It is stated in Cashman, et al (2004) that e-commerce facilitates SMEs to compete with large organization and operate globally. Globalization of tourism is a driver for e-commerce adoption (Gunawardana, 2000). Adoption of E-Commerce tools enables customers to more easily communicate to others involved

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

in the tourism industry (Gunawardana, 2003). As stated by Cloete et al. in 2002 E-Commerce can deliver the tools to provide cost effective ways for SME s to market them, launch new products, improve communications, gather information, and identify potential business partners. Research findings of Lawrence (1997) conclude that e-commerce adoption leads to tremendous improvement in marketing and the ability to reach new customers. He further stated that trading partners such as suppliers who have adopted e-commerce force SMEs to adopt e-commerce as it provides cost saving in huge margins in long term. These cost savings are not only through external communication processes but also through internal communication processes. External communication is enhanced through EDI, online sales, whereas internal communication is enhanced through the use of internet rather than traditional telecommunication

According to Calvin B. Lee (2002) higher customer service levels lead to greater revenue and net income. The above stated research finding elaborates the extent to which customer service can lead to the company development. In every business, the customer service is very important. Without the help of customer service profit-oriented businesses cannot acquire leading positions as the ultimate objective of any business would be to satisfy user requirements in order to earn profits. For an internal Research & Development department to operate successfully, customer service is an important element as it provides the necessary feedback required from the customer to generate a useful product or service. When the customer service is in electronic form the difference is that the feedback provided is faster. According to Estep and Castleberry (1999, p. 13) one primary benefit of e-commerce is the potential for an improved relationship with customers.

2.1. Factors Influencing Firms' E-Commerce Adoption

Paynter and Lim (2001) in their research finding states that e-commerce technology which plays a major role in selling of their products through internet is significantly increasing the growth of the company. They also predict that growing number of Internet users, who are mainly buyers provide the opportunity for the organization to expand the marketplace by deploying a cost effective and efficient solution. With relevance to above arguments the following hypothesis would be developed.

2.2. H1: Relationship Between Adoption of IT and Adoption of E -Commerce

Based on an analysis carried on a number of researches, it can be generally stated that successful E-Commerce adoption by SMEs involves the active participation of the CEO or the owner of the company in their investment in IT. According to Cloete, Courtney, and Fintz (2002) it is stated that even though the CEO or owner identifies the potential of e-commerce usage in their company, but due to their lack of understanding in technology they will be reluctant to adopt e-commerce. With relevance to above arguments the following hypothesis would be developed.

2.3. H2: Relationship Between Management Involvement and Adoption Of E-Commerce

According to Mukti (2000) has pointed out that one of the main barriers in adopting E-Commerce is the Legal issues which surround them. When E-Commerce mode of communication is used, legal issues are of special importance; even though the communication originates through a computer there are no physically documents to make a business deal legally binding. With relevance to above arguments the following hypothesis would be developed.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

2.4. H3: Relationship Between Legal Requirement and Adoption Of E-Commerce

Adoption of IT will enhance the internal efficiency of the organization by utilizing the Internet for IOS (Inter-Organizational Systems). The Korean Ministry of Commerce pointed out that the adoption of E-Commerce will help the organization; thereby it will build efficient and effective relationships between the customers and suppliers within the company.

Customer service is an important element as it provides the necessary feedback required from the customer to generate a useful product or service. When the customer service is in electronic form the difference is that the feedback provided is faster. With relevance to above arguments the following hypothesis would be developed.

2.5. H4: Relationship Between Adoption of IT and Customer Service

The customer satisfaction is one of the main priorities of the management; Estep and Castleberry (1999, p.13) states that one primary benefit of E-Commerce is the potential for an improved relationship with customers. Today most of the customers are involved in the E-Shopping or E- business. The management involvement in providing the best service according to the customer s expectations is one of the top priorities of the management team. This involves effective adoption of E-Commerce in their SMEs.

2.6. H5: Relationship Between Management Involvement and Customer Service

With relevance to findings of Estep and Castleberry (1999) a primary benefit of e-commerce is potential for improved customer relationship. Since Gunawardana (2000) express in his findings that country to country e-commerce legal conditions are different. The e-commerce law in Sri Lanka is currently weak and its effectiveness in the business has not reached to the companies and consumers. Basically, there are no awareness about it, which has led to less trust among the parties involved in the e-commerce transaction. Therefore, legal requirement would be important over customer service. With relevance to above arguments the following hypothesis would be developed.

2.7. H6: Relationship Between Legal Requirement and Customer Service

According to Chan and Al-Hawamdeh (2002), e-commerce totally depends on the digital communication and IT. When considering E-Marketing this is a very important feature of E-Commerce. Gunawardana (2000) stated that one also could conclude that marketing a product or service through internet is easier than any other way. E-marketing is the vast cost-effective way. These arguments on adoption of IT and E-Marketing would facilitate the below developed hypothesis.

2.8. H7: Relationship Between Adoption of IT and E-Marketing

Findings on Osmonbekov (2003) stated CEO or Manager are taking key role to adoption of IT in SMEs. Standing and Stockdale (2003) points out the at E-Marketing is the cost-effective marketing strategy and it provides an opportunity to SMEs by providing avenues to compete with larger firms by making

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

marketing, communication and information resources available for comparatively low financial cost. Establishing an effective E-Marketing practice involves a greater management involvement by providing the best IT for their SMEs. These arguments would facilitate the below developed hypothesis.

2.9. H8: Relationship Between Management Involvement and E-Marketing

Adoption of E-Commerce is mainly for few main purposes, of which to market the company themselves by providing company information and to mark et the products and services offered by the companies. Since the company is advertising in the internet and selling its product without any physical documents, the legal requirements plays a major part during the adoption. These arguments would facilitate the below developed hypothesis.

2.10. H9: Relationship Between Legal Requirement and E-Marketing

The relationship with the supplier is also extended by adoption of E-Commerce. Another research finding of Stricker (2003) states that cost of delivery may be saved due to E-Commerce adoption The communication and access of business deals between the two parties through the most cost effective E-Commerce operations turns the relationship with the supplier well-organized. These arguments would facilitate the below developed hypothesis.

2.11. H10: Relationship Between Adoption of IT and Supplier Service

According to Estep and Castleberry (1999) they point out that one of the primary benefits of e-commerce is that it improves the potential for an improved Relationship with suppliers and the management. The adoption of e-commerce will facilitate both the parties by giving up-to-date detail of every transaction, where the business deals with both the parties will be more cost-effective. These arguments would facilitate the below developed hypothesis.

2.12. H11: Relationship Between Management Involvement and Supplier Service

Estep and Castleberry (1999) in their study states that one of the primary benefits of the e-commerce is that it improves the relationship with suppliers and the management stronger, the legal requirements play a major role between these two p arties since there are no physical documents as evidence of the Transactions held between the two parties. These arguments would facilitate the below developed hypothesis.

2.13. H12: Relationship Between Legal Requirement and Supplier Service

The increase of E-Commerce today has also built a greater demand for e-currency. It has opened up an opportunity to SMEs global network by allowing payments worldwide. E-payment methods are essential in E-Commerce to attain the speed of processing payments and for accuracy of transaction information (Singh, 2002, p. 443). Also, the electronic payment system provides opportunities for new global and national trading relationships (Paynter, Lim, 2001, p.3). This creates a high importance of E-Payment in E-Commerce. This arguments would facilitate the below dev eloped hypothesis.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

2.14. H13: Relationship Between Adoption of IT and E-Payment

According to Singh (2002), E-payment system has induced customers to purchase online at their convenience. The management involvement is necessary since today E-payment is considered to be the fastest mode of transaction. Paynter & Lim (2001) states e-payment system provides opportunities for new national & international trading relationships, these sorts of opportunities are out for grab when SMEs are not adopting the e-commerce.

2.15. H14: Relationship Between Management Involvement and E-Payment

According to the research carried out by Silveira, 2003 it is stated that currently in Sri Lank a, there is culture of cash payments. The different modes of carrying out e-payment are for e.g.: credit cards, e-money, etc. According to Singh (2002) generally it is accepted norm that credit cards are the most preferred method of making payments in the current business environment. However, it is stated that it has to be reliable and secure payment systems (Brendan & Hussain, 2001). According to Singh (2002, p. 443) Payment information via e-mails or automated responses are greatly appreciated by Customers the legal requirements should be clearly defined as when the customer or the supplier involves in the transaction process, since it is still considered as an insecure method of payments. These arguments would facilitate the below developed hypothesis.

2.16. H15: Relationship Between Legal Requirement and E-Payment Methodology

The section provides information on collection of data, data gathering procedure, dimensions of variables, research instrument, data analysis and guide to adoption of E-Commerce activity level. Data were collected from twenty-one companies through interviews. The population of the research will be all small and medium enterprises registered with BOI in Sri Lanka. However, due to budget and time constraints, the sample of the research was obtained only in the Colombo Metropolitan area. The total population of the Board of Investment registered SME s are 30.

In this research non-probability sampling technique was carried out. In that, particularly convenience sampling method is used because of time and budget constraints. A survey questionnaire was developed and data was gathered through personal interviews. The table 1 shows the total sample size, enterprise on the operation, response received from the enterprise and response rate.

For the research purpose after collecting the 10 data set questionnaire from companies, the reliability test carried out. The Conbach's Alpha is 0.8955. Therefore, questionnaire is reliable.

Table 1. Survey response rate

	Total sample size	Enterprise on Operation	Response received	Response rate
SME Survey	36	30	21	70%

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

The questionnaire was the main element for this research. It has divided into three sections. Section I is divided into subsection on the basis of variables. This is to make it easy to fill the questionnaire. Subsections are the variables to collect information related to the e-commerce adoption. There are 50 statements, which are categorized into Customer Service, Supplier Service, Management involvement, adoption of IT, e-marketing, legal requirement, and e-payment. Every item required the respondents to choose one answer out of five alternatives. The scale used is called the Likert scale, where the five alternatives are strongly disagree, disagree, moderate, agree, strongly agree respectively. Section II is designed to collect information related to the benefits received from using E-Commerce applications. There are 14 items where the respondents choose one answer from each item which is of Likert scale type. Section III is designed to collect information related to the company profile. There are 16 questions where the respondents are required to tick one answer or fill in the blank.

3. DATA ANALYSIS

All data from the respondents are coded and entered into the data sheet of the SPSS program for statistical analysis. To evaluate the entire variable, each variable has set of Likert scale questions. On that, got the mean of each set of variables and convert that to ratio type data. The following analysis and tests are carried out:

1. The first part of the analysis consist various tabulation of data, where frequency and percentage will be displayed.
2. In the second part of the analysis, Simple Linear Regression analysis will be carried out to identify the relationship between the adoption of E-Commerce and the firm-based characteristics.

From Table 2, it can be seen that among the respondents, those from the manufacturing sector constitute the highest percentage at 57.1%. That is more than half of population in the SME industry. Continue with this followed by the IT sector. This is current growing sector in Sri Lank a. The figures reflect the current trend that IT is becoming a major sector in the economy. One of the reasons could be that many companies now venture into IT related business because the government is providing all kinds of incentives to promote IT to transform the economy into knowledge economy. Another obvious reason is the global trend of Information revolution where Internet is becoming a part of everybody live and IT is becoming the basic enabler of every business, the demand for IT related products is increasing, naturally more and more companies are investing in the IT sector.

3.1. Company Ownership

From Table 3, Private Limited Company is the highest form of company ownership among the respondents, which constitute 76.2%. The second highest respondents rated the Partnership. The lowest are public Limited Company and Others, which constitute only 4.8% each category among the respondents.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Table 2. Sector

Industry	Frequency	Percentage
Finance	1	4.8%
Information Technology	4	19.0
Manufacturing	12	57.1
Education	1	4.8
others	3	14.3
Total	21	100.0

Table 3. Ownership

Company	Frequency	Percent
partnership	3	14.2%
Private limited company	16	76.2%
Public limited company	1	4.8%
others	1	4.8

3.2. Number of Employees

From Table 4, it can be seen that among the respondents, most of them have 50 - 250 employees, while only 23.8% have more than 10 - 50 employees. It shows that most small and medium Enterprise has more employees as the extent of operation.

3.3. Connection of Internet Service

Table 5 shows the 52.4% respondents have using Dial-up Connection for the internet usage in companies. With that 33.3% respondents are using data service (leased line) and 28.6% respondents are using ADSL. The lowest connection usages are IP-VPN and ISDN. If we consider all these facts, all these SMEs are well known the Internet advantages and its benefits. That is why at least in the companies has minimum dial-up connection

3.4. E-Commerce Activities Usage by SME s

As per Table 6, it can be concluded that most frequently used E-Commerce activities in SMEs are e-mail, internet and web site activities. The percentages are respectively 95.2%, 90.5% and 71.4%. It can be generalized that the usage of e-commerce in relation to these three activities are above 70%. These are the most commonly used activities in SMEs. The leased used e-commerce activities in SMEs are the following: EDI (electronic data interchange) 28.6%, making purchase online 23.8%, online payment 14.3%, CRM (customer relationship management) 14.3%, e-customer service 14.3% and video conferencing 9.5%.

Table 4. Employees

No. of employees	Frequency	Percent
Less than 10	2	9.6%
10-50	5	23.8%
50-250	7	33.3%
250 and more	4	19.0
Data unavailable	3	14.3

Table 5. Connection types

Connection	Usage	Non-Usage	Usage %	Non-Usage %
Data Service	7	14	33.3%	66.7%
IP-VPN	1	20	4,8%	95.2%
ADSL	6	15	28.6%	71.4%
IDC	0	21	0.0%	100.0%
ISDN	1	20	4.8%	95.2%
Dial-Up	11	10	52.4%	47.6%

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Table 6. E-commerce activity usage

Activity	Usage	Non-usage	Usage in %	Non-usage in %
E-mail	20	1	95.2%	4.8%
Internet	19	2	90.5%	9.5%
Web site	15	6	71.4%	28.6%
On line payment	3	18	14.3%	85.7%
Purchase online	5	16	23.8%	76.2%
E-customer service	3	18	14.3%	85.7%
Video Conferencing	2	19	9.5%	90.5%
CRM	3	18	14.3%	85.7%
EDI	6	15	28.6%	71.4%
others	1	20	4.8%	95.2%

4. HYPOTHESES TESTING

Prior to conducting the statistical analyses, the three major assumptions of a multiple regression analysis, namely, normality, linearity and homogeneity of variance were examined and found no major violations. Consistent with the well-established procedure in creating interaction terms (Aiken and West, 1991), the variables were first mean-centered before creating the interaction term. Along with mean-centering, the variance inflation factor (VIF) and tolerance levels were also checked for the presence of multicollinearity. Accordingly, it was found that all tolerance values were well below 0.1, which is considered as the rule-of-thumb cut-off point (Hair et al., 2006). Table 7 below shows the results of simple liner regression analysis. First hypothesis proposed a significant, positive relationship between adoption of IT and adaption of e-commerce. To further test the first hypothesis (H1), a one-way analysis of variance (ANOVA) was conducted in order to see whether there is a statistically significant. Hypotheses 1, 2, 8.10 and 11 were statistically significant and proved that there is relationship among the two variables. Other remaining variables proved that, there is no relationship.

5. CONCLUSION AND IMPLICATION

The main issue addressed in this study was why SMEs are reluctant or are not prompted to adopt e-commerce to develop of day to day business. The most frequently used e-commerce activities are the internet, email and websites. The least used activities are electronic data interchange, making purchases online, online payment, customer relationship management, e-customer service and video conferencing. Overall, what was found that the SME s use only the basic or low-level e-commerce activities to carry out day to day operations.

The next finding is to identify the relationship between firm-based characteristics and adoption of e-commerce in SME. Under this first one is adoption of IT has a relationship with the adoption of E-Commerce. There is evidence that the level of adoption of E-Commerce is influenced by the adoption of IT. It was found that there is a 25.5% impact of adoption of IT on the adoption of e-commerce. It is also

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Table 7. Adoption of IT on adoption of E-Commerce

Hypotheses	R^2	Sig F
H_{1-} Adoption of IT on adoption of E-Commerce	0.255	0.010*
H_{2-} Management involvement on adoption of e-commerce	0.212	0.023*
H_{3-} Legal requirement on adoption of E-Commerce	0,0000	0.955
H_{4-} Adoption of IT on customer service	0,128	0.175
H_{5-} Management involvement on customer service	0,242	0.051
H_{6-} Legal requirement on customer service	0,105	0.225
H_{7-} Adoption of IT on E-Marketing	0,221	0.074
H_{8-} Management involvement on E-Marketing	0,295	0.033*
H_{9-} Legal requirement on E-marketing	0,002	0.868
H_{10-} Adoption of IT on Supplier service	0,137	0.023*
H_{11-} Management involvement on supplier service	0,233	0.001*
H_{12-} Legal requirement on supplier service	0,021	0.423
H_{13-} Adoption of IT on e-payment	0,003	0.836
H_{14-} Management involvement on e-payment	0,001	0.901
H_{15-} Management involvement on e-payment	0,001	0.901
H_{1-} Legal requirement on e-payment	0,001	0.935

*Significant at 95% confidence level

clear that the adoption of IT is vital for successful implementation of e-commerce activities. Companies who have less access to advance information telecommunication infrastructure and lack of technological expertise are likely to have low level of adoption of e-commerce and low level of e-commerce activities. This is supported by the fact that there is an impact of 25.5% of adoption of IT on adoption of E-Commerce in Sri Lanka. On the contrary, companies who have better access to Information Telecommunication infrastructure that support e-commerce and have better knowledge in technology are likely to have higher percentage of e-commerce adoption and higher e-commerce activities. This is not seen in the Sri Lankan context where adoption of IT is mostly confined to day to day business activities that do not involve high usage of e-commerce. This is further supported by the earlier finding that e-commerce activities are mainly concentrated on e-mail, internet and websites in Sri Lanka.

The second one is management involvement has a relationship with the adoption of e-commerce. There is evidence that the level of adoption of e-commerce is influenced by management involvement. The finding was that there is 21.2% impact of management involvement influencing the adoption of e-commerce. This could be explained from the management aspect. The lack of IT knowledge amongst top management was seen as an obstacle to adopt e-commerce and denotes the commitment shown towards the adoption of e-commerce. The majority of the respondents also believe that top management commitment is important for the adoption of e-commerce. However, the lack of IT knowledge at the top management level in using the technology or literacy of IT has hampered the adoption of e-commerce activities. The third one is to find out the critical success factors of adoption of e-commerce, for SMEs in Sri Lanka. The significance of critical success factors of e-commerce and firm-based characteristics are studied. The factors which had significance impact on adoption e-commerce are given below:

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

1. E-Marketing and Management Involvement

There is evidence that management involvement has an effect on e-marketing. The analysis shows that management involvement has 29.95% impact on e-marketing which is a critical success factor of e-commerce. The current business environment is such that in order to be competitive, fast communication and global connectivity is an important factor. E-Marketing enables managers to identify niche markets. This has been proved; since data collected shows that most companies agree that e-marketing immensely assists them in identifying niche markets. Likewise, companies have agreed that advantages derived through E-Marketing such as cost minimization, self-marketing and launching products; encourage managers to increase their involvement with e-marketing. These are the reason as to why there is significance between management involvement and e-marketing.

2. Supplier service and Adoption of IT

There is evidence that supplier service determines the adoption of IT. The analysis shows that supplier service has 13.7% impacts on adoption of IT. It is always best for a company to find the best fit supplier, since output and timely customer delivery depends on the quality and reliability of the supplier. By adopting IT, the company introduces new methods of running a business. The use of computers and the internet opens up the opportunities of finding relevant, reliable and quality suppliers. In order to be able to find key suppliers and be in touch with them, most companies agreed on the fact that IT needs to be adopted.

3. Supplier service and Management Involvement

There is evidence that supplier service determines management involvement. The analysis shows that supplier relation service has 23.3% impact on management involvement. Here again the management emphasizes on the need to have reliable, relevant and quality suppliers. Therefore, the benefits derived through supplier service, which relies on IT, will definitely increase the management involvement in this regard.

The Top executives and the top management in the target SME companies pointed out that the adoption reduces the cost and at the same time it also increases the efficiency in dealing with suppliers. These were seen as the two primary benefits in adopting e-commerce in their companies. They also identified that it also increases their service to the customer and also increases the relationship with the customer, and it goes to the level of making the customer loyal towards the company. The other main benefits should also be noted since the respondents showed a very favorable response to them. The benefits shown in the moderate level should also be noticed and SME companies should take the advantage in gaining by adopting E-Commerce in the best strategic way.

Chapter 35
Addressing Risks in Global Software Development and Outsourcing:
A Reflection of Practice

Brian J. Galli
Long Island University, USA

ABSTRACT

This article describes how outsourcing and offshoring for software development is a widely used business strategy implemented by many organizations worldwide. Due to its significant benefits, project managers can accrue greater flexibility, lower labor costs, and have access to skilled workers, which are the advantages of outsourcing and offshoring in global software development (GSD). Though there are advantages and benefits to incorporating this business practice, there are risks associated with it as well. Therefore, it is necessary and vital to discuss the challenges and risks that may arise which the project managers should consider before establishing and implementing such a project, to ensure a successful project result. The objective of this research is to identify the challenges and risks involved in GSD and discuss a risk management plan based on these factors. This article has found that communication issues and cultural differences are primary causes of most risks identified. To minimize the risks associated with GSD, these factors must be minimized.

1. INTRODUCTION

1.1. Background

Due to the advancements made in technology and its expanding worldwide use especially in the field of software projects, there has been an increasing trend in using global software development (GSD) by many companies. The term global software development emerged as a concept that is defined as "…software development that uses teams from multiple geographic locations…" Nidhra Yanamadala,

Afzal, and Torkar (2013). Verner, Brereton, Kitchenham, Turner & Niazi (2014) states that GSD is used to describe a software development business strategy where "…organizations shift all or part of their software development to another country (referred to as offshoring), to lower cost destinations and/or to destinations where the required skills are more readily available." An example of GSD is when multinational organizations distribute their software development activities across multiple subsidiary sites (Verner et al., 2014). Many of these sites are located in different countries. Distributed software development (DSD), distributed software engineering (DSE), and global software engineering (GSE) are other terms used to describe this same software development business strategy (Verner et al., 2014). For simplicity, the term GSD is used throughout this paper.

In businesses that utilize GSD, teams that are located in different geographic locations perform the software development work tasks. The distribution of these software development activities to other teams in another location is increasingly becoming a common practice recently. However, there are risks involved when managing a GSD project due to the teams being located in separate locations. The risks that can be encountered include organizational, cultural, temporal, language, political, and geographical barriers. These barriers that can arise when managing a GSD project present as risks.

Software outsourcing refers to the method in which part of the software development work task is allocated to another team in a different location. The benefits obtained from software outsourcing, which are cutting costs and increasing efficiency, can help companies, maintain their competitive advantage in the field. This advantage is the driving factor for incorporating the use of this software development business strategy for GSD. However, the benefits associated with GSD will not be attainable if the risks involved with GSD are not managed during the life cycle of these projects (Verner et al., 2014). But, if project management account for these risks to be managed correctly, offshore software development can produce high-quality work and product that is beneficial for the software organization. Evidence from research and literature portray the risks and challenges of managing outsourcing and offshoring in GSD projects.

This study identifies and analyzes the risks associated with outsourcing and offshoring in global software development projects. This paper is organized as follows. Section 2 describes the literature review to summarize and synthesize literature analyzed in this paper. Section 3 describes the research methodology used in the study. Section 4 presents findings from the selected literature, which are presented and analyzed with the discussion. Lastly, Section 5 addresses conclusion, future work, limitations, and risk assessment.

1.2. Problem Statement

There is a wealth of literature that shows the crucial role that risk plays in software development projects. However, there is an evident gap in knowledge regarding how risk enables the smooth progression of software development projects. This research stems from the knowledge gaps that exist within the related literature on global software development projects and risk management. The focus of this article is to evaluate the elements and applications of the most current risk management in the area of global software development projects. The article seeks to examine the overlaps and disparities of these risks in order to understand the differences and similarities between them. From there, this study seeks to propose solutions that encompass the best practices and elements of the current arguments in order to outline a proposed "universal" framework that could applicable to all forms of global software development projects and to all industries/business sectors. The research will focus on providing evidence-based answers

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

to the primary questions that experts in global software development projects and risk management ask. For example, how to maximize on the expertise of risk in order to achieve the goals and objectives of global software development projects. Additionally, the findings of the research will provide a platform for building further research relating to global software development projects and risk management.

To understand the risks and challenges involved in global software development projects, the following research questions have been identified:

1. What are the common risks involved in outsourcing and offshoring in global software development projects?
2. What are the recommendations to mitigate known or identified risks in outsourcing and offshoring in global software development projects?

1.3. Originality

The purpose of this study is to contribute to existing literature regarding the effectiveness of global software development projects and risk management. Moreover, it seeks to compare project global software development projects and risk management features by focusing on their assessment tools. Data is derived from different studies and combined in a well-mannered approach. This paper is based on original research conducted to check the hypotheses.

The study has taken the viewpoints from different researchers and recommends new ways to resolve already existing issues. The purpose of the study and hypotheses are described. In the paper, the methodology is discussed along with its findings. Using a design-science-investigate strategy, authorizing a valuable growth reveal for both reasonable and hypothetical applications, develops a valid assessment model of global software development projects and risk management. This paper initially provides an outline of development models with attention to their evaluation instruments as an answer to the examination question. An explanation is provided about the strategy utilized for the outline and assessment of the evaluation instrument. The consequences of the meetings are also laid out in the analysis. This is trailed by the initial discoveries and suggestions in the conclusion, which also plots investigative limitations and future research ideas.

This paper contributes to the profession by adding to the slender body of literature on the subject to applying global software development projects and risk management. There are findings within this study that highlight some of the benefits of utilizing global software development projects and risk management, and the pitfalls that can occur with global software development projects without thinking of risk and sustainability. This study uses real-world examples to highlight the value of taking the theories that we work with and examining them in the context of the real world. The practice of risk management in global software development projects is inherently practical, so there is significant value in a study that not only examines these subjects in theory but also in practice.

1.4. Contribution to the Industrial Engineering Profession and Research Field

The current study is a significant contribution to the Industrial Engineering (IE) profession and research field. The study saves engineers' time, so they can work more effectively and focus on their goals. It helps engineers in organizing and maintaining the system with the use of the latest technologies. Moreover, it helps engineers save time, materials, machine time, money, energy, work hours, and other resources

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

that hinder generating productivity. Finally, the research helps engineers improve the productivity and quality of their overall work. This model helps organizations make innovations in their products and other essential aspects. It would assist practitioners in finding effective strategies that provide benefits to the organization.

Hence, in the research field, this article is helpful. First, it would be a beneficial piece of writing providing information and awareness to industrialists and all readers. Easy to understand and user-friendly vocabulary and writing are utilized to accommodate all readers. This research reveals a new side of the global software development projects and risk management and sheds light on the effectiveness and requirement of this model for the management and production of companies. Moreover, a clear theoretical framework is provided in this research to help readers know the relevant information. Additionally, readers and researchers can use this study as a reference in future studies. It would be helpful for companies to boost their performance and achieve a competitive advantage in commerce. Undoubtedly, this paper is a valuable contribution to the IE profession and research field.

2. LITERATURE REVIEW

Nidhra et al. (2013) conducted a Systematic Literature Review (SLR) to identify the challenges faced in project management relating to Knowledge Transfer (KT) in GSD as well as mitigation strategies to overcome such challenges. SLR is a research methodology, which involves finding the most relevant published literature using search strings based on research questions. The collected information from literature is then analyzed to support and respond to the research questions (Khan and Khan, 2017). The study identifies the similarities and differences in challenges and strategies by comparing the findings and observations from interviews with industry experts. Similarly, studies conducted by Betz, Oberweis & Stephan (2014), Khan, Mahrin, & Chuprat (2014), Chadli, Idri, Fernández-Alemán, Ros, & Toval (2016), and Kamaruddin, Arshad and Mohamed (2012) highlighted the problems encountered in KT that related to issues involved with communication, trust, time zone difference, and lack of proper documents in IT offshore outsourcing projects. Likewise, Betz et al. (2014) interviewed experts from German companies who had experience in offshore outsourcing in software development projects as clients. From these German experts, the researchers were able to identify problems involved in the process of KT and associate each problem to an activity within the field of knowledge management. A follow-up study was then carried out to deduce their findings in which they came up with recommendations to increase the project's success in the future. Khan et al. (2014) also identified language barrier, culture difference and communication, and KT as the biggest risks from their SLR. Similarly, Chadli et al. (2016) identified language and terminology differences, lack of effective communication and KT as the biggest risks from their SLR.

Betz et al. (2014) came up with five problems areas involved with KT based on their research study where they conducted interviews with German clients involved in offshoring and outsourcing software development projects. They first identified the problems encountered due to the different geographic locations of the two parties. Because of time difference and distance issue, there is only a limited time window for the teams to communicate. This can result in project delay, which is inefficient. For example, when a decision is needed by a member but cannot be made because of this limited time window, the decision cannot be confirmed promptly. It is also much more difficult to meet and discuss issues in person because of the geographic distance. Companies may also have only a limited budget for travel expenses

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

so most of the time, video calls are used for conferences between the two teams but it is not as effective as meeting face to face. Thus, this temporal and spatial distance can result in additional costs for KT.

The language barrier is another main problem area identified by Betz et al. (2014). The study conducted by Khan and Azeem (2014) identified 'language and language proficiency,' 'national culture' and 'organizational culture' as the three biggest risks faced by vendors in GSD. English is not the primary language in many of these countries that companies seek to outsource their activities. Therefore, miscommunication or misunderstanding of directions can frequently occur. Being able to convey the work task efficiently properly is challenging between team members with different linguistic backgrounds. So, it is hard for information to be exchanged properly because of this inability to share knowledge. Likewise, another problem area identified is that offshore team members may not understand specifications given by the provider. This is partly due to the cultural difference but occurs because communication is already poor and since domain knowledge is highly variable among different countries, it is difficult for clients to determine how much domain knowledge is available at offshore locations.

Verner, Brereton, Kitchenham, Turner & Niazi (2014) conducted a similar study to investigate and discover risks and risk mitigation advice to guide organizations involved with GSD. The authors address risks relevant to GSD such as communication, culture, language, and lack of trust. Limited face-to-face meetings due to geographic distance negatively impact project management. Not being able to hold face-to-face meetings can create trust issues and makes collaborating on a project difficult to do. Verner et al. (2014) claim that distance makes meetings hard to plan and coordinate due to the time difference which leads to unproductive waits, delays in feedback, and complications in simple tasks. Different cultures and the language barriers between development sites result in miscommunication, misunderstanding, and lack of KT in essential project related information. These challenges eventually make developers lack trust among them. Mutual trust is an important factor in GSD because developers need to collaborate and work together on a project to be successful.

Blomqvist, Peterson, and Dhar-Bhattacharjee (2015) conducted a research study where they investigated the experiences of employees in Swedish companies that offshore IT services to India. The results from Blomqvist et al. (2015) show that regarding the organizational dimension of offshoring; the company allocated mainly non-strategic work tasks to India. Blomqvist et al. (2015) conducted interviews with four companies of which two were small start-up companies, and the other two were big multinational companies. They interviewed employees and managers in Sweden and India. The subjects that were interviewed were mainly software developers that were managers in Swedish onsite companies and employees from Indian offshore companies. The interviewees were asked questions about their job, work, background, experience with offshoring and on shoring, working environment, and personal feedback. Each interview was one hour long on average and was recorded and transcribed for analysis. The purpose of this research study was to gain a better understanding of how work was conducted and organized in a Swedish company based off of the interviews from 18 Swedish manager and employees. The Swedish company offshores its activities to a company in India. The interviews were analyzed and main issues that arise from the experiences of both the manager and employees were identified. The researchers organized the findings among four primary dimensions that dealt with the organizational, operational, cultural and economic aspects of offshoring services.

Matthiesen, Bjorn & Peterson (2014) conducted an ethnographic study to discuss cultural blind spots through an interview and observation between an Indian IT vendor and an IT development division of a Danish bank from project management perspective. The study identified and investigated challenges that were neglected due to the cultural blind spots. The cultural blind spot is defined as "an unidentified

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

knowledge of our cultural behavior and practices within organizations" (Cultural Blind Spots, 2017). Cultural blind spot causes tensions between the home ground organization and remote vendor because the home ground organization focuses on preparing and improving the remote IT vendor site while paying less attention to the changes that come along at the home ground. According to Matthiesen et al. (2014), the Danish IT developers believe "extra work" was created for them because collaborating and working with a remote Indian IT vendor increased communication and coordination with remote colleagues. Their findings confirmed that cultural blind spot causes tension, inefficiency, and obstruct KT among home ground organization and remote vendor in GSD. The authors conclude that to address organizations' cultural blind spots, an active effort is required to take actions. For an organization to become a truly global organization, the organization must continuously improve to take a critical stance toward one's practices, and continuously make changes (Galli, 2017).

Focusing on social risks, Mantalay and Chakpitak (2015) conducted a study to identify the cultural discontinuities from the perspective of both German managers and Thai software developers. By interviewing primary stakeholders such as German managers working in Thailand, locally recruited Thai staff, German software developers working at the headquarters, and German managers in Berlin, the authors were able to identify different types of cross-cultural discontinuities and how cultural differences such as differences in communication style, learning style, and time management can affect GSD projects. The authors argue that many small and medium enterprises consider overlook cross-cultural discontinuities when proceeding with GSD projects and recommend that organizations consider cultural aspects as a critical feature contributing to their success or failure in GSD.

Similarly, Niazi, Ikram, Bano, Imtiaz, & Khan (2013) conducted an SLR to see what factors help to establish trust. Through their research, they were able to identify factors that are important for establishing trust in offshore software outsourcing relationships. A total of 39 factors were identified which were then categorized by continent to see if any of these factors were more common in one continent than the other (Galli, 2017).

Another study analyzes IT outsourcing from the perspective of an Indian company and its relationships with its European clients. Soderberg, Krishna & Bjorn (2013) conducted a research study in which they investigate how these relationships are maintained thru their partnership by also using data from qualitative interviews. With outsourcing becoming a major industry since the mid-'80s, India is considered as the primary supplier for outsourced IT services. The country produces profits of 100 billion dollars in US money, and their clients are mainly from developed countries such as the US, Japan, and European countries.

The researchers drew their conclusions by conducting 17 interviews with the general manager, the head of presales, various heads of the engagements as well as with project managers and team leaders to conclude how the Indian company dealt with the near-shore outsourcing of a great variety of business process outsourcing services to European clients. Furthermore, empirical material collected during visits to the Indian company's site and its on-site vendor teams close to European clients were used for analysis. Their research approach is qualitative and interpretative. Thru the analysis of the interviews conducted, the researchers found that the Indian company vendor was able to maintain strong relationships with its clients by having a long-term engagement with the field of banking and insurance as well as through conscious relationship management with the clients.

There were three major aspects identified for having this solid partnership, which was: senior management commitment and employee identification with projects, mutual trust and transparency, and cross-cultural understanding and sensitivity. Thus, collaboration is the key factor in providing success when offshoring activity is being done in the field of global IT development projects.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Another study conducted by Niazi et al. (2016) using SLR approach identified challenges of project management in GSD then validated the results using a questionnaire-based survey. In the research, lack of trust was identified and verified as one of the biggest challenges GSD. Total of 19 challenges important to the success of GSD project management was identified and concluded that the results from SLR and the questionnaire had no significant difference.

Colomo-Palacios, Casado-Lumbreras, Soto-Acosta, Garcia-Penalvo & Tovar, (2014) conducted a 360-degree feedback evaluation analysis to provide an overview of the implications of GSD for project managers. The 360-degree feedback provided a comprehensive performance assessment by taking into account of all individuals who can reasonably provide comment on the individual evaluated, including self-assessment, assessment from below (subordinates/staff), peer or co-worker assessment, and assessment from external agents (Colomo-Palacios et al., 2014). The results of the study show that geographic distance can have negative effects on productivity and efficiency, which consequently affects the overall project performance. However, despite the productivity losses incurred, the substantially lower labor costs that GSD projects benefit from still provides an incentive for organizations to continue utilizing GSD (Colomo-Palacios et al., 2014).

Soderberg et al. (2013) study on analyzing the complex relationships that arise in IT outsourcing from an Indian vendor perspective also reinforce how trust and transparency, commitment and identification, cultural understanding and sensitivity were important factors that are critical for the maintenance of the strategic partnerships. They interviewed to gather qualitative data and their results revealed that vendors were able to ensure strong relationships by having committed senior management and employee identification with projects, mutual trust, and having a cross-cultural understanding with sensitivity (Galli & Kaviani, 2017).

2.1. Research Gap

The current literature highlights the current gap in research. While there is a wealth of literature that shows the crucial role that risk plays in global software development projects. However, there is an evident gap in knowledge regarding how risk enables the smooth progression of global software development projects. This research stems from the knowledge gaps that exist within the related literature on global software development projects and risk management. The focus of this study is to evaluate the elements and applications of the most current risk management in the area of global software development projects. The study sought to examine the overlaps and disparities of these risks in order to understand the differences and similarities between them.

3. METHODOLOGY

The literature review was approached using two plans. The first plan was an unstructured plan where its aim was to find useful information of global software development projects and risk management. The second plan was structured plan where it is referred to databases and specific search methods.

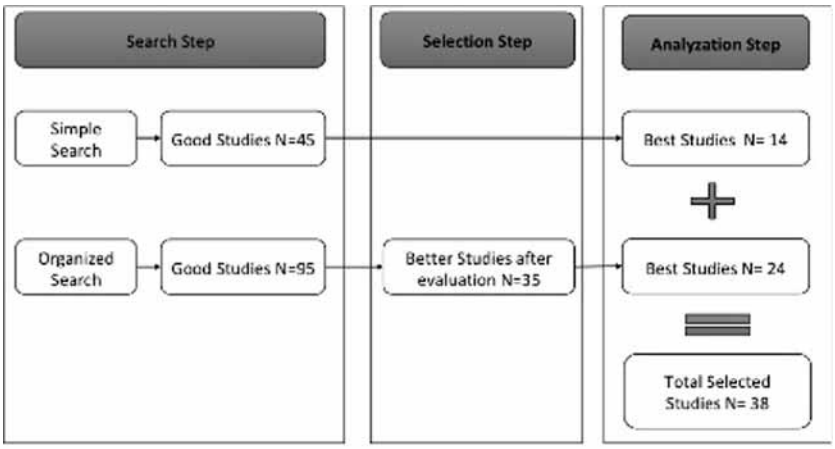
EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

3.1. Unstructured Plan for Literature Review

It was based on searching for publications that are related to global software development projects and risk management tools because this paper aims to find the relationship between the two concepts. We identified some important fields within our area such as project management; risk; risk management; software development; outsourcing; risk analysis. We identified 45 articles, which are relevant to our study. Then we eliminated some of them according to the next step.

3.2. Structured Plan for Literature Review

In this plan, we used three steps to systematically create a structured plan. The three steps are explained as follows:



1. **Plan and Scope:** This step was limited to research that was relevant to global software development projects and risk management. One of these concepts had to be the major focus in the determined articles. Our aim was to successfully get articles that have valuable information to our study.
2. **Conceptualize the Review:** Secondly, we enhance the knowledge of our research by looking for other concepts that are related to the main two concepts. Examples of other concepts are project management; risk; risk management; software development; outsourcing; risk analysis. We eliminated some specific terms that are not helpful to our study such as size of firms and periodic measurement.
3. **Search, Evaluate, and Select Literature:** Thirdly, we devoted our effort to have our results to be relevant. Various databases were used to have these results such as ABI/Inform Global, ProQuest and ScienceDirect. Then we evaluated the journals by looking to the abstract and conclusion to make sure that any relevant journal, which has valuable information, had to be considered. We finally selected the most relevant journals to be 95 journals. Figure 2 shows the process we used in the search and selection.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 2. Research appropriate for literature review

Following the three phases in Figure 1, the final total selected studies were 38 publications. In the selection process, the selected studies after evaluation was 35. Journals were excluded because of title, abstract, or duplication. Also, we aimed to focus on the peer-reviewed articles, academic articles and literature reviews. In the analyzation phase, we narrowed down the selectee studies to be N= 14 and N= 24 by scanning for the most important journals. We completely appraised each journal to reach this number N=38.

3.3. Risk Identification and Risk Analysis

The thirty-eight kinds of literature selected using the criteria defined above were thoroughly reviewed to identify the challenges and risks discussed. During our research, it was necessary to categorize literature by the risk topics discussed in each literature to identify common known risks of project management in GSD. Since our research focuses on risks relevant to project management in GSD, only risks pertinent to outsourcing and offshoring were identified and analyzed. Other project management risks that are operational or technical, such as dealing with management or risks of different project methods were omitted in our research.

4. FINDINGS

4.1. Identifying Risks

The results of this study were divided into categories with subcategories that address the risks and challenges involved in outsourcing and offshoring activities in global software development projects. The six categories were: communication, cultural difference, geographical distance, and lack of trust, software quality, and human resource. Thru a systematic literature review of research addressing this topic, results were organized into these six categories and presented with mainly qualitative data thru SLRs, interviews, or surveys.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Among the fifteen-selected literature, eleven kinds of the literature identified communication risks such as KT and language difference as a common risk, followed by eleven of literature identifying social risks as a common risk. Seven of the literature identified geographical distance and time difference and five of literature identified lack of trust as a common risk. Three articles identified a human resource, and lastly, one article identified efficiency, productivity, and quality of work as an additional risk involved in GSD (See Figure 1). SLR and Interview methods were the two most common methods used to investigate risks involved when managing a GSD project. Table 1 indicates the summary of publication year, research methodologies used, and risks identified in each of the fifteen research papers referenced in this study.

Table 1. Risk topics discussed in literature (Continued next page)

Authors	Title	Publication year	Research method	Risk topics identified and discussed

4.2. Risk One and Two: Communication and Cultural Difference

Effective Knowledge Transfer (KT) is essential for success in software development projects. KT, which is defined as "the delivery or passage of information and knowledge skills among members" and can be done through a systematic exchange (Bresman, Birkinshaw, and Nobel, 1999; Makino and Delios, 1996; Wang, Tong, and Koh, 2004). KT involves the transfer of knowledge with a clear idea to a specific recipient (Nidhra Yanamadala, Afzal, and Torkar, 2013). It is important that thoroughly reviewing and fully understanding the software requirements and specifications before initiating a project, is an important yet challenging task that many project managers can experience when working with a local software developer. It is obvious then that working with a team outside of the primary geographical location may have added challenges creating multiple levels of difficulty in an already complex project environment.

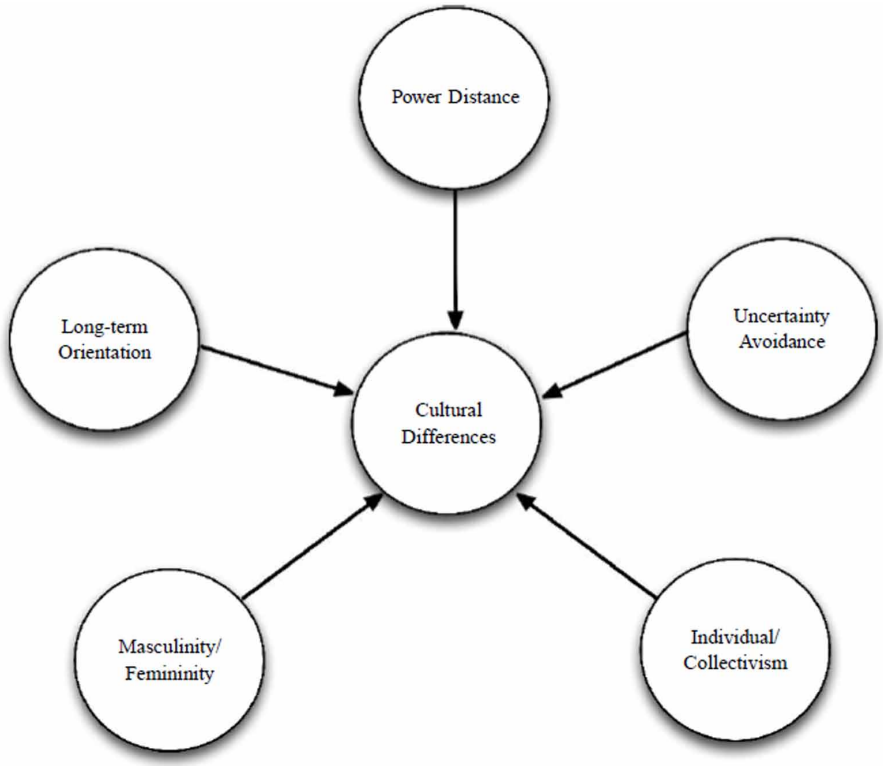
EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

This concept is a crucial factor involved when outsourcing or offshoring activities within an organization. KT is especially significant in project management for GSD because there is two parties in different geographic locations involved that need to effectively communicate and work together over a period to successfully finish the project. Being able to transfer technical knowledge accurately, for example, can significantly affect the results of the software development and project success (Galli, 2017).

KT can prevent the delay of deliverables by facilitating the process and eliminate the communication gap that can occur which can lead to delay. E-mail, intranet, and Internet can all be used to increase the efficiency of transferring knowledge. But, these technological methods cannot be used solely to eliminate the problems associated with KT. Their needs to be structured organization and disciplines to facilitate transfers, or it could lead to failure. For example, if the subject with the knowledge does not know how to transfer the knowledge to a receiver, then this results in decreased efficiency and effectiveness of KT. If KT is not carried out correctly, this can also result in miscommunication or misinterpretation, which is detrimental to project management. For example, if knowledge and information that is crucial to complete a project, but it not properly transferred to its complexness, the deliverable of the project may not be what the project manager have anticipated. Likewise, if the subject cannot adequately transfer knowledge or if the knowledge receiver cannot comprehend the knowledge due to language barriers, this makes KT ineffective and more challenging (Galli, 2017).

KT incorporates the risks involved with communication, language barrier, and cultural differences, which are all factors intricately, related and influence each other. Asian countries such as India and China have been the largest host countries for software development industries in offshoring activities (Veloso, Botelho, Tschang, Amsden & Stefanuto, 2003). Thailand is an emerging economy that has a significant potential for growth in knowledge-based industries. Therefore, Thailand's economy has geared to focus on software development and has been developing to incorporate more knowledge-based work. Although Thailand is becoming one of the host countries used for software outsourcing, there have been issues reported with producing high-quality deliverables that are probably attributed to the lack of effective knowledge transfer due to the difficulty in getting appropriately trained and skilled workers for the work tasks. Being able to manage international knowledge workers to perform effectively is challenging and especially for Thailand, it is important to understand the cultural differences to effectively implement outsourcing knowledge work. The Southeast Asian locations like Thailand offers high prospects for success for companies who want to offshore their software development activities. Thailand provides relatively low-cost labor compared to other Asian countries like Singapore and a large pool of skilled employees as well that is suitable and attractive to many small firms.

Because there has been little research conducted on how the cultural discontinuities affect knowledge work, Mantalay and Chakpitak (2015) conducted a case study at German small and medium enterprises (SMEs) that outsourced its activities to Chiang Mai, Northern Thailand to explore these cross-cultural discontinuities. They followed a German case firm whose work activities were allocated to a Thailand software development company. Their research highlighted the potential cultural disparities and impacts found on work performance and quality in the workplace. The researchers gathered qualitative data for analysis from four primary stakeholders: German managers working in Thailand, locally recruited Thai staff, German software developers working at the headquarters, and German managers, also in Berlin. Data were collected thru semi-structured interviews and focus groups that were conducted among each four main sample groups. Besides the focus groups, interviews were held to question further the Ger-



EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

man managers on topics such as how they felt work performance and qualities were affected by culture. After collecting data from focus groups and conducting interviews, analysis of cultural discontinuities was performed using Hofstede's cultural dimensions theory.

Hofstede's cultural dimensions theory is a well-known cultural theory used to assess cultural findings, and it was used for this case study to analyze the cultural disparities between the German and Thai knowledge workers. There are five main parts of this theory that were used as a reference to understand the behaviors of the manager and employees in a cross-cultural business workplace. The five parts of the Hofstede's cultural dimensions theory are power distance, uncertainty avoidance, individual and collectivism, masculinity or femininity, and long-term orientation (see Figure 3). From this analysis, the researchers were able to identify and link cultural discontinuities and work performance issues.

Analysis of the case study using the Hofstede's cultural dimensions theory shows that there are significant differences in four out of the five cultural dimensions. The culture had a significant impact on the work performed as shown thru the results of this case study. The quantitative differences between every five dimensions were calculated among the Germans and Thai workers. The cultural dimension of individualism had the greatest difference between the two groups with a difference score of 47 (see Figure 4). The cultural dimension of individualism encompasses the value of individuality placed by society. Therefore, a society that has high individualism encourages individual achievement and initiative. A culture that has low individualism stresses group loyalty and group dependence more. This significant difference portrayed between the two groups is evident and shown by the Thai software develops who in comparison to the Germans, prefer communicating as a group, while the Germans communicate strongly

Figure 3. Hofstede's five cultural dimensions (Mantalay & Chakpitak, 2015)

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 4. Differences between German and Thai national (Mantalay & Chakpitak, 2015)

DIFFERENCES BETWEEN GERMAN AND THAI NATIONAL CULTURES (Data Adapted from Hofstede, 1984)			
CULTURAL DIMENSIONS	GERMAN SCORE	THAI SCORE	DIFFERENCE BETWEEN CULTURAL DIMENSIONS
• Power distance	35	64	+29
• Individualism	67	20	+47
• Masculinity	66	34	+32
• Uncertainty avoidance	65	64	+1
• Long-term orientation	31	56	+25

as individuals. The importance of this highlights the differences in learning styles and needs between the German managers and Thai software developers. For example, the German managers try to promote innovation and creativity as methods to use when developing software for the Thai employees but they prefer rather follow commands than think individually (see Figure 5).

The Thai employees place a low value on individualism and naturally prefer groups while the Germans place a high value on individualism. Therefore, these cultural traits, which relate to the power distance relationship and the Thai's preference for autocratic management style and low emphasis on individualism, must be taken into account when proper project management is constructed.

Masculinity also had a big difference of 32 between cultural dimensions (see Figure 4). This dimension refers to how important society places on either achievement or nurture. For example, a society that has high masculinity stresses ambition, achievement, and wealth while a society that has low masculinity stress on nurture for growth and higher quality of life. The results portrayed that Thai employees settled standard work as an adequate job and focused more on quality of life while German managers sought for perfection and achievement in work.

There also was a significant difference between the power distance relationship between the German and Thai cultures with a difference of 29 (see Figure 6). Power distance is related to the equality expectations within a working group usually addressing the issue of less powerful members of the group expecting inequality from their superiors. The Thai employees had a score of 64, which is much higher than the German, which had a low score of 35. So, the Thai employees expect a higher level of inequality and unequal distribution of power. This result can reflect and highlight the autocratic management style that is used in their culture. In comparison, the Germans expect each to be treated more equally. These differences drawn from observations of this study suggest the different needs and expectations from Thai employees and German managers (Galli & Kaviani, 2017).

Figure 5. Interview of a Thai senior software developer (Mantalay & Chakpitak, 2015)

"Learning is somehow involved with cultural issues. Thais work mostly in silence and stay quiet despite difficulties. They try to sort out the solution, but with an empty head. However, when I sit and advise them closely, they seem to work with more confidence and even more quickly when I show them working steps such as 1,2,3..."

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Furthermore, the importance of the power distance relationship is evident due to the different communication styles preferred between the German managers and Thai software developers. For example, an observation was noted that during conference calls or meetings, Thai software developers were hesitant to share their knowledge and would usually appoint a few representatives from their team to speak on their behalf (see Figure 6).

On the other hand, the Germans were more eager to share and discuss problems and issues when needed. This cross-cultural discontinuity creates further distance in communication.

Uncertainty avoidance assesses the extent to which an individual deal with ambiguity or uncertainty in situations. The German and Thai scored similarly with a score of 65 and 64 respectively (see Figure 6). Therefore, both of these groups have a similar dislike of uncertainty. But thru the responses recorded from interviews and focus groups, the reasons for their high uncertainty avoidance are related to different aspects of their work. The Thai employees do not like ambiguous instructions or uncertainty when their superiors give them orders. On the other hand, the German managers do not favor uncertainty or ambiguity in the Thai employees understanding their commands or whether an activity is fully completed.

There was a significant difference in the long-term orientation dimension of the cultural theory. A culture that has long-term orientation emphasized persistence, ordering relationships by status, and adaptability. A culture with a short-term orientation follows tradition, focus on quick results, and not save for the future. The difference of 25 in this category suggests that there are implications for the performance of the Thai knowledge workers and the most appropriate ways to motivate them.

The researchers summarized five cross-cultural discontinuities from the data collected. The first cross-cultural discontinuity determined was the concept of work completion. There were differences between the two groups in what was the expected outcome of work completion. The German managers were unsatisfied with the completed work that they received from the Thai software developers. They stated that the completed work was not complete according to their standards for the software products had important missing components or non-functional parts. Thus, there is a difference with the standard of product accomplishment between the Thais and Germans. To overcome this cultural discontinuity of work completion, a checklist can be utilized for the Thai workers to make sure the work is complete and of high quality according to what the Germans would expect to be a finished product. This can also be related to the long-term orientation cultural dimension that Germans encompass in their society, so they are more likely to persist in completing their work thoroughly while the Thais who have a short-term orientation finish when they think their work is good enough. Furthermore, Germans have scored high in masculinity, which relates to success and accomplishment while Thais focus more on better quality of life and personal relationships. The important conclusion to take from this observational study is that when offshoring practice is adopted into business practice, the business must be cognitive of the cultural traits and be expected to accommodate these differences to manage their project outcomes. By under-

Figure 6. Interview of German team member (Mantalay & Chakpitak, 2015)

> "...I have not spoken to some team members, but they seemafraid to speak. If we have group meetings or videoconferences they don't talk, and this means they are not communicating. So you only have one or two people who are communicating with us and these people have to communicate for the others..."

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

standing these cultural aspects, it can increase the effectiveness of management, which is necessary to have success in offshore business activities. Understanding culture is useful for developing economies like Thailand to ensure productivity and high-quality service is met (Galli, 2017).

The second cross-cultural discontinuity noted by the researchers is the power distance relationship due to the differences in communication styles. The Thai software developers tend to rely on a few members of the group to represent their team to speak on their behalf during group meetings or discussions for work. The Germans are more open to taking active discussions about work while the Thai developers feel hesitant to share their thoughts or ideas. Language is primarily the main barrier to this communication problem that is present.

The third cross-cultural discontinuity addresses the differences in learning style and needs. The Thai developers have a business style where they are accustomed to following orders and commands than carrying out the work by themselves. German managers will try to engage the Thai employees in creative ideas to finish their activities, but this is not always efficient or successful. Their work style differences can negatively impact the project's success if not taken into account because if clear instructions are not given to the Thai software developers, many flaws and glitches are found in the final product, or the product is not completed because they cannot finish the work without given clear work tasks. Better work outcomes can be accomplished possibly if German managers oversee the Thai employees work and give them guidance thru their work. As the results from the interviews and discussion groups showed, the Germans place a high value on individualism while the Thais prefer groups that can be attributed to their autocratic work style.

The feedback needs differ between the Germans and Thai, which can cause strain in their work relationships. This fourth cross-cultural discontinuity shows that Germans are more direct and expressive when giving their workers comments about their work. They expect changes to be made when they feel the work is not satisfactory giving constructive criticism. But Thai employees take these feedbacks personally and feel like the German management do not like them and are discouraged to continue their work. This can lead to less contact with the management, confidence levels dropping, and frustration. These effects will be detrimental to the project management and create a negative work environment for the workers. With unhappy and frustrated workers, they will be less inclined to be innovative and efficient in their work performance. With less contact with management, relations are not solid, and trust is not formed between the team members. These effects will ultimately lead to low-quality products that are mainly attributed to the cultural dimension of masculinity and femininity where the Thais value working environment and relationships.

Because of the cultural differences, time management is a cross-cultural discontinuity experienced and evident from offshoring practices. Problems can be encountered when Thai software developers are unable to complete their final version of a software product. They spend a longer time than the Germans in completing a project. Thus, this creates a delay in the project's completion, which decreases efficiency. Proper time management must be constructed to ensure work activities can be met on deadlines and that the Thai employees have the information and instructions to complete the projects correctly properly (Galli & Kaviani, 2017).

Khan and Azeem (2014) also explored the intercultural challenges in offshore software development outsourcing relationships thru a systematic literature review study. They identified intercultural challenges in OSDO (Offshore Software Development Outsourcing) relationships by calculating their frequencies thru past literature and found that "national culture" is the most common challenge mentioned. More than half of their sample mentioned national culture as an intercultural barrier with the frequency of 55% (see Figure 7).

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 7. List of challenges along with reference (Khan & Azeem, 2014)

6	difference in mutual understanding	14	23	(4)(5)(8)(36)(39)(43)(11)(14) (15)(19)(54)(55)(60)(57)
7	attitude towards authority	12	20	(1) (2) (3) (5) (37) (6) (38) (43) (12) (52)(25)(10)
8	work ethics	12	20	(1)(2)(3)(4)(35)(5) (36)(37) (53) (6)(38)(52)
9	response to time	9	15	(4)(8)(11)(12)(15)(17)(30) (44) (56)
10	education system	3	5	(1)(2)(3)
11	professional culture	2	3	(1) (34)

Language, ethnic group's norms and values are all encompassed in the national culture dimension. Language and language proficiency was the 2nd most common intercultural challenge identified with a frequency of 52%. Language barriers can potentially lead to miscommunication or misunderstandings. In an OSDO relationship this is more common because even if both parties speak English as their common language, there can still be misunderstandings because of cultural differences. Strong accents and slang terms can also be problematic and hinder communication as well. Team members that are less proficient in the language being used to communicate may also feel reluctant to ask for help when needed because of the fear of looking incompetent and thus results in poor work outcome. 52% of the papers describe language as a critical intercultural challenge. Therefore, ensuring that language is properly translated, so knowledge transfer is effective, miscommunication can be prevented and avoided. Com-

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

munication is especially important in software development because proper instructions and commands must be understood for the work to be completed correctly and to construct a high-quality product. So if one team member does not understand another team members, knowledge transfer does not occur, or communication gets lost in translation which can lead to defects in the work product. This will lead to increased costs to fix these problems and setbacks in project's deadlines.

Organizational culture has a frequency of 33% suggesting that culture can be a hindering factor in collaborating on a project for there can be clashing views on how to approach a problem between the team members due to cultural differences. For instance, engineers from America versus engineers from Europe had different methods on up-front design. While the Europeans lean more on the initial design effort, the Americans proceed quickly on implanting the design. This cultural difference can interfere with collaborating with each other when organizational cultural norms conflict in problem-solving methods. This difference can create conflict and negativity among the group thus being a negative impact on the project management process. Ways to approach a task are different between organizational cultures. Therefore, it is necessary for teams to know the other team's methodology in approaching tasks to construct proper coordination. If you ignore these differences, it can end up jeopardizing business relationships so knowing these cultural differences will help to accomplish objectives.

The difference in social behavior is another challenge identified in 25% of the papers. The different social behaviors such as social norms or social relationships affect the collaboration effort seen in the relationship among the team members and thus their ability to share and transfer knowledge effectively. Different cultures also result in different communication style and attitudes which both are mentioned 23% frequency that can lead to decrease in trust, collaboration, and communication. Having mutual understanding is critical for being to communicate in OSDO relationships effectively.

Furthermore, Niazi et al. (2016) findings thru a systematic literature review on the challenges involved with project management in global software development showed that the most common project management challenge identified in global software development was the "lack of cultural understanding in teams" with a 62% frequency in the 101 studies selected. Cultural difference is a major problem that arises because the teams are separated by a large geographical distance and thus have different cultural backgrounds. These cultural differences are a challenge for project managers because it can lead to miscommunication, misunderstanding, and language barriers. For example, in some culture, if you talk or intervene when someone else is speaking, it is considered rude. Especially in Asian countries where cultural norm is to listen and not interrupt the speaker and to follow orders from their superiors, this can pose a problem when communicating for many managers want feedback or criticism from their employees, but the employees are used to just following orders and not providing opinions. In European cultures, directness is a sign of honesty, trust, and respect. But in many other cultures, directness is taken for rudeness and disrespect. This type of misunderstanding causes unnecessary conflict, high levels of distrust and friction between the head office and offshore management. This can be avoided with an increased understanding of how people from other cultures communicate.

Also, many times the offshore vendor do not speak English well so communication can be a challenge for messages or instructions can be interpreted differently leading to unanticipated or unwanted results. Therefore, lack of cultural understanding" can lead to other risk and challenges to project management such as lack of communication and lack of trust which both negatively impact the global software development process (Galli, 2017).

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Lack of communication was the second most commonly mentioned challenge with a frequency of 54%. The geographical distance and time difference are the reasons for the cause of this challenge, which leads to problematic issues when dealing with executing project management properly. There is a direct relationship with the degree of communication on the results of the global software development project's success. Without adequate communication, projects can potentially fail as presented by Ericksen and Ranganathan (2006) who described a case where an offshore software development-outsourcing project did not succeed due to lack of communication. Communication can involve face-to-face meetings or thru media sources as e-mail or instant messenger systems. Whatever communication style is being used, it must be done appropriately to make sure messages are being relayed and understood correctly. Without doing so, this could cause more delay in the project's timeline or misunderstanding of requirements and can even jeopardize the relationships between the two parties.

Similarly, Chadli et al. (2016) identified risks and categorized them into subcategories of "task-actor interdependency" and "task-structure interdependency." For the risk factors related to "task-actor interdependency," the most commonly cited risk was "language and terminology differences between the development sites which can result in misinterpretation and uncovered information" (See Figure 8). Language differences can lead to ineffective communication, which can negatively impact all aspects of the project management lifecycle. Difficulties can also arise caused by different knowledge levels or knowledge transfer problems. Related to the language barrier, lack of effective communication such as decreased communication spontaneity, frequency, or richness can cause problems with knowledge management. Furthermore, due to the different locations, inability to communicate in real time due to

Figure 8. Risk factors related to "Task – Actor" interdependency (Chadli et al., 2016)

Risk Factors	Reference
1. Language and terminology differences between development sites can result in misinterpretations and unconveyed information	[6], [20], [26]–[32]
2. Difficulties caused by different knowledge levels or knowledge transfer problems	[6], [20], [27], [33]
3. Lack of effective communication (decreased communication spontaneity, frequency and richness) causes problems with knowledge management	[5], [6], [20], [26]–[28], [31], [32]
4. Inability to communicate in real time due to limited overlapping work hours causes collaboration problems	[6], [20]
5. Task uncertainty represents lack of information needed to develop the software, and it can result in slow change coordination and process and relational conflicts	[6], [20], [34]–[36]
6. Poor documentation	[26], [27], [31]
7. Limited working experience in a GSD environment	[6]

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

limited overlapping work hours causes collaboration problems. Poor communication can lead to task uncertainty because of the lack of information needed to develop the software. This can result in slow change coordination and process and relational conflicts as well. Other risk factors identified were poor documentation and limited working experience in a global software development environment, which can all negatively impact the project's success.

Betz et al. (2014) identified language problems as a major problem area involved in offshoring activities. English is not the primary language in countries like Germany so misunderstanding can occur more frequently. Thus, it can be frustrating when the vendor and client are trying to communicate, but they cannot understand because of the different dialects. And sometimes the original meaning of communication can get lost in translation further creating a language barrier. Problems reported with offshore representatives include not being able to understand their reasons for calling, their accent, and their natural, cultural affinities. Information cannot be exchanged properly because of the different linguistic background of the team members, which is a problem. The third problem relates to the second problem of the language barrier where it addresses how offshore team members do not understand specifications. Since communication is not allowing knowledge to be exchanged, the team members receiving the instructions or work tasks do not know how to meet the demands. Usually, this results in limited feedback as well which will result in poor deliverables (Galli & Kaviani, 2017).

Khan et al. (2014) also were able to identify certain risks associated with global software development thru a systematic literature review approach. Similarly, to other researchers, they were able to identify that communication is a challenge especially when there is the geographical distance between the teams because cultural backgrounds are different, language preference may not be the same, and also the time difference can present as a challenge as well. Lack of cultural awareness and intercultural skills is a major obstacle to successful communication between project members. Project management such as coordination skills, technique, and competence is required because decisions need to be dealt effectively. Group relationship, team member's value, and team's collaboration effort are other factors identified that can affect the global software development project's life cycle.

4.3. Risk Three: Geographical Distance and Time Difference

Geographical distance category takes into the account of risks involved with different time zones and geographic location which are inevitable challenges associated in global software development companies that have vendors and clients in two separate locations Blomqvist et al. (2015) portrays this challenge thru their study that highlight the experiences of employees and managers in a Swedish company that offshores its IT services to India. The researchers divided their findings into four dimensions from the impacts of offshoring, which include: organizational, operational, cultural, and economic aspects. The first highlight how offshoring results in changes to the organization of work and labor in companies. Like other past researchers, their case study firms have allocated non-strategic and routine work tasks to India while the onshore company handled the more executive software development tasks. Since the onshore site handled work tasks that required more technical expertise, this creates a division of labor that increases job enrichment for onshore employees who are assigned to more critical responsibilities. Thus, the onsite employees feel they play a bigger role in part of the project management work duties.

Because the onshore and offshore sites are geographically distant from each other, there are many problems that can arise because of this distance. The third dimension the researcher's highlight is the cultural dimension. Miscommunication is common and often a result of cross-cultural communication

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

problems. The work ethics and backgrounds among the Swedish and Indian teams are significantly different which can lead to decreased efficiency and strain in the work environment for both teams. Language is also another barrier. For example, many of the Swedish employees find it hard to understand the Indian pronunciation of English. Some employees never got used to the Indian accent or could not understand what their Indian colleagues were saying. To deal with this language barrier, some teams resorted to using only written forms of communication and never even talked with each other. Many of the team used media forms of communication such as chat room or e-mails rather than phone calls. This method seemed to work well and was easier than talking and trying to understand what their counterpart was trying to convey. However, this decreases face-to-face meetings and minimizes interactions, which can present some drawbacks especially when trying to resolve conflicts. Businesses can lose sales or money because of miscommunication, and there's a greater risk of that when relying on electronic means to carry the conversations.

Thru another case study report about an outsourcing global software development between an Indian IT vendor and an IT development division of a Danish bank. Matthiesen et al. (2014) reinforce the idea of how global software development with ITS presented a challenge for IT developers because they had to find ways to collaborate globally and make their project management go well. Another result from outsourcing is increased work for IT workers because of effort required to handle the dependencies across geographic distance and time differences. There are challenges especially in understanding the contextual information correctly about the work task given to IT developers in the Indian sites by the business employees in Denmark. The ITS workers frequently wait for the Bank IT employees in Denmark to respond to them on matters that concern documentation or answers to their questions about the work assignment. The researchers attended a meeting at the Danish site to observe how tasks were clarified between the business developer in Denmark and the IT developer in India. Although the Danish worker tried to explain and provide additional information on a work task to the Indian worker, both parties could not understand the instructions for the work tasks as shown by the observational notes taken during their interaction (see Figure 9). The observation highlights that the Indian worker does not understand the issue and that there is miscommunication that needs to be addressed.

Figure 9. Work Instructions (Matthiesen et al., 2014)

James says he will then ask his system manager who initially made the design decision [...] "I understand, there is no reason for us to go through it!" James says. It seems like he is explaining to Nikhil that he fully understands the issue; however, he is not able to give more relevant information before he has discussed this matter with the system manager. (Observation notes, Denmark, 10/04/2012)

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

The Indian IT developers rely on the Danish business developers to receive the correct instructions or information to perform the work task. But the one who creates the work task and its description is the systems manager who rarely attends these kinds of clarification meetings because of other responsibilities that need to be attended to in the company. Therefore, since the correct information is not being exchanged or understood by both parties, the work task is not accomplished correctly or not met, and thus problems arise. This challenge ultimately forces the Indian developers to continuously ask for clarification of work tasks which delays the project and efficiency overall. For example, the Indian IT developers were eager to get more information about the work task during an observation between the developers in a voice meeting (See Figure 10):

Furthermore, a lot of time is spent waiting for the Indian IT developers for the Danish team to respond back to them, but they cannot receive the information making it hard to proceed with the work. The language barrier is a common obstacle faced by the IT developers and project managers. Observation from audio conference meetings with IT developers illustrate the frustration faced by the IT developers (See Figure 11):

Many prefer other forms of communication like email or instant messaging system. Communicating thru this social media tool is highly preferred by most employees.

Niazi et al. (2016) also discussed the issue of the geographical distance and "lack of management of time differences" which is potential risks to global software development in 40% of the articles. Because the client and vendor are usually in different locations, there are inevitably in different time zones so it will create a challenge in coordinating activities. Usually, the hours that the client is working do not overlap with the hours that the vendor is working so there is no ideal time where communication can be involved. This leads to delay in responses when immediate or urgent action is required to proceed with an activity. Because of this factor, it negatively impacts global software development projects by causing delays in response time.

Figure 10. Work Instructions (Matthiesen et al., 2014)

> *As Shashi gets to speak, it's really mostly about some other tasks than what the meeting would be about, and it is welcomed by James [...] Shashi sees a chance just to get some updates on some other issues, a kind of briefing, as well as to get some advice from James. (Observation notes, India, 10/03/2012)*

Figure 11. Work Instructions (Matthiesen et al., 2014)

> *Martin says several times that it is "difficult" and that he normally tends to evade these kinds of meetings. "It is different for Allan [the Danish colleague also present at the meeting]: he talks to them every day and has done so for a year or more." (Informal talk, Denmark, 10/04/2012)*

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Chadli et al. (2016) discussed the risk factors related to "task-structure interdependency" and the most common risk factor mentioned is the temporal and geographical distribution which complicates the project manager's ability to plan, coordinate, and control project progress. This also relates to the different time zones and limited face-to-face interaction, which incurs extra traveling cost, makes virtual meetings harder to plan and thus weakens social relations. Poor risk management, traceability, and quality management are also risk factors mentioned that can lead to poor detailed planning that negatively impacts task allocation and leads to some work being done twice and other work being omitted. More time and cost must then be spent on fixing these problems that could have been avoided if proper project planning was implemented. Because additional costs are incurred and additional time is needed to re-do the work, this will lead to decrease in the efficiency of a project which is an undesirable result (Galli, 2017).

Betz et al. (2014) discuss the temporal and spatial distance challenge of knowledge transfer in offshore outsourcing development projects in the perspective of German clients. Because the time zones are different, there is usually only a limited period to allow for the teams to communicate. This becomes problematic when a member of the offshore team needs to decide an onshore team and cannot do so because of the time difference. Usually, the working hours or the offshore site is opposite to the working hours of the onshore base. An offshore employee may be working on off-hour times of an on-shore employee, so when the off-shore employee needs a conflict to be resolved or more information to proceed with the next step in the software development, the issue cannot be attended to immediately. Thus, the decision is delayed, and the project cannot be completed on time. Meeting face-to-face becomes a challenge as well because large geographical distances separate the teams, and thus communication must be done thru other informal means such as electronic emails, videoconferences, and instant messaging network.

Kamaruddin, Arshad, and Mohamed (2012) carried out a literature survey to gather information about the communication challenges that arise in Global Software Development particularly in a company that uses the agile method where communication is very vital between the software developer and its client. Issues that were related to the communication process in Agile Global Software Development were identified from forum feedback information primarily. Being able to identify these issues is important because it highlights the real problems that had occurred in Agile Global Software Development. Communication is an important aspect of the global software development because knowledge transfer can only be performed correctly and efficiently if there is understanding of the work activities between the team members. The researchers identified 13 issues that were challenges faced by workers in Agile Global Software Development which included: different culture, different language, different project background, lack of frequent face-to-face contact, lack of trust, lack of customer involvement, lack of commitment or teamwork, different working hours or time zones, miscommunication of requirements, low quality of telecommunication or bandwidth, high communication cost, unprepared communication tools, and poor communication infrastructure (see Figure 12 and Figure 13). Based on these identified issues that are related to communication, it will somehow help researchers and business managers to acknowledge these real problems that had occurred in Agile Global Software Development (Galli, 2017).

Figure 12 present the issues that are current challenges due to the vast geographic distance between the two teams that potentially create chaos to the project's lifecycle. The table highlights many of issues addressed in literature, but the main issues that relate to the issue of far distance are the lack of frequent face-to-face contact, lack of trust, lack of customer involvement, lack of commitment/teamwork, and different working hours/time zones. Because of the vast distance between the teams and low budget for travel to cut costs, instead of communicating face-to-face, the teams would conduct video confer-

ence calls and uses more asynchronous communication methods to communicate. This informal way of communication used because of lack of face-to-face meetings would impact the teams by decreasing relational bonds and collaboration, which can lead to lack of trust. Also, because communication relies more on asynchronous methods, this leads to lack of customer involvement because of infrequent interactions. Customers will be less inclined to be fully committed during the project development because the relationships are weak. Although teamwork is required to produce a good quality product, the software development teams communicate and collaborate less because of the distance. This informal communication leads to lack of team spirit because there is no sense of teamwork established. The remote

Figure 13. Conceptual model for communication issues (Kamaruddin et al., 2012)

distance inevitably results in time zone difference, which increases the communication gap. This will lead to difficulties in scheduling group meetings that is during a time where both teams are in working hours (Galli & Kaviani, 2017).

4.4. Risk Four: Lack of Trust

Another challenge that outsourcing and offshoring of software development face are establishing trust with vendors. Trust is imperative in successful outsourcing and offshoring of IT projects. Working and dealing with a project team in another country or location itself is challenging enough due to the time difference, culture difference, and language barrier. Niazi et al. (2013) states that trust plays a vital role in establishing the offshore software outsourcing relationships between client and vendor organizations. According to the research conducted by Niazi et al., 2013, researchers agree that trust plays an important role in GSD in establishing relationships. Client and vendor that are willing to establish a relationship, in general, are more likely to result in a positive desired outcome. By having a strong trust with the vendor, it is more likely to complete projects.

In the research conducted by Nidhra et al. (2013), the authors found that trust plays an important role in KT. As discussed above, KT plays a key role in GSD, and yet it is one of the biggest challenges project manager's face when working on a GSD project. Through the SLR they conducted, the authors were able to learn that there is a strong relationship between trust and knowledge sharing among the client, onshore, and offshore team members. Mutual trust is essential for knowledge sharing and success in outsourcing and offshoring. Also, the authors conducted Interview to compare challenges identified from the SLR. The interviewees also mentioned how trust is important in success in KT, which leads to success in GSD. The Interviewees mentioned that trust is essential to the project success in GSD because if knowledge is sensitive or confidential, lack of trust affects transferring such knowledge. Similarly,

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Blomqvist et al. (2015) also Interviewed managers and software developers involved in GSD to identify challenges involved in GSD. Their study also argues that trust is another factor that plays a key role in KT, which leads to success in GSD.

Because of the distance and minimal interactions, offshoring presents the challenge of creating confidence and trust among the onshore managing company and the offshore software outsourcing team. To further enlighten the factors involved that are important to establishing trust in offshore software outsourcing relationship, Niazi et al. (2013) identified a list of factors thru a systematic literature review study. Understanding these factors is necessary to help guide offshore software outsourcing companies in handling these issues that are related to establishing trust. By being aware of these challenges that are related to human resource, this may also help ensure a successful project result and maintain positive long-term relationships between the client and vendor.

Their results showed that 50% of the factor was attributed to "face-to-face meeting" which was the most common factor (see Figure 14). The second most common factor was "better communication" which was identified in 44% of the literature. Communication is important for the establishment of trustworthy relationships between a client and its vendor. The third most common factor was "contract management between client and vendor" with 39% of the literature citing this factor. There are many risks involved when a contract is made between a client and vendor that can happen during the preparation for the outsourcing business practice, during the contract phase, or after the contract phase where there can be overlooked mechanisms and increase risks.

Furthermore, 33% of the literature have identified "reliable management," "mutual expectations," and "better client and vendor relationship" as critical factors. When using outsourcing tactics in business, most companies do not take into account unanticipated results that can occur. They fail to recognize unexpected outcomes and projects fail because of factors such as physical time, cultural differences, organizational difference, and lack of knowledge transfer, which are not anticipated. Therefore, these outsourcing problems can be addresses thru "reliable management," "mutual expectations" and "better client and vendor relationship" which will help to create trust in relationships between the client and its vendor.

Other factors important for establishing trust are "knowledge sharing" which was reported in 33% of the literature as well. By sharing knowledge, it helps the team members to have the important information and skills they need that need to be used to develop software. It also confirms an effective and well-communicating outsourcing relationship over time, which establishes trustworthy bonds. "Training programs" can also help to establish a trust for having a skilled staff is what will determine the impact of quality on the project's result. Being able to provide the training to increase an employee's technical skills to better compete in the offshore software outsourcing world will benefit the project's outcome and the company itself. The IT industry requires highly skilled employees who can competently produce products with high-quality performance. Offshoring outsourcing companies need to be trustworthy and have reliable management methods to maintain good relationships between a client and its vendor.

Trust is the main factor needed for having a successful outsourcing relationship. 39% of the literature has cited "defining processes, tools, procedures, and policies" as another crucial factor that is important for building trust in these relationships. By having defined and structured mechanisms, this can increase the success of outsourcing activities, which will ultimately lead to higher quality products and client service. Because of globalization and advancements in the software technology, companies must consider using outsourcing strategies to take advantage of the cost savings and potential high-quality products

they can obtain from offshore vendors. For example, Indian software companies participate as being vendors for offshoring companies because they produce high-quality software and thus they dominant as the primary offshore software-outsourcing provider.

As the number of software outsourcing contracts between companies is increasing, there is a greater understanding of how trust in software outsourcing relationships plays a pivotal role and is critical to success. Understanding the factors that are required for building trust between a client and its vendor will increase the project's success in offshore software outsourcing projects. As shown thru the results of their study, there are many factors involved that are of vital importance when establishing relationships between offshore software outsourcing parties. To have a solid and stable relationship, the offshore software outsourcing company needs to have clear management strategies, strong communication skills, and be trustworthy. Therefore it is indicated for companies to focus on the factors identified thru the systematic literature review study of the most frequently cited factors to incorporate into their business strategy when they offshore software activities.

"Lack of knowledge management and transfer among teams" was identified in 38% of the literature according to Niazi et al. (2016) (See Figure 15). Knowledge transfer refers to transferring of knowledge from one part of the organization to another. If knowledge transfer of a particular task or role is not done properly, then the quality of the work is diminished, or products are not made properly. 35% of the article mentioned "lack of coordination" which can be caused by the time difference as well which is present in many different development sites. Another key challenge and addressed in Niazi et al. (2013) study is creating confidence and trust among the client and vendor relationships. They found that 34% of the articles identified this as a project management challenge. Trust is a critical factor in a client-vendor relationship for a well-established one will yield a positive outcome. It is difficult to create a strong, trustworthy relationship however when the members are separated by a big geographical distance.

4.5. Risk Five: Software Quality, Efficiency, and Productivity

The software produced in the global software development is affected by factors that include quality, cost, and vendor partners ability to deliver the product. In their study, Blomqvist et al. (2015) addressed the operational aspect of offshoring where there is need to make new methods or processes for knowledge transfer. One way to address this challenge is to increase documentation. From their study, two companies used this strategy to confine the work tasks in a way that they can be offshored to an off-site and decrease the company's reliance on an individual employee. Some companies invest a lot of time and effort into implementing increased documentation, but there are some problems associated with it, which are decreased efficiency, increased work labor, and deskilling. Thru the analysis of interviews conducted for this case study, the employees stated that it was very time-consuming to document knowledge to transfer it to another cultural context. By doing so, it also removed the core focus of the original intent of the work task.

In other companies, documentation was less of a problem. Instead of incorporating an increased documentation strategy, the companies included their Indian colleagues as part of their team throughout the whole process. By having their clients team members more active and participate actively in their partnership, this resulted in increased teamwork, cooperation, and communication. The knowledge transfer was handled more frequently thru a face-to-face or voice-to-voice basis, which minimized the need for documentation in KT activities. This method of handling KT also increased pride among the employees in their work and accomplishments, which yielded positive results.

Figure 15. List of challenges identified (Niazi et al., 2016)

Challenges	Freq. (n = 101)	%
Lack of cultural understanding in teams	63	62
Lack of communication	54	54
Lack of management of time differences	42	42
Lack of knowledge management and transfer among teams	38	38
Lack of co-ordination	35	35
Lack of trust	34	34
Geographical distance	28	28
Requirement engineering activities	28	28
Lack of control	27	27
Lack of team awareness	23	23
Change management activities	22	22
Lack of a uniform process among different development sites	19	19
Allocation of tasks	18	18
Conflict management	17	17
Cost and effort estimation	15	15
Integration activities	14	14
Risk management	14	15
Lack of proper IT infrastructure	10	11
Protection of intellectual property	8	9

Khan and Khan (2017) conducted a systematic literature review where they highlighted a list of challenges faced in offshore software development outsourcing (OSDO) in globalized software engineering companies (see Figure 16). As shown in the results of the table, 64% had the highest frequency, which was due to lack of project management. There are many factors associated with this challenge, which include miscommunication, time differences, miscoordination, and lack of knowledge management. The 2nd highest frequency reported was poor monitoring system with 51% and the 3rd highest frequency was due to the lack of outsourcing relationships management with a reported 50%. More than half of the articles reviewed by the authors mentioned "poor monitoring system" as a challenge that negatively impacted outsourcing companies. This can be explained by the lack of cooperation or proper monitoring system for outsourcing work tasks. Reasons for lack of outsourcing relationship management can be attributed to the under-resourcing of contract management, staff that is not qualified or inexperienced, which are major concerns for the success of OSDO.

The researchers further analyzed the challenges in OSDO based on time periods to determine whether or not these challenges carried with the passage of time. They divided the time into two periods in which the first half spanned from 1992-2002 and the second half spanned from 2003-to mid-2012. Results from their linear-by-linear association chi-square test to determine the significance of the challenges across the time periods revealed that there is no significance determined. It is significant in the frequencies of the challenges across the passage of time. The challenge of "lack of project management" significantly decreased from 71% to 63% from the two time periods suggesting that this challenge is recognized and thus work was done to minimize it (see Figure 17). The "lack of outsourcing relationship management"

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 16. List of challenges in OSDO contract (Khan and Khan, 2017)

S no.	Challenges in OSDO contract	Explanation of the challenges	Frequency: $n = 127$	Percentage of factors occurrence
1	lack of project management	poor project management by vendor organisation	81	64
2	poor monitoring system	lack of control and checking	65	51
3	lack of outsourcing relationship management	poor outsourcing relationship between the stakeholders	64	50
4	cultural and linguistic issues	lack cultural understanding and language barriers	54	43
5	non-competitive price	high cost	54	43
6	IPR and regulatory issues	lack of knowledge of intellectual property rights and conde of conduct can effect outsourcing contract	49	39
7	failure to manage end-user expectation	failure to fulfil user's requirements in full	47	37
8	lack of negotiation strategies	lack of negotiation policies in case of conflict that may occure in outsourcing relationship between client and vendor organisations	46	36
9	unforeseen contingencies	hidden costs such as employee turnover, system crash, financial problems, political problem	41	32
10	contractual inflexibility	static contract increases the failure rate	37	29
11	political instability	instable situation in country decrease the chance of contract completion	34	27
12	lack of vendor's capability, viability and responsiveness	poor intreset of vendor in contract management reduce the chance of its success	33	26
13	high turnover of vendor employees	switching of vendor employees effect the project success in due time	30	24
14	inadequate specification and outsourcing plan	incomplete requirement also effect the smooth completion of contract	21	17
15	lack of quality control process	inproper check on quality control effect the success of contract	19	15

Figure 17. Period wise list of the challenges in OSDO contract (Khan and Khan, 2017)

Challenges in outsourcing contract management	Sample size find through SLR ($n = 127$)				Chi-square test (linear-by-linear association) $\alpha = 0.05$, df = 1	
	First period (1992–2002) ($n = 14$)		Second period (2003–2012) ($n = 113$)		χ^2	p
	Freq	Percentage of occurrence	Freq	Percentage of occurrence		
lack of project management	10	71	71	63	0.395	0.529
lack of outsourcing relationship management	6	43	58	51	0.355	0.551
cultural and linguistic issues	7	50	47	42	0.357	0.550
poor monitoring system	9	64	56	50	1.073	0.300
IPR and regulatory issues	7	50	42	37	0.859	0.354
non-competitive price	8	57	46	41	1.366	0.243
lack of negotiation strategies	5	36	41	36	0.002	0.967
unforeseen contingencies	3	21	38	34	0.841	0.359
failure to manage end-user expectation	7	50	40	35	1.130	0.288
high turnover of vendor employees	5	36	25	22	1.265	0.261
lack of vendor's capability, viability and responsiveness	5	36	28	25	0.768	0.381

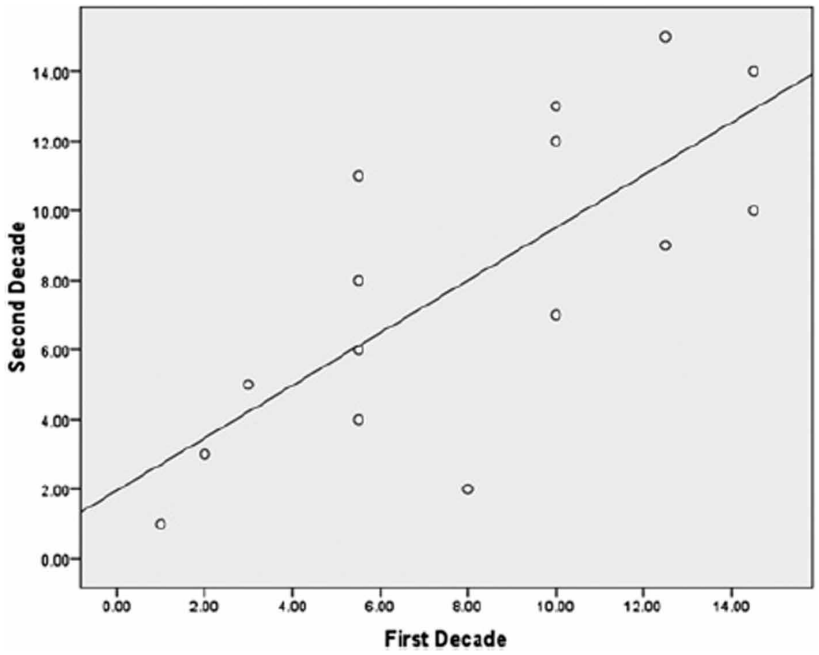
political instability	2	14	32	28	1.241	0.265
inadequate specification and outsourcing plan	2	14	19	17	0.057	0.811
lack of quality control process	3	21	16	14	0.513	0.474

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

challenge increased from 43% to 51%. All the other challenges identified such as culture and linguistic issues, poor monitoring system, IPR and regulatory issues, non-competitive price, lack of negotiation strategies, and failure to manage end-user expectation are reduced in the second period also suggesting that the software companies are learning to deal with these challenges and how to handle them properly.



Performing a correlation analysis using Spearman's rank correlation coefficient performed further analysis. The results from the correlation analysis between the ranks of the challenges over the two time periods were 0.745 showing that there is a strong positive association that is present among the challenges across the two time periods (see Figures 18 and 19).

Figure 18. Spearman's rank correlation (Khan and Khan, 2017)

Challenges in the adoption of outsourcing contract management	Sample size find through SLR ($n = 127$)			
	First period (1992–2002) ($n = 14$)		Second period (2003–2012) ($n = 113$)

Figure 19. Scatter diagram of relationship among the challenges across the two periods (Khan and Khan, 2017)

When the challenges were analyzed based on the size of the organization, the results showed that there were nine challenges associated with small organizations whereas there were nine challenges associated with medium-sized organizations and 11 challenges associated with large sized organizations. Size was not a determinant for the first five challenges such as "lack of project management", "lack of outsourcing relationship management", "culture and linguistic issues", "poor monitoring system" and "IPR and regulatory issues" for they were all equally critical factors for small, medium, or large organizations. Lack of project management was the biggest challenge for the small organization, but all the challenges were significant so small organizations must be prepared to avoid or prevent these thru proper planning skills. More challenges were associated with the size of the organization increased. The challenge "unforeseen contingencies" was determined to be significantly different between the different sizes of organizations. The small-sized companies had 0%, which means they do not encounter this challenge at all possible because they only deal with small projects where there is a fixed cost while larger organizations are usually dealing with outside contractors, and thus have more likelihood of encountering unforeseen contingencies (see Figure 20).

Niazi et al. (2016) further explored the challenges by categorizing the challenges into client-vendor categories. They identified the viewpoints of both the client and the vendor using a Fisher Exact test (See Figure 21). Comparing the challenges identifies in client and vendor organizations, there were more similarities identified than differences. The most common challenges in client and vendor organizations were: lack of communication, lack of cultural understanding in teams, lack of knowledge management and transfer among teams, and lack of management and time difference. There were two significant difference notes thru the analysis comparing the client and vendor organizations. Vendor organizations are more concerned about the cost and effort estimation challenge than the client organizations, which are

expected because there is much risk, involved in their investment. Also, requirements engineering was identified as an important factor in global software development because most of the failures encountered are associated with requirements involved in the engineering process that can affect the effectiveness of the software development process.

Colomo-Palacios et al. (2014) analyzed the project performance from different perspectives in global software development. Their results showed the gap between the planned duration and actual duration is greater in offshore teams than in-house teams for global software development projects. This shows the challenges in project management that are faced for global software development teams because of

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

its complex work activities leading to difficulties in meeting deadlines. Previous literature had shown that there is a difference in the performance of the offshore and inshore teams regarding the difference between planned duration and actual duration. Because of this, more effort is required in offshore teams, but as a result, it leads to lower performance consequently. Offshore teams also require more effort than in-house teams (see Figure 22). Data also shows that there is lower productivity measured in the offshore teams than in-house teams. In-house teams are managed more promptly than offshore teams, which lead to higher production rates. Therefore, the low production rate seen in offshores teams can be attributed to management challenges in communication and coordination. There was greater number of defects in the results of the projects seen in offshore teams versus the in-house teams because probably the offshore teams handle projects with fewer function points, which decrease the quality of the software product. Thus, the challenges faced by global software development teams manifests in the low level of quality and productivity seen thru the results.

Betz et al. (2014) identified problems concerned with the backflow of knowledge that does not take place because the knowledge is not transferred. Because of this, it can potentially result in an increase in labor costs due to more cost spent on communication between the team members. Situations will arise where the knowledge is not transferred, and thus project planning ends up not being accurate. Thus, more expenses must be made to fix this problem. So, thru this process, there is the risk of the cost of knowledge transfer not being known or accounted for.

Companies that seek to expand their business globally have been forced to outsource or offshore activities to outside countries because of increasing competition. Particularly Asian countries have been appealing to many companies, especially small and medium enterprises or SMEs, who are attracted to the global opportunities offshoring offers but may not have the resources to deal with certain obstacles, in particular, the management of employees in a cross-cultural work environment (Mantalay & Chakpitak, 2015). Therefore, a risk many companies face when incorporating offshoring/outsourcing business practices is cross-cultural discontinuities.

While the benefits of offshoring or outsourcing are well known, the challenges that arise are not well recognized regarding cultural discontinuity. Cultural differences are a significant barrier and risk that can be prevalent when businesses resort to dealing with activities abroad that manifest particularly in staff management. Understanding of culture awareness requires experience and practicality that does not become natural within a short period. It is important to develop this cultural awareness and understanding of cultural issues when operating overseas because it is fundamentally crucial to firms to manage staff and projects appropriately. It becomes more important to SMEs especially because they are most likely unable to have the expertise or financial resources to address these cultural issues that can potentially decrease their work quality and performance (Mantalay & Chakpitak, 2015). Therefore, understanding and dealing with cultural differences between recruited local knowledge workers and the firm's' expatriate management is a significant issue affecting SMEs who decide to offshore their activities.

Case studies have been conducted that highlight the cultural discontinuities that exist and how it affects the company's work performance and quality. A case study of a German software developer operating in Northern Thailand has addressed this particular risk focusing on knowledge work, which is highly susceptible to cultural differences because of its heavy reliance on communication, which can lead to notable conflicts.

Furthermore, there is an intimate relationship that exists between culture and work performance that is related and complex. Managers must lead the group by managing locally recruits human resources. Therefore, managers must be competent in understanding how to effectively lead these newly recruit local

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

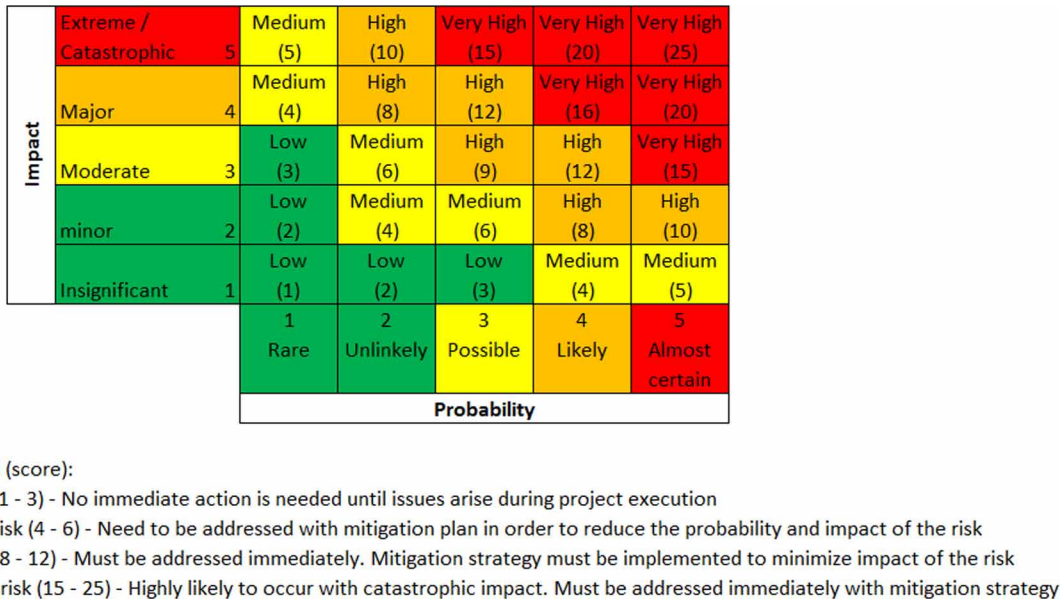
employees to perform well in activities allocated to them. However, many of these local employees have different expectations of management and conflicting differences in their work preparedness that is related to cultural disparities. Rodsutti and Swierczek (2002) observed that there is an association between the characteristic of managers and their cultural background with the work performance of the employees.

4.6. Risk Six: Human Resource

Human resource category incorporates risks related to managing workforce and functions of team members. A systematic literature review study conducted by Nidhra et al. (2013) stated that during an interview, one of the participants suggested that for a medium sized project, at least thirty percent of human resource at each tier of knowledge ranging from novice to expert should be maintained. This is because knowledge transfer is not properly managed most of the times. For instance, when an employee takes leave from a company, a replacement must be able to carry out the work tasks of that employee's position to continue the project. To do this, the knowledge must be transferred to the replacement so that he or she can continue the work and not hinder the project's lifecycle. It is necessary for knowledge transfer for a replacement be ensured so that when an employee takes leave, tasks can be continued efficiently and properly. To further address this issue, another interviewee mentioned that a well-planned knowledge transfer protocol should be implemented to account for the employee turnover. Thus, much collaboration effort is required especially in partnerships that work in remote distances to complete the complex tasks involved in IT development projects.

4.7. Risk Assessment Analysis and Evaluation



After the risks involved in the outsourcing and offshoring in GSD were identified, a qualitative analysis was conducted to analyze and evaluate each identified risk. The qualitative risk analysis tools and techniques from PMBOK, 5th edition was used. To further analyze the risks identified thru literature and past researchers, a risk assessment matrix was used as a project tool to prioritize and develop an effective strategy. A risk assessment matrix was created based on the probability and impact matrix described in PMBOK, 5th edition to evaluate the likelihood or probability of the risk and its severity of consequences (See Figure 23). Because this research focuses on the risks involved with outsourcing and offshoring in GSD, the identified risks were grouped based on their likelihood and the extent of damage or consequences it can incur. This is an effective way to determine the potential risks and its impact on the project.

