liability companies. However for a fully-fledged EU member and market economy company legislation needs to be harmonized so as to introduce new forms of companies.

The Principle of Enhanced Liability of Management Board, Controlling Members, and Shareholders

Liability of corporation members is brought down to liability for company's obligations, but only in the amount of invested capital, for they are not liable for company's obligations with their personal assets. An exception is the case when owners use the company as a "shell" for their own unfounded enrichment. This is most often manifested by mixing personal and company's assets, in using company assets for personal purposes and personal benefit, fraudulent abuse of company and its assets and similar actions, followed by untruthful or incomplete presentation of the status of assets in business records. Candidates for the abuse of legal personality include, among others, one-member and no employee companies, companies with close links among members with family ties and highly undercapitalized companies. Abuse of legal personality is a relatively new legal institute and its most common form involves deceiving creditors and abuse institute was invented as a "defensive mechanism". Activation of this institute can be demanded if the charged person:

1. Used the company to achieve otherwise prohibited objectives;
2. Used or disposed with company's assets as their own personal property;

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

3. Used the company or its assets to cause damage to company creditors;
4. Reduced the company's assets for personal gain or gain of third parties, although they knew or ought to have known the company would be unable to meet its obligations.

In judicial practice this institute has been applied very rarely and very restrictively. It should be regulated in more detail in order to encourage courts to apply it more effectively.

Director's liability is regulated by limitation of authority, prescribed level of due diligence according to which the director is bound to carry out his/her duties in good faith and in a reasonable belief that he/she acts in the best interest of the company. He has an obligation to report personal interest and avoid conflict of interests, keep business secrets confidential and respect disloyal competition.

Status, obligations and responsibilities of the controlling members are defined in detail. A party is the controlling member of the company always when such party owns, independently or with related parties, the majority share in the company's capital assets. The controlling members / shareholders bear unlimited joint and several liabilities for company's obligations even upon deletion of the company from the register. Various limitations have been prescribed for the purpose of protecting company's members and creditors such as, e.g., prohibition of subscription of shares – company's shares cannot be subscribed by its controlled company, nor by a third party acting in its own name and for the account of the controlled company. The controlling company is held liable for damages suffered by the controlled company due to actions upon binding instructions on how to run business, guided by the group's interests. The controlling shareholder having shares that account for minimum 90% of the company's capital assets is bound to buy shares of each of the remaining shareholders at a price set in the same fashion as in payment to disagreeing shareholders. All above protective measures enhance SME development by strengthening the legal institute of liability of the above mentioned groups of parties.

The Principle of Transparency for Company Operations

The transparency principle is highly positioned in the hierarchy of essential principles of the company law. In fact, ensuring transparency is one of the two goals for adoption of the Code of Business Ethics (Serbia Code of Business Conduct, 2006). In addition, transparency of financial information is a legal requirement for participants in the capital market (Todorović, Bunić & Todorović, 2013, p.11). Protecting investors' interests by disclosing relevant and reliable information is one of the segments of harmonization of regulations within the EU.

The transparency principle means that along with the traditional set of financial statements, other reports are also made available to the public in line with the accounting standards. The annual audit should be published by an independent and qualified auditor while external auditors should be responsible to shareholders providing information equally to all participants. This approach builds corporate social responsibility ensuring transparency towards all stakeholders and creating a long-term value through protection of interests of company members/shareholders. Therefore, this principle has a strong impact on building organizational development of SMEs.

The Principle of Modernity, Sophistication, and Liberal Enactment

The Serbian legal system belongs to the system of European continental law, but it also incorporates some institutes of Anglo-Saxon law. The new Company Law is a modern piece of legislation largely aligned

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

with the EU company law. The principle of liberal enactments serves specific interests of all investors who can operationalize their business idea without the claws of imperative norms. Enactment norms are predominant in the law and offer freedom of choice of a solution for each particular situation regardless of the form of company, except partially for the public joint stock company. There is freedom of choice in relation to the solution foreseen by the norms, giving an opportunity to the interested entities to regulate their rights and obligations by themselves differently than as set forth by the law in accordance with the principle of autonomous will. Therefore the Serbian company law should contribute to creation of a legal system complementary to the internal EU market. It facilitates growth and development of SMEs because it optimizes the regulatory framework of SMEs and is in legal correlation with SME Development Strategy and some laws such as the accounting law (Serbia Accounting Law, 2013), and business registration law (Serbia Law on the Procedure of Registration with the Business Registers Agency, 2014). However, in the author's view, the present version of the procurement law (Serbia Public Procurement, 2015) still fails to offer liberal enabling provisions supporting SME development.

ANALYSIS OF FACILITATING AND INHIBITING REGULATORY FACTORS OF SIGNIFICANCE FOR SME DEVELOPMENT IN EU AND SERBIA

In a comparative analysis of company law, especially in the part relating to regulations of some essential issues of corporations, different factors with a substantial impact on growth and development of SMEs in the EU and Serbia can be distinguished. They represent unique opportunities and challenges for SMEs. Therefore, in this section of the chapter the author brings attention to the factors that can either enable or inhibit successful SME development applying the comparative method of scientific research.

Procedure for Establishment, Registration, Change of Legal Form, Mergers, and Acquisitions

This is a factor revealing unambiguous legislative progress in Serbia in legal gravitation towards the EU, with some inhibiting aspects. The Serbian Business Registry Agency (SBRA), which controls all registers at the central level, has increased the number of registers from 15 to 17. Although the procedure of filing the registration application is substantially simplified and the costs of establishing a company significantly reduced electronic company registration is still not in full operation. Optimal time for company establishment is now significantly shorter and it takes just a few steps, meaning that a business can be started up in 24 hours (European Commission, 2015c). The minimum amount of LLC's capital assets was lowered (most common SME form) from 500 EUR to 100 RSD (counter value ~ 1 $). This may makes it easier to start a business, but it does not provide sufficient protection of creditor' rights.

The possibility of changing a legal form and approaching mergers and acquisitions (M&A) represents a great opportunity for growth and development of SMEs through synergy, cost reduction and diversification. Legal aspects of M&A could contribute to enlargement, growth and development of SMEs and with proper assessment of tax risks and burdens can be optimized. Fusion is regulated in great detail by EU and Serbian Company Law, but the intended protection of interests of all categories of affected parties has not been achieved. The protection of rights of stakeholders is high, but there is insufficient protection of employees and stakeholders in ensuring preservation of their past status.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Rights and Obligations of Company Members and Shareholders from the Standpoint of Creditors and the Principle of Fiduciary Duties

The issue of company creditors' protection is always one of the burning issues of economic stability in any country. These issues result in double threat to SMEs in Serbia, both as creditors and debtors. Competitors from the ranks of "big players" can abuse their dominant position to push the SMEs into bankruptcy by not paying invoices, without the true background of their ruin ever becoming known while the bankruptcy proceedings do not provide adequate opportunities for their reorganizations and a new beginning. The new solutions in the Bankruptcy Law (Serbia Bankruptcy Law, 2014) demonstrate readiness of Serbian institutions to create an environment in which creditors' interests would be protected. The Law has enabled legal entities to respond timely and in the most favorable fashion in case of business troubles in the interest of the legal entity and that of the creditors and the company as a whole. It introduces the *Prepared Reorganization Plan* institute for the first time. Amendments to the Company Law also set the imperative legal solidary liability of company's members with "their own assets" proportionately to their share in the company's capital assets. This legal solution is not grounded in the very nature of this company. According to Vasiljević (2012) "it is entirely arbitrary and reflects the understanding of absolute omnipotence of legislation, which does not respond to itself, logic or philosophy of law" (p.12). Some blanket provisions of this Law enable high discretion, for instance, in case of inadmissible payments to a company's member by the company, when the member is liable to return such payments to the company and the company cannot release him/her from that obligation, and with this such obligation can be claimed from a *bona fide* company member only if necessary to settle the claims of company's creditors. Protection of creditors in case of reduction of the company's capital assets is brought down to a written notification of creditors by the company on the decision to reduce the company's assets, who have the option to request protection of their claims, as in the case of status change (Jevremović-Petrović, 2011, p. 248).

The principle of fiduciary duties is a clause of loyalty of members of company bodies and controlling shareholders and members towards the company prescribed by the Code of Business Ethics. It stipulates an obligation to act in the company's best interest (International Finance Corporation, 2008). In author's opinion the above factors should facilitate SME development.

Minimum Founding Capital

The minimum founding capital1 for LLC has an inhibiting impact on SME development because the law stipulates the minimum amount of only 100 RSD (around 1US $), unless a higher amount of capital is foreseen by a special law for companies engaged in specific economic activities. The good side of this solution is that there is no need to assess the value of contributions forming the minimum part of capital assets, in view of the fact that the contributions are in the form of money. This further means that when subscribing a contribution to the company its value cannot be overestimated, which is the fundamental drawback when a non-pecuniary contribution is subscribed to the company. An argument against such solution is that conducting economic activity does not require just money, but also existence of certain assets and rights, so their exclusion from the value of minimum part of the capital assets is not founded, especially in case of a non-pecuniary contribution, which can be acquired only from the founders, but not from third persons. This provision may have a stimulating effect on establishment of new SMEs,

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

but cannot suffice as security to company's creditors, because it is commonly known that the higher the company's capital assets, the higher creditors' security, bearing in mind that a LLC member is not liable for company's obligations with own personal assets. Hence, there is also negative impact on implementation of the bankruptcy law.

Improvement of Corporate Governance and Development of Employee Participation in Management

Improvement of corporate governance, development of employee participation in management has a facilitating SME impact. All companies in Serbia, regardless of their legal form, are subject to a comprehensive package of regulations. In the author's view further development of corporate governance for SME development is recommendable. Collective participation of employees in management consists of three segments:

1. Consultative participation enabling employees to give opinion on certain issues, with final decision made by the employer;
2. Actual participation where special working teams organise work, work independently and make nearly all decisions on their own in conditions of limited oversight;
3. Participation through representatives allows employee participation in the work of managing and supervisory boards and ensures other forms of participation.

Despite the comprehensive regulation of trade union organization and prescriptions from the Labor Law employee participation is not sufficiently developed in Serbia. It works only to some extent in the public sector, while the trade union organization in the private sector is very poorly developed. Given that the General Collective Agreement ceased to be valid back in 2011 (Serbia General Collective Agreement, 2009) and no agreement was reached in a tripartite dialoge on a new one, and that collective agreements are rare in the private sector, protection of workers in Serbia is reduced to the minimum prescribed by the Labor Law. Social dialogue is still an issue because trade unions representatives abandoned the negotiations on amending the Labor Law (Serbia Labor Law, 2014). The law is now aimed at enabling easier employment, flexibility and mobility of Labor force, enlargement of trade unions and increasing convergence with the EU legislation have in fact deteriorated the position of employees. Since all levels of employee participation in Serbia are below the satisfactory level, the author takes the view that institutional measures need to be taken for the development of participation such as in the French model or through co-decision of employees as in Germany and Sweden.

Valuation of Non-Monetary Contributions of the Founders

Valuation of the non-monetary contributions that may be exercised by the founders themselves has a facilitating impact on the development of SMEs in all forms of companies, with the exception of public joint stock companies where the law lists the competent entities to carry out this assessment (certified court expert, auditor or other professional authorized by the competent authority of the Republic of Serbia to perform valuation of certain assets or rights). On the one hand this factor increases cost of establish-

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

ment, and on the other provides greater protection of shareholders. However, the legislator leaves an option to future company members to entrust valuation of assets and rights to an authorized assessor.

Clear Demarcation of Open and Closed Societies

Clear demarcation of open and closed societies seems to have a restrictive impact on SME development, and a regulatory step backwards was taken in this field. The previous company law clearly distinguished between open joint stock companies, established through public invitation for subscription and payment of shares and the closed where shares were issued only to the founders or to a limited number of other people. The current Serbian law recognizes only public and non-public companies, without a clear demarcation and uses poor legislative technique which makes it difficult to "navigate" in the law.