Based on probability and impact matrix described in PMBOK, 5th edition, the level of impact is divided into five categories, which indicate the severity of damage that can occur, by the potential risk. These five categories are insignificant, minor, moderate, major, and extreme/catastrophic. The probability is the chance of the risk occurring during the project's lifecycle. This is also divided into five categories, which depend on the likelihood of the event occurring, which are: rare, unlikely, possible, likely, and almost certain.

Thus taking the probability and impact level into consideration, a formula can be used to determine the risk assessment level for each potential risk. A low-risk level, which is the green colored boxes, indicate that the level of risk is low, so no immediate action is needed until issues arise during project execution. A medium risk level, which is the yellow colored boxes, indicates that the level of risk of the medium so the risk needs to be addressed with a mitigation plan to reduce the probability and impact of

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 23. Risk matrix (probability and impact matrix, PMBOK 5th edition)

the risk. A high-risk level, which is the orange colored boxes, indicates that the level of risk is high so that must be addressed immediately. A mitigation strategy must be implemented to minimize the impact of the risk. Lastly, a very high-risk level, which is the red colored boxes, indicate that the level of risk if extremely high so it is highly likely that a catastrophic impact will occur due to the risk so it must be addressed immediately with a mitigation strategy.

Using this risk assessment tool, the identified risks were given a score for its probability and impact to determine its risk level. For probability, the risk that was most frequently identified will have the "Almost certain" and the risk with the least frequently identified will have the "Rare." The impact was based on our qualitative analysis above. Then, each risk is assigned with recommended risk strategy as described in PMBOK 5th edition. There are four strategies for negative risks (threats) and four strategies for positive risks (opportunities). The four risk strategies for negative risks are avoided, transfer, mitigate, and accept and the four risk strategies for real risks are exploit, enhance, share, and accept (PMBOK 5th edition).

Each identified risk can be undertaken by any one of these risk strategies. A risk mitigation plan is proposed for each risk, which is discussed in Section 5, Conclusion.

5. CONCLUSION

5.1. General Conclusions and Risk Mitigation Plan

Global software development is becoming the forefront of IT business world due to globalization. Many software developers are drawn to the benefits of offshoring and outsourcing their work activities, but they do not have the resources or methods to handle the risks and challenges associated with it. These risks

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

and challenges are harmful to the project's success so project manager should recognize these factors to ensure they are capable of dealing with it and not jeopardize their efforts. Besides identifying these risks involved, our aim of this research study is to provide a strategy to mitigate these factors.

Our findings contribute to the understanding of the risks involved in project management in outsourcing and offshoring business practice in IT software development projects. Through a systematic literature approach, we have categorized the risks into six main categories. Although there has been much research conducted on identifying these risks, not much research has been conducted as to how to manage these risks. Therefore, we proposed a risk response based on PMBOK, 5th edition to deal with these risks that firms can reflect on and refer back to when planning a global software development project.

After identifying and analyzing the identified risks from outsourcing or offshoring in IT project management, a risk mitigation plan was proposed for each risk. For the knowledge transfer risks, all of them can be mitigated thru an organized risk management strategy for they are all determined to be of the high-risk level category. Regarding the miscommunication that often occurs, we propose that by providing a translator during conference calls or during important meetings can help to mitigate this risk. A translator can bridge or ease the communication process thus facilitating meetings and helping to transfer knowledge more efficient. Although there may be an increased cost in using a translator, it would be expected that it is a necessary investment because communication is a primary risk factor that can result in negative consequences. Therefore, any means to mitigate this risk will increase the project's success and potentially ease the frustration felt by the team members when effective communication is not achieved.

The language barrier is almost always expected to occur in outsourcing or offshoring projects because the team members are located in two locations that are usually in different time zones and separated miles apart. The team member's primary language usually does not overlap contributing to the communication risk problem and thus the different linguistic backgrounds present as a challenge when communicating. Thus, to mitigate this risk, a translator can be hired to convey messages for the team members in English and local language to ensure proper communication. This will ensure that nothing is lost in translation and that both teams fully understand each other's messages as accurately as it can be to carry out their work tasks and activities. By doing so, it will facilitate the communication process and make sure that knowledge transfer is being completed appropriately.

Training departments can also deal with this situation by first incorporating a deeper understanding of the English language characteristics combine with basic linguistics training which will greatly improve the trainer's understanding of the needs of their trainees and how best to address those needs. The training programs should also be checked for effectiveness and be upgraded as needed regarding content, length of training, and performance objectives. The key to this is ensuring that all training material is contextualized for the industry in which the trainees will be working. Continued support should also be provided for the trainees and representatives. Language and communication raining is a long process, involving the adaptation and adoption of new skills and new ways of thinking and speaking that take time to become a natural part of a person's communication. Training departments and offshore centers cannot have the mindset that once initial training is over, the skills learned will remain. It is a continuous process that must be maintained with constant monitoring, coaching, feedback, and revision to make sure that all members retain their new communication skills. Ongoing coaching sessions and regular mandatory assessment will engage employees and reinforce positive behaviors while at the same time it will help prevent agents from slipping back into undesirable habits.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

The risk of cultural differences presents a challenge when outsourcing or offshoring activities are involved in business practice. Because the team members are from two different geographic locations, they come from different cultural backgrounds. Their cultural differences influence their thinking in their work practice. So, the work ethics in a team member of the client will be different from the work ethics in a team member of the vendor. These differences decrease the knowledge transfer process as well so to mitigate this risk; a training program is recommended to introduce the project teams to each other's cultures by implementing a cultural education program. By increasing the cultural sensitivity among the team members, they can understand each other better and thus be able to work better together which will result in a positive effect on the project's success.

A mitigation strategy is proposed for the time zone difference risk, but an avoidance strategy is proposed for the geographic location risk identified for the remote distance category. Since the team members are often separated by great geographic distance, they are also in different time zones, which can be a risk in delaying the project's timeline for team members have different working hours. So when immediate response or action is required from one team member to proceed with a work task but it cannot proceed immediately because the other team member is off hours due to the different time zones, this delays the project's timeline, and thus deadlines are not met. Time is wasted which decrease efficiency and also frustration has been expressed by team members because responses are delayed. To mitigate this, we propose that conference calls be arranged on a time that can accommodate both time zones appropriately to discuss project issues. By setting a designated conference meeting in which all team members can participate will help to mitigate the time zone difference problems experienced.

Geographic location is a project management risk that can be dealt with by implementing an avoidance strategy. This is the only identified risk that we proposed to use an avoidance strategy because you can avoid working with a team that is located in a region that is less likely to be affected by local political, weather, or any other events or incidents that can negatively affect the project. Decisions can be made to use clients that are located in regions that won't affect the project's schedule negatively due to local events or incidents. Also, it can allow for the vendor team to easily visit the location if needed.

Trust issues are a common risk identified in the human resource category due to the team members' increase in doubt when the project's run into problems. A mitigation strategy is proposed for this potential risk by arranging face-to-face meetings for a project manager to increase trust in building relationships. Physical interaction increases the bond relationships between team members and thus increases trust among each other. By being able to trust another team member, it not only creates a positive environment for the workers but also significantly increases the collaboration effort displayed by the team members when problems arise, or issues need to be handled.

Likewise, the risk of losing key personnel because of their leave during the project's lifecycle is another risk-identified part of the human resource category. To mitigate this risk, we propose a mitigation strategy where all project progress and important documents are backed up so that another team or person can continue working on the same project to minimize delays and halts in the project's schedule if necessary. By doing so, the replacement personnel for that team member's position can easily continue the work tasks without much back-tracking or time spent in trying to figure out what to do. This will keep the project's intended schedule intact and not delay anything in progress.

The risk of low quality due to software builds having numerous bugs, and crashes is a negative effect that is part of the software quality category. We propose to use a mitigation strategy to address this problem by training team members on quality management. Most IT projects require certain technical expertise so ensuring that the team member has a well-trained background and can perform tasks requir-

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

ing specific technical skills is necessary for the products to have high-quality results in the end. Training programs to increase these necessary skills required to develop software can benefit the project's goal in the end by eliminating potential malfunction, bugs, and crashes that are often seen in products made by incompetent team members.

Unforeseen project cost increases are often unaccounted for when carrying out IT projects developments. Thus, project cost limit is increased, and project managers need to put in extra work effort to accommodate working with the remote team. The plan to mitigate this risk factor is to prepare cost contingency plan in case of scope changes, schedule changes, or unknown probably risks are encountered. By doing so, the unexpected cost is unaccounted for and not encountered as a barrier in the project's life and can be dealt with easily.

Lastly, mitigation can be used to address the risk factor of vendor or collaborating teams no longer being involved in the project. We propose a similar strategy used for the turnover of key personnel by also ensuring that the project's progress and important documents are backed up so that the replacing worker can continue the project's tasks to minimize delay in the project's schedule is necessary.

Risks are always involved when carrying out projects involved in the field of IT development. Thus, it is important for businesses and companies to recognize these potential risks that can negatively impact the project and even have a catastrophic event if not addressed immediately. Although these risks cannot be eliminated, they can be mitigated or avoided by implementing appropriate risk management strategies. We have proposed a risk mitigation plan based on the risks identified and categorized into different risk levels, that we believe will increase the project's success and be a platform for others to consider and use when dealing with outsourcing and offshoring activities in IT development projects.

Regardless of the scope and size of the project, there are risks involved in every project. Risk management is one of the main areas of project management that is focused on this study. The Project Management Institute (PMI) has stated project risk management as one of the main project management knowledge areas that must be considered if a project is to be completed successfully (PMBOK, 5th edition). Risks cannot be eliminated from projects but it can be identified, and a mitigation strategy can be developed to minimize these risks.

A risk, which is defined as "An uncertain event or condition that, if it occurs, has a positive or negative effect on one or more project objectives", must be identified as part of the risk management process (PMBOK, 5th edition). Risks must be taken into account to determine risk management and thus be used for project development so appropriate actions can be taken to minimize risk and increase the project's success. Using the risk matrix (Figure 1) described in Section 3, Results, a risk register was created to help project managers to plan and manage risks involved in GSD (See Table 2).

In the communication category, knowledge transfer had the very high-risk level. Most literature has mentioned communication as a potential and primary risk involved in GSD project management. The trigger for this is that project managers find themselves explaining the project requirements and expectations repeatedly. Related to this is the risk of a language barrier, which is related to communication for a project manager, and team members have difficulty communicating with collaborating team members in remote locations because of the different languages being used. The risk level score for language barrier was 20, which is also very high-risk level. Cultural risk arises from the fact that collaborating team members in remote location often think differently due to their different cultural backgrounds. This risk also had a score of 20 which makes all the communication risks have a very high level of risk thus these factors should be addressed immediately, and a mitigation strategy should be implemented to minimize the impact of these risks.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

The third category of geographical distance has two risks identified, which are the different time zones and geographic location. The different time zones means that time is frequently wasted due to the waiting for a response from a collaborating team in the remote location. The trigger for geographic location is that the project schedule is affected due to local events or incidents. These two risks have a risk level of 8 and 12 respectively, which places them in the high-risk category, which means they need to be addressed with mitigation plan to reduce the probability and impact of the risk.

The fourth category is a trust, which addresses the risk of trust. The risk of trust issues due to the project team members starting to doubt collaborating project team members when a project runs into problem had a risk level score of 9 which is a high risk. The next category, Human resource addresses turnover of key personnel which is due to the key personnel no longer being involved in the project in the middle of the project which resulted in risk level score of 8 which is also high risk.

In the next category, software quality has two risks identified, which are quality and efficiency/ productivity. The trigger for quality is that software builds have numerous bugs and crashes often resulting in the risk level score of 4 which is medium risk level. Similarly, efficiency/productivity risk has the trigger for the project is being delayed due to software developers not working efficiently resulting in the risk level score of 4 which is also medium risk level. Cost is the next risk has the trigger of project cost

Table 2. Risk register

Category	Description of risk	Trigger	Probability	Impact	Risk level	Strategy	Risk mitigation plan
Communication	Knowledge transfer	Project managers find themselves constantly explaining the project knowledge area requirements to team members.	Almost Certain (5)	Major (4)	Very High (20)	Mitigate	Document project knowledge area and have it readily available for all team members.
	Language barrier	Project managers and team members have difficulty communicating with collaborating team members in remote locations due to the language difference.	Almost Certain (5)	Moderate (3)	Very High (20)	Mitigate	Hire a translator to write messages (such as emails) in English and local language to ensure proper communication. Select a vendor with knowledge of the client's language and culture.
Cultural	National cultural difference	Collaborating team members in remote location often think differently due to cultural background.	Almost Certain (5)	Moderate (3)	Very High (20)	Mitigate	Train and introduce project team to other cultures by implementing a cultural education program. Select a vendor with knowledge of the client's language and culture.
Geographical distance	Different time zone	Time frequently wasted waiting for a response from collaborating team in a remote location.	Likely (4)	Minor (2)	High (8)	Mitigate	Arrange conference calls on time that can accommodate both time zones to discuss project issues.
	Geographic location	The project schedule is affected due to local events or incidents.	Likely (4)	Moderate (3)	High (12)	Avoid	Select a vendor in a stable country - Avoid working with a team that is in a region that is less likely to be affected by local political, weather, or any other events or incidents that can affect the project.
Trust	Lack of trust	Project team members start to doubt collaborating project team members when the project runs into problems.	Possible (3)	Moderate (3)	High (9)	Mitigate	Arrange face-to-face meetings for project managers to build relationship and trust.
Human resource	Turnover of key personnel	Key personnel are no longer involved in the project in the middle of the project.	Unlikely (2)	Major (4)	High (8)	Mitigate	Ensure all project progress, and important documents are backed up so that another team or person can continue working on the project to minimize project schedule if necessary.
Software quality	Quality	Software builds have numerous bugs and crash often.	Rare (1)	Major (4)	Medium (4)	Mitigate	Train team members in quality management.
	Efficiency and productivity	The project is delayed due to software developers not working efficiently.	Rare (1)	Major (4)	Medium (4)	Mitigate	Train team members on working more efficiently to increase productivity.
Others	Cost	Project cost limit is increased due to unforeseen cost. Project manager finds extra work effort is necessary to accommodate working with a remote vendor or team.	Rare (1)	Moderate (3)	Low (3)	Mitigate	Prepare cost contingency plan in case of scope changes, schedule changes or unknown probable risk.
	Vendor/partner failure to deliver	Vendor or collaborating team is no longer involved in the project.	Rare (1)	Major (4)	Medium (4)	Mitigate	Ensure all project progress, and important documents are backed up so that another team or person can continue working on the project to minimize project schedule if necessary.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

limit is being increased due to unforeseen cost. This is a low risk with the risk level score of 4. Lastly, vendor or collaborating team is no longer involved in the project creating the potential for deliverables failed to be delivered. This is a medium category risk with the risk level score of 4.

The risk response determined for these risks were to mitigate the risk for all of them except the risk of the geographic location, which was, determined to use avoidance as a strategy.

5.2. Implications and Relevance to Project Management

Based on the acquired skill and management strategies from the research, there is a need to make use global software development and risk management in conducting business projects and project management. This can be achieved by ensuring a global software development and risk management approach that utilizes distinct skills to create a team that sees the company or projects ultimate goals. In this case, there is a need to invest substantially in global software development and risk management before thinking of the mode of technology to use in the project or management. More specifically, these results highlight the importance of a top-down and bottom-up approach to leadership and strategic planning especially when it comes to elements of global software development and risk management, operations management, and process improvement. The results of this study highlight the criticality of integrating global software development and risk management into the leadership styles and tools leaders use to manage their global software development and risk management.

The findings from this study also highlight the importance of global software development and risk management throughout all aspects of an organization; obviously, global software development and risk management is one element in an organization's business model, but this study shows that the global software development and risk management element directly impacts many other elements of an organization. Management and leadership of any organization need to have the training and skill sets, to not only manage their global software development and risk management, but to effectively manage their overall organizational project management. This study has shown that many of the current-state issues seen within an organization's global software development and risk management stemmed from the leadership's lack of effectively leading and managing their employees and operational issues. If the leadership has the tools and knowledge to effectively manage their global software development and risk management instead of focusing on the bottom line (i.e., profits and costs), then the performance of an organization will improve and, as a result, the profits and costs will also improve.

Most importantly, this study highlights that business leaders tend to focus mainly on the financial elements of their business while ignoring or minimizing the global software development and risk management element; this might work in the short-term, but the research shows that it is not a good long-term strategy. Over the long-term, leadership must have a multi-faceted approach where they manage all elements of the business, including: global software development and risk management, operations, HR, financials, performance, and strategy from one overarching understanding that all of these elements are critical and they are all related. By understanding this view, a business leader will be better equipped to lead a successful company in both the short- and long-term.

5.3. Contribution and Relevance

Though extant literature has been devoted to the studying these variables, attention has not been paid to global software development and risk management and the relationships these concepts have. Review

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

of the literature showed that there is limited amount of research that explored the variables and their relationships. Therefore, this study sought to further analyze different global software development and risk management and presented a proposed unified framework as well. This study sought to fill a void in the research that was identified earlier on this study; previously, this void has left some risk and uncertainty when studying the variables and these relationships, but this study sought to alleviate that.

The results of this research study contribute to several different bodies of knowledge, including: global software development and risk management, project management, leadership, team dynamics, capability levels, and risk. By performing this study, the results help to enhance and evolve these bodies of knowledge since this study not only build on existing research but it attempted to expand and fill a gap in the research that was identified earlier on this study. By more thoroughly understanding these variables and their relationships, we can understand the advantages and disadvantages of the variables and their relationships, which in turn should help improve the effectiveness of these variables.

This study also contributes since it introduces new ideas and avenues for future research in each of these bodies of knowledge. Not only did this study seek to explore different variables and their relationships, but it also sought to understand the relationships and identify new ways of thinking about the factors under study. The results of this study were also valuable from a practitioner perspective since the understanding of these variables and relationships helped to introduce ideas and strategies that a practitioner can deploy to be more effective in their profession. The results from this study help a practitioner to understand the relationships and variables but also the implications related to these variables and relationships.

5.4. Limitations

Limitations of this study are that the sample size was small and may not be enough to conclude the themes and patterns generated through this systematic literature review research. Future work should focus on expanding the sample size to strengthen the conclusions and gain results from different sample groups. There also may have been a tendency for bias because most of the data collected were from self-reported experience reports, case studies, and empirical studies. Therefore, by expanding the sample size and using a variety of different groups will help to generalize the conclusions better with stronger validity. Although much effort was made to cover as many related papers that discuss the risks involved in outsourcing and offshoring, it is possible that some published papers were missed as well due to the ongoing and increasing research in this field.

Nevertheless, the sample size used for this research was sufficient to meet our objectives of this study with qualitative data to provide understanding to the potential risks frequently encountered by businesses that incorporate outsourcing and offshoring of their business activities. Thus, it is expected that our conclusions are relevant and can be applied to many firms in a similar situation to recognize these risks and provide guidance in devising a mitigation strategy to minimize the potentially detrimental effects these risks can have on their global software development projects.

5.5. Future Work

Future work should continue to study the effectiveness of these mitigation strategies through empirical research which will further help project managers to develop a better risk management plan catered to their project needs. Also, the risks identified are general categories so further research can explore each

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

category more thoroughly by highlighting specifics to gain a better depth of understanding. Future research should explore a few different arenas. For example, future research could investigate these factors and the relationship but in the context of other industries and managerial settings. In these settings or contexts, it would be interesting to study the strength of these variables and the relationship as well as the factors that impact these factors and their relationship. Another avenue of research could be to explore these factors and their relationship but from different perspectives, such as from an organizational, strategic, or cultural point of view. This would shed further light into the how this relationship is perceived across many different views and further understand the degree of impact that factors such as culture, strategy, human resources, operations have on the key variables and their relationship.

Chapter 36
Continuous Improvement Relationship to Risk Management:
The Relationship Between Them

Brian J. Galli
Long Island University, USA

ABSTRACT

In order for a company to economically survive, it needs to compete with a highly competitive market. The world is changing fast, adding different types of risks to companies. So, companies need to not only meet requirements but also exceed them. At the same time, companies are required to lower the level of risks they may encounter. As a result, continuous improvement and risk management should be key factors to insure company success. This study explores the relationship between the two concepts and gives examples where the interconnections between them exist. Also, the study explains the important key components of continuous improvement and the classifications of risk management. Finally, this article focuses on three aspects, managing complaints, developing strategy, and creating a suitable culture. These aspects are evaluated based on the relationship between continuous improvement and risk management.

1. INTRODUCTION

Continuous improvement and risk management are widely used by companies to improve their products or services compared to competitors. In addition, these concepts focus on eliminating the wastes and lowering prices to meet customer needs (Avanesov, 2009).

In the past few decades, the concept of continuous improvement was a common method to improve the quality of an organization. At that time, Deming was the most influential person to the quality world. Deming established 14 principles for improving quality. The fifth principle stated that improvement should be constant and forever (Galli & Kaviani, 2017). Another idea was introduced by Juran, who initiated the trilogy concept relating to a quality plan. Its main focus was on improvement and controlling

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

a continuous loop. Toyota system and ISO 9000 initiated two more ideas. For companies to economically survive, ISO certification is required where this certification becomes a main requirement for such companies to run their work. ISO 900-2015 supports the notion of continuous improvement (Galli & Kaviani, 2017). It focuses on continuous improvement and mentioned the idea of PDCA, standing for plan, do, check, and act for process. Quality-oriented programs such as Lean Six Sigma, Total Quality Management, and Kaizen are used to meet the customer requirement and make them satisfied about the services or products (Choi et al., 2016).

On the other hand, in 1994, risk management for any project was defined as an organized process to identify, analyze, and respond to different classes of risks (Galli & Kaviani, 2017). But a recent study in 2013 (Filho & Uzosoy, 2013), categorized risk management into six critical steps. They are: plan, identify, perform qualitative analysis, perform quantitative analysis, response, and monitor and control (Avanesov, 2009).

In literature, the classes of risks for one study (Galli et al., 2017) are classified in term of risk related to politics, construction, operation and maintenance, contracts and policies, financial issues, and force decisions. In another study, the classifications are different, in three levels (Raval et al., 2010). The first level is high risk, which involves political, and government risks macroeconomic risks, legal risks, social risks, and natural risks (Raval et al., 2010). The second level is medium level risks which involves project selection risks, financial risks, residual value risks, design risks, construction risks, and operation risks. The third level is low risk level, which involves internal risks and 3rd party relationship risks.

Risk management aims to maximize and enhance the probability of getting positive events and to minimize and eliminate the probability of getting negative events. As a result, a successful project has the ability to manage these risks effectively. The literature has mentioned that the identification step in risk management is a critical step because after identifying the risk, the risk could be properly managed. In addition, if the risks are identified in the early stage, the cost and time related to the risk would be reduced (Choi et al., 2016).

Overall, by looking to the studies, we conclude there is no perfect approach that leads to successfully handle risks. There is a need to have a standard classification and definition of risk management for all kind of projects from small to large.

The objective of this research paper is to explore the relationship between continuous improvement and risk management (Raval et al., 2010). The approach is structured in three aspects. Firstly, technical complaint management is discussed in term of its main targets and structure. The second aspect is how to create a culture that leads to a continuous improvement. The last aspect that will be explained is how to implement a development strategy to support the notion of Continuous improvement to get high quality products and service.

The primary contribution of this paper is to find the gaps in implementing continuous improvement by taking into account risk management principles (Raval et al., 2010). Firms usually improve their quality of products or services by implementing change for the better, a continuous improvement concept. This paper will evaluate and prove that the lack of relationship between continuous improvement and risk management is a high concern to firm growth. Results of this study may contribute in management aspects, culture aspects, and strategic improvement aspects.

All recent research focused on either continuous improvement or risk management and there is no literature combining both or applying them simultaneously (Raval et al., 2010). This study will examine the relationship between the two and discover the hidden issues which should be considered as a major effect to organizations and/or firm growth.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

The rest of this paper is structured as follows: section 2 provides information about the literature review; section 3 provides information about the research methodology, hypotheses and the research focus; section 4 shows the results: section 5 evaluates and discusses the result; section 6 presents a summary and conclusion based on the evaluation of the result.

2. LITERATURE REVIEW

2.1. Continuous Improvement

The origin of the phrase continuous improvement was created in Japan. It was derived from the Japanese term Kaizen. Kaizen is two words in Japanese that means: Kai (change) and Zen (to improve). The person who created the concept of continuous improvement is Masaaki Imai, the father of continuous improvement (Lahidiji & Tucker, 2016).

2.1.1. Continuous Improvement Triggers

The time that a company or organization needs to apply the concept of continuous improvement is related to two main triggers. Firstly, changes in the business environment of the firm (for example: technology improvement, globalization, and time and quality aspects). Secondly, new management systems are introduced (for example: a considerable development in quality-oriented programs).

2.1.2. Most Important Definitions of Continuous Improvement

From 1982 to 2007, many specialists defined the term continuous improvement (Kattman, 2014). Each focused on certain points. Table 1 shows definitions of continuous improvement for five specialists:

As shown in Table 1, there are three main principles of continuous improvement. Firstly, process related aspects (such as: the process and the activities that should be identified and controlled). Secondly, time related aspects (for example: constant activity that must be done over time). Thirdly, aspects related to people orientation, which means all people from the organization should participate (Lahidiji & Tucker, 2016).

Table 1. Continuous improvement definitions

Year	Author	Definitions
1982	Deming	Improve constantly and forever the system of production and service (Principle 5 of transformation)
1989	Imai	Progressive improvement involving everyone in the company (including both workers and managers)
2000	Juergensen	Improvement initiatives that increase successes and reduce failures
2003	Brunet	Pervasive and continual activities, outside the contributor's explicit contractual roles, to identify and achieve outcomes he believes contribute to the organizational goals
2007	Manos	Subtle and gradual improvements that are made over time

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Since there are many definitions of continuous improvement, the definition we use in this study is a cycle of continuous controlled activities to be progressed by all employees over time to minimize waste and find new approaches of improvement (Formento et al., 2013).

2.1.3. Continuous Improvement Main Components

Some research papers help identify the major components to implement continuous improvement. There are 9 main components, explained in Table 2:

2.2. Risk Management

2.2.1. Risk Management Definition

A common definition of risk is an uncertain event that if it occurs, can have an impact on a project's goals (Kattman, 2014). Impacts are generated by different risk categories where these categories are either external, internal, or procedural risks. For example:

- External risk that is related to market and partner risk.
- Internal risk that is related to technological and human resources risk.
- Procedural risks that is related to cost and quality risk.

Table 2. Continuous improvement main components

Component	Explanation
Formalization	Without formalization, the continuous improvement may be intermittent. It might depend in the employee's attitudes or surroundings. To improve any project, we need to formalize programs and have clear structure.
Continuity	The improvement should be continuous as it is named and it should be forever. Without continuity, the improvement will not be effective and it will lead to negative impacts.
Deployment	Deploying the continuous improvement must be properly managed into all over the organization. As a result, all employees in all positions can do improvement for daily activity.
Training	Firstly, top management should be trained in how they can implement the continuous improvement. Then they need to identify the weaknesses which have the main negative impacts to the process. Thirdly, train the people who are involved in producing that impact. It is recommended to start training with primary tools but once the process requires more advanced tools, advanced tools must be used.
Commitment	Top management, leaders and other employees must show commitment. In this case, team work and suitable culture would be improved.
Specialist	Specialist in continuous improvement must be a member in any organization. Specialists can support the progress of the daily work to give advices. Also, they have the knowledge to give a daily recommendation that are related to continuous improvement.
Best Method	Scientific methods must be used. PDCA, DMAIC methods are examples of the best approaches that could be used to support continuous improvement.
Evaluation	When applying the concept of continuous improvement for any process or system, it should be evaluated.
Sharing	The result must be shared among all members. This will enhance the member knowledge for future perspectives in dealing with continuous improvement.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Uncertainty can become a possible risk source in two ways. Firstly, we are not sure if an event would occur or not. Secondly, we are not sure what the consequences would be. Also, International Organization for Standardization (ISO) has a definition of risk management as a specific activity to manage and control an organization relating to risk, where risk refers to an uncertain event or group of events, which could occur and will have an impact on the achievement of goals (Linder et al, 2014).

2.2.2. Risk Management Process

To overcome these risks, a process developed with five basic steps (Linder et al, 2014), as follows:

Step 1: Identifying each Risk. Recognize and describe risks that might affect a project or its outcomes.
Step 2: Analyzing each Risk. Determine the consequence of each risk and understand the nature of the risk and its potential.
Step 3: Evaluating or Ranking each Risk. Firstly, determine the risk magnitude. Secondly, make decisions if the risk is accepted or rejected.
Step 4: Treating each Risk. Highest ranked risks should be determined and then the risks must be treated to achieve appropriate risk levels.
Step 5: Monitoring and reviewing each risk. The final step is to monitor, track, and review risks.

In general, the risk management process is beneficial to the firm's management and success. Recent studies produce a methodological development to risk management.

2.2.3. Trends of Risk and Uncertainty

Implementing risk would only be required when uncertainty exists in a company. The surrounding environment is not perfect and usually there is uncertainty (Filho & Uzsoy, 2013). Based on the certain level of uncertainty, companies need to manage them and pay attention to their impacts.

Recently, businesses in the world are faced with a lot of change. These changes introduced trends in risk and uncertainty. Five main trends are explained as follows:

- **The Pace Is Rapidly Changed:** The world is dramatically changing especially in the last decade, and even there is no visibility for future stability. Rapid changes such as technological improvements, environmental changes, and competition increase will hinder the firms to accurately predict future scenarios. With less accuracy of prediction, firms will surely face considerable risk (Sanchez & Blanco, 2014).
- **Complexity Is Increased:** One source of risk is complexity itself. Practices and business processes would be very complicated if they use new technologies. The more complex the process, it is harder to discover the types of risks that may impact the business.
- **Economic Power:** New entrance of economic powers will lead to unexpected events resulting from rivalry and interaction with other powers around the world.
- **Globalization:** The interconnections between businesses all over the world are increased which would initiate a certain level of local or international disruption.
- **Risks Interconnection:** Increasing the risks that are interconnected is a key concern. Different types of risks are dependent on each other. As a result, the interconnection of rick will lead to higher risk.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

All of these trends affect firms, but they are not equal because organizations have different goals and procedures. As a result, they may look at risk differently (Sanchez & Blanco, 2014; Elahi, 2013).

2.3. Research Gap

A lot of researchers studied continuous improvement concepts and risk management. However, no study identified how continuous improvement is related to risk management. Thus, this study will focus on identifying that relationship. Applying the continuous improvement concept will produce some risks, so this study will address certain problems or risks that arise.

3. RESEARCH METHODOLOGY

3.1. Research Focus

In this paper, we focused on continuous improvement and risk management in complaint management, culture, and strategic improvement sectors. It analyzed the interaction between firms and customers regarding quality perspectives and also pointed out risks. In order to prepare for this research, several scientific papers that are peer-review were examined. The last step was collecting data and designing our research model based on literature.

3.2. Hypothesis

One assumption is presented, which is that all firms and organizations should pay attention and work to perform risk management analysis once they are ready to implement any continuous improvement tools. A second assumption is about policies and standards. Each company or organization must provide training to employees on how to use and understand policies and standards related to the concept of risk management and continuous improvement.

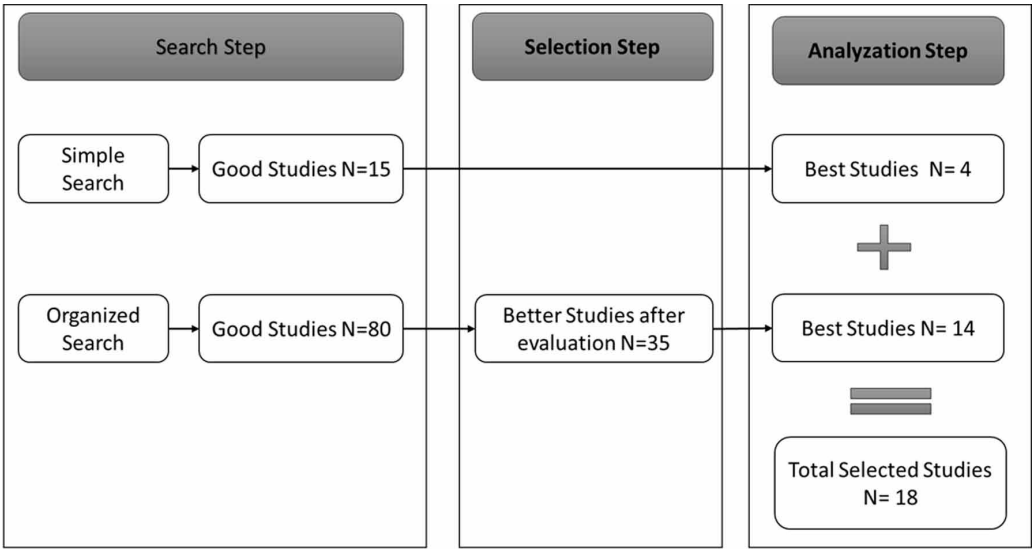
3.3. Research Approach

The literature review was organized in two approaches. The first approach was simple search where its main focus was to find useful information about continuous improvement and risk management. The second approach was organized search. In this step, we got all the helpful information from databases.

3.3.1. Simple Search for Literature Review

This step was based on searching for papers that show useful information about continuous improvement and risk management. Important areas such as quality, uncertainty, and types of risks, classifications of risk, and principles and key components of continuous improvement were identified. 15 articles were found. After that, we excluded some of papers in an organized search.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use



3.3.2. Organized Search for Literature Review

In this search, three steps were used. Explanation for the three steps are:

1. **Planning the Search:** All continuous improvement and risk management papers were identified. One of these topics had to be the major concentration. The goal was to successfully get papers that add valuable information to this study.
2. **Conceptualizing the Review:** We defined new terms to support the knowledge of our study by looking for other concepts showing relevance to the two concepts. For example, quality programs, uncertainty, classifications of risk, and components of continuous improvement. Elimination of some specific terms was done, such as sustainment and optimization, because they are not helpful to our study.
3. **Searching, Evaluating, and Selecting the Literature:** Several databases were used to have these results, such as ABI/Inform Global, ProQuest, and ScienceDirect. Then, we evaluated the papers by looking to the abstract, introduction, and conclusion to make sure any relevant study with valuable information was considered. Finally, we selected the most relevant papers to be 80 papers. Figure 1 shows the process we used in the search and selection.

The three steps are summarized in Figure 1, and the final total selected studies was 18 papers. In the selection step, we selected 35 studies. Papers were eliminated because of title, abstract, or duplication. Also, our goal was to focus on the peer reviewed articles, academic articles, and literature reviews. In the analyzation step, we narrowed down the selectee studies to be N= 4 and N=14. We finally appraised each paper to have N=18 articles.

Figure 1. Research approach for literature review

4. RESULTS

Overall, the results are arranged to start with technical aspects in complaint management and then implementing development strategy. The third result deals with suitable culture aspects for continuous improvement.

4.1. Technical Complaint Management

Technical complaint management deals with reception, handling, analysis, and use of customer complaints. Customer's complaint is very helpful to measure the performance of the firm and improve the areas, which lack quality (Pakocs & Lupulescu, 2016). The most relevant theory is Hirschman's exit-voice theory which is a major theory studying Customer's complaints. If a customer is dissatisfied with services or products provided by an organization, the customer may stop dealing with the organization (which is exit or complain, which is voice) (Filho & Uzsoy, 2013; Brajer-Marczak, 2014).

Technical Complaint Management focuses on targets such as, customer-oriented target, finance-oriented target, and quality-oriented target, but it does not focus on risk management-oriented target. However, the model of technical complaint management is well structured. The structure is divided into four sections (Elahi, 2013). They are data organization, failure identification, failure correction, and long-term knowledge transfer and process controlling (Brajer-Marczak, 2014). Overall, following this structure will lead to a partial success because it only focuses on continuous improvement without taking into account the importance of risk management analysis.

4.2. Implementing Development Strategy

The company's staff specialists have the responsibility and ability to improve and develop strategies for continuous improvement. Usually, qualified employees have impacts on business success. The most important strategy is staff training. Effective staff training is beneficial to both the company and employees for short or long-term effects (Pakocs & Lupulescu, 2016).

Implementing a development strategy has a main goal to make continuous improvement of product and service quality. In addition, risks may arise during implementation of staff training. Training staff should be highly qualified to give such training to target employees. Also, not all employees are willing or capable to participate in that training. In this situation, managers are responsible to select the best training provider and appropriate subordinates who should participate to avoid any risk (McLean & Antony, 2014; Brajer-Marczak, 2014).

4.3. Suitable Culture for Continuous Improvement

This area includes studies focused on the relationship between continuous improvement and other topics. There are five strategies to make a suitable culture that supports continuous improvement:

- Leadership corroboration
- Infrastructure programs, such as training and effective tools
- Maintenance issues and reporting guidelines
- Getting feedback from customers

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

- Hiring specialists in the continuous improvement area

All these strategies need effective management procedures that let managers, leaders, employees, and even the customer participate in enhancing continuous improvement and risk management. These procedures are usually issued by top management and might be with a specialist in the area of quality and continuous improvement. No doubt that both top management and specialists have the ability to change outcomes, but only if they successfully create a suitable culture to support their activities (McLean & Antony, 2014. Lack of authority of specialists may create barriers between specialists and target employees. Therefore, the work would be performed under risk and a non-suitable culture (Carvalho & Rabechini Junior, 2015).

Specialists in the field of continuous improvement must be qualified to insure the success of creating a suitable culture, especially when there are differences in culture. There are two classes of culture that can have a major impact on firms. The first is the culture inside the organization which effects the process of continuous improvement. The second is national or international that exists when the firm has many branches within the same country or in international countries. Furthermore, firms deal with suppliers either in the same country or in international countries and must insure they are dealing with cultural issues generating risks. So, specialists must have experience in dealing with differences in cultures and improve new methods to integrate the idea of continuous improvement.

5. DISCUSSION OF RESULTS

This study offers a review of the relationship between continuous improvement and risk management in relation to technical management compliant, development strategy, and culture.

5.1. Technical Management Compliant

5.1.1 Technical Management Compliant Targets

There are three major targets, and they are evaluated as follows:

1. **Customer-Oriented Target:** A successful complaint management in term of responses and immediate interaction can retrieve customer satisfaction. In addition, a complaint-handling procedure is well managed and counts the number of complaints. The more complaints, the more chances a firm gets information about product failure (Anca, 2016). This target aims to identify new approaches of improvement by getting information from the complaints and avoiding product failure where this is continuous improvement. Identifying new approaches of improvement is not enough. We also need to identify risks. External risks such as market risk must be identified (Carvalho & Rabechini Junior, 2015). For example, in a rental company that rents a heat exchanger, and the Technical Management Compliant collects the feedback where most stated the heat exchanger has a lack of quality. Getting this information is not enough to make the right decision whether the company should purchase a better-quality heat exchanger or not. Market risks should be identified if there is any change, for example, inflation rates, changes in interest rates, foreign exchange rates, and so on.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

2. **Finance-Oriented Target:** Cost failure related issues are considered, such as external failure cost and internal failure cost where these impact profit margin. Failure costs are generated if the product or service don't meet the customer needs. Technical Management Compliant will find an approach to avoid the external failure cost by collecting information from the complaints and conducting continuous improvement to the product or service. On the other hand, internal failure cost must be analyzed. In this case, analyzing the risk of getting internal failure will be the right approach. In order to eliminate the failure, we need to determine the consequence of each risk and understand the nature of the risk and its potential. For example, internal risk such as human resources risk may lead to internal failure, and as a consequence an internal failure cost will result (Anca, 2016). A recruiter in the human resource department of manufacturing company hired unqualified technician who produced a product with different specifications than the client wanted, which causes internal failure and risk.
3. **Quality-Oriented Target:** Information about perceived or expected quality of a product or a service is collected from customer complaints. This information can be used for long-term improvements of products and processes. How customers perceive product quality or what their expectation should be treated and ranked to priories our efforts in dealing with continuous improvement (Elahi, 2013). Treating the risk and ranking the risk will give an area for continuous improvement to develop. Technological risks should be presented to illustrate how continuous improvement is related to risk management in terms of quality-oriented targets. Customer complaints about technological issues may need experts to solve them. Therefore, a firm should gather information about perceived or expected quality of a product or service from customer complaints. After that, treat the issues and make decisions if the risk is acceptable (Brajer-Marczak, 2014). Then, the highest ranked risks should be determined, and the risks must be treated to achieve appropriate risk levels (Sanchez-Cazorla et al., 2016).

5.1.2. Technical Management Compliant in Term of its Structure

There are six major phases, and they are evaluated as follows:

1. **Data Organization:** The first phase of technical management compliant is data gathering from complainant. These data are critical factors to the whole process, so the data are stored on a database. Appropriate action in terms of risk management should be considered, such as risk based internal auditing approaches for the data stored (Shivaani et al, 2015).
2. **Failure Identification:** Its main objective is to standardize failure patterns and prioritize the critical problem. This phase depends on the quality of information taken from the database. This phase is integrated because it combines the idea of continuous improvement in making a failure pattern and risk management in prioritizing the critical problem.
3. **Failure Correction:** The root cause of the failure should be identified, which is the first step in this phase. The second step is to involve different quality management methods which help in creating a systematic and efficient root cause analysis. The third step is that the prevention of the failure needs to be defined and measured. Finally, the process that handles the complaint makes the implementation of an appropriate method. By doing these steps, Technical Management Compliant

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

is following one of the core principles of continuous improvement, process orientation (Lam et al., 2015). Management should understand the process and activities should be identified and controlled. However, the failure correction is not complete by implementing an appropriate method. To successfully complete this phase, we need to monitor, track, and review the risks arising within implementation (Shivaani et al, 2015).

4. **Long Term Knowledge Should Be Transferred by Appropriate Methods:** Failures which have been corrected for one product may be repeated again. In order to solve this issue, compliant needs to be linked to a knowledge management system which helps to transfer solutions to future product lines. As a result, every user is allowed to make adjustments. This phase is closely aligned with the continuous improvement concept where activities should be controlled by all staff over time to reduce the waste and identify new approaches of improvement. On the other side, an effort to manage the risk initiated from transferring the solution should be considered. For example, procedural risks related to cost risk is a major factor. Involving all staff over time will add cost. An analysis in the cost of risk should be implemented to guarantee success of this phase (Carvalho & Rabechini Junior, 2015).
5. **Process Controlling:** Process controlling system is required for complaint management because complaint management is a reactive process. This system includes the key performance indicators for the assessment of efficiency and effectiveness. At this point, technical complaint management uses the continuous improvement approach to improve the quality of product or service (Lam et al., 2015). Without process controlling system, lack of resources will present in failure correction projects. Creating such a system will cost money, a risk cost. This is procedural risk and to avoid it, we need to follow risk management approaches.
6. **Validation:** The term 'quality' is represented by an effectiveness and efficiency which consists of four determining factors. They are customer satisfaction, product improvement, product quality level, and compliant management efficiency (Pakocs & Lupulescu, 2016; Shivaani et al, 2015).

5.2. Implementing Development Strategy

5.2.1. Continuous Improvement Vs. Development Strategy

Strategic objectives are defined in various directions that are related to the continuous improvement concept. The first one is to achieve the highest levels of performance in terms of quality, and as a result, increase success and reduce failures (Filho & Uzsoy, 2013). The second one is in terms of product quality where the problem is related to renew some products, so that new products meet the needs of both old and new customers. In this direction, a company process of focused and continuous incremental innovation for a product is applicable. The third one is related to developing strategy to meet general environment and competitive environment requirements where this is considered a culture of sustained improvement aimed to eliminate waste in all organizational systems and processes. The general environment relates to external impacts such as the economy, technology, society, and political issues. On the other hand, the competitive environment refers to main competitors of the company and main suppliers.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

5.2.2. Risk Management against Staff Training

There are various reasons to perform staff training sessions. Reasons such as, employees do not know their duties and responsibilities, data referring to quality are not registered in reports, and employees are not properly trained when new machines are being used (Galli & Kaviani, 2017; Sanchez-Cazorla et al., 2016). Identifying new approaches of improvement such as staff training is considered a continuous improvement for the company.

To implement a training program for staff in the company, the company should focus on the following objectives:

- Assess the level of knowledge in quality management of operating staff
- Identify business concerns and ways for training
- Assess the degree of involvement of staff in quality development and improvement.

Training is considered a learning process. From training, employees get new knowledge and skills. It will help the company meet specific duties of the current job. As a result, the employees become knowledgably and skillful of their work and how they will participate to get the achievement of company quality goals.

Identifying the risks is considered a primary stage of risk management, because once a risk is identified, it can be managed. Risks may arise by implementing staff training as follows:

- Technical failures of equipment available to the lecturer during training
- Failure to meet the deadlines and financial provisions of the proposed activity
- Different level of knowledge between the participants in the training sessions
- Lack of money or specified budget for employee training.

Effective risk management relies on risks being identified before implementing staff training (Sanchez-Cazorla et al., 2016). These risks are evaluated and decisions are made to take proactive actions to eliminate the potential impact of risks.

5.3. Suitable Culture for Continuous Improvement

Building a culture of continuous improvement is usually established by developing strategies that support leadership, program infrastructure, maintenance and customers opinions, and hiring specialists in continuous improvement area. All of these strategies are explained as follows:

Leadership Corporation: In order to enhance building a suitable culture for continuous improvement, the leaders should be empowering innovators. Leaders who have open-minded, flexibility, and ability to adopt any new ideas are critical indicators to the success of developing a suitable culture (Galli et al., 2017; Dixon & Fargen, 2017; Van Kleef, 2009).

Infrastructure Programs such as training and specific tools: Three critical ways could be used to help the infrastructure programs which are training, monitoring, and continuous education. Leader member exchange theory could be used in this strategy. Its main goal to develop a strong relationship between the manager and the subordinates (Dixon & Fargen, 2017).

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Maintenance issues and reporting guidelines: High-level monthly strategic meetings will improve the quality of the product or services by fixing the maintenances issues and generating monthly report. Also, there are two more benefits. One should be friendly competition between departments to generate the best success. The other one is ownership of the company which can see the issues that affect time and money of any product the company produced.

Getting the feedback from customers: meeting with external and internal customers to get the proper feedback from customers about company performance will add value to the company. Discussions of possible areas of improvement often result in the making new processes and to improve the performance (Dixon & Fargen, 2017).

Hiring specialists in the continuous improvement area: qualified specialist must have appropriate skills in dealing with national and international policies and standard to positively create a suitable culture within the firm. One good approach to identify culture issues is to do benchmarking, and this task should be performed by specialists to apply all advantages from benchmarking and avoid all disadvantages from benchmarking (Van Kleef, 2009).

However, working with strategies to develop suitable culture may take years to build. Also, the larger the organization, the more difficult to make changes and may take longer to develop that culture. In this situation, time and cost risk are introduced.

Risks of creating suitable culture must be considered. Categories of risks that are related to culture are five and they are listed as follows:

- Authority power distance which measure who people are comfortable regarding the decisions of specialists
- Uncertainty which measure who people are capable in dealing with unknowns
- Individual or team work which measure who the culture enhances both of the team work and individual work.
- Gender aspect which measure how comfort are the roles being performed by male or female.
- Time period which measure the projects based in time, long term or short-term projects.

In general, this gap between continuous improvement and risks is a major issue. The two concepts must be combined to eliminate the problems generated when applying one concept without the other (Van Kleef, 2009).

6. CONCLUSION

Even though continuous improvement has been studied well in the previous studies, studies have not been mentioned the interconnection between continuous improvement and the types of risks that might be introduced when implementing continuous improvement. For any continuous improvement-oriented program, it should have a section that deals with risk management. Risks must be identified, analyzed, evaluated, ranked, treated, monitored, and reviewed.

The results of this study to a certain extent are limited, there are three main limitation to this study. The first limitation is about our focus, since it is based on profit organization to determine the relationship between continuous improvement and risk management. Attention was not paid to nonprofit organization or other governmental sectors. The findings to this study will be applicable to the profit organization but

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

it might be applicable or not to the nonprofit organization. Another limitation should be that this study selected the journals and articles that were published in the time period 2012-2017, except one journal, which was published in 2009.

Two main recommendations for future research could be introduced from this study. The first could be studying the relationship between continuous improvement and risk management for the nonprofit organization and governmental agencies. The second recommendation is finding a scientific approach that shows a standard classification of risk management for both profit and nonprofit organization.

Finally, this research explores new approaches that will let the profit organization take into account each aspect of the projects, especially when dealing with continuous improvement and simultaneously focusing on risk management. Risks are not all the same and each profit organization has its own perspective of risks. Further understanding of the risks related to nonprofit organizations will add value to the overall business.

Future research should explore a few different arenas. For example, future research could investigate these factors and the relationship but in the context of other industries and managerial settings. In these settings or contexts, it would be interesting to study the strength of these variables and the relationship as well as the factors that impact these factors and their relationship. Another avenue of research could be to explore these factors and their relationship but from different perspectives, such as from an organizational, strategic, or cultural point of view. This would shed further light into the how this relationship is perceived across many different views and further understand the degree of impact that factors such as culture, strategy, human resources, operations have on the key variables and their relationship.

ABSTRACT

New developments in the Information and Communications Technology industry have substantially increased the importance of the internet over the last decade. As a result, the finance sector has developed its technological capability to be able to compete in an online marketplace with other financial services providers and to be able to serve their customer. This chapter examines the use of technology in the financial industry and the various factors associated with it, as well as introducing the reader to the main types of project initiators-contributor business relations in online crowdfunding.

INTRODUCTION

E-Banking also written as electronic banking refers to the usage of computers in carrying out bank transactions. Examples of such transactions include withdrawal of money through cash dispensers or engaging in funds transfer through a point of sale. Electronic banking is also known as internet banking or online banking (Ainin, Lim & Wee, 2005). Therefore, this illustrates the complex nature of the concept of financial services as there is not a universal definition of E-banking. However, it is significant to note that internet or E-banking refers to the use of various electronic services that allow a financial account holder with a particular bank to access all his or her information through a computer. Therefore, in the context of this discussion E-banking will be defined as a self-service activity that permits bank account holder to get access to their accounts, as well as their updated general information on a financial institution's products and services. In addition, these users have the liberty of conducting financial transactions without time or geographical limitation by accessing the bank's website (Kallstrom, 2000, p. 20).

The technological advancement and the use of the Internet have raised a new platform for fundraising known as crowdfunding. Crowdfunding involves three parties: the project initiator or owner who needs funding, the contributor who is willing to give their money and the moderating organization that facilitates the engagement between the contributor and the initiator (Young, 2013, p. 33). Moderation can also be done through technology by the project initiator himself, using Web 2.0 and outside of platforms. The platform involves entrepreneurs or potential business owners asking for funding for their projects from the "crowd" or users from all over the world who may be interested in supporting their cause or business. Crowdfunding allow individuals the possibility to develop into their business ideas, even if it is only with a small amount of money. Governments encourage crowdfunding due to its positive impact on the economy as a whole, as it creates new jobs and fosters the economic growth of countries.

This chapter seeks to introduce the reader to e-banking services, online investments, and the main types of project initiators-contributor business relations in online crowdfunding.

BACKGROUND

In the late 1970's home banking was the only way of offering financial products without the customer being present at the banking hall (Xu, Wikes, & Shah., 2006, p. 19). Financial institutions call this service home banking; however banks offer this service through phones.

Banking customers were able to transfer money, pay their invoices or check their account credit through touch-tone telephone while they were at home. New software was created that permitted connecting customer to the bank through a dial-up connection. Although in the late 1980s this service was not very popular for several reasons. First, home banking was only allowed for some services agreed by the bank. Second, this new service needed an important investment in technology, and only few financial institutions could afford this cost.

The use of computers was not common at the time in many households (Laopodis, 2013, p. 26). Among the financial institutions that offered home banking services are the leading banks like Citibank, Manufacturers Hanover and Chase Manhattan. All of them had its origin in America, thus showing the contribution of the United States to the e-banking industry. In the mid-1990's banks were starting to realize the need to move their financial services into the virtual realm. Apparently, e-banking was becoming an attractive concept as it helped banks diminish transaction costs; it was helpful in promoting easy integration of services as well as introduced interactive marketing capabilities. Additionally, online banking was instrumental towards boosting the bank's customer lists and profit margin faced by the businesses. Furthermore, internet banking allowed institutions to bundle their services into single packages; thus, attracting more customers at minimal overheads. The period of late 1990s saw the advent of the clicks and bricks euphoria; as a result, many banks realized that e-banking was a strategic and imperative innovation (Lassar, Woodford, & Moschovitis, 2005, p. 15). More so, during this period there were a lot of mergers and acquisitions within the financial industry that resulted in expanding customer base Therefore, financial firms viewed the World Wide Web as the only channel that would help in maintaining customers, as well as build loyalty. However, in the wake of the banks realizing the potential of e-banking a lot of customers across the globe remained hesitant to conduct their financial transaction over the internet. For example, there was the Y2K scare that was a disambiguation about a world crisis by the year 2000. In this connection, many customers feared online transactions because of the fear that all computers would fail. Therefore, to avoid this problem a number of financial consumers

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

were reluctant to move into the virtual world of financial service provision. Companies such as America Online, eBay and Amazon.com invested in marketing purchase of items through online platforms. For example, Bank of America took about 10 years to reach 2 million e-banking clients. In 2009 as per a report by Gartner Group, at least 47 percent of American adults were banking online.

Computational investing is another topic that provides insights on investing and stocks. It includes a collection of theories that have effectively been used as strategies for investing. For instance, John Bogle's passive investment approach recommends that entrepreneurs should allocate resources to assets that have minimum trading expenses. The reason for that is that active involvement in market-stock trade cannot match the returns of the market (Laopodis, 2013, p. 32). In other words, Bogle advocates for a long-term view approach to investing – one should pay attention to taxes and costs. Therefore, according to him, a well-diversified portfolio is an assortment of low-cost assets that have been in the market for a considerable number of years. That is, investors should adopt a buy-and-hold strategy.

Another theory of computation investing is value investing. According to Warren Buffet, who developed the idea, investors should exercise discipline, intelligence, and patience in relation to buying stock (Laopodis, 2013, p. 32). In other words, the entrepreneurs should purchase shares of reputable companies only.

MAIN FOCUS OF THE CHAPTER

1. E-Banking

Internet banking allows access to financial information through accessing internet over a computer or by use of mobile phone that has Internet connection. Mobile banking is the latest revolution in virtual banking, it involves conducting financial transactions via a mobile device; for example, a mobile phone or tablet. The introduction of mobile banking led to new methods of payments by using a mobile phone to pay for commodities or services remotely. The first form of mobile banking was referred to as SMS banking. However, the invention of smart phones has overtaken SMS banking and now users of the internet-enabled mobile phones can use various applications based on the operating system to carry out financial transactions. There has been a remarkable growth in the number of households using virtual banking services. Population born between 1970 and 1990 also referred to as the generation Y embrace technology very fast once it comes to the market. Generation Y account for the highest number of users of online billing services to settle their account on student loans, credit cards and expenditures aimed at improving their lifestyle for example shopping online. Noteworthy, e-banking is highly entangled in every individual way of life without discriminating against age or those with disabilities (see Friedman (2000)).

Internet banking offers various services depending on the bank of choice for each customer:

Account Opening and Access Information

Banks that provide e-banking services allow their clients to open new accounts by accessing the bank's website. In order to complete this service, an individual logs in into the bank's website, fill an application online and submit the application. Afterwards, an account holder with online banking services enjoys the opportunity of accessing financial information wherever they are with an Internet connection. Such information may include closing or opening accounts, checking updates as well as make inquiries captured in the account or even making payments.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Electronic Check Conversion and Transfer of Funds

Electronic check conversion allows customers to convert their paper check to a new electronic payment. Essentially, the benefit of electronic payment is that the account holder with a bank can withdraw money from their account and wait until the other party receives the check. This service is faster as the normal check takes longer duration to process. Customers can also transfer funds across personal accounts and to different users as a way of covering the shortage in some accounts or make payments.

Download Online Bank Statement

Clients can go through this document because it allows one to check even the previous year transactions so as to make sure accounts are in order (Lassar et al., 2005, p. 24). In the event of complaint, users can save their bank statement either as word or as PDF on their computer, tablets or smartphone for future evidence.

Buy Financial Products

E-banking allows clients of the bank to buy financial products online. Examples of such products may include deposits, stocks, mutual funds and mortgages. The bank products vary across different financial institutions.

Buy Good Online

Users of online banking benefit from the ability to login into their accounts and to buy goods online or make payment to their credit card. Nowadays, it is easy to buy goods online safely and quickly or simply make enquiries; therefore, saving on travel costs and time.

Order for a Check Book

This is a booklet of blank checks that facilitates bank account holders to draw money from their account or deposit funds for the purpose of settling other company accounts or payment of bills (Lassar et al., 2005, p. 30). These checkbooks can be ordered online by e-banking service users, they receive the booklet through their mail.

Make IRD Payments

IRD refers to the income that an individual is not entitled to receive during his or her lifetime. Such payments include IRA or other retirement schemes that an account holder cannot receive before death. The amount of IRD payments is not part of the final income tax return. This service is now available through internet banking, and it is easy to process all information an individual may need pertaining to IRD payments electronically.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Tax Information and Documents

Financial institutions assist their customers to complete several tasks such as offering tax documents online. Additionally, the banks help their clients to fill and submit the forms online. Overall, a financial firm helps in resolving tax related issues and usually this service is available to the customers free of charge.

Alerts

An account holder with the access of internet banking can subscribe to receive alerts of every processed transaction by the financial institution. Consequently, the service will inform the customer about the existing bank account balance, and introduction of new products and transactions completed.

The Importance of E-Banking

The main important characteristic of internet banking is significant time management, elimination of queues due to the automation of most financial services and availability of easy maintenance tools for managing one's money. E-banking offers cheaper costs of attaining banking services and increased comfort. With regard to the latter, customers are able to make financial transactions any time of the day, and without physical interactions with the bank.

Another characteristic of e-banking is rapid and uninterrupted access to information. For example, business firms can enjoy easier access to information by checking on multiple accounts at the tick of a button. In addition, internet banking allows for better management of cash by speeding up cash cycles and increasing efficiency of business transactions since numerous cash management tools are available on the World Wide Web. For instance, it is possible to manage a firm's short-term cash through internet banks in money market funds, in commercial papers, in over-night deposits, or in bonds and equities (Appei, 2009, p.7).

Furthermore, e-banking allows a customer to enjoy the convenience of carrying out financial transactions from the comfort of his or her office or home. The fact that e-banking allows a rapid response enables customers to wait until the end of a financial transaction without any fuss about it. Finally, internet banking allows for effective management of funds. Customers are allowed to download their account history and fund analyses on their computers or mobile phones before carrying out any actual transaction.

2. Benefits and Challenges of E-Banking

E-banking has transformed the provision of financial services around the world (Liao, Yuan, & Chen, 1999, p. 66). Financial institutions as well as customers obtain certain benefits from using e-banking as compared to the conventional method of banking.

Online banking allows account users to make payments across accounts to just about anyone. For example, client of the bank can choose anybody or any company whom he or she wants to make payments to and the bill pay service will facilitate this transaction.

Internet banking gives the account holder the liberty to control almost every aspect of his or her account. Besides this control over personal or business bank accounts, the customer can access other services within the financial industry (Liao et al., 1999). For example, buy or sell interest-earning assets,

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

keep an update on stock market and money market. It is imperative to mention that accessing internet banking services on the bank's website is free, the only requirement is being an account holder with the entity and have access to the internet.

Customers enjoy the benefit of comparing best deals across banks and get access to the best special offers. Often individuals operate more than one bank account; therefore, it is easy using e-banking services to compare products offered by different banks. E-banking service allows bank account holders to access the financial institution on a 24 hours basis (Krantz, 2013, p. 19). Automated teller machines, and access to their bank account through the internet is convenient to the clients. Virtual banking is beneficial to customers because this system helps bank account holders to avoid queues common in banking facilities. Many of the customers who use online banking feel that this system saves time unlike when they spend time queuing in banks.

Internet banking contributes to a reduction of operational costs in the financial Institutions. In the long run commercial banks save on resources that would be paid to the tellers to manage the growing customer base in the bank. Therefore, it is relatively cheap to conduct financial services over the internet for the banks. Virtual banking has allowed banks to acquire a greater customer base through reaching new target markets (Liao et al., 1999). Precisely, the use of internet surmounts any geographical boundaries that would be difficult and expensive to break when using traditional banking systems. Interestingly, the banks use internet to reach the well-off households as internet penetrates highly in households that have a sustainable income. E- Banking reduces the costs affiliated to marketing especially with the introduction of internet marketing, helping to create a similar playing field for small and big banks. Therefore, the upcoming financial institutions can fight for survival through competing for customer base in the same market with the successful banks (Liao et al., 1999). Otherwise, it would be impossible for the small financial firms to compete with the leading companies through the traditional systems of marketing because of capital and market power challenges enjoyed by the big banks.

There has been a significant change in the level of efficiency in commercial banks after the introduction of e-banking. Use of internet in banking facilities allows the firms to operate in a paperless environment. For example, it is easy to keep records within a single file for a huge number of clients. The level of customer service and satisfaction continues to improve remarkably with e-banking systems. Principally, this improvement is attributed by the levels of efficiency in banks. In addition, internet banking offers the customers services that would be difficult to access through bank's branches (Liao et al., 1999). Online banking contributes to a reduction of the number of people visiting the facilities daily; therefore, improving on customer service both online and offline. Using e-banking services helps a financial entity to improve its public image by giving a good impression to existing and prospective customers. Noteworthy, an account holder may not be willing to use e-banking system, but by providing such services a bank helps in promoting a good reputation to the prospective and current customers.

Internet banking is beneficial to the stakeholders in the financial industry. Banks and customers enjoy extensive benefits by using this modern way of accessing financial information and products (Sarlak, & Astiani, 2011, p. 29). However, there are certain concerns or challenges that arise in the use of internet banking. Firstly, with the introduction of this new technology by the commercial banks there is a need to create a customer service support system that will provide support to the clients. Commercial banks face the challenge of maintaining a fast and reliable customer support system in a bid to protect their reputation as well as image in the market. Establishing such systems is costly but it is important towards getting the customers to trust internet banking as a way of undertaking financial transactions. Secondly, laws governing different countries present an interesting challenge to e-banking. Internet banking cannot

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

be limited within a geographical location or borders (Lassar et al., 2005, p. 45). However, each country or state has different laws that are distinct and are not applicable in territories beyond where the laws are enacted. Therefore, there is a need to harmonize some laws pertaining to electronic banking worldwide so as to ensure access to financial information and products is not restricted. Thirdly, the issue of security over the internet is another challenge that continues to affect online banking. In fact, this is one of the challenges for banks as customers inquire know the level of security or protection that virtual technology offers to them before they proceed to open online banking accounts. Internet technology attracts online cyber-crimes, and often bank customers become victims of fraud or theft especially with the use of ATM's (Lassar et al., 2005, p. 45). Hacking and phishing of financial information is an emerging trend and a challenge that banks deal with every financial year. Fourthly, internet banking creates regulatory challenges because of globalization of the financial industry. Internet allows provision of services from any location in the world posing a danger in regulation of financial intermediaries by the central bank. Inherently, commercial banks will find ways to avoid any supervision or regulation by the relevant authorities. For example, it is mandatory for every business to acquire a license from the government; similarly, financial institutions have to establish a licensed branch before they are granted permission to venture into virtual banking (Marina, 2009, p. 4). Fifthly, internet banking has led to increased activities of money laundering. Anonymity is one of the features evident with electronic banking. A client opens an account in a bank, but it is difficult for the financial entity to identify the type of business the nominal account holder is undertaking or even the location of the transactions. Presently, many governments have put up guidelines to combat money laundering. For example, it is mandatory for every individual opening a bank account to verify their identity and notify the bank of their residential address (Marina, 2009, p. 6). Finally, online banking poses serious macroeconomic challenges to the country's economy. For instance, the technological revolution in the finance industry particularly the advancement of banking practices makes it difficult for central bank to implement monetary policy. Consequently, it is always a challenge for the central bank trying to control economic activities and inflation especially with the globalization of financial services. In essence, expansion of electronic banking leads to a significant decline in financial transaction costs. Consequently, this leads to cheap credit in the economy hence eroding the effectiveness of monetary policy. Tobin tax is an example of a tool used by many governments towards controlling availability of credit in the economy especially it helps to increase costs of accessing financial products from the banks by the borrowers.

3. Investing Online

Some of the concepts discussed in Modern Investment Theory and computational investing are useful to stock brokers, especially when opening an online account. A stock broker is an individual or company that trades in shares on behalf of a client. If the interaction between the client and the broker is through a website, the broker is referred to as an online broker. The online service allows the investor to allocate some funds to the brokerage firm for the purchase and sell of stock. Normally, the transactions occur on order basis, that is, the client must request the broker to buy or sell profitable shares. Apart from trading in shares, a significant number of online brokers also provide other support services such as tax reporting, creation of financial statements, and so on. Optionally, an investor may decide to do the online trading independently. That means the entrepreneur will need to open an online stock brokerage account. To succeed in such a venture, the entrepreneur must consider several factors.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Firstly, the investor needs to acquire a portfolio tracking tool, which is a set of online tools that provide information on the trading of stock. Hence, the tool allows investors to keep a close eye on the performance of their stock while shopping for additional profitable investments. The portfolio tracking tool can be treated as an additional expense to the cost of opening an online brokerage. However, an effective method would be to treat portfolio tracking as a support service provided by an online broker (Hart, 2005, p. 36).

Secondly, transaction costs are incurred in operating the online brokerage account. Normally, the online broker that hosts the independent stockbrokerage account charges a specific amount for each transaction executed. In other words, an online broker may provide the portfolio tracking tool at a low cost, but charge the investor highly per transaction (Hart, 2005, p. 42).

Apart from that, some hosts charge for stop-sell order requests. Therefore, investors should take time to compare the charges of different hosts to ensure that they get value for their money.

Thirdly, the type of account matters. Often, investors have the option of opening either an individual retirement account (IRA) or retail account. Before opening an IRA, the entrepreneur should consult a tax advisor because some of the transactions done through the account are taxable. For instance, if a transfer of funds is done from the investor's IRA to an online broker's IRA, there are no tax penalties or consequences. However, taxes apply if the investor withdraws money from an online brokerage IRA. Conversely, transferring funds to a retail account has no tax implications. Similarly, the purchase of stock through the use of funds in the retail account has no tax implications. However, the income from the stocks sold through the account is taxable (Hart, 2005, p. 50).

Additionally, investors expect returns in form of dividends from companies in which they own shares. The dividends may be scrip dividends or dividend re-investment plans (DRIP). For the investors that subscribe to the scrip-dividend policy, the expected cash returns are automatically converted to new shares. Conversely, for those in DRIP, the cash dividends are first sent to a scheme administrator who then may use the funds to acquire the company's shares through the stock market or send the money to the stakeholders. Therefore, before opening an online account, the investor should consider the reinvestment service offered by the host (Hobson, 2012, p. 15).

Also, the investors need to determine the means through which they will fund their online brokerage accounts. Firstly, capital may be sourced from savings. In this case, keeping money in bank accounts yields low annual interest. Depositing the money into an online brokerage account will result in better cash benefits. Secondly, the IRA is also a source of funding. In this case, the funds can be transferred from an existing IRA to the online brokerage IRA mentioned earlier. Thirdly, the investors can opt to make direct deposits. In this regard, the cash-in-hand that they possess should be greater than or equal to the bare minimum required to open the online brokerage account. Given that the option will force the entrepreneurs to develop a working plan on how to make regular deposits into the account, discipline is required (Hart, 2005, p. 55). The investors can obtain additional hard cash from gifts, financial assets converted to money, extra income, refunds, and so on.

Therefore, before opening an online brokerage an account, one must consider several things. These include the type of account to be opened, transaction costs involved, and customer service. The investor should also take into account how the online brokerage shall be funded, the cost of the portfolio tracking tool, and the dividend re-investment policy provided. Once these queries have been addressed, the next step is to open an online brokerage account (Hart, 2005, p. 57). In reference to that, it is worth noting that managing a profitable stock investment portfolio requires thorough knowledge of ways of investing.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

4. Trading Stocks and Options Online

Online stock trading is another important subtopic of investing and stocks. This type of trade is to some extent similar to regular transactions that involve one walking into a shop, picking the required items, paying for them, and leaving. That is, the online traders select the shares they prefer and electronically transfer the sum required for the purchase. Once the money is received, the sale is reflected. However, online trading has some complications because the prices of stocks are set in real time (Krantz, 2013, p. 129). Thus, the online investors have to use the following options in trading through the internet.

Firstly, customers can trade their stocks online through market orders. In this case, they have to instruct their stock brokers to sell their stock. Normally, the brokers are requested to sell the shares at the highest price that a willing customer is ready to pay. As a result, such orders are quickly executed (Krantz, 2013, p. 129). Given that it is easy to find such willing buyers, the online investors pay a small commission for the brokers' services.

Secondly, stocks can be traded online through limit orders. In this case, the online investors are allowed to set the prices at which they are willing to purchase or accept the sale of stock (Schwartz, 2010, p. 156). For instance, consider an entrepreneur who owns 40 shares, each valued at $100. Suppose the price of the stocks is declining and hence the investor estimates that soon the value of a share will plunge to $70. In this case, the online investor can sell the shares in two ways. The first option is through the market order, which was discussed above. However, that may not give the best returns since the buyers may momentarily offer lower prices than the projected minimum. Optionally, the online investor could set the lowest selling price at $85 to minimize losses. Thus, so long as the decline proceeds as expected, the limit order is the preferable alternative. When the shares' price falls to $85 per unit, the broker will sell all stocks if possible. Limit orders are not based on price alone. Some investors give a deadline within which to sell the stocks (Krantz, 2013, p. 129).

Sometimes, one may not obtain the returns expected after the sale of shares through the limit orders. This is because the shares' price may decline so rapidly that the seller is unable to place the stocks on sale at the agreed price. In this case, the broker may only sell a restricted number of stocks. The rest of the shares are kept in the investor's portfolio. Thus, the limit orders provide a false sense of security.

Online investors can also use stop market orders to trade online. This type of order is similar to a limit order in that a minimum buying or selling price is set. However, for the stop market orders, when shares' price reaches the designated value, the orders are converted into market orders (Krantz, 2013, p. 130). For instance, using the previous example, the broker may be instructed to execute a stop market order when the stocks' price reaches $85. In this case, if the value of shares suddenly plunges to $80 per unit, the online broker would still have to sell the shares at that price.

Fourthly, the shares can be traded through a stop limit order. This option is similar to a stop market order. However, once the defined price is exceeded, the stop limit order is converted into a limit order (Krantz, 2013, p. 130). Thus, the stop limit order prevents the sale of shares if the value of the stocks falls beneath the limit price. To elaborate further, still using the same example, suppose the activation price for selling stocks is $85 and the limit value is $75. When the shares' value falls below $85 per unit, the order becomes a limit order. Hence, when the price reaches $75, the broker is supposed to sell every available stock at that price (Krantz, 2013, p. 130). However, a further decline in price would result in no sale at all. That is, the remainder of stock is kept in the online investor's portfolio.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Lastly, the online stocks can be traded through a trailing stop. This type of order basically follows the market. For a favorable market, rising stock prices, the online investor instructs the broker to retain the shares until the value of the securities reaches a predetermined value. This order is referred to as a trailing sell stop. For a bearish market, the broker is expected to sell the shares as the stocks' price approaches a set minimum value (Pardo, 2008, p. 85). This order is known as an exit trailing stop. Thus, the online investors continuously search for positive yields during the stocks' transaction life.

Apart from stocks, options can also be traded online. An option is a financial instrument that gives one the right to sell or purchase a precise quantity of underlying stock at a prearranged price within a defined time period. The option seller is not legally obliged to carry out all the tasks stipulated in the contract when the financial instrument is handed over to a buyer. The online trading of options is done through screen-based or electronic methods. In the United States of America, there are several institutions – exchange companies – that specialize on options trading. They include the International Securities Exchange (ISE), Boston Options Exchange (BOX), and NASDAQ. The online trading of options has advantages as well as prerequisites that are worth discussing in details (Fontanills & Cawood, 2009, p.43). The online trading of options yields more benefits to the online investor than full-service or traditional brokerage. For example, for this type of trade, commission expenses are lower. That is, the traditional broker may charge $100 for a round turn, whereas an online brokerage charges only several dollars (Fontanills & Cawood, 2009, p. 45). In this case, a round turn refers to each deal or sale. Normally, a commission cost is charged on all orders. The charge applied varies depending on the service being offered. Also, the commission expenses decrease as the services offered to the investors increase. Another advantage of the online trading of options is that the online investors receive considerable support in terms of information as opposed to what happens in traditional brokerage.

5. Online Crowdfunding

A new startup needs some amount of funds in order to get the business started. In order to transform the entrepreneurial project into a reality, then it is necessary to have adequate cash to execute all such plans. Moreover, the fundraising will help the entrepreneur to develop the business model for the growth of the project and a successful business marketing plan (Damos, 2014, p. 32).

The technological advancement and the use of the Internet have raised a new platform for fundraising known as crowdfunding. Crowdfunding involves three parties: the project initiator or owner who needs funding, the contributor who is willing to give their money and the moderating organization that facilitates the engagement between the contributor and the initiator (Young, 2013, p. 33). Moderation can also be done through technology by the project initiator himself, using Web 2.0 and outside of platforms. The platform involves entrepreneurs or potential business owners asking for funding for their projects from the "crowd" or users from all over the world who may be interested in supporting their cause or business. Crowdfunding allow individuals the possibility to develop into their business ideas, even if it is only with a small amount of money. Governments encourage crowdfunding due to its positive impact on the economy as a whole, as it creates new jobs and fosters the economic growth of countries.

This chapter seeks to explain the main types of project initiators-contributor business relations in online crowdfunding.

The term crowdfunding is a relatively new concept to the market, however its origin comes from the construction of the Statue of Liberty's Pedestal. John Pulitzer, who was a popular publisher at the time, employed his newspaper to collect money for the construction of the pedestal. The initiative raised

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

100.000 dollars in only six months. Pullitzer promised to print the name of each donor, regardless of the amount of money donated. In August 1885, Pulitzer announced that he had collected the amount to $100.000 for the statue's pedestal. The Statue of Liberty, that had arrived from France packed in crates, was erected the next year. (See Young, (2013)). Nowadays, Crowdfunding is becoming is already very popular around the world and the Internet platforms are leading the rasing of funds.

In 2013, Crowdfunding raised over 5.1 billion dollars to help people in various projects all over the world and the figure is projected to increase in the future with the new platforms becoming more popular (See Crowdfunding Industry Report from Research firm Massolution). The new law of the Jumpstart Our Business Startups (JOBS) by President Obama in 2012 introduced a regulatory framework. Most of it still has to be translated into active regulatory elements to this date, protecting donors to crowdfunding projects and enabling businesses to use crowdfunding as a real source of funding. The Act enhanced the credibility of the platforms for crowdfunding while at the same time ensuring that the project owners or entrepreneurs had a viable and a good source of funding for their projects. Kickstarter and Indiegogo are some of the most popular platforms boasting of members in millions of all parts of the world, these websites have enough people to pool huge amounts of resources for the funding of their businesses.

There are different types of relations between project initiators and contributor in online crowdfunding:

Reward-Based Crowdfunding

The reward-based form of crowdfunding is the most popular type with most contributors and initiators preferring this method due to the security of their funds under this method (See Crowdfunding Industry Report from Research firm Massolution, 2014). In reward-based crowdfunding, the target amount has to be established first for the completion of the project (Steinberg, 2012, p. 97). Then, the person or organization sets up donation amounts with an attached incentive that is proportional to the amount donated for the project. This method is hugely popular for artists, movie directors and other projects that have an aesthetic or prestigious value to the donor. For instance, if an artist was looking for a donation to help with a tour of Europe, he may offer signing autographs to people that will contribute $500 and backstage preparation with the cost to people contributing $1.000. These incentives ensure that the enthusiasts and the music lovers are motivated to donate to the cause (Young, 2013, p. 79). One of the unique characteristics with this method is that if the set platform allows for the project owner to get the amount only after the targeted amount is reached, he/she cannot be awarded the amount collected in case the donors do not raise all amounts. The donors can therefore get their money back and they have the confidence of recovery of the raised amount as a result (Agrawal, Catalini, & Goldfard (2015)).

One of the major benefits of reward-based crowdfunding is that it has low risks for the promoter or the company that is behind the campaign to raise funds or donated amounts. Once a company has raised the required amount for the project and they may have had the donations only with a special clause for the specific project they are able to avoid dealing with debts, credit implications or interest that is attached to the loans or government grants (Bruntje, & Gajda, 2016, p. 45). The reward-based crowdfunding method offers the chance to completely avoid all these problems and start their business or project without any possibility of future shortcomings due to any changes in the plans or the success of the project. The reward-based method also runs on low cost with the project owners being offered a chance to showcase their projects for only a small fee of their total collection and there are no high costs of managing the platform. As opposed to raising money through other conventional methods, where a person could end-up incurring a lot of costs for setting up the funds, crowdfunding sets this up at only a

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

small fee and the project is viewed and supported by millions from all over the world (Roebuck, 2011, p. 104). The reward-based method also offers the donors a chance to gain a personal connection with the project they have donated towards and the people they have funded.

Equity-Based Crowdfunding

Equity-based crowdfunding is a form of crowdfunding where the contributors become part-owners of the company raising funds. Equity-based is not a popular form of crowdfunding since the majority of the projects are not huge companies that donors and people funding the projects can get a stake and own part of (Douw, 2012, p. 60). Most of the projects are by entrepreneurs who do not have shares that the investors can invest in. However, since the enactment of the Act in 2012 this form of crowdfunding has gained popularity with most people seeing it as an investment opportunity for the interested investors in lucrative projects that the investors deem to pick up and be beneficial in a near future. This is offered at very low rates as compared to the market rate since the project owners will need to make their proposal and project attractive to the potential investors through their competitive prices and growth potential in the future (Douw, 2012, p. 60).

Equity-based form of crowdfunding is slowly catching up with the other methods of crowdfunding. It is, however, a safe and viable method to raise money for the company and beneficial for the donor if the company makes profits in the future and they gain from the dividends or distribution. Equity-based crowdfunding can also be used to create a venture finance market. Equity crowdfunding does not only involve the shares as the only forms of securities, but also debt notes, convertible notes, and hybrid forms of equity and debt (see Freedman & Nutting, 2015, p. 5). In addition, there are some forms of partnerships that qualify as securities in equity-based crowdfunding. One of the main attributes of equity-based crowdfunding in creating venture-based market is its ability to connect startup business and the medium businesses to the larger investor community. Equity-based crowdfunding offers a platform to reach out to the companies through a single advertisement on the web. It ensures that the information reaches out to interested potential buyers and sells the business to the investors (Mollick, 2014). The venture space is therefore in ensuring that the investors and the business people meet. In addition, the venture space ensures that people with similar businesses and ideas can interact and advise each other on the best practices and the best ways to improve the businesses. The venture space is not only useful in raising the funds, but also ideas and plans on the best ways to improve the business given that there are other members of the crowd with the same ideas. It can also lead to mergers and amalgamation of two or more different venture businesses since the equity-based crowdfunding targets the business people who are interested in increasing their venture capital either through shares or other securities. The equity-based finance structure has a pool of professional small and large businesses that need a regular appraisal either through funding or through further investments (Steinberg, 2012, p. 113). Economic growth is also a factor that is hugely influenced by the success of the equity-based crowdfunding, since the growth of business companies contribute to the economic growth of the country. Most governments all over the world are taking up the new platforms and legislations have already been passed to ensure that crowdfunding for businesses and individual projects help the larger financial community that is the whole country. The venture finance marketplace has therefore transformed the equity-based crowdfunding concept to rally the support of the government and security legislations since it has been viewed as a milestone and a new trend in the financial sector.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Reward-Based Crowdfunding

Credit-based crowdfunding is a method where the donors to a specific project loan out money to the person in the hope of future repayment of the amount owed. This is the safest method of crowdfunding for the donors since in case the project owner defaults in payment of the advanced loans the platform is liable for the payment of the loan to the donor (Tomczak & Brem, 2013, p. 341). Under this method the borrowers submit an amount that they wish to be loaned and the donors interested in the specific project advance the borrower the amount with a promise of repayment at a future date. The platform acts as the intermediary and or surety for the borrower and the donor to ensure that the donor gets the amount back and facilitate the pooling of funds for the borrower. The borrowers find crowdfunding attractive since it has very low or no interest rates for the borrowers and they only have to incur a fee to process the funds by the platform and agree on a flexible payment plan to refund the amount forwarded. In the event that there is any interest to be charged on the amount of money borrowed the borrower sets the interest to be charged that they are comfortable and can guarantee a refund within the stipulated time period (Mollick, 2014). This makes the method attractive for the borrowers since they are not required to pay a minimum or set interest rate that is predetermined and as a result they can guarantee payment. The lenders on the other hand have to evaluate the project for its risks or benefits and potential and establish if they are willing to lend money at the interest rate set by the borrower. The arrangement is similar to that of a bank loans with the main difference being the predetermined interest rates. Whereas in credit-based crowdfunding the borrower sets the interest rates, inviting donors to fund the project in a bank loan the borrower must agree to the terms set by the bank or the authorities involved (Althoff & Leskovec (2015)).

One of the main advantages is that the borrower does not have to give any form of collateral to the lender and they transact only in terms of good faith from the borrower and the donor of the project. The donor funds the borrower in the hope that they will repay the money not because they have a history of repaying or they have presented evidence to suggest that they are capable of repaying the money but only on faith they have on their project. This ensures that the platform eradicates many processes of loan funding and borrowing that would slow the timeline of acquiring a loan. Background checks run by the banks and also the examination of the presented information are a large part of the processing process making it tedious and time consuming. The process also rules out borrowing from poor and new business people that are looking for money to kick start their business and have no collateral or no history to guarantee payment of the amount that they have borrowed. Crowdfunding offers such people a chance to borrow even huge amounts of money without any form of guarantees and guarantors. Credit-based crowdfunding has been immense in eliminating the factors that hinder borrowing and lending since there are none in crowdfunding. The project and presentation of the ideas are the most important aspects of a project if one aims to be funded for a project accordingly. It is therefore advisable for one to lend both their time and resources in the presentation of the project to as many people as possible.

Donation-Based Crowdfunding

Donation-based crowdfunding is the last method available for funding new initiatives. In this method, funds are raised for an initiative of public interest, although there is no economic benefit to the community financing the initiative. One of the greatest challenges of social entrepreneurs today is accessing startup

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

capital, that´s why donation-based crowdfunding makes this method an interesting financing solution. One example of donation-based crowdfunding is the 2008 election campaign of President Obama, the campaign team collected more than $137 million by this method.

One of the risks in a crowdfunding initiative is targeting and unrealistic financing initiative, as crowdfunding platforms charge a larger percentage fee if the target is not met, failing to deliver on the project's promise will negatively affect the project's reputation. Thus, it is very important to engage the potential community into the project and design the project according to their interests. That´s why advertising the campaign is an important part of the crowdfunding process, always keeping costs in mind, it is important to advertise the campaign through several channels and reaching the largest possible potential supporters. Most donations-based crowdfunding initiatives reward donors with something in exchange for their contribution. Typically this is some kind of perk, this is usually the most expensive part of the crowdfunding campaign. The most challenging part of the crowdfunding process is moving from the zero donation phase, as potential donors usually imitate what other supporters did, then a potential donor might be not willing to give funding to a project when no money has been raised yet. Encouraging close friends and contacts to contribute in the initial stages of the campaign will be helpful. The Regional Studies Association (RSA) explains that the most critical zone is when the 10%-50% of the initiative has been funded, as most unsuccessful campaigns fail somewhere in this range. Thus, in order to take the initiative to reality it is essential to push the campaign after the launch with advertising and showing previous donations. In initiatives involving social entrepreneurship like the ones involving this type of crowdfunding it is more important to have the certainty that it is a feasible project, as a poor crowdfunding campaign could harm the reputation of the company and affect future initiatives to get funding. Another important issue to consider is that the amount raised can be affected by declined funds later on coming from credit cards, wrong donations, or fraud.

6. Security in E-Banking and Finance

Some factors affect the safety of internet banking and online financial services. These include regulatory body supervisions, customer awareness, and internet infrastructure. On the other hand, according to Chavan (2013), increased use of the internet and mobile services as a new channel for distribution of banking services requires more thought towards security against sham activities. However, this responsibility should not be left to banks alone; Lee (2012) explains that customers and regulatory bodies also have a role in e-banking security. Furthermore, banks do not have any influence regarding the electronic devices and channels used by their customers to perform transactions.

The bank should create a procedure to increase security. Firstly, it is supposed to formulate a secure online banking infrastructure. Then it should ensure the implementation of an appropriate information security policy. Thirdly, the bank should provide a robust monitoring system for fraudulent activities and notify its account holders of any high-risk transactions through SMS. Fourthly, the bank is supposed to offer a two-factor authentication (TFA) protocol for its account holders. The first factor is something like a PIN number, which the customer knows, whereas the second factor is something that the customer will own such as a smart card with a chip authentication (Lee, 2012, p. 8). On the other hand, the customers' responsibility is to ensure that they have enough knowledge regarding the safety tips required in e-banking. For instance, a customer should always stay alert in safeguarding his or her identity as well as limiting public access to personal computers. According to Lee (2012), there are numerous tips for

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

safely logging on and off to a computer (Lee, 2012, p. 10). For example, a customer should never use a public computer to access his or her internet banking website. Customers should also close any open tabs and windows in a browser before logging on into e-banking. Moreover, after using the online service, the customer should always remember to log off. In safeguarding their identity, customers should use unique passwords that are difficult to guess. According to Lee (2012), a strong password should have at least six characters with a combination of numbers and letters. Furthermore, it is good for customers to often change their passwords and disable the 'Autocomplete' function in their browsers so that it does not remember previously input data.

Lee (2012) also advises that customers should never leave their TFA devices unattended (Lee, 2012, p.14). Other tips include disconnecting internet connections when not in use, backing up critical data on removable hard drives or Compact Discs, and installing internet security software for real-time detection of intrusions on a customer's computer. The roles of regulatory bodies in e-banking security are also several. According to Lee, regulatory bodies should develop adequate policies that promote customer protection and international cooperation among partners (Lee, 2012, p. 19).

CONCLUSION

The e-banking revolution has quickly changed the global business of banking. As a result, banks all over the world have reoriented their business strategies in order to encompass the new opportunities offered by online banking. In other words, the banking sector has led global electronic trade in recent years. Internet banking has enabled banks to change strategic behavior, scale borders, and create new possibilities as a result. Furthermore, internet banking has changed banking services towards the neoclassical economic theories of market functioning. Due to this, the market has become transparent and clients can easily compare banking services from different banks. For example, while using the internet, the customer is only one-click away from competitors. Thus, if a client is not satisfied with the products or services offered by one bank, he or she is able to change to a preferred banking partner faster and more easily.

Online investing has tremendously reduced the physical costs of operations. As Williamson (2006) stated, technological advancements in information technology have reduced the costs of processing financial information, whereas use of the internet facilitates transmission of financial information. In fact, this is why online financial services have gained popularity in recent years. In the future, this will ensure that banking rates are friendly as well as encouraging to more innovations regarding the current products and services being offered by banking institutions. In addition, electronic delivery of financial services has enabled banks to meet their clients' expectations and create close customer relationships (Williamson, 2006). Hence, as discussed by Chavan (2013), online banking will eventually triumph over traditional banking in the coming years as more developing nations are now building their economies with specific focus on e-learning, e-commerce, and e-banking.

Online crowdfunding has funded many new companies and initiatives in their initial stages and is substituting the funding of organizations with more online platforms being created. The examination of the risk from both sides, the borrower and the donor, is essential before making an investment or borrowing to make sure that the business is finally successful. The legislation of the Act has enabled the platforms to conduct business better and have a larger crowd since the donors have the backing of the government and the law while engaging in the business.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Online Crowdfunding has introduced new funding new funding mechanism and rules for news businesses. Most of crowdfunding funds are collected through reward-based platforms, however equity crowdfunding is becoming more popular. It is expected that online crowdfunding will grow in popularity as many new crowdfunding opportunities become available. A new business that seeks funds through the online crowdfunding process comes out stronger as for the questions that has to answer and the scrutiny that it is put under, compared to convince a single angel investor. It is worth mentioning that because a startup does not obtain online crowdfunding does not necessarily mean that the business is not viable. It might be that investors may not be on that platform or perhaps is not the right time. One of the biggest challenges ahead will be communicating efficiently and engaging with investors after successful funding. Investors will possibly be interested in the big numbers and updates instead of the news from daily operations. Investors will be more likely to reinvest if they are kept engaged and the company is looking after them. Creating a mutual interest might foster that investors act as ongoing mentors in the business.

The importance of e-banking and online financial services can be summarized as significant time management, elimination of queues, cheaper costs. Customers are able to make financial transactions any time of the day, and without physical interactions with the bank. Another characteristic of e-banking is rapid and uninterrupted access to information. Furthermore, e-banking allows a customer to enjoy the convenience of carrying out financial transactions from the comfort of his or her office or home.

Security is an important issue in e-banking and finance. Banks have to create the organizational procedure for security. A secure online banking infrastructure is necessary, as well as the implementation of an appropriate information security policy, the bank should provide a robust monitoring system for fraudulent activities. Finally, the bank is supposed to offer a two-factor authentication (TFA) protocol for its account holders.

KEY TERMS AND DEFINITIONS

Angel Investor: An investor who provides funding for small startups or entrepreneurs.

Crowdfunding Platform: Internet platforms which enable companies to advertise over the internet and obtain investments from registered users in return.

E-Banking: The performance of banking business through the internet. It is also known as "Internet banking" or "Online banking".

Electronic Commerce: A business model that enables to conduct business over the internet.

Financial Institutions: An institution that provides financial services to potential clients.

Information Technology: It is the use of any computers, storage, networking and other processes to create, store and exchange electronic data.

Online Security: Computer security related to the internet involving browsing and network security. It is designed to establish measures to use against attacks through internet.

Online Trading: Individual investors buy and sell stocks over an electronic network through a brokerage company.

Chapter 38
Running Successful Crowdfunding Campaigns for Non-Profits

Amir Manzoor
Bahria University, Pakistan

ABSTRACT

Crowdfunding is a method to raise revenue and funding from a large number of people. First used by entrepreneurs as a way to attract small-sized investments to for-profit ventures, the crowdfunding platform has grown substantially over the last five years. Today, a valuable mechanism for fundraising for not for profit organisations, the crowdfunding platform is projected to realise nearly a US$100 billion by 2025. Non-profit leaders, employees and volunteers can benefit by successful crowdfunding campaigns as a means to raise revenue.

INTRODUCTION

Crowdfunding is an innovative mechanism to raise funds from a large number of people (a crowd). The funds obtained from the individual is usually small-to-medium (Ordanini, 2009). According to Mulvey, (2013), the non-profit sector can couple crowdfunding with social media to produce effective and efficient changes in the way non-profits organisations seek, obtain and sustain funds. Crowdfunding has changed the dynamics of funding and has become an instrumental pathway for not for profit fundraising for non-profits to do so social good (Hobey, 2014). One of the reasons for this growth could be because crowdfunding platforms directly connect donors with requestors.

Crowdfunding is a very effective and cost efficient mechanism for not for profit organisations to raise revenue and funding. However, some conventional nonprofits and charities consider it as a threat (Maldonado, 2012). Despite a small group considering online crowdfunding as a threat, existing stakeholders in non-profit sector would benefit from seriously considering crowdfunding for its revenue raising potential and evaluate then make informed decision about their organizational long and short term objectives and

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

business models. It should be acknowledged though that the dynamic growth in the online crowdfunding platform has been compared as analogous to what digital file sharing once was for the major players in the music industry (Southin, 2013). Southin (2013) suggests that the fundraising environment is changing and that the growth of online funding is just at the beginning stages of development.

This chapter explores how a non-profit can launch a successful crowdfunding campaign. Following the introduction, a brief overview of the crowdfunding landscape provides insights into crowdfunding and the changing economic landscape of fundraising in the non-profit space. The characteristics of a successful not for profit organization crowdfunding campaign are then discussed followed by specific recommendations for not for profit organizations to embark on a crowdfunding business model and crowdfunding strategies are provided for successful crowdfunding campaigning is outlined. This chapter contributes to the financial knowledge in the not for profit space and concludes with three additional future research project recommendations.

CROWDFUNDING LANDSCAPE

Businesses and nonprofits have raised funds by using small number of donors are able to donate large amounts of money. However the landscape of fundraising is changing. Crowdfunding is one method of fundraising that relies upon getting small amounts of money from a large number of donors. Crowdfunding is normally done online (Bray, 2015).

The recession of 2008 has produced significant negative impact on the trend of philanthropic giving. In this scenario, crowdfunding represents a unique opportunity to obtain funds from individuals who may provide a smaller amount of donation and feel that they can make the difference in the success of the mission of nonprofits (Becher, Entsch, Frey, 2011). Crowdfunding as an innovative approach of fundraising has quickly grabbed the attention of nonprofit sector. Around the globe thousands of individuals and nonprofits are using crowdfunding to impact the lives of needy people. Crowdfunding has provided opportunities of philanthropic giving out of a small group of wealthy donors (Andrew, 2013; Belleflamme, Lambert, & Schwienbacher, 2010).

Crowdfunding is not a new concept. This concept has been around for hundreds of years. This concept of collective fundraising was used as early as in 17th century to fund publications (Carvajal & García, 2012). Today, the modern notion of crowdfunding is deeply rooted in the very old business model that nonprofits have used in which the funds were generated by collecting micro-donations from individuals to achieve the cause of nonprofits (Belleflamme, Lambert, & Schwienbacher, 2010). The term crowdfunding was first coined by Michael Sullivan. He launched a fundraising campaign to create an incubator for projects involving creation of video blogs. The basic principles behind crowdfunding approach were reciprocity, transparency shared interest and getting funding from the crowd. However the concept of crowdfunding was fully operationalized when Kickstarter.com, one of the largest crowdfunding platforms, adopted it (Prive, 2012).

By 2011, many more crowdfunding platforms emerged. These platforms were able to raise US dollar 5 billion in 2013. 30% of this amount was devoted for social causes (Morgan & DiGiammarino, 2014). While the figures speaks themselves the novelty and success of today's crowdfunding is due to the modern Internet technologies and the new philanthropic mindset of the people that have provided crowdfunding practices of big push. Crowdfunding projects can be used by both nonprofits and commercial firms.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

The crowdfunding projects initiated by nonprofits are community-based and offer no financial gain for donors (Estellés-Arolas & González-Ladrón-de-Guevara, 2012). While crowdfunding can provide many alternatives nonprofits are mostly interested in the donation crowdfunding. The basic philosophy behind this option is that people are invited to invest in the project initiated by nonprofits because these people have a passion for the mission of nonprofit. The investors expect intangible return of the investment that can be personal satisfaction coming from doing good for the community.

While crowdfunding is helpful for nonprofits it should be noted that nonprofits cannot use it as an approach to generate funds on an ongoing basis. Crowdfunding should be used to supplement the other techniques of fundraising such as personal solicitations, fundraising lunch, and direct mail campaigns. Crowdfunding should be used as a short-term technique to raise funds that should be integrated into a balanced mixed of fundraising techniques. As such crowdfunding should not be considered a replacement of other traditional fundraising techniques. For example crowdfunding can be a great way to raise funds for a specific cause such as launch of a new service.

Before launching a crowdfunding campaign nonprofits need to ensure that they set the campaign timeline and funding goal. They should then make efforts to generate genuine excitement around the cause for which the campaign is being run. Doing so the nonprofits can easily engage the support of existing and new followers. They can also encourage their followers to engage their friends and family in the cause. If nonprofits properly leveraged the power of social media and personal interaction there crowdfunding campaign can grow exponentially (Hemer, 2011).