There are views (Jovanović, 2011, p. 319) that this Law was adopted for one time use during the transitional period of Serbia's EU accession, until a better one is adopted. The company law also has a legal gap with regards to the market price at which a company is bound to repurchase shares from disagreeing shareholders.

Regulation of Ownership and Control Functions, Protection of Minority Shareholders and Members of Corporations

The analysis of the Company Law, Capital Markets Law on and the Law on Takeover of Joint Stock Companies shows that these Serbian laws are now fully aligned with the EU Directives in the area of minority shareholders' rights (Đulić & Kuzman, 2012, p. 96). Therefore, at present, regulation of Ownership and Control functions, Protection of Minority Shareholders and Members of Corporations can have a limited facilitating effect on the development of SMEs, and is a direction to consider in future improvements to the company law. Hence, according to the World Economic Forum's Report Serbia holds the 94th place out of 144 countries covered by this competitiveness Report (World Economic Forum, 2016).

Obiovusly, a good legal framework is not sufficient for shareholders to enjoy effective protection if the regulation is not effectively implemented in practice. Since voluntary enforcement of law is clearly missing, the importance of forced enforcement is multiplied, and is manifested in the form of private enforcement by courts or public enforcement by regulatory and supervisory bodies such as the Securities Commission. A defect of this law is reflected in the fact that private persons are at will to decide whether to initiate enforcement procedure in case of violation of the rules, meaning that protection depends on citizens' private initiatives. This system is clearly not yielding intended results, taking into account that citizens' private initiative largely depends on their perception of the efficiency of courts and the legal system in general, costs, clarity of rules, burden of proof and incentives given to them. A detailed analysis of the practice of public and private enforcement needs to be conducted in the near future so as to identify issues and obstacles and define steps to eliminate them (Đulić & Kuzman, 2012, p. 95) in order to facilitate SME development.

Regulation of essential factors of interest for functioning of SMEs is certainly important, but development of new legal forms is equally important. For the reason, the next section of this chapter the author will focus on further development of new forms of companies in the EU and their possible introduction in Serbia.

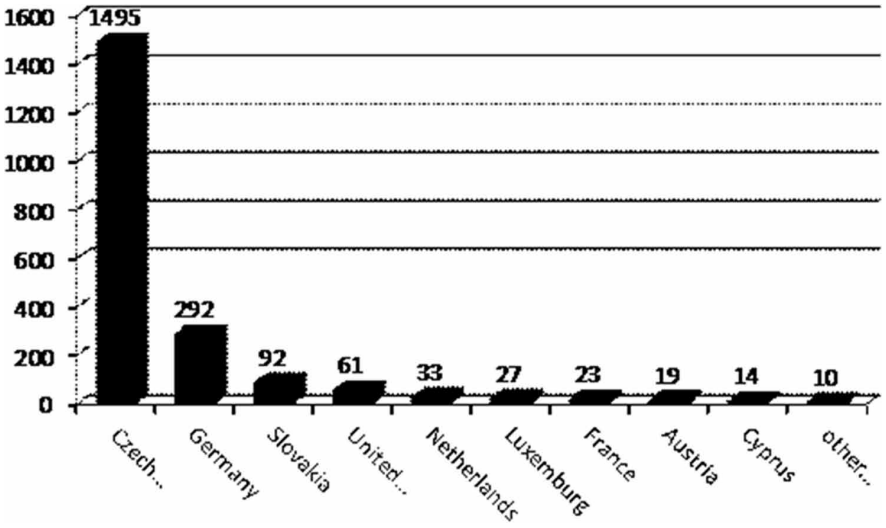
FUTURE RESEARCH DIRECTIONS AND INTRODUCTION OF POTENTIAL NEW LEGAL FORMS OF BUSINESS ORGANIZATION FOR SMEs

The author believes that it is very important to continue with research and development of SME regulatory framework in the EU and Serbia. Notably, the European Company, European Economic Interest Grouping (EEIG) and European Cooperative Society already exist in EU member states. The author provides a critical review of these forms of organization and linking of companies that could have a particular importance for medium-sized companies in both EU and Serbia.



The European Company

The European Company (also known by its Latin name *Societas Europaea* or SE) is a type of public limited-liability company regulated under EU law (European Commission, 2016b).

The European Company as a legal institute was introduced in 2004, but has so far been used by a small number of companies for various objective reasons. According to available data of the European Company Database only 2,125 SEs were established until March 2014. The number of European companies is presented in Figure 1.

There are several features differentiating this joint stock company from other company types. First of all, it is a legal entity, a business company and a corporation, with its capital assets divided into shares, shareholders not liable for company's obligations and it has a statute as the articles of association. Founders of SE can only be the existing legal entities, and physical persons cannot appear in the founder's role. SE can be formed only in one of the foreseen ways: merger of two or more existing joint stock companies, formation of the SE as a holding company by a joint stock company, formation of the SE as a daughter company by any companies Conversion of an existing joint stock company established following regulations of a Member State can be converted under certain conditions into SE and formation of SE as a daughter company by the existing SE. Once formed, an SE can also found other SEs.

Its main advantage is the possibility of company's restructuring across borders into a form of cross-border merger, which was impossible until by some Member State laws, and there were insuperable difficulties. European companies thus adjust to the economic reality of a single market without meeting strict and complicating conditions of national laws, without costs particularly in relation to liquidation and new establishment in another country (Jeveremović-Petrović, 2007, p. 403). Many economic analysts deem that this institute suits larger companies and is discouraging for SMEs as it can be established by a minimum of two companies from two EU countries with a minimum capital of 120,000 Euros. As noted (Stefanović, 2011, p. 238-244), this automatically eliminates the vast majority of SMEs for which this founding capital is too high.

European Economic Interest Grouping

European Economic Interest Grouping (EEIG) is another form of interest linking of companies for a limited time on a status-legal basis with a view of facilitating and developing performance of the economic activity of members of SME associations and persons as professionals engaged in liberal professions and for establishing a cross-border cooperation. This could benefit the growth and development of SMEs from Serbia (Jevremović-Petrović, 2005, p. 8) and across EU when cooperating with neighboring countries. It is an excellent opportunity for international association not requiring high costs and is not complicated as other possible forms of association such as mergers, acquisitions and joint ventures.

Another advantage of this form of company is creation of links in different EU Member States without losing own legal personality or independence. This means that EEIG represents a legal entity acting on its own behalf and account in business transactions. Inexistence of regulations at its minimum capital assets does not lessen the legal certainty of its creditors, because unlimited joint and several liability of its founders for company's obligations is prescribed. It is important to mention that EEIG is not a simple association, not only for its formal legal personality but also because its founders retain independence in business. They do not transfer their activities and business to the EEIG, nor do they harmonize them with the EEIG's (Stefanović, 2011, p. 261).

EEIG is usually formed in the services sector such as legal practice, public notaries, telecommunications, financial services and real estate transactions. This supra-national legal creation can be founded by minimum two members (physical or legal persons, national or foreign) from at least two EU Member States and as such it facilitates cross border SME development within the EU. It is established in accordance with national legislation of the member state where it is seated upon its entry in the corresponding register based on the agreement on foundation.

The European Cooperative Society

Another supra-national legal creation can be established in the EU titled *The European Cooperative Society* (SCE, for Latin *societas cooperativa Europaea*). As its aim of establishment is to perform certain economic activities in the interest of its owners, not to penetrate the market for profit generation, it has no direct impact on SMEs but indirectly it does. *The European Cooperative Society* may operate throughout the European Economic Area if established by 5 or more persons residing in different member states or by legal entities (i.e. SMEs) established in different member states and its subscribed capital shall not be less than EUR 30,000.

Practice shows that for development of their activities on the territory of other EU Member States SMEs use the generally known form of LLC, based on national law of the country in which they want to perform certain activities i.e. where they have their seat registered. It is a form of trading company most frequent in practice and particularly suitable for SMEs. Interestingly, the EU does not have a special regulation for LLCs because harmonization of legal norms relating to them was never proposed or initiated in the EU bodies. For that reason, this form of companies is subject to national law of the country of their establishment and harmonization is recommended.

Every systemic change of legislation, such as SME regulation optimization, usually has its threats and opportunities. For some of these changes it may be very difficult to define the category they fall in, e.g. with EU membership Serbian SMEs will join the single EU market, which will generate business opportunities for some SMEs while bringing "the end of business" to others for they may not be capable of meeting high technical and other standards regulated by the EU or handling the pressure of increased competition. Advantages of SME regulation optimization are numerous because they are implemented according to plan in line with a national SME Development Strategy. However, harmonization of national legislation with the EU *acquis* also bears certain costs, which could be categorized as follows according to the Standard Cost Model (European Commission, 2015a):

1. **Familiarization Costs:** Those incurred in the course of developing and understanding legislative requirements;
2. **Adoption Costs:** Representing the cost required changes to comply with legislation;
3. **Administrative Costs**: Representing the cost the administrative obligations required by the legislation.

Since there is no unique methodology to assess these costs, it is very difficult to determine them, especially since a difference should be made between costs existing without legislative harmonization (i.e. „business as usual costs") and those incurred due to harmonization (i.e. „administrative burden").

If change is made in Serbia through harmonization with EU law, optimization consequences will be numerous because they affect development of the entire Serbian economy whose prime mover is SMEs. Regardless of negative effects that may appear, the author finds them negligible as compared with the expected benefits.

CONCLUSION

The basic SME characteristics enable them to adjust faster and flexibly to dynamic conditions, changes in consumer needs and demands on the global market. These are also the sources of problems and obstacles restricting their development and not rarely endanger their survival. Experiences of developed countries show that a significant impact of SMEs on growth and employment can be expected only in an organized and stimulating business and legal environment suitable for their foundation, improvement and stability of business. This requires adoption of sound regulations and their efficient enforcement, which will enable fast, professional and objective resolution of problems they SMEs encounter in doing business. Growth and development in the EU and Serbia require development of SMEs whose competitiveness on the global market will be based on knowledge, use of new technologies and innovations. In order to

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

attain this goal in practice, readiness of the SME sector to conquer a market respecting adherence to necessary standards is of extreme importance.

On its way to the fully-fledged EU membership, Serbia has taken serious steps to meet the necessary requirements, some of which directly or indirectly relate to SME development. A comprehensive reform of legislation is currently ongoing for the purpose of its alignment with EU regulations, which goes in favor of SME development in Serbia, since the EU emphasizes this sector by strongly supporting its growth and development.

Analysis of SME regulatory development has shown that relying only on the existing legal forms is not enough to fulfill the needs of this sector and its expansion at growth rates necessary to maintain their share in the market. Finding and developing optimal regulatory forms is the key of further SME success.

The EU and the Serbian Government in particular, need to consider and propose a series of legislative and regulatory measures, instruments and institutions so as to improve the SME regulatory framework. Those regulations that are not operating in accordance with the legal intentions need to be innovated. Therefore, governments, agencies and institutions with the public support should improve the SME sector through regulatory development, tax reliefs, exemption from general economic-legal regulations and granting a relatively favorable status to SMEs. Hence, it can be justifiably assumed that the process of modernization of the SME regulatory framework will continue.

The assumption of continued process of developing legal regulations stems from an estimate that the low level of growth and development of SMEs in countries like Serbia persists. Increased quality of the institutional structure, along with the reform of legislation on financial markets, is a vital precondition for changes in the quality of SME development. Indeed, company law, stock exchange law, securities law, competition law and bankruptcy law analyzed by the author should be better harmonized to serve both SME development and Serbia's EU accession, instead of being obstacles. The fact that 2016 is declared the "Year of the Entrepreneur" shows that Serbia is on the right path. This project has various state programs to build entrepreneurial strengths, assist entrepreneurs starting or developing a started business, and provides financial and non-financial support for long-term development of the entrepreneurial spirit.