Many times donors are motivated when they have a connection to the cause and are inspired not only by the work of the nonprofit but also by the mission of nonprofit and the people being helped. Crowdfunding is a great technique for nonprofits to supplement existing fundraising techniques. However successful crowdfunding campaign required developing a strategy plan. The nonprofits should start crowdfunding campaigns by first creating a description of the crowdfunding project. This description should outline how this project will benefit both the nonprofit and the community it serves. This project description should be considered as the pitch that nonprofit will be using to support and promote the crowdfunding campaign. The next step is the identification of the people that are likely to support the crowdfunding campaign. The nonprofit should pay attention to determine the needs expectations and values of the people being targeted for fundraising (Lambert & Schwienbacher, 2010).

The identification of incentives for the donors is the next step. The incentives are very important for crowdfunding campaigns launched by nonprofits. This is because there is no financial benefit or return associated with the investment that donors make into the crowdfunding campaign. Cost of the reward is not important and many studies show that donors of crowdfunding campaigns sponsored by nonprofits are not interested in any gift or return for their donation. The important thing for them is the personal satisfaction they derive by helping the people in the community they feel connected to (Pitschner & Pitschner-Finn, 2014). However, public recognition is one significant motivation behind donation. Nonprofits should ask their donors if they would like to be acknowledged for their donation. This acknowledgement can be made, for example, by prominently listing the name of the donors on the nonprofit's website. Besides providing a letter of thanks to the donors, the nonprofit can also provide donors the letter of appreciation from people or organizations that were helped by their money (Garecht, 2016). These letters can provide great emotional impact.

Nonprofits can also hand over small items, such as stationery or bags with nonprofit's name and logo printed on them, to the donors. They can also provide some distinctive experience for donors by arranging meetings of leaders of nonprofits with the donors or arrange the donors' visit to the facilities

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

of nonprofits. Creativity is a key to success for every crowdfunding campaign. Nonprofits should think out-of-the-box and consider every option that can help build the support of the crowd they are targeting for fund raising. Nonprofits can leverage the power of visual elements in their campaigns. Short but powerful videos can be created to highlight the cause and strengthen the connection between the nonprofit and its supporters. The marketing plan should include an outreach plan that clearly outline how the crowd would be approaches e.g. through personal meetings or email (StartSomeGood, 2016).

CHARACTERISTICS OF A SUCCESSFUL CROWDFUNDING CAMPAIGN

Success of crowdfunding lies in generating interest with group of targeted people who are eager and willing to give for a cause. By increasing the number of people touched by the message of the crowdfunding campaign, nonprofits can increase the chances of success of the campaign by getting higher levels of funds. Nonprofits should develop a consistent, well-developed pitch for their crowdfunding campaign that can ignite support among the crowd and encourage them to use their individual influence and bring their friends and family to support the cause (Lamson, 2013).

Marketing efforts should continue throughout the campaign. These efforts should continue to make sure that campaign is sustaining and new energy is generating. It is a fact that donors are more comfortable supporting successful campaigns. Therefore, setting examples of early success is very important. Nonprofits should encourage their supporters to make early donations. Irrespective of the amount of individual donation, promoting the fact that a large number of donors are donating can encourage others to donate as well. This can help build the required momentum for the campaign. On most platforms, project creators can post updates about the project. Xu et al., (2014) found that success rate of crowdfunding projects that provided regular updates was fifty-nine percent of as compared with a success rate of thirty-nine percent among crowdfunding projects that provided no updates..

There are no limits in a crowdfunding campaigns and nonprofits can use both traditional and non-traditional methods to raise funds. However, nonprofits must have a funding goal. Non-profits should also make every possible effort to explain in a concise and clear manner to the donors how the donated money will be used. The promotional materials should provide a clear and easy-to-follow call to action that could drive the donation by the donors. Registering with tax authorities and using an established payment mechanism can help build reputation and trust among donors. A fast and trusted online payment mechanism can also make the process of giving fast, safe and with less complications (Read, 2013).

Crowdfunding can help nonprofits in their development plans by providing the needed cash and by generating awareness of the mission of the nonprofit. This awareness can then be used by the nonprofit to gain new supporters and potential donors. Crowdfunding campaigns are short in duration, but these campaigns provide a high level engaging and personal relationship building with the people. These relationships can help nonprofit strengthen its brand and reputation, expand its presence, and attract new fans. With increasing use of crowdfunding by the nonprofits and for-profits, there is also a need to develop standards and expectations. Without standards it will be difficult to use crowdfunding to reproduce the success (Carvajal, Garcia-Aviles, & Gonzalez, 2012).

Crowdfunding global platforms are varied and diverse. A brief overview highlights a few crowdfunding projects in the global community crowdfunding space. To start, Kickstart, one of the largest and most successful crowdfunding projects, deserves some mention followed by a brief overview of other global crowdfunding platforms and projects

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Kickstarter is a very large global community developed to support creative projects. Around the globe, more than 10 million donors have supported Kickstarter project. In July 2016, Kickstarter was running 108,651 successful projects. The successful project is the one that achieved its funding goal. Cummulatively Kickstarter raised approximately $US2.53 billion worth of donations between 2012 and 2016 (Kickstarter, 2016). The basic model of Kickstarter is based on a reward for donation. Kickstarter solely operates in US. Fundly is another large online crowdfunding platform that operates exclusively for nonprofits and charities.

Fundly only services U.S-based crowdsourcing campaigners and donors. Despite this limitation, by 2013, Fundly was running more than 3000 campaigns. These campaign raised more than US$ 300 million in donations (Fundly, 2013). Fundly charges a platform fee (4.9%) and credit card processing fee (2.9% + $.30) transaction to set up a fundraising page (Fundly, 2016).

Indiegogo is one of the world's largest crowdfunding platforms. With social media integration, direct email, and announcement features users can easily spread the word, raise awareness, and increase funding. For 501 (c) (3) nonprofits and charities in the US IndieGoGo offers a 25% fee reduction (indiegogo.com, 2016). In general, this exemption is applied to not-for-profit organizations (scientific, charitable, educational, religious, etc.) that must be registered and verified by the US Government through the IRS. 501(c) (3) tax exemptions and deductions are only available in the United States.

Besides these very large crowdfunding platforms, many other small-to-medium sized crowdfunding platforms for nonprofits. For example, *Causes* is a crowdfunding platform for GuideStar-verified 501(c) (3) nonprofits. Users can create a cause to support a nonprofit and integrate the campaign page with social media to mobilize their network to make donation. *CauseVox* is an online crowdfunding platform that nonprofits can use to create customized fundraising websites for campaigns. *Crowdrise* is an online crowdfunding platform that followers of nonprofits can use to create personal fundraising pages where their friends and family can donate. *Giveffect* is exclusively for charitable crowdfunding where donations go directly to partner nonprofits (Chung, 2013) (Chung, 2013). *Donate Now/Network for Good* provides free and economical fundraising tools that nonprofits can use to obtain donations on their own websites and on social networks. *DonorsChoose* is a platform that individuals can use to obtain donations for needy students.

FirstGiving can be used by individuals to obtain online donations. *Fundraise.com* can be used by both individuals and organizations to manage their online fundraising activities. *FundRazr* is a social fundraising tool for both individuals and nonprofits. *Givezooks!* Can be used by nonprofits to create custom online crowdfunding campaigns and integrate their campaign sites with social media to increase donor base. *GoFundMe* is a do-it-yourself online fundraising service for nonprofits. *Help Attack!* Uses social media to collect donations. JustGive (www.justgive.org) is crowdfunding platform where donors can give to nonprofit organizations through e.g. fundraising registries. *Pay It Square* is a crowdfunding platform to create customized fundraising pages and collect donations online. *Razoo* is a platform that individuals and organizations can use to create fundraising pages and accept donations. *StayClassy* is used by small- and medium-size nonprofits for online crowdfunding.

Each crowdfunding platform has features and expectations. Each nonprofit must carefully consider these features and expectations. All the platforms invite any nonprofit to set up an online fundraising campaign. Each fundraising page includes narrative, videos and pictures. These fundraising pages can link to social media sites or to the nonprofits' website. Nonprofits can either use their own payment mechanism to accept donations on these fundraising pages or use the payment mechanism provided by the platform. In former case, the burden of record keeping/processing and pushing the traffic to the fundraising page lies with the nonprofit.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

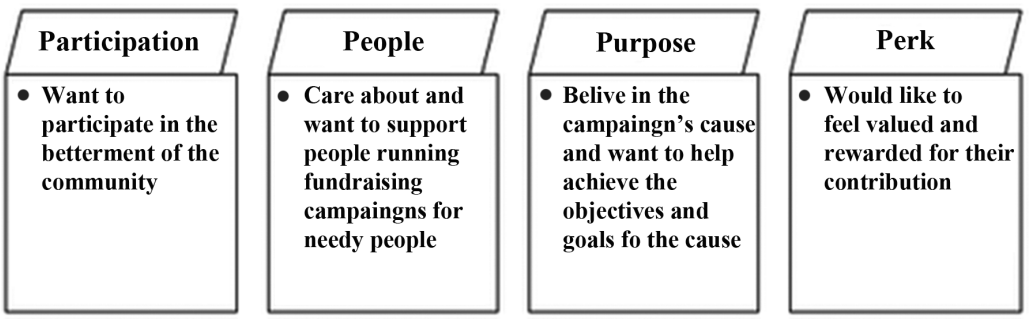
Success Stories

Globally, crowdfunding success stories are emerging of which only a few will be briefly mentioned here. Kids Company is a UK-based well-established charity that supports vulnerable children with food, clothing etc. Kids Company used crowdfunding to raise more than £100,000 online and became the leading UK innovator in fundraising by crowdfunding (Ratty, 2015).

AH20 is another UK-based newly founded charity dedicated to provide clean water for children and families in Nicaragua. Other such programs have also been set up. But AH20, has built an extensive reputation for its crowdfunding success.

The Canadian Hero Fund was started to provide scholarships to children of fallen Canadian soldiers. Since its inception in 2010, the Canadian Hero Fund has raised over $175,000 in scholarships revenue. Fifteen children of fallen Canadian soldiers (CanadaHelpsa, 2014) have benefitted from the scholarships.

The Canada-based The LEMON LOVE RIDE initiated the crowdfunding campaign to raise funds, enhance the profile of and acknowledge the role of hospice care in Canada. The LEMON LOVE RIDE aimed to help hospitals to fund operations and expansion plans. Since its inception, The LEMON LOVE RIDE set an initial funding goal of $10, 000 (Canadian) but within three weeks had reached its objective and the continued support of donors (CanadaHelpsb, 2014).



CROWDFUNDING BUSINESS MODEL

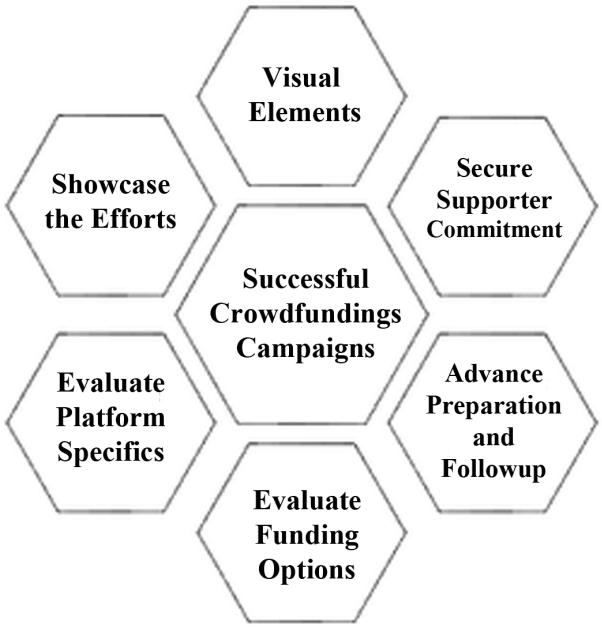
Ratty (2015), suggests that there are 4 Ps of giving. From Ratty's point of view, people give because they wish to participate, support, contribute and feel rewarded as an included member of society who have contributed to valuable cause. Figure 1 summarizes why people contribute finances to social and community projects.

Including the 4 Ps into their organizational business model and designing a crowdfunding strategic plan could provide not for profit organizations with the following benefits which include:

1. Building meaningful relationships with communities
2. Connect and reconnect with new and existing supporters
3. Communicate the impact of their mission

Figure 1. 4 Ps of giving
Source Ratty (2015) 1

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use



4. Building a recognizable brand
5. Access to and open up new networks
6. Generate funds
7. Generate organizational awareness
8. Generate organizational and program profiles

Crowdfunding presents a cost-effective way to gain support of community and to raise funds. There are few recommendations that nonprofits can use to build and sustain successful crowdfunding campaigns. Not for profit organizations should strategically consider Ratty's 4 Ps in the design of their crowdfunding campaigns. For example, to obtain funding, nonprofits must identify and offer incentives to the prospective donors. Realistic expectations, regarding the scope and reach of the organization, can help nonprofit avoid undesirable results. Nonprofits should set an achievable funding goal keeping in view the amount of expected support they can get (Wu, 2014). Figure 2 shows some important characteristics of crowdfunding campaign that are described below.

Visual Elements

Visual elements are a vital element of any crowdfunding campaign. It can not only help introduce the cause but also make it easier for supporters of nonprofit to share it with their friends and family. With cost-effective video editing tools, these videos can be economically produced and provide great return. MPW Media conducted a study that found medium was crucial when it comes from taking campaigns from idea to reality. The study analyzed 7,196 projects on Kickstarter and discovered that crowdfunding campaign pages with video were 85% more likely to achieve their funding goals (Emma, 2016).

Figure 2. Crowdfunding campaigns characteristics
Source Wu (2012), Zorn (2015) Emma (2016) 1

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Early Commitment by Supporters

Establishing early success stories is vital for crowdfunding campaigns. These success stories give donors confidence in the campaign and increase probability of their giving. Nonprofits should make every possible effort to ensure all the stakeholders, including supporters, are aware of their crowdfunding campaign before the campaign is launched (Wu, 2014). According to Zorn (2015), all successful crowdfunding campaigns are initially funded between 20-35% through the project creators pre-campaign awareness efforts within the first two weeks of launch.

Showcase the Effort

Showcasing efforts made in crowdfunding campaign can help nonprofit increase campaign success rate. For example, nonprofits can create an infographic providing highlights of the use of donated funds. Such highlights may include number of kids sent to school, number of people fed etc. This sharing of accomplishment can not only provide emotional impact but also help build momentum in the campaign.

Advance Preparation

Due to their limited duration, crowdfunding campaigns are highly dependent on how they are planned. An outreach plan should be developed and the supporters should be contacted well in advance of the launch of the campaign. It is important that committed donors be given advance notice of crowdfunding campaigns so that they have ample time to alert their social network about it (Bechter, Jentzsch, & Frey, 2011).

Follow Up

It is important to let supporters and donors know how the campaign is doing. This is because the crowd supporting a campaign feels the ownership and responsibility of the campaign. Updates and news of campaign on regular basis can keep this crowd informed and actively engaged in the campaign throughout. This follow up can also include appreciating the early supporters and offering them incentives to continue their philanthropic giving in future (Wu, 2014).

Evaluate Funding Options

Crowdfunding platforms can offer a fixed-funded model or flexible funding model. Under fixed-funding model crowdfunding campaign is given a pre-established timeline and financial goal (Cumming, Leboeuf, & Schwienbacher, 2015). If that goal is not achieved within the designated time frame, the organizers do not collect any funds. It is an "all or nothing" situation. Under the flexible funding model, organization can set the length of the campaign (e.g. 45-60 days) and the financial goal. If the organization fail to achieve the goal, they would still receive the funds but a large proportion would go to the platform provider. Kickstarter.com offers a fixed-funding model while Indiegogo.com offers an option of choosing between fixed or flexible funding model. If an organization feels that, they are short of time and unsure of the possible support they could get, flexible funding model is a better choice.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Evaluate Platform-Specific Features

While choosing a crowdfunding platform, the nonprofit should carefully evaluate the following options. According to Hogue (2015), if a crowdfunding campaign is able to raise at least twenty percent of its goal, it is very probable that the campaign will be able to reach its target. Around seventy-nine percent of the campaigns on Kickstarter that raised more than twenty percent of their target ended up being successfully funded. However, crowdfunding campaign is not easy to setup, manage and sustain. The look and feel of the campaign is important for successful outcomes. Marketing and social media is increasingly playing an important role, selecting the appropriate fee paying and payment processing portal and the ease of using the online crowdfunding platform are all elements that contribute to the success or failure of a crowdfunding campaign. The up-front effort and full buy-in options from the organizational leaders are prerequisite for measureable success.

CROWDFUNDING CAMPAIGN STRATEGY

Look and Feel

The platform should include visual elements that appeal to your audience and donors.

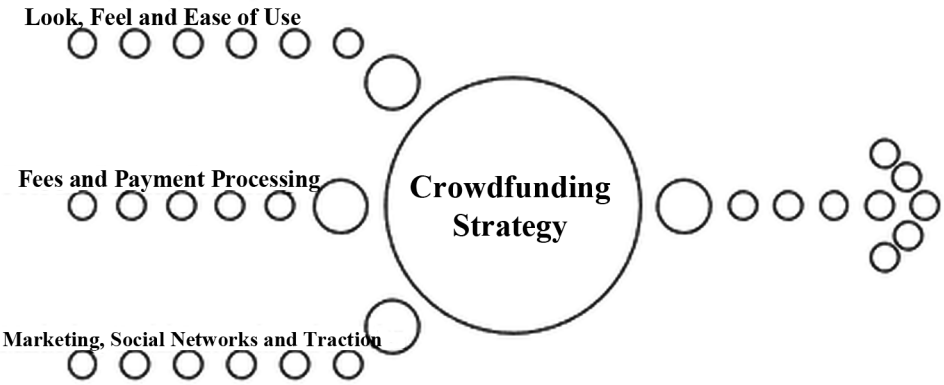
Ease of Use

Evaluate your abilities to design and run a crowdfunding page. It is preferable that the nonprofit should be able to design and manage the fundraising page with minimum requirements of specific skills (like HTML) to operate the site.

Payment Processing

The chosen platform should offer the preferred choices of payment mechanisms that nonprofit can use to accept donations online. It is preferable that platform should provide a variety of payment options. It is especially important if the nonprofit would like to handle the payment processing using its preferred payment processor.

Fees



Nonprofit should carefully evaluate the available platforms any set-up, maintenance, or credit card processing fees. They should perform a comparison of costs with the amount of money they are willing to invest in building and managing the fundraising page.

Marketing and Social Networking Capabilities

Marketing on social media is essential to build rapport, gain new supporter, and reconnect with existing loyal followers. The chosen platform should provide integration of fundraising site with various social media platforms.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 3. Crowdfunding strategy
Source: Wu (2012), Zorn (2015) Emma (2016 2

Traction

The chosen platform should provide nonprofits ability to monitor the donors' visits on the fundraising site. Nonprofits should monitor the visits and the amount of donations collected to see if they are meeting their funding goal.

The organizational business plan and the organizational crowdfunding strategy are both important to achieving crowdfunding objectives (Hogue, 2015). The investment is such a strategy is not easy. Various organizational elements require careful consideration. However it is anticipated that the initial initiative could produce exceptional outcomes. Careful consideration is required and the crowdfunding business plan and crowdfunding business strategy as depicted here are merely sketches. Figure 3 depicts how crowdfunding strategy relates to the crowdfunding outcomes.

CONCLUSION

Crowdfunding is rapidly and dynamically gaining popularity. Due to the cost efficiency, scope of and reach of diverse online communities, the opportunities provided for not for profit organizations who seek to raise revenue, are extensive. However, crowdfunding campaign is not easy to setup, run, and sustain. A good amount of up-front effort and full buy-in from the organization's leaders are prerequisite for measureable success.

Taking the four Ps of crowdfunding into careful strategic consideration, can help nonprofits build meaningful relationships with community, connect with new supporters and reconnect with existing supporters, communicate the impact of their mission, build a recognizable brand, open up new networks and generate funds, as well as awareness.

The crowdfunding campaign environment is a new phenomenon in the not for profit environment. Further research would generate knowledge on future directions in this space. Future research in the not for profit and crowdfunding space could include:

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

1. Comparative analysis of crowdfunding platforms that are used around the globe. This would enhance the understanding of crowdfunding being undertaken and the types of platforms that other not for profit organizations are operationalizing elsewhere.
2. Knowledge on similar crowdfunding platforms is lacking but understanding the differences between crowdfunding platforms would generate new knowledge and provide new insights on the mechanisms of different types of not for profit organizations, the use of similar crowdfunding platforms and the donor response rate. Such knowledge would greatly extend the knowledge and understanding of the success rate of crowdfunding and not for profit organizations
3. The impact of organizational brand, how it influences donor decision to contribute to the campaign, would provide insights to the success and failure of crowdfunding campaigns.

KEY TERMS AND DEFINITIONS

Branding: Refers to aligning what an individual or firm want people to think about itself with what people actually do think about the individual or firm.

Business Plan: A business plan defines business goals, explain why they are attainable, and plans for reaching them.

Community: Refers to a group of people who share some common interest.

Crowdfunding Platform: Refers to a website used to develop and run a fundraising campaign.

Crowdfunding: Refers to raise funds for a venture using a large group of people.

Donor: Refers to a person who donates something, especially money to charity.

Non-Profit: Refers to an organization that uses its surplus revenues to further achieve its purpose or mission.

Recognition: Refers to public acknowledgement of person's status or merits.

Social Networking: Refers to the use of dedicated websites and applications for people interaction.

Sponsor: Refers to a person who pays for a specific item to be released.

Chapter 39
SMEs in Nigeria:
Exploring Coopetition

Sola Oni
Pan-Atlantic University, Nigeria

ABSTRACT

Research in the area of small and medium sized enterprises (SMEs) and coopetition has been ongoing for a considerable length of time. However, such studies have focused on SMEs in developed countries while there is very limited research in the same area with a focus on SMEs in Africa and developing countries. This research therefore aims to explore possible benefits and barriers that SMEs in Nigeria would experience in the adoption of coopetition. Considering the fact that it is a relatively new area of research, existing theories examining similar fields of study will be analysed with the aim of generating a theoretical framework through which factors affecting the phenomenon in the country may emerge.

INTRODUCTION

Small and medium-sized enterprises (SMEs) contribute enormously to the economy of developed and developing countries alike. According to the International trade Centre (ITC, 2015), globally, SMEs make up over 95% of all firms, account for approximately 50% of GDP and 60% - 70% of total employment, when both formal and informal SMEs are taken into account. This amounts to between 420 million and 510 million SMEs, 310 million of which are in emerging markets. In Europe, according to the European Commission (2015), they are the backbone of the economy. SMEs represent 99% of all businesses in the EU and they have created around 85% of new jobs in the past five years. They have also provided two-thirds of the total private sector in the EU and are considered key to ensuring economic growth, innovation, job creation, and social integration in the EU (European Commission, 2012). Whilst there is no doubt about the contribution of SMEs to the economy of different countries, they are very likely to lack support in terms of finances, government policy and infrastructure particularly where SMEs in developing countries are concerned.

In spite of the many benefits that they provide to the economy, there are many challenges facing SMES in developing countries. In Nigeria, such challenges include the lack of government funding, inadequate infrastructure and unstable power supply. Financial constraints, management problems, lack of capital and the lack of support from financial institutions and government development agencies are issues that have also been cited as major hindrances to small business development in Nigeria (Okpara, 2011). Various studies have described Information and Communications technology (ICT) as an enabler that can aid growth and development (Hanna, 2003; Marker, McNamara &Wallace, 2002; Maier & Nair-Reichert, 2007). However, SMEs in the country are yet to take full advantage of these possibilities for various reasons. For example, a lack of power as well as the lack of skills have been identified as the two major barriers deterring the adoption of ICT amongst non-adopters in the region (Apulu, Latham & Moreton, 2011).

Additionally, SMEs in such countries unfortunately sometimes have the challenge of not being supported by government policy. For example, Okpara (2011) states that there is an inhibitive policy framework in Nigeria that discourages entrepreneurs from seeking funds to start up new or expand existing business. As a result, they have to find other means to ensure that they stay afloat. One of the ways they can achieve this is by engaging in coopetition. Coopetition, according to Levy, Loebbecke and Powell (2003) involves sharing knowledge that may be a key source of competitive advantage even though the knowledge gained by cooperation may also be used for competition. Small firms may be in a position to compete with larger firms in the area of coopetition, pooling resources to ensure that they sustain competitiveness and survive.

Recent research suggests that coopetition adds immense value to SMEs by reducing costs, improving access to research and development, and improving the innovativeness of SMEs. This research therefore aims to explore possible benefits and barriers that SMEs in Nigeria would experience in the adoption of coopetition. Considering the fact that it is a relatively recent area of research, existing theories covering similar fields of study will be examined with the aim of generating a theoretical framework through which factors affecting the phenomenon in the country may emerge.

This chapter begins by examining coopetition and considers what may make it a favourable alternative to current business practices of SMEs in Nigeria. The next section examines current literature and the context for this study. The following session analyses the issues, controversies and problems that may be experienced with coopetition. A framework that may help to resolve the issues is identified in the next session. The future research directions are then discussed in the next and finally, the conclusion of the study is presented.

LITERATURE REVIEW

SMEs and Coopetition

SME Definition

There are varying descriptions of what an SME is. The description of the term usually differs depending upon a combination of factors such as country, geographic region, level of development and business culture. Another reason why a general definition might be difficult is because SME definitions are sometimes linked to national support programmes and other regulations (ITC, 2015). In Europe, according

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

to the European commission (2005), small and medium size enterprises (SMEs) are enterprises with fewer than 250 employees. Micro enterprises are enterprises with fewer than 10 employees while small enterprises have between 10 and 49 employees with an annual turnover and /or annual balance-sheet total not exceeding 10 million Euros. Medium enterprises have fewer than 250 employees with an annual turnover not exceeding 50 million Euros or an annual balance-sheet total not exceeding 43 million Euros.

However, in Nigeria, they are described as consisting of micro, small and medium scale industries. A Micro/Cottage Industry is an industry with a labour size of not more than 10 workers, or total cost of not more than N1.50 million, including working capital but excluding cost of land. A Small-Scale Industry is an industry with a labour size of 11-100 workers or a total cost of not more thanN50 million, including working capital but excluding cost of land. Finally, a Medium Scale Industry is defined as an industry with a labour size of between 101-300 workers or a total cost of over N50 million but not more than N200 million, including working capital but excluding cost of land (Central Bank of Nigeria, 2005). SMEs are essential to the Nigerian economy as well. They produce about 10% of total manufacturing output and 70% of industrial employment (Carpenter, 2005).

Challenges Facing SMEs in Developing Countries

Despite the fact that SMEs contribute immensely to the economic development of developing countries, they are fraught with several challenges that may prevent them from surviving. For example, according to St-Pierre, Foleu, Abdulnour, Nomo and Fouda (2015), the business environment and the lack of resources in the African ecosystem are primarily to be blamed for poor competitive capacity and business failure of SMEs. This implies that businesses are unlikely to thrive if the environment is not favourable. The authors further identify other factors that may impede the growth of SMEs in Cameroon including, corruption, financial constraints and the country's economic situation (St-Pierre et al, 2015). Similarly in South Africa, the lack of an enabling environment as well as limited access to market, finance, credit, skills and networks; poor customer relations, lack of appropriate technology, low production capacity, and the lack of a quality product (Ramukumba, 2014) are identified as factors that may have an adverse effect on the growth of SMEs. In Nigeria, there are several primary challenges identified as limiting SMEs growth, according to Mambula (2002). These include lack of funding, lack of contact with research institutes, poor infrastructure, difficulty in obtaining equipment, spare parts and raw materials, business opportunities and new product development methods. More recently, Obokoh (2008) similarly identified the following as factors impeding the growth of SMEs in Nigeria. Such factors include access to funding and inconsistency in the application of government SME development policies. Another growth inhibiting factor for SMEs is the lack of widespread ICT adoption. According to Akpulu, Latham and Moreton (2013), SMEs in Nigeria appear to have ignored the relevance of ICT in doing business and are as such, not in a position to reap the benefits.

SMEs in other countries within the region and beyond continue to face similar challenges such as rising research and development costs, high risk and uncertainty in technological development. SMEs may be unable to resolve these and those previously discussed challenges using their own limited resources and capabilities (Gnyawali & Park, 2009). In order to ensure that SMEs survive and even become more competitive, an alternative could be to establish partnerships with direct competitors who have complementary strengths and face similar challenges (Kossiva, Sarri & Georgopoulous, 2014). This phenomenon, which has been applied successfully by large firms, is known as coopetition.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Coopetition

Developed by Brandenburger and Nalebuff (1996), coopetition is described as part competition and part cooperation. This phenomenon is based on the fact that most companies can achieve more success together, than they would if they were working alone in the business environment. The authors went on to explain that coopetition allows for the real world business situation, where there can be multiple winners in the marketplace with an objective to maximize the return on investment regardless of how well or how poorly other companies perform. Challenges within the business and other environmental factors could encourage businesses to participate in coopetition. For instance, according to Walley (2007), changes in the business environment have led from a position where many firms simply competed against each other, to a situation where they had to cooperate, and now to a point where they have to both cooperate and compete to survive. In order for businesses to survive, they must be creating some sort of value. The foundation for coopetition is the assumption that there are two essential elements that make up companies' activities which include creating value and capturing value (Gnyawali & Park, 2009). Thus implying that the strategy would be beneficial not only for creating and adding value but for long term survival, it may be worth adopting a different approach.

Apart from helping to create value, there are other reasons why coopetition might be worth considering for businesses, such as ensuring customer satisfaction. Walley (2007) argued that having a combination of cooperation and competition can be an advantage to consumers because research and development activities can be pooled to provide new products that they would have been unable to on their own. Thereby serving both the needs of the business and customer adequately as a result of coopetition. This combination may also be used to generate more profits and possibly to change the nature of the business environment to favour a particular business. Being able to change the business environment within which a particular business operates ensures that one is able to shape the industry's future, which helps to create opportunities for future success (Brandenburger and Nalebuff, 1996). The authors went on to postulate that a strategic framework in necessary to actively change the game of business and that coopetition theory provides such a framework. There is also a possibility of gaining competitive advantage from coopetition. According to Kossyva, Galanis, Sarri and Georgopoulos (2014), it is a process through which organizations can seek complementary partners to promote their own resources whilst also creating and transferring knowledge and investigating further opportunities without necessarily overlooking their own interests.

Whilst it is doubtless that there are several advantages to be gained by firms choosing to participate in coopetition, the bulk of existing research covers large firms as opposed to SMEs (Morris, Koçak & Özer, 2007). There is the question of how valuable this sort of arrangement could possibly be for small businesses who already as previously discussed, have a lot of concerns that they have to deal with on a regular basis in the struggle to survive. However, Gnyawali & Park (2009) explain three critical issues that suggest the pertinence of SMEs cooperating with their competitors as opposed to making other types of alliances. Firstly, because competitors are more likely to already be in possession of resources and capabilities that are relevant since they operate within similar markets. Secondly, since large competitors present a strong threat to SMEs and they are constrained where resources are concerned, they would benefit from collaborating to combine resources putting them in a better position to compete. Lastly, SMEs who compete with each other but have similar products and technologies can work together to create a uniform voice in the marketplace (Gnyawali & Park, 2009). These and other reasons make coopetition an important strategy to consider for SMEs in developing countries. It is therefore expedient to examine precisely what sort of value SMEs stand to gain, if any, from coopetition.

SMEs and Coopetition

Although existing research covers more examples of larger firms adopting the coopetition strategy, there is some evidence that SMEs may benefit from it as well. Morris, Koçak and Özer (2007), argue that small firms should find cooperation with competitors relatively easy. They provide the following reasons to support this position. SMEs' fixed commitments are often limited and their operations are not as controlled by structure and formal policies, their image and market positioning are not well established in and their external networks may not be as well defined. This view is shared by Gnyawali and Park (2009), who postulate that SMEs are more likely to find coopetition strategy easier to pursue even though it is a complex strategy. They also argue that unlike large firms, SMEs are more able to experiment with new business models because they are less constrained by existing structure and formal procedures and policies.

SMEs are generally known as knowledge generators, but poor at knowledge exploitation (Levy, Loebbecke & Powell, 2003). They tend to exist as separate entities and information islands. By nature, SMEs in the same sector would view each other as competitors, thus implying that they would not readily share information. However, recent research suggests that there are several advantages that SMEs would benefit from, if they learned to view each other as coopetitors as well as competitors. For example, Gnyawali and Park (2009) argue that coopetition helps SMEs to develop their ability to effectively pursue technological innovations. They go on to explain that most SMEs have constraints on financial and technological resources and cannot address certain challenges using their own limited resources and would therefore have to reach out to their competitors who have the resources and are willing to collaborate to address such challenges. In addition to providing access to resources that would be otherwise unavailable, coopetition has also provided international opportunities for SMEs where such may have been unattainable. There is also the possibility of increasing competitive advantage by creating opportunities for export where coopetition is engaged by SMEs (Kock, Nisuls & Söderqvist, 2010).

Existing research covering SMEs application of coopetition explores several areas including the question of the size of the SMEs. However, according to Jankowska (2011), the size of the SMEs involved in the author's study indicates that size had no impact on the consequences of coopetiting. However, they found that companies employing less than 50 people expressed the most optimistic view of the results of coopetition for their international competitive position and internationalization, which could be explained by the fact that it is easier to develop a direct and even personal relationship based on trust when you have smaller business entities (Jankowska, 2011). Previous research has also explored various ways in which Coopetition has been applied by SMEs. It has been used as a strategy to gain market power, as a strategy in innovation processes, as a strategy in supply chain relations and as a strategy for global competition (Bouncken, Gast, Kraus & Bogers, 2013).

Whilst the benefits of coopetition among SMEs have been widely published, there could be some disadvantages as well. For instance, in a study of the effects of coopetition in knowledge-intensive SMEs engaging in clusters, Bouncken and Kraus (2013) found that coopetition negatively affects revolutionary innovation while influencing radical innovation positively. However, the majority of the SMEs interviewed pointed out the importance of competition for both revolutionary and radical innovation.

Finally, it is worth noting critical success factors that would ensure that SMEs make the most of coopetition strategy. Chin, Chan and Lam (2008), identified critical success factors which fall under three success factor categories: management commitment, relationship development, and communication management. With results indicating that management leadership and development of trust are the most important success factors.

Features and Benefits of Coopetition for SMEs

Coopetition research among SMEs has gained traction in recent years and covers a wide range of industries such as Tourism (Pease and Rowe, 2005); Information Technology (Bouncken & Kraus, 2013); Agriculture (Walley and Custance, 2010); Football (Robert, Marques & Le Roy, 2009); Aviation (Klimas, 2014)and Wine making (Dana, Granata, Lasch, & Carnaby, 2013) with each experiencing varying, though mostly positive results. Various aspects have been focused on such as the size of the firms, the nature of the firms, knowledge needs of the firms and their innovativeness as well. A key question is how can an SME be sure that is participating in coopetition? What are the key features of coopetition? Czakon, Mucha-Kus and Rogalski (2014) have identified simultaneous cooperation and competition and mutual benefits stemming from coopetition, as the key characteristics of the phenomenon of coopetition. Other features which they recognised from their analysis of previous research include complexity, dynamics, managerial challenges and industry reshaping as a trait of competition. Dagnino and Padula (2002) considered that there are four different types of coopetition that differ according to the number of firms involved and the number of activities of the values chain. These include simple dyadic coopetition, complex dyadic coopetition, coopetition in a simple network and coopetition in a complex network.

Also, according to Chin, Chan and Lam (2008) researchers have recognized in more than half of published work that coopetition strategy is a multidimensional and multifaceted concept that assumes a number of different forms requiring multiple levels of analysis. Examples of the possible forms coopetition can take include clusters, business networks, strategic alliances and short-term agreements (Jankowska, 2011). Extant coopetition literature analyses coopetition between firms. However, Walley (2007) argues that this view is limited and adopts the stance that in underpinning commercial activity, coopetition extends far beyond the interaction between firms. The author specifically considers coopetition between various strategic units within a single firm, employees of a firm, and even between a firm and its customers. Regardless of what form or structure coopetition takes, there are several benefits for SMEs as reported in current literature.

SMEs through coopetition, can look for complementary partners, as a way of promoting their own resources; transferring and creating knowledge; exploring entrepreneurial opportunities, without losing sight of their own interests (Kossyva, Galanis, Sarri, Georgopoulos, 2014). SMEs may also gain competitive advantage through knowledge sharing (Loebbecke, van Fenema & Levy, 1999). Kossyva, Sarri and Georgopoulos (2014) analysed various types of coopetition strategy as well as the implications of economic crisis on Small and Medium-sized Enterprises (SMEs) and suggested that coopetition might be an appropriate business strategy for overcoming the effect of the economic crisis. E-business success among SMEs has been identified as a feature that may increase a country's long term competitiveness and coopetition has been found to have a positive impact on e-business success, thus implying that coopetition would be beneficial on the long run for SMEs and for economic development (Eikebrokk & Olsen, 2005). Coopetition helps to increase technological diversity and combine complementary resources of rival firms in developing new technologies and products (Quintana-García and Benavides-Velasco, 2004). SMEs can achieve multiple benefits from a coopetition network. Strengthening technological capability and capturing more business opportunities are two key benefits (Ruijun & Zhiman, 2011).

Adamik (2013) found that SMEs which cooperate with competitors more often have the resource base necessary for extension of their boundaries, they attain goals. SMEs attain by partnering with coopetitors real manifestations of extension of their business base, better satisfaction, increase business understanding, improve quality of and has a positive influence on the firm's innovativeness. According

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

to Kossyva, Sarri and Georgopoulos (2014), the decision to adopt a coopetition strategy means that SMEs may be able to gain access to financial resources and valuable knowledge which will provide the opportunity for them to improve their core competencies, pursue large-scale innovation projects, create new products and services (in less time than it would take if they went on their own), joint innovation efforts and increase their product range. Coopetition can increase and change the competitive potential of a firm (Jankowska, 2011) and may help to manage risks effectively when SMEs use the strategy wisely (Gnyawali & Park, 2009). The table below provides a summary of these and more benefits that have been discussed in existing literature in the field of coopetition.

The benefits as listed in the table and paragraphs above are without a doubt attractive to SMEs who not only want to survive but thrive as well. However, there are several challenges to adopting this phenomenon, which cannot be ignored and are presented in the following sub-section.

Risks of Coopetition

Beneficial as coopetition may be to SMEs in both developed and developing countries alike, there are some possible downsides which have arisen over the years. For example, rivalry and conflict between firms can hamper each company's performance when they choose to collaborate (Morris, Koçak & Özer, 2007). Sharing knowledge may not be as straightforward as the SMEs think. Some may desire to share knowledge but most will not do so unless the risk of benefiting outweighs the risk of loss (Row and Pease, 2005). Considering the fact that knowledge sharing may likely occur where such a coopetitive relationship or strategy exists, SMEs could therefore be at a risk of being victims of opportunists who want to steal the firm's secrets, particularly where innovation is involved (Bouncken, Gast, Kraus & Bogers, 2013).

Again, in a knowledge sharing context, some SMEs may be more involved in cooperation and therefore tend to share knowledge more openly while other SMEs emphasize the competitive aspect of the relationship and therefore may be more inclined to protect critical knowledge and also be more interested

Table 1. Summary of the benefits of coopetition to SMEs

Benefits	Source
Competitive advantage	Loebbecke, van Fenema & Levy (1999)
Improved international competitiveness	Jankowska (2011)
Innovation	Quintana-García and Benavides-Velasco (2004)
E-Business success	Eikebrokk and Olsen (2005)
Increased understanding of the business area	Adamik (2013)
Access to financial resources	Kossyva, Sarri and Georgopoulos (2014)
Risk Management	Gnyawali and Park (2009).
New products and services	Kossyva, Sarri and Georgopoulos (2014)
Access to unique and essential resources	Spence, Coles and Harris (2001)
Access to intrinsic assets that can help to create value	Ahuja (2008)
Strengthening technological capability	(Ruijun & Zhiman, 2011).
Capturing more business opportunities	(Ruijun & Zhiman, 2011).

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

in obtaining competitive knowledge from and about the partners (Ilvonen & Vuori, 2013). Knowledge sharing would be particularly critical for SMEs who are involved in innovation. They could therefore be at risk if adopting a coopetition strategy. For example, the innovation performance of SMEs may be at risk as a result of intensified tension when there are strong contradictions and dualities inherent in such relationships (Gnyawali, Madhavan, He, & Bengtsson, 2012). Similarly, Bouncken and Kraus (2013) found that coopetition negatively affects revolutionary innovation while it positively influences radical innovation.

A blend of both competition and collaboration would imply that SMEs are likely to depend on each other. However, if some SMEs become more dependent on others, then there is the chance that their vulnerability may increase (Zineldin, 2004). They also stand to lose autonomy over decisions or circumstances where they had complete control if they choose to adopt coopetition as a strategy as this may cause firms to experience a loss of control over activities or resources. This would be the case particularly when partners become less committed to the cooperative side of the relationship or focus only on their own benefits (Morris, Koçak, & Özer, 2007). Finally, a lack of experience in working with new partners can make considerable demands on management's time, efforts and energy, which may in turn lead to an abandonment of the firm's core business objectives (Zineldine, 2004).

Combining both competition and cooperation to form a new strategy creates quite a complex type of inter-organisational relationship which sometimes have resulted in participants calling for an end to the relationship. There are many reasons why coopetitive relationships have ended among organizations. Some of which may include one party not getting enough of a return, leakage of confidential information, different objectives and intentions, general distrust, and the tendency for the competitive aspect of the relationship to become prioritized over the cooperative aspect (Walley, 2007).

Both large firms and SMEs have clearly benefited from coopetition but there remains a need to understand how to effectively manage this sort of relationship such that participating SMEs benefit from its advantages.

COOPETITION AMONG SMEs IN NIGERIA

This research handbook's theme suggests that SMEs need to consistently renew themselves in order to sustain competitiveness by revisiting their strategies and exploring innovative ideas. Coopetition among SMEs in developing countries, is one way in which they can both revisit strategy and explore innovative ideas.

Challenges and difficulties that Nigerian SMEs are faced with include lack of access to funding, lack of government funding, inadequate infrastructure, unstable power supply, financial constraints, management problems, lack of capital and the lack of support from government development agencies. These challenges also include a lack of contact with research institutes, difficulty in obtaining equipment, spare parts and raw materials, limited business opportunities and new product development methods, inconsistency in the application of government SME development policies and limited ICT adoption. Further challenges include policy incentives being tilted in favour of large scale industries, poor access to information and to markets for SME products and services, poor access to modern technology, overdependence on imported raw materials and industrial inputs, lack of patronage of SMEs' products by government departments and agencies. Additionally, low literacy levels, training and technological knowledge on the part of SME operators, poor or non-existence of preservation and storage facilities,

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

poor implementation or non-existence of either strategic plans or business plans, lack of strategic focus including no succession plans, poor quality of products, lack of integrity, poor coordination of government policies as well as frequent changes in the policies; are also problems that Nigerian SMEs have to deal with (Mambula, 2002; Onugu, 2005; Obokoh, 2008; Okpara, 2011; Akpulu, Latham & Moreton, 2013).

To address some of these challenges and ensure that they thrive, SMEs may have to develop coopetition as a strategy, such that each SME participating in such a relationship is able to benefit mutually in a way that they are able to surmount the aforementioned difficulties. Walley (2007) argued that in many instances it is coopetition rather than competition that represents the most efficient form of inter-firm relationship. Engaging in coopetition with competitors may provide access to funding, infrastructure, equipment, new business opportunities, better access to raw materials, technology, innovative products and innovative production methods. The strategy seems to be a resolution to a lot of the challenges faced by SMEs as previously discussed. Coopetition has its strong points but there are also risks that may be involved in such a relationship. Beneficial as it may be, the question remains, what types of SMEs can benefit from this sort of arrangement and how do they draw value from such a relationship? Existing research covers SMEs in the following industries Tourism, Information Technology, Agriculture, Football and Wine making. The size of the SMEs and its effect on coopetitive relationships have also been analysed. However, current literature within the domain has focussed on SMEs in Europe with little focus on SMEs in developing areas in general and Africa in particular. Considering the fact that their challenges and opportunities may be different to those in more developed regions, this section analyses the issues, controversies and problems that may arise from exploring this phenomenon.

Influencing Factors

According to Cygler and Dębkowska (2015) coopetition belongs to the most complex types of inter- organisational relations because there are seemingly contradictory streams of relations and the attributes required from the parties involved may also be complex. They argue that not all candidates for coopetition are well suited to that kind of relationship. Similarly, Park, Srivastava and Gnyawali (2014) argued that since the basis of coopetition is the intensity of competition and the intensity of cooperation, it is expedient to examine the effects of each of them before delving into the effects of the simultaneous pursuit of both. Where inter-firm relationships between SMEs are coopetitive as opposed to being competitive, strategy for resources, capabilities and competencies will be different with the tendency to base strategy on resources, capabilities and competencies which are controlled as opposed to owned (Walley, 2007). Therefore, before delving into these kinds of relationships, SMEs must be able to address several questions. What is to be shared? Are they sharing costs, resources or knowledge?

Knowledge sharing among SMEs could carry a high risk and therefore any participating SME must understand what the value of knowledge is to the business (Ilvonen & Vuori, 2013). Risks of opportunism increase when SMEs share knowledge (Bouncken, Gast, Kraus & Bogers, 2013). As a result, any participating SME would have to develop a strategy that can help to address their knowledge sharing activities. This can be done both by recognizing better the knowledge that brings more benefits when it is shared, and by recognizing the knowledge that brings most benefits when it is kept inside the company (Ilvonen & Vuori, 2013). Whilst many SMEs wish to share knowledge this will occur only where the benefits from entering this sort of partnership exceed the potential losses. This is not the case where synergy and leverage are low (Row & Pease, 2005). Synergy refers to the additional value that cooperation

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

and the exchange of information and knowledge generates; and leverage refers to the additional value the knowledge receiver experiences as a result from the information and knowledge exchange brought about by coopetition (Levy, Loebbecke & Powell, 2003).

Levy, Loebbecke and Powell (2003) identified three important factors that facilitate the sharing of knowledge fundamental to coopetition. These include:

- **Synergy:** The additional value that cooperation and the exchange of information and knowledge generates;
- **Leverage:** The additional value the knowledge receiver experiences as a result from the information and knowledge exchange brought about by coopetition; and
- **Negative Reverse Impact (NRI):** The deleterious effect the receiver's use of knowledge exchanged has on the sender, since the 'partners' are also competitors.

According to Loebbecke, van Fenema and Levy (1999), SMEs are poor at reaping synergies. They are poor at leverage, have limited resources and their main focus is survival. Among others, tension is another factor that may have an influence on the phenomenon among SMEs in Nigeria especially if innovation is a core part of their operations. Again, as far as innovation and coopetition is concerned, on the one hand, Bouncken and Kraus (2013) argue that empirical studies stress the positive relationship between coopetition and innovativeness but on the other hand, Tomlinson and Fai (2013) argue that coopetition has no significant impact on innovation Tensions resulting from simultaneous knowledge sharing and knowledge separation are special issues which have to be dealt with in terms of coopetitive innovation (Bouncken, Gast, Kraus & Bogers, 2015). The authors found that there are three levels of coopetitive tensions: inter-organizational level, intra-organizational level, and inter-individual level.

Kossyva, Sarri and Georgopoulos, (2014) suggested that SMEs have to build a coopetitive portfolio" consisting of different kinds of coopetitive partners; other SMEs, large enterprises as well as taking part in business networks. Developing a "coopetitive portfolio", will allow them to manage each collaborative agreement separately and try to obtain the advantages of each partnership. According to Fernandez, Le Roy and Gnyawali (2013), effective management of coopetition is not about having to choose between the principles of separation and integration. However, it is about being able to effectively combine the two principles. The strategic challenge therefore is not about making choices between integration and separation but is about how to go about doing both at the same time. As previously mentioned, coopetitive relationships are not always successful, therefore it is expedient to ensure that critical success factors are identified to ensure that participating SMEs benefit maximally with minimal risks.

This section has discussed the factors, issues and challenges that may be involved in the adoption of a coopetition strategy by SMEs in Nigeria. In the next session, this study draws from previously examined literature to develop a framework to further understand factors that are likely to be of import to SMEs who may benefit from coopetition in Nigeria and other developing countries.

A Framework for Coopetition Between Nigerian SMEs

Existing literature in the field of coopetition covers several industries which could either be large or small/medium businesses. Considering the inherent particularities that make SMEs different to large companies, it is worth considering a framework specific to SMEs to study the phenomenon. Also, there seems to be a gap in literature examining the phenomenon among SMEs in developing countries. Some

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

level of cooperation does exist in this region, however, there is scant literature covering the research area. Nevertheless, SMEs in developed areas share several features with those in developing areas. It would therefore not be out of place to apply some of the factors identified from existing literature covering SMEs in more developed areas. Therefore, in addition to these factors, particular features of SMEs in a developing region are included in the proposed framework to provide a comprehensive view of what might be experienced in the field.

As previously discussed, researchers have recognized in more than half of published work that "coopetition strategy is a multidimensional and multifaceted concept that assumes a number of different forms and requires multiple levels of analysis" (Chin, Chan and Lam, 2008). In recognition of this fact, it is important to explain the context of the proposed framework. The framework considers the sort of relationships that SMEs currently participate in, their characteristics and how they may choose to coopete with other SMEs.

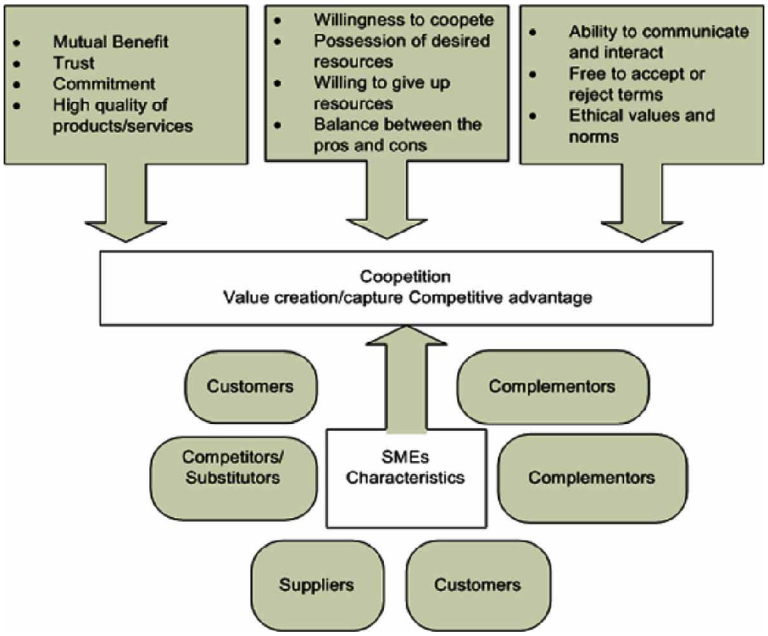
Current literature discusses some key features of coopetition which will also help to shape the proposed framework. According to Kossyva, Sarri and Georgopoulous (2014), coopetitive relationships consist of two dimensions; value creation and value appropriation. This will help to understand what sort of value the SMEs would derive and how it could help to improve their businesses. There is also the possibility of gaining competitive advantage. However, the mere adoption of a coopetition strategy is unlikely to provide competitive advantage. Instead, competitive advantage comes from an efficient management of the paradox and tensions that may be involved. (Gnyawali, He & Madhavan, 2008), pursuing integration and separation whilst comprehending the balance between the two is the key to realizing gains from competition (Bouncken, Gast, Kraus & Bogers, 2015).

According to Morris, Koçak and Özer (2007), coopetition has three key dimensions: mutual benefit, trust, and commitment. Similarly, Ruijun and Zhiman (2011) argued that a trusted relationship is the most important factor, compared with management commitment and communication management. Furthermore, holding high quality products is an important criterion for maintaining stability in the coopetition relationship. However, Zineldine (2004) argued that there are seven preconditions to developing a mutually beneficial business relationship. They are listed below:

- Organizations are willing to be engaged in an interactive exchange relationship.
- Each party possesses resources that the other party wants.
- Each party is willing to give up its some resource to receive in return the resource belonging to the other party.
- Each party is free to accept or reject terms and conditions of exchange that will leave them better off (or at least not worse off) than before the exchange.
- The parties are able to communicate and interact with each other.
- The parties recognize the ethical values and norms, interdependences, commitment and sustainable long-term relationship.
- The parties can strike a positive balance between the pros and cons of the relationship.

The Value Net, as developed by Brandenburger and Nalebuff (1996) constitutes a network of coopetitive relationships within which organizations take on multiple roles and seek complementary partners with the aim of creating value. The framework includes five players in a "business game". This players include the company in question, suppliers, customers, substitutors or competitors and complementors of that company.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use



The framework proposed in this study incorporates the value net as developed by Brandenburger and Nalebuff (1996). It then extends it by replacing firms with SMEs since, as discussed earlier, they are quite different to larger companies. This research argues that the characteristics which describe the particularities of SMEs depending upon the region within which they operate matter and is therefore included in the framework. The framework also includes the key dimensions and factors that have been found to be important for creating and sustaining coopetitive relationships.

SOLUTIONS AND RECOMMENDATIONS

As previously discussed, Nigerian SMEs are faced with several challenges and difficulties, some of which include; lack of access to funding, inadequate infrastructure, unstable power supply, financial constraints, management problems, lack of capital and the lack of support from government development agencies, lack of contact with research institutes and so on. To mitigate some of these challenges, coopetition has been suggested as a possible strategy.

The challenges that may be involved in the adoption of coopetition as a strategy for competitiveness of SMEs have also been discussed in the preceding sections. However, the opportunities for embarking on such a strategy are also numerous and make it a worthwhile pursuit, particularly when certain conditions are met. A major question that one would have to ask is, how is value created and captured within the coopetitive inter-firm relationship? If this question is difficult to answer, then coopetition may not be a clear path for that SME. While coopetition may combine the best of both worlds of cooperation and competition, there is still an inherent paradox, given the possible tension between value creation and capture (Bouncken, Gast, Kraus & Bogers, 2015).

Figure 1. A framework for examining coopetition among SMEs in Nigeria

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Some of the problems already identified from existing literature, which may stand in the way of gaining maximum benefit from coopetition include a lack of mutual trust among SMEs' business partners and a lack of integrity, which erodes confidence and trust (Onugu, 2005). If these concerns are managed, then it would be possible for SMEs to take the bold step of participating in a coopetitive relationship. They would also need to know how value is to be captured and what steps would be necessary to gain competitive advantage from coopetition. The framework that has been presented in the previous section provides a way to have a better understanding of how this process could be attempted and also lead to SMEs gaining competitive advantage and also helping to overcome the issues that prevent their growth.

This would be a relatively new territory for SMEs in Nigeria, for whom there is no clear roadmap for exploring a coopetitive strategy. Nevertheless, the proposed framework that has been developed in this research aims to fill this gap by providing a guide for SMEs willing to participate in what could be a game changer.

FUTURE RESEARCH DIRECTIONS

This chapter sought to examine the phenomenon of coopetition among SMEs in Nigeria with the aim of improving their processes and allowing them to be in a position to possibly compete against larger firms. Based on factors that were identified in existing literature, a model has been developed which could help to analyse these issues in depth. The next phase of the research would be to apply this model to SMEs in Nigeria with an ethnographic research methodology to evaluate the effectiveness of the model and the business strategy. The business strategy will be critically analysed with a view to determine if it is not only beneficial to SMEs but will provide greater chances of survival. It will also help to inform on the possibility of coopetition strategy allowing small firms to compete with large organisations.

Considering the culture and limitations that SMEs in Nigeria face, it is expected that the strategy would be met with some level of distrust to begin with. However, if some field/case studies are undertaken, this might generate more confidence and lead further SMEs to try the phenomenon and verify its appropriateness for them and whether it aligns with their business objectives.

To this end, future research directions for this study aims to carry out qualitative studies. Considering the fact that coopetition is a new phenomenon in the region considered in this study, this may also be used to follow the coopetition process. In line with Bengtsson, Eriksson and Wincent (2010), an ethnographic study will be particularly useful in this situation and it could help to unearth deeper meaning as not only do research participants tell the researcher about their experience, the researcher gets to see what the SMEs actually do and what their experiences are when they choose to participate in a coopetitive relationship.

CONCLUSION

Small and medium-sized enterprises (SMEs) contribute enormously to the economies of developed and developing countries alike and are the backbone of the economy. In spite of these, they lack support in a lot of areas which tends to result in SMEs failing to grow and sometimes failing to survive.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Research in the area of SMEs and coopetition has been ongoing for a considerable length of time and has covered both large companies and SMEs alike. It has also examined coopetition by SMEs in various industries. However, such studies have focused on SMEs in developed countries while there is very limited research in the same area with a focus on SMEs in Nigeria and other developing regions. This research therefore set out to explore possible benefits and barriers that SMEs in the country would experience, should they choose to adopt coopetition as a business strategy.

Challenges faced by SMEs in developing areas were also discussed and coopetition was suggested as a possible solution to the challenges that prevent SMEs from surviving and thriving. A framework was proposed to provide both a lens and a guide to ensure that the phenomenon may be studied in-depth and guide for any SMEs willing to participate in the process.

This study set out to examine the factors involved in coopetition and to examine benefits and risks which may make it a worthwhile venture for SMEs. It is hoped that the results from this research will inform both policy and practice. SMEs contribute a vast amount and it is time for governments in developing areas to take notice and begin to generate and effectively apply policies that will stimulate SMEs' growth and in turn stimulate their respective economies.

KEY TERMS AND DEFINITIONS

Competition: The activity or condition of striving to gain or win something by defeating or establishing superiority over others.

Cooperation: The action or process of working together to the same end.

Coopetition: Collaboration between business competitors, in the hope of mutually beneficial results.

Developing Country: A country with little industrial and economic activity and where people generally have low incomes.

SME: Small and medium-sized enterprises (SMEs) are non-subsidiary, independent firms which employ fewer than a given number of employees. This number varies across countries. The most frequent upper limit designating an SME is 250 employees, as in the European Union.

This research was previously published in the Handbook of Research on Small and Medium Enterprises in Developing Countries edited by T. Ramayah, Syed Abidur Rahman, Noor Hazlina Ahmad, and Hasliza Abdul Halim; pages 360-376, copyright year 2017 by Business Science Reference (an imprint of IGI Global).

Chapter 40
Effective Approaches in Higher Education Development:
A Survey in Fundraising Best Practices

Andrew Aaron Shafer
Aquinas College, USA & North Park University, USA

ABSTRACT

Effective approaches in higher education development will look at a variety of topics ranging from corporate and foundation relations, to alumni participation, the importance of online giving, campaigns, top advancement trends in higher education, and the ever-critical cultivation of major and mega gifts. The education of a constituency about the importance of private gifts to both public and private institutions cannot be overstated as well given that tuition costs soar yet prospective students, parents, and boards continue to fight for the value proposition. After reading, reviewing, and studying this chapter, faculty, students, and professionals alike will have surveyed knowledge of effective approach in higher education development and will have a greater appreciation for the work that development staff encounter every day. The objective of this book "to explore contemporary and future philanthropy approaches and development theory in international higher education," will certainly be enhanced exponentially by the thorough and useful information presented.

Every year new advancement strategies and tactics are presented in books, papers, online, and at conferences around the world. Fundraise this way, engage alumni that way, marketing your mission with this twist. The reality? Advancement, and more specifically, development/fundraising at its core has not changed in hundreds of years.

This chapter will look at a variety of topics ranging from corporate and foundation relations, to alumni participation, the importance of online giving, campaigns, top advancement trends in higher education, and the ever-critical cultivation of major and mega gifts. The education of a constituency about the importance of private gifts to both public and private institutions cannot be overstated given that tuition costs soar yet prospective students, parents, and boards continue to fight for the value proposition. reviewing, faculty, students, and professionals alike will have surveyed knowledge of effective approaches in higher education development and will have a greater appreciation for the work that development staff encounter every day.

CAPITAL VS. COMPREHENSIVE CAMPAIGNS IN MODERN FUNDRAISING

"Capital Campaign" vs. "Comprehensive Campaign". In the early days of fundraising campaigns, during the middle of the 20th century, most campaigns just focused on capital needs specific to facilities. Of course, other campaigns focused on endowment needs, scholarship, programs, or other special priorities. During the past 15 to 20 years, the approach to campaigning has expanded, and now most campaigns are comprehensive campaigns that include facilities, endowment, scholarship (in the case of higher education), programmatic, and operating support. Mega-campaigns in health care and higher education are frequently setting goals of a billion dollars or more. These mega-campaigns are almost always comprehensive campaigns that include all gifts to all areas of the organization given during the campaign period.

Comprehensive campaigns frequently raise question about how to "count" gifts but the reality is that comprehensive campaign production and results include any and every dollar raised in the organization. This can include but is not limited to cash, securities, gifts-in-kind, and estate gifts (planned giving). Major gifts, annual gifts, monthly gifts, lifetime gifts; regardless of the frequency, duration, or size of a gift it is a common misconception that one "counts" more in a comprehensive campaign than another.

The Council for the Advancement and Support of Education (CASE) publishes counting standards and below are their recommendations. These should always be referenced through CASE prior to and during any campaign as they do change periodically ('Preliminary Report of the Campaign Standards Working Group', n.d.).

CASE Recommendations

The working group makes the following recommendations specific to campaign counting and reporting (see attachment for proposed language recommendations and a comparison with current language in the third edition of the CASE Management and Reporting Standards):

- Revocable gifts may be included in campaign totals at face value if they are pledged during the campaign, documented, and as long as they are reported separately from outright gifts and irrevocable deferred gifts.
- Irrevocable deferred gifts may be included in campaign totals at face value, but both face and discounted present values should be reported.
- Conditional pledges may be included in campaign totals if there is a reasonable expectation that the conditions under which the pledge is made will be met during the campaign period and if there is appropriate documentation.
- Campaigns should be tied to the strategic goals of the institution, and for this reason the length of a campaign may vary. However, in order to maximize the commitment of volunteers, donors, staff and others, CASE recommends that a comprehensive campaign period generally not exceed eight years.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

- Government funds are very important to helping institutions achieve their strategic goals, they are often secured competitively and help leverage private funds, and fundraising staffs often are integral to securing government support. However, CASE reaffirms its position that comprehensive campaigns are fundamentally philanthropic ventures designed to raise resources from the private sector. Therefore securing government funds does not fall under the definition of philanthropy as a private act. For this reason, government funds should not be included in campaign totals, but institutions should work to raise visibility and recognition for the value of government funding in accomplishing institutional goals.
- CASE should include a disclaimer to the revised campaign guidelines recognizing that within increasingly complex gift agreements, there will be situations not expressly covered in these guidelines and standards.

Although annual gifts are likely smaller in size than what many donors would consider a "lifetime gift," their frequency can at times before even more valuable than more zeroes at the end. When an annual giving solicitation is made for an organization that is currently operating within the parameters of a comprehensive campaign, the materials should be branded and consistent in look and feel with your campaign branding. The tendency here is to create something completely unique to signify that "this is our annual giving direct mail campaign – send us everything that is in your pockets, couch cushions, and car crevasses." The new challenge is to shift the thinking to be more about developing the "pipeline."

A comprehensive campaign is truly meant to be a catalyst for fundraising within any organization. Very likely, if a church group needs a new sanctuary, they will fundraise for a sanctuary and only for a sanctuary. The sanctuary will be built, the church services will continue, but needs within the organization will still be lacking. This is the value of a comprehensive campaign. Not only should the church fundraise for that new sanctuary, but it should also fundraise for ongoing needs.

The annual giving "pipeline" is critical to long term success. Without it, your major gift prospect portfolio will be weak at best; nonexistent at worse. Annual giving mailing, therefore, must speak to the necessary task of thinking about direct mail campaigns, phone-a-thons, and annual fundraising events through a whole new light. There should be a seamless transition between a prospective donor visit in Fargo on Tuesday, and a fundraising gala in Nashville on Saturday. Messaging, graphics, and branding should all be part of your story. By focusing on a more purpose driven annual gift campaign, you can start to see a significant difference in the way that your donor consider support for the organization.

Alumni participation rates are an ongoing barometer for an institution's ability to reach out to its largest and broadest affinity group, its alumni. Although it is a small factor in most ratings and rankings, that rate does tell a story. In other words, alumni participation rates are important, they are a number, but they should not be the driving factor for any campaign.

There is no single way to run a campaign. Every campaign is different and truly depends on the needs or organization. It is not uncommon to even see two campaigns in the same organization vary greatly and both be successful. The best campaigns are those that are based on a sophisticated and thoroughly developed strategic plan that outlines the funding priorities most critical at that time. We call this plan the *Comprehensive Advancement Strategic Plan* or the CASP. The CASP is any institution's ticket to fundraising freedom. The document is a working document, not one that you begrudgingly create and then shelve the next week. No, the CASP should be printed, copied, published (internally), and shared broadly within the organization. For your key volunteers you could also share the document with them to the extent that they understand the confidential nature of its content.

The Design School at Stanford University ("d school," 2014) focuses on the concept of "design innovation." This way of working, thinking, and progressing in any industry or initiative is becoming commonplace. Design innovation simply correlates with creativity and a progressive attitude that encourages anyone to think beyond institutional history or tradition. Comprehensive campaigns are no different. Any comprehensive campaign, performed at the highest levels, should allow for design innovation to be at its forefront. This concept can relate to the internal planning phases but more importantly should be seen in the conversations with donors that every development office hopes results in mega-gifts. Any development officer or academic leader must be creative when working with constituents who are each successful in their own right and who certainly fully express their own passions as the focus of their philanthropy.

TOP ADVANCEMENT TRENDS IN 2015

In 2015, there are several trends to look for within your own organization but also within those organizations that you may serve in volunteer leadership roles, on boards, committees, or as an advisor. A few trends that will likely continue and commence include a greater emphasis on crowdfunding initiatives, enhanced corporate reorganization for philanthropy, tighter foundation restrictions and regulations, and further prioritization of pipeline development and retention through alumni participation in higher education.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

CORPORATE REORGANIZATION FOR PHILANTHROPY

As corporations continue to recalibrate after the great recession, they also work to determine how best to support the world's philanthropic landscape. Most corporations want to support all types of 501(c)3 organizations for the inherent goodness that is given. However, many corporations are also interested in the tax benefits of philanthropic support as well as the recognition that frequently follows a significant gift. The more that organizations can ensure that a corporation's investment is publicly recognized (only if the corporation actually wants the public "thanks," of course), the better off the organization will be long term. This is where the cycle of donor development comes alive. Stewardship for corporations is truly a blurred line between a simple thank you and cultivation of that next gift. The upcoming decade will likely see continued reorganization in corporate philanthropy during the first half of the period followed by "settling in" that will lead to more clear-cut specifications for gift proposals.

There are many different ways which corporations may support higher education. Frequently, these organizations give through a foundation structure. These types of foundations could be endowed foundations, corporate foundations, a partnership foundation, or even a scientific foundation (Cagney and Ross, 2013).

Endowed foundations may be created by an individual or a company. Corporate foundations enjoy a flow of funding from the company to which it is linked. The lifespan of a corporate foundation is often linked to the parent company. A partnership foundation may be created by any public body and could possibly be a mix of private company funding, university funding, and even other public funding.

Corporate reorganization for philanthropic support is critical and does exhibit a huge for potential funding opportunities in organizations of all types. The internal structure of an organization's philanthropy, however, is still a corporation's leadership decision.

DONOR PIPELINE DEVELOPMENT AND RETENTION

Securing new donations and gifts is hard enough; keeping those donors engaged and giving again is even more difficult. Another trend seems to be a stronger focus on donor pipeline development and retention. Think about this, if on any given year, your organization has 500 regular donors who you can rely on making a gift, without a doubt. In addition to those 500, you have 500 new donors, but you then have attrition of 50%. At the start of the next year, you would not have gained any donors! Roger M. Craver in his new book, *Retention Fundraising; The New Arts and Science of Keeping Your Donors for Life,* has a great chapter titled "Losing Donors Through the Leaky Bucket" (Craver, 2015). Craver argues that there are three things that can happen while a donor is in your bucket, and two things that need to happen to keep the leaks to a minimum. The three things that may happen while a donor is active with your organization are that they will stay and become loyal supporters, they will leave because of a lifestyle change (move, illness, retirement, etc.), or they will switch their giving to another comparable organization (Craver, 2015). Quality and purpose driven marketing as well as the quality of experiences the donor receives immediately after the gift is made will drive what is next for that donor's relationship to your organization (Craver, 2015).

Developing a strategic retention plan for your institution and your development shop should be top of mind and an area of focus. Retention and stewardship certainly go hand in hand and as the four areas of the donor lifecycle (Engagement, Cultivation, Solicitation, Stewardship) take shape in a personalized way for you, retention will likely see a natural fit in your regular day to day business plan.

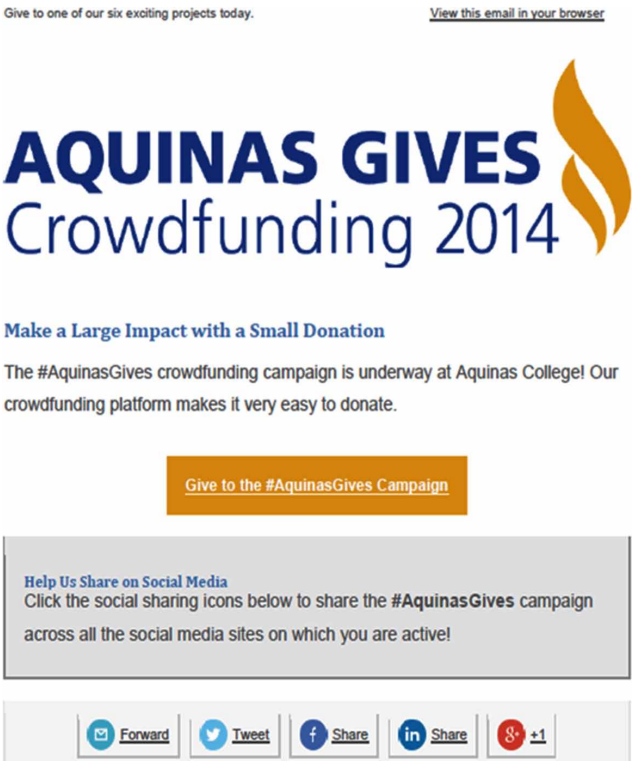
EMPHASIS ON CROWDFUNDING INITIATIVES

In 2013 alone, over $5.1B was raised through nonprofit crowdfunding programs. It is no wonder that this significant number has grown in 2014 thanks to the ongoing barometer for giving that is the internet and social media. Of the $335.17B given philanthropically in 2013, $5.1B only accounts for 1.5% of that giving yet online giving in that same period rose 13.5%. The numbers are according to both the *Blackbaud Index* and *Giving USA* data. For those that are not infatuated with facts and figures, the simple fact of the matter is that crowdfunding can be done by anyone, inexpensively, and with generally great success if marketed correctly. Go ahead, give it a shot in 2015; here are some suggestions on how you can make it happen.

Dating back to the 1700s, the roots of crowdfunding can be found among cultures and countries from across the globe. The thought of having a critical mass of people pool funds together for one common cause is quite simply logical and results in a much more expeditious turnaround for projects than other types of financing. It was not until 1997 that modern day crowdfunding really became a reality. A British rock band sought online gifts from their fans to support their reunion tour and soon-thereafter, *ArtistShare* became the first known crowdfunding platform available online ('The History of Crowdfunding', n.d.).

Joseph Hogue in his 2015 book, *Step-By-Step Crowdfunding*, suggests that there are "Six Habits of Highly Successful Crowdfunding." These six habits are broad based but applicable to any organization of any scope and size. The six habits are Personal, Comprehensive, Team Builder, Aggressive, Creative, Strategic (Hogue, 2015).

A few key steps to launch crowdfunding at your own institution are outlined below. While not difficult to understand, the steps can at times be difficult to implement. For a first time launch at any institution, of any size, encouragement to work by committee and with all arms of advancement, cannot be understated. These arms generally include advancement services, alumni relations, development, and marketing/communications.



After your committee or working group is established, the selected of a platform for your crowdfunding initiative is a good next step. For many, a regular CRM system may have the capability of fulfilling your needs for a user friendly online platform. The good news here is that by 2015, hundreds of platforms are available for use by institutions both large and small. As of this writing, there are approximately 18 platforms that most frequently are used for crowdfunding campaigns. For larger universities, it is even possible that your own IT unit may have the capacity to actually build a simple system unique to your institution, saving you from the at-times-expensive nature of processing fees for service. One thing to look for is a progress bar feature, letting your constituents know how close the particular project is getting to being fully funded.

As with any fundraising campaign or initiative, it is critical to share the impact of your priorities with prospect investors. Hogue, in his latest text, wrote that he believes the most overlooked stage in crowdfunding is the most important, the pre-launch phase (Hogue, 2015). In this planning phase, you can truly conduct a mini-feasibility study as a proof of concept before your crowdfunding even launches, potentially saving you and your institution extensive time and money in the long run.

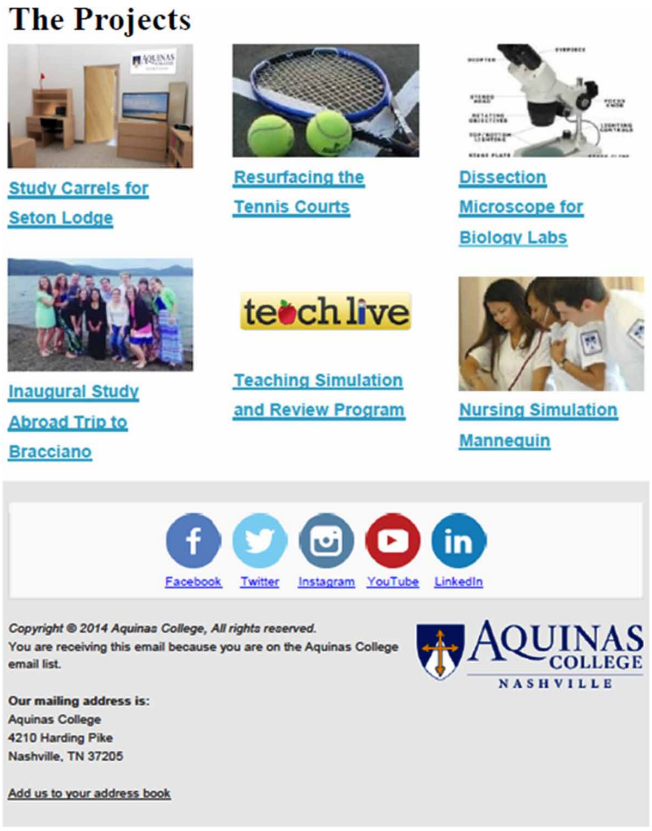
Illustrations and examples of e-mail that were used in a recent crowdfunding campaign can be found in Figures 1 through 12 (** Emails used with permission of Aquinas College, Nashville, Tennessee).

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 1.

WHERE WE ARE TODAY

In today's world of constant connectivity and mobile tethering, online giving among philanthropic organizations and online investing for for-profit organizations cannot be forgotten. Having mobile friendly devices that allow donors and investors to give on the spot and in the moment is critical.



It is also important to remember that while online giving and specifically crowdfunding initiatives do increase an organizations pipeline for major gifts, only about 2% of the more than $335 billion given in 2013 was collected through the internet. Comparatively, that 2% figure illustrates a 14% growth as compared to the previous year, this is all according to the *Chronicle of Philanthropy* and the *Blackbaud Index (MacLaughlin, 2015).*

IMPACT ON HIGHER EDUCATION

In his recently published book, *Crowdfunding for Social Good,* Devin D. Thorpe mentions three common themes as impact is highly saught after in crowdfunding campaigns. Those three are utilizing matching grants, being creative, and spreading the word (Thorpe, 2014). Matching grants are what can incentivize someone to make a rather fast giving decision. Unlike major gift cultivation, especially in higher education, crowdfunding cultivation is fast. It may be as simple as the opening of an e-mail and click of a mouse. Knowing that if you "act now" your gift may be matched 1:1, 2:1, or even better is possibly

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

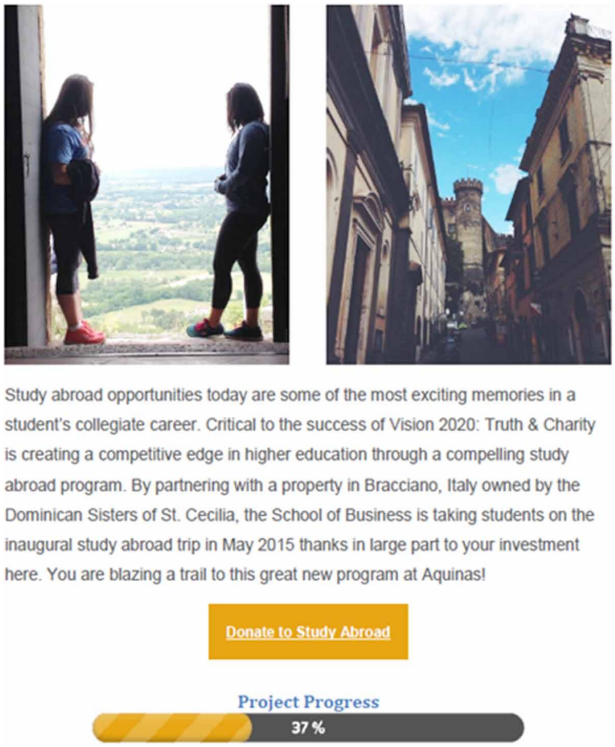
Figure 2.

all a donor needs to actually make the gift. Being creative, as previously discussed, is quite possible the single biggest driver for crowdfunding success. Crowdfunding is all about busting the status quo and driving dollars to new and innovative opportunities! Creativity is king here, repeating what the institution down the street or across the state did is unlikely to work for you too. Thinking about a project from a different perspective or from a brand new angle is what prospective donors are craving when making a crowdfunding decision. Finally, spreading the word is the marketing power necessary to obtaining that critical mass of large donor relationships. Social media and other digital marketing strategies and tactics, along with the occasion compliementary print advertisement, must extend far behold your typically audiences. Spreading the word to those that you may not have touched in years or taking the chance in even reaching out to new audiences with your message of growth and quick impact initiatives can also be a great way to further send your message far and wide.

Muhammed Chaudhry, President and CEO of the Silicon Valley Education Foundation, learned about crowdfunding and wanted their organization to engage in this quick, typically small gifts, large impact, opportunity (Thorpe, 2013). Setting a goal of $30,000, the organization only raised $27,000 but over 220 donors contributed that sum. Chaundhry commented that through those 223 donors, they have plans in place to potentially raise over $150,000 in other major gifts through follow up and further solicitations (Thorpe, 2013). This is the truly crowdfunding impact at work. Taking the chance to use this fast fundraising approach to drive other major gift solicitation cannot be underestimated and should never be forgotten.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 3.



Many non-profit organizations are beginning to engage in fundraising activities each year. Some even limit these activities to one critical day of giving. This "one day" concept is particularly popular among institutions of higher education. Purdue University, for instance, raised over $7.5M in one day during their first *Purdue Day of Giving* in early 2014.

The more common approach, particularly in higher-ed is a set period for crowdfunding, built on a popular platform available online (dozens of options are out there for low cost based on giving percentage), and designed to be mobile and user friendly. At my current institution, we engaged in a 15 day program to really drive participation among new and existing donors. The *#aquinasgives - Crowdfunding 2014* project also shows progress in a strategic plan that has struggled to bring several larger projects to fruition due to poor institutional history. By creating confidence with the six aforementioned projects that were successfully funded (overall campaign ended on scheduled and at 101% of goal achieved), the institution certainly hopes that many of these larger priorities will see greater interest.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 4.

KEY TAKEAWAYS

In the case presented herein, the in-depth look at crowdfunding and one institution's successful implementation of this new fundraising strategy should serve as a reminder that although best practices are important to consider always, effective approaches constantly shift. In 2012, the Jumpstart our Business Startups (JOBS) Act was passed in the United States Congress ("Jumpstart our Business Startups," 2012). This act, while applicable to private business, also shows that it is a best practice among any business, for profit or not, to participate in the exercise of meeting goals through many small gifts that contribute to one large goal.

Crowdfunding does take time to really do it well and correctly. Selecting a platform to use (or building one customized for your organization if you have the IT support internally), selecting projects that are likely to garner interest, and marketing the entire initiative are the three most critical pieces to these projects. If done well, organizations should see donations from many new donors who, hopefully, can become major gift prospects thanks to the process. The marketing outcomes and annual giving pipeline that results cannot be underestimated. And finally, any organization that is successful in these efforts must show the fruits from these labors very quickly. Stewardship after the crowdfunding campaign can make or break success in the future. In the end, however, modern day crowdfunding has a place in the strategic plan of any advancement operation no matter if you raised a few thousand dollars annually or a few billion. Please, share your successes and failures in crowdfunding with us; things that you learned and things that you wished you had done differently.

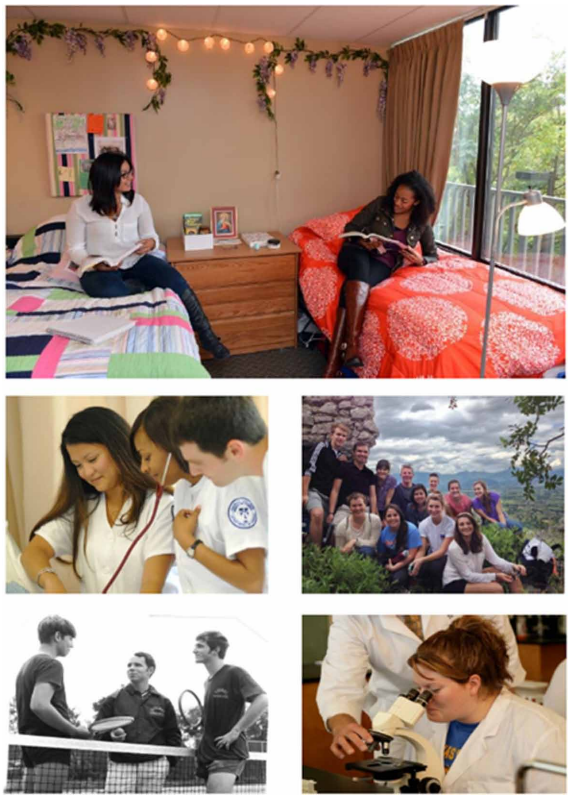
EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 5.

Building the pipeline of major gift prospects through a robust toolkit of direct mail, digital marketing, and leadership annual giving while renewing the institution's commitment to stewardship, and focusing on the long term growth and funding priorities; these should be the areas of focus for any institution who have a desire to practice effective approaches in higher education development.

CASE STUDY EXECUTIVE SUMMARY: *AQUINASGIVES* CROWDFUNDING CAMPAIGN

The Challenge



Creating and sustaining a reliable pipeline for major gift prospects is a concern for most nonprofits worldwide. Bold vision and big funding priorities mean that the large support is key but the smaller more frequent gifts provide sustainability. Simply put, the challenge revolves around the absolute best way to raise multiple small gifts for one small to medium sized project with a reasonably quick turnaround so that supporters can witness and be a part of the benefit of their investment. In this case, there was also a

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 6.

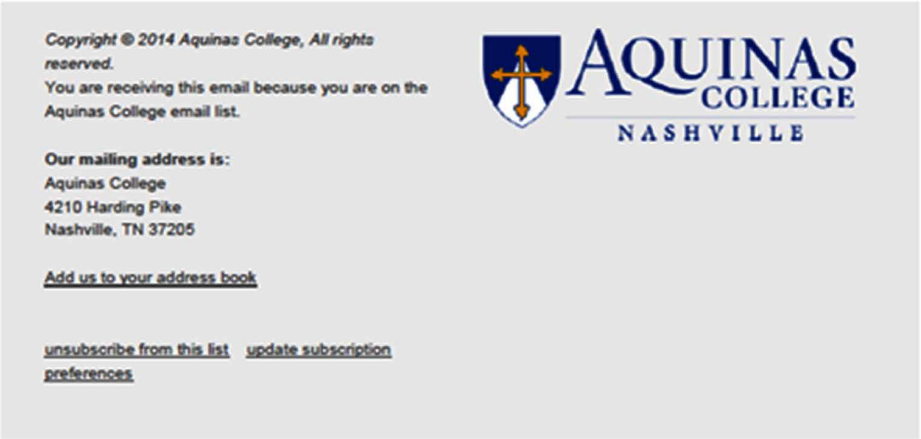


Figure 7.

Figure 8.

previously existing issue with the college not following through on programs and changes as it received funding. Crowdfunding campaigns were thought to offer a wonderful opportunity for short turnaround or production times in execution of the projects.

The Solution

Crowdfunding provides an excellent way to fund multiple small to medium size projects through many smaller gifts rather than a few larger major or principal gifts. We looked at Aquinas College and their efforts to engage in the first crowdfunding campaign for their institution. Six projects were put together from areas of the college across its campus.

The college quickly had to turn these projects around so that stewardship could then take place. In any campaign, but especially in crowdfunding campaigns, stewardship proved to be one of the most critical areas of focus. Without proper recognition, it appeared to be very unlikely that the majority of supporters to the *AquinasGives* campaign would consider a second or even third gift. Investing in crowdfunding appears to only work if the institution is prepared. This includes both the development office and also, in the case of academia, the academic leadership or provost's office.

Finally, this case also made a good case for support that only once a year, twice at most, can most organizations support such a crowdfunding initiative. It is definitively different than many other annual fund type programs due to the intense nature of marketing that goes into the program. The marketing and communications aspect of a campaign of this kind is the foundation for success. A strong communication plan, which was present for the *AquinasGives* example, is the only way to ensure that thorough planning takes place for promoting the mini-campaign.

The Result

Each of the six projects created for this crowdfunding campaign were listed at or below $5,000 in total dollars needed for implementation. Of the six, four ended up being full funded but even still the other two projects had enough financial support to be executed on and the overall campaign reached 103% of its stated goal.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 9.

Another stated goal of this initiative was for the organization to increase the total number of gifts and donors to the college. Real time statistics and results are available for crowdfunding since the majority of investments made will be completed online. The completion of a critical mass of new projects (six, in this case) also showed Aquinas' constituency that the college can execute on a plan and with the proper funding can create new opportunities for its faculty and students.

CASE STUDY TEACHING NOTES: *AQUINASGIVES* CROWDFUNDING CAMPAIGN

1. Given Aquinas' issues related to follow up and follow through with the execution of projects once fundraising is completed, do you agree with the approach to begin building rapport with consituents through smaller projects generally associated with programs such as crowdfunding? Why or why not?
    a. Student responses will vary. Being an opinion type question, this should help spur debate and lively discussion. Some may not even agree with the issue of follow through or may feel that there is not enough information to properly answer the question. This is where creative license and some assupmptions may need to be made on the part of students engaged in this study.
2. List and discuss the CASE counting standards for development and discuss their relevance to a crowdfunding campaign.
    a. Counting standard are always relevant to any campaign, regardless of the type, size, or scope. Crowdfunding is no different and therefore the same standards should always be applied. It would unusual for any one campaign to not follow the relevant standards in the industry.
        i. **CASE Recommendations:** The working group makes the following recommendations specific to campaign counting and reporting (see attachment for proposed language recommendations and a comparison with current language in the third edition of the CASE Management and Reporting Standards):
        ii. Revocable gifts may be included in campaign totals at face value if they are pledged during the campaign, documented, and as long as they are reported separately from outright gifts and irrevocable deferred gifts.
        iii. Irrevocable deferred gifts may be included in campaign totals at face value, but both face and discounted present values should be reported.
        iv. Conditional pledges may be included in campaign totals if there is a reasonable expectation that the conditions under which the pledge is made will be met during the campaign period and if there is appropriate documentation.
        v. Campaigns should be tied to the strategic goals of the institution, and for this reason the length of a campaign may vary. However, in order to maximize the commitment of volunteers, donors, staff and others, CASE recommends that a comprehensive campaign period generally not exceed eight years.
        vi. Government funds are very important to helping institutions achieve their strategic goals, they are often secured competitively and help leverage private funds, and fundraising staffs often are integral to securing government support. However, CASE reaffirms its position that comprehensive campaigns are fundamentally philanthropic ventures designed to raise resources from the private sector. Therefore securing government funds does not fall under the definition of philanthropy as a private act. For this reason, government funds should not be included in campaign totals, but institutions should work to raise visibility and recognition for the value of government funding in accomplishing institutional goals.

Figure 10.

Dissection Microscopes for the School of Arts & Sciences

The School of Arts & Sciences is proceeding with the ordering and purchasing of a new dissection microscope with full accessories, including an LCD viewing screen. We anticipate this microscope will be installed and functional in our biology laboratory by early summer, 2015.

Study Abroad Trip for the School of Business

The generous support of donors to crowdfunding have made it possible for several students from the School of Business to participate in the new AquinasAbroad program at our new international campus in Bracciano, Italy. The first group of students will spent the Fall 2015 semester in Bracciano and many will now be able to take advantage of less financial burden thanks to crowdfunding.

Study Carrels for Seton Lodge Residents

New study carrels for the Aquinas Residence Hall, Seton Lodge, have been purchased thanks to crowdfunding. They will be in student rooms for use when they return for the Fall 2015 semester. The carrels will be a wonderful addition to the space that is currently not inclusive of a well lit space dedicated to advance study and education.

vii. CASE should include a disclaimer to the revised campaign guidelines recognizing that within increasingly complex gift agreements, there will be situations not expressly covered in these guidelines and standards.

3. Using the outline for the Comprehensive Advancement Strategic Plan (CASP), explain how and where an intiative such as crowdfunding would fit in to the CASP.
   a. There are a few different ways in which students couple approach this question. The most likely scenario is that crowdfunding campaigns should fall under section IV of the CASP in "fundraising." Some student may argue that crowdfunding should be its own subsection with IV and some may argue that it should fall under IV – A. Annual Giving. It would also be more than appropriate for students to discuss the intense need for excellent marketing and communications plans for crowdfunding. Because of this requirement, students may also mention that crowdfunding should fall under section VII of the CASP in "Communications."

Chapter 41
Relevance of Entrepreneurship in TVET

Charles O. Ogbaekirigwe
Federal University Ndufu-Alike, Nigeria

Ugochukwu Chinonso Okolie
Ebonyi State University, Nigeria

ABSTRACT

The dynamic and complex nature of societies all over the world, with the evident failure of various levels of government and the private sector to completely solve the nagging problems of man, especially the down trodden, and less privileged, has made greater, the need for specially created and committed men and women to dedicate and sacrifice their resources to cover the gaps created by such failure. On the side of governments, perhaps, the failure result from insufficient fund caused by inadequate or poor resource management, corruption, or share insensitivity of the political leaders. This presented opportunity for citizens to create their own wealth and attempt solving their problems. This chapter therefore presented the importance of entrepreneurship programme in TVET as a means of equipping our youths to be self-reliant, capable of solving their problems and contribute to economic growth and development of their countries.

INTRODUCTION

Each time the word, "Entrepreneurship" is mentioned, it provokes different meanings to different persons. For this reason, the various definitions of Entrepreneurship, its various dimensions, perspectives and who the entrepreneur is, are succinctly explored. Most times, the "entrepreneur" who carries on the process of entrepreneurship is viewed as a manufacturer, inventor, business owner and the list is endless. However, the entrepreneur or being in entrepreneurship is not about owning a business, manufacturing or providing services, but ability to identify and evaluate business opportunities within where one resides and being able to take advantage of such business opportunities are among the distinguishing characteristics of the entrepreneur which this chapter discusses. It is also pointed out that the process

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

does not start and end at identification of business opportunities in an environment. As stated in the main body, without gathering the resources needed to take advantage of such opportunities that open to the entrepreneur, the business of entrepreneurship has not taken place. The International Training Centre of the ILO, (2005) states that "two views of entrepreneurship exist: one view sees entrepreneurship as involving the identification of existing gaps of what needs to be done, and taking action to fill the gap…. Thus, the numerous advantages of entrepreneurship as listed in this work would have been lost when these perspectives are not taken into consideration by the entrepreneur. Also, the concepts of TVET are clearly explored in this chapter.

After reading this chapter, the reader will be able to:

- Assess the variety of definitions and origin of Entrepreneurship in use, and categorize these according to the different dimensions.
- Discus the concept of TVET in Entrepreneurship.
- Explain relevant theories of entrepreneurship.
- Understand entrepreneurship as a discipline.
- Provide practical guide on the entrepreneurship process.
- Review and understand the different perspectives of entrepreneurship.
- Determine what it takes to be an entrepreneur.
- Reconcile the different perspectives of Entrepreneurship/ TVET.
- Explain the relevant theories of entrepreneurship;
- Gain relevant insight into the concept of Entrepreneurship in TVET.

Concept of Entrepreneurship

The word entrepreneurship was first used during the French military history in the Seventeenth Century Love (2013:21). It was originally coined from a French word "*entreprende",* meaning a person who voluntarily heads a military expedition. However, as pertaining to scholarly discuses, the word was first defined by the Irish – French economist called Richard Cantillion. One of the most outstanding English definitions of that era was, and still is that Entrepreneurship is a term applied to the process of willingly helping to launch a new venture or enterprise and accepting full responsibility for the outcome. In the course of the theoretical evolution of entrepreneurship, especially both as a process and a discipline, various scholars and researchers from different disciplines such as Management, Economics, Sociology, Psychology etc, grappled with diverse sets of interpretations and definitions to conceptualize this abstract idea. In addition to the diverse sets of interpretation, further literature reviews show that researchers have been inconsistent in their definition of entrepreneurship. This can be seen from the fact that there are a minimum of a hundred definitions to explain the concept of entrepreneurship. Buttressing this fact in a detailed study by William Gartner (2009), (an American Entrepreneurship researcher) 44 different definitions were obtained, from where 90 different attributes of entrepreneurship were identified.

In the last century, many writers have identified entrepreneurship with the function of uncertainty and risk bearing and others with the coordination of productive resources, the introduction of innovation and the provision of technical know- how. During the sixteenth century, people who organized and managed military and exploration expeditions in France were called "entreprendre". The word entrepreneur originates from the French verb, "*enterprendre*" and the German "*unternehmen"* both of which mean "to undertake". An entrepreneur is defined as one who organizes, manages and assumes the risks of business enterprise.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

As earlier stated, the early 18th century French economist, Richard Cantillon (1680-1734), who introduced the term entrepreneurship in his writings, formally defined the entrepreneur as the agent who buys means of production at certain prices in order to combine them into a new product. He further defines entrepreneurship as self-employment of any sort where the entrepreneur is the bearer of uncertainty and risk. Bill Bolton & John Thompson (2004) confirms that it was Richard Cantillon who brought entrepreneurship to the fore and also broadened the word 'entrepreneur" to mean those who carried the risk of the economy. Shortly thereafter, another French Economist Jean – Baptiste Say (1980) who is believed to have coined the word "entrepreneur" as an English word in the 19th century, defined an entrepreneur as "one who undertakes an enterprise as a contractor, acting as intermediary between capital and labour". It is rather a discovery to find from literature that after the pioneering work of Richard Cantillion, the postulations of Adam Smith caused the entrepreneur to almost disappear from economic thought. Bill and Thompson states "but with Adam Smith (1723 – 1790), the entrepreneur all but disappeared from economic thought". In their account, "a generation later, the entrepreneur was reintroduced by Jean Baptise Say (1767 – 1832) and brought back to centre stage. Substantiating this claim, Rothband (1995) puts it this way:-

if Adam Smith purged economic thought of the very existence of the Entrepreneur, J.B. Say, to his everlasting credit, brought him back. For Say, the entrepreneur, the linchpin of the economy, takes on himself the responsibility, the conduct and the risk of running his firm. Heal most always owns some of the firm's capital.....In Say's view, the entrepreneur must have judgement, perseverance, and knowledge of the world as well as of business, as he applies knowledge to the process of creating consumer goods.

It was Jean Baptise Say who also defined the entrepreneur as someone who shifts economic resources out of an area of lower to an area of higher productivity and greater yield. He equally added to Cantillon's definition by including the idea that an entrepreneur is one who brings other people together in order to build a single productive organization. However, Jean - Battiste Say's definition did not tell us who the entrepreneur is. As previously stated, Adam Smith and David Ricardo had defined the concept of entrepreneurship under the broad English term of business management. Although Smith and Ricardo suggested that they undervalued the importance of entrepreneurship, another British economist John Stuart Mill actually stressed its significance for economic development and growth. He it was who claimed that entrepreneurship required ''no ordinary skills'' and lamented that there was no good English language equivalent to fully portray the specific meaning of the French term "entrepreneur". Bill and Thompson (2004) state that a century later, Schumpeter (1934) supported the stand of Jean Baptise Say and John Stuart Mill in stressing the significance of entrepreneurship but more strongly. Schumpeter saw the entrepreneur not only as being centre stage, but shaking the stage. He it was who formerly used the phrase "creative destruction" to describe what entrepreneurs do. They conclude that the modern use of the word "entrepreneur" in the French language is something of a letdown. It simply means a building contractor and that entrepreneur can be found in the French equivalent of the yellow pages. In conclusion, they defined an entrepreneur as a person who habitually creates and innovates to build something of recognized value around perceived opportunities.

Therefore, for one to be able to conceptualize definitional issues around this very aversive subject, one should first of all take some brief foundational discus under the following titles:

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

1. The Entrepreneurial factor,
2. The Entrepreneurial function,
3. The Entrepreneurial initiative, and
4. The Entrepreneurial spirit or behaviour.

Entrepreneurial Factor

Some writers had seen the entrepreneurial factor as a new factor in production, just as you had men, machines, money etc. It is therefore seen as identifying an opportunity related to satisfaction of needs and converting it to something of value (either as a product or service). That, in our view, is the bases of classic theories of Schumpeter's innovative entrepreneur (1934- 1942).

Entrepreneurial Function

When considered as a function, it refers to the discovery and exploitation of opportunities or to the creation of enterprise. Under this, the risk-taking entrepreneur that occupies a position of uncertainty was proposed by Knight (1921).

Entrepreneurial Initiative

The entrepreneur is seen here as one with initiative and imagination who creates his own opportunities. Reference to entrepreneurial initiative underlies the reasons for correctly anticipating market imperfections or the capacity to innovate in order to create a ''new combination''. Entrepreneurial initiative covers the concepts of creation, risk-taking, renewal or innovation inside or outside an existing organization.

Entrepreneurial Spirit or Behaviour

According to Miller (1983), Entrepreneurial behaviour is seen as behaviour that managers exhibit to combine innovation, risk-taking and pro-activeness. The entrepreneurial spirit emphasizes exploration, search and innovation, as opposed to the exploitation of business opportunities (pertaining to managers).

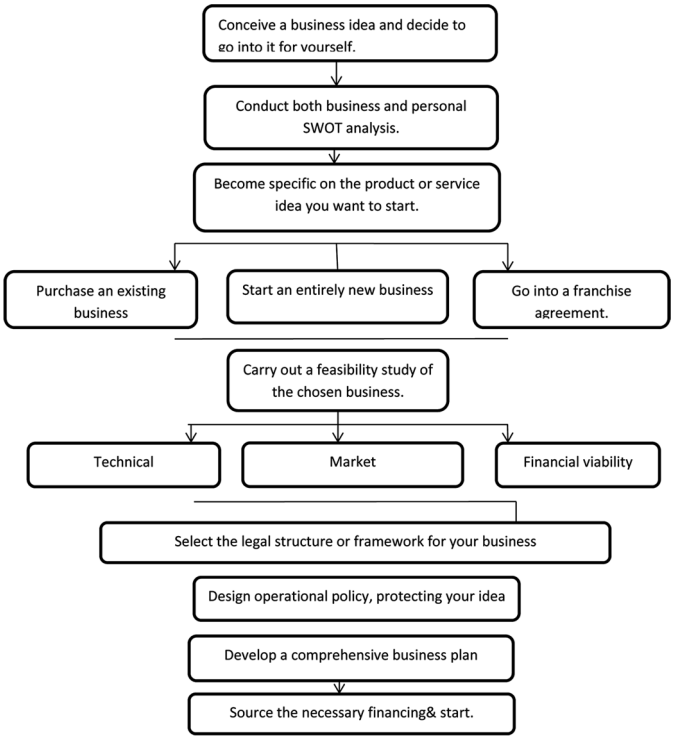
These different approaches are the reasons why entrepreneurship is described in different ways. As the author had earlier on emphasized, entrepreneurship had variously been defined from various angles by many authors, including contemporary ones. There is also the business process approach which includes the identification and assessment of opportunities, the decision to exploit or sell them, efforts to obtain resources and the development of the strategy and organization of the new business project as propounded by Eckhardt and Shane, (2003)

Having laid these important foundations in our quest at its conceptualization, we state some of the classical definitions of entrepreneurship so as to gain more insights. Entrepreneurship is ''a process by which individuals – either within or outside organizations –pursue opportunities''(Stevenson and Jarillo, 1990: 23) . This definition also captures the essence of intrapreneurship, as well as the emphasis that if the managers and businessmen of many of our firms were to adopt entrepreneurial behaviour in developing their strategies, firms would be facing a much brighter future than current perceptions suggest (Lee and Peterson, 2000). Thus, Entrepreneurship is the process of creating value by bringing together unique resource combinations to exploit opportunities. It also means that at the heart of any

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

entrepreneurial venture is an entrepreneur and his/her team. As a team, they become individuals with vision, tenacity and perseverance, and the passion to successfully implement a novel idea that had been conceived by the visioner. Morris, et al (2010) aver that Entrepreneurs are agents of change, they are the ''dreamers and doers'' who see a better way and do whatever it takes to make that better way happen. Much of what can be learned from them involves not so much their idea, but how they made it happen, how they overcome the obstacles and the negatives, how they found resources when there were none, how they brought along the team, how they dealt with personal and ethical conflicts, and more regarding implementation and growth. Another view of entrepreneurship is that expressed by Stevenson and Gumpet, who defined it as ''the process of creating value and transforming them to profitable activities not minding the risks involved. Moreover, it is pulling together a unique package of resources to exploit an opportunity [Stevenson and Gumpert 1985]. Therefore, we see that Entrepreneurship is a process that entails conceptual approach to doing new things, within a new philosophy of value, purpose, utility, quality and use which brings about the satisfaction of needs. Hence, it is therefore very relevant in Technical and vocational Education Training (TVET).

The Entrepreneurial Process in TVET



According to Fred Fry (1999) in Love (2008:135) the different steps that are involved in the success of an entrepreneurial outfit are starting a business; creativity and innovation; managing growth; seeking finance; and assuming risk. It is a known fact that starting an enterprise begins with the entrepreneur and business idea that had been conceived. The result of it is usually something of recognized value. In this process, the TVET entrepreneur engages in building the enterprise, creates and employs the different innovations that are at their disposal. This is mostly what initiates the process, because a good entrepreneur takes that creative idea that was conceived, and makes something great out of it. Without being an entrepreneur, even the best ideas will not even be put to use, it will fail and lead to nothing. Again, Bolton and Thompson (2004) state that entrepreneurs are individuals with very different ways of doing things but what they do is remarkably similar e.g., they all identify an opportunity, put together the necessary resources and build something of recognized value. So we see that the process has to do with the entrepreneur bringing inputs in the form of ideas and people, enters the process by building and growing it, and produces output by the birth of a new enterprise,

KEY FEATURES OF ENTREPRENEURSHIP

Contemporary studies by many scholars reveal important features of entrepreneurship that are worthy of mention in this chapter. From the submission of Stevenso and Gumpet (1985), we see that a major aspect of entrepreneurship is the identification of market opportunity and generation of a business idea that can be used to maximize the opportunity. When a new approach has been conceived by the entrepreneur, it often leads to generation of a business idea, either as product or service. The entrepreneur then searches further to identify the market opportunity by which those values, purpose, utility and use will be realized. Secondly, because entrepreneurial initiative covers the concepts of creation, risk-taking, renewal or innovation, there must be the gathering and commitment of resources even in the face of risks in order to pursue the opportunity. The entrepreneur must have the drive, the ability to conceptualise creatively. There must also be that aptitude for human relations so as to be able to harness the potentials of team

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Source: Author's concept

members. Most essentially, and as earlier expressed by Stevenson and Jarillo (1990: 230), entrepreneurship is ''a process by which individuals – either within or outside organizations –pursue opportunities''. Therefore, for entrepreneurship to really subsist and fully become effective there has to be the creation of an operating business organization to implement the opportunity – motivated business idea through which the benefits of the enterprise will accrue to the entrepreneur.

Perspectives of Definitions of Entrepreneurship

In this section, we seek to describe the various assumptions of the realist; the constructionist; the evolutionary realist that includes some elements of realist perspectives and some elements of constructionist perspectives with a view to understanding the definitions of entrepreneurship and the formation of entrepreneurial opportunities.

The Realist Perspective

Blanchard (1855) and ErnestMach's (Kockelmans, 1968) state that the realist perspective has its roots in classic positivism and dates back to August Comte. In that view, any theory that is not based on observable facts is meaningless. In their account, Comte claimed, that "the goal of science is perdition based only on observable terms" and stressed further that unobservable objects, processes, and events in current realist view are ascribed the same properties as the observable. In his views, there is a real

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

world existing independent of our attempts to know it; that we humans can have knowledge of that world; and the validity of our knowledge- claims is, at least in part, determined by the way the world is (Azevedo,1997). Theory in his view, either correctly or incorrectly describes the unobservable and it can be tested as either true or false. This also means that realists know the truth about genuinely existing unobservable entities. However, they (the realists) argue that the objects of scientific knowledge are phenomena and take the form of general laws that must be testable by experience and show logical links between specific phenomena and these laws.

This way of thinking of the realists manifests in entrepreneurship literature, in a set of ideals that has come to be known as discovery opportunities or the individual/opportunity nexus approach. The root of this approach is the work of the "Austrian economists" who differed from the more traditional neoclassical economists by assuming markets with imperfect information ([Kirzner, 1989; Von Mises, 1949). The central assumption of their discovery approach suggests that unobservable opportunities exist objectively and independent of individual perception and by implication that these opportunities can only be seen, and thus "discovered," by special alert individuals (Kirzner, 1973: 10). Therefore, the realist perspective of opportunity formation in this view attempts to answer the question - Who is an entrepreneur? This realist assumption asserts that individuals who are entrepreneurs differ from those that are non-entrepreneurs in many ways. This may also help in resolving the age-long discourse on the reason why one person sees opportunities in an area where others are complaining of lack of amenities, decaying infrastructure etc, etc. This position further assumes that without these differences, anyone in an economy could become aware of and then exploit an opportunity. However, if entrepreneurs and non-entrepreneurs differ, then not everyone in an economy will know about particular opportunities, and if they do, not everyone will be predisposed to exploit them.

Kirzner (1973), Shane, (2003) had examined several possible differences between entrepreneurs and non-entrepreneurs. According to them, most of those differences led to the development of information asymmetries between entrepreneurs and non-entrepreneurs. Shane,(2000), Kirzner (1973: 67) summarizes the differences between entrepreneurs and non-entrepreneurs by simply asserting that entrepreneurs are more "alert" to the existence of opportunities than non-entrepreneurs. The basic position of the realist discovery view of opportunities is that these opportunities exist independent of individual's knowledge of them, and that this knowledge can be acquired. However, the limitation of this view is that it holds the nature of the world and specifically the opportunity in this case, subject to empirical investigation. In conclusion, entrepreneurship provides grounds for opportunity to be tested for validity.

The Constructionist Perspective

The constructionist perspective is rooted in the work of Berger and Luckmann (1966). They aver that social action, institutions and conditions that are presented as objective phenomena in a realist perspective are instead constructed through the interactions and interpretations of people. According to Azevedo (2002), the primary difference between realists and constructionists is that realists explain observable and non-observable phenomena as if observable, and constructionists explain non observable subject matter through interpretive understanding of particular actions. This constructionist viewpoint have also manifested in the field of entrepreneurship by trying to understand how opportunities are formed and exploited. Sarasvathy (2001) states that a constructionist approaches to opportunity formation can be seen in effectuation logic. The central assumption in this view about opportunity formation would suggest that individuals interpret a phenomenon, and give it a meaning that is different from other's interpretation.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

It also emphasizes individual differences, such that in a constructionist approach of opportunity formation, individuals create realities and then mould their actions to these realities (Katz & Gartner, 1988).

This constructionist approach as it relates to entrepreneurship, states that the individual decides what opportunity to create and then uses available resources to accomplish the task. Resources in this view might not be used in the traditional ways but may be put to use in novel service (Penrose, 1959). It further states that it is in this way that entrepreneurs "designs the future" based on the environment and the resources available to them (Baker & Nelson, 2005). In a constructionist view, any resources, be it information or new knowledge are subject to interpretation. Baker & Nelson (2005) concludes this by stating that in this view, Entrepreneurs start where they are and with what they have and interpret their idiosyncratic relationship with their resources (Baker & Nelson, 2005; Mahoney & Michael, 2005)

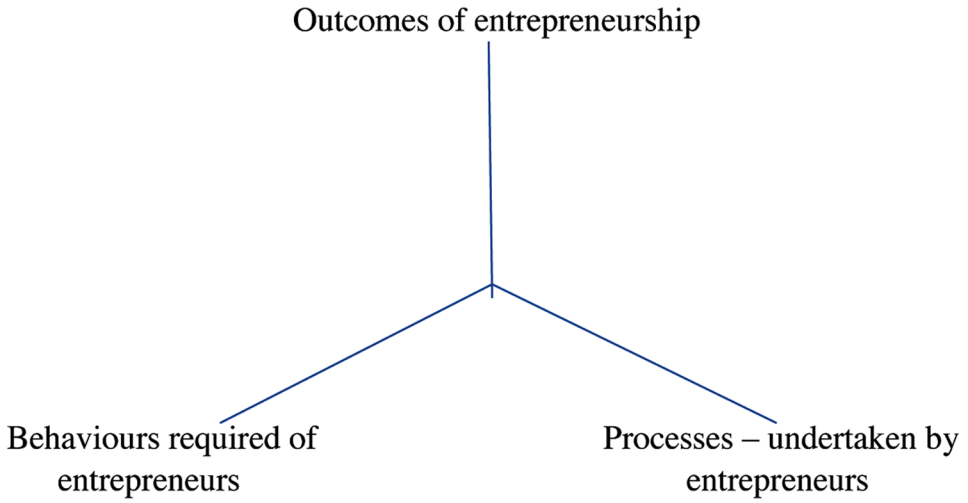
Just as the realist perspective of opportunity formation informs the nature of who an entrepreneur is, the constructionist perspective informs the nature of an entrepreneur. Entrepreneurs in this view perceive an opportunity that was not perceived by others, implying that entrepreneurs must be different from none entrepreneurs since they perceive and assign meaning to conditions and phenomena differently than non-entrepreneurs (Ford, 1999). In this view the formation of an opportunity and the entrepreneur cannot be separated since it is the differences in the perceptual, cognitive beliefs and interpretation of entrepreneurs that construct these opportunities. Moreover, the notion of self – fulfilling prophecy is a strong assumption suggesting that over – confidence and bias plays significant roles (Busenitz & Barney, 1997). In this view entrepreneurs' biases are reinforced and may be strengthened as their convictions become accurate. While the constructionist approach to opportunity formation knowledge is relative and the existence of opportunities in the perceptions of individuals may be appealing, the constructionist approach also has limitations. Knowledge and opportunities in this view are relative; the problem is that when everything is relative, logical coherence is renounced (Azevedo, 2002).

The Dimensional Approach to the Different Definitions of the Entrepreneur

There are three dimensions of the different definitions of the entrepreneur as it concerns this chapter presentation. In agreement to that, Stokes et. Al (2006) gave a diagrammatic representation of the three dimensions of entrepreneurship, from which we can deduce that all of the numerous aforementioned and other unstated definitions of Entrepreneurship focus attention on the following;

1. Behaviours of or required of the entrepreneur;
2. Processes undertaken by the entrepreneur;
3. Outcomes of entrepreneurship.

From the behavioural approach, we see the entrepreneurs as individuals with specific set of behaviours that mark them out as entrepreneurs. Wennekers and Thurik (1999), states that it is the manifest ability and willingness of individuals, on their own, in teams, within or outside existing organizations, to: perceive and create new economic opportunities (new products, new production methods, new organisational schemes and new product-market combinations) and to introduce their ideas in the market, in the face of uncertainty and other obstacles, by making decisions on location, form and the use of resources and institutions. Further to this, entrepreneurship is a way of thinking, reasoning and acting that is opportunity based, holistic in approach and leadership balance (Timmons & Spinelli 2004), while Casson (1982) states that entrepreneurs are specialists who use judgements to deal with novel and complex problems.



EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

However, the process dimension, as had earlier been discussed, highlights the development of a new business and innovation which makes the entrepreneur not only to write a business plan, bur goes ahead to mobilize the resources to start the business. In that wise, Hisrich and Peters (2002) states that entrepreneurship is the process of creating something new of value by devoting the necessary time and effort, assuming the accompanying financial, psychic and social risks, and receiving the resultant rewards of monetary and personal satisfaction and independence. We also conclude this behavioural discourse with the position of Steven and Jarillo (1990) that it is the process by which individuals – either on their own or inside organisations, pursue opportunities without regard to the resources they control. Lastly here, the outcomes of entrepreneurship are seen in the form of new products, new services, innovations, new ventures and creation of new values that benefit the society. This is corroborated by Simon and Saravathy (1999), who see entrepreneurship as the introduction of new economic activity that leads to change in the market place. Really, entrepreneurship here, is the creation of new organization (Gartner 1988).

Technical and Vocational Education Training (TVET)

TVET in the context of this chapter are twin terms, which may be considered to have the same meaning. Technical and vocational education training (TVET), according to Okoro (1994), is that aspect of total education process that focuses on individual occupation. He further stated that the function of technical and vocational education is to provide knowledge, develop skills and inculcate those attitudes that are necessary for entry into and progress in occupations. The central purpose of technical and vocational education is to get people into occupations requiring specialized training. The skills and knowledge acquired while training for one occupation may be of little or no relevance in other occupations. Oranu, (1992), views Technical and Vocational Education as that training that enables one to carry on successfully a socially useful occupation. He further stated that this definition refers to technical or technology education as training for useful employments in trade, industry, Agriculture, Business and Home making. According to Okoro (1993), technical and vocational education is any form of education whose primary

Figure 2. The three Dimension of entrepreneurship
Source: Wilson & Stokes (2006)

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

purpose is to prepare persons for employment in recognized occupations. Olaitan (1996), views technical and vocational education as that form of education, which emphasizes the development of occupational skills needed as preparation for work. It is a form of education, which promotes the dignity of labour by entrenching work as the goal of education. This explanation is necessary, because the difference in emphasis of work as the aim of education is the major distinction between technical education and general education.

Technical and vocational education therefore, is that part of total educational system, which offers training courses leading to the acquisition of specific skills to enable one to perform certain job. According to Okonkwo (2006), technical and vocational education like any other form of education, is a most potent instrument for poverty alleviation. He further stated that since TVET emphasizes preparation for the world of work, its contributions to positive change of development are also related and sometimes derived from work, this is why entrepreneurship awareness in TVET is very paramount. When the graduates are made to have entrepreneurial knowledge and skills through TVET, it becomes very easy to implement the objectives of TVET, which are to ensure that the graduates are able to be innovative and creative, establish their own small and medium scale businesses (Entrepreneurship), earn livelihood and employ others.

Effective entrepreneurship training programme in TVET will present many TVET graduates lots of ideas, knowledge and opportunities of starting small scale businesses instead of waiting to be employed in the governments' unavailable white-collar jobs. The entrepreneurship training in TVET must be focused on training students to gain skills even in areas outside their curriculum for graduation in their department/unit. Baldwin (2002) argued that entrepreneurial skills students can acquire during training can enable them to be self-reliant include marketing skills, financial resources skills, self-motivation skills, time management skills, administrative skills, innovative skills, professional skills, practical skills etc.

Neglect of TVET and its Implication on Technological Development

The neglect of technical and vocational education and training (TVET) over the years may have contributed to the high unemployment and rising poverty among the youth in developing nations, because many of them lack the basic job skills. For instance, Nigeria is today categorized under the list of poor nations. It is no longer news that the nation's youth unemployment rate has been shooting up the sky. The federal government recently acknowledged that about 80 per cent of Nigeria's youths are unemployed and 10 per cent underemployed (FGN, 2004). And the poor quality of graduates is worrisome. In spite of its abundant natural and human resources, Nigeria still faces an enormous challenge in its effort to reduce poverty. Thus, one way of reducing poverty according to Adebayo (2005) is to ensure sustainable job creation through TVET. Many, both in the developed and developing worlds, are increasing the emphasis they place on improving the capacity of technical and vocational education and training (TVET) systems, in recognition of the important role TVET plays in equipping individuals with relevant skills and knowledge for the job market. TVET can also better enable individuals to participate in social, economic and technological processes. From the foregoing, it can be concluded that Technical Vocational Education and Training (TVET) is such an aspect that its neglect poses a great threat to the economic and technological well being of a nation. Therefore, this paper is focused on the challenges facing TVET as a toll per excellence for economic and technological development of the Nigeria nation and possible solutions to the identified problems were suggested.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

TVET face challenges of meeting the changing demands of today's industries and the new challenges posed by the global economic environment. Some of these challenges include:

- **Non Integration of Education and Workplace:** TVET is being offered as formal education, but little reference is being made to the needs of the workplace. Changes in the workplace have not been met with changes in education and training. TVET should cater adequately to the varied needs of members of the society to enter and re-enter the world of work. It should also provide opportunities for achieving both personal and social development, which is grossly lacking in our TVET programmes in Nigeria.
- **Uncertainty and Anxiety:** Today, more people than ever before experience frequent career changes and periods of unemployment as a result of the changing demands of the workplace. It is difficult to predict with certainty the employment needs of the informal sector which absorbs a major part of the labour force. It is also becoming increasingly difficult for young people to choose courses of study and career they would like to pursue in their adulthood. Adults who may have been laid off or retrenched require guidance and support in looking for new jobs and some time new career. One of the most dangerous consequences of fundamental changes now prevailing in politics and of course, in education is uncertainty. In Nigeria, people are retiring or their appointments are being terminated without knowing what to do next to cater for their needs. Therefore, it is one of the most important tasks of technical and vocational education and training to enable people cope successfully with their uncertainties. This is not being achieved by our TVET programmes.
- **Trends of Globalization of Trade and Labour Markets: T**he trends of globalization of trade and labour markets, rapidly changing technologies, and mass unemployment are expected to continue in this century. The effect on these changes in the labour market are that some jobs are declining in significance, others growing in importance and others require completely new and different skills. The size of the workforce employed in the service and technology industries, where a high-level education and skills are required, will increase, while the demand for low-skilled workers will shrink. Many employees are likely to change jobs, and possibly even careers, several times in their working lives. The changing nature of labour market trends has significant implications for education, implying inter alia the need to provide lifelong learning, continuing and recurrent technical and vocational education, continued upgrading of knowledge and skills (Adegbile, 2002).
- **Non Preparation of the Young People for Life:** Here is a widely shared consensus about the goals of education. It is to prepare young people for life by developing their intellect, their aptitudes and their talents; and to create opportunities for them to earn their living and to take part in the democratic and economic process of the country. All educational systems have to serve these purposes. Vocational education, that is the education and training of skilled workers and employees has to be broader and more diversified. Take for instance, a car mechanic must have diagnostic skills and knowledge (computer literacy), be customer oriented (direct personal contact), have all the skills of the trade (high tech.), must take into account ecological effects of his or her work, be able to calculate the cost of a repair and, more generally, be conscious of adding value. This obviously is lacking in our TVET programmes.
- **Non Flexible Access to TVET Throughout Life:** Due to the high cost of TVET, the majority of those who could benefit from it do not have access. Available TVET programmes are often delinked to a large extent are delivered using traditional theoretical methods. TVET should address the needs of informal sector where most production activities go on.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

- **Challenges of Information and Communication Technology:** Information technology (IT) is at the root of a process of transformation in the course of which industrialized societies are changing into knowledge societies and the management of production into the management of knowledge. There will be less and less manual work while computers become the main tools catering for the information needs of all professions. As a result, letters and figures, into which all procedures have to be translated, become more and more important for all human activities at work and in private life. The end of the division of the world has opened the borders to the free flow of capital, goods and information and to unhindered travel of people at large, but not yet in all parts of the world. Going global is the challenge to entrepreneurs and of course to their employees.
- **Lack of Fund for Implementing TVET Programmes:** Matters related to cost, efficiency and effectiveness of vocational education schemes; pose a big challenge in Nigeria. The relevant issues here include, on the planning or macro level, system choice or the school versus the enterprise issue, the broad versus the narrow base approach to the area of specialization, and the duration of the TVET programme. On the operational or micro level, such issues include trainer-instructor ratios, utilization factors of training facilities, choice of equipment and technologies, and size and nature of productive activities. In Nigeria, all aspects related to the economics of vocational education are sources of concern, and even frustration, especially when taking into consideration the relatively high cost of TVET programmes, compared with other educational programmes;
- **Poor Social Status of TVET:** The social status of TVET in any society is, to a great extent, a reflection of the status of work values in the society. A rational and balanced approach can be realized if work activities are assessed both by their material and economic returns on the individual and society, on one hand, and their social and humanizing influences on the other hand. The social status of TVET can, on one hand, be enhanced in practice through appropriate career guidance and counselling services, as well as employment and placement services. Unfortunately, the two types of services are weak in most developing countries, accentuating more the status issues of TVET. In practice, the social status of TVET is also influenced, to a great extent, by the type of relation and nature of channels that link it with higher education that leads to the preparation of professionals. Successful TVET schemes are usually designed with inherent and built-in links with higher education and occupational levels, through the formal and non-formal systems of education, within the general concept of continuing and life-long education. In some education systems, especially those of developing countries, the realization of this concept would necessitate the restructuring and reform of higher education, in order to eliminate bottlenecks, and establish lateral and vertical channels among various fields and level of educational and training offerings, to promote occupational and educational mobility and, consequently social mobility. In general, therefore, higher education should be linked with abilities and performance standards of the learner, in respective of the type or stream of pre-university education or training the or she experienced. Other aspects of the status issue of vocational education include such factors as the status of the vocational teacher, the gender issue, and the vocationalization of general education. It is not unusual in many education and training systems to find that vocational teachers are not of equal status, socially and economically, to their general education counterparts. It is also not unusual to find that the relevant vocational education facilities and services are structured basically around the needs of male learners, with the result that the role of female learners, instructors, planners and providers of services, lags considerably behind the roles of males. Finally, a great service

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

can be offered to the status issue, if a strong element of vocational education, or more specifically prevocational education, is incorporated as part of general education in the form of diversified practical activities and life experiences, derived from the various socio-economic sectors.

- **Non Internationalization of TVET Programmes:** The approach to issues related to human resources development in general, and vocational education in particular, is more purely national concern. The challenge therefore, is that Nigerians trained under our TVET programmes can not fit into global TVET global practice. This is because; in Nigeria less emphasis is given to practical and more on theory. This is against the international practice of equal theory and practice. The consequence is that Nigerian TVET graduates are not employable in most countries adopting best practices in TVET.

Possible solutions to the identified challenges of TVET for effective entrepreneurial skills acquisition:

- The approach to issues related to human resources development in general, and vocational education in particular should become a concern with international dimensions that should take into consideration emerging conditions of increasingly globalized economies of the world, manifested by the changing structure and framework of world trade, labour mobility, common markets, commodity standards, multinationals, and the geographical characteristics of industrialization. It is thus becoming increasingly essential to think regionally and even globally when planning, defining policies and designing programmes at the national level, for the quantitative and qualitative aspects of TVET as a component of human resources development, especially in such matters as job classification, skill standards, educational levels, information systems and the identification of training needs.
- Promotion and marketing of TVET as a viable alternative to the more traditional mode of advancement and education. This could be done through the integration of competency-based training with academia both at the secondary and tertiary level.
- Establishment of a National Qualification Framework for education and training that include all levels from pre-primary to post-graduate.
- Establishment of National Worker Certification/Licensing Programme.
- Development of Industry-led Standard setting bodies in all sectors.
- Establishment of an independent labour market observatory.
- Provision of labour market reports on a continuing basis - both on the demand and the supply side.
- Development of a Dictionary of Occupations aligned to international models.
- Creation of mechanisms for defining, classifying, training and certifying people in the informal sector.
- Provision of training opportunities for entrepreneurship and innovation.
- Increasing the Employability and Participation of Vulnerable Groups - young workers, differently-abled, older displaced workers and the incarcerated population.
- Establishment of a National Training Fund with contributions from the Government and private sector. This is geared to making adequate funds available for planning and organizing of TVET programmes.
- Passage of legislation for the funding, accreditation, standard setting and quality assurance within the national training system.
- Development of a Modern Apprenticeship and Traineeship Programmes

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

- Encouragement of lifelong education through a seamless system i.e. school to work and work to school models.
- Provision of information on careers & proper career guidance of TVET recipients.
- Integrate ICT in all TVET programmes to enable recipients adopt and follow the ever increasing growth in ICT.

Through effective entrepreneurship and TVET training programmes in developing nations, the following will be achieved;

Personal Development

Entrepreneurship in TVET develop in individuals, capacities for decision making and qualities necessary for active and intelligent participation, teamwork and leadership at work and in community as a whole. Technical and vocational education training contributes to individual's personal development, increases one's productivity and income at work and facilitates everybody's participation in economic development and growth process. TVET is suitable for contributing to national socio-economic development and meeting needs of every citizen in developed and developing economy. Apart from the fact that TVET can empower individuals to be economically sound, it has the capacity to increase international competitiveness. The technological changes are taking places faster than one can imagine and the gap in technology and knowledge, between developed and developing economy has always been large. The developing countries stand the chances of bridging technological gap by transfer of technical knowledge through the adoption of technical and vocational education training. The truth is simple; without embracing the concept of TVET, the development gap will continue to widen even more and reduce the capacity of developing countries to be competitive in the global economy. TVET is used as a comprehensive word referring to that educational process involving in addition to general education, the study of technologies and related sciences and acquisition of awareness, knowledge, skills and attitudes relating to careers in various sectors of economy and social life. It is an aspect of education that provides knowledge, practical training for skill development to its recipients leading to straight access into specific profession.

Self-Reliance

Technical and vocational education training focuses on self-reliance, by equipping the graduates at the end of the programmes with scientific and technical skills, which will enable them, create jobs or employment for themselves and employ others. This of course, will assist to decrease the rate of crimes and youth restlessness thereby promoting national economic growth and development. The role of technical and vocational education training is not only to equip the students intellectually but it will also lay emphasis on various skills depending on interest and capability of students. There is a high need to assist people gain competency through mastery of scientific and technical skills; this implies guiding individuals towards their chosen occupations based on their acquired technical skills. Each profession requires specific skills to perform effectively without much supervision. TVET leads to provision of gainful employment; this is possible through graduates that have acquired right skills in establishing their own jobs. The type of skills in this direction are managerial, maintenance, designing and manipulative skills. In setting up gainful employment, there will be reduction in rate of unemployment, which courses poverty in developing nations and had drastically affected the social well being of the populace. The

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

role of technical and vocational education training on the standard of living of people cannot be over emphasized. Perhaps, that is why the General Assembly of the United Nations has proclaimed the 10-year period beginning from January 2005 as "the United Nations Decade of Education for Sustainable Development". In line with this, the United Nations Educational Scientific and Cultural Organization (UNESCO) now advocate four pillars of education; namely

1. Learning to know (Knowledge),
2. Learning to do (Skill),
3. Learning to live together (Peace), and
4. Learning to be (Personal self-fulfillment).

Technical and vocational education trainings, according to Adebayo (2005), has been established as the most effective means for society to develop its members' potentials to respond to the changes and demands of the future.

Career Orientation

Technical and vocational education training is education in career oriented with specific career courses offered in institutions such as technical colleges, polytechnics, colleges of education (Technical) and universities, which are meant to equip students with knowledge, understanding and skills of different occupational areas in industries. The implication is that TVET is tailored towards career orientation, which in turn leads to self-sustenance. It is also an education, which fits one into intricate experience of the real world of work through acquisition of relevant knowledge and skills. It is seen as job oriented training designed to develop appropriate knowledge, skills, attitude and understanding in world of work. TVET according to Uwaifo (2008), is the training of technically oriented personnel who are to be the initiators, facilitators and implementers of technological development of a nation by adequately training its citizenry on the need to be technologically literate, leading to self-reliance and sustainability. Technical and Vocational Education Training more than any other profession, has more direct impact on national welfare. Its contributions are widespread and visible ranging from metalwork technology, mechanical/automobile technology, electrical and electronic technology, building and woodwork technology etc. Consequently, Technical and Vocational Education Training can serve as change agents not only for technical systems but also for many other societal changes. The practical nature of Technical and Vocational Education Training makes it unique in content and approach, thereby requiring special care and attention. Technical and Vocational Education Training is the answer to empower teaming youths that roam about without doing any meaningful work in the society today. From the explanations, one can deduce that technical and vocational education training is:

- Education geared towards career orientation for self- sustenance/ self-reliance and poverty alleviation.
- Training geared toward a gainful employment.
- Education tailored towards the development of appropriate skills, attitudes and understanding required to fit one into any chosen occupation for a living.
- Education for training or retraining for the development of competencies in specific jobs.
- An integral part of general education.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

- An aspect of lifelong learning and a preparation for responsible citizenship.
- A sustainable instrument for promoting environmentally sound development.

Youth Empowerment

Technical and Vocational Education Training is an academic programme that aims at the development of human abilities in terms of knowledge, skill and understanding so that the individual may serve happily and effectively in carrying on the activities in the vocational pursuits of his choice. According to Fajimi (2005), technical and vocational education is education deigned to develop skills, abilities, understanding attitudes, work habits, and appreciations encompassing knowledge and information needed by workers to enter and make progress in employment on a useful and productive basics. It contributes towards the development of good citizens by developing their physical, social, civic, cultural and economic competence.

Skills Acquisition in TVET

The developing economies are challenged with the problems of unemployment and youths involvement in criminal acts. The graduates roam the streets in search for the white collar jobs, which are not readily available either in the public or the private sectors. Majority of these graduates do not have any form of technical and vocational skills that can help them out of these situations. A worthwhile skill acquisition will enable the individual to perform meaningfully in the industrial world. People that have acquired useful skills can help themselves and as well live by it; they can at the same time help others by training them to acquire the same skill they have for money, thereby generating more income again. This then mean that skill acquisition is a means of providing oneself with requisite materials for a satisfactory living. Every country in the world is faced with challenges of improving capacity of their workforce to respond to their national development needs and to demands of rapidly changing, more globally competitive world. Therefore, the future achievement of every nation, individual, enterprise and community is highly dependent on existence and possession of transferable skills and ideas. The recognition that the indispensable role that technical and vocational education training plays in equipping individuals with relevant skills and knowledge hence enabling people to effectively participate in socio-economic and technological innovation process cannot be over emphasized. Through skills development, people can better their chances of securing productive and gainful employments thereby sustainably augment their income levels and access to a excellence life.

There are assorted forms of skills students/graduates are expected to acquire through Technical and Vocational Education Training (TVET);

- **Innovative Skills:** The graduates of TVET are expected to have acquired innovative/ creative skills to enable them introduce something new that may be capable of sustaining them and others in the society. This sort of skills allows the individual to delve deeper, think of products, goods and services that are of importance to the society, which are not yet introduced into the society. The vocational education trainers/teachers should endeavour to train their students on how to be creative so that they'll be able to inculcate the attitude of creativity in the students. Innovative skills involve integration of new ideas and/ or accumulation of new knowledge, casting a broader net for the discovery of potential opportunities. When the TVET students are trained to develop such

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

skills, they'll contribute positively to their nation's economic growth and development through jobs creation. The main aim of development in a nation is to improve the living standards of the people through effective utilization of human and material resources; hence developing nations must be fully involved in the development of technical and vocational education training for self-reliance. This according to (Olaitan, 1992). will contribute positively to reduce poverty and hunger thereby boasting the economical and social status of any nation.

- **Practical Skills:** When a graduate of TVET is able to handle tools, equipment and at same time know how to join one or two objects to produce another, she/he is able to transform materials into products and services. Practical skills are acquired only when the vocational teachers are practically sound to teach the students through practical methods. But surprisingly, many vocational education teachers uses lecture methods to teach the students and most times, the courses of study are theory based. Practical skills provide the TVET students with occupational/career abilities to ensure self-reliance.
- **Self-Motivation Skills:** Having acquired the innovative and practical skills, the study will be able to develop self motivation skills. Self-motivation skills deal with the ability to be moved such that the practical and innovative skills acquired can be put to production of goods and services. Self-motivation is the ability to be self confident with extra drive and commitment to make sure necessary steps are taken to make dreams of successful business a reality. Without the self-motivation skills, the vocational education graduates would not be able to establish themselves or be self-employed. In the world of struggle like ours, one must be motivated to be able to succeed. This is the role of the TVET teacher. She/he must inculcate the attitude of self-motivation in the students such that they can stand in the midst of others professionals.
- **Financial Resources Skills:** This is the skill that will enable the student to be able to handle money judiciously. This sort of skill includes knowing how to stretch the limit start up that you have, spending only when needed, identifying the best pricing structure for your business in order to get the best return for your products and services (Fajimi, 2005). For one to establish an enterprise, spending frivolously must be avoided. Therefore the vocational teacher through teaching/training should be able to make the students develop this sort of skills. Also, TVET graduates who may wish to be self-employed are deeply skeptical to establish on their own businesses for lack of capital or financial resource skills. This situation inhibits the survival of the few existing enterprises around.
- **Marketing Skill:** This sort of skill involves thinking about how to reach the targeted audience for product and services. This entails understanding what people want, listen to the people's needs and interacting well with other people. Any TVET graduates who acquire this sort of skill crossed the bar of unemployment because, with marketing skill, she/he can market him/herself to other established industries. For every goods and services/business, it must be well marketed. Therefore, when the students acquire this sort of skills, it is easy for them to stand alone and be independent of the governments' white collar jobs. To achieve this, the curriculum planners must make sure that opportunities are made available for the vocational teachers to impart such skills in the students (Umunadi, 2010).
- **Time Management Skill:** This involves the ability to plan and manage time with a clear idea of the things to be done in a day. The graduates of TVET must be able to multi-task and prioritize the day's tasks to be successful in any form of business or trade.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

- **Administrative Skill:** The TVET trainers are expected to teach their students to acquire skills on how to fill, bill, print, make invoices, collect payments, manage receipts, keep proper accounts of goods and services, tools, materials and equipment. Studies has shown that why many vocational enterprises are not flourishing is because, majority of the owners of such enterprises lack administrative skills. Many of them do not have records of how much money realized from the enterprise, how much cash to reinvest and how much gain made from an existing enterprise. This is why many small scale businesses do not survive. The curriculum planners and the school administrators should adjust technical and vocational education training programme to accommodate administrative training such that students or graduates will be able to acquire such skill to be self-reliant.
- **Professional Skill**: Fasehun (2013) asserts that this sort of skill is very necessary for success in an enterprise. It is obtained in a cooperate arrangement between the school and the industries. It also involves the code of conduct, customer care technique and opportunity recognition. Ihekwoaba (2007) listed some skills that the TVET graduates must acquire to be self-reliant, enter the production business world to establish successful and thriving small scale enterprises in a developing economy.

Contributions of entrepreneurship in TVET to national growth:

- **Development of New Products and Services:** TVET entrepreneurs are the backbone of the economy in the sense that they have the enthusiasm, the vision and the driving force to set up enterprises. Through these new ventures, various new products and services needed in the society are produced.
- **Introduction of New Technologies:** As innovators and risk-takers, TVET entrepreneurs take advantage of business opportunities, social problems and difficulties to create something of value. In their bid to respond to the challenges of society, they creatively encounter and invent new ways of doing things that transform into unimaginable profits. Eg, Bill Gates has transformed the world of industrial enterprise with new (computer) technologies.
- **Mobilization of Capital Resources for the Society:** All the major factors of production such as Innovation, land, labour, and capital are mobilized and coordinated by entrepreneurs in that particular society. They use creativity to combine these resources in a mix that build up the wealth of the nations.
- **Introduction of New Infrastructural Facilities and Building of New Industries:** Every year, through the untiring effort of TVET entrepreneurs, new infrastructural facilities in the form of buildings and building materials of various sizes and makes, vehicles, etc, etc, flood the markets through the efforts of entrepreneurs. Chinese entrepreneurs and their innovations are almost ruling the world today.
- **Job Creation and Employment Generation:** As a result of the undertakings of TVET entrepreneurs in establishing factories and other service ventures, millions of jobs are provided in factories, many service industries, agricultural and allied services etc, etc.

The list of the contributions of entrepreneurship to national or even international development is inexhaustible. It is very heart-warming to note that the National University Commission of Nigeria has made the study of entrepreneurship compulsory in our tertiary institutions, irrespective of the course being offered by our students. According to Ikeme (2012: x), entrepreneurship education is critical to

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

successful enterprise setting due primarily to the fact that enterprise setting devoid of entrepreneurship education has greater chances of failure due to poor preparation for challenges associated with start-ups. Among other benefits of entrepreneurship education are listed as follows:

- Understand steps essential in business start-up.
- Enhance awareness of career and entrepreneurial option.
- Use strategies for idea generation and assessment of feasibility of ideas.
- Understanding basic financial concepts.
- Increased awareness of social responsibility and entrepreneurs' contributions to society.
- Enhanced personal and career goals and attitudes.
- Improved self – management skills because of focus on personal responsibility.
- Enhanced ability to pursue additional training or access to other resources and services.
- Improved problem- identification and solving skills for business operation issues.
- Enhanced self-worth through understanding of personal capabilities.
- Enhanced reliance on team work as focus to solve realistic and complicated problems.

Also listed as possible positive outcomes of entrepreneurial education to TVET students at all levels of academic endeavour are:

- Increased sense of "locus of control".
- Greater awareness of personal talents and skills.
- Improved school attendance.
- Higher academic achievements.
- Application of enhanced creativity skills in business situations.
- Enhanced business opportunity recognition skills.
- Ability to handle business situations ethically.
- Use problem – solving skills effectively.

Possible and specific positive outcomes of entrepreneurship education for graduates of the University or higher education who has undergone entrepreneurship education are equally listed as:

- Ability to pursue entrepreneurship as a means of earning a living.
- Improved business start-up planning and management.
- Ability to follow a business plan to achieve business goals.
- Demonstrate effective financial management and application of basic accounting principles
- Rethinking of business closings as an exit strategy versus failure.

CONCLUSION

By way of drawing a conclusion to this discuss, we repeat here that in the course of the theoretical evolution of entrepreneurship, especially both as a process and a discipline, various scholars and researchers from different disciplines such as Management, Economics, Sociology, Psychology etc, etc, grappled with diverse sets of interpretations, diverse perspectives and dimensions and different definitions to

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

conceptualize this abstract idea. The words "Entrepreneurship" and "Entrepreneur" are often used interchangeably and are equally mutual concepts. However, they are conceived with fundamentally different aspects of phenomenon. As stated in the main body of this chapter, Yes!, entrepreneurship in TVET involves individuals, groups of individuals, organizations, industries and even societies as a whole, but as a social process, it cannot be reduced to human behaviour, cognitive process or decision making alone. Given the spiraling nature of youth unemployment, developing nations should adequately address the problem with the aim of putting in place the requisite policy measures. There is no doubt that piece meal programmes will not do the job. The TVET Sectors in developing nations generally will only survive and grow if Industry and commerce are strong enough to attract graduates from the TVET system. A vibrant, industrial and commercial environment will promote the opportunities, avenues and resources to facilitate the provision of a well trained, competent and productive workforce which in turn will strengthen industry and commerce for increased productivity. In this regard, it is very important that every effort must be made by Governments to encourage the expansion and strengthening of industry at all levels (including small scale industries) in order to improve their TVET systems for socio-economic and technological development. To reduce the burden of unemployment and poverty on the youths the government should improve funding in this critical sector and increase access to technical and vocational education for the ever-growing Youths. It is my humble believe that when these recommendations are put in place the much desire technological development of developing nations will be achieved.

Chapter 42
Crowdfunding, Entrepreneurship, and Design Education:
Case Study of a Campaign by Design Students from China

Zhou Ding
Nanjing University of the Arts, China

Jiang Jiabei
Nanjing University of the Arts, China

ABSTRACT

The purpose of this paper is to develop further insights into micro-entrepreneurship programs participated in by Chinese industrial designers. A model of creative thinking is employed to explain the campaign creation process. A case study research in sample design entrepreneurs was designed and conducted, and it was composed of three steps: preparing for data collection, collecting the evidences, and analyzing the evidences. It was found that five main defects in creative thinking work as obstacles to crowdfunding success. In order to overcome these drawbacks, it is suggested that designers involved in micro-entrepreneurship programs should acquire the abilities of building prototypes, following the design procedure, finding and solving problems, defining ideation and applying the evaluation methods. Current findings and future study can contribute to the curriculum development for China's industrial design education.

INTRODUCTION

The Chinese government is making heavy investments to convert grass-roots innovation into business. In Shanghai, Communist Youth League supported the 2012 Shanghai Maker Carnival. The construction of more than 100 government-supported innovation houses is proposed by local officials. Some hackers' fabrication laboratories in China earn official supports which take the form of latest facilities or considerable allowances usually used as the rents (Parker, 2014). Around the globe, online crowdfunding currently becomes a significantly effective approach to realize a wide range of designers' micro-entrepreneurship dreams. A number of campaigns have been successfully launched on Kickstarter that one of the most popular international crowdfunding platforms. On the community of Kickstarter, a product design campaign for a smart watch named Pebble attracted more than $10.3 million from 68,928 backers as of May 2012 (Newman, 2012).

In the field of design education, what can domestic educators in China learn from these changing external conditions? Few researchers in China have so far studied this emerging question. Focusing on university-level design education and industrial business, two scholars Rodber and Wormald (2007) in the UK pointed out that the process of creating wealth through new-product development has changed since the early 21st century. Similar to Chinese government, British government strongly supports science and innovation to create innovative goods and services for economic success. Design thinking, marketing-oriented new product development as well as the integration of design system and service are highlighted as the important drivers. Thus two researchers suggested orienting industrial design education (IDE) to the latest trends so as to alleviate the mismatch between IDE curricula and newly required skills and knowledge in industries. While this suggestion can serve as a reference for this paper, it is of limited helps for China's IDE and crowdfunding campaign creation.

Despite the rapid growth of online crowdfunding, there is comparatively little research on fund-raising campaigns. Focusing on the participants' psychology and behaviour, a study proposed enhancing the motivations of both the creators and the supporters via crowdfunding support tools (Hui, Greenberg & Gerber, 2013). Gerber and Hui (2013) suggested applying the principles of connecting participants by, for example, creating a reward system and inspiring social feedbacks (Sakamoto et al., 2013). Kuppuswamy and Bayus (2014) indicated that project creators should pay more attention to the first and last periods of fundraising campaigns, in which platform backers tend to contribute more than in middle weeks. However, these prior researches regarding campaign management may rarely benefit entrepreneurs in their campaign creation.

In order to research online crowdfunding, a case study was conducted here targeting a group of industrial design students (hereafter referred to as the Students) at Nanjing University of the Arts, China. The Students created a smart ring for which the fundraising campaign was unsuccessful on Indiegogo, a large global crowdfunding and fundraising online site. Through figuring out how the Students carried out product design campaigns and why their creative thinking-based campaign creation failed to reach the funding goal, this research aims to develop further insights into the design micro-entrepreneurship based on China's IDE.

After presenting the key concepts and theoretical basis, this paper gives a systematic description of the research process, which is divided into three main sections. The first section details the process of preparing for data collection, including case selection and the formulation of the evidence-collecting procedure. The second section describes the collected evidences. Through analyzing the evidences, Section three concludes that the Students' crowdfunding failure was the result of their creative thinking

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

shortcomings, including deficient knowledge about prototype construction, poorly designed procedure, poorly defined target problem and solution, ambiguous function definition, and disorderly evaluation process. The research findings herein can potentially benefit not only micro-entrepreneurs engaged in crowdfunding design but also local design educators in China, who significantly need to rethink about IDE and develop related curricula to satisfy the changing industry's needs.

KEY CONCEPTS AND THEORETICAL BASIS

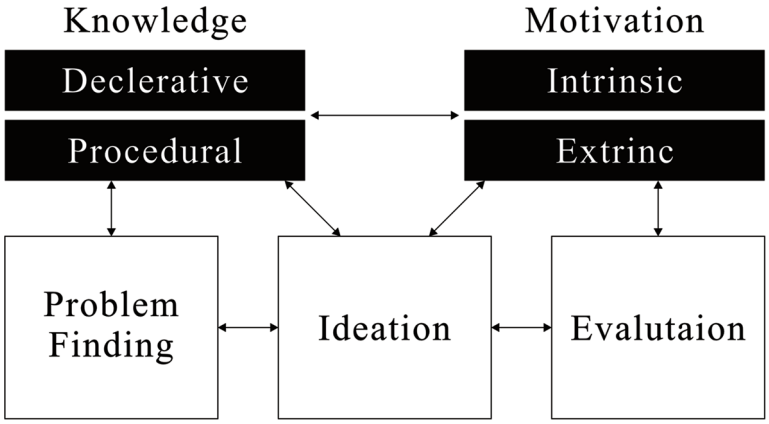
Crowdfunding and AON Model

Crowdfunding, defined as the integrated practice of raising funds from a large number of people particularly over the Internet (Drake, 2014), has gained rapid development since the beginning of this century. Following ArtistShare, the first online crowdfunding platform set up in 2003, related sites have mushroomed around the globe since 2005. More than one million individual campaigns were carried out globally in 2012, and the industry size would expectedly grow to US$5.1 billion in 2013 (Barnett, 2013).

Indiegogo, the research setting of this study, is one of the largest crowdfunding platforms worldwide. Its funding model is referred to as All-or-Nothing (AON), the most widespread and effective crowdfunding type (Weisul 2014). Based on it, project founders follow three main steps to realize their entrepreneurship projects. The initial stage is to start a complete campaign for a designed product. Then the product is released on Indiegogo platform. Meanwhile, crowdfunding work, including campaign material preparation, project marketing and project goal following (Hui et al., 2013), is implemented to raise funds. Following the above two steps, if the total funds meet the expected minimum before the expiration date, the project founders will definitely gain all the funds and rewards for future project implementation; otherwise, the project has to be sadly terminated by Indiegogo, and all the invested capital will be directly returned to investors. This AON model is typical and even imitated by numbers of crowdfunding platforms in China, like Demohour and Zhongchou. Therefore, case of the Students on Indiegogo has general significance in Chinese micro-entrepreneurship and industrial design context.

Creative Thinking

This research was carried out in the context of new product development, a complete process of bringing a new product to market. Authors tended to evaluate the effective transformation of market opportunities into products available (Krishnan & Ulrich, 2001) for sale as 'creative'. And the science behind the phenomenon is the designed products satisfy customer needs and wants. Runco and Chand (1995) defined creative thinking as a mental process of activity leading to original and adaptive ideas, solutions, or insights. Product design, as a kind of creative behaviour, is typically defined in terms of originality and adaptiveness that together follow the integrated processes generating the above results. In addition, two scholars presented a two-tier model of creative thinking in detail.



As shown in Figure 1, knowledge and motivation are two basic elements of the first tier. In general, knowledge is declarative or procedural. Declarative knowledge represents fact-based information, while procedural knowledge indicates specialized knowledge which usually requires explicit instructions and strategies. Motivations are classified into two types including intrinsic motivation and extrinsic motivation. Furthermore, the second tier of creative thinking consists of problem discovery, ideation and evalu-

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

ation, wherein problem discovery implies identification and definition of problems; ideation refers to the ideational process which is described as divergent thinking or associative thinking, while ideational flexibility, namely the variety of ideas, is one of the most important factors for divergent thinking; evaluation indicates various evaluative processes which could influence creative thinking. The model below was employed as a theoretical basis in this paper because it could bring a systematic framework for the following evidence collection. This framework demonstrates an understanding of creativity theories and concepts related to the topic of designers' micro-entrepreneurship and the broader areas of knowledge considered. Selection of the two-tier model of creative thinking depends on its appropriateness, explanatory power, and convenience in application.

In general, the theoretical basis of creative thinking strengthens current researches in four crucial ways (Anonymous, 2016). Firstly, an explicit statement of theoretical assumptions of creative thinking enables readers to critically evaluate the evidence collection of selected case. Secondly, this theoretical basis associates researchers of this study with existing knowledge, especially with regard to practical creation. Guided by the two-tier model of creative thinking, authors are provided with basic selection of research methods. Thirdly, articulation of the theoretical assumptions of current researches requires researchers to solve the problems about how product design campaigns are carried out by designers and why their crowd funding campaigns end up with success or failure. It enables researchers to complete intellectual transition from general description of an observed phenomenon to generalization of various aspects of the phenomenon. Last but not least, application of theories helps authors of this study identify the limitation to the generalization. A theoretical framework specifies essential reasons which influence a phenomenon and highlights demand for examining diversification of those reasons and conditions for the diversification. Therefore, by its application, the two-tier model of creative thinking is valuable because it fulfills the primary purpose of current researches, so that authors of this research may apply that knowledge and understanding to perform more effectively.

Figure 1. The model of creative thinking includes two components on the first tier while three ones on the second

RESEARCH DESIGN

A research design is the document of the study, which is created to seek answers for the researched questions. The design of this study effectively defined the aim, objective, scope, method, and data collection approach of the research. Based on critical evaluation of China's IDE in the current context of micro-entrepreneurship, the research aims to develop further insights into the design micro-entrepreneurship based on China's IDE. The research aims to work out two questions, namely, how the product design campaigns are carried out by designers and why their crowd funding campaigns end up with success or failure. Scope of the research is narrowed to designers' campaign creation on a crowd funding platform in view that crowd funding has become a new opportunity for designers' entrepreneurships in China and even the whole world.

As a type of micro-entrepreneurships of emerging designers, the number of crowd funding campaigns launched by Chinese designers is still highly insufficient. Therefore, an inductive approach based on qualitative case research was adopted (Eisenhardt, 1989; Yin, 2013). Bell (1999) also pointed out that "a case study approach is particularly applicable to individual researchers because it realizes certain research of one aspect of a problem within a limited time scale". In order to explore the solutions for research questions which possibly benefit design entrepreneurs and educators in China, the evidences shall be collected through interviews and observations, rather than experiments. As a result, case study became the most suitable method for this kind of researches (Yin, 2013).

Furthermore, the single-case holistic design is deemed as one of the most effective types of case study design, as this research aims to realize objective understanding of the environments and conditions, wherein crowd funding campaigns are created. The conclusion of current researches towards a typical object should be helpful for deepening the comprehension of similar cases. The technological issues of the holistic single-case study mainly focus on design of an effective investigation and interview for data collection, so it is divided into three parts: preparation for data collection, evidence collection, and evidence analysis. The first part consists of case selection and formulation of the evidence collection procedure; based on the model of creative thinking, an investigation framework is formulated and applied in this part. In the second part, the collected evidences are presented systematically. In the third part, the answers to the research questions will be proposed based on the evidence analysis.

PREPARING FOR DATA COLLECTION

Case Selection

When selecting a subject for a case study, researchers used information-oriented sampling here, which is opposed to random sampling. A representative and typical sample meets selection standards of a holistic single-case study, wherein qualitative evidence indicates the knowledge of a current research question. Therefore, a case of Chinese designers' micro-entrepreneurship became an ideal research object.

Authors of this research selected a product campaign on Indiegogo crowdfunding platform, which was launched by Chinese designers from domestic IDE system. The story of an entrepreneurial team, which was a group of industrial design students in China led by Youlin Chen, Zhengpeng Wu and Shuwen Xiao, was selected as the study case. This selection was made based on the following facts. First and foremost, the three group-mates were senior students at the School of Industrial Design, Nanjing

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

University of the Arts (NUA) in China. NUA also is known as the Nanjing Arts Institute, is a university offering undergraduate and graduate degrees in fine arts, design, and related subjects. The institutional history begins in 1912, with the foundation of the Shanghai Chinese Art College. The name was changed to the Shanghai Academy of Fine Arts of in 1930. The amalgamation of several universities in 1952 produced East China Arts College, situated in Wuxi. In 1958, the East China Arts College relocated to Nanjing, and in 1959 it acquired its present name (Anonymous, 2014). So far, the Ministry of Education and China Industrial Design Association still have a crucial influence on whole China's IDE system, in which most schools share the similar curricula and standards in design education. Therefore, the Students at NUA were rather typical representatives. Second, the entrepreneurial team had converted creative thinking into entrepreneurial practice by launching a crowdfunding campaign on Indiegogo, thus it was positively feasible to closely observe their campaign creation for collecting targeted evidences. Their campaign project, Rilove Smart Ring, is a gesture-based wearable device being able to control music, camera, phone calls and even home appliances. Supported by 68 investors investing a total of US$1,935 as of the expiration date, this campaign finally failed to reach its US$20,000 goal and was therefore terminated. Last but not least, the authors of this research taught at NUA, the Students' university, and had obtained the Students' consents to the investigation and interview.

Formulation of the Evidence-Collecting Procedure

In order to collect systematic evidences, this task was performed in six steps based on the model of creative thinking: declarative knowledge, procedural knowledge, motivation, problem finding, ideation and evaluation. As shown in Table 1, a framework, in which the aim of investigation and the interview questions for each step are defined, is developed:

- **Step for Declarative Knowledge:** At the first step, declarative knowledge including valued and neglected knowledge gained or missed by Students in current China's IDE system was surveyed. The valued knowledge stands for elements of fact-based information such as 3D modelling software, product engineering, and material applications, which could effectively promote the campaign creation. The neglected knowledge presents a series of elements in design process, wherein the Students intended to apply them but failed; or they had to consult others for these elements.
- **Step for Procedural Knowledge:** At the second step, procedural knowledge of the Students was investigated mainly based on their specialized experience. Procedural knowledge instructs them to organize campaign creation and apply creativity strategies during design.
- **Step for Motivation:** In order to interview the Students' possible intrinsic motivation and extrinsic motivation, the third step was organized in this framework.
- **Step for Problem Finding:** At the fourth step, the possible problem-finding process of the Students was surveyed. Does problem discovery only exist when a problem works as a starting point of campaign creation? To some extent, the quality of problem discovery depends on how a creator identifies and defines a problem.
- **Step for Ideation:** The fifth step aims to describe the Students' ideational process of campaign creation, which may be divergent or associative. In a possible divergent ideational process, the quantity of generated ideas is taken as one of the most important influential factors.
- **Step for Evaluation:** Step six aims to investigate a possible evaluation process of the Students, wherein the modification might be set up to improve the campaign creation.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Table 1. The case interview framework

	Aim of Investigation	Interview Questions
Declarative Knowledge	Describe valued and neglected knowledge in China's IDE system.	• Did you learn any kind of design knowledge at the university which contributed to the campaign creation? If yes, please describe it/them. •Did you learn any kind of design knowledge outside the university which contributed to the campaign creation? If yes, please describe it/them. • Was there any kind of design knowledge which you intended to apply but failed to, or about which you had to consult others? If yes, please describe it/them.
Procedural Knowledge	Describe the Students' procedural knowledge.	• Was there an explicit instruction that guided your campaign creation process? If yes, please describe it/them. • Please describe your campaign creation process. In other words, how did you create your campaign? • Was there any strategy applied in your campaign creation process? If yes, please describe it/them.
Motivation	Describe the intrinsic motivation and/or extrinsic motivation of the Students.	Please describe your motivation for the campaign creation.
Problem Finding	Describe the Students' problem-finding process.	• What was the starting point of your campaign creation? • How did you identify and define a problem?
Ideation	Describe the Students' divergent ideational process and/or associative ideation process.	• Please describe the ideational process of your campaign creation. • How many ideas were generated in your divergent ideation process—if you experienced such a process?
Evaluation	Describe the Students' evaluation process.	• Was there any evaluation process for your campaign creation? If yes, please describe it/them and answer the following question. • Was there any modification after the evaluation? If yes, please describe it/them.

COLLECTING THE EVIDENCES

Through summarizing the results of the interview with the Students, the detailed case evidences are listed in Table 2:

- **Evidences of Declarative Knowledge:** In terms of declarative knowledge supporting campaign creation, the Students declared that they learned digital modelling skill, products styles definitions, and ergonomics principle at school, and referring to online examples for product style and building visual communication outside school. However, current China's IDE provides deficient information with regard to engineering structures, prototypes building, interactive hardware or software.
- **Evidences of Procedural Knowledge:** According to the Students' description, explicit instruction was not included in their procedural knowledge. In order to create a product campaign, the Students scheduled and practised a flexible creation process: designing multiple elements of product, evaluating product design according to investigation, modifying final outcome, building full function prototype. Also, the Students applied strategy in the process, including brain storming and template-based online investigation.
- **Evidences of Motivation:** Basically, interview information showed that the Students worked with clear intrinsic motivation, such as satisfying personal interests, pursuing a sense of accomplishment, and exploring future career opportunity. Because of investment from partner and possible economic benefits, the Students' campaign creation also was driven by extrinsic motivation.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

- **Evidences of Problem Finding:** The Students started the campaign creation from defining a ring combining technology and fashion, but not a problem that needs to be solved. Namely, in the process of creativity, the Students ignored problem finding that an essential component of creative thinking system.
- **Evidences of Ideation:** In order to create a high quality campaign, the Students carried out an ideational process in which product form was generated and its function was altered until confirmation. This ideational process producing eight diverse ideas for product style is typically divergent.
- **Evidences of Evaluation:** The Students applied a series of evaluation process, first of all, self-evaluation. In addition, conducting tests on a small number of users, the Students evaluated product form and function. According to self-evaluation and testing, the Students furthermore modified product form and function.

Table 2. Case interview evidences

	Detailed Items	Evidences
Declarative Knowledge	Design knowledge learned at school	• CAD skills, especially in digital modelling. • Definitions of product styles. • Ergonomics.
	Design knowledge learned outside school	• Designing a stylish product through referring to online examples. • Visualizing a campaign for communication through referring to online examples.
	Design knowledge that is deficient	• Designing product engineering structures. • Building product models or prototypes. • Developing hardware or software related to interactive design.
Procedural Knowledge	Explicit instruction	N/A
	Campaign creation process	• Designing product function, form and business model. • Evaluating design through investigation. • Modifying design. • Building prototype.
	Applied strategy in the process	• Brain storming. • Online investigation template.
Motivation	Intrinsic motivation	• Satisfying personal interests. • Pursuing a sense of accomplishment. • Exploring future career opportunity.
	Extrinsic motivation	• Investment from partner. • Possible economic benefits.
Problem Finding	Starting point of campaign creation	• Defining a ring combining technology and fashion.
	Definition of problems	N/A.
Ideation	Ideational process	• Generating product form. • Altering product function until confirmation.
	Divergent ideation process	Generating eight divergent ideations for product style.
Evaluation	Evaluation process	• Self-evaluation. • evaluating product form and function by conducting tests on a small number of users.
	Modification process	Modifying product form and function through self-evaluation and testing.

ANALYZING THE EVIDENCES

In order to evaluate the Students' creative thinking, the above evidences were analyzed in the following six sections:

1. **Declarative Knowledge Analysis:** The Students' declarative knowledge was concentrated in the field of design aesthetics. And online resources also provided access to its development. However, a lack of practical knowledge resulted in the Students' failure to build a truly applicable prototype.
2. **Procedural Knowledge Analysis:** Basically, the Students received no explicit instructions. Despite the application of some strategies, a poorly designed procedure still complicated their campaign creation.
3. **Motivation Analysis:** The Students owned clear intrinsic and extrinsic motivations.
4. **Problem Finding Analysis:** The Students didn't build the campaign based on problem finding. Consequently, this campaign lacked adequate attraction to the target participants, because specific problems were not solved.
5. **Ideation Analysis:** The Students struggled to generate a complete ideation because of ambiguous function definition. Divergent thinking rather than associative thinking was applied in their ideational process.
6. **Evaluation Analysis:** The Students consciously evaluated the campaign, but disorderly evaluation process might obscure the guideline for modification.

In summary, the above analysis illustrates how the Students carried out product design campaigns. Another research question, why the Students failed to carry out a successful campaign, also is effectively explained. There are five main defects in the Students' current creative thinking: deficient knowledge about prototype construction, poorly designed procedure, poorly defined target problem and solution, ambiguous ideational definition and disorderly evaluation process, all of which acted as the obstacles to their crowdfunding success. Associative thinking was additionally evaluated to assist with the ideational process. Overcoming these drawbacks requires reasonably developing creative thinking.

LIMITATIONS AND FUTURE RESEARCH DIRECTIONS

The first limitation lies in the research scope: this research only targets crowdfunding, and other types of designers' micro-entrepreneurships in China are not involved. The second limitation is that the research design in this paper is made for single sample. Yin (2013) defined this type of design as single-case holistic design and also presented the other three more complex types of case study design: single-case embedded design, multi-case holistic design and multi-case embedded design.

In terms of future research, crowdfunding will still be the focus of our research, considering that this type of micro-entrepreneurship is highly accessible to Chinese designers. In addition, an integrated research will be designed to gain a deeper comprehension of the relationship between crowdfunding success and creative thinking elements. Multiple cases, particularly successful product-design campaigns, will be included in future research. Last but not least, both current and future findings will be employed to develop university-level curricula for China's IDE. Experimental courses, which aim to enhance the creative thinking of designers, will expectedly be carried out and evaluated at NUA.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

CONCLUSION

In the context of China's advocate of designers' micro-entrepreneurship, especially AON crowdfunding, domestic IDE and prior research can hardly produce ideal solutions to the emerging problems. How to effectively carry out a product design campaign? Which factors determine the success or failure of a fund-raising campaign? In order to answer these questions, a case study on a Chinese students' design team, which launched a crowdfunding campaign, was designed and conducted herein. In this study, evidences of the campaign creation process were collected based on the model of creative thinking. Analysis of the evidences revealed that the failure in the Students' fund-raising campaign could be attributed to creative thinking obstacles: deficient knowledge about prototype construction, poorly designed procedure, poorly defined target problem and solution, ambiguous ideational definition and disorderly evaluation process. This result objectively reflects the main defects of current China's IDE. Therefore it is required that related curricula and courses, which aim at improving the design entrepreneurs' creative thinking, should be positively developed. To be more specific, designers involved in micro-entrepreneurship should possess the strong abilities of building prototypes, following the design procedure, finding and solving problems, defining ideation and applying the evaluation methods. In future research, further insights into the relationship between the crowdfunding result and the elements of creative thinking will be developed, and possible research findings might be transformed into university-level curricula for China's IDE.

ACKNOWLEDGMENT

This article is one result of the research project XJ2014019 at Nanjing University of the Arts, China. During the period that the lead author worked as a visiting scholar in New Zealand, China Scholarship Council and Victoria University of Wellington's School of Design importantly supported his research work. He particularly thanks Dr. Anne Galloway, a senior lecturer in design culture and context at Victoria University of Wellington, for her tutorial of design research method.

KEY TERMS AND DEFINITIONS

AON Crowdfunding Model: A type of crowdfunding model in which project founders can gain all money if total funds meet expected minimum on expiration date, otherwise their campaigns must be terminated and all invested capital will be returned to investors. It is believed that AON fundraising campaigns involve substantially larger capital goals, and are much more likely to be successful at achieving their goals, because AON projects typically provide more detailed information on the campaign.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Campaign Creation: A process of creating a project for raising funds. A campaign is any series of actions or events that are meant to achieve a particular result, like an advertising campaign of television commercials and Internet ads that tries to convince kids to buy bubble gum-flavored toothpaste.

Commercial Wealth: Abundance of valuable resources or valuable material possessions in commerce.

Creative Thinking: A mental process of activity leading to original and adaptive ideas, solutions, or insights. Creativity is a phenomenon whereby something new and somehow valuable is formed. The created item may be intangible or a physical object. Creative thinking is a way of looking at problems or situations from a fresh perspective that suggests unorthodox solutions. Creative thinking can be stimulated both by an unstructured process such as brainstorming, and by a structured process such as lateral thinking.

Crowdfunding: A form of alternative finance, which has emerged outside of the traditional financial system. The practice of funding a project or venture by raising monetary contributions from a large number of people, today often performed via internet-mediated registries, but the concept can also be executed through mail-order subscriptions, benefit events, and other methods.

Industrial Design Education: A process of design applied to products being manufactured through multiple techniques. Industrial design is a process of design applied to products that are to be manufactured through techniques of mass production.

Micro-Enterprise: A small business generally employing 10 people or less, and have a capital asset of less than PhP 3,000,000. Internationally, most microenterprises are family businesses employing one or two persons.

Micro-Entrepreneurship: A process of starting a small scale business or other organization. The basis of micro-enterprise in the U.S. is micro-entrepreneurship, recognizing a fundamental right of people to apply their individual talents, creativity and hard work to better their lives.

Chapter 43
Factors Comprising Effective Risk Communication, Decision-Making, and Measurement of IT and IA Risk

Ricardo Daza
University of Fairfax, USA

Kathleen M Hargiss
University of Fairfax, USA

ABSTRACT

This article focuses on factors that comprise effective risk communication, decision-making, and measurement of information technology (IT)/ information assurance (IA) risk. A review of the extant literature provided the basis for the formulation of research questions. The sample population consisted of senior IT/IA practitioners from Florida chapters of information security professional organizations. Results of this study found that decision making, and measurement are all factors in effective risk communication of IT/IA risk to non-IT personnel. This research has implications for both IT/IA practitioners and recipients of risk communication through the identification of factors which influence IT/IA professionals in how and why IT/IA risk communication take place, and consequently, how to simplify and improve its effectiveness.

INTRODUCTION

For years the information technology (IT) department, and by extension, the information assurance (IA) department, has been perceived by board members and senior management as "someone who is managing back-office technology" (Wysopal, 2015). This is in part due to the inability of the departments to communicate using a common language. The IT/IA department speaks geek and managers speak business. According to Wysopal (2015), Chief Information Security Officers (CISOs) need to communicate the

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

level of risk in terms that board members can understand, namely using numbers not acronyms. This study examined the challenges of how to effectively communicate IT/IA risk information to an extra-departmental audience. The effectiveness of that communication is judged by both the quality of the information relayed in the message and the decisions they affect.

Background

Information Security can be thought of as an economics problem. According to Sowell (2014) economics is the study of the allocation of scarce resources to satisfy an infinite demand. Organizational governance entails the allocation of resources (human resources, financial capital), across the organization's various departments. No organization has sufficient resources to satisfy every request by every department. Therefore, those entrusted with organizational governance (typically senior management or a board of directors) must make difficult decisions on how best to allocate scarce resource to most effectively achieve organizational goals.

IT/IA departments are required to communicate to extra-departmental stakeholders about the risks to the organization from the use of information technology. According to Gigerenzer (2015), the best way to ensure risk-savvy decision-making, is through the introduction of knowledge about risk. If the objective is to perform effective risk communication, then IT/IA practitioners or anyone interested in effective communication of risk information must consider what makes effective versus ineffective risk communication. The most obvious factor might be decision quality, but that assertion necessitates further exploration regarding what constitutes a good decision versus a bad one. It may be tempting to say the quality of the outcome, but we are talking about decisions regarding risk, and thus, necessarily have a component of uncertainty.

Much of the literature in the decision sciences relies on gambling decisions to illustrate concepts and one is leveraged here. When a decision-maker bets with lower odds of success, and thus a higher payoff, regardless of the outcome of the wager, poor decision-making is likely because the statistical probability of winning is so low. The measure of a good decision regarding risk then is not solely about the outcome, but also the thought processes and logic used by the decision-maker, which brings us back to the information that was communicated, in what format was it presented, and how it was collected. The quality of those aspects should also be considered, such as the risk message content, its accuracy, complexity, clarity, and ability to overcome counterproductive natural human tendencies to make poor risk judgment (Cho, Torsten, & McComas, 2015). Evaluating the risk message in this last aspect is particularly challenging as no two people react the same way to identical risk information. Factors such as cultural background, education, professional training, age, gender, and racial identity can influence how risk is judged and highlights the importance of knowing one's audience (Cho et al., 2015).

The recipient of a given risk message can present an unknown quantity in most situations; unless the message is intended for only one recipient and that individual's identity and message profile is known in advance of message construction. If the intended audience is a heterogeneous group, the challenges are not only the influences of individuals making up the group such as gender, racial identity, age, et cetera, but also each individual's preconceived notions. Research demonstrates that media exposure informs many of our perceptions about risk and thus can influence decision-making (Bodemer, Müller, Okan, Garcia-Retamero & Neumeyer-Gromen, 2012). Information about risk from the media can distort risk beliefs as media outlets have different goals from the IT/IA practitioner and their stakeholders. Media has the objective of selling something, and sensationalism is the tool of choice, statistical accuracy is a decidedly low priority.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Risk messages can contain elements that invoke bias in the recipient; there are also unseen factors that can influence decisions—factors that even the decision-makers themselves are not aware of consciously. These influences can be difficult to detect, let alone invoke intentionally, but knowledge of their existence is critical to understanding the formation of a judgment. An extension of judgment formation is recognition of an individual's propensity to use heuristics to aid in decision-making, particularly in the realm of risk and uncertainty.

Risk message content quality is indicative, not as a factor of the action or judgment that it may invoke, but of the information's source and the methodology used to gather it. According to Hubbard and Seirson (2016), cybersecurity risk information is frequently sourced from subjective expert opinion rather than more rigorous quantitative methods available. This is risk communication that straddles both risk message domain, as well as the rampant use of risk matrices, and the preferred risk visualization that research has demonstrated is problematic (MacKenzie, 2014).

Problem Statement

One of the challenges that has long existed in the IT/IA space is the communication of risk information from the IA practitioner to business leaders in a form that facilitates effective decision-making (Hubbard & Seiersen, 2016). To make well-informed decisions, management must properly understand the risks to the organization created by the use of Information Technology. Today, IT/IA risk communication is delivered in the form of a count of technical vulnerabilities, their impact, and magnitude; this form is a foreign language to extra-departmental stakeholders.

Enterprise risk management is about aligning risk with organizational goals to help management to identify weaknesses as well as opportunities for improvement (Bromiley, McShane, Nair, & Rustambekov, 2015). According to Palm and Ward (2015) when communicating risk information, the target audience is an important consideration, particularly when communicating with management and the board of directors. Management uses specialized measures and metrics such as return on investment (ROI), total cost of ownership (TCO), and value at risk (VaR) to make decisions about every other aspect of the business. Therefore, it makes sense to understand the key factors that lead to effective risk communication, decision-making, and measurement of IT/IA risk.

The problem this study sought to investigate was the identification of the factors that comprise effective risk communication, decision-making, and measurement of IT/IA risk. The literature indicated a business trend toward holistic risk management decisions brought about through enterprise risk management (ERM), which highlights the importance of selection of good metrics to describe risk. As Gigerenzer (2015) points out, people are over-optimistic about risk, as the use of effective risk communication can combat our risk-illiterate society. So, IT/IA can no longer afford to consider the aspects of the organizational risk apart from the larger whole. If many different aspects of the business under an ERM describe their business risk and subsequently report that risk to a central decision-making authority, then it may be beneficial to select a metric that all aspects of the business can leverage in order to facilitate an 'apples-to- apples' comparison of risk for decision makers. According to Hayden (2010), the measure of a good metric should be judged by its ability to tell the audience what it needs to know about risk.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Study Rationale

As Hopkin (2010) succinctly stated, a successful risk management initiative should contain several elements, among them "alignment with other business activities" (p. 46). Communication is fundamental to alignment among groups; this study focused on the effective communication of IT/IA risk to an extra-departmental stakeholder audience. This study's findings were significant to IA leadership in that an improved facility and success communicating of IT/IA risk enhances the professionalism for all IA practitioners among peers and colleagues. The results of this research could aid IA practitioners in making a case for careful consideration of the target audience of, content contained in, and the desired outcome of risk messages. All these factors properly considered and managed have the potential to provide an exponential increase in the IA fields' ability to carry out the primary objective of safeguarding information, which cannot be done without the well-informed cooperation of stakeholders.

ENTERPRISE RISK MANAGEMENT

Jaquith's (2007) seminal book on security metrics (the first book of its kind in IT/IA at the time) provided excellent insight on the industry deficiencies in regard to risk management. Jaquith attributed the misdirection of the IT/IA field to the dominant force applied through security vendors both hardware and software, in prioritizing the industry. The objective of these vendors is to instill fear to create and increase demand for their products. This perspective prompted the question: How can IT/IA contribute to an organization's value proposition instead of just consuming overhead? Jaquith's assertion that "risk management has outlived its usefulness" led to the question: Why is risk management and enterprise risk management so important?

Also known as total risk management, enterprise-wide risk management, corporate risk management, and integrated risk management, ERM is used to describe methodologies that utilize organizational level measurement and aggregation techniques for the market, credit, and operational risks (Johri, 2013). Enterprise risk management represents a megatrend in the field of risk management toward a holistic picture of organization risk and has shown demonstrable; proven performance results from its implementation (Eckles, Hoyt, & Miller, 2014; Poorman, 2008). Enterprise risk management seeks to establish the organization's risk appetite to determine which risks should be accepted and which should be mitigated or avoided (Hoyt & Liebenberg, 2011). According to Rittenberg and Martens (2012), decision-makers need to know the organization's risk appetite and risk tolerance to best determine their organization, as whole and individual departments that can achieve the firm's objectives.

Enterprise risk management is a significant trend in risk management, and one of the reasons senior managers would need to ascertain the level of risk of IT to the organization. The literature revealed a lack of relevant information regarding the management of ERM, despite the existence of several robust ERM frameworks such as the committee of sponsoring organizations (COSO) and the ISO 31000 family of standards (Bromiley et al., 2015). These and other frameworks provide structure but do not prescribe specifics such as how to measure organizational risk, risk appetite, or risk tolerance.

When executed properly, ERM helps organizations create and protect value, better identify opportunities and threats, functions as an integral part of decision making, helps minimize losses, reduces uncertainty, and enhances trust and efficiently applies resources to risk treatments (ISO 31010:2009). The literature presented and often demonstrated a litany of benefits to the use of ERM such as increased profits and

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

shareholder value. However, this study was chiefly concerned with three benefits, which were improved decision making, optimal allocation of organization resources, and the frequent communication to both internal and external stakeholders (Bromiley et al., 2015).

Risk Communication

How risk information is conveyed is critical to its effective use by the recipients of the risk messaging, and according to Keller, Siegrist, and Gutscher (2006), the way that risk is perceived depends greatly on how it is presented. The objective of risk communication is of particular importance when communicating IT risk information to a non-IT/IA audience (such as extra-departmental stakeholders) and comes with several unique challenges. To understand the challenges to risk communication and thereby the appropriate resolution, the originator of the communication must first understand the motives and objectives of the communication. According to Wardman (2008), there are three distinct risk communication imperatives, which are normative, instrumental, and substantive.

The normative imperative aligns closely with the objectives of public service as its goals are to inform, provide transparency, inspire constituent trust, educate a non-expert audience, engage in meaningful debate, and reduce uncertainty (Fischhoff, 2005; Hood & Heald, 2006; Jaeger, Webler, Rosa, & Renn, 2013; Wardman, 2008). In this environment, risk messages are subjected to a market test whereby well-produced, accessible messages will find their market niche if the receiver can process them with little disruption or distraction, while poorly-produced risk messages will eventually fail (Jaeger et al., 2013). However, in so far as risk communication fulfills goals such as being transparent and informative the primary objective of transferring risk messages is the reduction of uncertainty. In this sense, mutual understanding is not something that is thought can be achieved purely through the exchange of knowledge about the world but is fashioned anew out of the divergent social realities which participants bring together (Jovchelovitch, 2007).

The instrumental imperative interprets risk communication as a resource or means that may be employed by an individual, group, or organization to further the achievement of a particular objective. The value of risk communication is judged according to how it supports the particular aims of an organization usually faced with an imminent public-relations crisis in which different aspects compete to achieve their interests and ambitions. A classic example of instrumental communication might be a commercial entity to public communication such as an oil company in the midst of an oil spill, where the communication objectives are therefore to win the hearts-and-minds of government entities, citizens, or employees (Gouldson, Lidskog, & Wester-Herber, 2007).

The substantive imperative promotes risk communication that is used to foster improvements in mutual understanding and the abundance of knowledge available to facilitate risk-related decisions. Advocates of this imperative purported that it may be possible to generate better decisions through information from various sources of diverse viewpoints that may not have normally been accounted for using an exclusively technocratic or individualistic approach. The substantive argument can at times align with the instrumental imperative, but in contrast to uniquely instrumental concerns, the substantive imperative for risk communication is conventionally portrayed as guided by the desire to achieve results that favor the general interest rather than self-serving ends (Stirling 2008).

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Risk Perception

Many different factors influence the communication of risk information, the goal is to create the intended perception in the audience, in order to achieve this, the author of the risk message must be familiar with the many aspects affecting risk perception. Risk is perceived differently by individuals as opposed to groups, and as we will see differences between laypeople and experts. The following section will review the various types of risk perceptions and challenges each adds to risk communication.

ROLE OF AFFECT

Emotions play a role in how individuals and laypeople perceive risk; in fact, it is the emotional response or reaction that is experienced first before cognitive forces can process the situation. An example of this is when a person is asked to compare two different risk scenarios, the one invoking the stronger emotional response is likely to be perceived as riskier. Risk influences emotions in two ways; first, those immediate feelings upon initial consumption of the risk information, and second, those emotions the risk is expected to create in the future. There are two schools of thought regarding the effect of feelings on risk perception, which are the risk-as-feelings hypothesis (Loewenstein, Weber, Hsee, & Welch, 2001) and affect heuristic (Finucane, Alhakami, Slovic, & Johnson, 2000; Pachur, Hertwig, & Steinmann, 2012).

Availability Heuristic

In their seminal paper, Tversky and Kahneman (1975) explored the heuristics of decision-making in situations of uncertainty. They pointed out that the frequency and ease of information relative to an event affect how a person perceives risk. The accuracy of a heuristic relative to how risk is perceived is dependent on the availability of information related to the case in question, and how much of that information is accessible to the individual. Given these concepts many aspects can bias risk perception such as media coverage, imagery, messaging. In another seminal piece of literature by Lichtenstein, Slovic, Fischhoff, Layman and Combs (1978), the authors tested the study participants' frequency of judgment using two different methods. In the first method, a participant was given two causes of death and asked to determine which caused more deaths. The other method, the participant was asked to rate the frequency of a cause of death, but before that, they were given either a high or low anchor such as an unrelated cause of death statistic like an annual death rate by drowning or poisoning. When the participant was given a large anchor before being asked to estimate a rate of a different cause of death their estimate was two to five times higher than situations where the participant was given a low anchor.

Their study revealed two biases, the first known as primary bias is the tendency to overestimate high occurrences and conversely underestimate low occurrences. The second form of bias known as secondary bias refers to the subjects' tendency to associate the wrong ratio to the occurrence of a risk. The availability heuristic was developed as a way to explain how laypeople gauge risk and ultimately perceive risk, which, to a great extent, is based on the

individual's recollection of incident information. If the information that the person recalls happens to correlate accurately with the actual rate of occurrence, then the layperson's risk estimate is accurate—if their recalled data is inaccurate, so too is their estimation.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Optimism Bias

To better understand how laypeople perceive risk early, researchers consistently discovered that one or more biases explain the reasons behind how and why non-experts interpret risk the way they do. Another common risk perception bias is known as optimism bias, where the individual tends to believe that a particular risk does not apply to them in an equal fashion as any other person. This optimism bias is experienced for both positive effects and adverse effects equally, hence it is often referred to as comparative optimism or the above average effect. In his study Weinstein (1987) presented participants with 32 life hazards, then asked what they believed their likelihood of manifesting the negative consequences of each of those life risks, they rated their chances lower on 25 out of the 32 life hazards.

Weinstein's work first brought optimism bias to light other studies have promulgated various explanations for this bias. Shepperd, Carroll, Grace, and Terry (2002) outlined four categories in their study as possible explanations for this bias. Other studies focused on whether or not this bias was, in fact, incorrect such as those studies that examined people's belief about how safely they drive versus the statistical average. Those studies show that the majority of individuals are not representative of the statistical average (Gigerenzer, Fielder, & Olsen, 2012; Johansson & Rumar, 1968; Svenson 1981). Meaning, most people believe themselves to be safe drivers and various studies demonstrated that bias to be true.

Media and Risk Perception

The literature demonstrated that media effects how risk is perceived through the frequency of and the bias in messaging. Media tends to provide a disproportionate volume of messaging about risk relative to its actual likelihood of occurrence, which can have the unintentional effect of misrepresenting risk in the minds of individuals. This media consequence was demonstrated in an early study by Slovic and Combs (1979) where the volume of newspaper reports about a particular risk scenario was compared against the layperson's perception of that risk, which tended to follow the amount of media on the subject rather than the actual level of risk. While media coverage affects risk perception, its effects have been demonstrated to be short-term (Sjöberg, Jansson, Brenot, Frewer, Prades, & Tönnesen, 2000). In addition to the effects caused by the volume of media on the layperson's risk perception, there is also the content of those media messages that contain bias. That bias takes the form of a lack of transparency and incomplete data. In a study by Bodemer et al. (2012), Internet and newspaper coverage of the human papillomavirus (HPV) vaccine was deficient in providing crucial information about the risks and benefits.

The Role of Numeracy in Risk Perception

This area of risk perception is of particular importance, as so much of how risk information is messaged and is encapsulated in numbers. Therefore, it is important to understand how numbers and statistics affect how risk is perceived. Persons differ in their ability to digest information in numerical form effectively, this is known as a person's numeracy, which can influence how they perceive risk information delivered in numerical or statistical format. Individuals low in numeracy tend to demonstrate a higher risk perception than those people with higher numeracy. Additionally, individuals low in numeracy are more sensitive to how numerical information is presented, frequency versus percentage, as a gain or loss. The exact cause of this behavior, whether it be difficulty interpreting the information or understanding scaling, remains unanswered (Reyna, Nelson, Han, & Dieckmann, 2009).

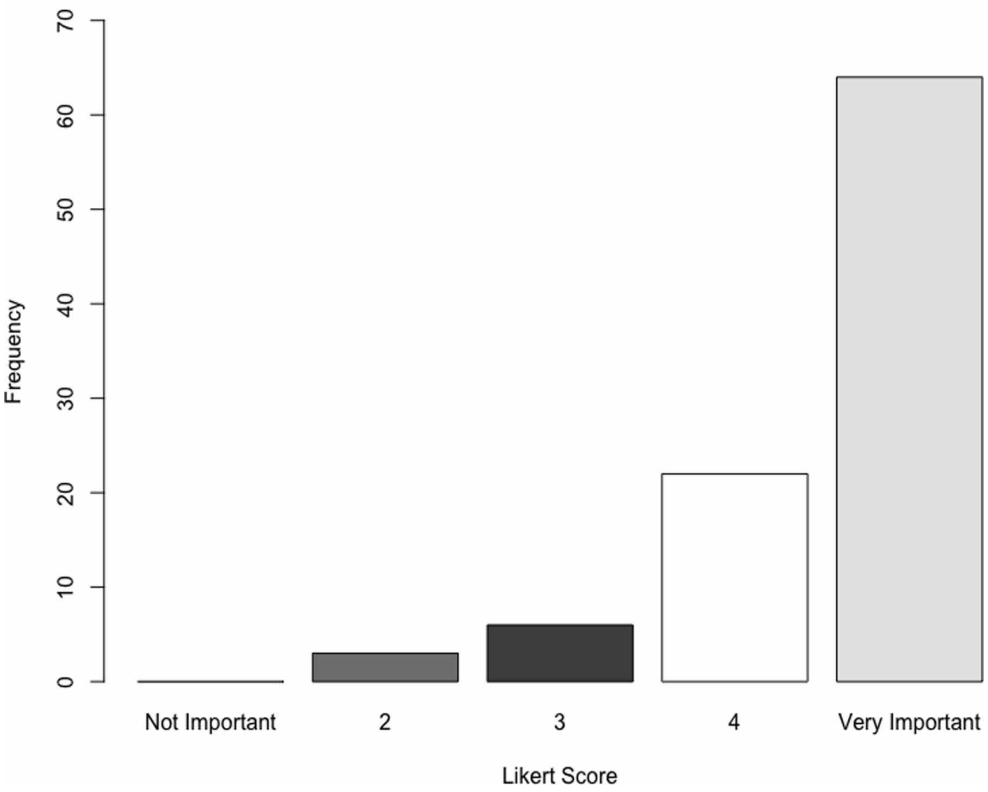
Risk Communication Findings

The goal or intention of a risk communication message should be considered, and its effectiveness assessed in that context. This study surveyed senior information assurance practitioners from the south-eastern region of the United States about their opinions and perceptions on the subjects of risk communication, decision-making and the measurement of IT risk. The findings in this study confirm several important ideas such as risk communication is a critical factor in how security effectiveness is perceived by organizational stakeholders (see Figure 1). The sample population also ranked the importance of the risk communication of IT risk information as 'very important' to effective decision-making by extra-departmental stakeholders (see Figure 2).

DECISION-MAKING



As Hubbard and Evans (2010) explained, when it comes to assessing risks, people display predictable bias, which leads to irrational decision-making. This is especially true in subjective assessments, particularly those made by experts. Research in the decision sciences showed that there are several weaknesses typically made assessing risk of any kind such as cognitive bias and the use of ordinal scales to describe

Figure 1. RC1: Importance of risk communication on security effectiveness

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 2. RC2: Importance of risk communication on decision making

risk. The two most relevant phenomenon affecting IT risk management, in particular, are overconfidence bias (Kahneman & Tversky, 1972) and inconsistency of judgment (Karelaia & Hogarth, 2008). Hubbard and Evans (2010) recommended the use of risk assessment methods that explicitly describe probabilities and magnitudes of loss quantitatively, rather than using some form of ordinal scale. Obstacles to good decision making are cognitive bias about risk, decisional familiarity and complexity, and the collection of evidence or data. Good decision-making requires a process to determine how decisions will be made, and that process must then be communicated to stakeholders (Roberto, 2013). The decision-making process requires examination and comparison of alternatives (Roberto, 2013).

Heuristics as Adaptive Decision Strategies

The prevalent position with respect to decision making is that a rational approach that makes extensive use of logic and gathers all available information for consideration is superior. In the world of IT/IA and risk management, decisions often have a component of uncertainty, particularly about the consequence or probability of a threat occurrence. According to Artinger, Petersen, Gigerenzer, and Weibler (2015), one of the defining aspects of managerial decision-making is uncertainty. The domains of the managerial sciences such as operations research and management economics typically define risk as a variable which represents the aspects of the decision where there is a component of uncertainty.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

The last decade has seen a surge in research about how best to bolster decision making in areas rife with uncertainty. This research showed an increase in the use of heuristics among managers (Bingham & Eisenhardt, 2011). Heuristics have colloquially been known as mental shortcuts and are generally described as inferior according to Kahneman (2014). Research in the managerial decision-making space is bifurcated into individual decision making and organizational decision making, while managerial heuristics is thought to bridge the divide between the individual and the organizational (Artinger, Petersen, Gigerenzer & Weibler, 2015).

According to Todd and Gigerenzer (2012), the concept of ecological rationality explains why managerial heuristics is able to bridge the gap between individual and organizational decision-making processes. Ecological rationality refers to the heuristic concept of how people are able to glean contextual information about a particular decision under conditions of uncertainty without complete data and still make an effective decision. Ecological rationality has been shown to foster more effective decisions as in the DeMiguel, Garlappi, Nogales, and Uppal (2009) investment study comparing the heuristic 1/N rule against the mean-variance asset allocation method. One of the key ingredients in the determination of the potential effectiveness of heuristics is the degree of uncertainty.

The point is not to say that heuristics always yield better decisions, rather it is heavily weighted by the environment of the decision. Heuristics can perform well, sometimes well enough to outperform more computationally intensive approaches to decision making. According to Gigerenzer and Brighton (2009), research has begun to show a relationship with respect to decision making an effort and accuracy. In short, insufficient effort to gather information relative to the decision can yield a suboptimal decision. Conversely too much effort can also produce a sub-par result.

Collection of data, familiarity, complexity, determining decision-making criteria, communicating said criteria, and keeping bias in check can seem an expensive prospect. It is here that a relatively new discovery in the decision sciences—heuristic decision making— becomes a factor. According to Gigerenzer and Gaissmaier (2011), heuristic decision making is about reducing the cognitive workload required to make decisions without losing decision quality. The term heuristics has been so overused that its true meaning can be difficult to ascertain. Heuristic is a word coming from the ancient Greek meaning to "find or discover for oneself." Shah and Oppenheimer (2008) proposed that heuristics reduce cognitive workload by minimizing the effort spent on the five tasks of decision making that encompass gathering, analyzing, and considering alternatives.

Decision-Making Findings

If the purpose of a risk communication is to inform better decision-making, then that must be the objective and measure of its effectiveness. This study findings demonstrated that decision-making is a critical factor in the selection of the method used to communicate risk to organizational stakeholders. Senior security professionals ranked the importance of the use of Risk Communication of IT risk information for decision-making as 'important'(see Figure 3). They also ranked the significance of decision-making on the form of Risk Communication of IT risk information took as 'very important' to making effective decisions by extra-departmental stakeholders (see Figure 4). Which links together two important independent variables (risk communication and decision-making) on the effective risk communication of IT risk information.

MEASUREMENT

So far, we have addressed risk communication and the myriad of challenges that exist with attempting to communicate risk information. This section will elaborate on the decision-making aspects of making the most efficient decision with the information provided. This section assumes that the entity communicating the risk information would like to provide the best information possible based on what is communicated, and the method used to encapsulate that risk information. Examining more closely how to collect, measure, and present the actual state of the environment as it pertains to risk.

What is the value and purpose of measurement? According to Hubbard (2014) information has three primary sources of value in a business context. First, information can reduce uncertainty and aid in decision making where there is an economic consequence. Second, information can affect the behavior of others, which can also have an economic impact. Finally, information may at times have a market value. Measurement is, at its core, information, and shares all three traits of value as information. The aspect most relevant to IT risk communication and thus the focus of this section is the first source of value, the reduction of uncertainty and facilitation of decision-making.

In the field of Information Assurance and the measurement of risk are analogous to social measurement such as that used to understand society. Social measurement is foundational in government, public policy, economics, business, academic research in the social sciences, and many more. Social measurements are frequently aggregate measures, whose function is to condense and encapsulate meaning as seen in the popular IT/IA measures such Return on Investment (ROI), Total Cost of Ownership (TCO), Mean Time Between Failures (MTBF), and Value at Risk (VaR). These social measurements are critical to governing how businesses are run to provide a means of comparison to inform decision-making.

Accuracy in measurement is vital, particularly in social measure as mentioned previously, it often represents an aggregation of many measurements. There are two concepts to accuracy in a measure, precision and bias, also known as reliability and validity. The precision component to measurement speaks to the variation between measures. Bias in measurement refers to any systematic deviation from the true value as seen during repeated measurement. As Hand (2016) pointed out, measurement is indispensable to understand, explore, predict, and ultimately control aspects of our world.

The Measurement of Cybersecurity

The management of risk, indeed IT/IA risk, can be thought of as a classic economics problem, one where there are virtually unlimited demands on a constrained supply of resources. The resources that must be most efficaciously distributed are those of capital, human, time, and knowledge to maximize the organization's objectives. No organization, no matter how large, has an inexhaustible supply of resources to minimize risk, hence the economics problem. As there are not enough resources for all, the problem becomes how best to distribute to some risk mitigation activities, and which ones to choose and which to ignore.

There are many reasons to measure IT/IA risk, but chief among them is the desire to understand better what is happening (Hayden, 2010). It is necessary to start with some clarifications; first is the difference between a metric and a measurement, which is often confused. As Hayden (2010) succinctly stated metrics are a result, measurement is an activity. Another point of clarification is what is the indicator of a good measurement, that should be judged by the measurement's ability to reduce uncertainty (Hayden, 2010; Hubbard & Seiersen, 2016). So, the goal of a good metrics program should be to obtain the answers to good questions that enhance our understanding of how things work and reduce uncertainty.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

In the quest to determine what we are trying to measure and where we need to reduce uncertainty, one method for designing a good metric based on the aforementioned criteria is the use of the goal, question, metric (GQM) paradigm first devised by Victor Basili (1992) for the measurement of software development. The GQM was later applied by Lance Hayden (2010) to the creation of IT security metrics in his book by the same name. The measurement of IT security is about asking the right questions, reducing uncertainty, and improving operational abilities (Hayden, 2010; Hubbard & Seiersen, 2016).