SMEs in the EU and Serbia are an important sector of the national economy, which is why the economic policy with other segments of the "policy mix" should support its development. There isn't a unique and universal recipe on how to proceed with legal harmonization for SMEs. One of important recommendations refers to optimizing SME regulatory framework and cooperation with line ministries and development agencies. The Governments' role is to increase institutional and regulatory support to SMEs, offer new instruments and better inform the sector, especially on how SMEs can develop new legal forms of organization.

This chapter examined an area that is extremely important – SME regulatory optimization in the EU and its accession countries such as Serbia. Further, this chapter highlighted the theoretical basis for cross border SME cooperation. Each of these terms were presented from a theoretical basis and examined in the context of new legal SME forms. Ultimately, SMEs must innovate and respond to legal advances as all other business organizations, regardless of their legal status and size, in order to compete.

KEY TERMS AND DEFINITIONS

Small and Medium-Sized Enterprises (SMEs): Small enterprises are defined as enterprises which employ less than 50 persons and whose annual turnover or annual balance sheet total does not exceed 10 million euros; medium enterprises employ fewer than 250 persons, have turnover below 50 million euros and annual balance below 43 million Euros.

European Union (EU): Unique economic and political union between 28 European countries that operates as a cohesive economic and political block.

EU Acquis: The accumulated of legal regime and body of common rights and obligations binding on all the EU member states.

Legal Harmonization: A process that approximates legal rules within an institutional framework through the adoption of regulatory models and laws more uniform and coherent with a policy agreed at a multilateral level such as the EU in which member states achieve uniformity in laws.

Legal Reform: Process of examining existing laws, and advocating and implementing changes in a legal system, usually with the aim of enhancing justice or efficiency.

Legal Certainty: A principle which holds that the law must provide those subject to it with the ability to regulate their conduct and is internationally recognized as a central requirement for the rule of law.

Micro Businesses: Enterprises and entrepreneurs operating independently which employ less than 10 persons and whose annual turnover or annual balance sheet total does not exceed 2 million Euros.

Legal Optimization: A systematic approach that shifts the focus to legal innovation or what should be different in a process with legal outcomes involving comprehensive structural change necessary for innovation, business outcome, or both.

ENDNOTE

[1] Editors' note: The possible connections between company size and founding capital in SME life cycle are also discussed in chapter 10.

Chapter 85
Are the Payments System and e-Banking in India Safer than in other SAARC Members?

Rituparna Das
University of Petroleum and Energy Studies, India

ABSTRACT

This paper deals with the issues in the way the banks are managing risks in payments and settlement systems using netbanking within the legal frame of information technology in India compared to other SAARC members. It compared India with the SAARC members with respect to management of credit risk, liquidity risk and operational risk in the payment system. The findings are: (i) India, Pakistan and Nepal are stronger in managing all of aforesaid risks in their payments systems relative to the rest and (ii) India is the most permissive by nature as to the crime of computer hacking.

INTRODUCTION

Electronic banking (e-banking) is synonymous with internet banking (i-banking) from the user viewpoint when it comes to online (i) distribution of banking products by banks and (ii) payments and receipts of funds by banks as well as users. In India electronic banking expanded as a result of the internet communication technology revolution. Because a major driving force behind the rapid spread of i-banking all over the world is its acceptance as an extremely cost effective delivery channel of banking services as compared to other existing channels, after studying the experiences faced by USA, UK and Scandinavian Countries and taking assistance from the leading Indian multinational IT (information technology) company Infosys Limited the Reserve Bank of India (RBI) designed regulatory and technological frameworks for India, which the banks need to follow. The statistics on payments, clearing and settlement systems in the countries who follow the guidelines of CPSS (Committee on Payment and Settlement Systems) are available in Bank for International Settlements (2011).

The rest of the paper critically discusses the anatomy of the electronic payment system in India compared India to other SAARC members in matter of managing credit risk, liquidity risk and operational risk from regulatory view point and examines the ease of hacking one's e-banking account from a hacker's perspective through axiomatic approach.

BACKGROUND

The onset of electronic banking (e-banking) in India dates back to 2001 after five years of commencement of electronic clearing service in 1995. Different innovations in this field include RTGS (Real Time Gross Settlement System), NEFTS (National Electronic Fund Transfer System), CTS (Cheque Truncation System), NECS (National Electronic Clearing Service), mobile banking and satellite banking. In the current decade by and large all commercial banks in India are offering internet banking, mobile banking and ATM facilities. In any Indian commercial bank (henceforth 'bank') governance of IT is a *part and parcel* of its corporate governance. Every such bank has an independent IT Committee with professionally qualified members. This Committee participates in the Board of Directors and manages all the risks related to IT at the enterprise level.

The needs for mitigation of credit risk in securities settlements and reduction in interest cost of slow speed in physical payments gave birth to the electronic payment and settlement systems. The second benefit of these systems is that they facilitate better management of operational and liquidity risks. The third benefit is that they help faster operations in cross border financial markets. But in the context of exposure to these markets one important lesson learnt from the history of financial crises is that the payment and settlement systems work as a channel through which business risk transmits and in the process, on many occasions, there is conversion of one category of risk to another, e.g. operational risk may change into market risk. A corollary of the above lesson is that through payment and settlement systems a single category of risk at the point of origin is distributed as multiple categories among the receivers. Other related lessons are that (i) categorization of business risk depends on the types of system design and settlement method, and (ii) it varies from case to case whether the settlement system alone has to bear the risk, share it with clients or bounce back to clients.

In India the banking regulator the RBI is at present in the process of addressing the following risks of payment systems - concentration risk, counter-party risk, credit risk, legal risk, liquidity risk, operational risk, regulatory risk, settlement risk and systemic risk. But during the last one year the Deputy Governors of the RBI expressed more concern about operational risk than other risks in their lectures on online banking and electronic payments. Because of the factors typical to emerging economies, like financial exclusion of a sizeable chunk of households, existence of informal sector, a massive parallel economy and availability of education on IT to a tiny privileged section of the population, other risks could not yet attract attention in the Indian context while online frauds like hacking, leaking database and phishing mostly having been engineered offshore, but involving onshore agents, have been receiving attention.

Therefore, being empowered by the Payment and Settlement Systems Act, 2007, the RBI requires every bank to (i) pursue eight basic principles of information security – confidentiality, integrity, authenticity, non-repudiation, identification, authorization, accountability and auditability, and (ii) identify its security requirements in line with the prescription of the CPSS constituted by the Bank for International Settlements (BIS). In the process a bank needs to detect the threats to information database, explore its vulnerability to security threats and the likelihood of occurrence of such threats, assess the potential

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

impact of such threats on its business and comply with the legal, statutory, regulatory and contractual requirements involving itself as a party and its trading partners, contractors and service providers as counterparties. For ensuring smooth operations and proper conduct of the payment systems the RBI plans to integrate their six aspects – safety, security, soundness, efficiency, accessibility and authorization. This study plans to draw a comparative picture of how the banks are managing risks in payment and settlements systems as per regulatory guidelines in India vis-à-vis other countries.

THE PAYMENT SYSTEM SCENARIO IN INDIA

A ready reference of payment systems in the context of e-banking and clearing houses is provided in Bank of England (1996).

In line with Bank for International Settlements (2011) Subbarao (2012) described the following different electronic payment methods and systems in practice now.

CTS - it is an image based cheque clearing system obviating the need for physical movement of cheques; a further technological improvement of the regular CTS environment is the grid based CTS; the grid based CTS encompasses multiple clearing locations spread across several states facilitating the processing and clearing of cheques of all the banks under that particular grid; the National Payments Corporation of India, the umbrella retail payment organization set up by banks, has since operationalized a grid based CTS in Chennai in 2011;

Electronic Clearance Service (ECS) - the localized ECS metamorphosed into an ECS suite of products: (i) a localized ECS catering to the bank branches of a local clearing house; (ii) a regional ECS covering all the bank branches of a state or several states as in the Northeast; and (iii) a national electronic clearing system (NECS) covering the entire country; alongside, the electronic fund transfer (EFT) has evolved into the pan-India national EFT (NEFT); together, these two products have revolutionized the electronic retail payment market landscape in the country;

RTGS: The RBI introduced the RTGS system in March 2004 for settling gross inter-bank and customer transactions of values over INR 200,000; initially the RTGS in 2004, the gross daily turnover was just about INR 5 billion which grew in 2012 to an average gross daily turnover of nearly INR 2.5 trillion, an expansion by a factor of 500; similarly, the volume of transactions that stood at just a few thousand on average per day when RTGS started has today increased to well over 200,000 per day; the RBI is now focusing on graduating to the next-generation RTGS system with enhanced liquidity saving features and faster and higher processing capabilities.

In terms of Kar (2009) in the case of large-value inter-bank funds transfers, the most common approach is the adoption of credit transfer mechanism like RTGS; in a credit transfer system the funds move from the payer / paying bank to the receiver/ receiving bank; RTGS system is a gross settlement system in which payment instructions received from the sender are processed and settled with finality on a real-time or continuous basis (without being deferred to a later time) i.e. each payment instruction that enters the system is processed for payment immediately; individually and independent of other transactions between the same parties to the transaction; since the RTGS system is of systemic importance, the central bank usually steps in, with the provision of intra-day liquidity, typically interest-free, in the form of fully collateralized intra-day repo or intra-day overdrafts, up to limits based usually on a bank's creditworthiness and its capital. As per Reserve Bank of India (2012d) the RBI took initiative

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

for facilitating real time funds transfer through RTGS because under the RTGS system, transmission, processing and settlements of the instructions will be done on a continuous basis.

In terms of Padmanabhan (2012) the introduction of new payment products and methods during last one and half decades could be termed as supply driven such as MICR (Magnetic Ink Character Recognition) technology, CEPS (Centralized Electronic Payment Systems) viz. ECS, EFT, NEFT, NFS (National Financial Switch), CTS, various type of plastic cards etc; these supply driven innovations for both paper-based and electronic payments have gained wide acceptance over a period of time; all these innovations and new payment methods have been driven by RBI, which rolled out the products and encouraged the banks to make use of these products to render better, faster, safer and secure services to their customers. Again in terms of Subbarao (2012) as technology improved and as banks moved on to core banking platforms, RBI shifted to aggregation and consolidation of the decentralized systems to exploit economies of scale; the shift to grid based CTS, and in the case of retail electronic payments, the NECS and the NEFT systems are illustrative of this.

Kar (2009) described large value systems such as RTGS and Securities Settlement Systems (SSS) for settlement of securities market transactions, and foreign exchange settlement system for settlement of transactions in the foreign exchange market; these systems deal with transactions of very high value which are time-bound, and when transactions in these systems are settled on gross basis, they put a high pressure on demand for liquidity by the system's participants.

BANKS' ACCESS TO CEPS

Initially only commercial banks were using CEPS. RBI is eager to make all licensed banks including cooperative banks, which are technologically capable but not using CEPS, use it, but a cooperative bank need to be a sub member of a member bank. As per Reserve Bank of India (2012a) though the sponsor bank is not required to take prior approval of RBI for sponsoring the sub-member/s into the centralized payment systems but as and when they sponsor a sub-member, they should immediately inform RBI the details of the sub-member, IFSC (Indian Financial System Code) or MICR codes allotted to the branch of the sub-member, date of commencement of sub-membership etc; the sponsor bank needs to put in place a risk management framework and a system of continuous monitoring of the risk management practices of sub-member/s that they desire to sponsor where the risk management framework needs approval from the Board of the sponsor bank.