When Algorithms Beat Experts

In the risk communication section, the comparison was made between how experts interpret risk information versus how a layperson interprets the same information. A similar question is considered here, namely is it better to have an expert determine risk or a statistical model. Fortunately, there was an abundance of research comparing experts' ability to predict forward-looking uncertain outcomes versus those predicted by statistical models. The research consistently showed the models outperformed the experts (Hubbard, 2014; Meehl, 1954). This is not to say that humans should be replaced, but rather should consider select situations where a statistical model can produce a more accurate result. Hubbard and Seierson (2016) recommended leveraging a sound mathematical model that can be populated with objective empirical or historical data.

Risk Matrices

A repeated theme in the literature discusses the cybersecurity professional's proclivity for ordinal scales and the use of Risk Matrices (RM) to communicate risk information. An important point to add to the discussion on RMs is that the use of ordinal scales is not in and of themselves incorrect; rather they are prone to error, misinterpretation, and oversimplification of the issue. Budescu, Broomell, and Por (2009) found that use of ambiguous labels can lead decision-makers to make errors in judgment.

Measurement Findings

The purpose of measurement in information assurance (IA) is to reduce uncertainty and facilitate decision-making. Measurement constitutes the content within a risk communication message. This study showed that risk message content is linked to perceptions about source data, that is, the measurement used as the content within a risk message. The other areas of this study namely risk communication and decision-making follow the literature. The findings around measurement in IA demonstrates a disturbing departure from the recommendation found in the extant literature on the subject of IA measurement.

When subjects were asked for their preference of method to gather risk information between qualitative, quantitative or no preference the population was fairly evenly divided (see Figure 5). Further, when asked their perception as to which the most accurate data source for is gathering IT risk information among 'expert-opinion', 'statistical model', 'vulnerability assessment' or 'interviews' the largest group 38.5% selected expert opinion (see Figure 6). Finally, when asked how risk communication recipients prefer information presented among 'business-centric' and 'technical', 100% of the respondents said business-centric (see Figure 7).

RECOMMENDATIONS

How best to digest this wealth of information about risk communication of IT/IA risk to extra-departmental stakeholders? It is important to consider that risk perception is in the eye of the beholder or in this case the perceiver. No two people perceive risk the same way thanks to their background, emotional state, human tendency to over or underestimate risk, suffering from optimism about risk, the constant ingestion of bias inducing media, and perceiver's having different levels of numeric literacy (numeracy). In

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

addition to those challenges the act of making decisions regarding IT/IA risk introduces cognitive bias and excessive use of ordinal scales. The IA industry most prevalent standard for communicating IT/IA risk information the risk matrix or 'heat-map', which is an ordinal scale and is burdened with frequent misinterpretation.

Fortunately, measurement can help as its goal is to reduce uncertainty, condense and aggregate information, and encapsulate meaning. Much of IT/IA risk information is presented numerically, which we know can be difficult for those with low numeracy – metrics can aid in reduction of the complexity of risk information and facilitate heuristics in the comparison of decision alternatives. The goal of effective risk communication is to enable better decision-making. Taking the best possible measurement of risk and presenting that information as a heuristically friendly metric is the approach that best addresses the manifold challenges outlined in this study.

CONCLUSION

Risk communication represents the 'what' we are trying to perform, to facilitate better decision-making is the 'why' and the use of metrics is the 'how' we overcome the many challenges covered in this study. While not a direct focus of this article a recurring theme in the literature is bias – bias in risk communication, decision-making and measurement. Bias is what effective risk communication must overcome to enable good decision making through the judicious use of the measurement of risk, presented as metrics.

Chapter 44
Determinants of Self-Employment Entry: Evidence from Portugal

Nadia Simoes

Sandrina B. Moreira
Instituto Politécnico de Setúbal, Portugal

Nuno Crespo
Instituto Universitário de Lisboa, Portugal

ABSTRACT

Self-employment is increasingly an attractive labor market option worldwide. In a European context, Portugal is well-known for displaying one of the highest rates of self-employment. This study explores the main determinants of the probability to enter into self-employment in Portugal. We present results from a binary logit model using individual data drawn from national-level statistics. Our findings suggest that individuals older than 35, males, married, low educated, individuals with previous experience, and heads of household are expected to enter self-employment. The empirical study also reveals important differences regarding households' compositions and dimensions, current and former unemployment levels, and at a regional level in Portuguese NUTS II.

INTRODUCTION

Self-employment has received a great deal of attention from academics and policy makers alike. National economic policies have encouraged self-employment as a way of fostering economic growth and reducing unemployment and poverty. Moreover, the economic literature on self-employment has studied this topic extensively, thereby giving support to more appropriated policy measures for promoting self-employment.

Even though an economist would not expect a large share of workers as self-employed, self-employment rates are quite impressive for certain countries. Taking into account OECD countries in general, for example, the last available data show that self-employment rates are 16.6% for EU27 and 16.1% for OECD (OECD, 2013). Turkey (38.3%), Greece, and Mexico top the OECD ranking of self-employment rates. At the bottom of the table comes Luxembourg (5.7%). Considering European regions in specific, self-employment rates are higher in Southern European countries (e.g. Greece: 36.3%; Italy: 25%; Portugal: 21.3%) than, for instance, in Central European (e.g. Austria: 13.8%; Germany: 11.6%) and Scandinavian countries (e.g. Denmark: 8.7%; Norway: 7.0%).

Portugal is among the European countries with the highest rates of self-employment and thus an interesting case study on the subject. Indeed, several authors have acknowledged the relevance of self-employment for Mediterranean or Southern European countries in general and the Portuguese case in a European context (García-Mainar & Montuenga-Gómez, 2005; Baptista & Thurik, 2007; Portugal & Addison, 2008; Teixeira & Davey, 2010). As might be expected, in Portugal, interestingly, self-employment rates are persistently among the highest when compared to other countries (Blanchflower, 2000; Cabral, 2007). Moreover, the same goes for latent entrepreneurship (Blanchflower, Oswald, & Stutzer, 2001; Grilo & Irigoyen, 2006; Gohmann, 2012). Using the last available data from the Entrepreneurship Flash Eurobarometer Surveys (European Commission, 2012), the declared preference for self-employment over wage employment in Portugal is above the EU average (49% compared with 37% at the EU level). The relatively high interest and awareness about self-employment in Portugal may provide a broader perspective for policymakers.

On the determinants of self-employment Portugal has had high international momentum on entry regulations. A recent regulatory reform awarded Portugal as the top reformer in business entry in 2005-06 and its position in the World Bank's Doing Business Index improved markedly (Branstetter, Lima, Taylor, & Venâncio, 2014). Among other findings, key estimates from Branstetter et al. (2014) indicate a positive effect of that entry deregulation on firm formation and employment. Other studies addressing the question of the factors that exert an impact on self-employment have focused on the Portuguese case, but they are, surprisingly, few in number. Moreover, to our knowledge, the available empirical research center either on a specific sector (Teixeira & Davey, 2010; Filipe, Ferreira, & Coelho, 2013) or on a certain Portuguese region (Silva, Trigo, & Antunes, 2011; Duarte & Diniz, 2012). The present chapter attempts to fill the gap by providing empirical evidence from Portugal on the factors that motivate self-employment in general. Thus, with an eye on the under-explored Portuguese case and taking into account the wide array of determinant factors from the existing empirical literature on self-employment, we estimate an econometric model using individual level data from the Portuguese Labor Force Survey.

BACKGROUND

According to Boskin (1974) and Taylor (1999), among others, the self-employment decision implies a comparison of the costs and benefits between paid employment and self-employment. A large number of factors influence that balance of costs and benefits, which might be either financial or non-financial in nature (Verheul, Wennekers, Audretsch, & Thurik, 2002). Much of the empirical literature has looked at the influences of these factors on an individual's entry into self-employment. Following Simoes, Moreira, & Crespo (2015), there are twelve critical individual determinant factors of the entry into self-employment grouped in seven categories: (i) basic individual characteristics (gender, age, and marital

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

status and children); (ii) family background (parents and spouse); (iii) personality characteristics (risk attitude and other psychological traits); (iv) human capital (education and experience); (v) health condition; (vi) nationality and ethnicity; and (vii) access to financial resources.

An overall analysis of the dominant evidence emerging from the empirical studies reveals that solid conclusions can be found in the majority of the factors considered. Based on that evidence, Simoes et al.'s (2015) comprehensive survey synthesize the expected impact of each individual factor on the propensity to enter self-employment as follows: (i) the probability of transition to self-employment is higher for men than for women; (ii) increases with age, though decreases after a given threshold; (iii) is higher for married individuals; (iv) is higher for individuals with children; (v) is higher for individuals with at least one of the parents with self-employment experience; (vi) is higher for individuals with a self-employed spouse; (vii) both decreases with risk aversion and increases with psychological traits such as over-confidence, need for achievement and autonomy, self-efficacy, and internal locus of control; (viii) increases not only with experience, but also the diversity of experience; (xix) is higher for immigrants than for natives; and (x) is higher for individuals with lower financial constraints. Nevertheless, arguments were also found pointing to an opposite direction in what regards to gender, children, having (or not) a self-employed spouse, previous experiences, and to nationality and ethnicity, though with no corresponding empirical confirmation from the predominant empirical literature. More importantly, concerning the impact of education and health condition on the decision of transition to self-employment, Simoes et al. (2015) suggest further research given the less clear results that remain on both individual determinants. Table 1 summarizes the findings and the main references used to support them.

In addition to individual factors influencing an individual's choice with regard to self-employment, other factors, like business cycle conditions and various forms of government intervention, contribute to explain self-employment. Even though the puzzling question of which macroeconomic factors influence transition into self-employment, an extensive literature now exists on the business cycle or the employment status. The two competing effects that may occur in that regard have been found on the empirical literature. Thus, unemployment is a critical factor that may either push or pull individuals into self-employment or, in business cycle terms, self-employment may amplify in recessions or, alternatively, in boom periods. Parker (2009) provides an excellent review of the empirical literature on that subject, concluding that more recent studies have favored to a growing consensus about a zero or positive relationship between self-employment and unemployment. Cichocki (2012) and Fritsch, Kritikos, & Pijnenburg (2013) are examples of newer studies finding support to the "recession-push" hypothesis, as opposed to Biehl, Gurley-Calvez, & Hill (2014), for instance, showing that old women are less likely to become self-employed in recessions.

The influence of government intervention on self-employment decision is also important and includes a wide range of reforms. Founded on the concept of institutions as "rules of the game", both formal and informal (North, 2005), these rules affect the incentive individuals face and therefore their self-employment choice. Among key institutional factors that researchers have investigated with respect to their influence on self-employment are labor market institutions such as employment protection legislation (EPL), minimum wage, and unemployment benefits, taxation, and other regulative activities like firm entry restrictions. Concerning the former, the strictness of EPL, the presence and level of minimum wage, and the generosity of unemployment benefits are expected to deter self-employment decision. Baumann and Brandle (2012), and Carrasco and Ejrnaes (2012) are examples of recent empirical evidence on the subject showing that the outcome is not as straightforward as stated. As to taxation, mixed evidence is found on the impact of taxes on self-employment and the same goes for tax progressivity, in

the sense of rising marginal income tax rate. Ferede (2013) reviews previous empirical literature on the subject, arguing that tax progressivity can either spur or reduce self-employment depending on the relative effects of taxing successful self-employed individuals and the tax evasion opportunities available to them. Finally, Prantl and Spitz-Oener (2009) and Branstetter et al. (2014) are among recent research on government regulation of firm entry that provide both new and previous evidence supporting the view that regulations related to business set-up constrain self-employment levels.

Finally, apart from self-employment determinants at the individual and national levels, regional studies need also to be taken into account highlighting the influence of regional space on self-employment choice. Despite the comparatively few empirical studies, a general outcome from the research conducted so far is that regional differences in self-employment rates do exist and persist overtime (Stuetzer, Obschonka, Brixy, Stemberg, & Cantner, 2014). Some studies employ regional dummy variables to capture spatial variations, while others, mainly using regional level data, focus on regional factors that are supposed to influence regional start-up rates (Eliasson & Westlund, 2013). Parker (2009) produces an interesting account of the different regional determinants at stake, reinforcing that research on the topic continues to develop.

MAIN FOCUS OF THE CHAPTER

Empirical Study

In the empirical analysis developed in this study, we use quarterly data from the Portuguese Labor Force Survey, carried out by the National Statistics Office, covering the period between 1998:01 and 2010:02 (50 quarters). The database contains information about the socio-demographic characteristics of the individuals, their levels of human capital, and their current and past labor market situation.

Our sample includes 865,990 working individuals, aged 15-64, living in Portugal. In this sample, the proportion of females is 45.5%, most individuals are aged between 25-54 years (70.5%), lived in Norte (30.4%), Centro (15.8%) or Lisboa (15.8%), and only 24% had concluded higher secondary.

The main goal of our study is to identify the determinants of being self-employed in comparison to being a salaried worker. To this end, we estimate a logit model (for more information on this model, see Greene, 2011). The dependent variable is a binary variable with the value of 1 if the individual is self-employed and 0 if he/she is an employee.

We consider four groups of explanatory variables: (i) socio-demographic characteristics – gender, age, nationality, marital status, labor market state (LMS) of the spouse, children, household size, head of the household; (ii) human capital – education, experience, previous LMS; (iii) business cycle – unemployment rate; (iv) regional variables. In addition, we include controls for time effects. Table 2 defines the explanatory variables in detail.

Regarding gender, empirical studies share a general finding: the probability of being self-employed is higher among men than women (Blanchflower, 2000; Baumann & Brandle, 2012; Koellinger et al., 2013). Unlike women, men have more pre-requisites to self-employment in place like lower levels of risk aversion and a greater tendency to seek external finance. Previous paid employment jobs may also capture gender differences in self-employment choice, because men are more likely to have more powerful work-related contracts than women and report lower levels of job satisfaction.

Age is a variable usually considered to explain self-employment. Higher age groups are more likely to become self-employed mainly because they have larger financial assets and a more accumulated knowledge and experience. Additionally, older people close to retirement may prefer self-employment to remain active or as partial retirement. Nevertheless, the probability of being self-employed rises up to a certain age and then the opposite is expected. A non-linear relationship between age and self-employment is thus the empirical result (Blanchflower, 2004; Andersson & Hammarstedt, 2010a; Baumann & Brandle, 2012).

Natives compared to immigrants seem to be in a disadvantage position regarding self-employment. Different hypotheses have been advanced for the superior preference of immigrants for self-employment such as living in enclaves to explore ethnic businesses, home-country with self-employment tradition, socio-cultural background favoring a self-employment career path, as well as lower employment opportunities in the wage-sector. Empirical studies have documented the country of origin has a determinant factor of self-employment entry (Constant & Zimmermann, 2006; Carrasco & Ejrnaes, 2012; Eliasson & Westlund, 2013).

Individuals with children and family commitments, as indicated by the presence of dependent children or marital status, are more likely to transit to more flexible employment conditions as self-employment. A married/cohabiting situation, in particular, also raises the possibility of the spouse to join in the business. The empirical evidence seems to support these arguments and the inclusion of both explanatory variables is currently a common feature (Baumann & Brandle, 2012; Eliasson & Westlund, 2013; Daw-

Table 2. List of explanatory variables

Variable Title	Description
GENDER	Dummy variable with value 1 if the individual is a female, 0 otherwise
AGE	Dummy variable with value 1 if the individual is aged between 35 and 54, 0 otherwise (reference group)
AGE 1	Dummy variable with value 1 if the individual is aged between 15 and 24, 0 otherwise
AGE 2	Dummy variable with value 1 if the individual is aged between 25 and 34, 0 otherwise
AGE 4	Dummy variable with value 1 if the individual is aged between 55 and 64, 0 otherwise
NATIONALITY	Dummy variable with value 1 if the individual is a Portuguese native, 0 otherwise
MARITAL STATUS	Dummy variable with value 1 if the individual is married, 0 otherwise
SPOUSE LMS	Dummy variable with value 1 if the spouse of the individual is non-employed, 0 otherwise
CHILDREN	Dummy variable with value 1 if the household includes children aged 6 or younger, 0 otherwise
HOUSEHOLD SIZE	Household size
HEAD OF HOUSEHOLD	Dummy with value of 1 if the individual is the household's head, 0 otherwise
EDUCATION	Dummy variable with value 1 if the highest educational level of the individual is lower secondary education, 0 otherwise (reference group)
EDUCATION 1	Dummy with value of 1 if the individual has no education, 0 otherwise
EDUCATION 3	Dummy variable with value 1 if the highest educational level of the individual is primary education, 0 otherwise
EDUCATION 4	Dummy variable with value 1 if the highest educational level of the individual is upper secondary education, 0 otherwise
EDUCATION 5	Dummy variable with value 1 if the highest educational level of the individual is university, 0 otherwise
EDUCATION 6	Dummy variable with value 1 if the highest educational level of the individual is post-graduation, 0 otherwise
EXPERIENCE	Dummy with value of 1 if the individual has previous experience (not first job), 0 otherwise
PREVIOUS LMS	Dummy with value of 1 if the individual was working in the previous year, 0 otherwise (reference group)
PREVIOUS LMS 2	Dummy with value of 1 if the individual was unemployed in the previous year, 0 otherwise
PREVIOUS LMS 3	Dummy with value of 1 if the individual was inactive in the previous year, 0 otherwise
UNEMPLOYMENT RATE	Annual regional unemployment rate
UNEMPLOYMENT RATE ALT	Quarterly regional unemployment rates by gender
REGION	Dummy with value of 1 if the individual lives in *Norte*, 0 otherwise (reference group)
REGION 2	Dummy with value of 1 if the individual lives in *Centro*, 0 otherwise
REGION 3	Dummy with value of 1 if the individual lives in *Lisboa*, 0 otherwise
REGION 4	Dummy with value of 1 if the individual lives in *Alentejo*, 0 otherwise
REGION 5	Dummy with value of 1 if the individual lives in *Algarve*, 0 otherwise
REGION 6	Dummy with value of 1 if the individual lives in *Açores*, 0 otherwise
REGION 7	Dummy with value of 1 if the individual lives in *Madeira*, 0 otherwise

son et al., 2014). Alternatively, Blanchflower (2000), for instance, captures the importance of family composition through the inclusion of both household size and the number of dependent children under the age of 15 years. In contrast, Bernhardt (1994) analyzes the relationship between marital status and the propensity to be self-employed through the explanatory variable "spouse works". The labor market state of the spouse may be seen as an additional conditioning factor to self-employment transition due to more or less inherent family responsibilities.

Following Co, Gang, & Co (2005), the head of the household is included as a proxy for the importance of the lack of financial constraints vis-à-vis risk aversion on the likelihood of self-employment. Both are primary aspects influencing an individual's self-employment choice and that seems to be a consensual outcome from the empirical literature (Holtz-Eakin & Rosen, 2005; Colombier, Boemont, Loheac, & Masclet 2008; Brown et al., 2011). Financial resources are usually needed to start a business and thus personal wealth enables that own capital or the collateral to get external funding. Likewise, the additional risk that self-employment normally entails compared to wage-earning jobs explains why individuals with a more risk-tolerant attitude are more likely to succeed in self-employment. According to Co et al. (2005), the relationship between the head of the household and self-employment entry is an empirical question i.e. depending on the sign of that relationship, either the lack of financial constraints seems to be predominant amongst heads of households, or, if negative, risk aversion.

The influence of education on self-employment is a complex issue. A number of studies find a positive association between the two variables (e.g. Holtz-Eakin & Rosen, 2005; Koellinger et al., 2013; Dawson et al., 2014) on the grounds that educational attainment develops business skills and competencies, as well as the capacity to identify business opportunities. However, neither the finding is non-ambiguous nor the explanatory arguments are exclusive. Empirically, for instance, there is evidence pointing to an insignificant relationship for women and, depending on the level of education attained, to either a positive or an insignificant one for men (Özcan, 2011), or, in the case of Blanchflower (2004), to a negative impact of education in Europe as opposed to the US. According to Simoes et al. (2015), a non-linear relationship between education and self-employment might be at work – as suggested by the results of Blanchflower (2000), for example, or advanced, more recently, by Poschke (2013) – and therefore further research is needed to explore the link.

Turning to experience, Eliasson and Westlund (2013) and Poschke (2013) are examples of more recent studies that corroborate the well-established finding – self-employment increases with previous labor market experiences – based on the approach emphasized by Jovanovic (1982) that individuals develop their competencies through experience.[1] Among previous experiences relevant for a self-employment decision is self-employment experience. Additionally, the previous labor market state can also account for the likelihood of being self-employed and thus be a proxy for opportunities in the labor market. Following a practice similar to Özcan (2011), Carrasco and Ejrnaes (2012) or Eliasson and Westlund (2013), we have introduced explanatory variables that indicate whether an individual was previously employed, unemployed or out of the labor force. Concentrating on transitions from unemployment situations into self-employment, we can then pick up the argument that unemployment is a push/pull factor into self-employment.

Regarding the business cycle, results in the literature on the nexus between unemployment and self-employment are mixed and, according to Parker (2009), currently pointing to either a positive relationship (Von Greiff, 2009; Cichocki, 2012) or an insignificant one (Baumann & Brandle, 2012; Ferede, 2013). This reflects to a certain extent the theoretical ambiguity given by the possibility of both recession-push and prosperity-pull effects.[2] On the one hand, self-employment is countercyclical, rising when the

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

economy is weakening, because the unemployment problem that comes along with periods of economic recession means that individuals can react to the lack of opportunities in the wage sector by seeking them out in self-employment. On the other hand, self-employment is procyclical, rising when the economy is strengthening, because both demand and opportunities usually increase during an economic expansion. Moreover, a recession-related soften demand may make self-employment less attractive. As noted by Moore and Mueller (2002), local, regional and national unemployment rates have been used with various degrees of demographic specificity. In the present study two measures are employed alternatively: (i) annual regional unemployment rates; (ii) gender-specific quarterly regional unemployment rates.

At last, regional dummy variables were included among the explanatory variables of the empirical study to control for regional differences and thus the possibility that some regions are more self-employers than others. Recent studies have often used this method finding statistically significant region-specific effects whose magnitude differ across regions (Andersson & Hammarstedt, 2010a; Eliasson & Westlund, 2013; Dawson et al., 2014).

Econometric Results: Evidence for Portugal

The main purpose of the study is to identify what factors might determine the probability of entry into self-employment in Portugal. The estimated results of the binominal logit model are displayed in Table 3.

Table 3 presents two models and the single difference between them concerns the unemployment variable. When the model incorporates the gender-specific quarterly regional unemployment rates, as an alternative to the annual regional unemployment rates, the estimated coefficients change slightly in terms of magnitude, but remain all statistically significant except for the region of Açores. Moreover, an overall analysis on the expect impact of the independent variables on the probability of being self-employed reveals that the following factors are important in explaining this phenomenon: (i) individual characteristics – gender, age, nationality; (ii) household characteristics – marital status, labor market state of the spouse, children, household size, head of the household; (iii) educational level; (iv) professional characteristics – experience, previous labor market state; (v) business cycle; (vi) regional space.

Results for gender and nationality are in accordance with the evidence from the predominant empirical literature on self-employment. Women and natives are less likely to be self-employed compared to men and immigrants, respectively. Regarding age, results show that it is one of the most important determinants of self-employment entry. Moreover, the influence of age follows a clear pattern, with the age group between 55 and 64 years of age reaching the highest propensity to enter self-employment when compared to the reference age group (35-54 years of age). In the same vein, younger individuals (age groups 15-24 and 25-34) have a lower probability of being self-employed in comparison to individuals aged 35 to 54.

Turning to spouse related variables, being married conciliates with a self-employment choice as expected. However, the spouse being either unemployed or inactive seems to be a factor deterring entry into self-employment. The influence of the labor market state of the spouse on the individual decision regarding self-employment has not been given much attention in the literature.[3] The reasoning for this finding can be matched with the increased family responsibilities that may follow from that labor market state of the spouse (non-employed). Indeed, that is usually the argument associated with a negative impact of children on the likelihood of self-employment. Though not a frequent outcome from empirical studies, our results also suggest that having dependent children decreases the probability of being self-employed.[4] By contrast, as observed in Table 3, that probability increases with household size, in accordance with

studies like Blanchflower (2000) and, more recently, Brown et al. (2011). Taken together, these findings indicate that, in spite of the potential greater family responsibilities, living in a large household may provide the additional support needed for this more demanding type of employment situation.

Concerning household's head, the evidence documented in Table 3 makes it clear that it increases the probability of self-employment. So, similar to Co et al. (2005), this may point out that the positive effect of the lack of financial constraints is greater than the negative effect of risk aversion on the choice to become self-employed. Additionally, the estimated impact of this explanatory variable may reinforce some of the previous findings, given that heads of households tend to be males, married and with an advanced age.

Education, like age, emerges as a crucial variable in explaining the decisions to enter into self-employment. All educational levels, with the exception of having no education, are negatively associated with self-employment, whereas having no education is directly associated with self-employment relative to having lower secondary education. Furthermore, the influence is monotonic and with a huge impact in the highest educational level, thus showing that additional levels of education and, in particular, a Master's degree or PhD most probably widen the range of better paid-employment opportunities (Andersson & Hammarstedt, 2010a; Brown et al., 2011).

The positive association between experience and self-employment is confirmed in our model. In addition, the labor market state of the individual in the previous year also revealed decisive. We find that both unemployed individuals and individuals in an inactivity situation are less likely to enter self-employment than employed individuals, with a more remarkable quantitative influence in the first case. Interestingly, the evidence obtained by Özcan (2011) and Carrasco and Ejrnaes (2012) supports the opposite conclusion when comparing non-employed with wage-workers, whereas Eliasson and Westlund (2013) finds that both unemployed and employed individuals are more prone to become self-employed than are those out of the labor force. Taking the two opposing possibilities for unemployed individuals as reference, our result is consistent with the view that the probability of having an own successful business is low, while the other reported results suggest that self-employment might be a last resource option and thus a more attractive solution.

Business cycle and regional space are the last two determinants at focus. As Table 3 indicates, the unemployment rate positively affects the probability of entry into self-employment, suggesting a countercyclical pattern for the Portuguese economy. This result is in line with the "recession-push" hypothesis, as evidenced by Moore and Mueller (2002), Von Greiff (2009), or Cichocki (2012). Concerning the region of residence, results presented in Table 3 imply that regional differences in terms of self-employment seem to be an important characteristic of the Portuguese economy. More specifically, living in Lisboa, Alentejo, and Madeira reduces the probability of being self-employed, while the opposite occurs for the other Portuguese regions. Lisboa and Norte are the two most dynamic regions enclosing the metropolitan areas of the country (Lisbon Metropolitan Area and Porto Metropolitan Area, respectively). Thus, similar to the findings of Eliasson and Westlund (2013), these metropolitan regions present distinct outcomes on their start-up propensity.

FUTURE RESEARCH DIRECTIONS

Further research should develop an improved and more complete empirical model of self-employment choice. On the one hand, more appropriate variables are needed, for use at an individual level, to capture important factors as access to financial resources, as well as risk aversion and other personality charac-

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

teristics of the potential self-employed individuals. On the other hand, well-known determinants omitted in the present study like the family background in terms of self-employed parents and a self-employed spouse need to be taken into account in the analysis. Also an in depth investigation on some of the puzzles and unclear results that are still present on the topic and whose evidence presented in this study has exacerbated, as was the case for education and unemployment. Finally, with a more deep understanding of the factors that may determine people in Portugal to more likely choose self-employment, the further question of why this is the case necessarily arises. Additional research on this subject would definitely be a decisive contribution, given the country's interesting self-employment records.

CONCLUSION

Who is more likely to choose self-employment? Based on evidence for the Portuguese case, that likelihood increases for individuals: (i) older than 35 years of age (ii) males; (iii) of immigrant origin; (iv) heads of households; (v) married; (vi) with a working spouse; (vii) with no dependent children; (viii) living in a large household; (xix) low educated; (x) with professional experience; (xi) previously employed; (xii) living in periods with high unemployment rates; (xiii) living in Norte, Centro, Algarve or in the region of Açores. This profile for self-employment entry in Portugal is not as straightforward as it might first appear for two main reasons.

First, age and education should be highlighted among the factors that motivate self-employment for policy reasons, given the evidence provided in the present study in both qualitative and quantitative terms. Self-employment was found to increase with age and decrease with educational attainment. In particular, the youngest individuals as well as those with the highest educational level exhibited the lowest propensity to follow a self-employment career-path. These findings (among others) should help construct appropriate policies to promote self-employment in targeted groups like the ones identified.

Second, the role of both family and the employment status in the decision to become self-employed should be taken notice, as the documented evidence in the present study would recommend. Being married – as long as the spouse is neither unemployed nor inactive – was found to exert a positive impact on that decision and the same follows for the dimension of the household – regarded that there are no dependent children in its composition. As to unemployment, we found evidence of two opposing effects on self-employment, with the magnitude of the parameters suggesting that the pull effect outweighs the push effect. On balance, we can thus confirm the existence of an inverse relationship between them and such net effect should be of policy interest.

ENDNOTES

1 More recently, Lazear (2005) developed a model showing that self-employment also increases with the diversity of previous labor market experiences, as opposed to paid employment, rewarding specialization instead. According to Simoes et al (2015), the evidence produced until now makes this a robust result.

2 Causality is also a potential problem, since unemployment may stimulate self-employment (recession-push) which, in turn, can reduce unemployment in subsequent periods (Baptista and Turik, 2007).

3 As referred in the preceding subsection, empirically, Bernhardt (1994) uses the variable "spouse works" has a refinement to the marital status variable, showing that if the spouse is working, the probability of the individual being self-employed increases. Biehl et al. (2014), for instance, also take into account the employment status of the spouse on the individual's propensity to be self-employed, though the relationship is insignificant.

4 See Sena et al. (2012) for a similar finding.

Chapter 45
Building Entrepreneurial Networking Quality to Improve the Success of Innovation and Batik SMEs Performance

Elia Ardyan

Sunarto Isstianto
Sekolah Tinggi Ilmu Ekonomi Surakarta, Indonesia

ABSTRACT

This study is to analyze the improving of the success of innovation and Batik SMEs performance by entrepreneurial networking quality, the quality of entrepreneurial trusting, co-creation, and entrepreneurial orientation. The respondents in this study were 63 owners or the managers of Batik SMEs in Solo, Indonesia. SEM-PLS was used as analysis equipment and WARLPPls version 5 was used to analyzing the data. The result of the study showed that, first, the improvement of success on innovating was only significantly by the quality of entrepreneurial networking and the quality of entrepreneurial trust, while entrepreneurial orientation and co-creation were not able to improve the innovation successful. Secondly, the performance of Batik SMEs could improve significantly when it was influenced by the quality of entrepreneurial networking, co-creation, and the success of innovation, while the entrepreneurial orientation and the quality of entrepreneurial trust could not improve the performance of Batik SMEs significantly.

INTRODUCTION

Since 2009, Batik was acknowledged by UNESCO as World Culture Heritage from Indonesia (Budiono & Aryanto, 2010) and Batik belongs to 14 categories of creative industry. The art of Batik becomes the identity and the local symbol in Indonesia (Ismail, 2015). At the beginning, Batik was known as an ancient method of textile decoration practiced all around Asia since prehistory and the name of Batik is adopted from Indonesian (Haake, 1989). In advance, its designs and motives are developing. Every region has its own unique motives and designs. The regions which produce Batik such as Pekalongan, Solo, Yogyakarta, Ciamis, Banyumas, Indramayu, Lasem, Tasik dan Sragen.

The entrepreneurs of Batik try to innovate in order to follow the advanced era and consumers demand. The customers have changeable and unpredictable desire and needs, and they demand something new. Therefore, innovation is the main dynamic ability to face the fast changing of environment (Camps & Marques, 2014) and as the most vital thing for the life of SMEs in Indonesia.

In some literatures, innovation is very important for company. Innovating happens in many forms, such as in design, product, marketing technique, prize, service, organization or method used by the management (Drucker, 1954). The innovation of the product is an important factor to measure the success of a new product (Bao et al., 2012). The successful SMEs in building innovation will create unique positioning (Im & Workman, 2004) and improve the performance (Ardyan, 2016). This innovating ability will make the performance of the company improve (Low et al., 2007; Mu et al., 2007).

Business networking is very important in a company. The concept of business networking is very important, despite the less development of it (Ford & Mouzas, 2013). Business networking refers to conscious effort of the actor in changing or developing the interaction process or relation structure he involves in. Networking is the nucleus of management in business landscape (Ford & Mouzas, 2010; Henneberg et al., 2010). Networking is important in improving the interaction among related actors (Ford & Mouzas, 2013). The actors may include government, industry, university, and others. Building a strong business networking will give impacts toward the promoting of business development (Sato, 2000). The networking which relates university, industry, and government (triple Helix) can influence innovation strategy (Erosa, 2012) and the performance of business (Purwaningrum et al., 2012).

In SMEs, performance formed from some ways. There are 3 importance variabel that influence SMEs performance, i.e.: (1) how to build the quality of entrepreneurial networking and the quality of entrepreneurial trusting. The importance of networking in SMEs has been written by some writers, considering the need of SMEs to acquire access into other organization's resources (Partanen et al., 2008; Tikkanen, 1998) and the ability to improve the performance (Ahuja, 2000; Nurhayati, 2009; Stam & Elfring, 2008). (2) is able to conduct co-creation. Co-creation is an action to create a value collectively between company and the other stakeholders. This ability of creating collectively can improve the work (Chuang & Lin, 2015; Grissemann & Stokeburger-Sauer, 2012; Nysveen & Pedersen, 2014; Wang & Wu, 2013). (3) has entrepreneurship orientation. In some studies, the entrepreneurship orientation will influence the performance, especially SMEs (Arif et al., 2013; Soininen et al., 2012). However, there is contradiction of the result of those studies. There is also a study which explains that entrepreneurship orientation does not have impact on the performance (Baker & Sinkula, 2009; Sciascia et al., 2014).

The aims of this study are as follows:

1. To examine the impact of the quality of entrepreneurial networking on the innovation successful.
2. To examine the impact of the quality of entrepreneurial trusting on the innovation successful.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

3. To examine the impact of the quality of entrepreneurial networking on the SMEs performance.
4. To examine the impact of the quality of entrepreneurial trusting on the SMEs performance.
5. To examine the co-creation on the innovation successful.
6. To examine the co-creation on the SMEs performance.
7. To examine the entrepreneurial orientation on the innovation successful.
8. To examine the entrepreneurial orientation on the SMEs performance.
9. To examine the innovation successful on the SMEs performance.

LITERATURE REVIEW

The Quality of Entrepreneurial Networking

At the beginning, the theory of social networking was used on social psychology (Schoenherr et al., 2015). The theory of social networking discusses the connectivity and relation in social structure. The theory of social networking considers social relation in term of node and relation (Wasserman & Faust, 1994). Node is actors including individual, group, organization, and society in a network (Katz et al., 2004), while relation is related to the relation among the nodes. The relation among the actors can be categorized into communication ties, formal ties, affective ties, proximity ties, cognitive ties (Katz et al., 2004). Gronavetter (1973) explained that network ties consist including strong ties and weak ties. Strong ties is defined as a strong tightness in a relation between individual, relatives, and closed friend (Granovetter, 1983). Furthermore, Granovetter (1983) mentioned that the strong tightness shows some key characteristics between the related sides including the frequent interaction, the long history, intimacy and sharing, feedback of exchanging which enables sharing secrets one another and interaction based on trust. The weak relation refers to new friends and ordinary friends compared to closed friends (Granovetter, 1983). Its relation is not closed.

Gould and Penley (1984) defined network as the practice of system development or contact network both from the inside and the outside of the organization, which gives relevant career information and individual support. Michael and Yukl (1993) focused on the attitude in building the network, while networking behavior is defined as an attitude in building the informal relation among the individuals inside or outside the company. Orpen (1996) explained that network is used to build relation. Michael and Yukl (1993) explained that network is functioned for information exchanging, influence exchanging, and partnership. Other various studies explain that network is functioned for career success (Gould & Penley, 1984; Langford, 2000; Shortland, 2011). Kase and Liu (1996) considered network based on the idea that a relation is an effectiveness in communicating complex information, signal sensing, and knowledge transfer.

In this study, we focused on the concept of entrepreneurial networking quality. The quality of entrepreneurial network is used to see the grade of the network in the context of SMEs. The quality of the entrepreneurial network is association from some individuals or organization communicating one another to produce mutual benefits (Nurhayati, 2009). The indicator of the quality of the entrepreneurial network are work networking with loyal suppliers, work networking which gives additional values, qualified work networking, and work networking with profession organization (Gulati et al. (2000); Kasa (2007); Nurhayati (2009)).

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

The Quality of Entrepreneurial Trust

Nahapiet and Ghoshal (1998) divided social capital into three dimensions including relational, structural, and cognitive. Relasional dimension is a degree of interaction and the quality of social relation (Jones, 2005). Structural dimension can be categorized as networking, configuration, the stability among the actors and the rule of networking. Cognitive dimension is in form of norms, value evaluation, attitude and relation of the members of the network, trust, or perception of organization support, two sides relation between the members, sharing information and trust from one to another. In this study, the dimension of social capital is the quality of the entrepreneurial network and the quality of entrepreneurial trust. The social capital as network and trust has important role in improving the performance (Ahuja, 2000; Stam & Elfring, 2008).

The second dimension of social capital discussed in this study is the quality of the entrepreneurial trust. Trust is a dynamic aspect in the relation among peoples (Flores & Solomon, 1998). This study sees the quality of trust in the context of entrepreneurhip. The quality of the entrepreneurial trust is defined as the trust of the partner will conduct action that brings the company into certain benefit (Nurhayati, 2009). The indicator of the quality of the entrepreneurial trust are trusted by supplier, trusted by investors and financial organization, and trusted by (Kasa (2007); Nurhayati (2009)).

The previous studies explained that the higher social capital is the higher innovation grade (Coleman, 1988; Knack & Keefer, 1997; Putman, 1993). Tsai and Ghoshal (1998) investigated the impact of social capital towards the internal function of company, focusing on how far social capital facilitates the ability of the company to create value by innovation. Bhat (2005) thought that social capital influences the process of innovating. Martinez-Canas et al. (2012) examined the role of knowledge aquitition between social capital and inovation. This study examined 214 companies in Spain located Science and Technology Park (STPs). The result showed that when it is seen directly without considering the moderation variable, social capital influences positively and significantly on innovation. The result of Tsai et al. study (2013) shows that social capital dimension (trust and sharing) can improve the will to do innovating. Some experts explain that the role of social capital on innovation is caused by the higher of social capital so it can reduce the cost of transaction among the actors, to reduce the cost of searching and information, bargaining the cost, and the decision of the cost (Landry et al., 2002; Maskell, 2000).

Sanchez-Famoso et al. (2014) examined 172 family companies in Spain. From those companies, it was divided into two types of respondents. They are non-family members and family members. The result of this study showed that social capital from family members gave positive impacts significantly on innovation, while social capital from non-family members has positive impacts but it is not significant on innovation. Luo et al. (2004) conducted research on 262 companies operating on some metropolitan cities in China. This research examined the influence of relational resources on the work. One of the relational resources is social capital. In this study, social capital is divided into two dimensions. They are business partnering and governing-agency. This research showed that both of the dimensions of social capital will improve the work of the company (especially on the growth of the sale).

Entrepreneurial Orientation

Some previous researches explained that entrepreneurial orientation will increase the success in conducting innovation (Avlonitis & Salavou, 2007; Covin & Slevin, 1991). In the research conducted on the SMEs in Greece, Salavou and Lioukas (2003) found that the technology posture and entrepreneurial

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

orientation will increase the product innovation radically compared to incremental innovation. The organization orienting on entrepreneurship in innovative form, is dare to take the risks and always tries to produce new products through proactive attitude in order to catch the chance of the market (Covin & Slevin, 1989; Wiklund & Shepherd, 2005). Miller et al. (1982) thought that innovation of the product needs the company's taking risks and being proactive. In the study conducted by Miller and Friesen (1982), they thought that the innovation happens when taking risks is considered in the strategy of the company's products. Some literatures analyzed the positive results between entrepreneurial orientation and the work, both in the work of business and company (Li et al., 2009; Matsuno et al., 2002). For more specific, some experiments explained that entrepreneurial orientation can improve the performance of SMEs (Arif et al., 2013; Soininen et al., 2012).

Co-Creation

Co-creation is collective participation between the consumers and the producers to create the value in the market (Swass, 2010). Including the consumers into the collective creating is an important strategy to satisfy the demand of product personalization and to create the excellent of product (Zhang & Chen, 2008). The creating value focuses on how the company motivates the consumers to design the product and services collectively and conducting innovation (Lehrer et al., 2012). Co-creation is related to collective creating and the value evolution with some individuals through interaction (Prahalad & Ramaswamy, 2004b)

The changing of the technology, competing and the demand of the customers fundamentally changes the way of the business to operate. Traditionally, the way for business centralized in the company (Prahalad & Ramaswamy, 2004b). The strategy of creating the traditional value loses the utility in the developing economy (Lehrer et al., 2012). The company allocates the focus from the improvement of internal efficiency into the utilization of external resources, especially the customers, in order to get the new competitive excellention in new economy (Prahalad & Ramaswamy, 2004b; Zhang & Chen, 2008).

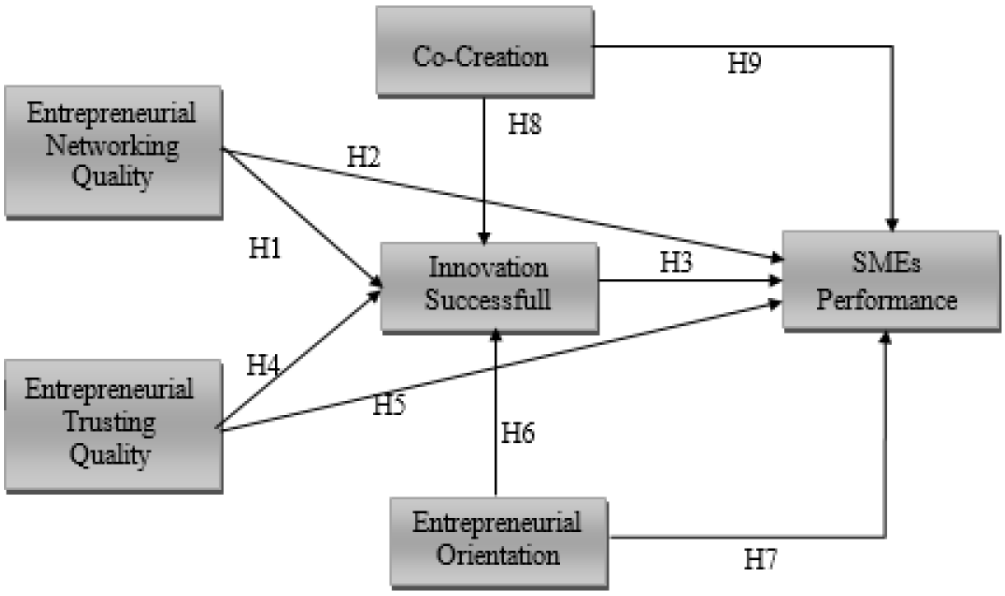
Innovation Successful

Innovation becomes the foundation of the success of the SMEs. Innovation becomes the source of excellence when competing with a business (Schumpeter, 1934). At the beginning, innovation is only possessed by big companies because the research and development cost is great in amount and only the big company can finance for it (McDermott & Prajogo, 2012). Oke et al. (2007) explained that innovation in SMEs is incremental innovation compared to radical innovation. Innovation focuses on the development of the new products (Mu et al., 2007). The company is considered as being able to innovate if the company is successful in implementing creative idea into the products or services (Amabile et al., 1996). Khin et al. (2010) thought that a product is called innovative if the consumers get some new benefits from the design, function, and the new features. Janssen et al. (2015) explained innovation into two words, *novelty* dan *newness*. Innovation means that her is something new applied on process, products, and idea (West, 1990). In this study, the success of innovating can be defined as the success of the SMEs in implementing creative idea in order to create new process and final products.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

The SMEs Performance

The high performance is one of success which is desired by many organizations. There are many academic interests in measuring the performance of SMEs and trying to identify the important factors of their success.



There are some studies measuring the performance of SMEs and the performance of the SMEs is adopted from the business performance. The measurements of the performance of the SMEs including profitability, growth (revenue growth, growth potential, enterprise growth), market development, net sales revenue increased sales, increased market shares, satisfaction, return on investment (ROI), reaching financial goal, relative finance and relative non-finance, top management's satisfaction with overall performance last year, market share overall performance relative to major competitors last year, and overall performance of the last year (Bakar et al., 2014; Minchna, 2009; Naude et al., 2014; Nedzinskas et al., 2013; Omerzel & Antoncic, 2008; Sok et al., 2013; Zheng et al., 2009). There are also those consider finance ratio as the measurement of SMEs performance (Voulgaris et al., 2000)

In this study, the measurement of the SMEs performance focuses on the growth. The growth can be seen from many ways. Robson and Bennett (2000) measured the growth into three measurements including the percentage of change in the work, the change of percentage of profitability of the employees. Another experts see the growth through the growth of sale, market segment (Zheng et al., 2009), the growth of the company (Bakar et al., 2014), and others. In this study, the indicator of SMEs performance is the growth of sales and profitability.

HYPOTHESIS

Relationships are illustrated in Figure 1.

Figure 1. Empirical research model

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

The Relation between Entrepreneurial Networking Quality, Innovation Successful, and The Performance of SMEs

Networking and Innovation cannot be separated. Kase and Liu (1996) explained that innovation needs the complexity of the network of relation between personal and group. Networking can bring various information exchange, influence exchange, and friendship (Michael & Yukl, 1993) which can bring creative ideas to build the success of innovating. Seufert et al. (1999) explained that there is integration between networking and knowledge management. Knowledge will be created and transferred into a network which will bring fresh ideas and concepts to create innovation. Network will bring new technology functioned to change the product, process, or service into something new. Network also can allocate the scarce resources (Cornelli & Aldreich, 2001) which can create different product compared to the competitors. Chiu (2009) explained that entrepreneur which is able to build network will increase the work of innovation. Network has important roles if someone has interest in the entrepreneurial activity (Martinez & Aldrich, 2011) which can produce idea, process or new product.

Various researches explained that network can improve the performance (Lamprinopoulou & Tregear, 2011). The entrepreneurs which can build qualified network, will create a long-term relation with business relation. This long term relation will improve the work. Luo et al. (2004) conducted researches on 262 companies in some metropolitan cities in China. This research examined the impact of relational resources on the performance

Schumpeter (1934) thought that innovation is urging factor for the work. McDermott and Prajogo (2012) considered that Schumpeter's concept (1934) has not been clear yet because the concept is only for big companies. To see if the innovation as urging factor, especially SMEs performance, so the idea of Oke et al. (2007) is needed, that the researchers must see the type of innovation. The company will grow and develop if it can introduce new products. Various researches explained that the success in conducting innovation will influence the work (Ardyan, 2016; Avlonitis & Salavou, 2007; Bhat, 2005; Eris et al., 2012; Han et al., 1998; Matear et al., 2002).

From the above explanation, there are some hypothesis proposed as follows:

H1: The quality of entrepreneurial networking gives positive and significant impacts on the innovation successful
H2: The quality of entrepreneurial networking gives positive and significant impacts on SMEs performance
H3: The innovation successful gives positive and significant impacts on SMEs performance

The Relation between the Quality of Entrepreneurial Trusting, Innovation Successful, and Performance of SMEs

The result of Tsai et al. study (2013) showed that the dimension of social capital (trust) can improve the will to do innovation. Some experts explained that the role of trust on innovation is caused by the higher of trust so it can reduce the cost of transaction among the actors, reducing the cost of searching and information, prize bargaining, and cost decision (Landry et al., 2002; Maskell, 2000). The trust towards the suppliers, partner at work, clients, government, and another business units will give contribution (Tsai

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

& Ghoshal, 1998). The higher trust will be the lower cost of monitoring toward the cheating partner. The lower monitoring is enabled to make further cooperation projects to innovate.

Trust is a conviction possessed by the company which shows that partner will do some actions enabling the company achieving certain benefit (Anderson and Narus, 1990). The improvement of trust will improve the SMEs performance (Nurhayati, 2009).

From the above explanation, there are some proposed hypothesis:

H4: The quality of entrepreneurial trusting gives positive and significant impacts on the innovation successful.
H5: The quality of entrepreneurial trusting gives positive and significant impacts on the performance of SMEs

The Relation between Entrepreneurial Orientation, Innovation Successful, and The Performance of SMEs

Basically, the company orienting on entrepreneurship will be able to improve the innovation of the products (Avlonitis & Salavou, 2007). Miller and Friesen (1982) thought that the company orienting on entrepreneurship, different from the conservative company, innovates bravely and regularly when taking big risks for their market strategy of market. The company must be proactive to supply the needs of the consumers, so the company will make some innovation of products for the consumers. The entrepreneurial orientation will make the company to make penetration in (Zhou et al., 2005). Lower product innovation comes from the lower entrepreneurial orientation, while higher product orientation comes from higher entrepreneurial orientation (Avlonitis & Salavou, 2007)

Some researchers explained that there is relation between entrepreneurial orientation and the work. At the beginning, the concept of model which explains the relation between entrepreneurial orientasion and work was made by Covin and Slevin (1991). Wiklund and Shepherd (2003) found a strong correlation between entrepreneurial orientation and the performance. Keh et al. (2007) found that entrepreneurial orientation can improve the performance of the company, especially SMEs. The relation between entrepreneurship and the performance will increase time by time (Wiklund, 1999). Covin et al. (2006) thought that the effectiveness of right EO is measured using the criteria reflecting the success of the company to realize the entrepreneurial chance into the growth of the company. The company with aggressive competitive orientation will have an ability to revise the competition rules, define the limitation of the competition, achieving the market position. This action enables the company to get the market segment and surpassing the competitors (Lumpkin & Dess, 2001; Zahra & Garvin, 2000)

From the above explanation, there some proposed hypothesis:

H6: The entrepreneurial orientation gives positive and significant impact on the innovation successful
H7: The entrepreneurial orientation gives positive and significant impact on the performance of SMEs

The Relation between Co-Creation, Innovation Successful, and Performance of SMEs

In this era, the consumers begin move to the company and efficiency focus towards the consumers' experience, for example, by doing collective creation to create value (Prahalad & Ramaswamy, 2002). This

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

is caused by the collective creating in innovating (Chen et al., 2011). Wang and Wu (2013) examined the impacts of dimension of collective creating (sharing knowledge) on the work. The customers agree to share information and technology with the supplier, the supplier can more understand the needs and the problems of the customers, which becomes the basic to improve the customers satisfaction (Narver & Slater, 1990). Through intensive interaction and knowledge exchanging, the supplier can integrate the comment and the suggestions of the customers into the process of production and make needed modification. As the result, sharing the knowledge of the customers can reduce the respondents' time to respond, lower transaction cost, and causing more cutting of cost (Carr dan Pearson 1999). The result of Wang and Wu research (2013) explained that sharing knowledge has positive and significant impacts on the work, seen from collective creating between the producer and the supplier or the producers and the consumers. Other experts have explained that the role of collective creating on the dimension of performance (Chuang & Lin, 2015; Grissemann & Stokburger-Sauer, 2012; Nysveen & Pedersen, 2014)

From the above explanation, there are some proposed hypothesis:

H8: Co-creation gives positive and significant impacts on the innovation successful
H9: Co-creation gives positive and significant impacts on the SMEs performance

RESEARCH METHODOLOGY

Collecting the Data and Sample Profile

This study chose Batik SMEs because Batik is one of culture heritage acknowledged by the world so we must protected. The sample of SMEs in this study is Solo (Kampung Laweyan and surrounding). Kampung Laweyan is one of the clusters of Batik producers known by surrounding area in Indonesia. This study made survey to the owners or the management of Batik SMEs.

There were 150 questionnaires and only 63 questionnaires which returned and could be analyzed furthermore (responds rate 42%). The average length of Batik SMEs is around 10.4 years. From the 63 respondents, there were 24 male respondents and 39 female respondents. Most of the respondents have bachelor degree (34 respondents). This is Table 1 of respondents characteristics.

Measurement

There were 6 construct used in this study: The quality of entrepreneurial networking, the quality of entrepreneurial trust, collective creating, entrepreneurial orientation, innovation successful, and SMEs performance. All the constructs were measured by seven-point Likert scales (1= strongly disagree; 7=strongly agree).

The quality of entrepreneurial networking is associations from some individuals or organization communicating one another to produce mutual benefits (Nurhayati, 2009). The indicator of the quality of the entrepreneurial network are work networking with loyal suppliers, work networking which gives additional values, qualified work networking, and work networking with profession organization (Gulati et al. (2000); Kasa (2007); Nurhayati (2009)).

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

The quality of the entrepreneurial trust is defined as the trust of the partner will conduct action that brings the company into certain benefit (Nurhayati, 2009). The indicator of the quality of the entrepreneurial trust are trusted by supplier, trusted by investors and financial organization, and trusted by (Kasa (2007); Nurhayati (2009)).

Co-creation is collective participation between the consumers and the producers to create the value in the market (Swass, 2010). The indicators of collective creating is intensive interaction, involving consumers, synchronizing decision, and transparence (Chuang and Lin (2015); Liao and Kuo (2014); Prahalad and Ramaswamy (2004a); Yi and Gong (2013); Zhang and Chen (2008)).

Entrepreneurial orientation from a company is identified as a company involved in technology innovation, conducting a risked efforts, and pursuing the proactive chance (Miller & Friesen, 1982). The dimension of entrepreneurial orientation is risk taking, innovativeness, and proactive (Covin & Slevin, 1989).

Innovation successful is the success of SMEs in doing innovation in the process or the final product. The success indicator of innovating is the success in applying new idea, creative in using the method in production process, the success in creating something new, and being able to offer new product as the first (Calantone et al., 2002).

Performance of the SMEs is the measurement of success achieved by SMEs in form of financial and non-financial. The indicators of SMEs performance are sales growth and overall profitability growth (Lindblom et al. (2008); Omerzel and Antoncic (2008))

The Data Analysis

To analyze the data in this study, we used SEM-PLS with WarlpPLS version 5.0 used as supporting equipment in analyzing the data. The reason of using SEM-PLS is because the sample is relatively small in number like 63 owners or managers of Batik SMEs.

Reliability and Validity

The test of reliability was by composite reliability and Cronbach alpha while the test of validity used convergen (AVE and loading factor). The instrument is said reliable if the score of composite reliability

and Cronbach alfa more than 0.60. The instrument is said valid if the value of the factor loading more than 7 and the score of AVE is more than 0.5. Table 2 shows that all the qualifications of validity and reliability have been fulfilled, therefore we can conclude that the instruments are reliable and valid.

Goodness of Fit

Model fit shows if the model of the research has been fit with the data of the research. There are 5 measurements showing that the model has been fit with the data. They are Average Path Coefficient (APC), Average R-Square (ARS), Average Adjusted R-Square (AARS), Average Block VIF, and Average Full Collinearity VIF (AFVIF). Table 3 describes that the model has good goodness of fit because the score of each indicator of goodness of fit shows is above the qualification.

The Results and Discussion

See Table 4. The quality of entrepreneurial networking can improve the innovation successful significantly ($B= 0.294$; $p<0.05$). H1 is accepted. The result of this study is similar with the previous study which

Table 3. Goodness of fit

Indicators of Model Fit	Value	Cut Off	Result
Average Path Coefficient (APC)	APC=0.218; p=0.017	p< 0.05	Good
Average R-Square (ARS)	ARS=0.288; p=0.004	p< 0.05	Good
Average Adjusted R-Square (AARS)	p=0.013	P<0.05	Good
Average Block VIF	AVIF=3.587	AVIF≤5	Good
Average Full Collinearity VIF (AFVIF)	AFVIF=2.240	AFVIF≤3.3	Good

Table 4. The result of hypothesis test

HIPOTESIS	KOEFISIEN	HASIL
H1: The quality of entrepreneurial networking → innovation successful	0.294 (p<0.05)	Accepted
H2: The quality of entrepreneurial networking → SMEs performance	0.248 (p<0.05)	Accepted
H3: Innovation successful → SMEs performance	0.201 (p<0.05)	Accepted
H4: The quality of entrepreneurial trusting→ innovation successful	0.218 (p<0.05)	Accepted
H5: The quality of entrepreneurial trusting → SMEs performance	-0.167 (p=0.083)	Rejected
H6: Entrepreneurial Orientation → successful innovation	0,134 (p=0.135)	Rejected
H7: Entrepreneurial Orientation → SMEs performance	-0.321 (p=0.003)	Rejected
H8: Co-Creation → innovation successful	0.095 (p=0.219)	Rejected
H9: Co-Creation → SMEs performance	0.289 (p<0.05)	Accepted

said that the quality of entrepreneurial networking can improve the success of innovation (Ahuja, 2000; Landry et al., 2002; Vandekerkhove & Dentchev, 2005). The quality of entrepreneurial networking is shown by the strong relation among the sides of a networking. This strong relation causes knowledge transferring is easily between those involving in the networking. If it is synergized, it can create ideas, skills, and supporting financing. The uniting of ideas, skill and financing can produce radical penetrations (Subramaniam, 2005). Zacca et al. (2015) explained that the capability of networking will create knowledge which gives impacts on innovation.

The quality of entrepreneurial gives positive and significant impacts on SMEs performance (B= 0.248; p<0.05). So, H2 is accepted. The SMEs which can build qualified networking, can create long term relation with business partners (Lamprinopoulou & Tregear, 2011). This long-term relation can improve the work. Basically, the good networking will give benefit in form of information and resources which give ability in making business decision and motivating the work (Spreitzer, 1996). The resources will improve the excellention of competition and the work of a business (Khayesi & George, 2011). So, it can be concluded that the quality of entrepreneurial networking will improve the SMEs performance significantly.

Innovation successful has positive and significant impacts on the work of SMEs (B= 0.201; p<0.05), so H3 is accepted. The result of this study is similar with the previous study (Ardyan, 2016; Avlonitis & Salavou, 2007; Bhat, 2005; Eris et al., 2012; Han et al., 1998; Matear et al., 2002). The ability of the SMEs in applying new idea, creative in using the method of production process, successful in producing

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

something new, and can offer new product at first turn (Calantone et al., 2002) must be suitable with the desire and the needs of market. It can influence the growth and the profitability (Ardyan, 2016).

The quality of entrepreneurial trust can improve the innovation successful significantly (B= 0.218; p<0.05), so H4 is accepted. The result of this study is similar with the previous study (Landry et al., 2002; Tsai & Ghoshal, 1998). The trust of entrepreneur towards the supplier, customers, government, or other organizations will influence the innovation in Batik entrepreneurship. The research conducted by Tsai and Ghoshal (1998) explained that social interaction can improve the number of innovation in the organization through exchange and combination of resources.

The result if this study showed that the entrepreneurial trusting quality gives negative impact on the performance of Batik SMEs (B= -0.167; p=0.083), so H5 is rejected. There are some points which can be the causes. The main cause is the type of trust in Batik industry in Solo may be based on the charismatic figure and born in Solo (especially Laweyan). In this study, the dimension of trust quality is trusted by the buyers, investors, and government. Those cannot improve the perfoermance of Batik SMEs.

The entrepreneurial orientation has positive impacts but it is not significant on the innovation successful (B= 0.134; p=0.135), so H6 is rejected. The result of this study is contrastive with the previous studies (Avlonitis & Salavou, 2007; Covin & Slevin, 1991). Other results also showed that entrepreneurial orientation has negative impacts on the work, so H7 is refused (B= -0.321; p=0.003). The result is different from the previous studies, that there is positive and significant impacts between entrepreneurial orientation and the inovation (Arif et al., 2013; Soininen et al., 2012).

Co-Creation has positive impacts but it is not significant on the innovation successful (B= 0.095; p=0.219), so H8 is rejected. Basically, co-creation will make product innovation (Blazevic & Lievens, 2008; Chen et al., 2011). There is a reason why co-cration cannot create the success of innovation. That is that the producer of Batik does not understand the motivation of the consumers in conducting co-creation co-cration. The quality of consumers' contribution on innovation activity is based on the perception of gaining benefit from the activity (Namibisan, 2002). Holbrook (2006) explained that consumer motivation to collaborate are social value and economics value. Roberts et al. (2014) also found that motivation is an important factor to encourage customers doing co-creation. Furthermore, Roberts et al. (2014) explained that there are three consumer motivations in doing co-creation: egosentric, altuistic and opportunity/goal motive. Franke and Shah (2003) concluded that internal needs to get the satisfying products a sense of fun and excitement will make creative action.

Co-Creation has positive and significant impacts on the SMEs performance (B= 0.289; p<0.05). It can be concluded that H9 is accepted. The result of co creation is a desired product of the consumers. The consumers feel satisfied with product they get and it will influence their loyalty. The more loyal, it can give great impact on the SMEs performance.

CONCLUSION

This study is seeking how the impacts of social capital dimension, entrepreneurial orientation, and co creation on the success of the success of innovation and SMEs performance. The result showed that: first, the improvement of innovation is significantly influenced the quality of entrepreneurial networking and trust while entrepreneurial orientation, co creation cannot improve the success of Batik SMEs in innovating. Secondly, the performance of Batik SMEs can improve significantly if it is influenced by the quality of entrepreneurial networking, co-creation, and the success of innovation, while entre-

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

preneurial orientation and the quality of entrepreneurial trust cannot improve the performance of Batik SMEs significantly.

The theoretic implication in this study are: first, the quality of networking and trust can improve the success of innovation of Batik SMEs. However, when the SMEs and consumers collectively create motives and design, this cannot improve the success of innovation for Batik SMEs. Secondly, the aim of creating value collectively is not to find something new but to improve the performance of the SMEs. Co-Creation only creates the trust in the consumers that they are cared for and appreciated in their opinion. This condition will not improve the innovation but the consumers can be loyal to buy and finally improve the performance of SMEs from the growth of sale and profit.

The managerial implication in this study are: first, focusing on building networking and trust must focused on how Batik SMEs conducting innovation. The strong networking and trust will relate with the stronger external party. This strength must be used by the entrepreneurs to absorb much knowledge, experience, and information from external party to bring something new for Batik product. Secondly, one of the ways to improve the work of Batik SMEs is by doing innovation. Innovation can be done if the employees have knowledge, experience, and skills in producing something new. The employees must have high creativity. Therefore, the SMEs must make cooperation with the government and private organizations to give training for the employees, so their skills making something new can be improved.

This research has some limitation. First, it is enabled that the choosing of the entrepreneurial orientation indicator is not suitable with the real situation of the field so it makes the results do not give significant impacts on the success of innovation and working. For the next research, it is suggested to choose the indicators which are suitable with the condition of the business. Secondly, the sample is very limited in number. It is needed to conduct some researches in other areas which become the cluster of Batik producers, such as Sragen, Pekalongan, and another. Thirdly, it does not consider the local culture to analyze the difference among the areas.

Chapter 46
The Relationship between Entrepreneurial Competencies, Competitive Intelligence, and Innovative Performance among SMEs from an Emerging Country:
Competitive Intelligence in SMEs

Ainul Abdul-Mohsin
Universiti Sains Malaysia, Malaysia

ABSTRACT

Competitive intelligence is vital to an organisation because it emphasises on understanding and measuring an organisation's competitive environment and the unstructured information that influence an organisation's strategic decision making. In fact, it also assists in creation of ideas and innovation. Yet, research on competitive intelligence practice among entrepreneurs is quite scanty. There is a need to investigate if entrepreneurial competencies and innovative performance is influenced by competitive intelligence. Thus, this study aims to analyse the relationship between entrepreneurial competencies, innovative performance and if competitive intelligence is the missing link among the entrepreneurs within the Malaysian SME context.

INTRODUCTION

Over the years, Malaysia has made significant progress to become a fast growing developing nation. Bolstered by a relatively stable political environment, much stride was made in the economic and social spheres. The country now prides itself with robust industrialisation to further propel its economy that was once heavily dependent on mining and agriculture. In 1991, the idea of realising a fully developed nation status, a nation that is entirely competitive, dynamic, robust and resilient by the year 2020, was mooted (Economic Planning Unit, 2001). This vision, dubbed Vision 2020, is predicated on the assumption that the country will invest in, among other things, policies and programmes to unleash the innovative power of the economy's engines of growth. This is so because innovation, and hence the emergence of an innovation-based economy, is crucial to the competitiveness, dynamism, robustness and resilience of the country (Guha, 2011). An Innovation Economy denotes an economy that emulsifies knowledge, technology, entrepreneurship and innovation in order to accelerate productivity, which is the heart of economic growth (Janeway, 2012; Nelson & Winter, 2002; Schumpeter, 1943). In order to compete with other developed countries and achieve developed country status as enshrined in Vision 2020, it is imperative that Malaysia take steps to develop a more knowledge-intensive and innovation-driven economy.

Towards this end, the government of Malaysia of late has embarked on a new economic strategy known as the Economic Transformation Program (ETP) (PEMANDU, 2010). Specifically, the ETP seeks to transform Malaysia into a high-income nation, a prerequisite of a fully developed nation. One of the most significant and vital factors of the ETP is the leadership of the private sector in building the nation's economy. In contrast, the government acts as the catalyst in policy making and high-impact funding. The plan is for the private sector to fork 92% of the nation's economic investment from 2010 to 2020, where approximately 73% would be domestic direct-investment and 27% foreign direct-investment (PEMANDU, 2010).

An interesting fact disclosed by the Department of Statistics Malaysia is that 97.3% or 645,136 of the total established businesses in Malaysia are SMEs and only 2.7% are categorised as large organisations (Jabatan Perangkaan Malaysia, 2012). As a major investing sector, the importance of the SMEs in the transformation of Malaysia has been duly recognised by the government. In the Third Industrial Master Plan 2006-2020 (IMP3), for instance, special focus was given to them by the government with their needs being addressed (MITI, 2006). The SMEs provide 57.5% of the nation's employment (National SME Development Council, 2014) despite having 97.3% of the total number of business establishments in Malaysia. In terms of Gross Domestic Product (GDP), they contribute a meagre 1/3 or 32.5% (Star Business, 2013).

In Malaysia, the definition of SME revolves around two criteria, namely the number of people employed by the entity or the amount of revenue generated. Prior to 1st of January 2014, an entity is considered a SME if its annual sales turnover does not exceed RM25 million (approximately USD6.1 million) or if the number of employees does not exceed 150 people. Due to changes in the world economic landscape, especially triggered by price inflation, structural shifts and changing business plans, the definition of SMEs has been revised accordingly. The new definition has the impact of including even more organisations into its fold. This revision, which was effective 1st January 2014, is described in Table 1.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Table 1. SME definition effective 1 Jan 2014

Classification	Manufacturing	Services and Other Sectors
Micro	Sales turnover of less than RM300,000 (USD74,000) or employees less than 5	Sales turnover less than RM300,000 (USD74,000) or employees less than 5
Small	Sales turnover from RM300,000 (USD74,000) but less than RM 15 mil (USD3.7 mil) or employees from 5 but less than 75	Sales turnover from RM300,000 (USD74,000) but less than RM 3 mil (USD736,000) or employees from 5 but less than 30
Medium	Sales turnover from RM15 mil (USD3.7 mil) but not exceeding RM50 mil (USD12.3 mil) or employees from 75 but not exceeding 200	Sales turnover from RM3 mil (USD736,000) but not exceeding RM20 mil (USD4.9 mil) or employees from 30 but not exceeding 75

Background

In recent years, the number of businesses in the SME sector has escalated in accordance to global development. A census conducted by the Department of Statistics Malaysia in 2011 established that 89.23% (591,883 establishments) of the SMEs are in the services sector, 5.98% in the manufacturing sector, 3.34% in the construction sector, 1.33% in the agricultural sector and only 0.063% in the mining sector (Jabatan Perangkaan Malaysia, 2012; National SME Development Council, 2014). Most of those in the services sector are involved in wholesaling, retailing, hospitality and food and beverages businesses.

In 2013, the performance of Malaysian SMEs was promising as indicated by many positive indicators such as increase in sales, increase in new orders, introduction of new products, business expansions within the country and even expansion to other countries (National SME Development Council, 2014). Despite this and the proliferation of SME establishments, SMEs generally are facing many challenges ranging from high cost of raw materials, shortage of skilled workers, low productivity and rising overhead costs, barrier to global sourcing, financing and credit issues, no accessibility to latest technology tools, high regulatory costs and lack of managerial capabilities (Mohd Aris, 2007; Muhammad -Mohd Zylkifli, Abdul Kamal, Mohd Rushdan, & Zakiah Hassan, 2010; National SME Development Council, 2014; Samad, 2007).

In order to address these challenges and to concurrently elevate SME competitiveness to be at par with those of developed nations, the Malaysian government has embarked on a commitment to support the SMEs via learning and development programmes, funding, matching grants, and outreach programmes. In addition, the government has stepped in to steer the economy away from being labour intensive to a more capital, knowledge and technology based that has the ability to innovate, design and develop new products and processes. This has the impact of making the SME sector more resilient (Tan, et al. 2011).

Nevertheless, despite all these assistances many SMEs still fail to sustain (Ahmad, Abdul Halim, & Mohamed-Zainal, 2010). Perhaps there are other factors that the SMEs need to consider in order to better grasp the reasons for their failure and their incapability to contribute sufficiently to the development of the Malaysian economy.

Transition into Becoming a High Income Status Nation

Like Malaysia, many other nations aspire to be a high-income nation. A study of thirteen countries that sustained a 7% yearly growth since 1947 noted that only six were able to achieve high income status. This accomplishment was driven by a revamping of the countries' SMEs. In five of these countries,

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

namely Hong Kong, Singapore, Japan, Taiwan and the Republic of Korea, the SMEs contribute significantly to the respective countries' GDPs. In contrast, Malaysia, which started off at the same starting point as Taiwan and the Republic of Korea, has lagged behind these two countries in the past decades. The Republic of Korea, for instance, has shown tremendous progress due to the rapid emergence of a technology, knowledge and innovation led-economy that fosters entrepreneurship and infrastructure enhancement (Shukran, Sultana, & Rahman, 2011).

Another noteworthy factor is that the Republic of Korea invests heavily in innovation capability by leveraging on its competitive intelligence (Kim & Ha, 2010). The concept of competitive intelligence (CI) is not new but has typically been neglected by many organisations, particularly SMEs. By engaging in CI, the Republic of Korea has successfully transformed itself into a high-income advanced economy and the world's 11th largest economy by 1995 (International Monetary Fund, 2014). More pertinently, 99.8% of businesses in the Republic of Korea are SMEs and they provide the population with 87.5% of employment. The Korean SMEs also contribute to more than 50% of the national GDP in 2011(Asian Development Bank, 2014; Guha, 2011).

The experiences of the other five countries have similarly shown a hike in the SME contribution to their GDPs from 2012 to 2014. For example, Hong Kong SME GDP contribution is at 58% (Chen, 2012), Singapore at 50% (Singapore Government, 2013), Japan at 55.3% (Hafeez, Shariff, & Mad Lazim, 2013) and Taiwan at 85% (Ur-Rahman, 2013). The ranking of these five countries on the Global Competitive Index Report for year 2014-2015 are as follows: Singapore was ranked second, Japan sixth, Hong Kong seventh, Taiwan fourteenth, and South Korea twenty-sixth (World Economic Forum, 2014). On the Global Innovative Index 2014, Singapore was ranked seventh, Hong Kong tenth, South Korea sixteenth and Japan twenty-one (Cornell University, INSEAD, & World Intellectual Property Organization, 2014). Malaysia was ranked twentieth on the 2014-2015 Global Competitiveness Index and thirty-third on the 2014 Global Innovative Index. From these rankings it is clear that Malaysia needs to explore new strategies to be at par with others. The rankings are consistent with the findings of Che-Ha and Mohd-Said (2012) on the lack of empirical evidences of innovation activities being carried out by SMEs in Malaysia.

It is evident that Malaysia needs a lot of catching up to do before it is able to compete with others. The SMEs are still lacking in competitiveness and innovativeness. In this era of globalisation, the survival of Malaysian SMEs depends highly on the organisations' innovativeness, creativity, technology, knowledge and entrepreneurship. The study by Bilton and Cummings (2010) indicate that highly innovative SMEs tend to grow quicker than non-innovative ones. Hence, Malaysian entrepreneurs must be bold enough to reinvent themselves and make themselves more relevant to the needs of the times or else they will face the possibility of being ousted from the market. As the experience of the Republic of Korea shows, Malaysian SMEs should prioritise their strategies to become more competitive and innovative. They should also be more vigilant of what the SMEs in developed countries are doing and be prepared to emulate them.

In addition, to the Asian experience, Malaysia can also look to the European Union (EU) for inspiration. In the EU, 98% or 20.7 million of the total business establishments are SMEs. The SMEs provide 87 million jobs and contribute to 67% of the total EU employment today. Their contribution to the GDP is more than two thirds (Ecorys, 2012). For instance, since the 1990's, France is one of the countries in the world that support its SME expansion by providing intervention programmes, such as the Competitive Intelligence (CI) programme (Larivet, 2009). This programme heightens the awareness of the SMEs on the importance of essential skills in developing CI practices and the benefits to be derived from it. Consequently, France and Belgium made the decision to include SMEs in their economic policies and

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

CI is part of the national agenda. This has made France and Belgium unique as compared to other countries. In contrast, most countries have yet to focus on CI as part of their strategy to enhance innovation. They only implement general plans involving scientific and technological information or knowledge management when planning their economic agenda (Bergeron, 2000).

According to Ahmad, Ramayah, Wilson, and Kummerow (2010), the studies on SMEs have typically been classified into two categories - external and internal. External studies focus on the role of governments in helping SMEs, particularly in creating the necessary environment that is conducive to their success, while internal studies are those that focus on organisational or individual variables like resource and managerial or planning competencies that influence business success. The present study looks at entrepreneurial competencies (EC) and their relationships to competitive intelligence (CI) and innovative performance (IP). It is thus an internal study.

Competitive Intelligence

Competitive Intelligence (CI) has been established in European countries as well as some Asian countries as a mechanism to enhance the innovative performance of SMEs. It is defined as an ongoing and systematic evaluation of the external environment for opportunities, threats and developments that could have an impact on the organisation and influence reactive decision-making (Strauss & du Toit, 2010). It entails the following of specific steps from the acquisition of raw information to the production of intelligence for decision makers (Roitner, 2008). CI has also evolved into a systemic application discipline (Bartes, 2010). As such, it is not only a product but also a process. CI is not just market research and information gathering. It is an ongoing process of translating data and information into intelligence by using psychological techniques and new technology. This ongoing process is to assist the decision makers to have a holistic understanding of their industry, the stakeholders, competitors' behaviour and capabilities, and finding ways to maintain or develop their competitive edge (Fuld, 2010). Various sources indicate that the generally accepted norm for the CI process includes the constructs of planning, collection, analysis, communication, and organisational awareness for decision makers in deciding action (Strauss & du Toit 2010; Saayman, 2008; Bose, 2008; Miller, 2001; Vedder et al.,1999; Gates. 1999; Kahaner, 1996). Support for this interpretation also comes from Muller (2002) observation that individuals who are knowledgeable in CI refer to CI as 'multistage process' which consists of identification of CI needs, data collection, analysis and distribution of information and feedback. Interestingly, the United States Central Intelligence Agency (CIA) CI cycle also consists of five phases which are planning, collection, analysis, dissemination, and feedback (Bernhardt, 1994; Calof & Dishman, 2002). Regardless of size, organisations normally establish systems to safeguard their internal environment by scanning the surrounding. However, they often miss to accurately assess the external environment (Herring, 1992).

The purpose of CI is to reduce environmental uncertainty and improve management decisions. It is a method by which an organisation aims to obtain strategies advantage by gathering actionable information about the factors that affect the business environment and apply the information to the planning process and decision-making in order to improve the organisation's performance (Saayman et al., 2008).

CI can assist the business in many ways, from the creation of new concepts, products, opportunities, markets, and positioning and the launching of new products, processes or services, to the generation of new ideas, the tracking of trends, mergers and acquisitions and the formulation of strategies (Wadie, 2011). A study conducted in the scientific township of Isfahan, Iran on the effect of CI on innovativeness indicates that the use of CI leads to innovation and ensures the survival of the organisation (Hussein,

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Farzaneh, & Amiri, 2011). This finding is corroborated by the study of small establishments in Canada that also shows a clear relationship between CI usage and innovative performance (Tanev & Bailetti, 2008). In addition to the effect on innovation, scholars of marketing have noted the importance of CI in shaping strategic decisions, the creation of new products and the building of the organisation (Jaworski, Macinnis, & Kohli, 2002).

Bisson (2010), in his article, remarked that French SMEs are increasingly dynamic in applying CI and getting connected to the globalised economy. For this reason, CI has a strong foothold in the EU. It has proven to be an important source of innovativeness and organisations are willing to invest heavily in this area (Priporas, Gatsoris, & Zacharis, 2005). Previous research on Malaysian SMEs has primarily focused on the external factor of governmental assistance and support in developing the growth of the SMEs (Saleh & Ndubisi, 2006). Too few studies were attempted to uncover and understand the internal factors that would influence the undertaking of CI by Malaysian SMEs.

Entrepreneurial Competencies

Entrepreneurial competencies (EC) refers to the "underlying characteristics such as specific knowledge, motives, traits, self-images, social roles, and skills which result in venture birth, survival, and/or growth" (Bird, 1995). For the purpose of this study, EC refers to the total ability package of an entrepreneur to perform the job role successfully, and this includes entrepreneurial, managerial and technical functional roles (Man, Lau, & Chan, 2002). EC is important for business growth, survival and success because it is capable of minimising the negative impact of business environment and is a key driver in SMEs (Ahmad, Ramayah, et al., 2010). It has been shown that successful entrepreneurs possess a high level of entrepreneurial competencies (Li, 2009). Therefore, EC is a crucial determinant in the examination of CI among Malaysian entrepreneurs.

According to Muller (2002), the success of CI is highly dependent on the availability of a set of required skills since CI is a multidisciplinary subject. Above all, Edelman, Brush, and Manolova (2002) stated that in SMEs all important and vital resources are held by the entrepreneurs and the SME performance depends on their skills, knowledge, abilities, experience and education. The entrepreneurs are the core decision makers and have the greatest influence on the organisation's roadmap formulation and the way the organisation is steered forward (Masurel et al., 2003). A preposition can be made that the result of a performance is affected by applying the appropriate knowledge into action, which is actually the competency.

It is important to examine the relationship of entrepreneur EC and CI because the SMEs' decision making process is a reflection of the entrepreneurs' competencies. An entrepreneur may personalise his approach on how the information is collected, analysed and ultimately used to improve innovation performance. This is pertinent in view of the fact that there exist very little findings on the relationship of entrepreneurial competencies and competitive intelligence to innovative performance relating to SMEs in Malaysia.

Innovativeness of Malaysian SMEs

In this era of rapid globalisation, the survival of SMEs depends highly on the organisations' innovativeness, creativity, technology, knowledge and entrepreneurship. Innovation, in turn, is the crucial building block for economic growth, development, and better employment. Rogers (2008) defined innovation as

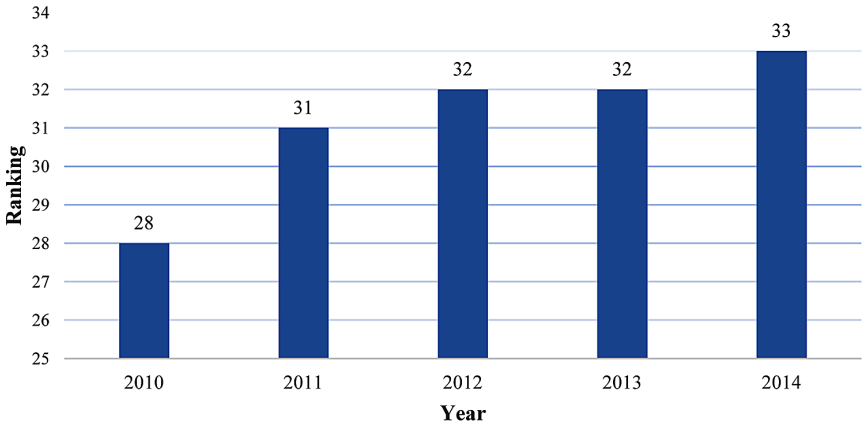
EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

the introduction of new knowledge or the advancement or modification of existing knowledge. This is in tandem with the view of Damanpour (1996), who posited that organisational innovation can include managerial, in addition to process and product innovation. Innovation, then, is multi-dimensional. Many or most authors would agree that having distinguished and superior competencies are very important for the survival of SMEs because such competencies will spur innovation.

As mentioned before, there is a dearth of information on SME innovative activities (Che-Ha & Mohd-Said, 2012). Although the research by Sveiby (1997) suggests that knowledge transfer is critical to organisational learning and success since knowledge grows when being used and depreciates when not used, Malaysian SMEs are incapable of fully embracing the idea. In general, they do not invest enough in IT infrastructure to promote knowledge management and innovativeness. Part of the reason for this is the large financial cost involved, lack of top management commitment, poor organisational culture, and lack of policies on knowledge sharing also contribute to this malaise (Chong, Chong, & Gan, 2011).

In conclusion, as confirmed by Hussein et al. (2011), CI can lead to innovativeness and this will help to ensure the survival of the organisation. Hence, it is vital to examine the relationship between CI and innovativeness in the Malaysian SME context. Malaysian entrepreneurs must not only be vigilant in scanning the environment for information but must also be smart in intelligence generation. Generating intelligence is a stepping stone to the cultivation of innovation culture in any organisation. Thus, the survival of Malaysian SMEs will depend on how well they are able to operate in an ambiguous environment and their resiliency and ability to create their own competitive edge (Mohd-Said, 2012). Even with all these challenges, SMEs are indeed a source of dynamism and innovation in the new global economy.

Problem Statement



Malaysia is progressing into an innovation-driven economy to achieve the status of high-income nation by 2020. As highlighted in an earlier paragraph, the new transformation is piloted by the private sector (PEMANDU, 2010). Yet, in Malaysia, 97.3 percent or 645,136 of the total business establishments are categorised as micro, small and medium businesses (Jabatan Perangkaan Malaysia, 2012) . Despite the various initiatives provided by the government to escalate their productivity, SME's are not performing to the expected level and contribute to only 1/3 or 32.5% of the nation's Gross Domestic Product (GDP) (National SME Development Council, 2014; Star Business, 2013). Furthermore, Malaysian SMEs are not competitive and innovative in conducting their businesses (National SME Development, 2011). Malaysian entrepreneurs are slow in reacting to the environmental changes, robust competition and new innovation. It is self-evident that innovation is the route to economic growth as it creates new organisations. This creation of new innovations is the fundamental source of growth in business and also for their continued existence (Teece, 2010).

It is obvious that one of the ways for SMEs to become innovative is to rely on the entrepreneur's ability and creativity to innovate. Nevertheless, Malaysia's ranking as reported by the Global Innovation Index for the past five years has been stagnant. In fact, it has declined from 28 to 33 in 2014. This is exhibited in Figure 1.

Previous studies of SMEs are either external or internally focused. Of the latter kind, particularly those relating to organisational variables and individual variables, there is certainly a lack of materials. This gap fuels a strong suspicion that the Malaysian SMEs do not have the pre-requisite entrepreneurial competencies (EC) to engage in CI and consequently improve their innovation performance (IP).Thus, it is postulated that greater success can be accomplished if the SMEs were to adopt CI since CI has proven

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 1. The Global Innovative Index from 2010 to 2014
Adopted from Cornell University et al. (2014).

to be effective in engendering business innovativeness and ensuring the survival of the organisation. Based on the above literature review, the following propositions are anticipated. Given the fact that entrepreneurial competencies have similarities with competitive intelligence skills, it can be anticipated that there is a positive relationship between entrepreneurial competencies and competitive intelligence. It can also be anticipated that CI has a positive relationship with innovative performance. This is because CI is also empirically proven to increase innovative performance in SMEs. According to Zaugg and Thom (2003), organisations with a greater pool of competency can convert the skills and knowledge into new or incremental products, services, technology or administrative practice. For an organisation to increase its innovation, it should have the ability to translate information into intelligence.

Hypothesis 1: There is a positive relationship between opportunity competency and competitive intelligence.
Hypothesis 2: There is a positive relationship between relationship competency and competitive intelligence.
Hypothesis 3: There is a positive relationship between conceptual competency and competitive intelligence.
Hypothesis 4: There is a positive relationship between strategic competency and competitive intelligence.
Hypothesis 5: There is a positive relationship between technical competency and competitive intelligence.
Hypothesis 6: There is a positive relationship between competitive intelligence and innovative performance.

METHODOLOGY

This study applied the quantitative methodology because most researches on these topics are conducted by positivists. The population for this study is the SMEs from various industries across Malaysia. This study employed the survey method and data is collected through mail questionnaires which are targeted at the small and medium enterprises (SME) in Malaysia. The respondents are Malaysian entrepreneurs who are also owners of SME businesses that have been in operation for three years or more. Only current active SMEs are considered to reflect the actual present-day SME environment.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

In deciding the sample size, this study utilising the statistical G*Power analysis (Faul, Erdfelder, Buchner, & Lang, 2009) and the minimum sample size with a medium effect size of 0.15 is 138. The researcher has decided to collect at least 138 samples because 50 samples as suggested by Hair et al. (2010) is the minimum number that the researcher must have in order to run a multivariate analysis. The measuring tool also plays a very crucial role in empirical research. The items for the questionnaire in this study employed measurements from the literature. Bachman and Schutt (2014) strongly suggest that if there are items already formulated, tested and provided good measurement, the items are recommended to be adopted or adapted. The measure for entrepreneurial competencies are drawn from Man, Lau, and Snape (2008), Ahmad (2007) and Chandler and Jensen (1992). Competitive intelligence is measured through the questions proposed by Saayman et al. (2008). This study also applies the measurement by Johannessen, Dolva, and Kolvereid (1997) to measure innovative performance.

Prior to conducting the quantitative data collection, a preliminary interview was carried out among 10 SMEs to obtain their perception on entrepreneurial competencies, competitive intelligence and innovation performance. This adhered to Morse and Richards (2002) who argued that employing a qualitative approach is appropriate if the purpose is to learn from the participants in a setting or process the way they experience it, the meaning they put on it, and how they interpret what they experience. Data obtained from these preliminary interviews are used to refine the survey instrument based on the local context.

A pretesting is also conducted to test the content validity and relevance of the survey instrument. The survey instrument was in dual languages as many Malaysian SMEs owners are more comfortable in answering surveys in Bahasa Malaysia. The translation in this study used the extended parallel translation procedure known as collaborative translation. This method assisted in achieving equivalence in meaning and captures the intended sense of statement (Douglas & Craig, 2007; Limpanitgul & Robson, 2009; Saunders, Lewis, & Thornhill, 2007).

Another major concern on measuring different constructs with the same method is the effect of Common Methods Biases. For the past fifty years, scholars have been debating about the biases effects that the measurement methods may have on the validity of the measurements (Podsakoff, MacKenzie, & Podsakoff, 2012). Common Method Biases (CMB) is defined as variance that is caused by the measurement procedure rather than the constructs of the measures (Podsakoff, MacKenzie, Lee, & Podsakoff, 2003). As such, this study has taken pre and post remedies suggested by Podsakoff et al. (2012) to minimise CMB. The remedies taken are procedural and statistical techniques.

FINDINGS AND DISCUSSION

The model hypothesis testing was tested by means of the Structural Equation Modelling (SEM) procedure using the SmartPLS. SmartPLS was preferred over other approaches because it is able to handle constructs measured with single and multi-item measures, able to incorporate reflective and formative measurement models and most importantly it can measure complex models with many structural model relations (Hair, Hult, Ringle, & Sarstedt, 2014).

One thousand questionnaires are mailed out to the respective respondents. Only 167 replies meet the specifications of the study, giving a response rate of 16.7%. According to Dennis Jr (2003), a reply rate of 10% is common with SMEs. This finding is consistent with the arguments made by Abid, Rahim, and Scheepers (2011), Bakar and Ahmad (2010), Hilmi, Ramayah, Mustapha, and Pawanchik (2011) and Quek and Sha'ri Mohd Yusof (2003) who have conducted empirical research on Malaysian SMEs

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

and have received a response rate between 5% to 25%. A Harman's one factor single test was conducted to test the presence of CMB. The result showed that 7 factors explained 74.19% of the variance with the first factor explaining for only 41.18% of the variance from the data collected. An assumption was made that the data was not being corrupted by CMB.

Prior to testing the model, the goodness of measure for all constructs is examined in order to test for their validity and reliability. The recommended items' loadings for reflective constructs cut-off value is 0.708 but 0.7 is considered acceptable (Hair et al., 2014). Nevertheless Hair et al. (2010) also cautions social sciences researchers to consider indicators with outer loadings between 0.40 and 0.70 instead of automatically removing them. The rule of thumb is, if deleting the items do not have any effects on the composite reliability and the construct's content validity, then the items can be retained. To measure the convergent validity, the composite reliability (CR) and average variance extracted (AVE) must be approximately 0.70 and 0.50 respectively because these are the acceptable value in many literature (Fornell & Larcker, 1987). Furthermore, Götz, Liehr-Gobbers, and Krafft (2010) argue that CR is a closer approximation of internal consistency compared to the Cronbach's alpha. Following this procedure, any loadings below the requirement are deleted giving the final AVE and CR value above the scale of 0.5 and 0.7. Table 2 demonstrates that the CR values range from 0.871 to 0.959 of which all exceeded the recommended scale. The AVE values for all the constructs range from 0.576 to 0.689 which are also higher than the recommended cut off scale. Thus, a conclusion is made that the constructs explain more than half of the variance of its indicators. Table 2 also summarise the results for the measurement model which clearly suggest that each construct shares greater variance with its own measurement items when compared with other constructs.

The Fornell-Larcker criterion is exercised to test the measurement model discriminant validity. Discriminant validity is the extent to which a construct is truly distinct from other constructs by empirical standard (Hair et al., 2014). It is important to establish the discriminant validity because it implies the construct is exclusive and describes observation not represented by other constructs in the model. As shown in Table 3 the square root of the AVE for each construct is higher than the correlation for each construct which indicates adequate discriminant validity for the constructs proposed in this study.

Figure 2 and Table 4 present the structural model and the path coefficients results which indicate the causal relations among the constructs in this study model. The analysis for the path coefficients and the hypotheses are performed using the bootstrapping method. Four hypotheses are supported with t-values larger than 1.645 and significant $p < 0.01$ and $p < 0.05$. From Figure 2 the R^2 value for innovative performance is 0.418 which suggests that 41.8% of the variance in the dependent variable is explained by competitive intelligence. The competitive intelligence R^2 value is 0.482 which means 48.2% of the variance in the competitive intelligence is explained by the opportunity, relationship, conceptual, strategic and technical competencies.

From Table 4, tests involving opportunity (H1) and relationship (H2) competencies reveal non-significant relationships with competitive intelligence. This perplexing finding is in contrast to the findings by Baron and Markman (2000), Kayakutlu and Büyüközkan (2010). According to these authors, opportunity and relationship competencies are important to the performance of competitive intelligence. Hence, care needs to be exercised in making sense of the result. The first point that needs to be noted is that research on competitive intelligence has mainly been done in western countries where the focus has been mainly on large organisations rather than SMEs. Unlike the SMEs where budget is a constraint, large organisations can afford entertainment and business expense to facilitate client engagement and business networking. Secondly, due to their financial stability and track record, large organisations are

always given more attention and opportunities by the government and the business community in Malaysia compared to SMEs. Moreover, large organisations have established their reputation due to their branding and marketing strategies. Thirdly, cultural differences could also be a factor. According to the Hofstede's cultural dimensions theory, a society's culture is affected by the society's values and behaviour (Hofstede, 1984). Malaysia's culture from the Hofstede's lens of the 6D Modal identifies Malaysia as high in power distance, a collectivistic society and a normative culture. This means that businesses in Malaysia are not adverse to a hierarchical set-up, employer/employee relationships are perceived in

moral terms and that there is a great respect for traditions. Due to cultural influence and budget constraint, SMEs in Malaysia may less likely invest heavily in relationship building with the business community and government agencies. Furthermore, in a hierarchically ordered society, the CEOs of the business entities are expected to be the contact point for all the higher level appointments and this can create time constraint and limitation on relationship building. Another conceivable reason for the non-significant relationship maybe due to the basic concept of *malu* (shame) in the culture of the Malays in Malaysia (Abdullah, 1993). Malay respondents constituted 79.04% in this study. To the Malays *malu* is an element of basic goodness and virtue in society and in one study, the Malays were reported to score highly on self-consciousness than other ethnic groups (Mastor, Jin, & Cooper, 2000; McCrae & Terracciano, 2005). The Malays are found to be *malu* to ask for favours and opportunities. Therefore, it is likely that opportunity and relationship competencies are less developed among the Malay SMEs due to the reasons given. However, mindful of the above discussion, it is plausible to conclude that entrepreneurs with superior conceptual, strategic and technical competencies are more likely to engage in competitive intelligence which may help them in enhancing their innovative performance.

Table 4 result confirms that conceptual competency has a positive effect on competitive intelligence with ß value at 0.218, t-value equals to 1.846 and $\rho<0.05$ significance level. The result is not surprising because as explained by Adidam, Banerjee, and Shukla (2012) the effectiveness of the CI depends exclusively on the implicit knowledge and expertise aptitude in linking the event, perceptions and data into trends in the organisation's decision making process (Grant, 2010). Furthermore conceptual competency requires the abilities to diagnose issues, analyse thoughts and match new concepts with the current knowledge and capabilities (Baron & Ensley, 2006; DeTienne & Chandler, 2004). The result in Table 4 also confirms that strategic competency has a positive relationship on competitive intelligence with ß value at 0.16, t-value equals to 1.80 and $\rho<0.05$ significance level. Strategic competency also requires the ability to plan for the short and long term and to anticipate issues (Ashurst, Cragg, & Herring, 2011).

Technical competency also has a positive relationship on competitive intelligence with ß value at 0.255, t-value equals to 2.975 and $\rho<0.01$ significance level. Thus, H3, H4 and H5 are supported. These findings are in agreement with Fai and Von Tunzelmann (2001) argument that organisations start with generic technologies and switch to incorporating new technologies to develop new processes and products innovation. Therefore, organisations with specific industrial technology and technical competency have a positive relationship with competitive intelligence. This line of reasoning is consistent with Sewdass and Toit (2014) which mentioned that to practise competitive intelligence, a person must be technically and scientifically competent to differentiate between information and intelligence. For CI to be successful, the core requirement is to be able to plan, collect, interpret, distribute and give feedback (Ranjan, 2009) which Muller (2002b) had identified as analytical skills and understanding scientific methodology. This agrees with Sarasvathy, Simon, and Lave (1998) study which has shown that entrepreneurs have these specific characteristics in information processing. Thus, strategic, conceptualisation and technical competencies play highly in determining the success of CI.

Table 4 also shows more pronouncedly that competitive intelligence is positively related to innovative performance with a ß value of 0.647, t-value equals to 15.737 and $\rho<0.01$ significance level. This is an interesting finding because there are evidences that lead to the conclusion that the use of CI leads to innovativeness, creation of ideas and increase in innovative performance (Hussein et al., 2011; Tanev & Bailetti, 2008). After all, Jaworski et al. (2002) has always emphasised the importance of CI in shaping strategic decision, new products and building the organisation. The outcome of H6 lends a strong support to the reasoning by Krücken-Pereira, Debiasi, and Abreu (2001) that competitive intelligence is a tool for

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

innovation process. Competitive intelligence is designed to foresee customers actions, competitors and government strategy (Gilad, 1996). Competitive intelligence utilises and scans the whole competitive environment to gain insight into the market condition and is proven to support an organisation's business strategy, market penetration, and development and product innovation (Petri°or & Strãin, 2013). Therefore, competitive intelligence is a tool that assists in the development of an innovative performance of an organisation.