RISKS IN THE PAYMENT SYSTEM

The concept of risks in payment systems has been suitably explained by the Bank of Thailand (2012) as the possibility of payments being incomplete; the impact can be measured in terms of damaging value or level of confidence in payment systems, e.g. in case of incorrect or delayed payments, there are costs arising from transferring funds back, interest charges, replacement costs and other types of charges; in case of not receiving or receiving partial payments, there will be a principal loss, while in some cases, which involve high value payments or payment participants at large, this may cause systemic risks among financial institutions and eventually affect the stability of the financial system; such risks generally exist in the payment systems that are not settled on a real-time basis i.e. net settlement

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

systems, whereby the longer the time difference between payment and settlement time, the higher the risk exposure it is. Moreover, the risks will also depend on the volume and value of transactions in the payment system; different causes of payment system risks lead to different types of risks, major causes are counter party risk i.e. liquidity risk and credit risk. Bank of England (2009) refers to six payment incidents – (i) settlement risk: settlement member's insolvency/illiquidity, (ii) settlement risk: settlement member's operational problems, (iii) operational risk – disaster/terrorist attack, (iv) operational risk – system/network failure, (v) operational risk – utilities failure, and (vi) operational risk – external threat to networks. In terms of Gilbert (1989) many banks overdrew their reserve accounts at the central bank during part of each business day as they process payments within the payment system; the central bank is concerned about the extent of this intraday credit because it does not charge interest on it though it provides overdraft facility to the banks who may overuse it; further it may be creditor to a failed bank if the latter fails when already overdrew the reserve account, or a sound bank may assume risk through participation in electronic transfer. Kar (2009) maintained that in any payment transaction there is a time lag between instruction and settlement; unlike cash transactions between two counterparties, the incident of the damage is not limited to only two parties, rather it affects all participants in the system including those not contributing to the damage in the forms of

1. **Credit Risk:** The risk that a counterparty will not settle an obligation for full value, either when due or at any time thereafter;
2. **Pre-Settlement or Replacement Cost Risk:** The risk that a counterparty to an outstanding transaction for completion at a future date will fail to perform on the settlement date leaving the solvent party with an unhedged or open market position or deny the solvent party unrealized gains on the position; the resulting exposure is the cost of replacing the original transaction at current market prices;
3. **Principal Risk:** The credit risk that a party will lose the full value involved in a transaction e.g. in the case of securities transactions the risk is that the seller does not receive payment after delivery of the security or the buyer does not receive the security after payment – here full value of the security or fund transferred is at risk; when principal risk arises in foreign exchange transactions it is called cross-currency settlement risk or Herstatt risk; it is also a major risk in the securities settlement system; it occurs during the settlement process wherein the transaction is completed by final transfer of securities from the seller to the buyer (known as delivery) and final transfer of funds from the buyer to seller (known as payment); during this stage, counterparties are exposed to credit risk / principal risk where the seller could deliver the securities but not receive payment and vice versa;
4. **Liquidity Risk:** The risk that a counterparty does not settle an obligation in full value when it is due, she may not be insolvent but may settle the obligation afterwards; it is certainly higher when transactions are settled on a gross basis between counterparties to the transactions; its magnitude risk may be larger in Module 1 of the delivery vs. payment system (DvP) with gross settlement of both legs;
5. **Settlement Risk:** The risk that the settlement in transfer does not take place as expected, it may assume the forms of credit risk or liquidity risk; again while providing protection against settlement risk and pre-settlement risk the central counter party (CCP) itself becomes exposed to credit risk and replacement cost risk; and concentration of such default risk in a single institution like

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

the CCP has the potential to disrupt the system's functions itself thereby placing all participants at another level of risk;

6. **Operational Risk:** The risk that deficiencies in information systems or internal controls could result in unexpected losses;
7. **Systemic Risk:** The risk that failure of a participant in a transfer system or financial market, to meet its obligations will cause other participants or financial institutions to be unable to meet their obligations when due; such a failure may cause significant liquidity or credit problems and as a result might threaten the stability of the financial system;
8. **Legal Risk**: The risk of loss because of unexpected application of a law or regulation or because a contract cannot be enforced; it also arises if the applications of laws and regulations are not clear; and
9. **Settlement Agent Risk:** The risk that the settlement agent which holds the cash accounts used for settlement purposes by participants in the system, may default preventing the depositor from accessing the funds derived from transactions; the risk is increased when all participants in the system opened accounts with the same settlement agent unless it is a clearing bank.

ADDRESSING RISKS AND LEGAL ISSUE

Risk Management in Payment System

As the apex bank of the country Reserve Bank of India (2912c) expressed interest in the payment systems on account of critical roles played by the payment systems with respect to financial stability, economic efficiency, monetary policy transmission and fiscal policy implementation. The same observed that an efficient payment system can promote financial stability and economic efficiency, at the same time it may induce and transmit risks in the financial systems; increased fraudulent activities which include attacks on IT infrastructure and delivery channels (cyber attacks), also pose significant risks to payment system providers; necessary measures to strengthen security have to be taken as such attacks are growing in scale and sophistication; this may also result in reputational risks to the payment system providers. Hence Reserve Bank of India (2012c) directed the banks to promote an enterprise risk management competence throughout the bank, including facilitating development of IT-related enterprise risk management expertise and establish a common risk management language that includes measures around likelihood and impact and risk categories and to integrate their risk management processes for its e-banking activities into their overall risk management approach. The same also prescribed that an information system auditor (IS Auditor) in a bank must define, adopt and follow a suitable risk assessment methodology in consonance with the focus on risks, to be addressed as a part of the overall Internal Audit Strategy and thus a successful risk-based IS Audit Programme can be based on an effective scoring system arrived at by considering all relevant risk factors.

Mitigation of Principal Risk component of Credit Risk

An important way described in Kar (2009) in which the principal risk is eliminated in securities transactions is through a mechanism known as Delivery versus Payment system (DvP) whereby a strong

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

linkage is created between the two legs of the settlement process and the system's procedures ensure that delivery occurs if and only if payments occur and the non-defaulting counterparty does not lose its principal either because of delivery of securities or payment of value; SSS adhere to one of the three approaches to DvP known as follows: Module 1 - here the securities as well as funds obligations in the transactions are settled continuously on a gross basis; Module 2 – it ensures that securities are settled on gross basis while funds are settled on the basis of net obligations between the system participants; Module 3 – it settles both securities and funds on a net basis; thus a strong linkage is created between delivery of securities and payment of funds.

Mitigation of Settlement Risk

In line with Bank for International Settlements (2011) Kar (2009) narrated the use and the existence of CCP who guarantee completion of settlement process; a CCP is an entity that interposes itself between counterparties to financial contracts, thereby becoming the buyer to every seller and the seller to every buyer; in this process, commonly known as novation, the original bilateral contracts between market participants are removed and replaced by a new contract with the CCP itself; by doing this in SSS, the CCP is in a position to guarantee funds to the seller of the security, that in the event the buyer defaults, it will pay the seller who fulfills the obligation of delivering securities to the CCP; similarly, the buyer is protected against default by the seller with the CCP providing the securities as long as the buyer fulfills the obligation of making payment to the CCP; in India in order to address settlement risk the mechanism of using CCP was introduced with the operationalisation of Clearing Corporation of India Limited (CCIL); in order to facilitate a smooth transition to the new mechanism, the settlement of government securities transactions was centralized at the Public Debt Office in Mumbai; with CCIL acting as CCP by novation, settlement guarantee was provided, thus reducing the occurrence of replacement cost risk or pre-settlement cost risk and also settlement risk; with this arrangement in place, the DvP Module 2 was adopted since February 2002 for settlement of transactions in government securities where securities are settled on a gross basis while funds are settled on the basis of multilateral net obligations; once this mechanism had stabilised, the DvP Module 3 arrangement was put in place from April 2004 with settlement taking place on the basis of multilateral net obligations for both securities leg (security-wise netting is done) and funds leg; due to the netting effect, the pressure on liquidity is also reduced in the system; under the CCP arrangement, members with obligations to deliver securities, will pay-in the securities to CCIL while the members with payment obligations will pay-in the funds to CCIL; thereafter, CCIL will pay-out the securities and funds to members who have a net receivable position in securities and funds, respectively; CCIL also ensures that its settlement guarantee commitment is honored by putting in place an arrangement for lines of credit with certain institutions for provision of both securities and funds, which will be accessed in case of default by any member to the CCIL; again after the establishment of the CCIL a major chunk of foreign exchange transactions are put through the CCIL arrangement and settlement takes place on the basis of multilateral netting obligations; this facilitates reduction in liquidity risk (as compared to the earlier gross settlement arrangements), replacement cost risk as well as settlement risk because CCIL has put in place lines of credit to facilitate settlement of both the INR leg as well as US$ leg.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Mitigation of Liquidity Risk

As per Reserve Bank of India (2012e) gross settlement in a real time mode eliminates credit and liquidity risks. In the words of Kar (2003) in the case of traditional settlement methods, incidence of liquidity risk was usually minimized through bilateral netting arrangements; multilateral arrangements for netting continued to be faced with the constraints mentioned earlier, till the Continuous Link Settlement (CLS) Bank arrangement was launched; under the PvP-based arrangement of CLS Bank, while settlement of trades takes place in the books of CLS Bank on a gross basis, the members need to fund their accounts on the basis of multilateral net short positions they are expected to have; further, in order to mitigate liquidity risk, the CLS Bank itself has committed lines of liquidity / funds with major banks for each currency; thus, in the event of a pay-in failure by any member, CLS Bank will use these liquidity facilities to complete its own pay-out obligations to the non-failing members in the required currencies thereby preventing systemic failures; in an RTGS system potential liquidity risk has to be addressed by both individual participants as well as the system; in order to facilitate better liquidity management (within the system) by the participants and also enhance the efficiency of transactions being settled; RTGS systems provide facilities such as Queuing Mechanism (under which pending payment instructions are temporarily kept within the system itself rather than being rejected for lack of funds in the paying bank's account), assignment and re-ordering of transaction priorities, interface with other systems from which the participant may be able to source additional liquidity, and so on.

Mitigation of Pre-Settlement Risk

Kar (2009) recommended use of a CCP locally in each country (as in the case of SSS) for settlement of transactions in specified currencies; by providing settlement guarantee, the CCP provides protection against pre-settlement risk or replacement cost risk.

Mitigation of CCP Risk

Regarding transactions in government securities, as per Bank for International Settlements (2011), all participants need to open subsidiary general ledger (SGL) account and use the securities in their SGL account to provide collateral and contributions to the settlement guarantee fund maintained by CCP to facilitate the guaranteed settlement of government securities transactions; this fund is used for CCP-related risk management; if a member defaults, its contribution to the fund is utilized. As per Kar (2009) the default risks facing a CCP may be mitigated by adoption of extensive risk management policies and practices by CCPs including membership criteria, extensive use of collateral and their valuation, margining requirements, committed lines of credit, etc; CCIL minimizes concentration of risks on itself by adoption of various risk management practices including membership criteria, maintenance of collateral pool, margining, mark-to-market of collateral, etc.

Mitigation of Credit Card Fraud Risk

Similar to the way, as happened in Australia reported by Bank of International Settlement (2011), this risk is taken care of nowadays by one-time password and immediate message to the registered mobile number after transactions.

Table 1. Risk Management of payment system

Country	Liquidity Risk Management	Credit Risk Management	Operational Risk Management
Afghanistan	No	No	No
Bangladesh	No	No	No
Bhutan	No	No	No
India	Yes	Yes	Yes
Maldives	No	No	No
Nepal	Yes	Yes	Yes
Pakistan	Yes	Yes	Yes
Sri Lanka	Yes	Yes	No

Sources: The references mentioned in the previous paragraph

Based on Bank for International Settlement (2004), Kar (2009), Reserve Bank of India (2012e), Maldives Monetary Authority (2011), Nepal police (2016), Mcquerry (2015), Bangladesh Bank (2014), International Business & Technical Consultants. (2016) and State Bank of Pakistan (2012), Table 1 shows the risk management in the payment system in the SAARC members.