CONCLUSION AND IMPLICATION

The purpose of this study is to examine the relationships between entrepreneurial competencies, competitive intelligence and innovative performance. This study makes several contributions to the literature on Strategic Management. The result coincides with the Resource based theory that regardless of the size of the organisations, they are able to utilise the resources (tangible, intangible, competency and capability) to achieve competitive advantage. Secondly, while previous literature concentrates on large organisations and focus on the competitive intelligence process, this study extends the pool of literature by examining the SMEs entrepreneurial competencies that lead to competitive intelligence. It seems clear that this study acknowledges that entrepreneurial competencies and competitive intelligence are positively related to innovative performance but only *specific* entrepreneurial competencies exhibit significant relationship with competitive intelligence because these *specific* competencies (conceptual, strategic and technical) require high ability of scientific understanding. These *specific* competencies also demand high ability to link the past, the current and the future occurrences with depth understanding of the likelihood of the risks and the advantages from their decision making. Finally, the most important contribution of this study is that it conformed to the RBT that says that competitive/innovative advantage can be achieved more easily by exploiting internal rather than external factors and that this can be exploited from the bundle of valuable tangible and intangible resources of an organisation.

It is a common knowledge that entrepreneurship is indeed an important factor for a country's economic success. Although many studies postulate that entrepreneurial competencies impact on innovative performance, the intervening role of competitive intelligence does accelerate this impact. Therefore, the government agencies initiatives programmes should be more biased towards enhancing competitive intelligence behaviour. These training programmes need to be developed with the full comprehension of the cognitive psychology of the Malaysian SMEs and the programmes should be related to competitive intelligence and innovativeness rather than generic scientific and technological training programmes. Extra attention should be given to factors that relate to the championing of competency, such as cultural factors and prior experiences. Training programmes must be focusing on conceptual, strategic and technical competencies. For this reason, *specific* competencies (conceptual, strategic and technical) are essential in bringing about competitive intelligence. On the whole, the empirical evidence indicates that competitive intelligence boosts innovative performance. As a result, the model stipulates that competitive intelligence is a powerful tool that bridges the relationship between *specific* entrepreneurial competencies and innovative performance among SMEs.

KEY TERMS AND DEFINITIONS

Competitive Intelligence: An ongoing, systematic evaluation of the external environment for opportunities, threats and developments that could have an impact on the organisation and influence reactive decision-making and follows specific steps from acquiring raw information to producing intelligence for decision makers in deciding action.

Entrepreneurial Competencies: The total ability package of an entrepreneur to perform the job role successfully which includes entrepreneurial, managerial responsibility, and technical functional role.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Innovation Economy: An economy that emulsifies knowledge, technology, entrepreneurship and innovation in order to accelerate productivity, which is the heart of economic growth.

Malaysia: A country that practices federal constitutional monarchy located in Southeast Asia.

SmartPLS: A statistical software with graphical user interface for variance-based structural equation modeling (SEM) using the partial least squares (PLS) method.

SMEs: Malaysian small medium enterprise is classified as micro, small or medium and depends on two criteria which are full-time employees and annual sales turnover as defined by the National SME Development Council.

Vision 2020: A blueprint for Malaysia to become a self-sufficient industrialised nation by the year 2020 encompasses economic prosperity, social well-being, educational world class, political stability, as well as psychological balance.

Chapter 47
Exploring the Factors to Green IT Adoption of SMEs in the Philippines

Alexander A. Hernandez
College of Information Technology Education, Technological Institute of the Philippines, Philippines

ABSTRACT

Green IT adoption is a sustainable use of computing resources to address the growing environmental challenges resulted from business activities. Drawing from this need, this article aims to examine the influential factors that affect Green IT adoption in SMEs. This article is an initial attempt to understand the Green IT adoption experience of SMEs in the Philippines. A framework is created encompassing the interactions of factors that facilitate the successful Green IT adoption of SMEs in developing countries. The framework was then analyzed with data from multiple case studies of Philippine SMEs. The results suggest that individual attitude, IT infrastructure, managerial support, availability of budget, and government support have significantly facilitated Green IT adoption in SMEs. The results of this article will assist business owners, policymakers, and industry associations to further Green IT adoption by SMEs in the Philippines. Practical and research implications are presented.

1. INTRODUCTION

Green Information Technology (GIT) allows the use of resources in sustainable manners, both in the area of environmental protection and business resource efficiency. GIT covers a broad range of organizational activities, human, and managerial practices related to the information technology infrastructure and business operations in organizations (Loeser et al., 2017). GIT adoption has resulted in new approaches to doing business which offers substantial benefits to organizations through resource efficiency achievement by reducing business footprint while enhancing performance. The growth of GIT adoption has also enabled a greater appreciation of its environmental benefits and awareness of sustainability issues and challenges in organizations. Thus, GIT adoption is predicted as the driver for sustainability among organizations.

The adoption of GIT has certainly provided useful benefits that enabled organizations to enhance their economic and environmental performance (Gholami et al., 2016) and develop better collaboration with their business partners (Kevin et al., 2015), and customers (Radu, 2016). The benefits suggested by adopting GIT have not only influenced for large firms to embrace it as well as the growing Small-Medium-Enterprises (SME) (Lim, 2015). The SMEs involvement in GIT adoption has afforded them better sustainable opportunities that they would not be able to achieve in the traditional notion on the adoption of information technology. Therefore, by involving in GIT adoption, SMEs have the opportunity to create a new market and sustain and reduce the impact of business on the environment, and leverage to remain competitive (Weng and Lin, 2011).

Despite the growing benefits of GIT adoption within organizations, a handful of studies is available on exploring the factors facilitating the successful adoption of GIT in SMEs, especially in developing countries (Kamaruddin et al., 2013; Piaralal et al., 2015). For example, the Philippines is one of the emerging economies with a growing number of SMEs in Southeast Asia region estimated at 774,664. The SMEs represent 99.6 percent of the total number of enterprises in the country. The Philippines was chosen as a reference to a developing world as it represents typical features of developing countries (Seyal and Rahim, 2006; Lertwongsatien, and Wongpinunwatana, 2003). The Philippines, despite the benefits from the stable economic development at an average of 5.2% between the period of 2010 and 2014, the e-Readiness Index (ERI) and Network Readiness Index (NRI) are still very low. However, The Philippine government started to dedicate a fraction of Gross Domestic Product (GDP) to Information and Communications Technology (ICT) adoption, to address the lagging technology adoption situation compared with other developing countries (Indjikian and Siegel, 2005). This situation is further difficult to understand as there are very few studies conducted to analyze the development of GIT adoption among SMEs and in the Philippines. Thus, it is necessary to understand the factors that facilitate the successful adoption of Green IT in organizations, most especially in developing economies. Therefore, this study attempts to investigate the fundamental research question:

What are the underlying factors for successful Green IT adoption in developing countries?

Hence, GIT adoption by SMEs has implications for the Philippines and the economies of other developing economies.

2. LITERATURE REVIEW

2.1. Green IT

The environmental challenges covering the rising carbon footprint emissions, depletion of natural resources and increasing waste ending in landfills is gaining more attention and discussion among public and private stakeholders (Hilty and Aebischer, 2015). These challenges resulted in the formation of accords in various regions to understand the implications of technology use on human safety, business, technology development, and environmental sustainability (Nisha et al., 2013). Conversely, it is a significant area of research in the information systems and environmental education. Thus, sustainability through Green IT was conceived as an important strategic focus for organizations. GIT is an efficient resource consumption using IT infrastructure as well as applying managerial and human practices, and

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

organizational policies towards sustainability (Molla et al., 2014). To date, many organizations have been proposing their GIT agenda (Ardito and Morisio, 2014), and anchoring it to the sustainability mission and vision (Hernandez and Ona, 2016), to realize the full benefits of GIT, both for economic and environmental performance. Previous studies suggest that adoption of GIT in organizations have been very limited (Khor et al., 2015), especially in developing countries (Hernandez and Ona, 2015). It requires technological and organizational readiness, and support from the external environment to progress from simple to broad – complex GIT adoption activities (Deng and Ji, 2015). Hence, there is a greater need to explore and initiate GIT adoption in organizations in developing economies.

2.2. Overview of the Philippines SME Industry

The Philippines SMEs is one of the fastest growing sectors and plays a vital role in the creation of quality jobs, opening doors of economic activities, and diversification of investments in the entire country. In 2015, the SMEs provided a total of 3, 532, 935 jobs or 62.3 percent of total jobs generated by all types of business establishments and (Lanzona, 2015).

Presently, the SME industry comprises information technology, logistics, and supply chain, manufacturing, marketing and business development serving financial and banking, tourism, health and medical, game development, and sustainability services, among others. In the National Capital Region (NCR), a rising competition is experienced by SME firms with new entrants. Existing SME firms, however, constantly leads the NCR SME sector, in which, competition is extremely influential (Aldaba and Aldaba, 2014).

2.3. SMEs' Characteristics in Adopting New ICT

Previous studies suggest that smaller firms exhibit different characteristics with larger firms (Lee, 2009). These characteristics assist SMEs organizations to adopt new technologies requiring some level of knowledge and skills. SMEs are progressively engaging in IT adoption as positively influenced by the top management (Ghobakhloo, Aranda, and Amada, 2011), getting responsive to technology adoption due to familiarization with ICT (Nguyen, 2009), making available to financial resources and personnel, and knowledge (Kartiwi and MacGregor, 2007), progressively influencing business partners to adopt innovation, (Shah, Ali, and Jani, 2011;), and (5) continuous investment to new technology to improve business activities (Tehrani and Shirazi, 2014).

2.4. Factors to Green IT Adoption

The capacity to incorporate the internal and external factors indicates the success of GIT adoption (Lim et al., 2015) in an organization. The subsections present the internal factors covering individual (attitude) and organizational factors while external factors include IT infrastructure, government support and industry pressure the contributes to the successful Green IT adoption in SMEs in developing countries.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

2.4.1. Internal Factors

2.4.1.1. Individual

Prior studies argued that managers' attitude have some degree of impact on the decisions to adopt technological innovation as positive attitude elicits better acceptance of technology (Del Rio Gonzalez 2005; Kevin et al., 2015; Weng and Lin, 2011). Also, it signifies the faster realization of the benefits and deployment of technology innovation in organizations (Etzion, 2007; Kamaruddin, 2013). Yaha, Nair, and Piaralal (2014) found that CEO's innovativeness and knowledge of green practices and practices also influence the adoption of Green IT. Thus, it is essential to understand the top management attitude, motivation, and values toward adopting new technology or innovations.

2.4.1.2. Organizational

Organizational support is identified as a critical factor in any successful technology adoption. The financial resources available and support are necessary to a faster diffusion of technology (Weng & Lin, 2011). The organization size is associated with financial resources (Lee, 2008; Lee, 2009), large organizations are usually more rapid in technological innovation adoptions given the financial resource availability (Zailani, Amran, and Jumadi, 2011; Lei and Ngai, 2012). Moreover, managerial participation and support assist in increasing knowledge and awareness of the benefits of innovation adoption by constant communication with the employees of the organization (Lin and Ho, 2011; Nedbal et al., 2011) making available of the innovation needed, sponsoring education in the utilization of innovation (Gonzalez-Benito and Gonzalez-Benito, 2006; Zhu et al., 2008; Jeyaraj et al., 2006), thus, enhancing the possibility recognizing the merits and lowering resistance to change within the organization (Mithas, Khuntia, and Roy, 2010; Jung, Kim and An, 2011).

2.4.2. External Factors

2.4.2.1. IT Infrastructure

De Zoysa and Wijayanake (2013) found that the technological complexity and infrastructure levels are significant factors affecting the GIT adoption within organizations. More specifically to developing nations in which Internet Service Provider (ISP) infrastructure is still slowly developing, regulations are being created, and equal accessibility is crucial to GIT adoption. The Internet is one of the primary components for faster deployment of GIT, while, Internet infrastructure and access in developing countries are outlying from acceptable (Shah Alam, 2009). Molla, Cooper, and Pittayachawan (2011) found that there is a significant association between technological resources and firm innovativeness. Thus, firms need to invest in creating an adequate IT infrastructure and capacity as it plays a major role in progressing GIT adoption in organizations.

2.4.2.2. Industry Pressure

The aspects of industry pressure are all known to affect technology adoption in various countries (Hsu et al., 2013; Gholami et al., 2013). Conversely, an organization with state of the art IT infrastructure could find it easier to encourage external stakeholder such as business partners to adopt a certain technological innovation (Scupola, 2009). Thus, integration of SMEs and business partners is critical for GIT implementation.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

2.4.2.3. Government Support

The government can establish a constructive business environment and drive innovation adoption (Weng & Lin, 2011; Molla, 2009; Thomson, and van Belle, 2015). Moreover, the government must ensure legal guidelines, protection for GIT adoption activities, privacy and security procedures (Tan, 2009). Similarly, the government plays a significant function in offering the needed national IT infrastructure, for instance, reliable Internet connectivity with acceptable speed that follows relevant technology standards (Lawrence and Tar, 2011). Moreover, government support significantly affects decisions of organizations to adopt technologies (Aragon-Correa and Sharma, 2003). Certainly, the government programs aiming to offer financial and economic support structures help SMEs in the adoption of GIT (Rothenberg and Zyglidopoulos, 2007; Ho and Lin, 2012). In isolation, the study will examine government's function in influencing the adoption of GIT in the Philippines.

2.5. Conceptual Framework

Through the literature search and incorporating relevant theories of GIT adoption in developing countries, this research has identified five key factors facilitating the successful GIT adoption including individual, organizational support, IT infrastructure, industry pressure, and government support (Table 1). The conceptual framework is presented in Figure 1.

The dotted lines show the shared relationship among the factors involved in GIT adoption. These factors have direct and indirect influences through their effects on other factors that could contribute to the adoption of GIT in firms. As the government's influence shapes all other key factors, it is presented as a large square which covers the other factors. The organization and IT infrastructure factors are shown with a reciprocal relationship with individual factor as individual-manager with a positive perspective and attitude could progress GIT adoption (Klewitz, Zeyen, and Hansen, 2012) in firms. The industry is also foreseen to affect IT and organizational capability in a specific developing country. Large firms often have the power to influence their business partners to adopt GIT (Johnson and Schaltegger, 2016). Therefore, with the readiness of their industry to adopt GIT, organizations may achieve economies of scales by adopting GIT. Thus, organizations could be willing to implement GIT. The availability of IT infrastructure and capability may also assist the readiness of the industry to a certain level, which could result in faster adoption of GIT.

3. METHODOLOGY

As the purpose of this study is focused on examining the factors that influence successful GIT adoption, an exploratory approach is the most appropriate for this study to obtain a deeper understanding of the GIT adoption experience of SMEs. This research utilizes multiple case study approach (Dube and Pare, 2003; Yin, 2011) to investigate GIT adoption by SMEs in the Philippines. It allows researchers to explore the phenomenon of interest comprehensively over a period as it presently lacks in the literature on GIT adoption experience by developing nations. Moreover, multiple case studies offer compelling, robust and intuitive means to examine GIT adoption within the SME industry. It is preferred over single case study as rational conclusions are more influential from multiple cases rather than single case study alone (Hartley, 2004). This argument provides main motivation in selecting multiple case studies as the

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 1. Factors contributing to the successful GIT adoption of SMEs in developing countries

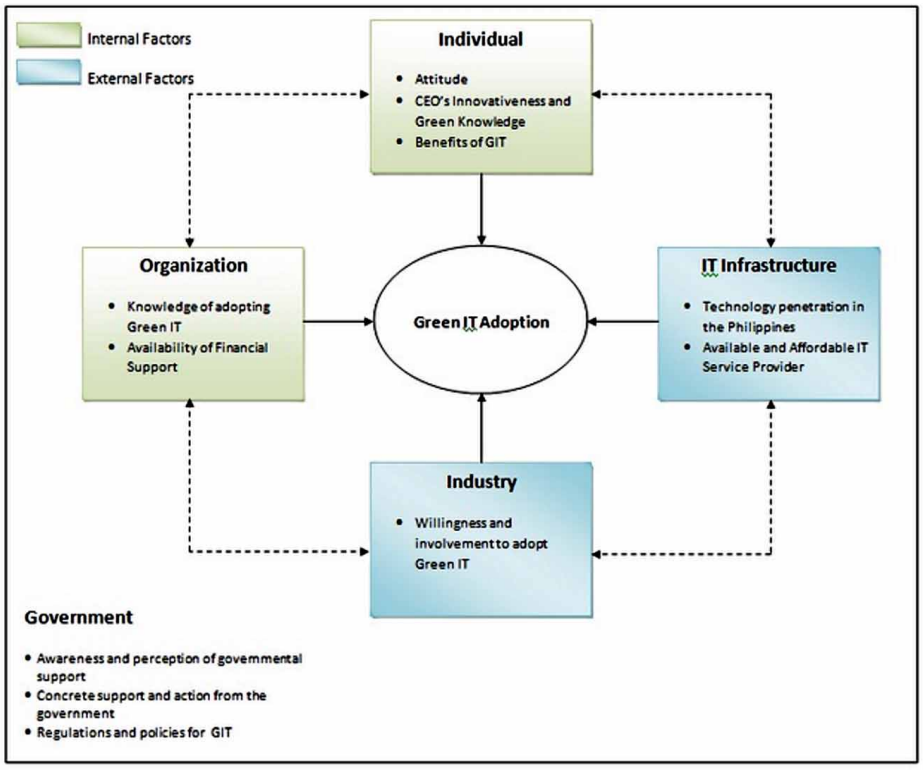

Table 1. Literature summary of GIT adoption in developing countries

Factors	Description	Research
Individual	• Attitude • CEO's Innovativeness and green knowledge • Benefits of implementing Green IT to the organizations	Del Rio Gonzalez, 2005; Etzion, 2007; Weng & Lin, 2011; Yahaya, Nair, Piaralal, 2014; Kevin et al., 2015; Kamaruddin, 2013
Organizational	• Knowledge of adopting green IT • Availability of financial support	Zailani, Amran, and Jumadi, 2011; Lei and Ngai, 2012; Weng & Lin, 2011; Lee, 2008; Lee, 2009; Lin and Ho, 2011; Zhu et al., 2008; Jeyaraj et al., 2006; Gonzalez-Benito and Gonzalez-Benito, 2006; Nedbal et al., 2011; Mithas, Khuntia, and Roy, 2010; Jung, Kim and An, 2011
IT Infrastructure	• Technology penetration in the country • Available and Affordability of IT Service Provider	Weng & Lin, 2011; Shah Alam, 2009; Molla, Cooper and Pittayachawan, 2011
Industry Pressure	• Willingness and involvement to adopt Green IT	Weng & Lin, 2011; Scupola, 2009; Hsu et al., 2013; Gholami et al., 2013
Government Support	• Awareness and perception of governmental support • Concrete support and action from the government • Regulations and policies for GIT	Weng & Lin, 2011; Aragon-Correa and Sharma, 2003; Rothenberg and Zyglidopoulos, 2007; Ho and Lin, 2012; Molla, 2009; Thomson, and van Belle, 2015; Lawrence and Tar, 2011

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

research method of this study. Choosing different types of firms with various programs and activities within the SME industry is certainly significant for the rationale of this research. Thus, offering a broad understanding of the adoption practices, experiences, and processes. Interviews are widely accepted approach in qualitative research method to obtain in-depth information concerning the context and phenomenon involved. Thus, face-to-face interviews were chosen in this research to broadly understand the problems and gain detailed insights into the GIT adoption experience of the SME firms. This research employed semi-structured, open-ended questions to allow the participants to fully communicate their opinions, thoughts, and insights regarding GIT adoption.

3.1. Questionnaire Development

There were two different versions of question guide used based on the research of Perotti et al. (2012). The complete and detailed version of the questionnaire was maintained by the interviewer, and the shorter version was sent to the interviewees. The questions were organized into five main sections: Individual, Organizational, IT Infrastructure, Industry, and Government. Moreover, the SMEs were also asked about general questions regarding their firms.

3.2. Sample Selection

Table 2 lists the participating companies and the interviewees involved in each case study. A short profile of each company is provided in Appendix A. This study included a game development – SME, one software development SME and one IT support services - SME. These three firms are locally owned from the very start of their business operation in the Philippines.

The three companies have distinct business operations. SME A core business is in game development while SME B is engaged in software development, and SME C has involved in IT support services. Interviews were conducted between March 2016 and January 2017. All participants from the three SME firms were interviewed in three periods to ensure that the needed GIT adoption information was covered. Follow-up interviews were also conducted to understand the SMEs GIT adoption experience entirely.

3.3. Data Collection, Validity and Reliability

The Chief Executive Officers (CEO) of the firms were interviewed as they are main decision-makers within their firms, and therefore, play a vital role in deciding the adoption of GIT. The three SME firms are represented in the study as SME A, SME B, and SME C to maintain anonymity.

To address the validity and reliability of the data collection, this research has applied multiple case study approach which is proven to minimize the interviewer bias towards the results. The tape-recorded face-to-face interviews conducted consist of approximately one to two hours for each interview. These interviews were transcribed for analysis. For the validity of the interviews, the participants were asked to verify the conclusions drawn from each interview (Yin, 2011).

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Table 2. Firms chosen for the study

SME	Core Business	Employees	Annual Revenue	Designation
A	Game Development	79	USD 87,000	Chief Executive Officer
B	Software Development	95	USD 95,000	Company Owner
C	IT Support Services	120	USD 58, 000	Chief Executive Officer

4. DATA ANALYSIS

4.1. Individual Support

The participant in SME A revealed optimism in GIT, efficiency, and communication of environmental benefits was found significant in encouraging full support, and boosting the morale resulted in changing work attitude in regard to GIT. The attitude of the participant towards GIT is a vital consideration in the acceptability to adopt it, the CEO elaborates:

We already started Green IT, and I believe it is enough to adopt to this innovation which promotes energy saving, environmentally friendly use of computers, and disposal. I firmly believe that Green IT is a responsive approach towards sustainability.

Given that GIT is new in the SME industry, it was not only perceived applicable and profitable, the majority of the stakeholders felt positive about GIT. It is found that attitude towards GIT constitute positive perceptions accumulated in the participants' experience embodied with functional benefits reflects a complete experience that participants have with GIT.

The main reasons for the positive attitude to be actively present in SME B staff is because of the continued acceptance of technologies as means of conducting business and extensive successful communication in many ways. The participant also believed that people nowadays have a lesser resistance to technology because they are more bound to technology in the organization in conducting business compared to other staff in the past. Thus, they are more comfortable with interfacing with innovative technologies and are less uncertain in trying them. It is through better awareness and ease of use level minimizes resistance towards GIT.

In SME C, attitude is a key element in any IT adoption decisions. The participants' attitude towards technology adoption may be illustrated by their optimism behaviors' regarding the change introduced by the organization. The participant perceived acceptance to GIT as a positive behavior and effective communication of the benefits by the top management. The participants believed that changes are bound to take place, and they are expected to adapt to change, the company owner explains:

We grew up in this company introducing innovations…I am always going to adapt whatever is needed to help our business become sustainable…We see Green IT to bring our company to beneficial outcomes and sustainable resource saving initiatives.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Also, the participant of SME C indicated that they are comfortable and felt easiness in using GIT, likewise, showing that they are educated and had a positive attitude towards IT usage and implementation. In addition, the CEOs of the three SMEs similarly have strong acceptance of innovation and knowledge on progressing green IT adoption process and processes within their organizations. The participants perceived constant innovation as a driver for sustainability in both economic and environmental performance.

4.2. Organizational Support or Readiness

The organizational support was an essential factor towards GIT adoption in SMEs. The participant of SME A revealed that managerial support highly encouraged GIT adoption by accelerating decisions, extensive communication, and support by building the morale of the staff of the organization.

The CEO ensures the continuity and drive of GIT adoption within their business operations. The organization has centralized decision-making approach, likewise, allowing for faster deployment of improvement activities relating to GIT, as the CEO of SME A explains:

The support towards the awareness of Green IT is visible. I lead various working teams and assist them in preparing our employees to apply Green IT, and that is something vital to our business strategy, where technology is integral part of our operations.

The managerial support to continue GIT adoption was essential to take advantage of its benefits. Moreover, the top management positions were occupied by professionals with strong technology knowledge and experience. As a result, it facilitated further decisions and implementation of GIT innovation within the SME A.

In SME B, the CEO facilitated collaboration to motivate and introduce change, adopt faster and influence financial resource allocation. The top management has a clear vision on GIT adoption by comprehensive communication and ensures that it is understood by the people in the organization, the CEO elaborates:

I have a strong conviction about using Green IT…All employees have contributions to the implementation of Green IT…they know what and why they should be part of the program…when I explained the benefits to all of them, they have a quicker turnaround and good results. I had reduced their concerns about it and their support was a huge factor.

Acceptance of new technological innovation such as GIT assisted the staff of SME B to improve their capabilities through communication of benefits, which helped them to become familiar with the practices and processes involving its initiation up to evaluation. Furthermore, the CEO was supportive of providing the essential resources for employing GIT activities and initiatives. Lastly, the CEO of SME B revealed that they regularly advised the employees to be updated with the most recent developments in GIT activities.

The findings showed that SME C had established leadership roles to further GIT in the organization. It is supported by their strong commitment to encouraging everyone to take part in achieving their GIT objectives. The top management builds the morale of the staff within the organization. For instance, senior management provides training to encourage GIT adoption by staff. The participant revealed that

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

top management commitment was very essential in the succeeding adoption and implementation stages of green procurement as they believe that the lack of top management support would clearly bring GIT to failure.

Also, the CEO of SME C believed that GIT adoption practices must be based on consistent collaboration and cooperation by all stakeholders rather than simply oriented to a single business unit or function. The CEO explained that entire management team has strong commitment and support allowing them to spur innovation and promoted the continual use of technology to enhance value-driven GIT practices and processes among them.

The three CEOs also explained that they allocate financial budget to continue to expand the adoption of GIT within their organizations. These SMEs have fully utilized the financial budget allocation for GIT awareness building and education, research and development, procurement of energy-efficient IT equipment, and participation in various government and private campaigns toward IT end of life management (e.g. recycle, reduce, reuse (3R)), and improvement of office environment allowing intelligent and natural lighting systems, provisions for other green business practices. Overall, the financial budget allocation was vital in adopting GIT in SME firms.

4.3. IT Infrastructure

The three SME firms expressed satisfaction on the IT infrastructures offered in the Philippines as they perceived it sufficient to execute their business operations and technology adoption. The CEO of SME A expressed that is easy and convenient to avail for IT services by Internet Service Provider (ISP) firms in the Philippines as there is growing number of ISP providers that offer adequate, affordable and reliable services. Also, it was explained that the ISP firms in the Philippines had been rapidly growing, offering more affordable Internet packages and relative speed and cost. Therefore, it is recognized that the ISPs in the Philippines is making progress to advanced standards. Given the strong IT background of the SME organizations, they have accordingly assessed the ISPs capabilities to support the Internet service needs in their business processes where GIT is involved. It allows the SME organizations to deploy GIT based business services on the Internet quickly. Significantly, the SME organizations have been aware of the current conditions of IT infrastructure in the Philippines.

4.4. Industry Pressure

The SME A recognized the need to take action on the recommendations of their business partners to adopt GIT. Although most of them decided to implement as to their initiative, the CEO believes that considering all stakeholders inputs such as business partners have built a better relationship with them to strengthen the adoption of GIT, as the CEO explains:

We listen to our business partners, but our companies guidelines take precedence...on what is the most profitable for our business and not others…logically, the starting point is always our company…

The CEO of SME A revealed that industry pressure by important business partners' is based on recommendations to further GIT adoption leading to a more sustainable business and environment performance achievements.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Industry pressure in SME B is characterized by the request of their important business partners. Likewise, the organization was forced to take positive action on initiating GIT adoption gradually to stay relevant with their business. Similarly, SME C experienced industry pressure through the recommendations by their business partners shaping their decisions to adopt GIT within the organization.

4.5. Governmental Support

In any technology innovation adoption, it was cited that regulatory support was an essential factor in GIT. The government encourages GIT adoption by formulating and implementing measures on energy-efficiency, legislation and incentives programs. Through the local agencies, they were encouraged to continue GIT campaign leading to resource saving, sound electronic waste management, and energy-efficiency.

The CEO of SME A rationally accepted that cooperative international and local agencies had put more likely some demands to adopt GIT as well as become more responsible by following environmental regulations by actively setting directions about GIT within the organization. Hence, formulate a proactive response to regulatory and legal measures to achieve GIT objectives. The government regulations were found significant to promote GIT adoption with their organization. It was made successful through constant support, incentive, and policies, which spearhead informed decisions towards GIT.

The findings from SME B revealed that the legal environment is conducive to promote GIT adoption and conduct business process innovation complemented with the regulatory support. The current subsidies encouraged cooperative relationships between the government and SME B which aims to help in the promotion and practice of energy-efficiency programs, as explained by the CEO:

We are compliant with government laws to operate…regarding the improvements in business….it is much easier for all SME companies…therefore, for us it is not only compliance but provide options to apply Green IT and business innovation given the policies applicable.

The CEO of SME C emphasized that direct control of regulatory activities related to GIT be constantly coordinated to ensure that significant provisions are followed at all times including quality of services, fostering environmental protection and social responsibility. Besides, the CEO of SME C emphasized that the government demonstrate a strong commitment to promoting GIT adoption through sectoral and industry cooperative agreements. These programs have direct impacts to the organization on their IT asset procurement processes, utilization of new technologies, and IT end of life management. The CEO elaborated on this view during the interview sessions.

5. DISCUSSION OF FINDINGS

5.1. Internal Factors

In this study, the participants from the three cases perceived that positive attitude affects GIT adoption. The majority of the participants agreed that they perceived GIT to take positive effect in their job and entire business operations. All participants revealed that through communication of the benefits of GIT, and positive attitudes are observed among the participants. The findings showed that positive experience

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

in GIT innovation more likely develops an attitude to adopt such innovation and knowledge on green practices among CEOs. Therefore, new initiatives or activities trying to enhance GIT adoption in SMEs need to highlight the establishment of constructive attitude, innovation and knowledge on GIT among the stakeholders.

The organizational support analyzed from empirical findings revealed to have a significant influence towards GIT adoption in SME firms. CEOs with strong IT skills and competencies together with technology champions specializing in GIT adoption worked together to assist in promoting the benefits of using GIT based technological innovation. Comprehensive sharing and communication of technological innovation's advantages to the staff improved awareness and encourage positive mindset.

Such an ability for convincing the organization to apply proactive strategic decisions approach for technological innovation adoption plays significant motivational medium for a speedily and informed actions with any GIT adoption. It was commonly distinguished by most of the participants in all three case studies to perceive managerial support and commitment as a significant factor following the successful GIT implementation.

This research revealed that CEOs acquired the necessary skills and competencies before they involve employees to adopt GIT. Therefore, top management has a clear understanding of the advantages and disadvantages of GIT to experience some forms of resistance among staff and reduce negative attitude about the adoption of GIT.

Furthermore, the managerial support accelerated decisions and progressed by directly communicating the relevance and scope of GIT adoption in attaining sustainability as a long-term objective. Thus, the study is consistent with the belief that top management commitment and support is significant for optimal and faster deployment of GIT to enhance business practices and processes. Moreover, management roles and responsibilities, skills and competencies were important in enlightening the significance of technology change management within the SME organizations.

Also, availability and direct allocation of financial budget to progress GIT adoption were vital in SMEs. These firms have committed to further GIT adoption by providing the necessary financial support allowing CEOs and managers to infuse GIT in all aspects of business operations.

Therefore, organizational support and positive attitude towards any technological innovation adoption certainly affect the decisions to adopt GIT within the SME firms.

5.2. External Factors

The IT infrastructure was found a considerable factor to the SMEs and assists them in successfully progressing Green IT adoption. Also, these SMEs find the IT infrastructure in the Philippines to be sufficient and ready for any technology adoption needs. Moreover, the SME organizations have strong knowledge about IT infrastructure in regards of strengths and weaknesses given they have applied different kinds of electronic business practices in the past.

Prior studies prove that industry pressures such as by corporate partners force organizations to adopt GIT (Molla, 2009). Industry pressure came out in the analysis of data from three cases of the study. Majority of the participants strongly emphasized that it is important to respond the earliest to the request and recommendations of their corporate business partners to maintain optimal corporate relationships, while some mentioned that it would not affect their decisions as far as they were more focused on what is more beneficial for them.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Collectively, the three cases have certain desire to have the capability to be compatible with technological innovations, by maintaining their competitive advantage, especially at the time that there are high levels of industry pressure. The organizations also perceived GIT adoption as cutting-edge approach appropriate for the present situation. Particularly, the sector they belong require GIT adoption due to the heavy use of IT and sustainability needs. The high GIT business awareness from its market-industry permitted the SMEs from completely engaging in the adoption of GIT and business. Thus, the pressure and demand of market and industry influenced the three case studies in becoming ready for GIT adoption.

The empirical findings revealed from the three cases that regulatory support experienced, and introduced by the government was found to have serious effects on the decisions to adopt GIT. More specifically, there was new energy-efficiency legislation in the country encouraging the organizations to take positive measures on energy-savings programs and initiatives. All participants from the three cases reported that moving forward to a more energy-conscious business offers value from energy-savings and other forms of resource reduction activities in the organizations were found effective. Also, the participants were familiar with government support to enhance GIT adoption in the Philippines. Thus, the action of the government is efficient and sufficient in directing SME companies in the adoption GIT.

Bose and Luo (2011) suggests that regulatory support affects the natural behavior of the organization relating to GIT and if incentives were provided it is more likely acceptable to adopt GIT. The findings revealed that their move towards GIT adoption is voluntary; however, they must be able to comply with certain regulatory legislations. Furthermore, all participants revealed that the legal environment in the country is conducive to promote GIT adoption and conduct business on it because the government provided incentives to them.

More importantly, all participants believed that the government has strong commitment and encouragement in promoting technological adoption by providing mediums with various stakeholders such as universities, research centers, and funding agencies to collaborate on new business opportunities from GIT adoption. It appeared that the government support is especially necessary for helping SME organizations to become more familiar with relevant legislations and programs in GIT to accept and implement it.

Besides, it appeared that regulatory support brought the willingness to SME organizations to implement GIT complemented by well-established energy-savings and resource conservation rules and regulations. Finally, having the assistance and support from the government is understood as a key factor for the faster GIT adoption rate in the Philippines and is not a key factor that interrupts SME organizations capability to adopt GIT programs. Thus, regulatory support highly affects SMEs to adopt GIT for long-term benefits and development initiatives.

6. CONCLUSION, IMPLICATIONS, LIMITATIONS, AND FUTURE WORK

This study is an initial attempt to provide an in-depth understanding of Philippine SMEs experience towards GIT adoption. Hence, this work contributes to the growing need to empirically examine GIT adoption experience in organizations most especially in a developing country perspective. More significantly, this study provides an understanding of the factors that facilitate successful GIT adoption in SMEs. Hence, this study contributes to GIT adoption discussion, more importantly, through developing a framework containing the interactions of elements that influence the adoption of GIT in developing countries.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

The study developed a conceptual framework that can be used to analyze the factors that affect successful adoption of Green IT in Philippine SMEs. The conceptual framework consists of two sources of influence: internal sources, and external sources. Four of the five factors were found significant in Green IT adoption in SMEs covering individual, IT infrastructure, organizational, and government support.

First, the study also found that the individual aspects significantly affects the initiation of Green IT adoption in SMEs considering their positive attitude, knowledge of technology, and recognized the Green IT benefits for the organizations. Second, the IT infrastructure is a contributing factor to the successful adoption of Green IT within the SMEs as the Philippines have satisfactorily IT infrastructure and ready to provide support for technology adoption needs. Third, the organizational support plays an important role in Green IT adoption, as managerial support, adequate financial budget and knowledge on Green IT was considerably available for three organizations. Lastly, government support is crucial in any adoption attempt of organizations; it is found that policies and guidelines are implemented to further the uptake of Green IT in organizations. Hence, the government is playing an active role in encouraging SMEs regarding Green IT and its benefits to contribute to the growing economy in the Philippines.

6.1. Implications

The findings of this research offer practical and theoretical implications. In regard to theoretical implications, the results can be used as a reference to further GIT adoption in developing economies. This study empirically investigated a conceptual framework that emphasized the five key factors comprised of both internal and external factors which might serve as factors for SMEs in adopting GIT practices.

The conceptual model could be further utilized as groundwork principles in investigating the factors to GIT adoption. It could be used as a guideline to enhance GIT situation in the Philippines. Also, this research has identified some of the main enablers by the SMEs in the country in GIT adoption.

Regarding practical applications, the findings of this study could be useful for policy creation and private organizations aiming to adopt in GIT practices. The findings could be used by legislators as a guideline in setting up plans, strategies, and approaches to accelerate GIT adoption level in the Philippines. Furthermore, present better intuitive information on which facets the government should mainly center on concerning the challenges faced by SMEs.

Moreover, the Philippine market has several business opportunities related to SMEs and ICT industries which are unexplored in the past years. Therefore, private IT firms could use these findings to be aware of the factors and grasp the potential and existing opportunities to serve and assist the unexploited market and completely lead and take advantage of GIT adoption to develop business operation and services.

6.2. Limitations and Future Research

Despite the contributions of this research, it is not free from limitations. First, this study only considers firms within the Philippines SMEs industry. Different industries (e.g., Business Process Outsourcing, Semiconductor) may have different profile and experiences in the adoption of GIT. Second, this research did not examine the roles of associations within the industry, standard bodies, and cooperating organizations in engaging firms in GIT adoption and its resulting benefits. By engaging these parties, a more inclusive and insightful understanding of GIT adoption could emerge. Moreover, the findings from the three firms revealed that these agencies and industry associations are actively taking part in promoting

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

GIT adoption within the industry. It would be valuable for future researches to explore how the roles of these associations change over time and the implications this shift on the adoption of GIT processes with the SME sector.

Lastly, this research is based on multiple case studies comprising three private firms within the Philippines SME sector, and a smaller number of participants were involved, and only the CEOs of the firms. Hence, the results might be biased as they present CEOs point of view. Also, the limited data on Green IT in the Philippine SMEs has limited the data collected for this study. Thus, the results have limited generalization. Future researches could involve a larger number of participants to increase the statistical generalization, and achieve a more comprehensive understanding of the GIT adoption experience in the Philippines.

ACKNOWLEDGMENT

The author gratefully acknowledges the constructive and helpful comments of three anonymous reviewers and associate editor on the earlier version of the manuscript which helped to improve the presentation of the article considerably.

APPENDIX

SME Companies

A.1. SME A: A game development provider based in Manila. The company was established in 2004 and growing its game development market by investing in research and development. To date, SME A has been serving mostly local firms. Thus, 90% of its game development products and services are produced for local and international firms. SME A's initiative to adopt GIT was driven by demand by its multinational firm competitors and the need to streamline its business process for operational and cost efficiency. SME A has been adopting GIT in working environment, waste management and data center operations.

A.2. SME B: Engaged in software development services to other companies. The company primarily serve local customers and suppliers mostly in the National Capital Region, while, they also serve other Asian countries such as Thailand, Singapore, Hongkong, and Malaysia. SME B has been actively doing GIT in end of life management, operations management, and data center operations. The company aims to engage in other GIT adoption practices fully, and processes as Sustainable Development Goals (SDG) in the Philippines was started. SME B believes that the software development business can be sustained by eco-innovation and eco-efficient strategies that encourage environmentally friendly business activity.

A.3. SME C: An IT support services firm. The company has considered a good number of GIT programs and initiatives in the past five years. SME C serves local and foreign clients in the IT support and services business. The company has been adopting GIT in procurement, business operations, working environment, and data center operations to attain sustainability in both economic and environmental perspectives. SME C is optimistic that GIT adoption can enhance customer satisfaction and competitiveness within the IT industry.

Chapter 48
Real Estate Crowdfunding: 2015 and Beyond

Steven A. Cinelli
REMARQ, USA

ABSTRACT

Like a juggernaut, "crowdfunding" has hit the media, the financial markets and the common narrative by storm. Incipient in many ways, the intermediation of financing transactions online has become a billion-dollar industry. As technology has advanced, even recreated, industries, there seems none more primed than "finance", an inherently information business. By creating improved efficiency, both art and science of finance are enriched. A 21st century vestige of the 1980's syndication business, real estate seems to be enjoying the fruits of the crowd, with $1 billion of property financings conducted online in 2014, with an expected $2.5 billion this year. For sponsors and investors, there appears legitimacy to the online approach, underscored by the level of venture capital now finding home in this burgeoning sector. Yet, like its progenitor, might real estate crowdfinance find legislative, regulatory, and practical headwinds, stunting its progress? Still early, with business models, scalability and sustainability still suspect, the current momentum seems promising.

WELCOME THE CROWD

While coined as a term only a few years ago, "crowdfunding" certainly has taken the markets by storm. Now in its pubescent period, the investment and financing methodology of aggregating small amounts of capital through online interactive platforms now accounts for billions of dollars (or Euros or Yen) in capital formation and a breadth of new investment opportunities for global participants. Gaining visibility in non-securities based fundraising, *ala* perquisite platforms such as Kickstarter and IndieGoGo, the power of technology to efficiently expose private investment offerings is creating a changed landscape for existing (and largely analog) financiers and intermediaries. This is particularly the case within the real estate realm. 2014 was a breakout year for real estate crowdfunding, with over $1 billion being infused into property-related investments through a hundred or so platforms, with an expected 250%

growth this current year (2015) (Massolution, 2015). Whether the growth of real estate crowdfunding is a function of discerning and executing a new and improved way of intermediating capital providers with capital users, or rather taking advantage of an opportune moment as swelling regulatory and legislative oversight hampers the commercial banking mother lode, it does appear that the market, as of now, shall be characterized by exceptional progress. But we do remain judicious in our view of the quality and expanse of such advancement, and core to this view, is the sustainability of the underlying crowdfunding business model, particularly for real estate.

IF THERE'S A HISTORY, THERE'S NO MYSTERY

As I commented in the 2015 Massolution Real Estate Crowdfunding Industry Report, what we are witnessing is largely a 21st century manifestation of the real estate syndication model heavily utilized during the 1980s, at least for commercial real estate endeavors. Working either as a principal or as an intermediary, groups would raise funds from "syndicates" of accredited investors through the private placement of limited partnership offerings, with proceeds being used to acquire, rehabilitate, construct, or reposition commercial or multi-family real property. In the effort to aggregate such funds, the "syndicator" or say, sponsor, would prepare a placement memorandum, sometimes consisting of hundreds of pages, which it would provide individual investors generally by snail mail, and then "dial for dollars". Participant investment sizes were set at a level to induce broad participation, but not so low to the extent of creating a "herding cats" phenomenon. The verbal exchange between fundraising sponsor and prospective investors tended to be laborious, as many of the questions or comments were redundant from investor to investor, regardless the size of a particular investment commitment, whether $25,000 or $250,000. Telling the same story time and again, was a characteristic of the syndication process. And then there was the monitoring of who received a book, what the nature of the conversation was and finally allocating time to complete the one-on-one sales process. Post fundraise, the communication between sponsor and investors was equally arduous, layering more paper, snail mail, and repetitive repartee.

Enter crowdfunding, or more explicitly, the analog nature of fundraising communication between sponsor and investors going digital. Rather than authoring a paperback tome, crowdfunding platforms expose dozens if not thousands of investors simultaneously to an investment proposition through engaging and informative websites, with customer relationship management (CRM) systems to support both outreach and ongoing investor management. Simply, this has become the process of telling the story singularly to a plurality, underscoring the efficiency of digital communications. Consider the cost and time savings of creating a single digital copy and allowing through invited online access compared to the mailing out 500 individual books, and then following up on each. And yes, pursuant to securities regulations, each of the old style books were to be manually numbered and controlled. Further imagine if such "book" required an amendment or introducing an update in the project. The efforts and costs to distribute what needed to be shared for informed investment decision making drastically have been reduced. This has wide ranging implications: in reducing the cost of intermediation, smaller transactions might be economically "syndicated", as one can only assess so much in intermediation fees so as not to severely impact investable funds, nor gouge the economics in the end for the investor.

Another aspect of online syndication is that a broader audience can be reached. There has been nomenclature applied here, such as the "democratization" of investing, which respectfully has a semblance of truth. Reducing the cost of intermediation, and specifically on a per investor basis, smaller minimum

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

investment sizes can be handled, leading to larger syndicates, which allegedly can be managed efficiently. A 1980s syndicator would be glassy eyed with a thousand participants in a million-dollar deal, and probably couldn't charge enough to make it worth his while, let alone spend time on property requirements.

Certainly one key difference from the syndicators of yesteryear is that the motivations on investors' part to invest has changed. Back in the 1970's and 1980's, individual marginal tax rates were elevated to 70% (Taxfoundation, 2015) for incomes over $200,000 and a key selling point of the syndications was that the periodic passive losses from owning real estate (largely through the depreciation expense) could be used to offset an investor's other ordinary income, thereby reducing taxes. Thus real estate syndications were real tax driven, as tax shields, and potentially in the end, if the property materialized a gain on sale, even better. Because of the huge demand for such tax shields, there was an onslaught of demand and syndicators continued to aggressively accumulate investor capital to put to work. What transpired though leading to a compression of this industry were: (i) the excessive level of investment led syndicators to invest in weaker properties and the actual losses ensued; and (ii) the federal government changed the tax laws, so that no longer could passive losses offset ordinary income. In effect, the syndication industry came to a halt.

A key difference between that period and now is the offerings made by the crowdfunding syndicates are investor motivation and the common usage of debt as a financing structure for the underlying properties rather an ownership equity position. Rather than owning the property as an equity holder, and advantaging the passive losses, the typical financing structure is a first lien secured loan, which would get paid back with interest upon the disposition or refinancing of the property. The interest rate on the loan, typically between 8% and 14%, addresses the appetite for yield that current investors maintain. We do recognize that many platforms offer equity type investments, but over 80% of 2014 RECF financings were embodied as secured promissory not

But back to the democratization spin: this is really not a new twist. In 1960, under an act of Congress, the Real Estate Investment Trust Act (Taxfoundation, 2015) was instituted, creating a mutual fund methodology for real estate investing. It was observed that real estate, particularly large commercial buildings and diversified portfolios of income-producing properties were the exclusive province of institutional investors, and legislators developed REITs as means for small investors to aggregate their funds to be deployed into larger real property. And to support the use of REITs as an investing aggregate, they were assigned a favorable tax treatment (namely the REIT itself was non-taxable subject to it distributing 90% of its income). The REIT methodology has proven to be advantageous to income-seeking investors, by offering portfolios of both real property ownership interests (equity REITs) and real property mortgage loans (mortgage REITs). The REIT industry is significant, with over $900 billion (REIT, 2014) of REITs outstanding, ninety percent of which are in equity form. In fact, taking the US lead, there are now REIT genres in over thirty countries.

APPETITE FOR ALTERNATIVES, REAL ESTATE IN PARTICULAR

Over the last twenty years and in particular the seven years, spurred with the convergence of the financial crisis and a broader quantitative easing from the Federal Reserve and other central banks, there has been dramatic shift in investment portfolios to alternative assets, and in particular real estate. With interest rates resting at an all time low, many investors are not only seeking out higher returns yet are desperate to find them given their own requirements. Think about pensions funds, whether public or

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

private, that must address actuarial payout requirements to their respective retirees. Close to half of public pensions in the US are underfunded, so not only are they challenged to meet quotidian payouts, but they have catching up to do for the accruals that continue. Bonds, or debt obligations of private and public sector entities, including the sovereigns, may be less risky than holding real estate, but investors have recognized that spreads between prime commercial real estate assets and high quality bonds have increased significantly over the last ten years, and their risk/return thesis has steamrolled the growing interest into enhanced real estate allocation. Currently we have seen interest rate differentials of close to 300 basis points (3.00%), between prime assets and high rated bonds, thus in a low interest environ, one can understand the move.

In general, alternative assets are increasingly becoming a staple in larger investment portfolios. For decades, traditional or core assets, such as public equities and bonds, represented the bulk of an investment portfolio, whether that is an individual investor or an institution overseeing billions of dollars of investable funds. But certainly over the last ten years, we have seen a demonstrable allocation away from core assets into many things alternative, such as private equity, venture capital, real estate, hedge funds, and even commodities. This has been a function of macroeconomic challenges and conditions, coupled with a growing comfort in what had been heretofore considered illiquid assets. And we are witnessing this practice across investor classes.

From a current macro view, public equities are priced up, elevating to price/earnings (19x-27x for S&P500 based on the analyst, The S&P500 PE Ratio, n.d.) and other performance ratios to levels not reached in since the tech bubble years in the early 2000's. With a historical ten-year average of a P/E of 15, certain analysts believe that the equity market is over priced by 30%. This could continue to propel upward though assuming a return of the retail (small) investor into the market, who has been sitting on the sidelines since the financial crisis of the late 2000s, and the elongation of quantitative easing by the Federal Reserve Bank, keeping interest rates low and liquidity available. But low interest rates have softened the appetite for fixed income investments, like bonds, as investors are seeking higher returns that what is readily available. Further, as analysts suggest equity prices are high, they also anticipate that market interest rates will gradually rise, negatively impacting bond prices. All said, investment capital must find a home and with the challenges of generating targeted and required returns, we are witnessing a marketed shift to alternatives.

But this is not defaulted assertion, one of chasing yield, for the reallocation to alts. Alternative assets provide investors new avenues to manage portfolio risk and return, correspondingly targeting certain outcomes, addressing exogenous factors such as interest rate movement and inflation. In fact, alternatives have become a strategic imperative in most larger portfolios. Many sizable investors whom once allocated a small portion (<5%) in search of pure "alpha" (above market returns), have now developed increased internal capability to pursue alternatives as a fundamental strategy. This is not manifested as a merely an increased allocation to managed venture or private equity funds, which still command expensive costs with management fees and carried interests. This is rather the desire to commit more funds, with better economics, including high levels of direct investing in these asset classes.

For institutional investors, alternatives will account for over 26% of their portfolios, according to a McKinsey & Company 2014 research report (McKinsey Company, 2014), and this escalates to about 30% for those investors with over $10 billion of assets under management. And in respect to such portfolios, nearly ten percent is dedicated to real estate.

REAL ESTATE AS AN ASSET CLASS

In assessing asset classes, investors' focus is generally on return, but in the context of other characteristics and criteria, such as liquidity, principal risk, comparability to other classes, interest rate levels, and volatility to name a few. And the basic premise is that the higher return being sought, the higher the risk being taken. With respect to real estate, some of its attributes are as follows:

- Its a tangible asset, i.e., you can see it and touch it.
- It typically generates return in two ways - through current income and capital appreciation
- With the exception of investing through publicly traded REITs, it is generally considered illiquid, meaning it will take some time to monetize the asset into cash, and when it is monetized, there is a high friction cost, such has there are typically selling or brokerage commissions.
- It is generally viewed as a complementary addition to the portfolio as it has low correlation with the core asset groups, i.e., its value moves independent of stocks and bonds, and thus can diversify or reduce overall portfolio risk.
- It is considered a hedge against inflation, as its income may rise through rents as overall price levels increase.
- It is financed with a combination of equity and debt. Debt investors may enjoy a fixed return through interest and principal payments while mitigating their risk with a secured interest in the property. Equity investors capture a variable and hopefully higher overall return, through rents and property price appreciation, which is enhanced by using the "leverage" of the aforementioned debt.
- And lastly, real estate's value tends to be highly localized due to market conditions, credit availability, and the timeliness and breadth of information available on the property.

In terms of investing in real estate, there are various methods, such as investing in pools of properties with others or on an individual property level, and in the financing instrument itself, namely equity or debt. As discussed, there are REITs (Real Estate Investment Trust), which enable investors to pool resources together and purchase a larger property or its underlying debt.

Other mechanisms to invest in real estate are through smaller limited partnerships or other Special Purpose Vehicles (SPVs), which also enable individual investors to pool funds to acquire medium sized properties, generally outside the range of the single investor individually. Sponsored generally by a syndicator, this further allows for diversification as well as passive investing, as sponsors serve as managers, for which they are compensated. Crowdfunding makes use of LP and other SPV structures to hold investment interests on behalf of the small investors providing for some level of bankruptcy or liability remoteness. And as stated, with either REITs or LP structures, real estate crowdfunding is the newest way to aggregate funds, but typically using online communications to facilitate capital raising and ongoing reporting back to the investors.

An additional way to gain real estate exposure is by acquiring property on one's own, be it residential or commercial, which is then rented out to a tenant. The investor, now landlord, bears all the responsibility of being the sole owner, such as being obligated on the mortgage financing, property taxes and insurer, dealing with maintenance and repair issues, and generally managing the relationship with the tenant. Certainly, there is a tradeoff in such active investing with doing something more passively, but there are costs and return limitations in the case of aggregated investing.

TYPES

Real estate is not a one size fits all proposition and the crowdfunding industry has been exposing most to its investor communities. There are many subclasses of real estate, each enjoying different attributes, risk elements, and return expectations. Further, depending on the subclass and the purpose of the underlying financing, which investment capital is deployed, time horizons may differ, as well as the nature of return being sought. As earlier described, real estate can offer two means of return – current income and capital appreciation, and based on the structure of the financing program and type of property, returns could emanate from either or both means.

Amongst the various subclasses are (Massolution, 2015):

- **Commercial and Industrial (C&I):** This subclass generally consists of office buildings, warehouse and distribution facilities, and retail space, which are leased out to private and public parties, thereby generating rental income. Such leases can be structured on short-term or long term basis, consist of flat payments or have periodic adjustments, and can even be tied to the operating performance of the lessee, in the case of specialty retailers with "percentage rent" clauses. In recent years, there has been considerable investment in redeveloping existing properties as many of the most active urban areas are gentrifying and repositioning themselves, creating incremental lease rates, and thus yield for investors. This subclass constitutes the largest proportion of the REIT industry.
- **Hospitality:** Think hotels and resorts: these properties generate income from providing lodging paid on a short-term basis, while offering amenities, such as food and beverage services, i.e., restaurants, golf, spa, social function services and business conference facilities. Generally suffering during recessionary times as both business and vacation travel becomes anemic, hospitality participants have enjoyed a substantive upsurge since 2011, with improving economic conditions buoying both business and consumer spending. During 2014, one RECF platform offered a partial equity interest in the Hard Rock Cafe Hotel, combining both economic incentives with patronage elements.
- **Multi-Family Residential:** This subclass refers to those properties deriving rental income for periodic residency, such as apartment buildings, but also cooperatives, duplexes and condominiums, which may be individually owned, and serve as rental property or primary residences. As purchase prices of single family residential have risen over the last three years, the demand for rentals has escalated significantly, which in turn has provided compelling income streams for multi-family investors.
- **Single-Family Residential (SFR):** This represents properties independently owned and detached from other properties, which serve as either primary (or secondary) residences or used for rental purposes. The value of US SFR properties approaches nearly $20 trillion, making it the second largest asset class in the US. Globally, residential real estate has been estimated at over $110 trillion, witnessing a considerable move upward over the last four years, bouncing off the temporal nadir of the crisis years. New means of SFR exposure have been practiced during such time as large real estate private equity firms and sponsors, such as Blackstone, Starwood Waypoint, Colony and others have accumulated large SFR portfolios or have purchased bulk packages, known as "tapes", of SFR properties owned by mortgage lenders, a result of foreclosing on delinquent home loans. Such bulk purchases are generally done at deep discounts, with properties then becoming part of a growing rental home portfolio.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

- **Infrastructure:** Generally, this subclass includes projects funded by either public sector entities or in collaboration with private sector participants and non-governmental organization (NGO). Included projects would be roads, bridges, storage facilities, educational facilities, student housing, agriculture, including vineyards and forest lands. In many cases, municipalities may take the lead by "floating" tax-exempt bonds, or some combination of NGOs and for-profit organization participate with complementary funds. We have categorized this as potential revenues may be derived from such projects to repay the capital provider, such as a bond issuer.
- **Community Projects:** A subset to "infrastructure", there is a growing public sentiment and participation in financing community projects for the purpose of improving the socio-economic condition, rehabilitating dilapidated structures or creating a structure (e.g. fountain) honoring a community leader or organization. These developments are generally not "revenue generating", so no economic return or reimbursement is being sought by capital providers.

FINANCING AND INVESTMENT STRUCTURES

There are generally two approaches used in the structure of the applicable financing. The first approach is for capital providers to invest as equity participants, wherein they own a contractual percentage of the property being financed. Depending on the legal structure being used (to be discussed herein), such equity investors are "shareholders", much like stockholders are in an operating company, and whose economic return is largely based on the appreciation of such company. Certainly, such property "equity" holders may also participate in the current income that is generated from said property, such as corporate shareholders may enjoy periodic dividends. With the current interest rate environment, many real estate equity investors are primarily attracted to the stream of payments from lease income, and secondarily to the overall appreciation of the property, which would be realized upon its disposition. Net rental income as a percentage of the original investment principal may compare favorably with other fixed income alternatives, such as treasury bills and bonds, and corporate obligations.

The other approach is to serve as a lender on the project, i.e., provide capital in the form of secured debt. This has been the predominant form of finance for projects finance through crowdfunding platforms. From a risk and return perspective, investing in debt is generally lower risk, given that the property as collateral is pledged in support of the loan and such debt ranks senior to the equity in the case of liquidation. But with lower risk comes a lower anticipated return. Such return is generally limited to an interest rate, which in most crowdfunding cases, is fixed during the life of the investment. But given some apparent lack of credit availability from conventional sources, such as commercial banks, various platforms (like Patch of Land) provide high yield short term loans up to 12 to 18 months. Another area of debt financing which we will discuss is in the residential mortgage space, with platforms following the lead of non-bank mortgage originators offering attractive, price-driven, low friction mortgage loans to homebuyers and homeowners.

In either the debt or equity structures, sponsors or the platform will frequently set up an investment entity, a Special Purpose Vehicle (SPV) as earlier referenced, which serves as the aggregator of investor funds and acts as the nominal owner of or lender to the project. For legal, regulatory and management reasons, the SPV will be the single owner of the investment structure and be overseen by the sponsor, who will manage the project on an ongoing basis. The SPV structure has been used in large part to have a single "voice" or vote on select matters, and would represent as a single shareholder for corporate gover-

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

nance purposes. While there are many SPV structures, the typical form is a Limited Liability Company/ Corporation (LLC), which blends elements of a corporation and a partnership, providing creditor and liability protection for LLC members, and pass-through tax treatment so that the SPV is not taxed as the entity level, thereby avoiding two layers of taxation – at the corporate level, and when distributions are made, as the member or shareholder level.

Table 1 is a comparison of the two financing approaches (Massolution, 2015).

It is worth noting that with the onslaught of crowdfunding, approximately 80% of the platforms and 90% of the funds raised to date have been in a loan or debt structure. On one hand, firms like Patch of Land, have made a market in providing short-term, high-yield loans to sponsors and developers seeking to renovate and "flip" a property. In 2014, Patch completed approximately sixty-five transactions, with an average transaction size of $350,000 (Massolution, 2015). Since then, both its overall capacity and average transaction size have increased precipitously.

The largest of the RECF platforms in terms of capital deployed, LendInvest, has focused on providing mortgage loans to aspiring homebuyers and homeowners, predominantly in the greater London market. During 2014, it is estimated that over $200 million of mortgage loans were originated by LendInvest, with a global reach continuing.

Table 1.

Structure	Debt	Equity
Role of Investor	Lender	Owner (Shareholder)
SPV Structure	Limited Liability Company, Limited Partnership, S-, C-, B- Corporation, Delaware Statutory Trust	Same
Fundamental Characteristic	Loan collateralized (secured) by real property and assignment of leases	Ownership Interest in the Property
Documentation	Promissory Note and Mortgage or Deed of Trust	Title of ownership on Grant Deed or Warranty Deed. Shareholder Agreement
Rights and Defaults	Creditor Rights – can pursue foreclosure in the case of default, such as non-payment of interest and/or principal when due	Shareholders Rights – Subject to underlying Investor Rights Agreement
Terms and Conditions	Fixed Maturity and Payment timing; Limitation on additional debt; balance sheet and operating covenants	Evergreen Maturity; voting rights; registration rights; and rights of first refusal on subsequent financings
Investor takes Property Price Risk	No. Debt is a fixed principal obligation	Yes. If the price rises, the investor enjoys gains. If price drops, investor incurs loss.
Economic Return	Periodic payments of interest on outstanding principal balance of loan, plus the return of principal.	Periodic payments of Income or dividends, plus participation in the price movement of the property, either up or down.
Liquidation Preference	Priority position over Equity.	Subordinate to Debt.
Transferability	Yes, subject to securities laws	Yes, subject to securities laws
Legal Recourse to Owner	Possibly, depending on legal structure of investment vehicle and terms of Debt by Lender	No. Generally limited to investment amount. Sometimes Equity Agreement includes capital calls, i.e.., request for additional equity investment.

PLATFORM APPROACHES

While we have identified during 2014 nearly 100 platforms engaging in some level of real estate finance intermediation, such platforms take different approaches to how they conduct their activities. This is really a matter of what they do, and for whom, as well as the types of economics they may derive.

We distinguish between "objective" and "subjective" platforms, or in more colloquial terms, "marketplace" facilitators and "direct issuers". In the former case, there are numerous platforms that have constructed their respective platforms to serve as a *utility* for sponsors and other types of fund raisers. They have built the infrastructure for sharing an investment proposition with their online network of investors, and handle most activities through the fundraising process. Simply, their sponsor client is "renting" the platform to enable the fundraise, wherein the platform is compensated in usage fees. From a business model standpoint, these platforms are driven by volume of transactions and increase fee generation.

In the "subjective" category, this is generally sponsor-based, i.e., the platform is directed as an extension of the sponsor, possibly even owned by the sponsor to efficiently raise funds. Relationships with the investor network likely pre-exist, with now such relationships being moved from an analog engagement to one digitally. This is very much the 21st century version of the older syndication model, where technology is used as the means of communication, but the economics of the syndicator remain the same – earning various layers of fees, coupled with a significant profit participation.

There is a third approach, considered a hybrid, which in most ways is a marketplace utility as described above. However, as an added feature to the service offering, certain platforms have arranged for interim financing, via lines of credit, where the platform will pre-fund the investment opportunity, assuring the sponsor has the capital to pursue his effort, and then take it upon themselves to remarket on a fractional basis the project to its investor base. Taking principal risk in terms of pre-funding, such platforms remain confident that their investors will afford the necessary take out. A number of the platforms that have raised venture and operating capital, have used their balance sheet liquidity to enable such warehouse financing to take place, rather than third party credit facilities. Of course for taking such risk, these hybrid platforms earn higher fees and may in fact participate in the overall performance of the financed project.

THIS IS STILL A FINANCE BUSINESS

While we can wax on about the merits of the internet in capital formation, a most pressing palaver is one that is fundamental within the media industry: what is more crucial - content or distribution – to the success of a platform? Certainly we can default to affirming both, indicating that one needs to develop strong and absorbable content, while cultivating reach. But in the end, finance is an information business, and although the 'net enables investors to be engaged globally at tremendous pace, the quality of the content will determine winners from losers. Democratizing the investment process by introducing more levels of investors, one need take heed that while enabling investors to participate, are they being delivered appropriate information to make an informed investment decision, and further, do they have the acumen to comprehend the content and its caliber? And do the new world intermediaries, in their betrothal to online engagement, actually assess and, as many espouse, "curate" the transactions with the appropriate level of insight and discipline, or shall we see the exposure of deals adversely selected, as fundraising sponsors see this as a new, and maybe only, path to raising funds for their projects?

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

As a directed aside, there has been an active, though lengthy, exercise at the Securities and Exchange Commission to reassess the current definition of "accredited investor" (Accredited Investor, n.d.). As of now, nearly every RECF platform exclusively directs its opportunities to the accredited investor. Developed as part of the Securities Act of 1933, the SEC provided an exemption to public registration of securities if issuers were to sell to those investors of means, namely those that had both the financial capacity to lose the capital they invest, but also had the wherewithal to investigate the merits of the opportunity. While earlier amorphous as to what constituted "means", in 1982 in a partial rewrite of the '33 Act, Regulation D was established defining an 'accredited investor' in terms of specific income and net worth levels. Yet since 1982, the absolute levels of income ($200,000 for single natural persons; $300,000 of married couples) and net worth ($1 million) have not been adjusted, with the exception of the personal residence exclusion from net worth. Well, over thirty-three years, one does recognize the value of the dollar has been impacted by time and inflation. Inflation adjusted, income and net worth levels to remain on par with 1982 would see a "bump" in income levels to $600,000 and a net worth threshold of over $3 million. This would in effect "de-democratize" the private investing world, removing nearly 70% of the currently classified "accrediteds" from the market.

In current Commission discussions about the definition, a key proposal deals with the financial acumen of the investor to determine whether or not s/he is capable of assessing the risks, given professional status, academic training, or germane credentials, such as a CPA or CFA. While not promulgated, the concept of credentials and observed acuity to determined accredited status makes tremendous sense, and, as stated, the ability to understand and assess the risk was core to the original definition. It does not go unnoticed that most of the wealth of the US is based in privately held companies and the ownership represented in unregistered securities. The existing exclusion for "insiders" (i.e., directors and officers) is predicated on knowledge of the company and its prospects.

This diversion into how the SEC may reconstitute the definition of accredited investor is apposite to the role of content provided by the crowdfunding platforms. Depending on the platform, and how they consider their role as a procurer of content, it is implied that is a level of responsibility on these screens to investing to provide adequate and comprehensible content for decision review and making, particularly as they are being paid to facilitate

CUSTOMER PROPOSITIONS

While we recognize that certain platforms are appendages of direct sponsors to supplement their direct fundraising activities, we will really address those platforms that are "fee for service" providers. Specifically, a sponsor of a real estate investment project is engaging a crowdfunding platform to assist in and manage the fund raising process, as would an investment bank or registered intermediary. To wit, the platform is compensated, largely on its success to raise the requisite funds through its online intercession with its installed investor community. Because of securities regulations, this is a 'closed system' where investors need to be registered within the platform and communication on any offering is done within a secured environment. In effect, while the platform gets compensated by the sponsor (user of capital), the sponsor engages the platform given its base of investors, prescreened with a hopeful appetite for the 'product' the platform avails. In essence, as with any intermediary, there are two customers - the buyer and the seller, in other words the sponsor and the investor.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

LET US REVIEW THE PROPOSITIONS FOR AND TO BOTH

Why would a sponsor engage a platform? Simply, to raise capital on its behalf. The use of intermediaries to drive the fundraising process is an old discipline, but one that typically has scale issues. The time and effort to develop content, package, distribute, engage and close investors is considerable, and sponsors may generally choose to allocate that responsibility to "hired help". Intermediaries, particularly investment banks, are engaged given a demonstrated ability to work with stables of investors, understanding their respective desires and inclinations for investment opportunities.

Sponsors, or users of capital, have a series of motivations for using a real estate crowdfunding (RECF) platform. Fundraising becomes much more efficient, as the financing process is the creation and delivery of information passed on to investors for review. By using an internet-based platform, the reach "horizontally" and "vertically" is tremendously enhanced. From a nomenclature basis, "horizontally" addresses the breadth of reach using online means; in other words, as simple and timely as communication can take place with an investor in San Francisco, the same communication concurrently can take place with investors in New York, Los Angeles, Chicago, even Rome and Hong Kong. Rather than using analog means, simultaneous distribution and reception of content through digital means has altered the landscape measurably. This is about telling a story "singularly to a plurality", as earlier stated.

Additionally, the use of technology allows the investment story to be shared in a more robust way, rather than merely in written format. The ability to depict the story "vertically" can enhance the investor engagement, deepen the knowledge of the project for the investor, which together can improve the likelihood that the investor may participate. Being able to use content beyond that which is "flat", such as script and photographs, sponsors and platforms can utilize videos, 3-dimensional depictions, interactive modeling, and provide online interviews with the principals: all of which creates more resonant story-telling.

Beyond the sharing of the investment to the network, technology also creates efficiency in ongoing investor management. Certainly, pitching the opportunity is key, but the administrative benefits through the fundraising process, say which may require updates, amendments or edits, can be performed with greater efficacy, and including post-transaction reporting. Do note that applied digital technology also addresses the ability to deal with more participants which may have smaller individual investments. Imagining an analog offering of $5 million, with a minimum investment of $5,000. Translating into up to 1,000 investors, this could be an absolute nightmare if dealing solely with analog (paper and phone) communications. This ability to deal with more fragmented networks enables broader reach to more levels of investors as compared to requiring larger minimum investment sizes.

And from the sponsor's standpoint, by having the ability to aggregate smaller sums from a larger contingent of investors, may in fact improve the overall economics of the deal for the sponsor. Many times, when a single large investor, *ala* an "anchor" investor, participates, such investor may desire to improve its own economics as it may view itself as critical to getting the deal done. This may translate into lower management or transaction fees to be earned by the sponsor, or a reduced profit participation. Either way, the "democratization" of investment can avail benefits to both the smaller investor and the sponsor.

Lastly, a growing motivation for sponsors to use such platforms is that financing may be committed up front. Whether a sponsor-driven platform or a hybrid, numerous platforms are taking "principal" risk, wherein they are prefunding the investment, intending to lay off the investment to their investors afterwards. For the sponsor, he receives his targeted funding without the risk of a crowd market's dismissal

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

of the opportunity. Quite true that there is a cost for such "bridging", but for the sponsor, his returns are more clearly based on the funded project's performance, so eliminating the risk of the initial step (of funding), it appears to be a worthwhile tradeoff.

AND FOR THE INVESTORS

We also much consider the motivations from the other side of ledger, namely that of the investors. There are a number of reasons for the growing participation in crowdfunded real estate opportunities. One observation is that investors can have access to incredible numbers of investment alternatives, delivered efficiently and comprehensively in a web environment. Rather than searching out investments through reams of paper prospectuses, an investor can review either on one RECF site or various sites a multitude of investments. Like angel investing and the syndication activities of years gone by, much private placement activity was highly localized, i.e., that investors with relationships with sponsors were generally geographically nearby, and thus the opportunities were also characterized by such local flavor. Now, with the expanse of online communication, investors can be exposed to sponsors and projects from hundreds of locations, which allow for broader opportunity and diversification.

Additionally, within the breadth, investors also gain access to varying structures and return elements. Different platforms may offer short-term debt while others, longer-term debt, or possibly a hybrid of debt and equity to enhance a prospective return. Also, as with syndications, investors can benefit from the active engagement of the sponsor, rather than pursuing real estate investing on their own, dealing with "toilets, tenants and taxes". Sponsors, and hopefully the platforms, conduct significant review of the project, its potential and its risks, disclosing such to enable informed decision making. For many investors, they desire to deploy capital on a passive participation basis, relying on those sponsors to deliver the returns being advocated.

But this is an investment process that is not without challenges for the investors, which must be recognized. In general terms, the investments being facilitated by the platforms are unregistered securities, and as such, have a high degree of illiquidity, in other words, they cannot be resold on a simple and efficient basis. While there are discussions by some platforms of developing secondary markets and trading, this shouldn't be expected in the near term, and thus investors need realize that an indefinite holding period is likely.

And as mentioned above with respect to an "anchor" investor possibly impacting the economics of the sponsor, the lack of one can prove deleteriously expensive for the participatory investor. Whether through egregious fee levels, profit participation, and administrative expenses, investors are subject to the financial whims of the sponsor, which according to certain accounts, sponsor and non-sponsor platforms may enjoy as much as 40% of an investment's economics, at times without any principal exposure. This can serve to dampen the normalized returns to the capital provider.

One other area that has yet been broadly tested has been the role of the platform in a transaction that may not perform as anticipated. While sponsor-directed platforms have an economic motivation to deal with challenges on behalf of their investors through profit participation, other "objective" platforms may find themselves in a conflicted position. For example, while the platform is raising capital for its paying client, the sponsor, it has developed and brought to the table its investor network to participate in the sponsor's project. What happens in the case difficulties ensue with the project, such as cost overruns, financing or marketing issues, or even suspect activities? What if the financing needs to be restructured

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

or refinanced or compressed from a loss? Which side of the table does the platform sit on – that of the sponsor, who has compensated the platform or that of the investors, which need to feel that their interests are being addressed in a fiduciary capacity, in hopes of mitigating risk? This to date has not yet been tested, with some of the platforms indicating the "outsourcing" to others for risk-mitigation and restructuring assistance, we do believe the jury is out on how sideways deals may be moderated and remedied.

SIZE OF THE MARKET

Over the last three years we have seen explosive growth in the real estate crowdfunding industry. Initially buoyed by a mere handful of platforms engaging in short to intermediate term commercial real estate loans or meager equity participation in relatively small rehabilitation or development projects, we have now witnessed a seismic shift in both number of platforms as well as types of financings being conducted. This phenomenon further has global breadth, as markets through Asia and Europe, Latin America and Canada, have developing platforms, particularly in the area of residential mortgage lending. In fact, one of the most notable crowdfunding projects was consummated in Colombia, where Prodigy Networks raised on behalf of the sponsor, approximately $172 million from 3,100 investors. A $240 million, 66 story, mixed-use residential/commercial building, BD Bacatá, is the tallest building in Colombia and certainly marks the power of the crowd.

The real estate crowd funding market continues to accelerate its growth and we anticipate this to continue as key segments, like originating single family mortgages, benefit from continued restrictive behaviors in the commercial banking market. From meager beginnings in 2012, where less than $20 million of financing was intermediated through online platforms, according to Massolution 2015 RECF Industry Report, we witnessed over $1 billion in 2014 volume with 2015 expected to advance by 2.5x that level, achieving about $2.6 billion across real estate asset classes and structures (Massolution, 2015). A snapshot of the market's growth is shown in Table 2 as we look at it from different perspectives.

Type of Real Estate

Since the beginning, C&I real estate has dominated the RECF product suite, with the exception of the BD Bagata project in Colombia in 2013, a mixed use (retail/residential) property sponsored by Prodigy Networks. Multi-family and single family residential properties continued to find interest within the platforms either in terms of "fix-and-flip" short term financing, or more recently, the growing appetite for first mortgage loans requested by sponsors in longer term rehabilitation and repositioning projects or homeowner/homebuyers in permanently financing their homes. Certainly, LendInvest, to date the most prolific of the platforms in terms of volume, has arranged over $200 million of mortgage financing in the London market.

We do anticipate that the growth in the home mortgage space will continue at a solid pace and to include the RECF players, as alternatives to bank originated mortgage loans have been on the rise since the financial crisis of 2008-2010. Non-bank originators now account for over 40% of US mortgage loans, of which 90% are ultimately being purchased by the government sponsored enterprises, Fannie Mae and Freddie Mac (Light, 2014). Notable US student loan platform, Social Finance (SOFI), expanded its product offering in 2015 by introducing higher loan-to-value, interest only owner-occupied purchase money and refinance loans, and is estimated to close nearly $400 million during this calendar year, with

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Table 2. RECF growth (in millions)

	2012	2013	2014	2015	2016	2020

institutional investors purchasing the growing pools. Through the European Union, Asia and elsewhere, mortgage originators are still largely the commercial banks, with covered bond programs offering the liquidity for refunding, with the commercial banks participating with many of the platforms as they become new source of originations.

Geographically, the US still dominates with over 90% of the North American volume. Of the 85 platforms identified by Massolution, 70 were domiciled in the US, with close to a dozen new platforms getting ready to launch in 2015. Europe, led by LendInvest, is witnessing additional activity across sub-classes of real estate, and the current year should see more than a doubling of total financing activity. Asia, while slower to develop in the real estate market, notes that dozens of platforms have launched or are soon to launch to hopefully follow the exceptional growth experienced in the peer-to-peer lending environment, which has built a $20 billion annual market with close to 1400 platforms in China alone.

As mentioned, the financing structure of most real estate crowdfunding projects takes the form of debt. Whether by ease of use or capturing the demand for higher yield, debt structures have been used across types of property and geographies. This is not uncommon across other financing segments in the crowd and P2P lending arena. P2P consumer lending, led by stalwarts LendingClub and Prosper, carved a niche for yield hungry investors, while SME (small to medium sized enterprises) platforms, or small business lending, has also attracted yield players as well as small banks, which are asset hungry, but can't originate on the same cost structure. In fact, OnDeck Capital, a leader in SME lending and a 2014 IPO, had disclosed that its average loan interest rate is over 51% per annum in its S-1 filing in

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

(now since lowered to 28%). Why with interest rates as stratospheric as that are platform originations steamrollering financing across classes and geographies? Certainly investors are keen, but the overall availability of credit has led many borrowers to trade access to credit over cost of credit.

There is a confluence of factors that we believe account for the tremendous rise in marketplace lending, including of course within real estate. While we believe the marketplace lending is disruptive and providing a new avenue for capital to reach desirous capital users, we believe this is largely a response and opportunity afforded due to the financial crisis of 2008-2010 and the legislative and regulatory oversight placed upon the commercial banking sector. Whether from the Dodd-Frank Wall Street Reform and Consumer Protection Act of 2010, or the Third Basel Accord of similar year, more stringent capital levels, risk management and compliance requirements, stress testing guidelines, and market liquidity risk assessment have collectively contributed to how commercial banks conduct themselves and practice the art of banking and finance. In simple terms, the banking industry was subjected to a major scolding by the regulatory regime, which viewed the practices and results of the major banks threatening capital markets and amplifying systemic risk within general economies, leading eventually to a pull back on the industry's traditional business line, the extension of credit. From 2009 through 2013, lending fell off tremendously and then began to rebound, but this laid an opening for others to enter the field, drawn largely to areas where the banks had taken a significant hit, such as commercial real estate loans, consumer credit, and single family mortgage loans. This has become a bastion of the crowdfunding contingent.

With blistering penalties, added compliance costs and requisite reserves, coupled with an interest rate environment making it difficult to generate needed loan/deposit spreads, the lending activity of most banks, large and small, witnessed slower growth. Certainly, coming out of the recession period, centered with the financial crisis, there has been growth, but we see non-bank entrants playing increasingly larger roles. Many major banks generated the preponderance of their respective income from activities outside of conventional balance sheet lending, but whether due to the Volcker Rule or other disciplines, such activities have been required to be tempered if not eliminated. What's left is low margined business, that of credit extension, particularly if these lenders do lend and hold the loan. True, there is aggressive loan sales, particularly in the mortgage space (to the GSEs), but for markets that either securitizations or sales cannot take place, it seems like the industry would rather sit on the sidelines, holding (somewhat) gilt-edged sovereign securities, avoiding upped capital and reserve levels if they choose to reenter the lending streams as once they did. It is worth noting that over the last thirty years, the number of commercial banks have been reduced from north of 14,000 to about 5,500 currently (see Figure 1).

This recent retrenching of the banking industry during a period of external capital demand has given increased rise to what's become know as "shadow banking", i.e., the extension of credit outside the regulated commercial banking framework. According to recent reports, credit extension outside the banks now rivals loans on bank balance sheets in the US (59% for banks to 41% for non-banks, per Goldman Sachs) (Nash & Beardsley, 2015). And in fact, total liabilities in the "shadow" are estimated to exceed $120 trillion, including swaps and other derivatives.

But to regress, the changing and challenging banking environment has given rise to new players to address the funding needs of consumers, businesses, sponsors and investors. We do believe this to continue indefinitely and shall assume that in the near term, the buoyant competition between banks and non-banks will assimilate into various partnering efforts (see Table 3).

Table 3 represents the top producing RECF platforms according to the Massolution 2015 RECF Industry Report (2015). Some of the notable findings are:

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

- Most platforms indicate a capability to avail both debt and equity finance on behalf of the sponsoring issuer. Ultimately, we have seen that 90% of the financing that has been done by the platforms is in a debt-like structure. The most common is a short term first lien loan, generally being used to finance a rehabilitation project.
- There is a growing movement into the owner-occupied single family residential mortgage space, with SOFI and Sindeo, playing off the success of LendInvest in the UK.
- Volumes continue to increase, particularly for those that have received some form of venture funding. They have had the ability to leverage their balance sheets, and either commit capital to close deals up front, later to syndicate the investment to their investors.

There has been additional movement in the recent year with a number of platforms now funded, beginning to experience some level of scaling. It is still suspect as to the overall revenue generation and sustainability, but we are seeing progress. Some of the RECF platforms (Times Realty News, 2015) that are demonstrating recent growth and deserve some notable profile are:

- *Realty Mogul* is a well-funded RECF platform which recently completed a $35 million Series B financing round, moving its total funding to north of $45 million. It has apparently consummated $80 million of property financings, largely debt, though there is a mix of equity participations in larger deals which it provided a minority tranche of the total equity. The company reports that it has invested in 240 different properties, which have a total project cost of nearly $500 million.
- *Fundrise* garnered quite a bit of visibility when it raised a significant funding round ($40 million) early in its development, from investor social media company RenRen and a series of New York commercial real estate developers. Uniquely, Fundrise has not limited its activities to accredited investors like the rest. It was first (and only) RECF platform to conduct securities offerings under Regulation A, i.e., under $5 million of funds raised, and before the Regulation A+ limits were established. It is estimated that Fundrise has completed $60 million of capital raises.
- *Patch of Land* has carved itself a niche is high-yield short term debt investments. Reducing the size of the participations to $5,000, accredited investors can participate in these short term loans, which yield from single to mid-teen digit returns. To differentiate its efforts, it has been practicing bridging the financing, using its own balance sheet, to fund a loan, later syndicating it to its investor network. Having raised over $24 million in venture financing, it has the capability to warehouse many of the loans it originates. Additionally, it is one of the few firms that is investing as a principal in its transactions. As of this writing, Patch has funded nearly $27 million in over 100 projects.
- *RealtyShares* began its activities in 2013 and has experienced some decent growth by offering both debt and equity participations in commercial and residential projects. Noteworthy, it has even included a bitcoin payment option. Recently, the company raised a $10 million Series A round. Thus far, it is estimated that RealtyShares have raised approximately $10 million for projects this calendar year.
- *iFunding*, another player in the real estate space, further reduces the minimum investment to $1,000 for accredited investors, placing such money into a variety of projects, whether multi-family residential, office or warehouse. It continues to experience growth as it placed just over $15 million in invested capital last year, and has seemingly doubled the volume through 2015.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

- *EarlyShares* is another emerging platform that actually began as a corporate finance platform, raising capital form early stage growth companies. Catching the wave of real estate investing, it began to focus on high-yield real estate investments, marketing average preferred returns of 7% and targeted overall internal rates of return of 18%.
- *Sharestates* is a New York based platform offering one-year senior secured debt investment opportunities, largely along the East Coast. The type of real estate focused on is generally multi-family, but the firm has moved into other subclasses. Of recent note, it inked a partnership with Ranger Capital, a mixed strategy asset manager, that has been increasingly committed to expanding its alternative asset portfolio. Under the partnership, Ranger is planning to invest up to $30 million in Sharestates deals.

HOW DO THE RECF PLATFORMS MAKE MONEY?

Many platforms have different operating approaches and as such they derive revenues in different ways. It is almost tautological on how the platforms state the benefit to each of their respective constituencies. There have also been certain accounts that the fees charged along the way have been excessive, on a deal by deal basis, where as much as 30% of the economics of a deal may be subsumed by the platform, rather than enhancing investor returns. Table 4 is an overview of the variety of fees or methods of compensation derived by the platforms.

HAVE THEY DELIVERED?

While we have discussed the growth in the market in terms of the number of operating platforms as well as growing volumes of transactions, can we state that the platforms are really delivering a "new world" of real estate financing and investing? Here are some takeaways from our research over 2014 (Massolution, 2015):

- Total project costs per deal ranges from $300,000 to $10,000,000.
- Funded participation by the crowd ranges from $150,000 to $4 million.

Table 4.

Compensation to RECF Platforms	% of Industry Revs by Fee Type
Application/Advisory Fee	3.0%
Construction/Development Fee	1.0%
Platform Usage Fee	20.0%
Transaction/Success Fee	32.0%
Financing Fee	10.0%
Management Fee	18.0%
Administrative Fee	8.0%
Carried Interest/Profit Participation	8.0%

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

- Average crowd funded deal size in 2014 was $800,000.
- "Crowd" is being redefined – there are more institutional investors.
- Over 500 campaigns were run in 2014.
- Platforms averaged between 4 and 25 campaigns, but this is changing with size of platform and type of financing offered. Certain platforms, such as LendInvest consummated nearly 350 campaigns in two years.
- Success rate of completed funding – 65%, with that number improving with more platforms moving towards prefunding deals.
- Average all-in yield was 11.2% - 7.8% current + 3.4% capital appreciation.
- And – investment results are promising, as most deals are short-term loan, with good performance, yet equity is a longer term hold, which is too early to tell how returns will be.

DRIVERS TO FURTHER GROWTH

By all accounts, this is a growth space. While we recognized under 90 platforms in 2015 within the US, we now are identifying close to 150. Again, this doesn't address the dozens of international platforms through Asia and Europe. And many of the existing platforms are accelerating their respective growth, given both macro- and micro- conditions in the market. But growth, quantitatively and quantitatively, can be much different based on strategies and resource availability. With an apparent "wind at their backs", here are a number of drivers to continued growth:

- Relatively low interest rate environment leads to higher allocation to real estate investment allocation. The search for yield is being partially satisfied with offerings of high-yield short term secured loans or payouts on attractive lets.
- Many sponsors are developing their own platforms as the ability to connect, control, converse and even cajole investors through online vs. analog communication has proven beneficial. We are also seeing that a number of intermediary platforms are now deciding to take "principal" investment risk, and hopefully add to their company value through portfolio returns.
- Continued regulatory and capital pressure on commercial banks, a fundamental source of commercial real estate (CRE) lending, has created a bit of credit pull back, opening opportunities for crowdfunding and other shadow banking endeavors.
- Improving sophistication of platforms in terms of what they offer to sponsors and investors. Whether that is bridging the financing, or offering solid aftermarket reporting, those differentiators can accelerate preference to certain platforms.
- Capital availability is a huge stimulant to growth. And that is capital in two flavors. A number of platforms have raised internal growth capital from the venture community, which allows them to build capacity in deal review and processing, as well as using their balance sheets to securing bridge loans to pre-fund the crowd offerings. Further, institutional investors, similar to the P2P lending space, are increasingly participating in this space, with dedicated capital commitments to select platforms. In one respect, this negates the "crowdfunding" descript, as one or two larger players taking down an entire issue would not be characterized as a "crowd". So this reverts to the earlier observation of RECF is the digitized version of the 1980 syndication model.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

- With the aforementioned capital, and pre-committed and sizable investor participation, various platforms are doing larger deals. Like the P2P industry, the processing costs of a transaction, independent of size is largely the same. With larger deals, where transaction fees based on size are paid, the economic model improves.
- We anticipate seeing more strategic alliances and alignment between these *avant garde* platforms and their banking brethren, particularly in areas that origination costs for the banks has become unworkable. This is particularly expected in the single family residential mortgage market.
- While the mantra thus far has been about "deal flow" and "upsizing the deal", we do believe that in the end, within the finance world, the primary proposition of value will arise from data production and monetization strategies. With the exception of a mere handful, data monetization has not registered as important. We believe this will change.
- And while real estate is contained within the illiquid alternative asset grouping, as transaction volumes in size of deal and number, we anticipate seeing a return of the securitization market, with private label securities, which may include pools of crowdfunded offerings. SoFi has successfully securitized nearly $1 billion of student loans, and is intent of doing the same with their direct mortgage business.

And in discussing opportunity, we cannot be naïve in assuming clear sailing for unbridled growth. True, there will be obstacles. Some of the concerns to growth emanate around risk management, which in terms may alter the success of any particular crowdfunded investment. Could it be poor underwriting of the risk up front, i.e., adverse selection of deals; or post-funding oversight, i.e., if a deal goes sideways, how is risk mitigated and managed? Here are some of the issues that we believe will arise, which could have a dampening effect on the growth:

- While real estate crowdfinance may facilitate $2.5 billion in fundings for 2015, it is less than 1% of overall real estate financings conducted in the US. With an estimated $1.5 trillion in single family mortgages and just over $1.2 trillion in CRE financing estimated in 2015, the role of the "crowd" is *de minimus*. Nonetheless, the marketplace finance platforms are operating in the domain of a highly regulated commercial banking industry, and as one pundit suggested "If it looks like a bank, it could get regulated like a bank". One of the provisions with the Dodd-Frank Wall Street Reform Act addressed substantive non-bank financial firms, and in its "too big to fail" concerns established oversight on selected "systemically important financial institutions" (SIFIs). Using largely balance sheet tests (e.g., asset size, leverage, debt levels), these SIFIs are subject to the compliance requirements of their commercial banking compatriots. Among the acknowledged SIFIs are Metropolitan Life, Prudential, AIG, and GE Capital (Wikipedia, n.d.). Will any of the marketplace platforms become the size to warrant SIFI oversight? Highly questionable. But the regulatory and legislative tails into those operating in the "shadows" is a possible concern, independent of size.
- Risk management, particularly for problematic transactions, will reveal a needed capability and sustainability of many platforms. As we saw in the 1980s, as capital was abundant, syndicators were deploying funds is less than admirable projects. There compensation structures were premised on getting the deal done, with front end fees, only to see the ultimate project waste away.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Might we witness the same with the current portfolio of RECF platforms? One mitigating factor is that most transaction structures involve senior secured debt, as opposed to the earlier equity participations. Certainly deploying creditor rights as opposed to being subjected to them offers a risk mitigant this time around.

- Further to the above point, we are currently seeing a weakening in credit performance in P2P and SME lending. Is this due to stretching one's underwriting protocols to "do the deal" and sustain growth, or are broader economic conditions weakening? Finance is as much science as it is art. We incurred the wrath of over-lenient financing from the banks leading to the financial crisis of 2008-2010. Might the quest for growth lead to underwriting leniency?
- Currently, the transaction sizes within RECF are relatively small. The average transaction size in 2014 was under $800,000 with the mean transaction size about half of that (Massolution, 2015). While we know there are platforms that have raised capital, are using their balance sheets, and have institutional commitments for what they offer, most are still undercapitalized and focused on very small transactions. This raises the question of business and revenue models, and their respective sustainability. If a platform successfully consummates a $500,000 senior loan, it may make in total fees up to $35-$40,000. With personnel review, infrastructure, technology and general overhead, dozens if not more transactions need be processed to achieve breakeven if not ongoing profitability. Note that such transactions are generally not review per a simple credit scoring module, as each property, sponsor, risk factors and other variables are different. So we ask, at what point does this become a scalable model? Intermediation in these CRE and other transactions can be laborious, even if you use online connectivity with investors. There is still front end analysis, structuring, and monitoring to be done. How much margin can one derive if one only generates $40,000 in gross revenues?
- And as a subset to the above, how should these platforms be valued by the investment community? Should they be valued off of transaction volume, revenues, earnings, or other self derived metrics, such as size of investor base, possibly ongoing (recurrent?) portfolio management fees? Late last year, as Lending Club and OnDeck Capital prepared to price their respective IPOs, this author questioned the market valuations place on them. In comparative terms, while in the consumer or small business lending businesses, they were being valued at revenue and asset multiples 10-20x other companies with larger dedicated franchises, such as Wells Fargo, Capital One, and JPM Chase. Yes, those are banks, but they have deployed significant technologies to conduct their business, and they are diversified. Should LC or ONDK enjoy what can only appear as "technology multiples" vs. financial institution multiples, even though the fundamental business is lending. Since the IPOs and the immediate aftermarket run up, both have settled at about half their IPO prices, and are doing whatever they can to perform and justify even the current values.

CAPITAL MARKETS, ENTERPRISE VALUES AND EXIT STRATEGIES

As earlier references, capital access for the platforms has been a key driver to their respective growth. We have witnessed many raising venture capital even some strategic funds to progress. Further, firms like Realty Mogul and Sharestates have, like the top P2P lending platforms, received committed capital for usage within their markets to insure capacity to fund offerings.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Dot.com Redux?

During the early 2000's, the investment markets got whisked up in the next generation of commerce, namely the *dot.com* phenom. It appeared that a new value proposition was placed on companies that decided to move their business intercession to the internet for reasons of more efficient and less costly distribution. In fact, many upstarts decided to go directly on line to sell goods and services bypassing conventional distribution and sales channels. In many ways, there seems to be similarity in the growth of online financing platforms. During the dot.com days, there were those that succeeded (and still are) while there were many crash-and-burns. Rather than espousing the digital connection as the driver, the winners knew their basic businesses: Ebay in auctions, PriceLine in travel, Amazon in logistics, and eTrade in brokerage. But then we saw others like Webvan.com, which should have learned better the economics of the grocery business or Pets.com, which seemingly misgauged just how big its market was and its pet owning customer behaviors.

We know that venture capital has found a nice home in crowdfunding, particularly in real estate. But we ask on what basis are models being defined and valued. Recall the dot.com valued "eyeballs" even it there was no way to monetize such. Is investor network size or sponsor relationship bases to value? We have alluded to what the business of these platforms is – namely efficient intermediation for which fees are paid for success. The economics are still suspect with small transaction sizes, level of review and transaction volume.

A question that is raised refers to the potential value creation of such platforms for their investors. Many which have raised operational funds, upwards of $50 million, and at valuations that place post-money values in excess of $130 million. While we know the space is claiming to be "disruptive" to other real estate financing methodologies, such as banks and direct funds, we question whether the business and revenue models support such lofty values, and if so, what supports this. Unlike the P2P space, which is characterized by replicable financings, where some level of credit scoring and actuarial analysis can be performed, thus availing scale, can the RECF platforms be operated with the same mechanisms? Each transaction is seemingly different, requiring certain "laborious" analysis, assuming that the platform is doing some level of review and diligence. So the question is how many transactions can a platform undertake in a given week, a month, a year? As reflected in the mortgage origination business, it used to be that a loan officer could process 8-10 transactions a day. Now, maybe two, with the continued adds of regulatory and compliance requirements. With a cost of labor, and the size of deals which drive revenues per deal, how scalable is the model?

But we ask how should these companies be valued, based on their outlook for revenues and profitability, or on the use of technology to intermediate financial transactions? To expedite the review and processing of transactions, facilitated by technology is a plus, but will the investment results prove out in the end, or will, as some speculate, that adverse selection will creep in. Major financial institutions, all of which deploy technology across their organizations. But yet, they are still valued as financial institutions. For them, technology is a way to reduce costs, thereby providing desired financial services more swiftly and hopefully profitably. But that is their score card - delivering a product or service on a profitable basis. Referring to the platforms, technology too is an enabler, but should not be viewed as the end-all. These companies need to be measured the same way. What do they sell? How do they generate revenues? And can they generate revenues, servicing their clientele, on a profitable basis? We believe the jury is still out.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Let's ask what does create value for the platforms, all of which will hopefully evolve into revenues and ultimate profitability. We see four main pockets of value, which we believe that platforms should position for:

1. **Differentiation:** While many platforms are offering the same "product" to their respective investor communities, such as short-term high yield notes, we ask what's the difference between one and the other, separating a platform from the pack? A good example of differentiation is SOFI, which began in refinancing student loans, but its recent move into mortgage lending is notable. Rather than offering what thousands of mortgage originators (online or offline) are pushing, it has structured a high loan-to-value (~90%) without the historically required mortgage insurance. Its underwriting process and focus is creating a unique niche, yes, differentiation, that continues to set it apart.
2. **Unique Customer Engagement:** Certainly nicely designed and user friendly websites are a given, but how and what the websites may do to enhance the lifetime value of the customer to the platform is a key. Besides generating fees on completed transactions, how frequently does the investor (and sponsor) return to the site and are there further ways to monetize that relationship. Might this be through "paid" analysis and research, or other products that could be cross-sold? How "sticky" and "monetizable" is the environment that the platforms engage their customer?
3. **Revenue Model and Scalability:** We have discussed this earlier. Do the platforms have a unit economic model that is profitable on a fully-loaded deal by deal basis, using applied technology? Or do they have to reach a certain level of volume, either in total dollar volume or number of transactions? Like the P2P industry, profitability is becoming visible largely with increased loan sizes, not sheer numbers of deals. What must be the volume, transaction size and fee level to have positive unit economics?
4. **Data and Analytics:** Finance is an information business first and foremost. The use of technology can move and refine information much more nimbly than humans, and with higher frequency transactions, ability to track performance, introduce indigenous and exogenous factors into the mix, new insights can be introduced. Improved risk management, pre- and post- deal, as well as improved pricing the risk can be the result. While some platforms understand this in basic terms, few have developed data strategies, including monetization of the fruits of their activities. We do believe this to be the ultimate Holy Grail of technology enabled intermediation.

Through various conferences and articles, platform principals have been queried as to where is the inherent value within their models. The responses are deemed suspect and in fact, we believe that in the end, are just basic business practices, coincident to all platforms, offering limited incremental value. We don't believe they necessarily "create value". Here are some of the typical responses:

1. **"Quality Deal Flow":** Many platforms espouse the nature of their deal flow, i.e., financial opportunities that they have been introduced to for consideration of funding. Building a successful portfolio of deals, proving execution history and ultimate investment performance, like a Goldman Sachs, builds reputation and more outside interest to "shop there". But stating that one sees $10 billion of transaction opportunities to yield $10 million being pursued, becomes a logistic issue as well as tough to place value on. Establishing relationships with highly successful sponsors that become "in house" exclusive clients, has some merit, but in the nascent stage of the industry, it would seem that few platforms have earned the desired reputational capital.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

2. **Diligence:** Being exposed to new transactional opportunities is critical, but more so is the review and analytical process to determine whether an opportunity should be pursued and if so, how to structure it. A challenge is that large intermediaries have teams to assess and deliberate, and ultimately choosing to move forward on its selections, for which they are compensated upon completion. The fees paid to larger intermediaries tend to reflect the relative size of the deal, i.e., bigger fees for bigger deals, which allow for broad upfront effort. When it comes to smaller transactions, fees tend to reflect such size, so is the level of diligence more limited? Or given the structures of the offerings such that diligence can be compressed, e.g., with short term secured loans. And as technology is applied, can the diligence become enhanced with lesser levels of labor, and produce improved decision making?
3. **Investor Network Numbers:** A key benefit of using an intermediary is the breadth of its relationships to funding sources. Rather than a principal who is seeking funds directly "dialing for dollars", using an intermediary with established contacts in the investment community facilitates the fund raising process. Further, it is hoped that the likelihood of successful fundraising is improved, as intermediaries may have a unique sense of their investor sentiments and appetite for a particular issue. When comparing to an online platform, such investor relationships may not be as close knit and generally, the sheer numbers of online investor networks, while impressive, may not be characterized by the same strength of relationship. While the numbers may suggest the law of average in terms of more investors lead to a higher chance of success, one may ask is it better to have 10,000 small investors rather than 1,000 active larger investors to effectuate at deal? And are such networks proprietary to a platform, or do investors, seeking new places to deploy investable funds, sign up to many platforms? Numbers alone seem not to tell the story, rather, how active are the networks to get the job done.
4. **Visibility to Break Even Operations:** This is a little discussed topic, in part as the industry is in development and growth mode. As referenced, small transactions, still requiring a level of analysis and processing, tend to generate smaller fees. Has the economic model, on a deal by deal basis, been assessed and what might have to be achieved to attain breakeven operationally?

PROGNOSTICATIONS

As an industry in development, with new entries and methodologies, what might we experience in the coming periods? While we have alluded to the significant growth over the last year and forecasting similar rates over the next few years, what may be possible futures for this space? Here are some of the observations that may impact, positively and negatively, for further expanse. To characterize the "what if's", allow us to deploy a couple metaphors, black swans and butterflies. This descriptive we used in the Massolution RECF Industry Report which was released in the Spring 2015 (Massolution, 2015).

A "Black Swan" hails from Nasim Taleb's manuscript on Black Swan theory, which addresses hard-to-predict impactful events that with hindsight could have been expected. And the "butterfly effect", articulated by Edward Lorenz, implies that small changes in conditions in one area can result in huge differences elsewhere.

Some of the black swans we may reflect upon are:

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

- The demise of the "2 and 20" partnership model. Much of the institutional capital invested in alternative assets are generally managed through investment funds, where the manager garners a management fee, e.g., an annual 2% fee based on funds being managed, and a profit participation (or carried interest), which generally tracks at twenty percent (20%) of the earnings after return of initial capital. Over time, based on the performance of the funds, this can be a very expensive proposition to institutions, and many have developed internal capabilities to invest directly, thereby bypassing the aforementioned economic costs. With broader access to opportunities availed online, with professional underwriting, disclosures and portfolio management, it is conceivable that institutional investors will see the marketplace platform approach to deploying capital directly as a viable option, rather than through funds.
- While "crowdfunding" has typically been identified as small sponsors, entrepreneurs and other fundraisers using platforms to aggregate disparate capital for diminutive ventures, we have seen large corporate entities jumping into the fray. Not necessarily motivated by capital formation, but rather striving for better connectivity from their end consumer or client. Companies like Nike, Warner Brothers, CocaCola and Proctor & Gamble, have used the power of the "crowd" to facilitate engagement benefiting product development and marketing. As with consumer products, will larger real estate sponsor groups tap into crowd methods, harvesting a larger portion of the market for their own fund raising. Very likely, as we have already experienced
- Unsavory litigation. While most of the crowd platforms are operating under the 'accredited investor' exemption, i.e., offering investments to those that can 'fend for themselves', it is anticipated that eventually some form of Title III of the JOBS Act or Regulation A+ with enable non-accredited investors to participate in private and/or illiquid offerings. As such, might there be an occasion that a small investor, whom loses money in a deal, conclude that disclosures or overall management of a deal were less than adequate, casting a legal pursuit. Have the platforms accounted for such contingency? Or rather, while espousing the broader "crowd", will the platforms just remain affixed under the Regulation D exemption?
- Many platforms have successfully raised capital as referenced, with lofty valuations. With the IPO aftermarket performance of Lending Club and OnDeckCapital, will this put a damper on fundraising and valuations of companies pursuing marketplace finance. Recent exception is SoFi which consummated a $1 billion private financing led by SoftBank, valuing the business well into "unicorn" status. We remain cautious of both the flows and valuation of capital into this space. In fact, we do anticipate that there will be more strategic investment directed here, led by larger financial institutions.
- In the wake of The Dodd-Frank Wall Street Reform Act, financial institutions, large and small, have been subject to increasing levels of regulatory scrutiny as a result of the financial crisis of 2008-2010. Even large non-commercial bank financial institutions, characterized as Systemically Important Financial Institutions (SIFIs), such as Metropolitan Life, Prudential and GE Capital, are now subject additional layers of reporting and review. We have seen recently that the largest players in the P2P lending industry are now in dialogue with regulators about better or best practices, as well as risk management. We assume that as the RECF platforms gain in size, and intruding on the historic landscape of the banks, there will be the prospect of regulatory review, beyond the SEC's oversight of securities issuance. How this effects the practices and viability of the platforms is subject to speculation.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

And now, what about changes that might cause broad ripples, i.e., having a butterfly effect on the industry and its future. Among the "butterflies" we might just see are:

- Changing the definition of Accredited Investor. Having not adjusted the definition since 1982, the SEC has been reviewing what characteristics should define a "natural person" investor to participate in private (unregistered offerings). On one hand, by inflation adjusting the financial requirements (income and net worth) from the 1982 level to levels 2.5x higher would reduce the overall number of possible investors that could participate in such private offerings by almost 70%. In a constructive and historically sound manner, the SEC is reviewing other methods of "accreditation", such as professional and academic acumen as the tests for participation. We mention "historical" as the original exemption provision in the Securities Act of 1933 referred to not just the financial capacity of the investor, i.e., the ability to absorb losses, but also the ability to conduct an intelligent review of the investment opportunity. This "informed decision making" viewpoint is critical, particularly now in the "information age", and the ability to disseminate broadly requisite content to investors. This new approach may open up private markets, while underscoring the responsibility of platforms to articulate offering materials for investor consumption. Ultimately, this could enhance the overall numbers exponentially.
- While Title III of the JOBS Act has not been promulgated as of yet, there have been over twenty US states that have developed intrastate constructs for crowdfunding, thereby allowing unaccredited investors to participate, albeit limitedly, in private offerings. Will the states continue to take this up on their own in wake of the sluggishness at the federal level? We believe so.
- Crowdfunding is a subset of the growing "shadow banking" evolution, namely the extension of credit outside the regulated commercial banking market. We do see that both borrowers and lenders have a growing comfort in transacting outside the banking system. And with improving controls, risk management and accessibility, we see this to continue and accelerate.
- While access to investments through online mechanisms can avail investments to larger investor communities, this is not just about access but about opportunity. While the SEC's mandate has been proffered to mitigate risk through disclosure and reporting requirements in the '33 Act and '34 Exchange Act, crowdfunding should also be viewed as contributing to investment opportunity. Heretofore, venture and other alternative investments have been the province of the "upper class" which has the "qualifications" to participate in such higher-yielding investments, where the common investor could not gain access. In the narrative about income and wealth disparity at venues like the World Economic Forum in Davos, we need to find ways for broader communities to have access to compelling investments in order to build wealth, though the approach need be couched with certain protections and limitations. But of the three million businesses in the US, only 5,000 have public registered stock for investing and trading. Given that the preponderance of wealth has been created in privately held companies, might not a thoughtful approach to availing a more expansive miscellany of investments be constructive and economically elevating? We believe that the SEC, while in its quest to wrestle with risk, should also create frameworks for broader participation.
- Lastly, and in particular to the millennial generation, the crowdfunding phenomena has embellished philanthropic activities. This has been positively felt by small non-profit organizations, as well as community development real estate projects. We expect that this trend will continue at an accelerated pace.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

FINAL OUTLOOK

The real estate crowdfunding industry will continue with its explosive metric of growth. From new platforms, to expansions of product offerings and improved risk management protocols, and finally, growing investor comfort in the online investing practice: this bodes well for this burgeoning market both in the US and abroad.

We anticipate seeing a phenomenal growth in the residential mortgage market, which has already seen the impact of non-bank originators absorbing over 40% of the market's demand. New US entrants, such as SoFi and Sindeo, will further the competitive landscape in a trillion dollar setting. Already, LendInvest in the UK has demonstrated leadership.

There will be regulatory creep, as more activity is conducted through these platforms, with increasing scrutiny to protect both users and suppliers of capital. As one pundit exclaimed, "if it acts like a bank, it should be regulated like one"

2016 will mark a year of wins and losses. We will witness platforms gaining in size and capabilities, becoming formidable members of the financial markets. We will also see that the current frothiness of value, driven by amorphously described "disruption", see some dampening, and result in numerous platforms being shuttered or consolidating with others. That assumes that they recognize what the value they are creating really is.

Many platforms, and in particular their venture investors, may have had visions of public offerings during the coming 12-24 months at lofty valuations. Early litmus tests (LC and ONDK) and equity market conditions may cause rethinking in monetization strategies. Might we see two step partnerships with larger institutions, desirous of a "fintech" exposure begin to take investment positions, later fully absorbing these platforms: quite possible.

Overall, while playing in the "shadows", there will be much light shining from this industry over the coming years.

Chapter 49
The Impacts of Trait Emotional Intelligence and Entrepreneurial Self-Efficacy on Perceived Behavioral Control Among Undergraduate Students

Teresa Torres-Coronas
Universitat Rovira i Virgili., Spain

María-Arántzazu Vidal-Blasco
Universitat Rovira i Virgili, Spain

ABSTRACT

The economy needs entrepreneurs to identify market opportunities to offer solutions to social problems. Therefore, understanding the factors that affect entrepreneurial intention has become an important research topic. This article examines perceived behavioral control as a determinant of entrepreneurial intention. It also analyzes how trait emotional intelligence and entrepreneurial self-efficacy impact on perceived behavioral control. The resulting model shows that integrating these competences in entrepreneurship programs has a positive impact on perceived control behavior. Gender implications are discussed.

INTRODUCTION

Entrepreneurship, or the process of launching and running a new business, is associate with economic growth and self-employment (Fritsch, 2011). For business organizations, the entrepreneurial behavior of their employees is also key to improving their competitiveness. Therefore, increasing attention is being paid to the factors that influence entrepreneurial intention (Ahmetoglu, Leutner, & Chamorro, 2011) and it has now become a "consolidated area of research within the field of entrepreneurship" (Fayolle & Liñán, 2014, p. 665).

For Do Paço et al. (2013) there are two approaches to the analysis of entrepreneurial intention: one that focuses on personal characteristics and another that focuses on behavior. The first approach analyzes the personality of the entrepreneur (Dinis et al., 2013), emotional intelligence (Ahmetoglu et al., 2011; Neghabi, Yousefi, & Rezvani, 2011; Rhee & White, 2007) and entrepreneurial self-efficacy (Liñán & Chen, 2009; Zampetakis et al., 2009). These studies reinforce the idea that psychological characteristics (the trait approach) influence entrepreneurial intentions. The second approach analyzes the background to entrepreneurial intention, with Shapero's Model of the Entrepreneurial Event and Ajzen's Theory of Planned Behavior (Ajzen, 1991). In Shapero's model, entrepreneurial intention depends on the perceived feasibility and perceived desirability of the prospect of starting a business along with the propensity to act. The Theory of Planned Behavior focuses on attitudes and perceived behavioral control (PBC).

The inter-relations between the two approaches increase the complexity of the models for analyzing entrepreneurial intention. There is evidence to suggest that physiological states affect self-efficacy, with anxiety and stress lowering self-efficacy beliefs (Boyd & Vozikis, 1994). Salvador and Morales (2009) and Laviolette, Lefebrve and Brunel (2012) show that emotional intelligence significantly correlates with entrepreneurial self-efficacy. That is to say, people with a greater level of entrepreneurial intention are in favor of entrepreneurial behavior and they regard themselves as capable of behaving in this way (Morales-Alonso, Pablo-Lerchundi & Núñez-Del-Río, 2016).

This paper uses Ajzen's model (1991) to analyze those factors that affect PBC, the crucial element in entrepreneurial intention. The study carried out includes the gender perspective given the fact that there are fewer women entrepreneurs (Díaz-García & Jiménez-Moreso, 2010) and their different level of competence (Alcaraz-Rodríguez, Alvárez, & Villasana, 2014).

Higher education institutions need to understand this background because training in entrepreneurship has both a positive effect (Zhang, Duysters, & Cloodt, 2014) and a negative effect (Oosterbeek, van Praag, & Ijsselstein, 2010) on entrepreneurial intention and PBC. If entrepreneurship programs are designed to encourage the creation of companies, new explanatory models need to be explored to improve their efficiency.

The current article analyzes PBC and the variables it is affected by using a structural equations model, and highlights the differences between men and women. The first section presents the literature review and defines the research question, hypotheses and proposed model. Then the methodology is described and, finally, the results are discussed and the conclusions of the study provided. The results show that both psychological factors related to emotional intelligence and dimensions of entrepreneurial self-efficacy have a positive impact on PBC. These results are key to helping students, regardless of their background and personal traits, to meet today's labor market expectations through more effective training courses.

LITERATURE REVIEW

The Theory of Planned Behavior

The theory of planned behavior is one of the theoretical frameworks for studying entrepreneurial career choice (Autio et al., 2001; Ajzen, 1991; Shapero & Shokol, 1982). Entrepreneurial intention, defined as the conscious state of mind that directs personal attention, experience, and behavior toward entrepre-

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

neurship (Bird, 1992), is the strongest predictor of entrepreneurial activity (Obschonka, Silbereisen, & Schmitt-Rodermund, 2010). Thus, the creation of a company is the result of planned behavior and it is best predicted by the intention present in the individual (Ajzen, 1991). It is a personal choice.

In Ajzen's model, intention is predicted by attitude towards the behavior (or how appealing being an entrepreneur is to the individual), subjective norms (or the perception of the social pressure on behaving in a specific way) and, PBC (or perceived self-capability). Attitude towards the behavior and PBC are better predictors of entrepreneurial intention than subjective norms (Morales-Alonso et al., 2016). Gender influences subjective norms and PBC because entrepreneurship is a less desirable for undergraduate female students and their PBC is lower (Díaz-García & Jiménez-Moreno, 2010). For Dinc and Budic (2016) cultural and social issues have a considerable impact on the formation of positive perceptions about entrepreneurship in the minds of women.

In general, PBC, is "a function of beliefs about resources, opportunities and other factors that can facilitate behavioral performance" (Yzer, 2012, p. 104). These beliefs originate from vicarious experience, persuasion, physiological states, and personal experience (Bandura, 1997). This means that it is important to study the effects of entrepreneurial self-efficacy and emotional intelligence on perceived behavioral control.

Entrepreneurial Self-Efficacy

Originally defined by Bandura (1994) as "one's belief in one's ability to achieve a certain level of performance or a desired outcome that can influence situations and affect lives" (p. 72), self-efficacy is key for detecting an entrepreneurial person (Markman, Baron, & Balkin, 2005) and predicting entrepreneurial intention (Moriano, Palací & Morales, 2006; Laguna, 2013). That is to say, if there is no perception of skills, the behavior will not be produced. Efficacy beliefs are concerned "not only with the exercise of control over action but also with the self-regulation of thought processes, motivation, and affective and psychological states" (Bandura, 1997, p.36). Therefore, entrepreneurial self-efficacy is included in the models that study entrepreneurial intention and its dimensions, like perceived behavioral control. Studies on the impact of entrepreneurship education on entrepreneurial self-efficacy remain inconclusive (Shinar, Giacomin, & Janssen, 2014).

On the basis of the above, the following hypothesis can be formulated:

H1: Entrepreneurial self-efficacy will have a direct and positive impact on perceived behavioral control.

Trait Emotional Intelligence (Trait EI)

One of the most important developments in the emotional intelligence literature is Petrides and Furnham's (2001) conceptual bifurcation resulting in two distinct perspectives on emotional intelligence: ability EI and trait EI. The ability EI perspective conceptualizes EI as a constellation of cognitive-emotional abilities located in extant frameworks of human intelligence (Petrides, 2011). It involves actual abilities and it measures with 'maximum-performance' tests (Petrides & Furnham, 2001). On the other hand, trait EI is defined as "a constellation of emotional self-perceptions located at the lower levels of personality hierarchies" (Petrides, Pita, & Kokkinaki, 2007). It involves a collection of emotion-related self-perceptions and emotional self-efficacy, that is, the confidence in one's capabilities to perform various tasks (Bandura, 1997). It is a personality trait rather than a cognitive ability.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Trait EI is an important factor in the prediction of entrepreneurial outcomes (Ahmetoglu et al., 2011) and entrepreneurial behavior (Bahadori, 2012). Given the social nature of entrepreneurial activities, trait EI can predict entrepreneurial success. Indeed, higher levels of trait EI are necessary to exploit opportunities and innovations (Chell & Baines, 2000). Therefore, there is a relationship between entrepreneurs' Trait EI and their success (Karimi, Kloshani, & Bakhshizadeh, 2012).

Regulating stress may be one of the pathways that links trait EI with positive attitudes towards entrepreneurship and entrepreneurial intentions. Therefore, "trait EI, as an index of emotional self-efficacy, may be an important personality antecedent to entrepreneurial attitudes and intention" (Zampetakis et al., 2009, p. 610) through a higher level of self-perceived control. In parallel, Mortan, Ripoll, Carvalho and Bernal (2014) show that the capacity to appropriately manage and use emotions plays an important role in entrepreneurial self-efficacy.

Studies by Salvador and Morales (2009) and Laviolette et al. (2012) show that emotions affect entrepreneurial self-efficacy, a variable that is not unconnected to gender roles (Mueller & Conway Dato-on, 2013) or cultural barriers (Shinnar, Giacomin, & Janssen, 2012). Other studies, however, show the contrary (Mueller & Conway Dato-on, 2008, 2013) and authors such as Zhao, Seibert and Hilla (2005) consider gender to be more closely related to emotional intelligence than entrepreneurial self-efficacy.

Accordingly, the following hypotheses can be formulated:

H2: Trait EI will have a direct and positive impact on PBC.
H3: Trait EI will have a direct and positive impact on entrepreneurial self-efficacy and, therefore, will have an indirect impact on PBC through entrepreneurial self-efficacy.

METHODOLOGY

Participants and Procedure

This research aims to explore the factors that affect PBC using a questionnaire sent to undergraduate students during the academic year 2016-2017. The final number of participants was 459, of whom 76.2% were women. Of all these, 63.7% had never been employed but 37.7% had been on work experience programs during their courses. A total of 40% of the participants study Social Sciences and Law; 8.1% Architecture and Engineering; 12.4% Sciences: 27.5% Health Sciences; and 12.0% Arts and Humanities.

Measuring Instruments

Below we describe the scales and the psychometric properties of the assessment instruments used.

Perceived Behavioral Control

This variable is the participants' perception of their own ability to create and manage a new company. A questionnaire of four questions has been used (Autio et al., 2001), with a Cronbach's Alpha of 0.856.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Entrepreneurial Self-Efficacy

The scale used to measure this variable is the ESE questionnaire by De Noble, Jung and Ehrlich (1999), in its version validated by Moriano et al. (2006). The final version of the scale consists of 23 items. In accordance with these authors the goodness of the construct was measured, which gave four factors that explain 56.9% of the variance. The resulting factors are: Networking or the ability to enter into effective relations; Innovation or the ability to construct an innovative environment; Proactivity or the ability to recognize new opportunities; and Stress or the ability to rise to unexpected challenges. Cronbach's alpha for these factors is, respectively, 0.86, 0.747, 0.791 and 0.665. Therefore, reliability is high (De Noble et al., 1999, Moriano et al., 2006; Moriano et al., 2012a).

The Trait Emotional Intelligence Questionnaire-Short Form (TEIQue-SF)

The instrument chosen to measure trait EI is the TEIQue-SF (Petrides & Furnham, 2006). It has four components: well-being, self-control, emotionality, and sociability. In general, individuals with a high score on well-being are fulfilled and satisfied with life. The self-control factor refers to one's degree of control over urges and desires. Individuals with a high emotionality score possess a wide array of emotion-related skills: recognizing, perceiving and expressing emotions. The sociability factor focuses on social relationships and influence.

The psychometric properties of the instrument are supported by Petrides (2009), Siegling, Vesely, Petrides and Saklofske (2015), and the recent work by Andrei et al. (2016). For the present study, the Alpha coefficient for reliability was 0.84 for the trait EI scale and 0.8 for the factor of Emotionality (8 items), 0.6 for Self-control (6 items), 0.82 for Well-being (6 items) and 0.67 for Sociability (6 items).

Contextual Factors

Participation in Entrepreneurship Education (Variable Education)

Some studies have found that entrepreneurship education has a positive impact on students' entrepreneurial self-efficacy (Cooper & Lucas, 2006; Kilenthong, Hills, & Monllor, 2008; Setiawan, 2014). The questionnaire included three questions on whether participants had received training on entrepreneurship at university or elsewhere. Cronbach's alpha was 0.518.

University Environment (Variable Environment)

Following Autio et al. (2001) and Coduras et al. (2008) we asked the participants about the resources available at the University for encouraging entrepreneurship (for example, dedicated start-up units, incubators and specialist advice services). Participants gave their personal perception of the degree of the university support to entrepreneurship. The scale yielded a Cronbach's alpha of 0.804.

Major (Field of Knowledge)

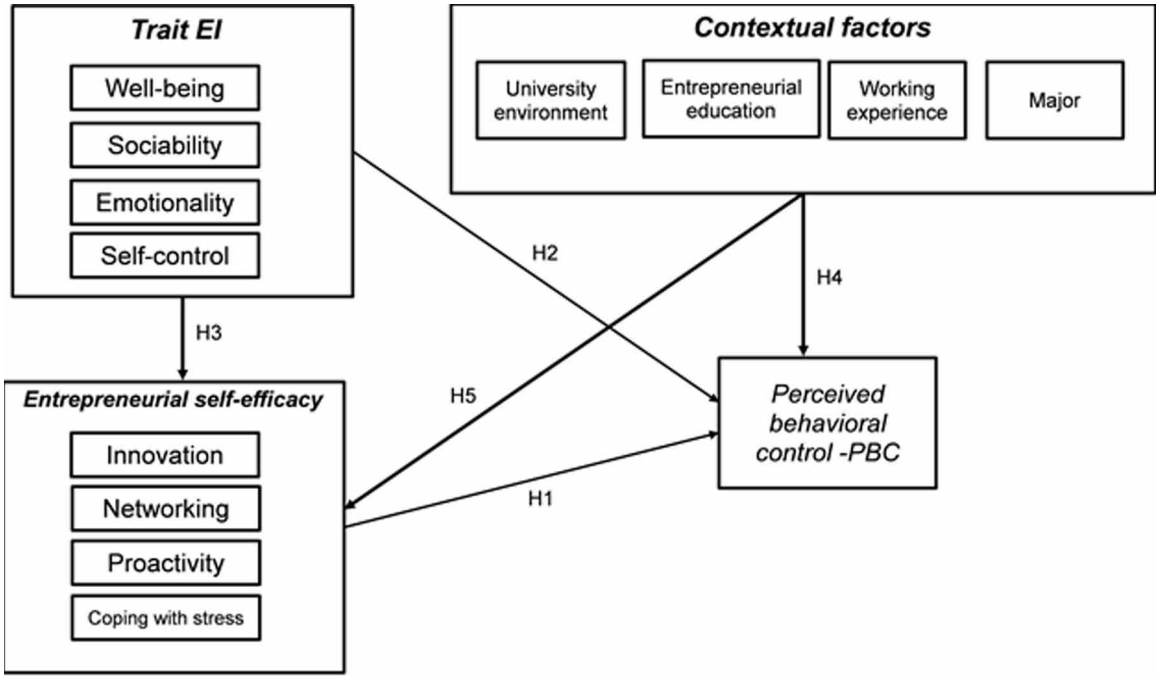
Hassan and Wafa (2012) found that students on the science program have significantly higher entrepreneurial intentions than business or arts students. So, major has been included as a contextual variable.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Working Experience

The Jack-of-all-trades approach by Lazear (2005) shows that having experiences in many different roles increases the probability of becoming an entrepreneur (Miralles, Giones, & Riverola, 2015). Greater experience is related to greater entrepreneurial competence (Camuffo, Gerli, & Gurbita, 2012) and a greater PBC (Liñán & Chen, 2006; Liñán et al., 2011).

Incorporating contextual factors enables the following two hypotheses to be formulated:



H4: Contextual factors will have a direct and positive effect on PBC

H5: Contextual factors will have a direct and positive effect on entrepreneurial self-efficacy and, an indirect effect on PBC

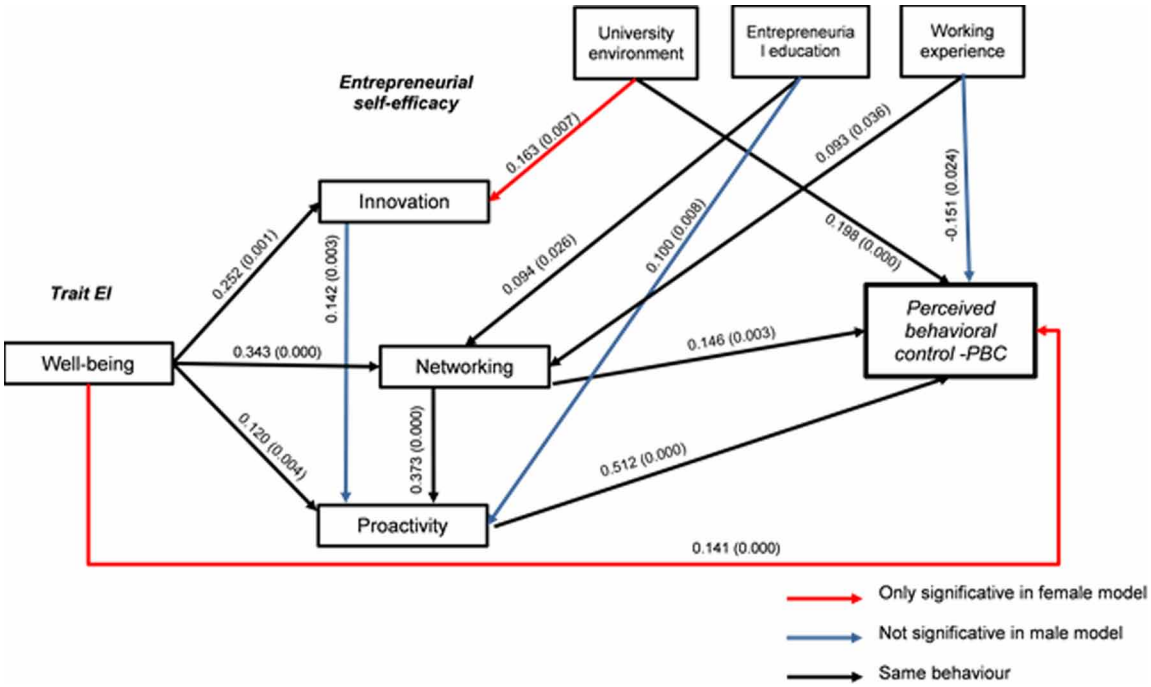
Validation of the Final Model

The model proposed considers that psychological factors – particularly Trait EI – and the perception of one's own abilities – entrepreneurial self-efficacy scale – have a direct impact on PBC. It also considers that the entrepreneurial culture of the university – University environment –, any training that students have been given in entrepreneurship, their work experience and knowledge area – Major – also affect PBC. Gender is also taken into account and the model is validated independently for men and women. Figure 1 synthesizes the proposed model.

Figure 1. Proposed model (Source: Own elaboration)

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

RESULTS AND DISCUSSION



To validate the model a bootstrap analysis was carried out with 500 samples with the program SMART-PLS. The general model and the models for men and women were tested. Below we discuss the results of the model that presented the best reliability.

Figure 2 shows the result of the Bootstrap analysis, with the standardized path coefficients. For the endogenous variable PBC, the R-square value is 0.669, meaning that about 66.9% of the variance in PBC is explained by the model. The R-square for Proactivity is 0.468, and for Networking and Innovation it is 0.331 and 0.154, respectively.

Construct Validity and Reliability

The validity of the instruments used was checked using convergent validity, discriminant validity and construct reliability. All the statistics of the outer model loadings are significant, which confirms the convergent validity of the construct for both the general model and the individual models for men and women. Discriminant validity, assessed using the average variance extracted, enabled the discriminant validity of the instrument to be confirmed. Finally, the composite reliability was checked with Cronbach's alpha. All alphas were above the value of 0.7 normally accepted to corroborate the construct for both the general model and the individual models for men and women.

Figure 2. Path coefficients (Source: Own elaboration)

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Hypothesis Test and Results

Figure 2 and Table 1 show the paths and indirect effects for the whole sample and the model for men and women. To facilitate interpretation, only the significant paths are shown.

Hypothesis 1 stated that entrepreneurial self-efficacy affected PBC. This hypothesis is shown to be correct only in the case of the variables Networking and Proactivity. Unlike other studies, there were no differences in the behavior of men and women (Laviolette et al., 2012; Do Paço et al., 2013). The variable Networking has an indirect effect on PBC through Proactivity (Table 1) and the impact is greater in men. This result is interesting for purposes of education in entrepreneurism because people "who are aware of their entrepreneurial potential are more likely to get involved in entrepreneurial training and will benefit more from it" (Luca, Cazan, & Tomulescu, 2013, p. 1049), which could have an impact on entrepreneurial intention (Bae, Qian, Miao, & Fiet, 2014).

Hypothesis 2 (impact of Trait EI on PBC) is confirmed only for the dimension Well-being and for behavior in women, so it is not as important as in the study by Mortan et al. (2014). The direct effect on PBC is supplemented by the indirect effects of the variables Innovation and Networking (Table 1). The effect on Proactivity of emotional intelligence has already been discussed by Zampteakis et al. (2009).

Table 1. Indirect effects

	Original Sample	Sample Mean	Standard Deviation	T Statistics	P Values
Education -> PBC	0.086	0.087	0.026	3.314	0.001
Female	0.070	0.069	0.031	2.240	0.026

Hypothesis 3 is only corroborated for the dimension Well-Being of the Trait EI scale and three dimensions of the entrepreneurial self-efficacy: Innovation, Networking and Proactivity (Figure 2). Well-being affects PBC through these three variables.

As far as hypotheses H4 and H5 are concerned, Education does not seem to have a direct effect on PBC, in contradiction of previous studies (Dinc & Budic, 2016; Fayolle & Liñan, 2014). It does have an indirect effect, however, through the variables Networking and Proactivity. Also, as is only to be expected, a university culture that supports entrepreneurship (Environment) has an impact on PBC, as has been shown by Shinnar et al. (2016) and Coduras et al. (2008). It should be pointed out that it only affects ESE in the dimension Innovation and is only important for women. Rae and Woodier (2006) highlight that the role of significant others (e.g. parents, friends, role models) is more influential than career development centers. The variable Networking is significant in all cases.

Finally, we should point out that Working experience is significant for the variables Networking and PBC but only in men. This partially corroborates studies such as the one by Miralles et al. (2016) and Liñán and Chen (2009). For PBC it does have a significant effect in men although the effect is an inverse one. The more work experience, the lower the PBC.

CONCLUSION

Entrepreneurship is an important productive force in the economy, vital to the progression of organizations and economies and it plays an important role in economic growth. In recent years the working environment has undergone structural changes that have given rise to opportunities for entrepreneurism and made self-employment a channel for professional development. Therefore, the factors that affect attitudes to entrepreneurship need to be understood.

This study examines perceived behavioral control as one of the main determinants of entrepreneurial intention. It studies how trait EI and entrepreneurial self-efficacy impact on perceived behavioral control, and includes the gender perspective. The results obtained show that psychological factors related to Trait EI (well-being) in the case of women, and some dimensions of entrepreneurial self-efficacy (particularly Networking and Proactivity in both men and women) have a direct, positive impact on perceived behavioral control. Paradoxically, entrepreneurial education does not affect perceived behavioral control, which should prompt education institutions to redesign its curricula so that they can provide more effective courses. Although the number of education programs has increased in recent years it is not clear whether the approach will increase the vocations for creating companies.

By incorporating perceived behavioral control into the entrepreneurial intention literature, we have attempted to contribute to research into entrepreneurship by shedding light on what has consistently been identified as an under researched issue. The hypotheses tested may be able to guide future empirical investigations in the critical role perceived behavioral control plays in the development of entrepreneurs.

This exploratory research has some limitations, largely due to the methodology of the model of structural equations used to test the relationships between the constructs. The reliabilities of the scales were not as accurate as desired, which suggests that the results need to be interpreted with caution. Not all the components included in the instrument were found to be significant. Therefore, the model is an initial contribution that needs to be studied in other contexts and with other tests to be more generaliz-

able. For example, the study analyzed one academic year and used data from a single university, so it would be interesting for future studies to include longitudinal data from several years and compare them with other universities to increase the generalizability of the results. In general, more research in this area would improve our understanding of the impacts of trait EI and entrepreneurial self-efficacy in perceived behavioral control among university students.

Chapter 50
Entrepreneurship Development in Northeast Region of Romania

Alexandru Costin Cîrstea
Bucharest University of Economic Studies, Romania

ABSTRACT

The actual trend of a growing entrepreneurial phenomenon at international level, makes a priority also for Romania to improve its local entrepreneurship level, by developing and implementing strategic measures for sustaining the entrepreneurial activities in rural and urban areas all over the country. The first step for achieving this it is to make an analysis for obtaining an accurate current stage of development of Romanian entrepreneurship at local and regional level. Using statistical data analysis and questionnaire survey, this study represents a clear mapping of entrepreneurship development status and SMEs evolution in the Northeast region of Romania. The results can be used to propose further measures for supporting local and regional entrepreneurship and the research methodology was also applied in a similar study conducted by author in the Southeast region of Romania

1. INTRODUCTION

The present study aims to answer the problem of identifying viable solutions to medium and long-term effect on support entrepreneurial initiatives and sustainable development of SMEs. This current issue is important, considering that entrepreneurship at international level has an increasingly significant share in the economy. Research methods used in this study are analyzing statistical data provided by the National Institute of Statistics and Eurostat and questionnaire survey, administered to a sample from Northeast Region of Romania (own data collection). The first part of the study presents an analysis of statistical data recorded in the Northeast region of Romania, such as: structure and dynamics of SMEs, SMEs situation at one year after start, the density of SMEs; number of employees in SMEs; the gross investments of SMEs and the share of innovative enterprises. The second part of the study presents the results of a survey regarding the interest for developing entrepreneurial activities in the Northeast region, which was applied on a sample of 246 respondents.

The questionnaire contains 12 closed questions, of which 7 are referring to the subject of the investigation and 5 are referring to socio-demographic characteristics of the respondents. The paper ends with a set of conclusions and results of the study, which can be used to elaborate and implement strategic measures to stimulate entrepreneurship in the medium and long term, both in the Northeast region and at national level.

2. LITERATURE REVIEW

The recent period is one of the spectacular changes in all areas of socio-economic activity worldwide, the most important of them being registered on technical, informational, educational, cultural and political domains. Among the significant changes lately noticed in Europe and other highly developed countries is the position of entrepreneurship and SMEs in the center of economic and social development, by transforming them into a dynamic element and a strong creator of added value, jobs and financial resources to central and local budgets (Cirstea et al., 2016)

Thus, the development of small and medium sized enterprises (SMEs) represents an important part of economic policy, which influences the rhythm of the long lasting economic growth in Romania (Istocescu, 2005). Romanian business environment is still facing a lot of problems, such as: decrease of internal demand, excessive taxation, bureaucracy, high credit costs and difficulties for accessing loans, delays in revenues from customers and so on. (Nicolescu, 2010). According to some recent studies, the major reasons for the failure of businesses seem to be management competence, lack of planning and securing financial resources (Mughan et al, 2004). That's why the entry of new firms is often held to be beneficial for economic efficiency and growth because new entrants stimulate competition and efficiency and may also generate, disseminate and apply innovative ideas (Bruno et al., 2008).

But for SMEs to become a real factor of local economic dynamism, they must also be integrated into a well-structured environment, into coherent territorial network for producing relations, exchanges between them and other operators, such as banks, higher education institutions, training centers, consultancy firms, local governments (Istocescu, 2005). In these circumstances the present study of entrepreneurship level is welcomed in order to elaborate and implement a set of strategic measures to sustainable develop entrepreneurship in Romania.

3. ANALYSIS OF SMEs INDICATORS IN NORTHEAST REGION

This section presents a data analysis over a set of indicators related to SMEs activity in the Northeast region of Romania. The first part of the analysis presents the structure and dynamics of SMEs in the region.

3.1. SMEs Structure and Dynamics

Having a number of 53997 active SMEs in 2015 the Northeast region owns only the 6th position at national level, surpassing only West and South West regions. In the period 2012 - 2015 the number of active SMEs increased at regional and national level. The dynamics of micro and small enterprises was positive, but the regional increase in Northeast (7%) was less than the national level, where both categories of enterprises increased by 8% in the period under review. In 2015 the number of active SMEs

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

in Northeast region increased by 3835 units compared to 2012 and by 850 over the previous year, due to relaunch of the business sector and to the programs for stimulating entrepreneurship and business development (see Table 1).

It was also observed that among the counties constituting the North-East region the largest number of SMEs in the period 2012 - 2015 was recorded in Iasi county, followed by Suceava while in Botosani and Vaslui were recorded the fewest enterprises.

From the point of view of active SMEs distribution by size class in 2015 the highest share was the micro-enterprises with 89.1%. But this high percentage is changing from one year to another, due to the average life span, which is shorter than the other classes of sizes. Small businesses accounted for 10.8% of the total active SMEs, while medium-sized enterprises accounted for 1.6% of the total number of active SMEs in Northeast region. Another negative indicator is the number of SMEs/1000 inhabitants, where the Northeast region is situated on the last position, compared to the other regions of Romania.

3.2. The State of SME Over One Year from Start

Table 2 gives an overview of SMEs after one year of existence, classified in active, inactive and closed, in the period 2012-2014.

In 2014 the largest share of SMEs established less than a year were active (81.1%), while 13% were inactive and 5.9% were closed. It should be noted that in the period 2012 - 2014 it increased the percentage of enterprises that have remained active, along with a reduction in the percentage of those inactive. At regional level, the Northeast region is on the third position at maintaining the activity of the firms in the first 12 months of operation, being surpassed only by Bucharest-Ilfov and Center. Also, the average for this indicator is higher than the national average in the year 2014, which shows a good capacity of entrepreneurs to surpass the first year od enterprise life span. It thus appears that, in order to maintain and even to increase the rate of survival of SMEs in the region, there are necessary measures to stimulate investment in business training, mentoring and expert advice in this area and also grants to stimulate the initiation and development of medium and long-term business in the region.

Table 1. Number of SMEs at regional and national level

3.3. SMEs Density

In Table 3 it is shown the density of SMEs in 2015 in Northeast Development Region and in the component counties.

With 32.51 active SMEs per 1,000 inhabitants the Southeast Region remains in fifth position in recent years after Bucharest-Ilfov, Northwest, West and Centre regions. Furthermore, the density of SMEs in this region is under the national average. The higher density of SMEs at the level of 2015 was recorded in Iasi county, followed closely by Neamt county. At the opposite were Botosani and Vaslui, where there is a certainly need of measures for stimulating entrepreneurship development.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Table 3. SMEs density

	SMEs number	Inhabitants	SMEs density (number of SMEs at 1000 inhabitants)
Northeast region	106437	3273367	32,51606
Bacau	21830	606589	35,98812
Botosani	7848	403088	19,46969
Iasi	29632	780948	37,94363
Neamt	16837	461869	36,45406
Suceava	21260	631410	33,67067
Vaslui	9030	389463	23,18577

Source: Own calculations based on National Institute of Statistics data, 2017

It is also to be taken in consideration that at regional level in the past few years, large progress was made, knowing that the SMEs density doubled its value between 2013 – 2015 in the Northeast.

3.4. Number of Employees in SMEs

Analyzing the number of employees at the regional level it can be observed a positive dynamic of this indicator in the period 2013 - 2015, both at national and regional level. The number of employees in 2015 to the Northeast region accounted for 11.18% of the national total, this indicator having a growing trend from the previous year. The positive dynamics of this indicator recorded at regional level in 2015 was the same registered nationally, a sign that the region's economy is slowly increasing (see Table 4).

However, compared to the other regions of the country, the percentage of the national total number of employees is low.

3.5. Gross Investments in SMEs

In the period 2013-2015, the gross investments of SMEs in the Northeast region registered a grow of 25%, following an upward trend all over the period. Regarding the share of gross investments in SMEs from national level it can be shown that in the 2013 – 2014 period it registered a growing trend, but a downtrend in the next year. However, the level of gross investments in the Northeast region in 2015 recorded the smallest value among the other regions of Romania (see Table 5).

Table 4. Number of employees in SMEs at national and regional level

	2013	2014	2015
National level	4801104	4900684	5041186

Source: National Institute of Statistics, 2017

3.6. The Share of Innovative Enterprises by Size at Regional and National Level

The number of innovative businesses nationwide declined in recent years, from 33.31% in 2010 to 20.67% in 2014. The downward trend was also maintained in this period also in Northeast region, where it was recorded a falling from 47.19% in 2010 to 32.17% in 2014 on the share of innovative enterprises. Comparing with the other regions in 2014 Northeast ranked the second position, being surpassed only by South East region. In 2014, both at national level and in Northeast region, the medium sized enterprises have a higher share of innovation (36.94% for Northeast region and 26.57% for national level) (see Table 6).

4. THE EVALUATION OF CONCERN FOR ENTREPRENEURIAL ACTIVITIES IN THE NORTHEAST REGION

In order to identify the concerns of initiating and developing entrepreneurial activities in the Northeast region, a structural survey was applied, to a sample of 246 people residing in the counties of the region. The questionnaire contains 12 questions, of which 7 are regarding the subject of investigation and 5 are regarding the socio-demographics characteristics of the respondents.

The first question regarded the intention of respondents for starting and developing an entrepreneurial activity in the near future. To this question a percentage of 52.2% of respondents said "yes", while 47.8% answered that they are not interested in starting a business in the near future. For the following questions were considered only the respondents who declared that were interested in starting a business in the near future.

The next question aimed at identifying the domain that respondents want to work in business. To this question, most respondents (28.6%) said they want a business in the creative industries (advertising, architecture, art, crafts, design, fashion, film, music, TV, radio, research and development etc.). In contrast, the lowest business areas preferred by respondents are wood and furniture (0.1%), textiles, leather goods, IT and health by 4.8%. Other responses were engineering and construction, baking and beekeeping.

Another question was about the entrepreneurial knowledge and/or experience of the respondents. To this question, a percentage of 52.4% of respondents said they have entrepreneurial knowledge and / or experience in business, and 47.6% said the opposite. A cross-sectional analysis between labor market status and responses given to this question indicates that 16.95% of those who have entrepreneurial skills or experience in the field of business are students, 47.46% are employed, 5.08% are unemployed, 16.95% are self-employed and 8.47% are entrepreneurs. The remaining respondents have other employment statuses (retired, homely, child raising etc.).

	Small-sized	15,60	15,32	12,97
	Medium-sized	32,81	22,89	15,44
National level	Total	33,31	30,82	20,67
	Small-sized	29,85	27,54	18,25
	Medium-sized	40,85	38,75	26,57

Source: National Institute of Statistics, 2016

Also, by age it is shown that the largest share of respondents who said they had entrepreneurial skills or experience are aged 25-34 years old (40.68%), followed by those with aged 18-24 years old (18.64%).

Next question probed the interest for participating in entrepreneurship training programs. To this question, an overwhelming percentage of 90.5% of respondents said yes, while only 9.5% said they are not willing to participate in entrepreneurship training programs to improve knowledge and skills in this area.

Cross-sectional analysis revealed that among those who said they would participate in entrepreneurial training programs, 56.79% are people who have previously declared to have knowledge or experience in entrepreneurship or in the field that they want to set up a new business.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

From the questionnaire was identified also the percentage of people who have attended training in entrepreneurial skills over the past three years.

Analyzing the data collected shows that only 14.3% of all respondents participated in the last three years to courses for developing entrepreneurial skills.

Regarding the structure of the sample:

- 14.3% of respondents are students, 52.4% are employed, 4.8% are unemployed, 19% are self-employed, and 9.5% are entrepreneurs.
- 14.3% of respondents are in the age group of 18-24 years old, 33.3% in the category 25-34 years old, 38.1% in the category 35-44 years old, 14.3% in the category 45-54 years.
- Regarding the sex of the respondents, 42.9% were male and 57.1% were women.
- In terms of monthly income, 23.8% reported income below 500 lei per month, 19% between 500-1000 lei, 9.5% between 1000-2000 lei, 23.8% between 2000-3000 and 23.8% over 3000 lei.

5. CONCLUSION

Analysis at the level of Northeast region revealed that among Romanian regions and compared with national averages, the South East has low socio-demographic and economic indicators during 2012-2015.

Regarding the analysis of the structure and dynamics of SMEs the study showed that construction domain had a better share in Bucharest-Ilfov, North-East and Centre; Trade was the major orientation of entrepreneurs in South-Muntenia, South-West Oltenia and Center, while the transport sector has higher shares in the North-East and South-East regions.

Regarding the interest of the residents of Northeast region to initiate and develop entrepreneurial activities it is shown that there is a high interest for the creation of start-ups for all ages (between 18 - 64 years) with a greater preponderance of people between 35-44 years. Also, although the majority of respondents have mid-level knowledge about market data, management, marketing, they are willing to improve their knowledge and entrepreneurial skills, both through training activities in the field and through counselling sessions with experts in entrepreneurship and internships at companies, to learn the secrets of entrepreneurship.

The lower socio-economic and SMEs indicators recorded lately in the Northeast Region impose coherent strategic measures to support entrepreneurship through specialized training, consultancy and mentoring to initiate and develop business and also infusion of financial capital (for example by giving minimal aid for start-ups).

A set of measures have to be implemented for economic rebound in the region and to support the development of SMEs and start-ups. In this sense, the lines of action must focus on:

- Developing and implementing projects with European financing to support entrepreneurship among the unemployed, employees and / or students from the region that have a set of logic and chronological steps: entrepreneurial training and consultancy for making a business plan, entrepreneurial mentoring and internships in companies from similar fields, supporting grants for initiation and development of business, consultancy for new businesses development in the market
- Supporting innovative SMEs from European funds and venture capital
- Developing specialized advisory services oriented to the needs of SMEs

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

- Simplifying and improving the legislative and administrative framework
- Developing public-private partnership for supporting SMEs
- Developing national network of business incubators and science parks
- Free access to loans for SMEs with low interest rates, leading to an increase in gross investments followed by an increase in staff employed in SMEs

The expected results in the short, medium and long term for supporting entrepreneurship in the Northeast region should be:

- Increasing the number of active SMEs, which generate revenue and jobs
- Increasing the share of innovative enterprises in the region
- Increase participation in adult vocational training in the region
- Decrease the phenomenon of migration in the region
- Increasing the employment rate in the region
- Increasing wages and living standards
- Lowering the level of poverty in the region
- Improving the situation of SMEs in the first year of existence, increasing the survival of SMEs and increasing the chances of medium- and long-term development of SMEs in the market
- Increasing the gross investment in SMEs, with ripple effects on the entire economy both regionally and nationally

Chapter 51
Maximising Value Through IT and Business Alignment:
A Case of IT Governance Institutionalisation at a Thai Bank

Abrar Haider
University of South Australia, Australia

Sureerat Sae Tang
University of South Australia, Australia

ABSTRACT

Contemporary business organisations need to be responsive to internal as well as external changes. Organisational intuitiveness, being fundamental to this responsiveness, requires that these organisations develop and manage their information processing and management infrastructure to enable an integrated and informed environment. Organisations generally have a deterministic approach to technological infrastructure development and do not give requisite attention to soft factors that shape its use. Information technologies, however, are strategic resources that require supportive human action through appropriate set of roles, responsibilities, and decision rights to works effectively, evolve in use, and enable value on continuous basis. This paper presents a case of an information technologies governance in a financial services organisation. It highlights that governance practices need to be institutionalised in the organisation, such that they become an integral part of the organisational, social, and technical environment of the business.

INTRODUCTION

Information technologies (IT) are predominantly socio-technical systems that bind organisations and individuals together through information that enables business processes and manages business operations. Business managers thus focus on the broad uses of IT by questioning how individuals and organisations use IT, how IT can solve problems, how IT supports business processes, how to build and strengthen

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

skills to use IT proficiently, and how IT delivers soft value to enhance organisational performance. There are three areas of technology implementation and adoption theories: technology determinism (IM, technology-enabled business, and agency theory), socio-technical interactions (actor network theory, socio-technical theory, and contingency theory), and organisational imperatives (strategic competitiveness, resource-based view theory, and dynamic capabilities theory) (Haider 2013). Technology deterministic theories focus on the success of IT projects to support thriving business. Technology deterministic theories mainly consider adopting recognised best practices, frameworks, business models, along with compatible and applicable technologies that are user-friendly with potential and capabilities to deliver business competitiveness, growth, and more productivity. This means that these technologies enable business processes by handling and responding to business requirements precisely to deliver successful IT projects. Socio-technical theories mainly involve the alignment of the technology and organisational environment to deliver stronger relationships with positive business performance that meets business objectives. Organisational imperative theories aim to develop strong relationships between end-users with multiple responsibilities in different business operational areas and technology within complex environment that are capable of aligning business and IT strategies.

Literature review suggests that technology managers take a deterministic approach to technology implementation (see for example, Haider 2013), whereby they focus on the promises associated with technology rather than the cause and effect relationship, and the contextual intricacies that realise those benefits. As a result, the information technology environment in the contemporary business landscape is replete with vulnerabilities, like lack of fit between technical infrastructure with strategic business considerations, incompatible technology, lack of information ownership, overdependence on outsourcing, inability of the organisation to assign responsibility and accountability, budget blowouts, and ineffective risk assessment and mitigation. As a result, employees in large sized service organisations maybe technically competent, yet they cannot fully appreciate the soft and hard role of information technologies in the organisation, and cannot fully apply their knowledge and skills for the optimum advantage of the organisation.

Managing value from information technology infrastructure is the core tenet of IT governance. It provides the decision rights and accountability framework that encouraging desirable behaviours in the use of information technologies within the organisation. These behaviours are shaped through the mutual interaction of cultural, social, technical, and organisational environments prevailing in the operating context of the organisation. IT governance, therefore, is not the job of a few individuals in the organisation or the information technology department; it is everybody's responsibility. At the same time, the Thai service industry is a complex environment, which consistently struggles to work within the established norms of Thai culture—particularly large sized service organisations, which are forced to have a reactive rather than proactive approach to information technology infrastructure development and use. It is, therefore, important to assess how these organisations institutionalise governance of their information technologies within their operating environment, such that it becomes an integral part of the business workflow embedded through organisational values.

This paper starts with conceptual explanation of IT governance and explains its significance for service organisations. It then discusses the institutional theory and highlights the social, organisational, and technical factors that help institutionalise a system in an organisation. This is followed by a detailed case study of a Thai bank and its experience with IT governance, using the theoretical frame of references developed in the earlier sections of this paper.

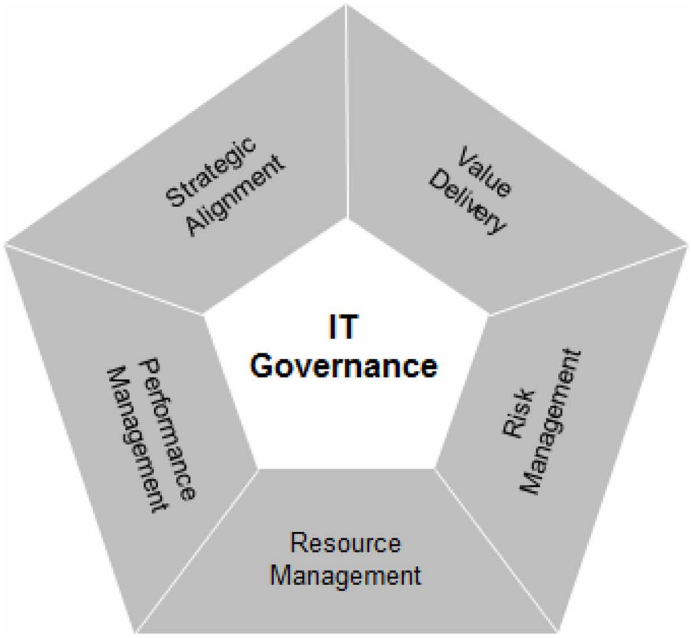
EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

CONCEPT OF IT GOVERNANCE

Different scholars have defined IT governance from different angles. For example, Grembergen (2004) suggests that IT governance is the organisational capacity exercised by the Board, executive management and IT management to control the formulation and implementation of IT strategy and in this way ensure the fusion of business and IT. The author suggests that in order for IT to function properly in the organisation, alignment between IT strategic business orientation is a must. On the other hand, IT Governance Institute (2003) argues that, IT governance is the responsibility of the Board of Directors and executive management. It is an integral part of enterprise governance and consists of the leadership and organisational structures and processes that ensure that the organisation's IT sustains and extends the organisation's strategy and objectives. This is by far the most comprehensive definition because it not only talks about who is responsible for IT governance, but also explains why it is necessary and how it is related to other strategies and plans. Weill and Ross (2004) suggest that IT Governance is the decision rights and accountability framework for encouraging desirable behaviours in the use of IT. This paper adopts this definition because different organisations use IT differently. And even in one organisation, different employees use IT differently. Therefore, IT governance is not just about how resources are allocated and managed and how resource capability and capacity of the organisation is developed. IT governance is about how resources should be changed, who is responsible for this management and development and who is responsible if things do not go according to plan. This means that simply assigning roles and responsibilities is not enough. Employees in the organisation have to be encouraged, coerced, motivated, and trained to operate and manage IT in a way that helps an organisation achieve its objectives.

IT governance leads IT to move an organisation forward in different ways. However, it is important for the board of directors, with its decision-making powers, to be involved, and business and IT managers of different business areas to attend the meetings to discuss different issues on the IT agenda: business initiatives, IT-enabled business processes, project approvals, business performance, and the process of technology implementation, deliverables and benefits. These leaders are well-aware and conscious of the value of business performance that involves business transformation, risk management, accountability and responsibility, business continuity and performance measurement (Brown 2006; Aguilera and Jackson 2003). They are keen to acknowledge the type of requirements, resources and people to involve in different projects to make them succeed (Nolan & McFarlan 2005). Likewise, communication strengthens their relationships and collaboration to achieve effective implementation of IT governance (Johnson & Lederer 2005). Hence, communication and decision-making are the first priorities of IT governance to operate a business productively and responsively. This means meeting outcomes involving decision-making and consensus agreement, accountability and of IT managers to ensure the organisation does not encounter survival difficulties in the competitive business market.

IT governance requires considerable information from business and IT strategies to create an understanding of an organisation and form strong relationships between the business and IT arms of the organisation (Bowen, Cheung & Rohde 2007). IT governance aims to support senior managers to make decisions to allocate organisational resources carefully by ensuring they align properly with business and IT strategies (Brown 2006; Grembergen 2004). Subordinates then become aware of scarce resources, and use them wisely and responsibly. IT governance focuses on planning organisational strategies, controlling system reliability and mitigating risk (O'Donnell 2004). This means IT governance primarily



EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

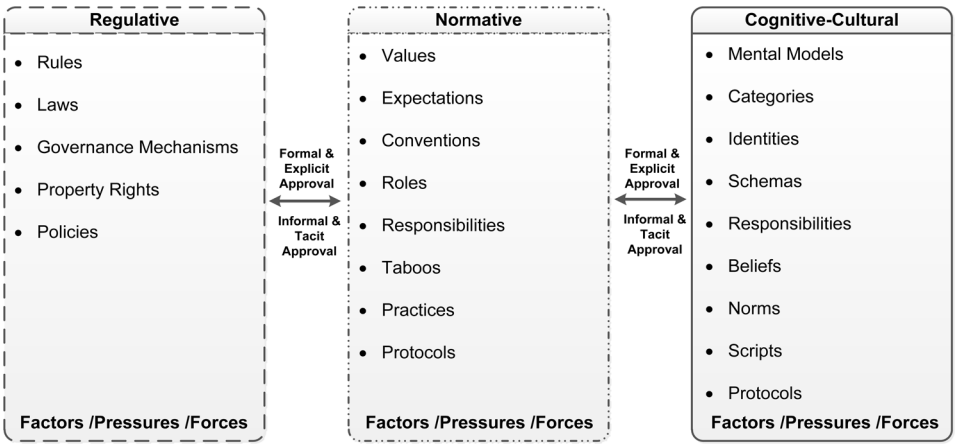
focuses on business strategy with attention to the adoption and alignment of technology with business initiatives. Thus, it is important to understand that strong business knowledge and effective IT skills are required to implement IT governance effectively (Liu et. al. 2008).

Figure 1 illustrates the scope of IT governance. It focuses on five domains, i.e., strategic alignment, value delivery, risk management, resource management, and performance measurement. The most significant and fundamental domain of IT governance, i.e., strategic alignment calls for establishing the relationship between business and IT planning, thereby ensuring that IT operations are aligned with business operations. This means that all IT implementations in the organisation must be fully mapped with the organisational information requirements, such that the collectively the IT infrastructure works as the enabler of organisation's strategic and operational information requirements. Therefore, the value delivery domain calls for practices that ensure that IT does deliver the perceived benefits against business strategy, while at the same time optimizing costs and enabling tacit as well as explicit value of technology. This, in return, requires the organisation to make sure that IT stakeholders comply with business requirements and that risks posed to information and information managing resources are properly identified and managed; hence the third domain, i.e., risk management. The fourth domain, performance management, contributes to other domains and calls for monitoring organisational IT performance on various accounts, such as, strategy implementation of IT and project management, monitoring compliance completion and usage of IT, and measuring process performance in terms of service delivery and achievement of business objectives. The firth domain certifies proper management of IT resources (both technology and human) and managing investments in infrastructure and people.

The effectiveness of IT governance is compromised if relevant change management strategies are not put in place. Organisations, therefore, need to blend execution of IT governance practices and learning together to bring about learning and innovation in an organisation. IT governance is, therefore, not a one

Figure 1. IT Governance Scope. Source: Adapted from (IT Governance Institute 2007)

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use



off endorsement of some business activities, processes, and controls. It should be treated as a governance mechanism of continuous learning aimed at the evolving use of IT, shaped through alignment between the organization's strategy and diffusion and application of IT within the organisation, guided by the value profile that stakeholders attach to it. IT governance is, therefore, not just a managerial concept, and requires commitment and understanding of every employee in the organisation. Its effectiveness, however, depends on the way it practices, controls, and processes have been institutionalised in the organisation.

INSTITUTIONAL THEORY

In institutional theory, there are five key concepts, i.e., isomorphism, organisational fields, institutional logics, institutionalisation/legitimacy, and organisational and institutional change (Washington & Patterson 2011). These concepts are shapped by three types of social forces in an institution, i.e. regulations, assumptions and expectations, and cultural cognition (Macfarlane et al. 2013; Scott et al. 2000). An organisation, thus, integrates and aligns different and similar variables to create organisational value (Washington & Patterson 2011) by systemising all processes, practices and ideas. In other words, these interactions help an organisations evolve and institutionalise various concepts, such as technology use, across the organisation through the processes of facilitating and sharing, which leads people understand and make sense of their roles, jobs, and activities by enabling them to practice, communicate, and co-operate collaboratively.

Figure 2 summarises a view of institutional theory, integrated with its pressures, forces and factors. It shows that institutional theory focuses on paying high attention to holistic assessment of dynamic operational processes to gain better alignment with more internal process synergies. External variables concern competition, social regulations, technological change, and the economic and political environment, all of which impact organisational capabilities in meeting organisational objectives. Dynamic relationships in the organisation are built through the organisational structure, which allows people to understand their roles and responsibilities to deliver effective organisation performance (Greenwood & Suddaby 2006). In other words, everyone being aware of the structural change within an organisation (Dorado 2005) aids understanding of clear organisational strategies and policies (Battilana 2006).

Figure 2. Institutional Theory. Source: Adapted from (Scott 2001)

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

People make sense of what they have to follow to manage organisational change and consequent organisational development (Lawrence & Suddaby 2006). Best practices are implemented to assess institutional change and gain institutional stability, while supervising people so they learn from past mistakes (Mutch, Delbridge & Ventrescu 2006) and leading them to understand all institutional domains vertically (Chizema & Buck 2006).

Institutionalisation is achieved when a phenomenon is embedded in organisational life in such a way that it becomes an integral part of organisational life. This integration means that business cannot be executed legitimately (in economic, social, and technical terms) without it. Institutional isomorphism means that the whole organisation conforms to the same set of principles, rules, and norms regarding a particular phenomenon. It occurs through three factors—coercive, normative and mimetic. Coercive isomorphism is the result of presses from internal and external forces that force the organisation to exhibit specific behaviour. These social, cultural, regulator, economic, technical and political forces are exerted on an organisation such that it conforms to the rules and desires of a dominating party. For example, rules and regulations regarding taxation and employee relations, set forth by the government, are examples of external coercive forces. Another example of external coercive pressure is making a trading partner conform to a specific technology standard because that will make it easy for the dominating business in the supply chain to transact business. These pressures emerge from legal mandates, or are influenced by political structures and power relations in organisations, involving authority and approval to meet requirements or expectations.

Normative isomorphism refers to the collective effort of employees to evolve a social, cultural, economic and technical environment that breeds a desired behaviour as well as controlling it. It arises from resources (training, knowledge, technologies and related areas), which are adopted to gain professional practice and achieve effective and productive outcomes (Macfarlane et al. 2013; Washington & Patterson 2011). Thereafter, effective organisational change management and organisational relationships certainly embrace the organisational environment, which gains effective cooperation internally and externally. This isomorphism is achieved through management policies, education and training of employees, job descriptions and experiences, and networking through professional associations. Norms and values thus evolved in the organisation increase the similarity of knowledge, skills, and attitudes of employees in a specific work environment. Mimetic isomorphism calls for deploying successful best practices, solutions or remedies of other organisations (Washington & Patterson 2011) to empower employees in uncertain situations (Macfarlane et al. 2013). When organisational technologies are poorly understood, when goals are ambiguous, or when the environment creates symbolic uncertainty, organisations may model themselves on successful organisations, within the same industry or outside of it (DiMaggio & Powell 1983). For example, a technology platform adopted by a competitor may be considered by an organisation to address uncertainties occurring due to changes in the business environment.

Applying institutional theory to IT governance means that unexpected situations are avoided and risks mitigated. People are encouraged to improve their individual skills learn to gain more knowledge to support and remedy IT governance and related domains in the organisation by sharpening their technical efficiency or organisational performance to meet organisational/stakeholders' expectations. It thus, aims for responsive behaviours under the institutional forces in an organisation.

RESEARCH METHODOLOGY

This research employs an interpretive epistemology with a qualitative perspective. The aim of this research is to explore how large sized Thai service organisations institutionalize IT governance practices. In order to address the research question for this study, 17 middle to senior managers representing various roles in the organisation were interviewed and a further 141 surveys were completed among the staff of Company A. were selected The interviews were conducted over a one to one and half hour period and included a cross section of job descriptions that participate in IT governance practices at various levels. This cross section includes staff involved with development, implementation, supervision, management, and use of technical as well as non-technical practices and processes relating to IT governance in company A. The interview questions were open-ended and interviewees had freedom to describe their experiences and problems beyond the scope of the questions. In addition, researchers were provided access to all documentation as well as access to sites of concerning IT governance. The interviews were transcribed and data from all sources were analyzed using NVivo software using its features of themes, descriptions and assertions. Survey data was categorized through various visual descriptions. The conclusions drawn in the following case, thus, represent interpretations of the evidence as understood by the author. To comply with confidentially agreements with the case study participants; theirs as well as their organization's identity has been suppressed.

CASE STUDY

Company A was established in 1945 with a registered capital of THB5 million (USD156, 885) and 21 employees. It has been one of the major local commercial banks in Thailand since 1976, and is listed with the Stock Exchange of Thailand. It is indexed with the bank of Thailand, which operates as the central bank—designating monetary policy, examining financial systems, supporting banking assistance to the government and financial institutions, releasing securities and new prints of banknotes, and controlling the foreign exchange rate in Thailand. Company A is one of the five largest commercial banks in Thailand as determined by its total assets, loans and deposits.

Company A's services include personal saving and investments, fund transfers and bill payments, foreign currency services, personal loans, international trade services, bank guarantees, credit and debit card services, cash management, domestic credit, international banking, investment banking and securities. Currently, it has a registered capital of THB30,486 million (US958 million) with total revenue in 2013 of approximately THB1.43 billion (US44,966 million). There are over 19,000 employees who work in over 900 branches across Thailand, with 11 overseas offices in the US, Hong Kong, Cayman Islands, China, Japan and Myanmar, with trade partners worldwide. Table 1 summarises Company A's key information.

Organisational Structure

Company A is a large organisation with significant involvement in Thai monetary policy and operations. As Figure 3 shows, there are 13 core business divisions with numerous smaller departments, sections and teams. The top management in the organisation represents four major components—shareholders, board of directors, independent directors' committee, and the management committee. In addition, the

Nature of business	*Banking and financial services*
Year of establishment	*1945*
Head office	*Bangkok, Thailand*
Location	*Across Thailand with designated countries*
Total revenues 2013	*Approximately THB1.43 billion (USD44,903 million)*
Registered capital	*Approximately THB30,486 million (USD958 million)*
Total branches	*Over 900*
Total overseas offices	*11*
Total employees	*Over 19,000*

board of directors is advised by a range of directors and committees. The executive management team governs and controls the operational divisions and provides directions and guidelines for the business. Individual divisions collaborate closely across different product areas. The organisation has decentralized formal management, thereby, individual divisions have extensive authority to run business activities.

Information Technology Organisation at Company A

In Company A, IT is in the systems division, with 14 key IT operating subordinate departments (see Figure 4). The CIO is the manager of the systems division, and is responsible for executing and controlling all IT functions related to all business activities in every business division and each subordinate department throughout Company A.

IT operational services are divided into two areas of responsibility—corporate and divisional IT. Corporate IT operates under the IT planning department in relation to the use of IT at the strategic level only. Divisional IT focuses on IT operations, and maintains all IT activities and services in the business division levels, including all subsidiary departments and branches. Therefore, the systems division handles all IT concerns and operates all IT activities in relation to all business transactions. The systems division is located at head office in Bangkok, leading all in-house and outsourced IT operations within head office and throughout the branches all over Thailand.

Major Technologies at Company A

Table 2 lists the various IT systems and applications that are implemented and operated to meet the business requirements of Company A. It classifies six business programs: (1) marketing, (2) personal online banking, (3) business online banking, (4) electronic funds transfer, (5) IT security and (6) banking operations.

The core banking system delivers all financial and banking data integration in real time: transaction banking, lending, mortgages, deposits, and online and mobile access. The credit management administration system controls credit transactions by integrating the selected vendors to facilitate data exchange with corporate and retail customers. Moreover, the credit management administration system enables the

Banking operations	*Core banking system: transaction banking, lending, mortgages, deposits, and online and mobile access*
	Credit management administration system
	Loan origination system
	Queue system
	Document imaging system

loan origination system to control and monitor all steps in loan application processing. With over 900 branches across Thailand, Company A facilitates customer service by implementing a queue system, a document imaging system and related banking systems.

Company A originally implemented data security and branch service systems. However, data protection issues arise from the different business processes, business applications and record management systems implemented on servers. Thus, a virtual server and storage was introduced to strengthen safety and protect data from attacks or risks from viruses and malicious intrusions. Risk-management tools,

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

such as key risk indictors, risk event databases and related systems, monitor and control risks. Record management systems are the key applications that manage and interact with different business activities and systems, for instance, financial data, accounting and payroll, operations, compliance, data security, policies, compliance, standards and regulations. For business online banking, an electronic data capture system validates online credit card transactions over e-commerce websites for safe online payments. It detects fraudulent credit cards trying to make online transactions. This process focuses on strengthening the safety and accuracy of online financial data to support merchants that are business customers of Company A. NFC technology has been employed and developed for mobile banking. Customers can easily check their balance, transfer funds, top-up savings and make payments via their mobile phone. A dynamic currency conversion system allows electronic funds transfer so credit card holders can make payments converted into local currency from 35 different currencies. In addition, a real time exchange rate trading system is available over Company A's website. The bulk payment system allows transfer of large transaction payments.

In terms of personal online banking, Company A focuses on safer online financial transactions. Verified by Visa and MasterCard Security Codes are used to deliver fraud detection systems to strengthen customer shields. One-Time Password is a unique password notified by Short Message Service (SMS) over customers' mobile phones and email to immediately update and confirm transactions. Company A was the first bank in the Southeast Asian region to bring this technology to the banking industry. This service encourages and supports customers shopping over the internet and making payments through online transactions. Online security is vital for business online banking. Customers can easily access Company A's website to scan for viruses online and download security software products to help increase online protection.

Company A considers that IT infrastructure is vital to its business. It is implemented in different functional areas of the business divisions to ensure its products and services deliver value. A social networking service is also a key marketing channel that connects customers easily and interactively, possible as a result of strong growth in the use of social media. It markets new business products and services. A CRM system is implemented in both retail and corporate business divisions to ensure good relationships using technology to cooperatively manage and automate sales, marketing, customer service and technical support. A sales-force automation system is adopted to collaborate with CRM to drive and increase performance and profitability. Company A adopts a campaign management system to design and promote multichannel marketing initiatives and follow up their effects by analysing customer classification.

Information Technology Operations and Management

Company A mainly focuses on two areas of IT performance—management of outsourcing and vendors and business-IT strategic alignment. The SLAs focus on measuring performance and processes of different outsourcing activities and vendors. In addition, the BSC measures IT performance against alignment with business models, processes and strategies in response to profitability. Company A adopts a back-office centralisation solution to increase productivity and decrease expenses and staffing levels throughout all branches in metropolitan areas. All the non-core business functions are centralised in a shared environment.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Implementation of IT infrastructure routinely involves IT service management. The ITIL is adopted to support the IT planning department configure management, focus on organisational strategies and projects, and coordinate other teams and departments vertically and collaboratively. ITIL was adopted to create a master plan by allowing the IT planning department to manage all IT projects thoroughly, transform them properly and assign the responsible people correctly.

Strategic Alignment

Company A has a well-established procedure for technology implementation. Each new technology is introduced in the organisation in response to some strategic considerations. The organisation follows an extensive process of performance audit, whereby performance of processes as well as technologies is measured periodically. This evaluation provides management with feedback on the efficiency of processes as well as technologies. This assessment helps in identifying the technology and process gaps, which helps technology implementers identify the right kind of technologies that suit the business. Once they understand what technology is right for the business, proposals or quotations are sought from technology vendors. Doing so, not only organisational managers know what type of technologies is right for the business but at the same time they also know the limitations and capabilities of technology, which helps them with change management. The head of software quality assurance summarises the process:

We list all priorities from each business improvement initiative. We check the most useful technologies and methodologies that match the business requirements. The various committees that we have then meet on this IT agenda and take decisions on technology developments/procurements/improvement. These are thus able to indicate project stakeholders as well as resources required to undertake the projects.

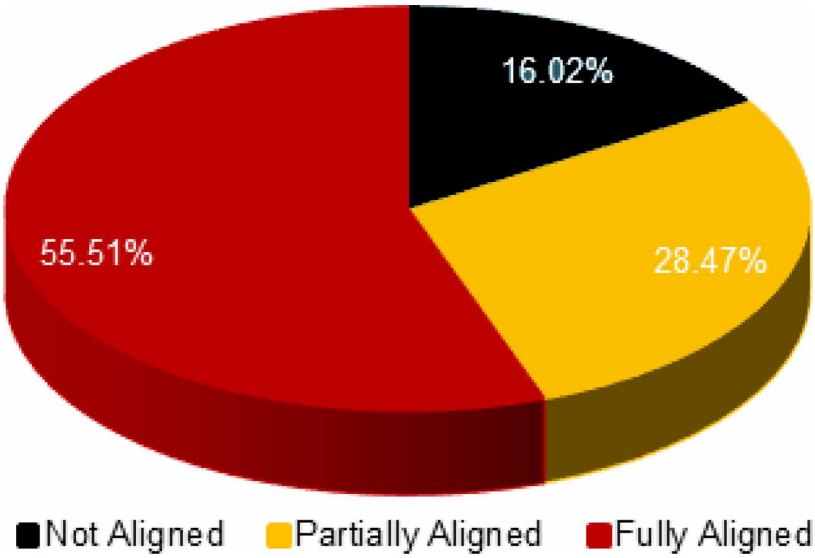

Figure 5 shows that most respondents in Company A (55.51%) believe that IT is fully aligned with business model. On the other hand, 28.47% of the respondents believe that IT is partially aligned with business model, and relatively low number of the respondents (16.02%) believes that it is not aligned with the business model. This shows that Company A has a relatively low number of employees in the organisation who do not understand and interpret business requirements properly, and are not able to understand how technology is used to address these business requirements. Company A takes a closer look at IT-based enterprise architecture and business processes to investigate where the business needs are and adopts the right solutions to improve performance and mitigate risks related to IT infrastructure. Conformance to enterprise architecture not only helps with better performance, but also identifies root causes of the issues and loopholes that contribute to problems and issues with business processes.

Strategic Information Technology Implementation

Company A is a technology savvy organisation. Top management supports technology introduction, operation, and management at various levels in the organisation. There is fair bit of confluence between top management and the CIO. Once the top executive provides clear directions and visions on where the business is heading, the CIO is able to map business requirements with technology. The close association between the CIO and the CEO helps the organisation grow in synchronisation with technology. In this way, technology becomes an integral part of organisational growth. The head of IT strategy and policy further explains:

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 5. IT Alignment with Business Model

I think the most important is sponsorship from top management. It can improve IT systems, processes and the methodological thinking of people. It would be much simpler if the board of directors agree and support the intention to keep moving using technology. Their strong lead can support IT implementation to minimise difficulties in the business processes and achieve better results. Once this is done, the rest is easy because we provide education and training along with clear communication to involved people. They will clearly understand benefits of IT in the business.

External influences from both local and global environments impact the business of Company A, especially political factors. It is important for Company A to be aware of changes that directly and indirectly affect the ability of business and investment to meet organisational strategies and achieve business objectives. Company A focuses on government factors and legal concerns by anticipating and influencing public policy actions. In doing so, Company A complies with the bank of Thailand as mandated by the Thai Government. Senior managers take into account major political realities, such as, government-driven tax laws, trade quotas and restraints, regulatory frameworks, industry subsidies, investment incentives, local content manufacturing requirements, regulated pricing, trade agreements, economic treaties and bureaucratic processes. Since political developments and changes control business direction, Company A follows and updates practices according to directions from the bank of Thailand. This approach helps Company A to avoid problems and issues emanating from noncompliance and financial malpractices. A senior IT architect specialist provides insight in to this:

The regulatory team is responsible for working with the latest guidelines and policy from the bank of Thailand. These changes directly affect all banks in Thailand. The regulatory team is always aware of changes and understands what to change and improve. It also updates the latest information and reports to the participating people in the organisation, including our internal and external stakeholders.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

To keep up with the changes, Company A relies heavily on IT. It is not only proactive in implementing new technologies, refurbishing and upgrading existing ones, but also keenly peruses BPR for continuous improvement. IT governance is the cornerstone of these strategies, whereby the company adopts and customises only reliable and trustworthy existing IT governance frameworks to meet its business considerations. The expected benefits of these existing frameworks meet the business objectives of Company A. The guidelines available through these frameworks help Company A to cope with its business effectively and proficiently. A senior IS auditor states:

We adopted and customised CobiT and ITIL in some areas. These methodologies support monitoring of different workflow processes relating to project management, quality assurance, capacity management, and customer relationship management. These help us mitigate risks and incidents from unexpected situations. They also reduce controlling processes and minimise costs for long-term management of processes.

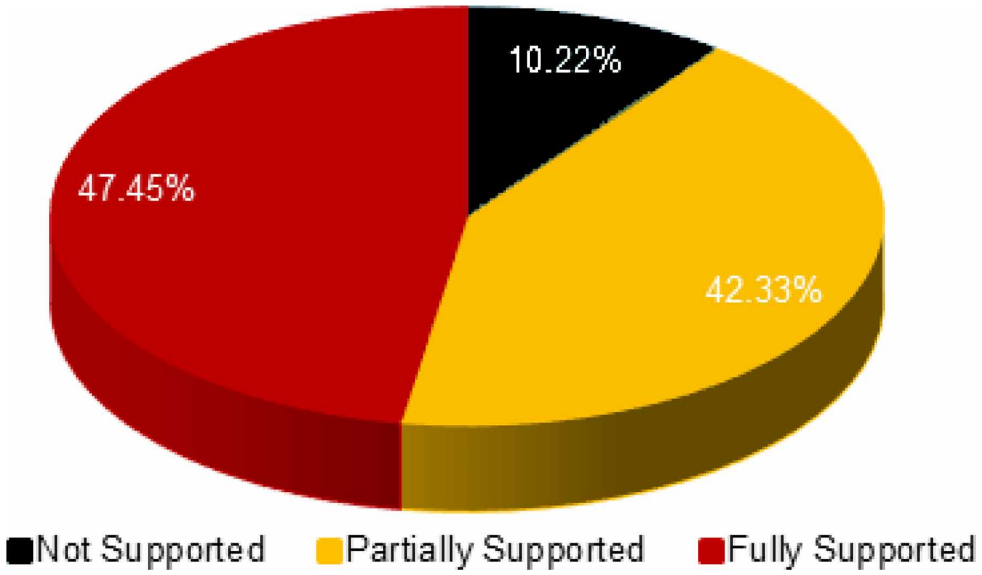
Information Technology Investment

In Company A, the IT department works closely with other business functions. This collaboration helps IT people recommend solutions in terms of returns on investment and benefits expected in the future. For example, the senior IT strategy and policy specialist comments:

We acknowledge what kind of problems the business department has and encounters daily. We know what type of IT solutions to adopt and support them. This knowledge helps us understand the requirements and propose a variety of solutions for the end users to select from.

In Company A, a steering committee manages IT investment decisions. The committee pays attention to details in project scope, goals, plans, schedules, timelines, costs, quality expectations, tools and deliverables. They focus on reporting of project progress, and project changes and results of measurement. The senior software quality assurance specialist explains:

The committee highly focuses on making decisions on IT investments. They always inquire about the problems in the business departments that are related to the use of IT and the IT department always gets involved. They support the need to align business and IT and achieve better relationships.



Value Delivery

Figure 6 shows that 47.45% of the respondents in Company A believe that IT system fully support business services, with an almost equal number of employees suggesting that they partially provide support. This shows that Company A spends significant effort in taking care of the vulnerabilities and technology as well as the processes enabled by technology. Otherwise, the IT support systems can be a burden that can slow down the business. However, since the bank also involves third party technology services, it requires the IT department to continuously monitor and check the progress against value profile required of IT and related processes and procedures, and SLAs.

Company A operates in a highly volatile environment. However, its internal workflow and procedures are fairly stable. This helps the organisation to not only focus on an acceptable level of service to accelerate value for customers, but also helps it to continuously innovate and transform its business to

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 6. IT and Business Service Support

meet and exceed internal and external customer expectations. This has led to very high level of employee turnover. As a result, retention of expertise is an issue with the bank. Company A has limited number of experience skilled employees who have in-depth knowledge of IT related to backend banking processes. IT also has a fairly large number of new or relatively newer employees who are not fully trained and do not possess the same level of expertise. The head of software quality assurance confirms this:

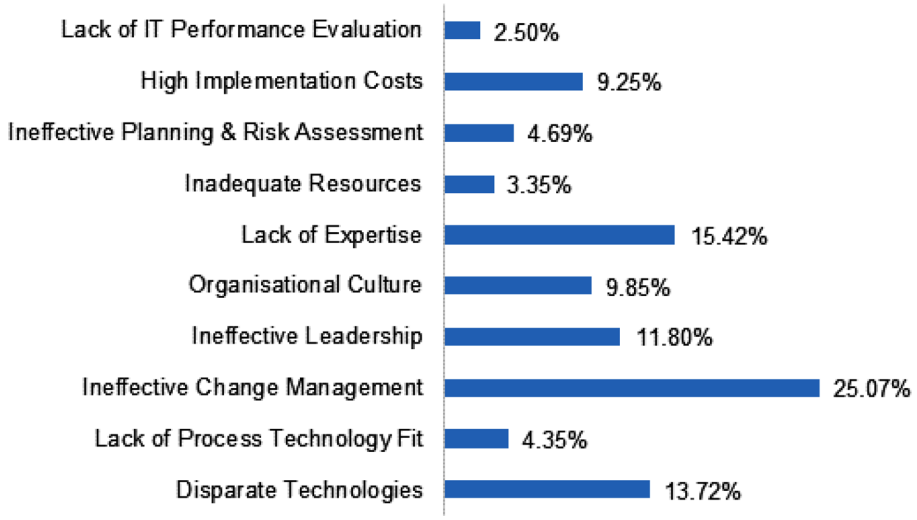
It is essential to have people who are ready and information well-prepared in advance to gain high productivity or high efficiency in a banking environment. Otherwise, I will say that we would waste time. I would like my department spend less time in preparing the department to provide the required level of surveys and more timing actually providing that surveys.

It is understandable why most respondents (25.42%) believe that lack of expertise is the main cause of failure to achieve expected value from IT (see Figure 7). Other major impediments to achieving value from IT as reported by the respondents include high costs of implementation and lack of planning. It is important to note that 15.57% of employees believe that employees are reluctant to change. This is because employees in Company A are fairly proactive in learning new technologies and do not have any issue with learning new technologies and new ways of doing business.

Figure 8 shows that 47.42% of respondents believe that the organisation's IT infrastructure's value delivery is mature whereas 42.01% of the respondents believe that value of IT service delivery is emergent, which means that the existing IT infrastructure is effective in providing required results. It also shows that IT is aligned with the business model, and IT support services are fully supported for business processes. The existing technologies are up-to-date and are not a hindrance to specialists. The existing technologies are contemporary and add value to the work of employees in the organisation. In other words, IT infrastructure fulfils the demand of higher workload and capacity to meet the rapid work of business, such that mistakes are avoided and delays in business processes and delivery of transactions are minimised.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 7. Causes of Failure of IT to Deliver Expected Value



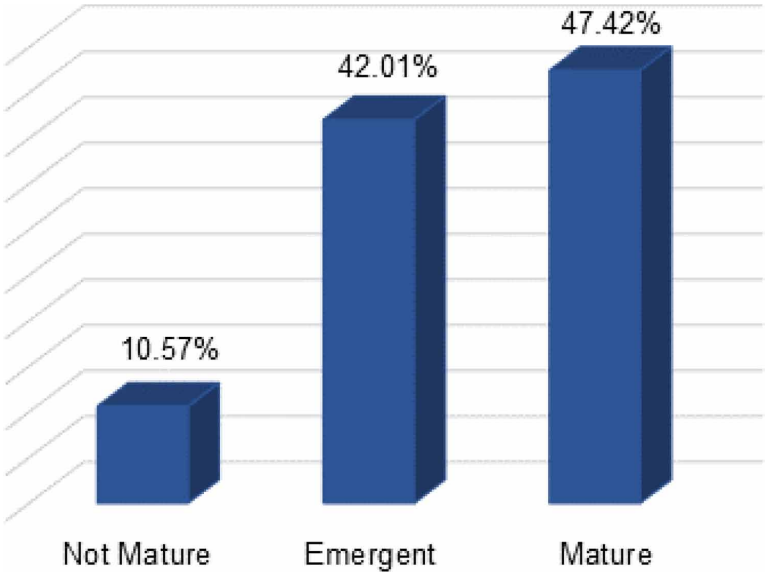


Figure 8. Value of IT Service Delivery

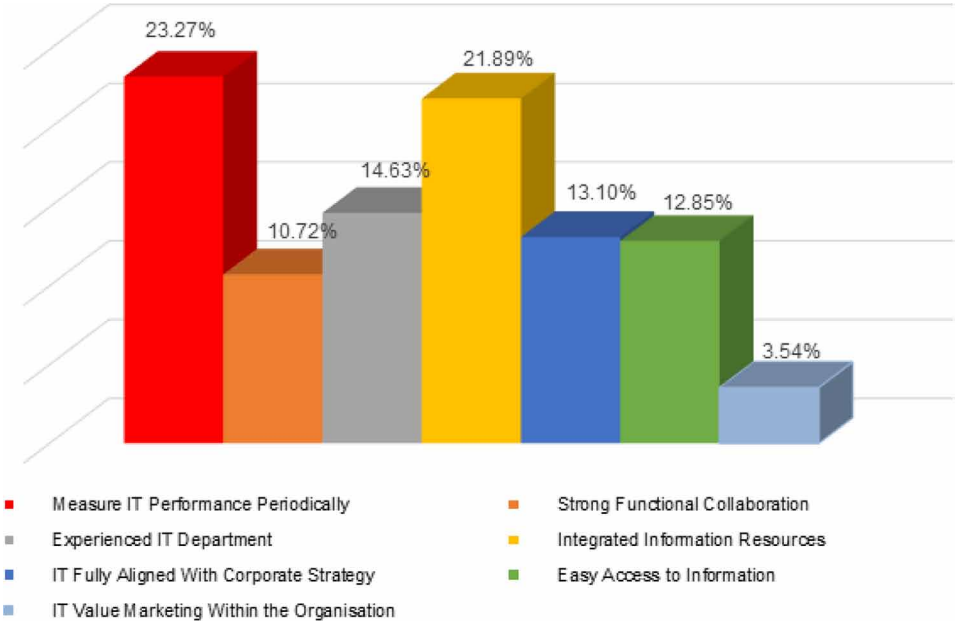


Since Company A is a financial institution, it has a propensity for measuring performance in financial terms. For this reason, most respondents (23.27%) agree that measure IT performance periodically is the key strategy to improve the perception of value delivery (see Figure 9).

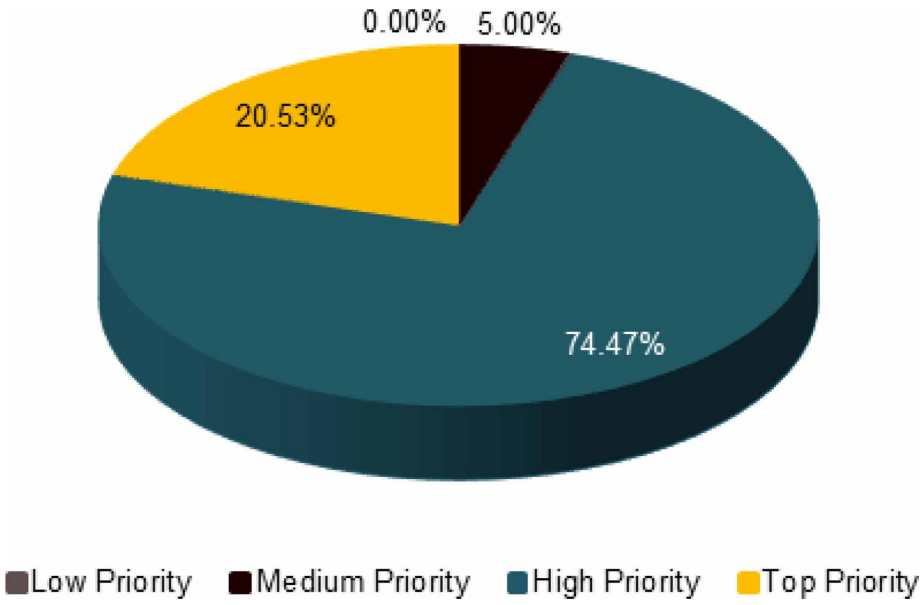
Integrated information resources is rated by 21.89%. This reaffirms that the organisation is fully programmed to view IT as means to developing a robust CRM infrastructure. The fairly even response rate in other categories indicates that the role of IT is well-established in the organisation. Considering Company A's business, the results are not surprising. It shows that employees understand the business well and know how to maximise value from IT. It also shows that Company A considers performance

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 9. Key Strategies to Improve Value Delivery Perception

measurement in a variety of business areas and utilises resources to ensure that employees understand the value of IT. Company A regularly monitors contractors and vendors and accesses the SLAs to mitigate risks and unexpected situations. The capability and capacity of IT infrastructure is used to support business growth.

Resource Management



Being a financial institution operating in a highly competitive and technology intensive industry, Company A is quite keen on managing its critical IT resources. In terms of resources, it not only proactively manages the critical technology resources, such as hardware and software, but also the HR related to IT. A senior IT strategy specialist provides a statement about the organisation in terms of resource acquisition and management:

The planning team follows strategic directions from top management and update their plans with regards to ITIL change and configuration management. This team receives a master project plan that integrates other plans together and ascertains technologies required and assigns the responsibilities to people according to their experience and expertise. Senior management thus ensure that work is high quality, knowledge of employees is utilised properly and other employees learn from their expertise.

In Company A, there is a high turnover of technically qualified HR, therefore, it relies on well-thought out plans for employee retention, knowledge sharing, and peer based learning. Company A also lays equal importance on investing in existing hardware and software resources to upgrade and/or re-furbish them to gain continued and sustained value from them. This explains why 74.47% of employees in Company A believe that the organisation uses resources wisely and effectively (Figure 10). This shows

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 10. Efficient Use of IT Resources

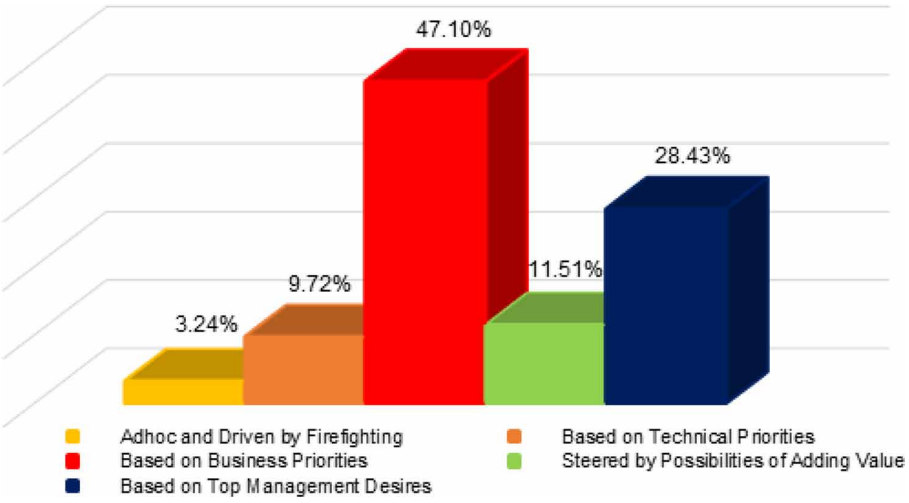
that employees are trained to not waste resources and help organisation to reduce costs. Company A thus gains savings and is able to channel resources where required. Company A employs this technique to capitalise on opportunities in cautiously applying IT resources and strategically preparing itself for improved economic conditions. The response to the survey also indicates that employees in the organisation understand the criticality of IT resources and can relate to their efficient use for the overall competitiveness of the organisation.

At Company A, top management has made IT an integral part of organisational life—employees cannot think of doing their job without technology. Company A encourages multiskilling of employees, which enables employees to build and strengthen their skills across various functions and platforms. Apart from technical and operational skills, they also learn particular banking skills specific to Company A's business. The organisation also provides ongoing support to employees, they become proficient in technology use within the organisation. The business analyst explains the support available to employees, so that they are trained to handle different aspects of IT based business execution:

We have a team that provides training and service support to internal staff. They are technically sound and picked from various departments. This cross-functional collaboration helps them create all inclusive training programs, which I think would be pretty expensive if commercial trainers were hired. In our case, this team is able to give a thorough perspective of critical technologies to employees in a much friendlier and close to home environment.

In addition, Company A also utilises vendor-based training and support. External vendors provide support services to the organisation on an as-required and where-needed basis. A senior software quality assurance employee explains the overall training paradigm:

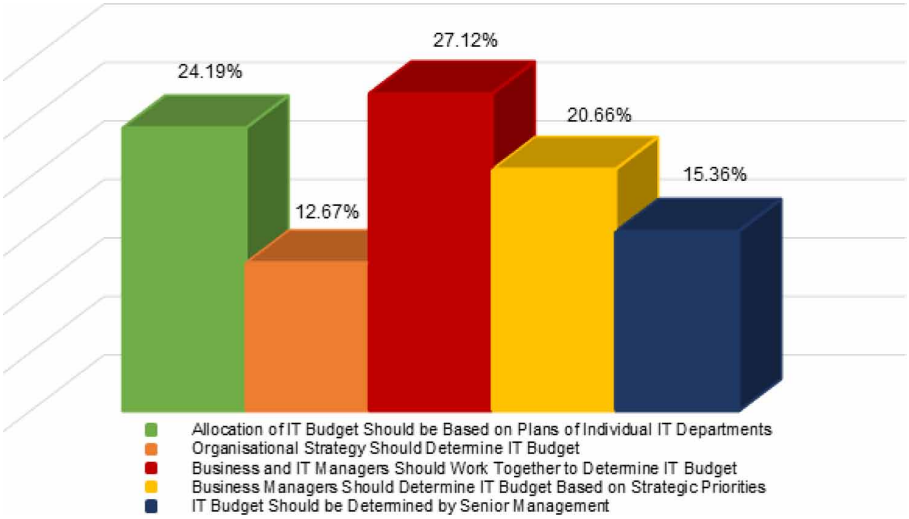
EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use



We have external IT specialists from IBM to organise IT service support, in terms of applications and servers at headquarters and branches. We hardly get IT problems. Vendors are required to follow all IT infrastructure master plans that have been created and directed by IT architecture team. If there are new policies, new guidelines, new processes and new designs, organisation will pass them on to vendors, so they update their training programs.

At Company A, top management is proactively involved in IT resource acquisition, allocation and management. At the same time, their technology implementation is derived from strategic business considerations, such that employees understand the rationale of technology, its utilisation, and how it contributes to individual efficiency as well as the overall business's profitability. It is, therefore, not surprising to note that 47.10% of respondents believe that resources allocation should be based on business priorities and 28.43% are of the view that it should be steered by possibilities of adding value (see Figure 11).

Budget Allocation



As explained earlier, Company A is a technology savvy organisation and allocates substantial budget for IT related infrastructure. The organisation has a fairly supportive CEO, who supports IT implementation at various levels in the organisation. It is, therefore, not surprising to note that majority of the survey respondents (27.12%) believe that business and IT managers should work together to determine IT budget (see Figure 12). This is because they have faith in, and trust top management that they will allocate funds when required. It is equally important to note that 20.66% of respondents believe that business managers should participate in IT planning and approval of budgets based on strategic priorities, whereas this organisation has IT infrastructure which is well aligned with its strategic business model. Similarly, there are only 12.67% of respondents who believe that organisational strategy should determine IT budget. It could be argued that these responses are somewhat biased because of continuing support and heavy involvement of the top management in Company A with IT related initiatives. In any

Figure 11. Allocation of Resources

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 12. IT Budget Allocation

organisation with similar characteristics and a non-supportive CEO, responses in these two categories maybe higher. Nevertheless, in Company A budgets are granted for approved projects only where business opportunities are evident. Budgets are monitored and controlled to make sure that they are spent wisely and effectively.