(CRIMINAL) ECONOMICS OF HACKING: SAARC COUNTRIES

In criminology there are standard theories like strain theory, social learning theory, social control theory, labeling theory and theory of biology, genetics, and evolution. The rational choice theory applies to both criminology and economics (Akers, 1991). As per this literature, if hacking benefits, the cost of hacking over the benefit deters (Ulen, 1991). The compatibility between rational choice to hack and the legal state of India relative other SAARC members is examined below.

Axiom IA

First let us consider safe access to internet (SATI) as a digital good, which is measured in terms consumption of megabytes (MB). All other goods the consumer who is a *Homo Economicus* here used to working with computer and SATI in daily life, consumes are bundled into a composite good G, the good that need to be given up in order to consume a positive quantity of internet. Let us distinguish between hacker and non-hacker. A homo economicus, who hacks is not a consumer. A homo economicus, who does not hack is a non-hacker or consumer. The price per MB facing a consumer is positive. For a consumer law of demand works for all goods.

Axiom 1B

Homo Economicus has right to privacy to access of internet to the extent of the specified megabytes she paid for.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Axiom 1C

One *Homo Economicus* can violate a right of another *Homo Economicus*. Law of demand does work on SATI for a hacker because it is rational for a hacker not to pay a positive price for SATI.

Corollary IA

In light of the Rational Choice Theory *Homo Economicus* can make utility analysis where demand may be derived from utility and there exists a marginal utility function as per Jeevons as described in Stigler (1950) and there also exists consumer equilibrium in terms of equality of the ratios of marginal utility to price of all goods in terms of Gossen also described in Stigler (1950).

Corollary 1B

Violation of one's right by another *Homo Economicus* is an infringement-offence.

Corollary 1C

A *Homo Economicus* commits an offence when the benefits therefrom exceeds the legal costs (Becker, 1974).

Axiom II

Use of SATI happens with low intensity or high intensity. Low intensity SATI consists of entertainment, personal non-enterprise email browsing, occasional networking and some utility services like online shopping, online bill payment etc.

High intensity SATI happens at enterprise level, research and development and continuous networking.

Corollary II

Axiom II implies the indifference curve of *Homo Economicus* would be convex with diminishing MRS at low intensity use of SATI and may be concave with increasing MRS at high level of use.

Axiom II

In the low intensity level SATI is a normal good. Demand for SATI varies inversely with price but positively with income.

In the high intensity level of use of SATI behaves like an inelastic good when price increases but like an inelastic good when price decreases. The marginal utility of SATI here is increasing at an increasing rate.

Axiom III

There is a market for SATI in the sense that there are demand for SATI and supply of SATI. Increase in real price of SATI means fall in demand *vice versa* attributable to low intensity users.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Corollary III

An increase in real price of SATI *ceteris paribus*, causes shrinkage in the equilibrium consumption bundle of *Homo Economicus* and *vice versa*.

Axiom IV

A common meaning of hacking in laws of different countries is unauthorized access to computer or data. An act of hacking for the purpose of fame or greed deprives *Homo Economicus* of the use of SATI for which *Homo Economicus* already paid the price. Different ways of hacking and hackers' markets are described in Leeson and Coyne (2015). This study distinguished between three types of hacking - (i) good hacking, (ii) fame-driven hacking and (iii) profit-driven hacking (PDH).

Corollary IV

PDH increases the real price of SATI facing *Homo Economicus* because more is o be paid on internet security.

Axiom V

PDH benefits the hacker by providing extra purchasing power, e.g. transfer of money from hacked internet banking account or getting information from hacked email account for the purpose of espionage.

Corollary V

PDH reduces the purchasing power of the victim.

Axiom V

PDH generates negative externality to *Homo Economicus* in the form of infringement upon his private right to access to internet. The concept is taken from Eatwell, Milgate and Newman (1987).

Corollary VI

PDH causes hike in real price of SATI facing *Homo Economicus*. if similar PDH continues to happen with more than one consumers of internet access, PDH will create distortion in a market that may be otherwise competitive primarily through affecting the consumer demand schedule via shortening the intercept, i.e. autonomous demand, which is not sensitive to price and demand.

Theorem

It may be deduced from Corollary 1C and Corollary VI, the administration (consisting of law and enforcement) need to make legal costs higher than benefits of PDH facing the hacker such that the consumer need not revise her pricing. The proof is in the Appendix.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Table 2. Penalty for computer hacking

Country	Law	Maximum Penalty	Provision for Bail at least in some cases
Afghanistan	None	None	
Bangladesh	Information and Communication Technology Act 2006	Either or both of three-years imprisonment and fine three lac taka	Yes
Bhutan	None	Crimila Lw of the Peoples' Republic of China 1997	No
China		Death (The Guardian, 1998)	No (Permanent Mission of the People's Republic of China, 1979)
India	Information Technology Act 2008	Either or both of three years and fine two lac rupees	Yes
Japan	The Code of Criminal Procedure (Act No. 131 of 1948)	Life Sentence (Mctague, 2014)	No
Maldives	None		
Nepal		Fine Rs 3 lacs or five-year imprisonment	
Pakistan	Prevention of Electronic Crimes Ordinance 2007	Either both of five-years imprisonment or five lac rupees	Yes
Sri Lanka	Computer Crime Act No 24 of 2007	one lac rupees, five-years imprisonment or both	No

Evidence: The maximum punishment for hacking in India is three years, fine two lac rupees or both as per the Information Technology Act 2008. Hacking is a bailable offence in India. In Pakistan the Prevention of Electronic Crimes Ordinance, 2007 is bailable except for the offences liable to imprisonment of seven years or more. In Bangladesh it is a bailable offence as per the Information and Communication Technology Act 2006. The maximum penalty is imprisonment of three years or three lack taka or both. As per the Computer Crime Act 2007 of Sri Lanka, the maximum penalty for the non-bailable offence may be one lac rupees, five-years imprisonment or both. In Nepal, as per the Electronic Transactions Act 2063, 2006, the maximum penalty for the non-bailable offence may be two lac rupees, three-years imprisonment or both. There seems to be no specific penalty for hacking in Bhutan (Oh and Lee, 2014). Maldives and Afghanistan are yet to have one. In China it is death sentence (The Guardian 1997). Outside SAARC, the strictest punishments are observed in China and Japan.

In terms of Table 2 India is the softest among those SAARC member countries having specific legal provisions against hacking.

Mitigation of Foreign Exchange Settlement Risk

Kar (2009) mentioned efforts of various international agencies, including central banks, paid-off in the form of Payment versus Payment (PvP) settlement effected through CLS Bank; in order to enable PvP-based settlement then in seventeen currencies arrangements were done to ensure that settlement take place through the RTGS systems in the countries of those currencies, with the pay-in first made

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

by all the settlement members into the account of the CLS Bank and then CLS Bank makes the pay-out subsequently to the accounts of the members who have to receive those currencies.

Addressing the Legal Issue

Reserve Bank of India (2012d) observed a major initiative towards integration of trade and finance over the globe through e-commerce is the United Nations Commission on International Trade Law (UNICITRAL)'s Model law, which was adopted by the General Assembly of United Nations and has been recommended to the member nations for consideration while revising / adopting their laws of electronic trade; Government of India has enacted the Information Technology Act, 2000 in order 'to provide legal recognition for transactions carried out by means of electronic data interchange and other means of electronic communication, commonly referred to as 'electronic commerce'…the Act, which has also drawn upon the Model Law, came into force with effect from October 17, 2000; the Act has also amended certain provisions of the Indian Penal Code, the Indian Evidence Act, 1872, the Bankers Book of Evidence Act, 1891 and Reserve Bank of India Act, 1934 in order to facilitate e-commerce in India; however, this Act will not apply to (i) a negotiable instrument as defined in section 13 of the Negotiable Instruments Act, 1881, (ii) a power-of-attorney as defined in section 1A of the Power-of-Attorney Act, 1882, (iii) a trust as defined in section 3 of the Indian Trusts Act, 1882, (iv) a will as defined in clause (*h*) of section 2 of the Indian Succession Act, 1925, (v) any contract for the sale or conveyance of immovable property or any interest in such property and (vi) any such class of documents; again the 4th Schedule to the Information Technology Act, 2000 has amended the Reserve Bank of India Act, 1934 empowering RBI to regulate electronic funds transfer between banks, and between banks and other financial institutions.

FURTHER RESEARCH DIRECTION

Padmanabhan (2012) pointed out that generally the credit card issuers are not liable for fraudulent transactions unless the customer reports the unauthorized transactions immediately; so the shift in liability from customers to banks comes into effect only after the customer informs the bank; banks argues that they take adequate steps to ensure safety of card transactions, and the least they expect from the customer is to report the card loss immediately; here this issue is the protection of a customer adhering to all the risk measures prescribed by the bank, but yet unauthorised transactions took place in her account. In this context Reserve Bank of India (2012d) held on a similar view that even though, the Information Technology Act, 2000 has provided for penalty for denial of access to a computer system (Section-43) and hacking (Section – 66), the liability of banks in such situations is not clear. The same pointed out that the Information Technology Act, 2000 in its Section 72 has provided for penalty for breach of privacy and confidentiality and Section 79 of the Act has also provided for exclusion of liability of a network service provider for data traveling through their network subject to certain conditions; thus, the liability of banks for breach of privacy when data is traveling through network is not clear; this aspect needs detailed legal examination and at the same time the issue of ownership of transactional data stored in banks' computer systems also needs further examination.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

CONCLUSION

This study analyzed the risks embedded in the payment system and e-banking systems in India It covered various risks in the payment systems, their management and how to mitigate the same based on the reports and guidelines distributed by the Reserve Bank of India and Bank for International Settlements. It made a comparison among the SAARC members with respect to management of credit risk, liquidity risk and operational risk in the payment system. In the axiomatic frame it examined the motive of rational hackers depending upon the legal state of affairs in the SAARC member countries. The author is of then opinion that India, Pakistan and Nepal are stronger in managing all of aforesaid risks in their payment systems relative to the rest and (ii) India is the most permissive by nature as to the crime of computer hacking.

ACKNOWLEDGMENT

APPENDIX

Let us consider a two person single good economy, where one is a consumer and the other is a hacker. The good is SATI with a positive price. When price per MB reduces by one unit, the demand of a consumer for SATI increases by, say, b_1 following Axiom 1A and the demand of a hacker for SATI increases by b_2 following Axiom 1C, where $1 > |b_2| > |b_1| > 0$, i.e. a hacker tends to buy more when price reduces and vice versa because through she may obtain free quantities of the good. Again as per Axiom IA the law of demand holds for a consumer but does not for a hacker. Hence $b_1 < 0$ and $b_2 > 0$.

If autonomous demand of the consumer and the hacker are respectively a_1 and a_2, where a_1, $a_2 > 0$ and the supply is assumed, for the purpose of simplicity, fixed at S, the autonomous net supply is $NS = S - a_1 - a_2$. In equilibrium the aggregate net demand:

$$\left(b_1 + b_2\right)p = NS \Rightarrow p = \frac{NS}{b_1 + b_2}$$

where the denominator is positive.

Expanding the above expression yields:

$$a_1 + a_2 + b_1(p) + b_2(p) = S$$

rearranging and rewriting of which results in:

$$\left\{a_1 + b_1(p)\right\} + \left\{a_2 + b_2(p)\right\} = S, \text{ i.e. } D_1 + D_2 = S$$

where D_1 and D_2 are demand functions of the consumer and the hacker respectively:

$$D_1 \Rightarrow q = a_1 + b_1(p), \text{where} \frac{dq}{dp} = b_1 < 0$$

and:

$$D_2 \Rightarrow q = a_2 + b_2(p), \frac{dq}{dp} = b_2 > 0$$

as per Axiom 1A.
Hence is the proof.

Chapter 86
The Role of Culture in IT Governance Five Focus Areas: A Literature Review

Parisa Aasi
Stockholm University, Sweden

Lazar Rusu
Stockholm University, Sweden

Dragos Vieru
TELUQ University Montreal, Canada

ABSTRACT

Information technology governance (ITG) is one of the top challenges of managers today and culture in different level can have an important role while implementing IT governance. This is a new and significant issue, which has not been investigated deeply. This paper sets out to provide a systematic review of the literature, focusing on the role of culture in IT governance. The literature review findings are categorized through the lens of IT governance's five focus areas which are IT strategic alignment, IT value delivery, Risk management, IT resource management and Performance measurement. This study contributes to the field of IT governance by reviewing and discussing the existing literature on the role of culture on IT governance. This literature review resulted that there are few research studies in this topic and many of the IT governance focus areas are not covered regarding the role of culture in these IT governance areas.

INTRODUCTION

In the current competitive business environment, the enterprises are greatly depending on the use of IT to create value for their business (Debreceny & Gray, 2013; De Haes et al., 2016). Information technology is potentially the key driver of economic capital in the 21st century and it is even changing the industries (Benbasat & Zmud, 2003; ITGI, 2003; Crowston & Myers, 2004; Sueyoshi & Goto, 2013; Workman,

DOI: 10.4018/978-1-7998-1760-4.ch086

2014; Venkatesh et al., 2016). Hence, IT governance, which deals with decision rights and responsibilities of people working with IT for gaining value from IT (Weill & Ross, 2004), is one of managers' top concerns (ITGI, 2003; ISACA, 2011). IT governance is strongly linked with the corporate governance. Corporate governance defines the division of power and wealth in the corporation. Corporate governance is influenced by culture (Licht et al., 2005) and consequently culture is a very important influencing issue in IT governance as well. There are many different uses of the term "culture," such as shared forms, ideas, symbols, values, ideologies, rules and collective norms and patterns, and, of course culture is not unique in this way and many definitions and aspects of it exist (Alvesson, 2012).

In fact, culture is blamed in many cases when IT governance fails to deliver value to the business (Kingsford et al., 2003). Culture should be considered with its both possible inhibiting and supporting effects on IT governance implementation (Ke & Wei, 2007). Still, there is a lack of research concerning the link between culture and IT governance. Therefore, this study aims at performing a systematic literature review on the relationship between culture and IT governance and to providing a future research agenda.

The role of IT within organizations is changing from an operational role to a more strategic one and this consequently stresses the need to make sure that IT is properly governed (Lunardi et al., 2013; Bergeron et al., 2015). IT governance is involved in the relationship between the ownership and control structures of the firm and IT performance (Ferguson et al., 2013). Successful implementation of ITG is a challenge for managers and yet we know very little about that (Debreceny, 2013, Jairak et al., 2015). It has also been suggested that culture plays an important role in the implementation and use of IT in organizations (Walsham, 2002). Culture has been often recognized as one of the impact factors when failures happen in IT implementation in organizations. With its potential constructive or catastrophic effect on organizations' management and operations culture should be reflected by managers while implementing IT governance (Dittes &Smolnik, 2016).

The literature on management shows that national and organizational cultures can affect companies' performance and there is a need for greater number of studies on the interdisciplinary fields that bridge IT and organizational studies and identify how they interact with each other. In the current dynamic work environment, both technological and institutional contexts should be considered to understand how organizations are operating (Orlikowski & Barley, 2001; Kingsford et al, 2003; Leidner & Kayworth, 2006; Kappos & Rivard, 2008, Orlikowski et al., 2016). Leidner and Kayworth (2006) believe that culture is a crucial dynamic, which explains the interaction among the social groups and IT in an organization. Claver et al. (2001) also states that the improvements in the organizational culture are required when organization are seeking to boost their information systems efficiency. Organizations need to match their technology with their organizational environment to achieve the optimized value from their IT (Hester 2013).

Additionally, when implementing IT governance, it is very challenging to respond to different technical, environmental and business changes. The speed and direction of change reaction in organizations influence the way a firm creates competitive advantage and deals with the new business environment challenges such as control and efficiency (Ventris, 2004; Harison and Boonstra, 2009; Chen et al., 2014). Laudon and Laudon (2007) argue that technology, task, structure and people are linked with each other and therefore changes in one of them influence the other three. The new technology used successfully by one company, may face failure in another due to organizational resistance to it and to differences in organizational cultures. However, the relationship between IS and culture remains a challenging topic for researchers and practitioners (Kappos & Rivard, 2008). It is considered that the gap spotting is a first

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

step towards a legitimate and fruitful approach to motivate the undertaking of a future theory development effort (Rivard, 2014) and this is the motivation for this literature review.

The aim of this study is to conduct a systematic literature review (Webster & Watson, 2002) of the relationship between culture and IT governance. Using the lens of IT governance five-focus areas framework, this study seeks to find traces of culture in each of these areas of IT governance in previous research.

The rest of the paper is structured as follows. Section two presents the theoretical background of the relevant literature on IT governance and culture. Section three discusses the research methodology followed by section four that presents the outcomes from the literature review. The last two sections present Discussions, Conclusions and Future research.

THEORETICAL BACKGROUND

An Overview of Culture

National Culture

According to Hofstede (1984), the culture of a society called the "national culture" is defined as the shared values, understandings, assumptions and goals that exist in the current society and have been learnt from earlier generations. This culture gives directions to the way of living, communication, life and work standards and expectations of the person (Dressler, 1976).

Rauch et al. (2013) indicates that different national cultural contexts are related to various issues, even to the degree of innovation and growth in firms. According to Deresky (2011), it is a critical skill for managers of organizations to have an understanding of the national culture of the environment in which they are running their business, especially when organizations operate globally. Different researchers have developed various frameworks for studying and understanding national culture and it has been assessed by both values and practices (i.e. Hofstede, 2001; Javidan & House, 2001; Gupta et al., 2002).

Organizational Culture

Organizational culture is the object of many studies in relation to its definition, its effects on organizations' success or failure, and its formation and influential factors (Schein, 2009; Alvesson, 2012). Organizational culture is expressed from two aspects: 1) practices and values and 2) behavior and beliefs. Organizational culture can be defined as the specific ways that an organization behaves over a period of time (Kostava, 1999). The organization's work practices define the organization's knowledge and competence, while organizational values and norms weave a belief system (organizational culture) by which organizational members make sense of their actions (Vieru & Rivard, 2014).

Cameron and Quinn (2011) have developed a strategy for measuring organizational culture by adapting both quantitative and qualitative approaches. They propose the Organizational Culture Assessment Instrument (OCAI), a six-dimensional model of organizational culture based on the Competing Values Framework previously introduced by Quinn and Rohrbaugh (1983). Another worth noting model is the "X Model of Organization Culture" developed by Smit et al. (2008). This model categorizes the organizational culture elements into five clusters named: leadership, strategy, adaptability, coordination and relationship. Choo (2013) proposes a typology called "information culture" and counts it as analogous

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

with organizational culture. Information culture is similar to organizational culture but with a distinctive focus on the cultural norms, values and behaviors regarding the way information is perceived, used and managed in an organization. Additionally, according to Kappos and Rivard (2008) there may even be subcultures within an organization related to the norms and values shared among its subunits. Guzman and Stanton (2009) also note the important role of cultural fit to subunits in the organizations. They suggest that the cultural fit of the employees working with IT occupations influences the IT performance.

An Overview of IT Governance

IT Governance Definition

According to Wilkin and Chenhall (2010) and Zarvić et al. (2012), the term "IT governance" appeared for the first time in research during the 1990s. Loh and Venkatraman's (1992) work is one of the first studies to use the concept of IT governance, pointing out that IT governance is starting to be acknowledged as a significant part of IT strategy.

IT governance is strongly linked with the corporate governance (Licht et al., 2005). Van Grembergen and De Haes (2009) also state that "enterprise governance of IT governance is an integral part of corporate governance" (p. 4). Corporate governance is defined as the division of power and wealth in the corporation and the system through which the organization is controlled and directed (Van Grembergen & De Haes, 2009). The link between the corporate governance and IT governance was found to be that important that the International Organization for Standardization (ISO) has created a specific standard (ISO/IEC 38500:2008) for corporate governance of IT. It defines the guidelines for preferred behavior in corporations to guide the IT decision making.

Van Grembergen (2007) defines IT governance as "the organizational capacity exercised by the board, executive management and IT management to control the formulation and implementation of IT strategy and in this way, ensure the fusion of business and IT" (p.1).

This study adopts Weill and Ross' (2004) definition of IT governance which represents the ensemble of decision rights and responsibilities of organization members implementing and using IT for gaining value from IT.

IT Governance Focus Areas

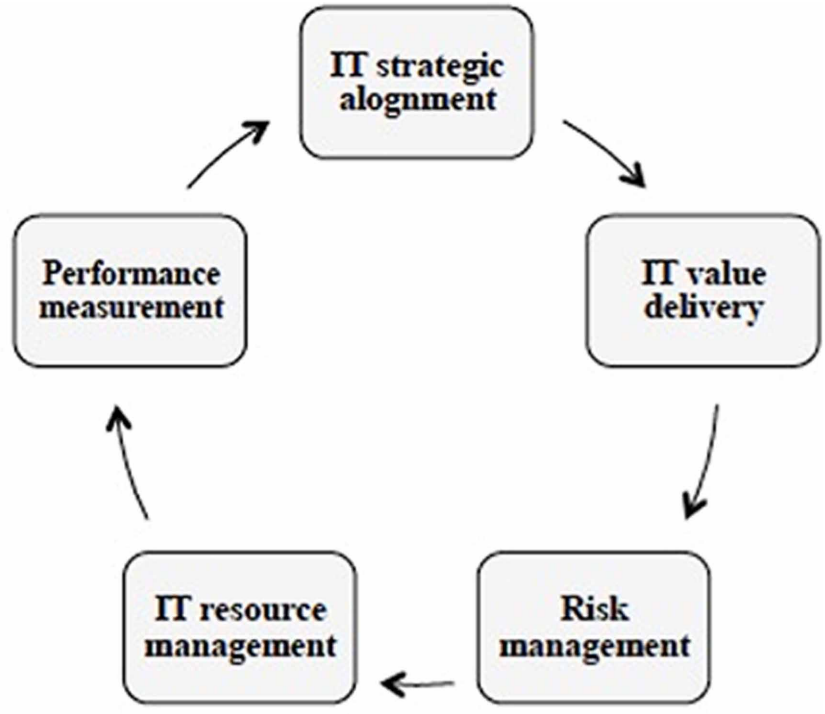
There are five focus areas for IT governance identified by the IT Governance Institute (ITGI, 2003): Strategic Alignment (SA), Resource Management (RM), Performance Measurement (PM), Value Delivery (VD) and Risk Management (RK). The five focus areas of IT governance are based on the stakeholders' values. The first three (strategic alignment, resource management and performance measurement) are considered as drivers and the other two (value delivery and risk management) are outcomes. Most of the IT governance models, frameworks, standards and structures consider these five focus areas during IT implementation (ITGI, 2003) and this is the reason for this research to choose this practical approach of IT governance in reviewing and categorizing the literature.

The ITGI (2003) defines each criterion as follows:

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

1. **IT Strategic Alignment:** Ensures a linkage between business and IT plans, defines, maintains and validates IT value propositions and aligns IT and enterprise operations. The main concern relates to the linkage of enterprise business and IT plans with operations.
2. **IT Value Delivery:** Deals with the execution of the value propositions through the delivery cycle, makes certain that IT delivers the promised benefits vs. the strategy. The main concern is optimizing costs and proving the intrinsic value of IT throughout the delivery cycle.
3. **Risk Management:** Ensures risk awareness by senior officers in the organization, a clear transparency and understanding of the organization's desire for significant risk and compliance requirements and embedding of risk management responsibilities in the organization. The main concern is to do with embedding accountability to mitigate significant risks.
4. **IT Resource Management:** Ensures optimal investment and proper management of critical IT resources: applications, information, infrastructure and people. The main concern regarding optimizing knowledge and infrastructure. The IT resource management area overlays all the other four areas.
5. **Performance Measurement:** Tracks and monitors implementation of strategies and projects. This also applies to the use of resources, performance of processes and delivery of services. An example is the use of a Balanced Score Card (BSC), which translates strategies into action for achieving goals that are measurable beyond conventional accounting. Key issues relate to setting and monitoring strategies and services (Figure 1).

IT governance is a continuous life cycle that can be entered at any point. Usually the organizations start with the strategic alignment and after that they start the implementation and then delivering value from IT. The risks should be identified and addressed, the performance needs to be measured, and the strategy should be monitored regularly. ITGI (2003) states that IT governance does not occur in an isolated place and it is influenced by the environment that it is taking place in and this environment is at the same time influenced by some factors such as: "stakeholder values; the mission, vision and values of the enterprise; the community and company ethics and culture; applicable laws, regulations and policies and industry practices" (p. 21). This highlights the significant role of environmental factors such as culture in the focus areas of IT governance.



RESEARCH METHODOLOGY

To conduct this literature review we followed the following steps: (1) identified keywords; (2) found the literature examining the topic; (3) selected and filtered the relevant studies; (4) organized the findings; and (5) summarized the findings from literature and categorized them (Creswell, 2011). The six-stage technique suggested by Punch (2014) was used to search for pertinent articles:

1. Using Boolean logic for key terms
2. Using phrase searching
3. Using proximity operators
4. Using truncates and wildcards
5. Determining database fields
6. Limiting searches

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 1. Five Focus Areas of IT Governance (Adapted from ITGI, 2003)

In order to prevent having an unmanageable number of articles with limited value, we decided to bind the sample articles to those significantly investigating both culture and IT governance (any aspect of five focus areas of IT governance). The concept of IT governance has received more attention from researchers and practitioners after 2000 and particularly the research literature in this topic in relation with culture is very recent. Therefore, we have considered the research literature published between years 2000 and 2016 for this research. We have focused to find the studies that have the culture and IT governance relationship, role or influence as their significant research question and results. Using the above strategy, the literature search was first conducted by accessing the databases of Business Source Premier, Science Direct, IEEE Explore, AIS and ACM digital library. Then a similar search was done in the leading journal volumes such as MISQ, MISQE, IJITBAG and IJIS and related conference proceedings, such as ICIS, HICSS and AMCIS. Duplications were found and removed.

Based on a search for combinations of keywords such as “culture”, “IT governance”, “IT strategic alignment”, “IT value delivery”, “IT risk management”, “IT resource management” and “IT performance”, we initially found 167 articles in culture and ITG (15 in culture and SA, 70 in culture and RM, 4 in culture and PM, 20 in culture and VD and 58 in RK). To be included in the review, an article had to meet two criteria. First, culture had to be the significant focus of the study and part of hypotheses, theoretical lens, findings and conclusions. Second, IT governance (in one or more of its five focus areas) had to be another topic examined by the article and it had to be in a relationship with one of the concepts related to culture. The articles in which culture was only briefly mentioned, or that were not focusing on IT governance were excluded.

Figure 2. Theoretical Approach on the Role of Culture in IT Governance Five Focus Areas

Considering the above criteria, the initial number of articles found were refined by reading their abstract first and if needed, their results, methodologies and eventually the full text. This process resulted in a sample of 15 articles that were reviewed to determine their methodological approach, type of culture and levels (national, organizational or subunit), area of IT governance, and key findings. We used Webster and Watson's (2002) concept-centric approach for writing the literature review. Figure 2 illustrates the analytical tool that this study used to seek evidence of cultural impacts on IT governance in the extant literature.

LITERATURE REVIEW OUTCOMES

A Taxonomy of the Cultural Concepts and Terms Used by the Reviewed Papers

The literature review was conducted using the lens of five focus areas of IT governance for categorizing the cultural impacts on each of them. A taxonomy of the cultural concepts and terms was defined and used to present the cultural issues in the selected literature (Table 1). This taxonomy contains the classification of cultural values defined by various authors and specifies the reference for those concepts and their cultural level (organizational/national). After reviewing the literature, a concept matrix was provided to represent the findings of each article related to each of the five focus areas (Table 2). The concept matrix as the result of this literature review summarizes the information on each article, including its author(s), studied culture level and methods and findings, which are clustered through the five focus areas of IT governance.

Table 2 provides the categorization of the reviewed papers based on the studied focus area of IT governance and the level of culture used.

As represented in Table 2, there are only 15 research studies concerning culture and IT governance. Four out of five focus areas received more attention from the research literature and there was only one paper found to investigate briefly the role of culture on the risk management area of IT governance.

Table 1. A Taxonomy of Cultural Concepts and Terms Used in the Reviewed Papers

Taxonomy of cultural concepts and terms used in the reviewed papers				
Cultural value-dimension	**Reference**	**Level of analysis**	**Description of values**	**Reviewed Papers**
Bases of truth and rationality	Detert et al., 2000	Organizational	Determines the degree to which the employees believe something is true or not and how they find it in an organization.	Rowlands et al., 2015
Nature of time	Detert et al., 2000	Organizational	The concept of time is dealing with the organization long-term planning, strategic planning and goal settings.	Rowlands et al., 2015
Motivation	Detert et al., 2000	Organizational	Motivation defines what motivates the employees in an organization.	Rowlands et al., 2015
Orientation to change	Detert et al., 2000	Organizational	The degree to which the individuals in an organization are open to change or take risks which is linked with innovation.	Rowlands et al., 2015
Orientation to work	Detert et al., 2000	Organizational	The certainty of work in human life and the balance between work as a production activity and as a social activity.	Rowlands et al., 2015
Isolation versus collaboration	Detert et al. 2000	Organizational	Deals with how employees work, alone or collaboratively.	Rowlands et al., 2015
Control, coordination, responsibility	Detert et al., 2000	Organizational	The degree to which control is concentrated or shared in an organization.	Rowlands et al., 2015
Orientation and focus	Detert et al., 2000	Organizational	The nature of the relationship between organization and its environment. The organization may have internal or external orientation in relation with its environment.	Rowlands et al., 2015
Institutional collectivism	House et al., 2004	Organizational	Institutional collectivism has been defined as the extent to which organizations are perceived to encourage and reward collective distribution of resources and collective action	Gu et al., 2014
Positive work environment	Howell and Shea, 2001	Organizational	Project champions in product development projects can add to the creation of a positive work environment	Gu et al., 2014
Leadership risk tolerance	Thamhain, 2004	Organizational	Leadership risk tolerance can be defined as the way management communicates the organization's tolerance to accept risk taking in projects	Gu et al., 2014
Results orientation	Greaver, 1998	Organizational	Focusing efforts on the results instead of the activities. In this way, the customer and the supplier should have a common purpose	Gu et al., 2014
Innovation and risk taking	Robbins et al., 2009	Organizational	The degree to which employees are encouraged to be innovative and take risks	Erasmus et al., 2012
Attention to detail	Robbins et al., 2009	Organizational	The degree to which employees are expected to exhibit precision, analysis and attention to detail.	Erasmus et al., 2012
Outcome orientation	Robbins et al., 2009	Organizational	The degree to which management focuses on results or outcomes rather than the techniques and processes used to achieve these outcomes.	Erasmus et al., 2012
People orientation	Robbins et al., 2009	Organizational	The degree to which management decisions take into consideration the effect of outcomes on people within the organization	Erasmus et al., 2012
Team orientation	Robbins et al., 2009	Organizational	The degree to which work activities are organized around teams rather than individuals	Erasmus et al., 2012
Aggressiveness	Robbins et al., 2009	Organizational	The degree to which employees are aggressive and competitive rather than easy-going	Erasmus et al., 2012

Risk management is one of the important aspects of ITG that can improve the ITG implementation. The reason that previous researchers have not done any investigation specifically on the role of culture on ITG risk management can be that at the current stage there is more emphasis from the practitioners' side on the role of culture in other ITG focus areas. Additionally, the researchers with a corporate governance perspective have studied risk management previously, which can be linked to risk management in IT governance. This can explain why there is not much research on culture and IT governance focus areas.

Role of Culture in IT Value Delivery

The value delivery focus area of IT governance deals with the benefits from IT through the business strategy and considers issues such as the costs of IT in the IT project cycles and how IT can provide solutions to reduce the costs and create more income for the business. Four studies were found that mentioned the role of culture in this focus area of IT governance: two with a national culture and two with an organizational culture point of view. Figure 3 summarizes the organizational or national culture factors influencing ITG value delivery mentioned by the reviewed literature.

Zhong et al. (2012) use the terms IT governance performance and IT value delivery interchangeably and discuss both the value delivery and performance measurement of IT in their paper. The authors indicate that ITG represents a combination of IT resources and complementary organizational resources, such as human resources and their cultures, which makes the firm capable of IT value creation and propose that national culture provides the complex structural, functional and social coordination through which the degree of IT value delivery is moderated. In their case study, Nugroho and Surendro (2011) suggest that clan organizational culture is key to the successful implementation of IT governance polices, especially in data management. The clan organizational culture brings more commitment of leadership and makes the organization focuses more on the loyalty of the employees, a friendly workplace and teamwork. The authors found that organizational culture is influential in designing IT governance and creating value from IT. In another study, Satidularn et al. (2011), emphasize the role of organizational culture in relation to how IT governance practices and structures are designed. The authors found that a strong organizational culture with a high degree of integrity, responsibility, accountability and ethical behavior may lead the studied firm to monitor and pay attention to IT governance. Finally, Prinz (2015) suggests that the national culture related concepts of worker participation, supervision, feedback, and rewards system have an influence on IT governance value delivery.

Figure 3. Organizational Culture or National Culture Factors Influencing ITG Value Delivery

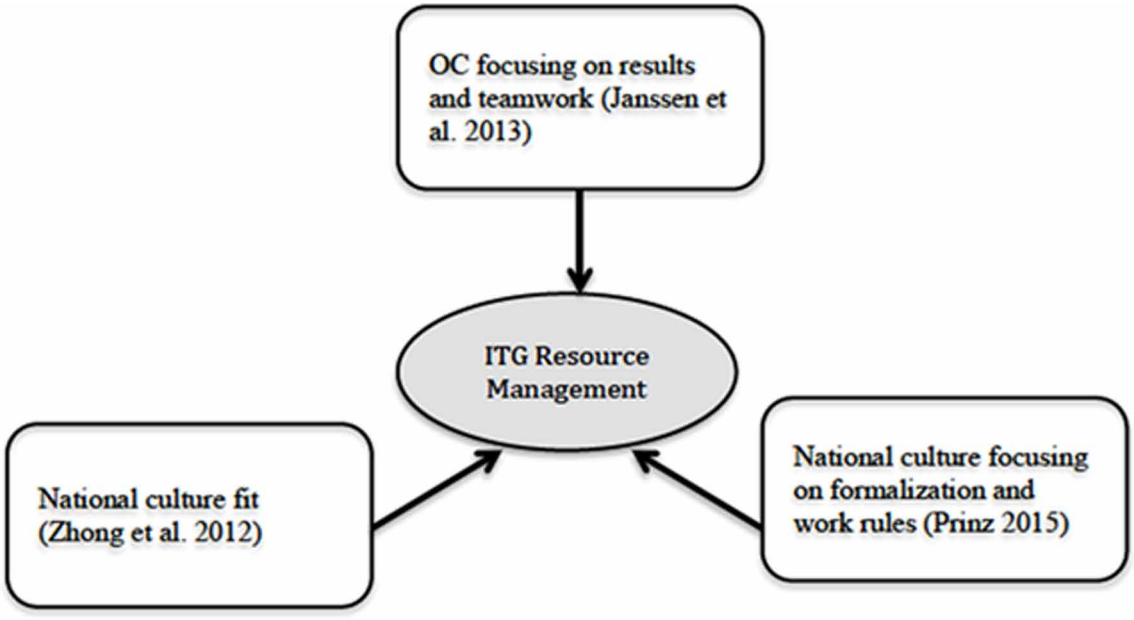
Figure 4. Organizational or National Culture Factors Influencing ITG Resource Management



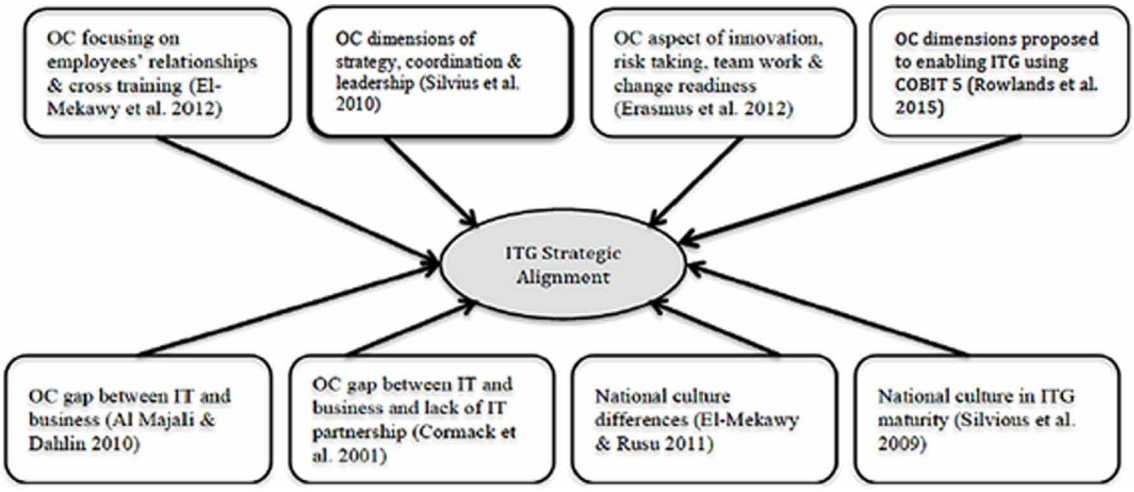


Figure 5. Organizational or National Culture Factors Influencing ITG Strategic Alignment

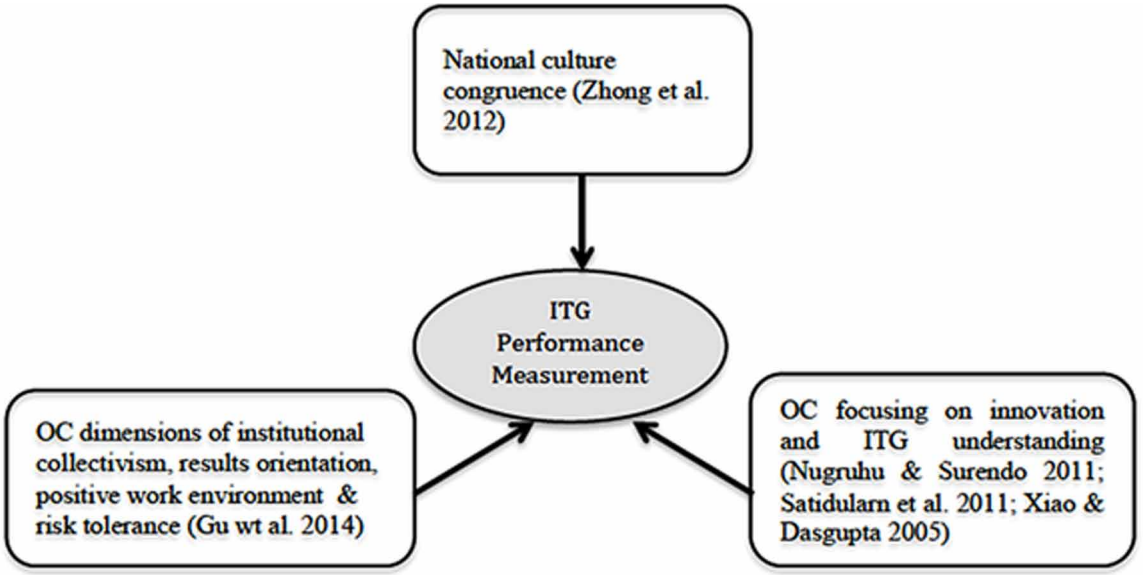

Role of Culture in IT Resource Management

Information technology resource management deals with the management of and investment in the IT resources, including people, applications, hardware and data. Among the reviewed literature in this area, three studies focus on the role of culture in IT governance. One of them uses an organizational culture perspective and the other two adopt a national culture perspective. Figure 4 summarizes the organizational or national culture factors influencing ITG resource management mentioned by the reviewed literature.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 6. Organizational Culture or National Culture Factors Influencing ITG Performance Measurement

According to Janssen et al. (2013), an organization with a cultural focus on results and team work tends to implement simple structures of IT governance and simple decision-making processes, uses more efficiently their IT resources and integrates better its organizational knowledge. The authors suggest that in the organizations that value individual work, there is less teamwork, the structures are more complex and the decision-making will be more difficult, slow and bureaucratic. This type of culture causes less participation of business executives in the IT governance model, less interaction between areas and different resources and therefore less optimized IT resource management. Prinz (2015) focuses on how national culture influences IT governance. The author found that worker participation, supervision, feedback, rewards, formalization and work rules have an impact on IT governance resource planning. Zhong et al. (2012) conceptualize IT governance as a set of firms' resources and discuss IT governance integration under the national culture influences. According to them, a combination of structural, functional, social capabilities and moderation of culture fit leads to improvements in firms' specific IT resources.

Role of Culture in Strategic Alignment

The strategic alignment focus area of IT governance aims to ensure that IT and business plans are linked with each other, both sides understand each other, and business and IT operations are aligned. The review of the literature produced seven papers that had an emphasis on the role of culture on the strategic alignment area of IT governance. Among these studies, two had a national culture perspective and the rest had an organizational culture perspective. Rowlands et al. (2015) suggest that the concept of organizational culture ITG is mostly focusing on the dimensions of COBIT 5. Figure 5 summarizes the organizational or national culture factors influencing ITG strategic alignment mentioned in the reviewed literature.

El-Mekawy et al. (2012) found links between organizational culture and the understanding of IT by business, understanding of business by IT, employee relationships, and cross training. Silvius et al. (2010) suggest that three dimensions of organizational culture called strategy, coordination and leadership, have

a strong relationship with governance in the business IT alignment maturity. In another study Erasmus et al. (2012) found that aspects of organizational culture like innovation, risk taking, team orientation, and change readiness have a significant impact on the strategic alignment components. These aspects of organizational culture can be used to encourage more collaborative IT decision-making and improve alignment maturity. Al Majali and Dahlin (2010) assess the culture gap between IT and business strategy

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

by analyzing the issue of strategic alignment in ITG. The authors indicate that leadership, processes, service quality, structure, values and beliefs represent the culture gap between IT and business strategy and affect the strategic alignment. Finally, Cormack et al.'s (2001) study highlights that the cultural characteristics of an IT group are associated with the tensions in the relationship between the business and the IT side. Among these cultural characteristics, the authors pinpoint to the indirect way of reporting to the CEO by the IT managers, poor communication, decentralized structure of the IT department, and system delivery processes. The authors conclude that the lack of efficient IT partnership is due to the organizational culture of the IT group. The role of national culture in strategic alignment has received attention in two studies conducted by El-Mekawy and Rusu (2011) and Silvius et al. (2009). Both studies identify the influence of culture on business IT alignment components. More specifically, Silvius et al. (2009) suggests that the difference in national cultures affect governance maturity and skills in business IT alignment.

Role of Culture in IT Risk Management

Risk management focus area of IT governance deals with risk awareness by senior officers in the organization, a clear transparency and understanding of the organization's desire for significant risk and compliance requirements. We found only one study concerning the relationship between culture and risk management. The study is done by Gu et al. (2014) and it suggests that leadership risk tolerance as a cultural aspect positively influences managers with respect to IT project performance. Leadership risk tolerance is defined as the willingness of managers to take and allow risks during projects (Thamhain, 2004).

Role of Culture in Performance Measurement

The performance measurement focus area of IT governance is related to tracking and monitoring the strategies, processes, and services to assess their performance and goal achieving. Among the papers reviewed we identified five that analyze the link between culture and the performance measurement of IT governance. Four of these studies use an organizational culture perspective and one uses a national culture approach. Figure 6, summarizes the organizational or national culture factors that influence ITG performance measurement as found in reviewed literature.

Gu et al. (2014) find that organizational culture has an impact on IT performance. The authors use the four dimensions of organizational culture – institutional collectivism, results orientation, positive work environment, and leadership risk tolerance, – to provide evidence that organizational culture affects the IT project performance in many aspects, such as meeting expectations, team members' satisfaction, benefits to the organization, and improving the competitive position.

In the same vein, Nugroho and Surendro (2011), Satidularn et al. (2011), and Xiao and Dasgupta (2005) identify a link between organizational culture and IT governance performance measurement. According to these authors, it is crucial that IT managers enable an organizational culture that facilitates innovation and helps understanding the practices of IT governance. Concerning national culture, Zhong et al. (2012) suggest that the existence of congruence between national culture and IT governance mechanisms may improve the likelihood of an effective IT governance performance.

DISCUSSION

More Emphasis on Organizational Culture Than National Culture in IT Governance

The findings of our literature review revealed that previous researchers considered either one or in some cases two levels of culture: national and organizational culture. Eleven research papers used the organizational culture and four the national culture perspective. This confirms the growing importance of the role of organizational culture in IT governance in recent years in comparison to that of the national culture. However, none of the studies that focused on organizational culture has provided exact details on how different aspects of organizational culture can be used in each focus area of IT governance. This is a significant gap found in the previous literature that can be studied in detail, resulting in precise linkages between organizational culture dimensions and IT governance components.

Methods in Studying Culture Influence on IT Governance

The literature review provided insights into the variety of research methods selected by the authors to analyze the link between culture and IT governance. Table 3 summarizes the methodological approaches used in the reviewed papers.

The qualitative research appeared to be the preferred approach for analyzing the link between culture and IT governance. However, depending on the framework used, some researchers chose to study the relationship between either organizational culture or national culture and IT governance, while others chose to use quantitative analysis or even a combination of quantitative and qualitative analysis (for ex. Nugroho & Surendro, 2011). In terms of geographical spread, the researchers had a focus on different areas of the world, such as the U.S., China, Australia, Netherlands and Thailand. Finding studies on the role of culture in IT governance in different parts of the world confirms the importance and the actuality of this topic.

CONCLUSION

This study aimed at assessing the extant literature on the relationship between culture and IT governance through the lens of the five focus areas of IT governance: value delivery, resource management, risk management, strategic alignment and performance measurement. The findings provide evidence that research on this specific topic is scarce. There were only 15 studies that met the inclusion criteria in this literature review; these papers focus on either organizational or national culture and analyze different IT governance areas in various contexts.

The most important gap found in the extant research represents the lack of precision in terms of culture – IT governance relationship granularity. There is no clear understanding of which dimensions of culture impact IT governance and which of the five areas of IT governance are affected. Authors used a monolithic view of culture and did not analyze which parts of the organizational structure are affected by it. Finally, none of the papers covered the role of culture in all five focus areas of IT governance. Based on the increasing interest in better understanding the role of culture in IT governance and the gaps found by this literature review, we propose that one interesting future avenue of future research would

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

be the analysis of the organizational culture impact on each of the five focus areas of the IT governance. Another topic of interest would be to assess the influence of specific dimensions of culture on each of components in ITG current frameworks and standards.

In conclusion, this literature review sheds light on the importance of cultural issues at different levels of analysis for implementing IT governance and emphasizes the need for in-depth future research in this area.