Risk Management

Risk management is perhaps the most important concern of Company A. It has put in place various technologies to monitor and manage risks related to information as well as the systems that create/capture, exchange and store it. These initiatives are complemented with policy and procedural controls to monitor vulnerabilities and develop effective risk mitigation and management plans. The head of IT strategy and policy notes:

We focus on the efficiency of security systems by considering the type of security vulnerabilities, importance of system, and priority of information service. We classify results in different categories: type of incidents, level of severity and weakness. The results are used to develop an estimation plan that ascertains level and severity of risks, which is then used to allocate resources and develop assessment techniques, and risk mitigation and/or risk management plans, procedures and technologies.

The risk estimation process at Company A ascertains the probability or the likelihood of the risk occurrence. This exercise helps the organisation establish the criticality, interconnectivity, and the likelihood of risk occurrence. The systems administrator explains:

Once we conduct risk assessment, we create the improvement plan by checking the level of risks. Then, we create action plans by concentrating on the issues in action plans to manage the risks. The action plan is about the necessary steps to be taken, to avoid the risk as well as to initiate resources and raise alarms. So that, other departments can take defensive measures.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 13. Technology Risk Management

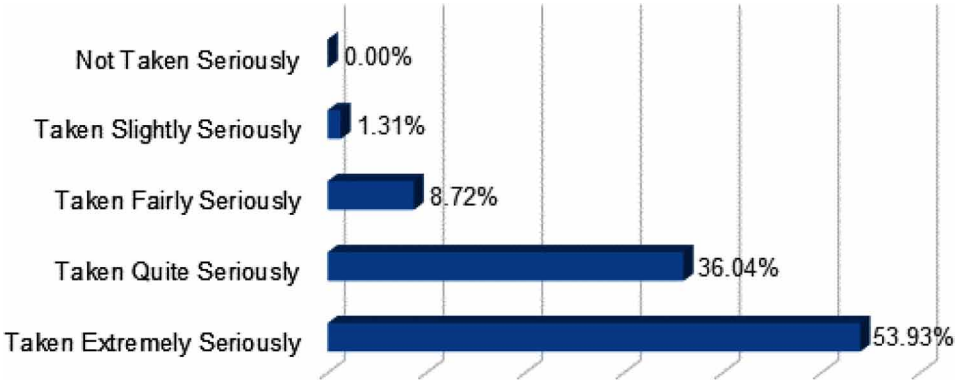


Figure 13 illustrates that 53.93% of respondents indicate that IT risk management in Company A is taken extremely seriously. It is unsurprising and understandable that senior management considers risk as the most important element of IT infrastructure in a banking environment. It is for the same reason that senior management pays close attention to IT risk management while considering business priorities and new and attractive business initiatives. It is also not surprising to note that none of the respondents believe that the organisation takes IT risk management slightly seriously or does not take IT risk management seriously at all.

At Company A, all departments have their own tools to investigate and monitor risks. Experts who work within their departments develop risk assessment reports. These risk reports are then shared among all functional areas of the business, thus employees in different functions understand vulnerabilities are coming from other functions. This not only helps senior management to develop all-encompassing IT risk management plans and processes but also helps in educating employees on different risks emerging from their own department as well as from other departments affecting their work. In the same way, the organisation also lays maximum emphasis on external risk sources. For example, the head of software quality assurance comments:

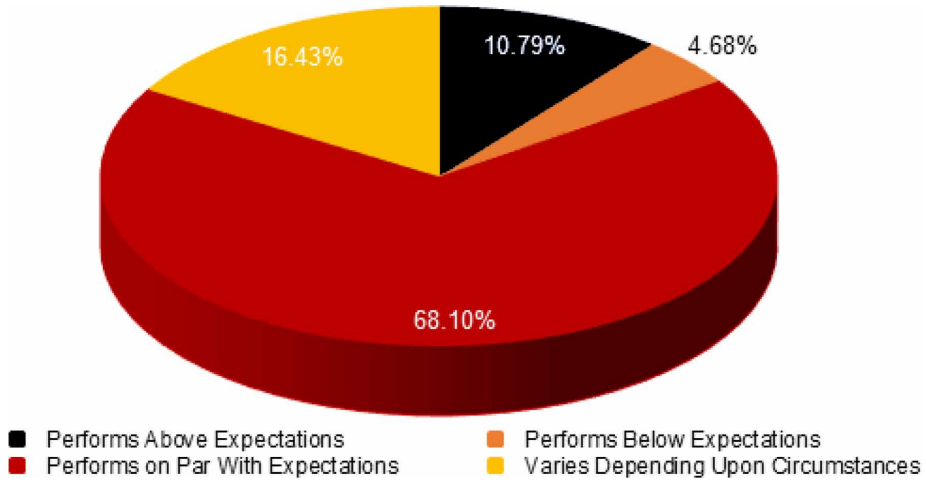
We always conduct risk analysis and assessment for outsourced work. Although we do not outsource any critical information, still risk assessment from external sources is a critical component of the overall risk management process in all departments.

Performance Measurement

Company A has a fairly well-established performance measurement regime. It utilises frameworks such as Balanced Scorecard to measure the overall performance as well as functional performance in different areas of the business. For example, for IT performance measurement the head of software quality assurance asserts:

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

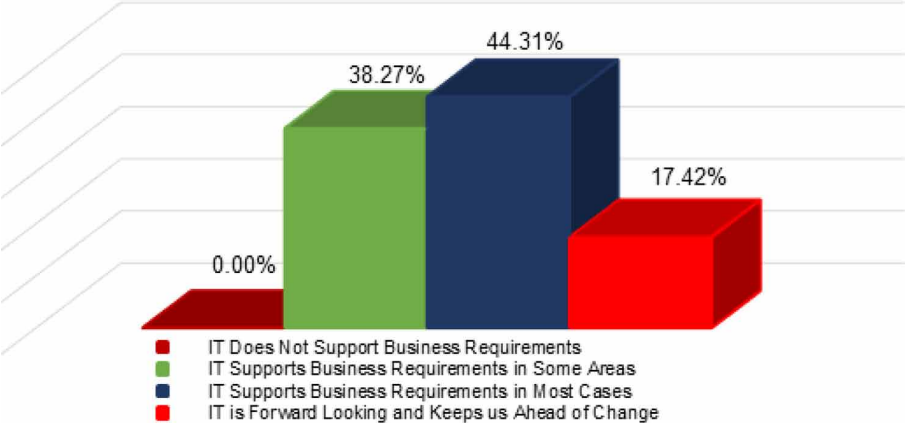
We adopt balanced scorecard to measure IT in a detailed way in different units. This gives us an in-depth analysis on the value assessment of IT to the stakeholders, customer service, and development of organisational capability. We couple this assessment with other assessments, such as; information quality, system reliability and availability, incident management, etc. to prepare detail analysis of IT infrastructure performance in the organisation.



Company A also continuously measures the performance of SLAs with the third parties. This complements the organisational effort in measuring performance of IT hardware. For example, the business analyst states:

We regularly measure performance of IT infrastructure, i.e., servers and networks. When we use this information along with the SLAs that we have with our major technology vendors, we can forecast future technology requirements and capacity planning. For example, IBM always reports us the capacity of hard drives and we make decision whether to invest more.

Performance measurement and management is not just an IT department function. It should be a critical component of every department's work agenda. This sentiment is reflected in the survey result illustrated in in Figure 14. Most respondents (68.10%) believe IT performance performs on par with expectations. They realise that the existing technologies can handle and support requirements of all business cases. This means most problems are responded and solved on spot with the right IT services and supports. This indicates that technology solutions and practices in Company A are well-suited to main business areas that are set in the business priorities. So, they deliver effective results.



Company A acknowledges that IT infrastructure is the primary organisational foundation to an agile business. It is vital to routinely investigate the capability and performance of IT infrastructure. Thus IT internal auditors or analysts collate monthly performance scorecards and provide cross-functional reporting for all operational areas. The performance is addressed in a report with recommendations for improvement to stakeholders and leadership team members. At Company A, performance measurement also focuses on measuring vendor performance in meeting SLAs. This signifies that the organisation

Figure 14. IT Performance

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 15. IT Capability

understands that IT depends on internal as well as external support, and business departments can only access service attributes of technical infrastructure as available at any given time. Therefore, in order to get the full value of IT infrastructure performance, both these perspectives have to be accounted for.

Figure 15 specifies that most respondents (44.31%) believe that Company A has an effective IT infrastructure, which supports business requirements in most cases. However, it is interesting to note that 38.27% of respondents are of the view that IT supports business requirements only in some areas. This means that in some business areas existing technologies and practices are not well-designed, incompatible, and unqualified to support business requirements.

Information Technologies Governance at Company A

As Company A heavily uses IT in its business, it is unsurprising that most respondents (35.50%) believe IT governance allocates responsibilities and accountabilities relating to IT use (see Figure 16). This means that employees clearly understand their roles, rights and tasks about how to use IT properly and responsibly on all IT operations with the desired behaviour and actions. They realise that IT governance is embedded in their routine jobs, daily systems and working lives. Some (27.18%) believe that IT governance allows them to use IT assets to direct and control risk management and productivity in the organisation. This signifies that the boards focus on how to use resources wisely. They are the responsible people who decide to approve and allocate plans and budgets. Budgets are granted only for approved projects that provide opportunities, and are transparent. The boards monitor and control budgets to make sure that they are spent wisely, smartly and effectively.

It is not only employees who are required to utilise resources wisely, but contractors and vendors are also monitored and assessed. Training in different techniques occurs so consumables and resources are not wasted, and to capitalise on opportunities by cautiously applying IT resources and strategically preparing for improved economic conditions. Hence, Company A minimises unnecessary costs, has fewer expenses and limited possibilities to encounter unexpected large payments. This means Company A gains more savings and more earnings in the meantime. Particularly impressive, Company A employs this technique to capitalise on opportunities in cautiously applying IT resources and strategically preparing itself for improved economic conditions.

Figure 16. Expectations from IT Governance

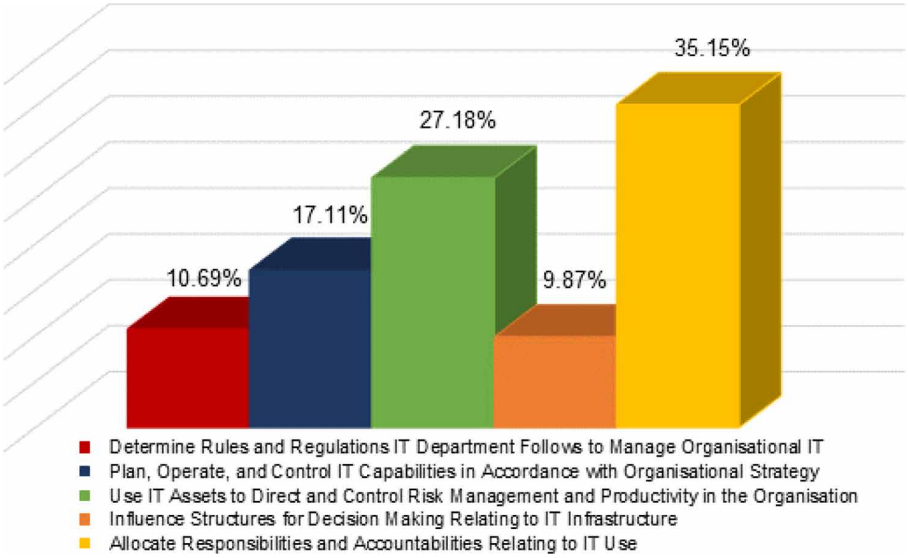

Figure 17. Involvement of All Levels of the Organisation in IT Governance

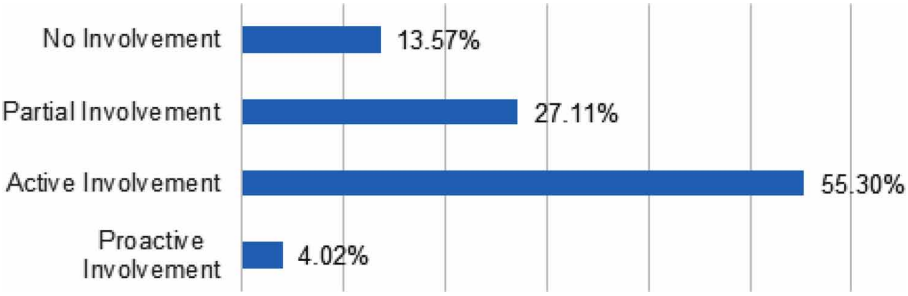

Figure 17 shows that most respondents (55.3%) believe that Company A has active involvement of people at all levels of IT governance. The boards and senior managers are careful and conscious of what is working. The hidden issues, the unforeseen problems and the benefits are predicted and expected. It is unsurprising that their subordinates are well trained and work hard. Moreover, effective communication is the golden key in this shared environment where the boards, the CEO, the CIO and subordinates routinely collaborate. Everyone understands their responsibilities and scope of decision rights. Therefore, everyone in all levels of Company A is eager to be involved in decision-making to achieve desirable behaviour in the use of IT and expected performance.

DISCUSSION

Company A, being a financial institution, has security of information at the top of its strategic agenda. It is also evident in its philosophy towards the way it has institutionalised technology. Company A treats IT as a strategic asset, though the overall scope of technology is limiting and has a passive stance. Imple-

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

mentation and utilisation of technology is policy driven and follows directions set by top management. Utilisation of technology is more focused on risk monitoring and management for known or detected risks. At Company A, proactive and pre-emptive risk aversion, however, is not associated with the value profile of technology. In certain areas of the business, there is complete alignment with technology, such that employees understand its rationale and show a positive attitude towards its use as well as gaining expertise. At the same time, there are other areas, where employees do not understand the justification for technology use, and work with it purely because it is supposed to be used. In these circumstances, it is difficult to assign or assume information ownership, which leads to bigger issues like assigning responsibility and accountability for inept and inadequate understanding and use of technology. The end result is that there is no single 'definition' or 'explanation' of technology use in Company A. The definition or explanation as intended by the top management is not followed by the entire operational level. Although, the top management is technology savvy and has been very actively acquiring and managing technology resources, yet their focus or obsession with security and risk management has resulted in divided opinions. It is just like citizens are required to pay taxes in most economies around the world; however, there are a relatively low number of economies where the results of taxation are evident through public emancipation. In the rest, although people pay taxes they do not see that money being reinvested in their social uplift. That may be due to government corruption or inability of the government to comprehend or prioritise what is important for the public. Whatever the case may be, the general public loses faith in taxation, even though, in theory, it is understood that the government is charging these taxes in return for safeguarding individual and collective interests of the public. Hence, there are issues like tax evasion and frauds. In the same way, the intent of Company A's top management is evident through the active agenda of implementing contemporary technologies, allocation of resources for their use and management, and training employees on the same. However, due to focusing on specific functions, lack of proper education of employees about the utility of technology, and inability of planners and managers to take the 'value chain' perspective of the entire organisation, technology use is treated differently in different functions.

In terms of mimetic pressure, the organisation draws from contextual forces that shape banking or service industry. In doing so, it has implemented best practices for CRM and those relating to backend financial transactions. It is further supported by Company A's keenness to follow alignment of the business model with technology, which helps employees to increase their capacity to understand the causal relationships between technology and business execution. Company A's upskilling and reskilling agenda helps employees to learn from peers within the organisation as well as from within the industry. This helps Company A with a better understanding of why, how, and what organisational aspects are to be focused in various types of change processes.

In terms of coercive pressure, there are three factors acting on Company A. First and foremost, pressure comes from the Bank of Thailand, which sets the legal, operational, and social direction as mandated by the Thai Government. In response to these guidelines, Company A deigns its products and services, business processes and their enabling and support infrastructure like IT, regulatory frameworks, investment incentives, and controls. The second factor is the pressure coming from within the banking industry, which is evolving technologically on a continuous basis. Company A has to change technologically continuously to remain relevant within its industry as well as to utilise the technological innovation relevant to the banking industry. The third type of pressure comes from the customers of Company A, such as commercial organisations as well as the general public. With growing automation of human life and connectivity among the general public, there are increasing demands for availability,

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

security, confidentiality, and completeness of information. This forces an organisation like Company A to continuously update its technical infrastructure to keep in sync with the technological changes in the operating environment well as the changing information needs and demands of the public.

Normatively, Company A has developed a culture that works as a well-oiled machine. Company A's CEO is committed to developing a robust technological infrastructure. The CIO of the organisation has significant input into strategic and policy direction of the company. Top management is, thus, quite liberal with financial and non-financial resource allocation. The company actively embraces new technologies, refurbishes existing technologies, and upskills its knowledge workers on contemporary technologies. Company A has a centralized structure, whereby technology implementation and management decisions are made by head office. However, top management also believes in delegation, and has delegated technology lifecycle management and majority of training to branch offices. This helps with the empowerment of middle management. Culturally, the organisation is security conscious and allocates a lot of resources and efforts in risk monitoring, mitigation and management. This has resulted in intensive internal competition between various functions on risk management. It helps employees in different functions understand technical and non-technical vulnerabilities originating from other functions of the business. This allows planners and managers to develop well-rounded IT risk management controls and plans, and in educating employees about the various types of risks posed to the organisation. However, the organisation seems overtly focused on security and risk, and often at the peril of improvement and innovation in other areas of the business. Company A also routinely conducts performance audits, where it assesses the value of the existing technical infrastructure, IT skilled HR, technology vendors, and SLAs, to the business. This evaluation is an ongoing activity in the organisation and the feedback is acted upon as and when deemed appropriate by the management.

CONCLUSION

This study presents a view of the institutionalisation of IT governance in large sized organisations. It contributes to theoretical research, as well as practice, in the field of IT diffusion and management and business management. There have been many research studies in IT governance; however, they have been focused on implementation diffusion and management aspects of IT governance. This study assesses how the case organisation has made IT governance an essential component of its organisational life. The findings from this study provide critical understandings about the organisation's view of technologies, as well as the psychology behind implementation of IT governance practices, as conceptualised and implemented in the organisation. This understanding helps understand how technology is viewed and absorbed within the social, cultural, organisational and technical environment of the organisation. At the same time, this understanding provides foundational knowledge for the development of more research to review further intricacies of IT governance practices and their interaction with the difference organisational, social, culture and technical systems within the organisation.

Chapter 52
Information and Communication Technology for SMEs' Competitiveness

Neeta Baporikar
Namibia University of Science and Technology, Namibia

ABSTRACT

Competitiveness of a firm is its capacity to achieve its targets. These targets are likely to be expressed in a variety of terms depending on the context (Barney 2002). Within a macroeconomic perspective, a competitive firm develops and sustains a level of performance that contributes to the Gross Domestic Product (GDP), employment opportunities, and the wealth of the people. From an entrepreneurial perspective, a competitive firm needs to survive in the market and to achieve market share and profitability. This paper deliberates regarding the theory of competitive advantage and discusses the role of Information and Communications Technology (ICT) for augmenting SMEs' competitiveness.

INTRODUCTION

Competitiveness of a firm is its capacity to achieve its targets. These targets are likely to be expressed in a variety of terms depending on the context (Barney, 2002). Within a macroeconomic perspective, a competitive firm develops and sustains a level of performance that contributes to the Gross Domestic Product (GDP), employment opportunities, and the wealth of the people. From an entrepreneurial perspective, a competitive firm needs to survive in the market and to achieve market share and profitability. The success of a competitive firm can be measured by both objective and subjective criteria. Objective criteria include return on investment, market share, profit and sales revenue, while subjective criteria include enhanced reputation with customers, suppliers, and competitors, and improve quality of delivered services (Barney 2002). A study of the SMEs in the Netherlands adopted a resource-based approach to identify the source of competitive advantage in a sample of 63 firms representing manufacturing and service sectors (Tilley & Tonge 2003). According to this study, "front runners" were distinguished from

"back members" by the way in which they combined three sets of competencies: market, technological and organizational. Wickham (2001) also apply the resource-based theory in their analysis of competitive advantage in entrepreneurial firms.

Although there are many economists who used the concept of competitive advantage before, Porter's work (1980, 1985, and 1990) is still the starting point for any discussion of competitive advantage (Jones, 2000). Barney (2002) argues that the term of competitive advantage did not appear in Porter's work until the year 1985, while Penrose (1959) and Ansoff (1965) used the concept of competitive advantage before that time. With this brief introduction, this paper based on in depth literature review, secondary published sources and contextual analysis deliberates regarding the theory of competitive advantage and discusses the role of Information and Communications Technology (ICT) for augmenting SMEs' competitiveness.

LITERATURE REVIEW

Barney (2002) discusses four approaches to measure the firm's competitiveness. These measurements are firm's survival, stakeholder approach, simple accounting measures, and adjusted accounting measures. Porter (1985) indicates that a firm experiences a competitive advantage when "its actions in an industry create economic value and when few competing firms are engaging in similar actions." De Wit and Meyer (1999) and Buffam (2000), indicate that a firm has a competitive advantage when it has the means to edge out rivals when competing for the favour of customers. Barney (2002) explains that a firm experiences a competitive parity when the firm's action creates economic value applied in several other firms engaging in a similar action. An important goal of a business enterprise is to optimize shareholders' returns. However, optimizing short-term profitability does not necessarily ensure optimal shareholders returns since shareholder value represents the net present value of expected future earnings. One of the techniques that reflect the shareholders return is the concept of the Balanced Scored Card (BSC) as an indicator for the firm's competitive advantage.

Resource-based theories of strategy have become increasingly influential in the recent years and most writers take their inspiration from the work of Penrose (1957). Whereas Porter (1980) intended to see the competitiveness of the firm as a result of its market position, resource-based theorists do claim that if firms within an industry are doing well, the reason for this is their core competencies. Core competencies are the collective learning in the organization, especially how to coordinate diverse production skills and integrate multiple streams of technologies as explained by Prahalad and Hamel (1990). Prahalad and Hamel (1990) focus on the resources, capabilities and competences of the organization as the source of competitive advantage rather than the environment, as in the traditional approach. Penrose, in her work 'The Theory of the Growth of the Firm (1959) is often credited with the idea of the resource-based view. Also, the work of Selznick (1957) stressed the role of distinctive competences and Chandler (1962) demonstrated the importance of organizational structure in the utilization of a firm's resources. Rumelt (1997) adopts the resource-based view. Senge (1990) and Argyris (1994) stress the acquisition of competences through internal mechanisms of individual and collective learning.

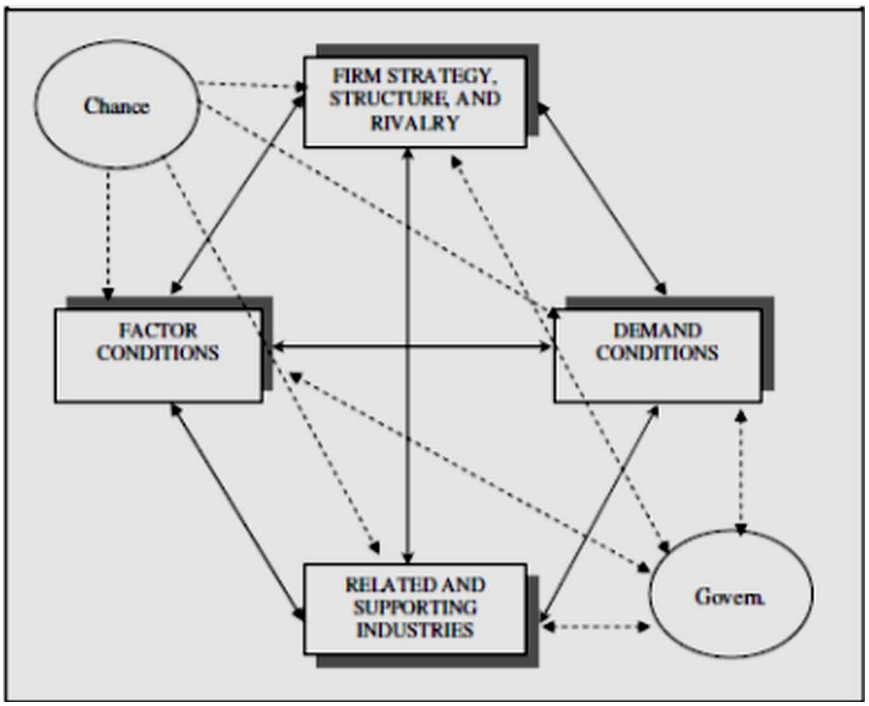
The resource-based theory becomes more and more subject of critique under the pressure of globalization. Some of these critiques are:

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

- The most important problem to the resource-based view is the lack of a clear and coherent treatment of dynamics; it does not theorize the mechanisms underlying the creation of new resources (Barney 2002);
- The application of the resource-based approach to the strategic management of the small firms has been limited.

Porter's Diamond

Porter (1990) identifies four stages of national industrial development: the factor-driven stage (characterized either by natural-resource-based activities (primary extraction or by labour-intensive manufacturing), the investment-driven stage (associated with the manufacturing of intermediate and capital goods and infrastructural building), the innovation-driven stage (when a country is human-capital abundant and active in research and development) and lastly the wealth-driven stage. He argues that the correct policy for industry and government depends on the nation's developmental stage. As well, Porter (1990) provides a useful concept that can help firms to explore improvements for productivity. The key principles of the competitiveness paradigm can be summarized as follows:



- Firms need a healthy home base to assist them in developing and sustaining the capacity to innovate. But firms, not nations, are on the leading edge of international competition;
- Competitive advantage results from an effective combination of appropriate firms' strategies and its environment;
- Competitive advantage is sustained through continuous innovation and upgrading of the productive capacities of the firms.

However, Porter's theory of national competitive advantage (1990) becomes more and more subject of critique under the impression of the digitalization, globalization and deregulation. Hence, although Porter makes a contribution to the theory of international trade and strategic management, none of the four determinants offered by Porter is new (Barney 2002). It means that Porter's work lacks the originality.

Porter has gained all his information from case studies of different industries in different nations. He does not offer any empirical or statistical evidence to support his theories. Although this criticism is mainly true, it should be stated that by using such a qualitative framework, Porter introduces several interesting points like the advanced and specific factor creation mechanisms and sophistication of demand conditions, which would have been very difficult to capture if he had just focused on quantitative method and formal modelling. According to Porter, domestic demand conditions of an industry are amongst the important determinants of the international competitiveness of this industry. The relationship between international competitiveness and the size of home demand is one of the issues that are open to dispute since there are two conflicting arguments concerning this relationship: firstly, if home demand is large, firms may feel secure to invest in industries where there are economies of scale, and given that there is intensive domestic rivalry and local buyers parallel foreign demand, this may encourage international competitiveness and secondly however, if home market is large enough, firms may not bother trying to export and may prefer to concentrate solely on the home market.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 1. Determinants of national advantage (Source: Adopted from Porter 1990)

Determinants of the national competitive advantage are grouped in four categories: factor conditions, demand conditions, related and supporting industries, and firm strategy, structure and rivalry (Figure 1).

After analysing the competitive industries, Porter extended his theory to the national economy as a whole. However, his ideas became more subject of critique under the impact of the ICT.

Clusters Approach

The goal of the economic development is to achieve prosperity for all citizens. Productivity and productivity growth determine the economic growth. Whereas, innovation is a key driver of productivity growth, and clustering supports both productivity and innovation (Porter 1990). Once a cluster is formed, the whole group of industries becomes mutually supportive. Clusters include an array of linked industries and other entities important to competition and they promote both competition and cooperation (Porter 1998a). Thus, clusters can affect competition by increasing the companies' productivity, deriving the direction and pace of innovation (Porter 1998b). Furthermore, being part of a cluster allows companies to operate more productively in sourcing inputs, accessing information, technology and needed institutions, coordinated with related companies, and motivating improvement (Fisher and Rueber 2000).

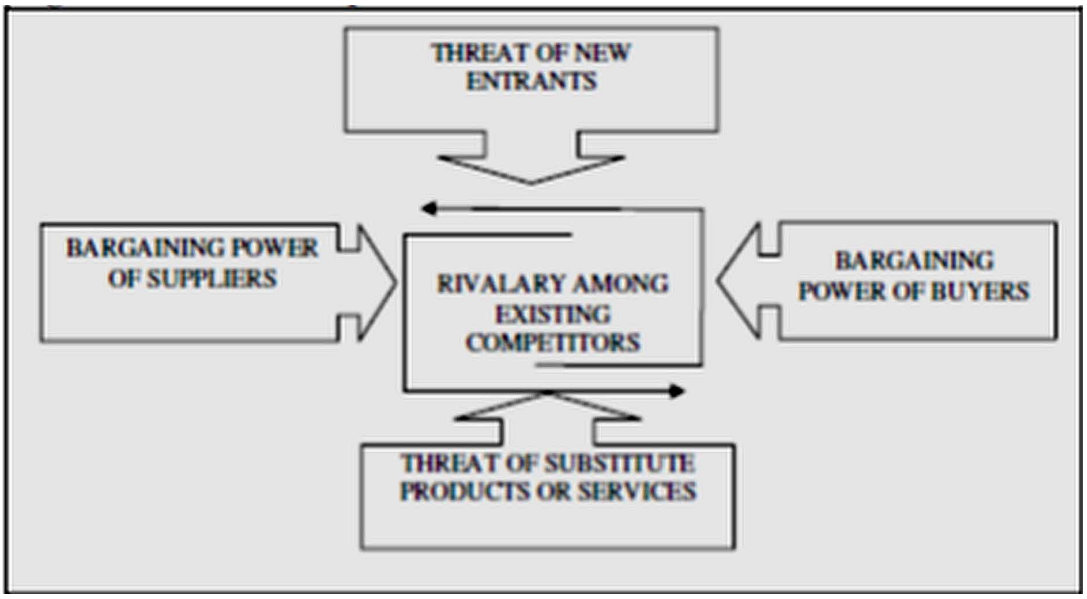
Porter (1998b) makes a convincing case drawing on lessons from experience:

…government, working with the private sector, should reinforce and build on established and emerging clusters rather than attempt to create entirely new ones. New industries and new clusters emerge best from established ones.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Clusters are a driving force in increasing exports and attracting foreign investments. For example, Business Network Program in Australia noted that the rate of increase in exports is four times higher in cluster networks than in non-cluster environments (Singh 2001). Singh (2001) discusses some of the common qualitative and quantitative performance measures to determine a cluster's success in creating and sustaining competitive advantage:

- The presence of upstream and downstream industries;
- The level of competitive inputs such as services, machinery and equipment;
- The level of employment in all business activities related to the cluster;
- The rate of increase in value-added products and services;
- The rate of increase in exports of value-added goods and services;
- Inter-firm cooperation and the quality of the linkages and interactions;
- New start-ups.



Porter's Five Forces Model

One of the basic areas of concern in industrial economics is the interaction between firm and the characteristics of the market forces. Economists, belonging to this school of thought, perceive the significance of the link between environment and strategies employed by the firm. They use the structure–conduct-performance diagram. Such a paradigm assumes basic conditions of supply (input, technology, etc.) and demand (growth of demand, price elasticity, etc.). Market structure is then put into perspective in terms of number of market players (buyers and sellers), barriers to entry, cost structure and product differentiation in relation to conduct that is illustrated in the pricing, product strategy, research and innovation (Porter 1985). Within such a paradigm, market structure, strategy and performance would comprise the variables that influence the firm's competitiveness (Kazem 2004). Porter (1980) attempted to explain the existence of the above-normal profits, as an expression of the firm's market power. In this paradigm, the industry-structure determines the firm conduct (e.g. pricing, advertising), which in turn determines the economic performance. Porter (1980) interpreted this line of thought by substituting conduct with strategy, and arguing that the firm performance is dependent on industry structure. Therefore, the level of analysis is the industry rather than the individual firm. Industry attractiveness depends on the level of the opportunity and the threat in an industry. The average performance of firms in the economically very attracted industries will be greater than the average performance of firms in the economically unattractive industries as explained by Barney (2002). According to Porter (1985), the rules of competition are represented in "five competitive forces" as shown in Figure 2. These competitive forces are entry to the new competitors, threat of substitutes, bargaining power of buyers, bargaining power of suppliers, and rivalry among the existing competitors.

Chaffey (2002) supports Porter's classic model of the five main competitive forces and he says that it still provides a valid framework for reviewing threats arising in the ebusiness era. The value of Porter's model enables managers to think about the current situation of their industry in a structured, easy-to-understand way as a starting point for further analysis. However, in the economic sense, the model assumes a classic perfect market. The more an industry is regulated, the less meaningful insights the model can deliver. The model is best applicable for the analysis of the simple market structures. A comprehensive description and analysis of all five forces gets very difficult in complex industries with multiple interrelations, product groups, by-products and segments.

Figure 2. The five competitive forces (Source: Porter 1985)

DISCUSSION AND IMPLICATIONS

Small and Medium Sized Enterprises (SMEs)

Peterson et al. (1986) explain that both quantitative and qualitative measures are used in defining the SMEs. These definitions vary according to the geographic area and the purpose of the study. Quantitative measures are the most popular tools to define the SMEs such as the number of employees and the annual turnover. The most frequent upper limit is 250 employees as in the European Union. However, in the United States the SMEs include firms with less than 500 employees. In general, small firms are those with fewer than 50 employees, while micro-enterprises have at most ten and in some cases five workers (OECD 2000). Financial assets are also used to define the SMEs. Some of the potential economic and social benefits of the SMEs to their capacity as follows: (a) create jobs at low cost of capital; (b) contribute positively to the Gross Domestic Product (GDP); (c) provide an opportunity to expand the entrepreneurial base; (d) provide the required flexibility to adapt to market changes; (e) provide support to large scale enterprises; (f) enter into market niches which are not profitable for larger enterprises; and (g) contribute to development policies that are more oriented towards decentralization and rural development. Nevertheless, all the above may never be fully realized without an adequate regulatory system and an encouraging environment.

Story (1994) defines the SMEs as follows: (a) enterprises with a relatively small share of their market; (b) managed by owners or part-owners in a personalized way, and not through the medium of a formalized management structure; and (c) acting as separate entities, in the sense of not forming part of large enterprise or group. While it is acknowledged that using the number of employees as a measure of firm size may create a number of anomalies. Besides, smaller firms' organization structures are likely to be organic and loosely structured rather than mechanistic and highly formalized as in smaller firms, all the roles will either be performed by one manager or by a very narrow range of managers who may have been

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

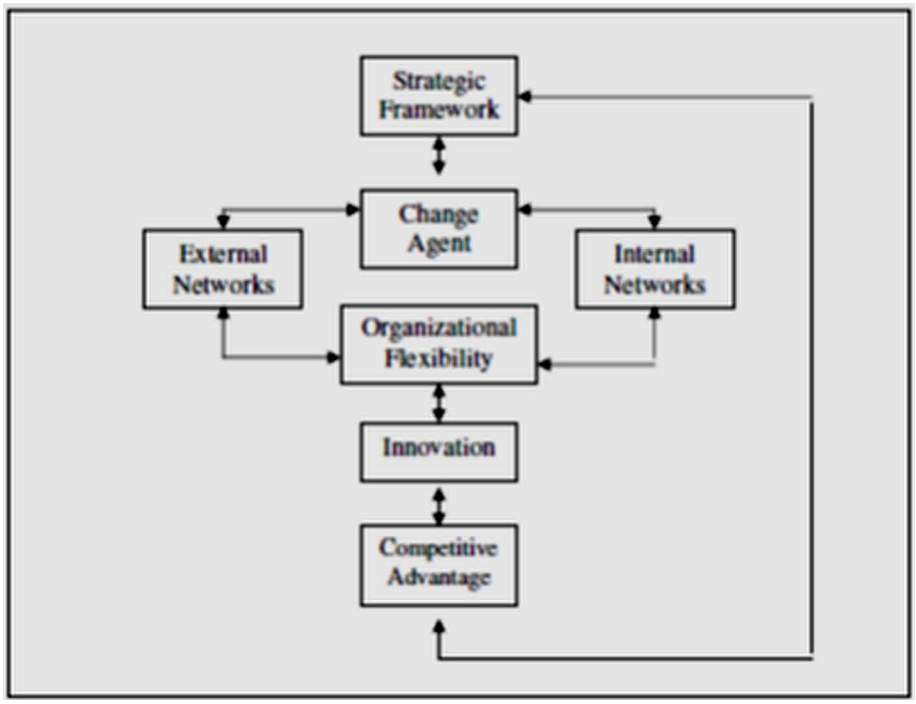
appointed because they are family members or friends rather than on the basis of ability or education. However, small firms generally have little commitment to research and development (R&D) and hence are highly dependent on external sources of knowledge. The size of the SMEs in the developed countries is interlinked with the size of the international niche markets where they compete, while the size of the SMEs in the developing countries is mostly determined by the domestic markets where they operate. Moreover, the SMEs in developed countries are more likely to be highly specialized compared to those in the developing countries. Most of the SMEs in the developing countries are one-person businesses, and the largest single employment category is working proprietors (Fisher & Reuber 2000). This group and its family represent the majority of the workforce in most developing countries.

Theory of Small Firm Growth

In order to improve the competitiveness of small firms it is not only about understanding problems confronting businesses but also about better understanding of how to overcome these barriers. Although many factors are hypothesized to impact on business outcome, there is no consistent pattern to the characteristics, which contribute to business competitiveness, success and growth (Gibb 1996; Audretch 2001). Employment generation may be an appropriate growth function (Smallbone & Wyer 2000). As pointed out by Storey (1994), the numerically dominant group of small businesses is those that they are small, and even if they survive they are always likely to remain small-scale operations. Kotey (2005) shows that small family firms are less likely to pursue growth compared with similar non-family firms. Although medium family proprietors desired growth, their actual growth was lower than similar non-family firms. Kotey (2005) shows that management practices are less formal in family firms, and the gap between family and non-family firms in this area widened with growth. As well, exports are low for both firms at the small level. However, medium family firms are less likely than similar nonfamily firms to export.

Personality-based approach is a model for understanding small firms' growth which looks at the entrepreneur as fundamental to the growth process that links the success of the firm to its owner-manager's competences. It also consists of a number of variations such as these that seek to link the personal characteristics of an entrepreneur with planning and the performance of the firm (McClelland & Winter 1969; Carsrud & Johnson 1989), while others like Brochhaus and Horwitz (1986) have researched personality types. Another approach is based on business management, where growth is seen as a function of the marketplace and focuses on the financial performance as well as diversification, profitability and product/market development (Penrose 1959; Ansoff 1965). Storey (1994) and Smallbone and Wyer (2000) suggest that consideration of the growing small firm should be based on a categorization of three components. These include the starting resources of the entrepreneur (e.g. motivation, age, education, management experience, family history and training); the firm (e.g. age, sector, location, size and ownership) and the strategy of the firm (e.g. training, market positioning, planning, and external equity). Wickhman (2001), on the contrary, shows that there is a very little evidence to suggest that any particular trait leads to successful entrepreneurship.

Zairi (1996) presented a two-staged model that provides push and pull-forces to achieve competitiveness for small business through continuous process improvement. In order to develop a conceptual model of the SMEs' competitiveness, the entrepreneurial competencies ahould include the process dimension and the entrepreneur should scan the external factors and focus on the firm's internal capabilities (Figure 3). Competitiveness is the mean by which entrepreneurs can improve their firm's performance, and which can be measured according to a number of dimensions including market share, profit, growth, and duration.



EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Jones and Tilley (2003) develop a conceptual framework for the competitive advantage in small firms (Figure 3). To be effective, Jones shows that the starting point for the SME must begin with the owner-manager establishing a broad strategic framework for the firm. He also ensures that organizational flexibility is the key source of competitive advantage for most SMEs. Jones and Tilley (2003) argue that the best measure of competitive advantage for the SMEs is value-added rather than profit, return on investment or market share.

SMEs' Strategies

There are different definitions for the firm's strategy. All these definitions are sharing in defining the strategy as an action to be taken in the future. Mintzberg and Waters (1985) consider corporate strategy as a political process, which is socially constructed rather than an unproblematic aid to the rational decision-making. Porter (1996) defines strategy as "The creation of a unique and variable position, involving a different set of activities." He states that the essence of strategy is choosing to perform activities differently from rivals do and those firms must consider strategic positioning and strategic fit when crafting strategies. Barney (2002) defines the strategy as "A firm's theory about how to compete successfully." The principle strategies that the SMEs have pursued to create and sustain competitiveness have been discussed in Bologna 2000 SME Conference. These include the following.

Figure 3. Framework for the competitive advantage in SMEs (Source: Jones & Tilley, 2003)

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Porter's Generic Strategies

Porter (1980) determines three generic strategies firms can possess: the cost leadership, differentiation and focus. By concentrating on the industrial level, Porter (1979, 1980, and 1985) underestimated the importance of the unique resources within the firm. Further, recent work contradicts Porter's assertion about being "stuck in the middle." This work suggests that the firms that are successful in both cost leadership and product differentiation can often expect to gain sustained competitive advantage (Barney 2002). Porter and Stern (2001) indicate that a firm can obtain profits more than the average actor by operating at a lower cost, or by charging a premium price, or by doing both. Differentiation is more attractive to small companies, particularly when linked with focus. Providing higher quality products when compared to competitors and being innovative are the key elements of the differentiated strategy (Jones & Tilley 2003). Besides that, marketing, development of alliances and the focus on the ethical issues comprise important components of the differentiated strategy (Kazem 2004). The generic strategies rely on a static picture of competition, and thus understate the role of innovation (Stalk et al. 1992). As well, they overemphasize the importance of industry structure (Rumelt 1991) and the wider environment, while they de-emphasize the significance of individual company differences in the procession of resources, capabilities and competence.

Innovation Strategy

Innovation is a broad term that encompasses any new development in firms (OECD 2000a). It can involve creating or reengineering products or services to meet new market demand, introducing new processes to improve productivity, developing or applying new marketing techniques to expand sales opportunities, and incorporate new forms of management systems and techniques to improve operational efficiency (Porter & Stern 2001). The most important impediments to innovation in the SMEs (OECD 2000a) are: limited resources research and development; access to new technologies and know-how and ineffective rules, procedures, education and training programs. Porter (2001) showed that innovation is a process rather than a single event and the internal factors that drive innovation are undeniable, but the external environment for innovation, at least, has the same importance. One of the most systematic examinations of innovation in the SMEs utilizes resources-based theory, which stresses the way in which internal factors including knowledge, skills, patents and brands are combined in unique ways by means of managerial capabilities (Grant 1998).

Network and Cluster Strategy

The SMEs belonging to clusters and networks are often more competitive and innovative than those operating in isolation (OECD 2000c). Some clusters are structured and formal while others are informal. Some clusters are share general information, while others deal with more specific objectives. Networking allows the SMEs to combine the advantages of smaller scale and greater flexibility with economies of scale and scope in larger markets – regionally, nationally and globally (Baporikar, 2015). A large number of firms result in greater competition for new ideas and facilitates (Porter 1990). Competitiveness of small firms is strongly influenced by the level of the inter-firms collaboration. The links take different shapes in which different firms join together to co-produce, co-market, or co-purchase, cooperate in new product development, or co-share information.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Flexibility Strategy

The SMEs have the ability to change the direction quickly at low cost. Small businesses offer some of the best options for making meaningful productivity gained in the global marketplace based on their flexibility and speed in adapting to market dynamism (Baporikar, 2016). According to Jones and Tilley (2003), organizational flexibility is the key source of competitive advantage for most SMEs.

INFORMATION AND COMMUNICATIONS TECHNOLOGY (ICT)

The emergence of the ICT especially the internet challenges the traditional business logic. The new economics of information therefore creates opportunities and threats to the firms. Thus, the shifts will occur at different speeds with varying intensities for all industries. Information and Communications Technologies (ICT) include technologies such as desktop and computers, software, peripherals and connections to the internet that are intended to fulfil information processing and communications functions. According to Porter and Stern (2001), internet is an enabling technology- a powerful set of tools that can be used, wisely or unwisely, in almost any industry and as part of almost any strategy. The introduction of the internet and the World Wide Web is leading to fundamental changes in operating models employed by businesses. Thus, firms must consider new business models that take advantage of existing and emerging internet-based technologies in order to stay competitive (Baporikar, 2014). Venkatraman and Henderson (1999) show that the new economics of information challenge traditional business logic, and thus the appropriateness of the current business model rooted in the industrial economy is questionable. Many organizations view investment in information not as means to cost reduction but as a way of adding value. To achieve that, they need an information systems strategy that is an integral part of their business strategy (Galliers 1987). Levy and Powell (1997) identify two dimensions of customer dominance and strategic focus for the strategic context that create four competitive scenarios namely: efficiency, coordination, collaboration and innovation as given in Figure 4.

One can observe the following in these competitive scenarios:

- ICT in the efficiency quadrant is for control of the business, primarily financial control, but no integration of ICT with business strategy;
- ICT in the coordination quadrant is the systems required to keep costs down and core additional use is in improving customer care, but limited integration of ICT with business strategy and viewed as a cost to the business;
- ICT in the collaboration quadrant reflects increase in the sophistication of the technology used and a shift of ICT integration with business strategy;
- ICT in the innovation quadrant is where real integration of the ICT ensues with business strategy.

One way of looking at the role of Information Systems (IS) within an enterprise is the five-era view (Applegate, McFarlan, & McKenney, 1996) which is: Data Processing, Management Information Systems, Strategic Information Systems, Business Process Reengineering, and e-Business. Venkatraman and Henderson (1999) develop five levels of IT- induced reconfiguration as shown in Figure 5.

These are localized exploitation, internal integration, business process redesign, business network redesign, and business scope re-definition. However, these levels are not conceptualized as a stage of evolution model but as distinct levels of business reconfigurations with an explicit focus on the role of Information Technology.

Applications of the ICT and the SMEs

The SMEs tend to move into electronic business (e-business) in stages. The first step involves using the Internet as a tool for communicating and obtaining information. In a second phase, the SMEs consider basic electronic commerce activities such as buying and selling. Finally, the SMEs start conducting banking and financial transactions (OECD 1998, 2000c). Lucchetti, and Sterlacchini (2004) carry out an econometric analysis on the adoption and effective use of the ICT among a sample of the Italian SMEs. In order to understand the main factors that drive the SMEs to the adoption of the ICT, they divide the available technologies according to a taxonomy based on their typical function.

Buhalis and Deimezi (2003) argue that the traditional economies have experienced a slower uptake of e-commerce. This is attributed to the difficulties in enhancing the usage of personal computers and in increasing the utilization of the Internet and the ICT throughout their production mechanisms. Duan et al. (2002) focus on the ICT skill challenges in the SME in Great Britain, Poland and Portugal. They show that the SMEs play a pivotal role in sustaining employment and creating income and prosperity. Shiels, Mclvor and O'Reilly (2003) show the phenomenon of the internet has forced organizations to examine their existing business practices and adopt new methods of working, both for existing and potential customers. However, introduction of the internet into the SMEs tends to be fragmented and also there is a tendency in SMEs manufacturing sector to view investment in the ICT as a cost (Baporikar, 2017). A report by the Organization for Economic Co-operation and Development (OECD1997, 1999a and 1999b) shows that the ICT sector is not a prerequisite for economic growth. Countries with a strong information technology sector, such as Japan, have recorded slow overall growth while, on the other hand, countries like Australia have shown strong growth without the benefit of a large ICT sector (Singh 2001). Moreover, only a few countries have the necessary competitive advantage to succeed in the ICT output, especially among developing countries. This means that the competitive advantage of marketing efficiency is not automatically achieved with the adoption of the internet. Hashmi and Cuddy (1990) point out that one of the problems for the SMEs is their propensity to invest incrementally in information systems rather than in a planned fashion. While on the one hand the new economy may weaken the traditional obstacles to the transformation of the SMEs into global players. It may also confront the SMEs with new obstacles and threats as many SMEs have little understanding of, and cannot comprehend, future technology developments.

Competitive Elements and the ICT

Some of the benefits of the electronic commerce OECD (2000c) are: it allows automation of common processes, requirement by large businesses, application in product design, higher level of product customization, standardization in production and effective logistics. Further these technologies help SMEs actively to create new products, adopt new business practices and change their way of interacting in the marketplace. Engaging in B2B or B2C induces them to improve their business process. Further, business procedures conducted informally are rationalized and institutionalized. Smallbone et al. (2003) are

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

concerned with the nature and extent of product and process innovation and adoption of the ICT in the SMEs. Small and Medium Sized Enterprises (SMEs) in developing countries need to be able to figure out how, when, and where to use ICT to reap the above gains. SMEs in the developing countries are facing more challenges when trying to gain than businesses in the developed countries. Some of these challenges are relating to technical infrastructure, laws and regulations, and limited logistics systems (OECD 2000a).

CONCLUSION

This paper presents the conjectural background of the three major areas of the research: small and medium sized enterprises (SMEs), competitive advantage, and the role of information and communications technologies (ICT) on the competitive advantage of the SMEs. As well, the paper discusses different models for the small businesses' growth. Competitiveness of a firm can be expressed in a variety of terms depending on the context. Within a macroeconomic perspective, a competitive firm develops and sustains a level of performance that contributes to the Gross Domestic Product (GDP), employment opportunities, and the wealth of people. From an entrepreneurial perspective, a competitive firm needs to survive in the market, at present and the days to come, and to achieve market share and profitability.

The Information and Communications Technology (ICT) allows automation of common processes, shortening the design process, leading to a higher level of product customization and standardization of parts, lowering inventory costs, and re-examining the cost structure of the value chain and their competitive strategies by redefining functions and skills (Baporikar, 2013). Furthermore, the ICT can contribute to solving the SMEs' problem in terms of the lack of resources and access to technology by promoting transfer of knowledge through the use of integrated processes.

Chapter 53
Optimizing Virtual Communities in Tourism to Facilitate Development of Small and Medium-Sized Enterprises

Silvena Dencheva Yordanova
Varna University of Management, Bulgaria

ABSTRACT

The chapter presents the essence of online/virtual travel communities and examines their current significance for SMEs. It presents types and characteristics as well as the most popular virtual travel SME communities and discusses ways of optimizing the development of SMEs by applying a strategy of virtual communities by selected hospitality SMEs. An eight step strategy to implement virtual travel communities by SMEs is elaborated. One of the main findings of the author is that virtual travel communities can be very useful for optimizing the development of SMEs by supporting all the stages in the decision-making process, focusing on pre-planning, making the decision and after the tourist and business visit stage. In order to understand how virtual travel community can optimize the development of SMEs, the author discusses tools for measuring the effectiveness of social media. Both future research directions and a conclusion are outlined.

INTRODUCTION

Virtual travel community has many definitions and advantages for small and medium sized enterprises (SMEs). One of those benefits is the internet which has fundamentally changed the way SME customers make their decisions. Nowadays, they are more affected to make decision by travelers from travel virtual communities, rather than their friends. In this vein, virtual travel communities support consumers in the pre-planning and planning process, during the trip and after it as well (Gulbahara & Yilidirima, 2015). Therefore, guest experience has become a dominant factor in the selection of a hotel, so review sites continue to be the fore-front when consumers are planning a hotel room purchase (Gulbahara & Yilidirima, 2015).

Consequently, travel online communities provide unbiased information and customers can easily without any effort find out what the others recommend about visiting a certain destination, which hotels are recommended by travelers who had already visited the place (Casaló, Flavián & Guinalíu, 2011). On the other hand, social media have become a very important part of the marketing strategy of SMEs as they provide an opportunity for engaging with customers and generating brand advocates (Oztamur & Karakadilar, 2014). In this regard, social media allow destinations to contact visitors at relatively low cost and higher levels of efficiency that can be achieved with more traditional communication tools (Kiralova & Pavliceka, 2015). In other words, travel online communities help SMEs in building their image, reputation and creating long-term relationships with customers by engaging them in constant communication by the blog or forum they provide to their web-site. Moreover, *web-based platforms* allow for real-time recording and sharing of tourist experiences and thereby add to advances of personal virtual identities (Munar & Jacobsen, 2014).

This chapter has three main aims:

1. *To present the meaning of online/virtual travel communities* (VTC) and examine their current significance for SMEs in the available literature;
2. To present VTC types and characteristics;
3. *To provide ways of optimizing the development of SMEs* by applying a strategy of virtual communities by a selected hospitality SME.

Following the above described structure, the VTC discussion will proceed with future research directions. Finally, the chapter is completed with a conclusion.

BACKGROUND

Internet affected the business by changing the business models. In this regard, SMEs have in fact started taking advantage of social media, and it has become quite a popular tool (Oztamur & Karakadilar, 2014). SMEs can benefit in many ways from applying virtual communities as part of their business. In this regard, SMEs now have the potential to access increased opportunities to innovate on an unprecedented scale (Jones, Alford & Wolfenden, 2015). SMEs define target markets, as digital marketing offers an unparalleled access to information at a granular scale, which can redefine the ways in which customer segments are created using free-to-use web-based tools (Jones, Alford, & Wolfenden, 2015). This allows the potential user to enter any person or brand's Twitter handle and analyze their followers.

The benefits of using a travel online community can be summed up, as follows:

- The traveler receives useful information about the trip planned;
- There exists easy access to information from other travelers.

In addition, companies and SMEs benefit from using online communities in the following ways:

- Through deep and constant relationship with customers.
- Through better customer service.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

- Through personalization of the message sent to the customer, according to his/her preferences and needs.
- By increasing brand awareness, brand engagement, word-of-mouth marketing, friends liking, trust and social validation (Kiralova & Pavliceka, 2015).

HIGHLIGHTS OF VIRTUAL TRAVEL COMMUNITIES IN SME DEVELOPMENT

The main focus of this chapter section is to present the essence of virtual travel communities, its types and characteristics. This will be followed by development of a strategy that will optimize the development of SMEs.

First of all, different types of virtual travel communities are presented and discussed. Based on the type of information exchanged between parties these are the main types of virtual interaction between travelers:

- **Blogs:** Short recordings that are chronologically ordered and contain media materials; Blogs are very useful for SMEs as they provide opportunities for feedback with customers. If the SMEs have a blog in their web-site, they can easily get constant feedback and understand the weak points in the service provided.
- **Chats:** Real-time communication through instant messaging programmes; Some customers prefer online assistant or living chat in making decision to buy from the web-site. They can improve optimization of SMEs by developing close contact to customer and assisting him during his decision.
- **Forums:** Web-sites for online discussions on specific topics, give more communication opportunities that chats or blogs. Most of the customers visit forums in their pre-research on certain topic. They are very useful and help increase competitiveness of SMEs by helping the customer to get acquainted with the information he is looking for. The more useful the web-site is, the more visited and preferred by customers it will be.
- **Wiki-Sites:** The web-sites aimed to deliver collective knowledge.
- **Social Networks:** A virtual network aimed to establish relations among its users, e.g. Facebook, MySpace, Vkontakte, etc (Liu & Park, 2015). They are very popular in the hospitality as SMEs use them for many reasons. They are the most used as virtual community as promotion tool, providing special promotions, etc.
- **Online Travel Reviews:** They are very useful tool for gathering information of certain destination as well as making the decision what to visit and why. They are very important information source that allow consumers to search for detailed and reliable information by sharing past consumption experiences (Liu &Park, 2015). The extensive travel information available online by using social media enables people to save time and efforts (Liu & Park, 2015). The researchers in online consumer reviews have focused on two main questions: the consumer decision making as a process and how it is affected by trust of people. Online reviews are useful for business as well as for consumers. On the business side, the hoteliers can understand how customers perceive the quality of the service provided such as accommodation, restaurant facilities. On the other hand, the potential tourist is affected to a greater extent by the marking given to a certain destination by a traveler who has been already there (Nguyen & Coudounaris, 2015). In other words, the tourist image of a certain destination can be formed through online reviews, involving:

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

- Specific aspect of the service offering reviewed;
- The overall valence of the set of reviews;
- Valence of the information presented first;
- Whether or not easy to process graphical information is present (Browning & Sparks, 2011).

The content of review-staff or core values affects the willingness to make online booking and perceptions of trust in a hotel. Then the overall valence of the set of reviews is held constant, a series of hotel reviews that is framed with negative reviews results will lead to lower willingness to book the hotel (Browning & Sparks, 2011). The virtual travel communities with this form of communication optimize the contact with a customer by converting it to a long term relationship.

Characteristics of Online Communities

There are several characteristics of online communities. Some of them are succinctly defined by Preece, (2001):

1. **Purpose (Content of Interaction):** Virtual communities are built around a common purpose, but there can be many different common interests among the members such as travel, golf etc. The purpose of the community defines the goals and members it has as well as its content.
2. **Place (Extent of Technology Mediation of Interaction):** It concerns the technologies, protocols and norms of the online community inside the community's space.
3. **Platform (Design of Interaction):** In virtual communities, interaction can be either synchronous (e.g. chat rooms) or asynchronous (bulletin boards, newsgroups). It concerns the response time of the participants. The faster the time for response is the more reliable is the community for its participants.
4. **Population Interaction Structure (Pattern of Interaction):** Interaction pattern in the online community is related to the group structure and type of social ties.
5. **Profit Model:** It is related how profit is created by using this business model.
6. **Sense of Belonging:** The sense of belonging plays a prominent role in understanding the realities of the community as a social universe (Qu &Lee, 2011). It is a crucial for the existence of a travel community. It can be formed on the net though travel members' active communication around shared travel interests. There is a relationship between community identification and positive member behavior. If managers can understand how community affects its members, then the community manager can use this advantage by exerting influence on individual travel members through applying a more specific management strategy (Qu &Lee, 2011). In this regard, community manager can provide rewards. The community rewards are often given to a member to recognize its efforts, consistent behavior and contributions this member makes to the virtual travel community (Wang et al., 2015). In other words, being a member of certain community is rewarded and is valued highly by its members.

Main Components of a Virtual Community

In this regard, following Wang, Shuang & Li (2015) the author defines the following *main components* that compose a virtual community of interest for SME development:

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

1. *The users* who interact online with a mutual interest to satisfy their needs, which is where SMEs directly come in;
2. A *purpose* for a certain information exchange. In the author's view this is a very important component as it defines why the community exists;
3. Guiding *principles* that compile a communication *policy* which concern users and their access.
4. *Network facilities* that work as an intermediary in the communication process, whereby the facilities can be managed by SMEs;
5. *Relationship building* in online communities is a very important component of the online community. Relationships can lead to offline transactions. For example, people look for someone known in Facebook (Facebook, n.d.) and add them as friends. It is interesting how online relationships can lead to offline. Good online community reputation coupled with good online communication behavior leads to higher travel community member's willingness to participate in an offline relationship;
6. *Sustainability of community* is another characteristic of the virtual community (Wang et al., 2015). Sustainability of the community is its longevity of over an extended period of time. It can be measured by the number of participants the community has and the number of posts and its quality. Participant loyalty and trustworthiness are important for making a community sustainable. This component is also of utmost importance as it defines the quality of the relationship that users have. That is the main idea to form online communities, i.e. to gather people having similar interests and preferences at one virtual place. In online community its members are strangers and their aim is to share impressions and experiences about trips and discuss specific information about destinations, so it helps future tourists to avoid wasting extra money or missing important attractions in an unfamiliar place (Wang et al., 2015). Tourists and SMEs can share their experience and thus support potential new clients or help them choose which destination to visit.

The Role of the Word-of-Mouth

In relationships the electronic word of mouth (EWOM) is a very powerful tool affecting the communication in travel virtual communities. It is connected with the opportunities provided by online communities with constant interaction between them. In this regard, it can be said that *Internet* provides a platform for immediate interaction and communication in real time. EWOM has important implications for the design and development of online environments and interactions with consumers (Standing, Holzweber &Mattson, 2016). It plays an important role in influencing customers to use online recommendation sources and has influence on their product choice. According to Standing et al., (2016) EWOM is crucial, especially when people are socially independent or the level of commitment in decision-making is low. In this regard, it involves building trust, attracting traffic, creating awareness and most of all turning browsers or surfers into buyers. One of the main functions of EWOM is to transmit emotions of its participants and as such it is very important for tourism. According to the study, women are more likely to use the positive comments. For example, one negative review does not affect the next so much, whereas several negative emotions expressed influence product value evaluations (Standing et al., 2016). The intention to visit certain destination is directly affected by the online word of mouth. Since, the decision to visit a destination is interpreted as a rational calculation of the costs and benefits of a site of alternative destinations, which were derived from external information sources, including word of mouth and traveler's blogs (Abubakar & Ilkan, 2015).

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Word-of–mouth (WOM) has a strong influence in the tourism industry, primarily due to the intangible nature of tourism services. According to the reports, more than hundreds of millions of potential tourists visit online reviews and consult with them prior to making any decision to travel. In this regard, WOM has the potential to reduce uncertainty, risk and has a significant impact on the tourists' destination image. The income, destination trust and WOM affect positively to the intention to travel to certain medical destination (Abubakar & Ilkan, 2015). In optimizing the development of SMEs, it is crucial for managers to know what the key components of the travel online community are.

Main Customer Online Intentions and Traveler Motivation

It is necessary to understand what provokes customers and SMEs to be involved in a virtual community. What is their motivation? Few studies focus on the real reasons provoking customer participation in virtual communities, and even less so for SMEs. In this regard, Amaro & Duarte (2015) discuss the *main intention* of the customers to purchase online and mention the following:

- *Intention to purchase online* which is the main predictor of customer behavior;
- *Attitude towards online travel shopping*, because positive attitudes clearly lead to purchase.
- *Online travel shopping self-efficacy* defined by the authors as consumers' self-assessment of their own capabilities.
- *Controllability* which is defined as individual judgments about the availability of resources and opportunities.
- *Perceived relative advantage of online travel* that increases trust in online travel shopping.

Several internal motivations for customers to participate in virtual community such as self-discovery, maintaining interpersonal interactivity, social enhancement and entertainment value are revealed by through research (Wang et al., 2015). These motivations are categorized as motivations for interdependence and motivations for independence. Interdependence focuses on building and developing relationships and affiliation with others. Independence is related to internal traits. It is very important for marketing managers of SMEs in hospitality to know the motivation of customers which is not only to attract them but also to keep them as loyal to the online community. For example, SMEs in hospitality in Korea experienced some difficulties in application of electronic commerce (Kim, 2006). Therefore, knowing real customer motives can be crucial as it will not only attract customers to the community but will keep them as loyal. Therefore, it is a factor leading to an optimization of the whole virtual travel community involving customers and SMEs alike.

One of the observed motives for joining a community discussed above is a sense of loneliness (Qu & Lee, 2011). By providing connectedness the travel online communities permit individuals to reduce their sense of loneliness among users (Qu & Lee, 2011). In this regard, online interaction provides individuals with an opportunity to share experience and exchange ideas with people who are physically distant form them. In this regard, *Internet* provides an opportunity for some customers to overcome their shyness and share emotions with unknown people, having similar interests or hobbies. Lonely individuals are likely to utilize online travel communities to uncover their emotions within respect to their travel needs and desires through effective peer interactions because online communities serve as an important platform for supporting community organized trips (Qu & Lee, 2011). The participation of the customer

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

is rewarded by providing certain motivators, such as rewards. Several types of rewards that can be given to community members, such as a member-ranking list, virtual medals and granting access to special information which others cannot access (Wang et al., 2015).

Furthermore, *the motivation* of travelers to participate in a travel virtual community also includes the following identified factors:

- **Knowledge Sharing:** It is the travel member's willingness to share their expertise or experiences with other members (Qu & Lee, 2011). For example, one member may be an information seeker, while the other prefers to be more actively engaged. Based on these criteria, there are several types of customers. It is very important that community manager knows what needs the customer has in order to send a personalized content, based on his interest;
- **Self- Construal:** It is the extent to which an individual interacts with others and views the self as an independent identity or in relation to others (Wang et al., 2015).
- **Behavioral Changes:** The participation in virtual travel community leads to changes in behavior. This is a result of having a sense of belonging to a certain VTC. The more members categorize themselves as part of a VTC, the more likely are they to accept and purchase products according to their members' suggestions (Qu & Lee, 2011).

Significance of Online Travel Communities for SMEs

The online travel communities are useful in the three stages of the traveler and SME behavior: the pre-travel phase (a destinations research, booking, and purchase), the during-travel phase (interactive forums, blogs) and the post-travel stage (feedbacks, reviews on hotels and destinations, shared visuals). In this regard, online travel communities should be included in the web-site of the hotel as they support the customer during his relationship with the company. Obviously a hotel can be an SME. The travel online community can help the customer with the choice of a hotel, during the booking and after the visit of the destination. It is important to know not only the motives of consumers in joining virtual travel community, but also to recognize different characteristics of the online community.

In sharing of ideas to people with common interests who meet online together and exchange ideas, social media may in fact create online community which spreads a sense of belonging to its members. The main aim of the organization is to cultivate sense of belonging to a group in the real or the virtual world, which engages consumers and introduces them to a sense of belonging (Kavoura & Stavrianea, 2011). Clearly, if the SMEs can create a sense of belonging for its customers, it is a prerequisite for the development of the business organization.

Travelers trust more the comments made in the social networks where other travelers place their point of view, share information and their experiences, they are influenced by the information provided and these networks consists of socialization and interaction among like-minded people with similar interests (Kavoura & Stavrianea, 2011).

There are many examples of travel virtual communities of significance for SMEs. A classification made on the criteria type of shared knowledge is used by the author. In this regard, the professional oriented online communities involve *Learning and Expert networks*, where SMEs are typically service providers (Dencheva, 2014). Also, the commercially-oriented online communities have the main purpose of generating revenue, and as such are most important for SMEs involving two types:

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

1. Business-to-Business or SME2SME: it supports the supply chain, better organization and communication between business SME organizations. Trading is involved between SMEs.
2. Business-to-Consumer or SME2Customer: communities are created by SME organizations to support and market a product to the end customers.

AN OUTLINE OF STRATEGY TO IMPLEMENT TRAVEL ONLINE COMMUNITIES BY SMEs

The advent of digital technologies affected all spheres of life, as well as SME businesses. The customer has become the most powerful factor of SME development due to the information provided by *Internet*. It is expected that in the future many more SMEs will use the economic benefits of sustainable travel by applying virtual communities in their business models particularly for smart travel tech for SMEs Business trips, optimal travel management and online booking strategies for SMEs, SME contract for car rental, airline ticket, hotel and ticker pricing strategies (Amaro & Duarte, 2015).

In the next section the chapter analyzes and recommends for further consideration the use of VTC for SME travel agency optimal marketing strategy1. The strategy of the SMEs follows certain steps. The most important is to set the goals of the SME business organizations. They are quite specific for each business, but the main idea is to understand what the aim of the *Internet* presence for the company is. The company might exist in the real world, not just as an Internet company and use *Internet* only as another communication channel to boost its sales. On the other hand, it may be real virtual company which aims to conduct business through Internet. The right definition of goals means defining who the target customers are. It is easier targeting on *Internet*, as customers are self-targeting. They decide which websites to visit, from which to buy. In this regard, it is very important to choose the right business model.

Strategic Step 1: Choice of SME Internet Business Model

The first step in the strategy is definition of the right internet business model responding to the main goals of the SME and defining its value proposition. According to Timmers (1998) definition of a business model is: "An architecture for product, service and information flows, including a description of the various business actors and their roles, a description of the potential benefits for the various business actors and a description of the sources of revenue" (p.2).

The business model is focused on understanding the customer, his need and how to meet his expectations. The most common types of e-business models on a worldwide basis are B2B (business-to-business), B2C (business-to-consumer), B2E (business-to-employee) and C2C (customer-to customer) all of which are applicable for SMEs.

The Business-to-business model is focused mainly on conducting sales relationships between two companies or developing relationship between company and its suppliers.

For example, in the Bulgarian hospitality industry, the Business-To-Business e-business model represents in most of the cases, relationship between a travel agency and a hotel. Other possible business-to-business relationships can be relationship between a hotel and an airline. Bulgaria has 1000 travel agencies. Based on this, it can be said that the travel industry is quite developed in the country and this represents a huge opportunity for the development of B2B e-business model. Based on the facts that,

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

through almost every single tour agent website, the online users can afford whole packages, including accommodation, flight tickets, it can be emphasized that the B2B e-business model in this country is very developed.

Tourist Service Providers (business) such as airlines and hotels sell their products to other businesses such as tour operators like (Wizzair, n.d.). To promote tourism, this model works with the collaboration of different businesses (i.e. Airlines, Hotels, Tour Operators, Agents etc.) and can provide dynamic packages to the tourists. On the *Internet*, services are often realized by huge networks and at the onset it is not always clear who profits and how much. This is especially true in the field of E-Tourism where many different companies co-operate in order to produce the final customers' service.

With the advent of Internet technologies, new forms of business models have appeared. One of the most popular remains the Business to Customer Model (B2C). What is specific for this model is the direct contact of the tourist provider with tourists. Tourists have an opportunity to make reservations on their own directly from the web-site of the hotel without the assistance of a tour agency. B2C business model in tourism is an advantage for both sides. Customers have access to information and can contact directly the hotel. On the other hand the hoteliers can receive fast feedback about the level of service they provide to the tourists.

The C2C e-business model represents online business relationships between with a seller (negotiator) and a buyer. In this model, a tourist can communicate with other tourists through the *Internet* (forums, blogs and email groups etc.) and can develop a tourist community.

The choice of a business model is affected by the usability and design of the web-site. In this regard, visual aesthetics is defined by Sanchez –Franco & Cataluna (2010) as"an artistically beautiful or pleasing appearance" (p.3.). Visual aesthetics is the extent to which customers believe a virtual community is pleasing to the eye. If customers find virtual communities pleasing, it is likely that both their state of mind and subsequent evaluations will be favorably enhanced and it will influence their emotions and their inclination to conduct business (Sanchez-Franco & Cataluna, 2010). The next feature that marketing managers should take into account when they develop their web-site as well as choose the business model to be applied is the usability of the virtual community. The usability of the web-site is connected with the ease that the customer can experience in what he looks for and make it fast (Dencheva, 2014). Therefore, usability is the ease with which the customer is able to learn to use the system and memorize its basic routine operations (Sanchez-Franco & Cataluna, 2010). Ultimately, the usability and aesthetics have a positive influence on customer satisfaction in virtual travel community.

Strategic Step 2: Analysis of the Competition

Second step of the strategy is conducting analysis of the competition. By analysis of the competition, the author means comparing the best practices, used by competitive web-sites and taking into account how the competition uses social media.

Strategic Step 3: Choice of Key Words

This is a very important tool, leading to a competitiveness of the company to be among the first ten results displayed in a product category. If the potential customers are interested in trips, and the company offers packages for a certain destination, marketing managers must think how to reach them. In this regard, Italian SMEs hospitality firms are promoting their destinations by using social media. According to

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Mariani, Felice, & Mura (2016) the type of posts made by regional domestic destination has an impact on the engagement, especially the visual types of posts, such as photos are having positive impact on the engagement of tourists. According to the study, evening and weekend posts have a positive impact on the engagement of tourists. The engagement rate is more important for marketing managers. Clearly, it is more important how people react to a Facebook post in terms of sentiment, rather than using just the numbers (Mariani et al., 2016).

Social media marketing initiatives cannot be measured commercially, as they mean to what extent their strategies on Facebook (Facebook, n.d.) and other social media are increasing the number of tourist packages and services purchased at the destination. In other words, by using social media SMEs in hospitality, at least on the example of Italian hospitality enterprises, cannot only reach potential travelers but also keep the loyal ones. The other opportunity is to create a forum, where the travelers can discuss their experiences with others. If the business organization is focusing on increasing the traffic to its web-site, it is a very useful tool. In this way, the number of visitors will be increased as well as the conversion rate which is the number of customers who will actually become buyers and loyal customers.

It also can be pointed out that customers trust in greater extent to their friends in making decision to visit a certain destination. At the same time, the number of people who trust a traveler is higher too (Dencheva, 2014). Virtual communities are an excellent tool to achieve the goals of the company, the trust of customers and develop SME brand recognition. In this regard, it is important to know what the real reasons are why people join the virtual travel community. There are different types of consumers on *Internet*, having different motives. Some are entertainment-seekers, while others are information-seekers.

Strategic Step 4: Analysis of Customers

Analysis of the customers is needed to understand what type of customers represent the SME audience, what interests and motives they have on *Internet*. In this regard, there are several types of customers:

- **Content Creators:** These are people publishing information in blogs who can be offered to upload or download their own video, audio.
- **Conversationalists:** These are people who visit social media, as they want mainly to communicate with other people and should be offered opportunity to chat with others in real time. An online program for communicating will satisfy them.
- **Criticizers:** These are the customers who always comment, show critical attitude towards all topics.
- **Collectors:** These are customers who visit different media, lead by the idea to collect points or win certain reward, look always for promotion and need to be engaged, stimulated. In this regard, these customers can be offered competitions, lotteries, games, as they have these needs.
- **Spectators:** The percent of these customers is highest. They only read the comments in the online communities, need an opinion of other customers to take certain decision.
- **Passive Customers:** They do not take part in the discussions nor take any position on certain questions.

In order to attract customers to the online community, different rewards could be given. For people who are looking for a place to express their opinion, this might mean giving them opportunity to share their travel experience or expertise on certain problem. The list of motives that customers have is very

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

precious for the marketing and social media managers. It will give an opportunity for self-targeting of customers. In this way, customers agree to become a part of a certain database and to receive information from a certain company and its products. In this way the company creates digital relationships with consumer.

Strategic Step 5: Creating a Sense of Belonging for Customers in the Travel Online Community

As discussed before, the sense of belonging is a very important characteristic of the virtual community. Managers should focus their efforts on offering value for which the customers will feel engaged and being a part of certain travel online community. Creation of the sense of belonging is connected with the social identification of the individual. Being a part of certain online community, the customer agrees that the values and principles of the community are part of his behavior. In this regard, he identifies with the community. It means that he is proud being a part of this community, as he fully identifies with it, as it is with the fans of renowned hotels for example.

In order to create a sense of belonging customers need to have an opportunity to publish their own messages as well as video and audio materials. Any business organization can use the opportunities provided by *Internet* for presenting information in order to create the online experience of the customer. Offering such online experience means the customer will be able to visit the web content again and again.

In this regard, use of video gives opportunity for brand creation and brand recognition as well as for full study of the opportunities of product or service offered. People have always tried being a part of a certain group. Marketing managers need to analyze very carefully the motives of people of using virtual communities. Motivation theorists argue that unobserved needs and desires motivate behavior, the purpose of which is to satisfy needs (Zhong & Luo, 2015). Congruence of user need satisfaction in social media marketing can be achieved by aligning the marketing content, process and goal with users' needs of using social media. To develop their marketing strategy and design appropriate advertising appeals, it is critical that marketers identify and understand the needs and motivation behind social media usage. This will give an opportunity for communication with their targeted audience on a personal, meaningful level through social media (Zhong & Luo, 2015).

The community needs to have an image of a communication channel to which customers can trust. In other words, the virtual travel community is perceived as a valuable information source to which recent and potential customers can rely in their choice of a travel destination (Dencheva, 2014). After the SME business organization knows and understands the motives why customers join the travel community, the next step is to give them an opportunity to share the opinion they have and provide them with different status, based on the motivation they have. For example, people interested in active participation in the travel community can be given a status of an administrator. It will be very motivating if the community manager provides certain reward for the community members. For example, giving full access and administrative rights for certain period for the publishers might be challenging and motivating for them.

How a business model will be organized is crucial for the effectiveness of the travel community. By business model is meant the organization of business processes and way of making a profit as well as attracting customers. After the motivation of customers is defined, it is important to know the opinion of the customers. In this regard, it will be more effective if the company creates a blog or forum to their web-site. In this way the company will have the opportunity to track the behavior of its customers, by

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

showing them interesting events and turning them to loyal. If the virtual travel community focuses not only attracting members but keeping them loyal then it should build an individual approach to a customer by applying various tools of digital communication technologies.

Strategic Step 6: Achieving Personalization for Customers in the Online Community

The development of a personalized content is an opportunity to interact with potential clients on a more personal level. Thus, the following recommendations are aimed to increase the SME personalization issue:

1. Develop a registration option or log in via social networks, so a visitor of the web-site is able to create his/her profile. The form includes personal details and preferences so when the customer logs in, he sees information content according to his preferences. In this case, the customer behavior can be tracked easily by knowing his preferences. Every time he/she logs in the web-site, a personalized content will be sent to him/her according to the personal details and information gathered about him/her. Each web-site is providing this option. However, registration is an opt-in option, which means that it is not obligatory. Some customers prefer to remain anonymous as it is one of the advantages provided by *Internet*.
2. Use *cookies* for user authentication, storage of personal preferences and settings; monitor the user status on the web-site, analyze the history and purchase behavior of the customer. There should be again opt-in option as some customers avoid using cookies.
3. Develop an internal search engine as well as online tour selection section, so a web-site use can easily access and buy a service offered by the respective company. It is a good option for fast and easy navigation in the web-site. As already discussed before, the visual aesthetics is very important tool for the success of the virtual community.
4. Develop an online assistant so that the customer can speak with a travel agent online. Online assistant is very effective especially for customers who prefer to have direct contact with real seller.
5. The web-site can be translated in several languages, based on the targeted customer group.
6. Send personalized e-mails to customer in birthdays or other celebrations. Personalization can be achieved not only by e-mail marketing campaign. If the customer is greeted on some occasion, he/she feels engaged with the community.
7. Send news to customer if he/she has given his consent.
8. Inform about events and tours offered with enclosed tour packages considering clients preferences and previous travel experiences. It is a part of an e-mail marketing campaign.
9. Develop a subscription option on the web-site for the newsletters and send newsletters to the clients about the new trips, destinations, "last minute" propositions.
10. Create a special travel community: "Travel-territory".

The web-site should provide an additional section called "Travel-territory" which is a place where each registered user can have his/her travel territory. This page will allow the tourist and SMEs to obtain supportive information regarding the destinations, make friendships with the other travellers, share experiences and impressions from travelling with the SME travel agency.

The proposed online community should have 2 subsections: *Tourists* and *Meeting Point*.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

- **Tourists and SMEs:** This is the page where all the user profiles will be represented. Each user profile consists of Names, About yourself section, Contact information, Friends, Map of destinations, Photo blog and Ratings. One registered user can visit a page, make a friendship and give "likes" to the pictures and blogs of the other registered user.
- **Meeting Point:** A forum, where a user or SME travel agent can create a topic and make discussions, ask questions and follow dialogues. Having a news portal is an important tool to make the customers visit the web-site and check the updated information on daily bases. In addition, there must be options to leave a comment on the post and share the post via social networks. In such a way, the information will be delivered to a wider SME audience and moreover the web-site will gain promotional benefits which can also be managed by SMEs.

Strategic Step 7: Developing a Popular Travel Online Community

The next important step is attracting customers, i.e. developing a popular community which is interesting so that people will be glad to join it. The openness of the online community is a very important characteristic which means easy access to its members. There are various approaches in popularizing it such as search engine optimization. The key moment in using search engines is finding the right word that the customers use. The first goal is that the company can be found easily among other things. It can be achieved by choosing all the words that are related with the product. All business organizations are trying to be on the top of ratings. It means that they can be found easily. After that the customers must find the content of the community useful and easy to use, share it to their relatives, friends and others. Therefore, in the beginning the main goal is traffic generation and focusing efforts on the information presented, on its content.

After it becomes popular, the next aim is to increase the number of likings. If customers like it and recommend it to each other, then the customers will be engaged with it. In order to achieve it, the interest of the customer would be taken into account by updating its content on a regular basis. In this regard, there should be a specialist dealing with it, working on regular posting, updating the information content so that it will be useful to its customers. If the web-site is well organized as navigation and design, and is user-friendly, then it will be recommended to others. In this way the customer base will be increased.

If the hotel creates a blog to its web-site but does not pay attention to the interest and does not present events latest, news, etc, there will be a great risk of distrust among customers. Blogging is one of the ways of promotion, which is considered as an inexpensive marketing activity as compared to traditional advertising. In this way, hotel companies have realized their advantages and have encouraged visitors to write comments on their hotel blogs with rewards (Gulbahara & Yilidirima, 2015).

Strategic Step 8: Measuring the Effectiveness of a Travel Online Community

It logically follows from the first seven strategic steps that virtual travel communities can help increase competitiveness of the SMEs by having direct contact with customers. They can be very useful for SMEs. The virtual travel community can help increase the number of customers by attracting customers not only from the regional country but also foreign customers. In this regard, virtual travel communities can increase the competitiveness of the SMEs by making them more competitive not only on local level but also internationally. On the other hand, if the SMEs focus its marketing efforts on increasing the visits, its effectiveness can be measured by number of likings and clicks. Engagement is proving the interest of

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

customers. It is impossible for a very short time, to increase the likings of the company with less marketing efforts and on low price. Internet allows such opportunity for SMEs. By presenting the company in any social media, it can receive fast feedback and clicking of customer to the main webpage of the company. The power of *Internet* is huge not only in attracting new customers to the company but also in keeping them loyal. In this regard, virtual travel communities provide excellent opportunity for SMEs to focus their attention on loyal customers by the recommendations they made to other future prospects.

In the beginning the main goal is visit and then the next goal is increase of the engagement rate measured by likings, clickings, etc. In order to be engaged in active communication, members of virtual community must be engaged in active communication. In this regard, managers of the community should have different approaches to customers, having in mind the differences in their behavior. In this regard, managers should stimulate the activity of their participants by giving them freedom to express opinion, comment, etc. For example, a guest of the hotel can be invited to share their experience in the book for guests. If there is a forum in the web-site of the hotel or blog, guests can easily publish their photos. It will be quite useful for potential guests of the hotel. In this way, the hotel can support prompt and provide quite feedback with customers that will be useful for both sides, as customers and company.

A lot of SMEs always offer some competition, lottery and other advertising methods to keep customers engaged. Having a dialogue with the company and its customers leads to higher engagement. It is beneficial for both sides. On one side, customers can express very fast their opinion and share experience they have with other potential customers. It is also useful for the company as they can understand the weak points in the customers' service. It is the challenge nowadays to have a long term relationships with customers and to see the customer as a partner. In this regard, interesting topics should be chosen. If the topics discussed in the forum, blog, web-site of the hotel are interesting for the customer, he will be attracted. The name of the company is not so interesting and attractive for the customer but rather its activity, values, etc. Customers are aiming to become a part of certain virtual travel community based on the motives they have. For example, info-seekers are focusing on professional blogs, forums, where they can find help and expert advice.

In order to understand how virtual travel community has optimized the development of SMEs, measuring the effectiveness needs to be conducted. By effectiveness is meant that the goals set by the company have been achieved with the results achieved (see table 1).

As emphasized before, the goals of the SMEs are defined with the right choice of the business model to be applied. If the company aims to use *Internet* as another communication channel to reach its customers, then the marketing managers are using the criteria for cost effectiveness of the campaign. If the company aims at creating brand awareness, then the brand awareness can be measured by number of people, who like and use the social media (Hoffman & Hodor, 2010). Also these people can be fans or make a reservation. Brand engagement can be measured by number of active participants compared with passive. Active users are people who active use the social media. They comment, like or share with friends. These people are engaged in company and can share it with friends. This is good because they made the company more popular for others. Therefore, the effectiveness of social media can be measured by the number of people who use, like, and share it. If many people see the company in social media that means this social media is effective for the company.

If the goal of the SMEs is to use social media for attracting audience, the appropriate measuring criteria can be Facebook Fans. The opportunity provided by social media is to create for free a Facebook page. Once the SMEs create a business page for free on Facebook it is possible to track the number of people that become a fan of this company. It is also possible to track the number of people who visit the

Table 1. Metrics for measuring social media effectiveness

Social Media Application	Brand Awareness	Brand Engagement	Word of Mount
Social network Facebook	•number of members/fans •number of installs of applications •number of impressions •number of bookmarks • number of reviews/ratings and valence +/−	•number of comments •number of active users •number of "likes" on friends' feeds • number of user-generated items (photos, threads, replies) • usage metrics of applications/ widgets •impressions-to-interactions ratio • rate of activity (how often members personalize profiles, bios and links)	• frequency of appearances in timeline of friends •number of posts on wall •number of reposts/shares • number of responses to friend referral invites

Source: Hoffman & Hodor (2010)

web page and the number of new fans. Facebook provides a decent free tool to track all of these stats (Facebook, n.d.). The social media gives excellent statistics who are the customers. Knowing the total number of visits will provide information if the campaign is successful in achieving traffic to the web-site.

FUTURE RESEARCH DIRECTIONS

The effectiveness measuring has been addressed in the last section and this remains to be studied in details in the future works. In order to understand how effective the VTC is, several factors should be further studies. At first, the goals and the choice of business model, followed by the analysis of the competitors. Effectiveness will give proper understanding for the marketing and community managers if the travel online community is meeting its goals and provides ways for optimizing it. In order to understand how effective were the digital marketing campaign, the focus of future research should also be on the entrepreneurial goals. They are quite different, ranging from (personal and business are often intertwined) which more effective digital marketing can help to facilitate. Future research also needs to focus on business sustainability and growth (customer acquisition and retention and combating seasonality), innovative marketing through digital media and autonomy (reducing dependence on marketing intermediaries), personal development, satisfaction in mastering digital marketing and technology and profitability-more effective and efficient marketing.

Future research needs to incorporate how SME companies can benefit from electronic commerce including access to information on tourism services, providing better information on tourism services, and providing convenience for customers.

It is expected that future research will prove that virtual travel communities can be very useful tools in achieving not only customer acquisition but most of all retention. In fact, it is due to the usefulness of the travel communities that people are brought together from different regions, united by their same interests or hobbies. The general idea of the community is sharing knowledge. In this regard, VTC not only helps travelers in making their travel decision but serves also as profitability centers. In other words, future research should explore whether higher level of satisfaction of its members leads to higher profitability of the communities.

CONCLUSION

The travel virtual communities represent an excellent opportunity for increasing the competitiveness of SMEs. The most important factor that needs to be taken into account is how *Internet* will be used by SMEs. Therefore, their choice of business model is very important. The steps of the strategy for applying virtual travel community are various and were elaborated by the author. They depend on the business. The chapter presents steps of strategy that could be taken by SMEs in the hospitality sector. However, the strategy presented can be applied to different companies from lines of business as well. The author presented the main steps to be followed by the entrepreneurs, operating in the *Internet era*. The chapter has further shown that virtual travel communities can optimize the processes in SME business organizations, not only externally but also internally. They provide fast feedback from customers. In this regard, the business organization can react faster and adapt to the requirements and needs of the customers. On the other hand, the community leads to optimization in the company inside. It is performed by close interaction between community managers and managers of other departments so that the company will function more effectively in the new *Internet* marketing paradigm.

Virtual travel communities provide an environment that facilitates users' interaction and search for devices. SMEs from the hospitality industry can change the way in which business is traditionally conducted, with travelers as co-creators and travelers as co-distributors. The travelers are becoming co-creators as they create the content in the travel community by posting photos, videos from the visited destination, by sharing their experience. As a result, a new SME business model has appeared the model of the community. It includes: the traveler, the business organization and the online tourism domain. It is created in most of the cases by the customers, and managed successfully later by the business organization. It is the key of success and future development of SMEs, particularly in the tourism industry.

KEY TERMS AND DEFINITIONS

Blogs: Short recordings that are chronologically ordered and contain media materials.

Conversion Rate: The number of customers who turn to buyers.

Electronic Business Model: An architecture for product, service and information flows, including a description of the various sources of revenue, business actors and their roles, their potential benefits for various business actors such as SMEs.

Likings: Criteria for people who express positive attitude towards a certain web page, i.e. they like it.

Personalization: Sending a personalized content to the user according to his/her preferences.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Social Networks: A virtual network aimed to establish relations among its users potentially supporting SME development.

Virtual Travel Communities: An aggregation of people able to exchange ideas, beliefs, experiences online through space and time with potential to support SME development.

ENDNOTE

Chapter 54
Working Capital Financing by Banks in Small Enterprises:
Problems and Challenges for Bangladesh

Md. Mosharref Hossain
Bangladesh Institute of Bank Management (BIBM), Bangladesh & Universiti Utara Malaysia, Malaysia

Yusnidah Ibrahim
Universiti Utara Malaysia, Malaysia

ABSTRACT

Among all the economic players, small enterprises (SEs), by number, dominate the whole world business segment. However, it is a very common problem for SEs, in every economy either developed or developing, to get access into formal financial sector. Working capital can be treated as the life blood for SEs to be operated. But unfortunately, most of the small enterprises face serious problem while obtaining such loan from banks. On the other hand, banks face a lot of problems to finance working capital to SEs. Therefore, this chapter intends to identify the problems faced by SEs in obtaining and by banks while financing working capital. A total of 413 small enterprises were interviewed through a structured questionnaire administrated directly by the researchers and selected purposively from the capital city (Dhaka) of Bangladesh. The major findings indicate that about 72% small enterprises got the access into banks for working capital loan although all of them face a lot of problems while obtaining such loan from banks. To identify the problems and challenges faced by banks while financing working capital to SEs, 34 commercial banks' officials working in SME department were interviewed through questionnaire and selected purposively based on their high involvement into SME sector lending. Bankers encountered different problems and challenges related to working capital financing in SEs. Based on the survey findings, a good number of solutions have been formulated for policy initiatives.

INTRODUCTION

Among all the economic players, small enterprises (SEs), by number, dominate the whole world business segment (EdinburghGroup, 2013). In consideration of the contribution to the world GDP, it varies from 16% (in low income countries) to 51% in high income countries (EdinburghGroup, 2013). In terms of employment creation worldwide, research suggests that small and medium enterprises are the dominant contributors in all the regions. Beyond the contribution towards the GDP and employment, small businesses are also significant for the society for building social network, ensuring life standard of poor people, export earnings, reducing social unrest, creating new entrepreneurs, satisfying consumers' needs with competitive price, fulfilling the requirements of many large businesses and others (Mamun, Hossain & Mizan, 2012).

Small and medium enterprises are considered as the backbone of the economies of Asia region. During 2007–2012, on an average SMEs account for 98% of all enterprises and constitutes more than 66% of the national labor force in Asia (ADB, 2013). This report also reveals that in the same period the sector contributed 38% (on average) of the GDP or manufacturing value added and 30% total export values. SEs are also the backbone of Bangladesh economy and their contributions can reduce poverty to a satisfactory level by creating jobs for the skilled and unskilled manpower in this sector. In Bangladesh, SME sector contribute 25% to the GDP, about 40% of gross manufacturing output, account for 90% of the private sector enterprises and about 70% to 80% of the non-agricultural workforce working in the sector which is around 25% of the country's total labor force (Alo, 2014, Februry 7).

Bangladesh economy is characterized by high population, low per capita income, high level of unemployment and underemployment, mass poverty and high income disparity (Mamun, Hossain & Mizan, 2012). In these circumstances, higher growth of SEs which is treated as an engine for economic growth and machine for job creation may reduce poverty of Bangladesh to a satisfactory level by creating employment for the skilled and unskilled manpower in this sector. Despite the high potentiality and remarkable contributions towards the economy, still the sector is facing severe financing problems almost all the Asian countries, along with other multidimensional problems depending on the countries, which are hindering their survival and jeopardizing potentiality of future growth.

As part of SEs financing requirements, working capital (WC) plays a significant role in the success of SEs. According to Kwenda (2015), working capital can be regarded as the reservoir of internal financial resources and can be used for supporting the growth or expansion of business. WC is that portion of a firm's capital which is employed in short term operations. It is a significant issue during financial decision making as this is a part of the investment in total assets that requires an appropriate financing investment (Bhunia, 2010). Although working capital problems can be experienced by organizations of any size, it is usually small businesses that experience most problems, especially during periods of start-up and expansion (McCosker, 2000). Too little of working capital will result in cash flow problem, failing to pay suppliers on time and being unable to claim discounts for prompt payment. On the other hand, too much resource tied-up in working capital will earn a lower-than-expected rate of return on capital employed. Proper management of working capital is important to guard the financing constraints (Ding, Guariglia & Knight, 2013). As a result, optimum investment in working capital is the precondition for the small business success. Therefore, Peel, Wilson and Howorth (2000) suggest that an efficient working capital management is particularly important for small and medium-sized firms due to the greater difficulties they have in obtaining funding on the long-term capital markets and, hence, their greater dependence on trade credit and bank credit as major sources of debt.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

As SEs are heterogeneous in nature and lack proper business plan, required documents and formal business structure, they traditionally faced difficulty in obtaining working capital from formal sources (Mamun, Hossain & Mizan, 2012). Availability of required working capital in appropriate time is the significant problem for most of the SEs. For the day to day business operation, timely availability of working capital and its utilization is required. This kind of problem arises mainly due to delay in payments made by the debtors. In his study, Hossain (1998) reveals that SEs in Bangladesh encounter great difficulties while rising working capital because of the reluctance of banks to provide loans to SEs. On the other hand, WC financing in SEs is one of the key area for the banks where they face challenges. Most of the entrepreneurs in our country are illiterate and are unable to prepare proper business plan that may help them to get money from bank (Mamun, Hossain & Mizan, 2012). Lack of proper documentation, un-structured business record, on the other hand, create major problems for them.

The number of studies that have addressed the financing and capital structure of SMEs are mostly for developed countries (Hughes, 1997; Watson & Wilson, 2002; Zoppa & McMahon, 2002; Hussain & Matlay, 2007); only a few address for developing countries (Peterson & Shulman, 1987; Aidis, 2005; Abor, 2005; Bhaird & Lucey, 2011). Research into the area of working capital financing to SEs in Bangladesh is very scant, particularly research investigating the problems of WCF in SEs and banks. Therefore, this chapter focuses on the problems faced by SEs in obtaining and by banks while financing working capital.

OBJECTIVES OF THE CHAPTER

This chapter examines the problems faced by small enterprises in Bangladesh while obtaining working capital loan from banks and problems and challenges encountered by banks for financing working capital to SEs. Thus the specific objectives of the chapter are:

- To represent present scenario of working capital financing by banks to SEs and their existing mechanism.
- To identify the problems faced by SEs in obtaining working capital loans from banks.
- To point out the problems faced by banks while financing working capital to the SEs.
- To propose some solutions for policy initiatives.

PRESENT SCENARIO OF WORKING CAPITAL FINANCING BY BANKS

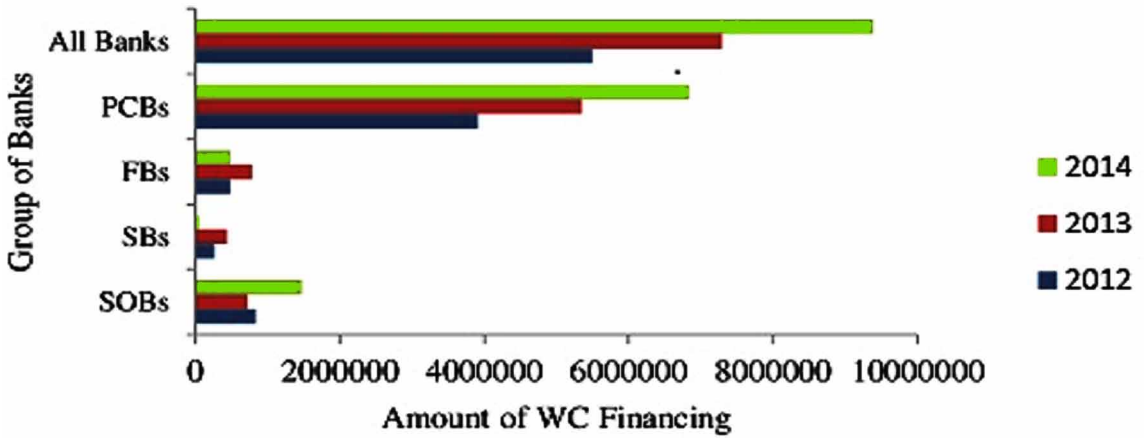
At present banks and financial institutions are coming forward to provide finance to the small enterprise sector. Different initiatives have already been taken and practiced by the financial institutions in order to facilitate small enterprise financing mostly for the behest of Bangladesh Bank (Mamun, Hossain & Mizan, 2012). The present scenario of working capital financing in SMEs has been analyzed in terms of percentage of total working capital financing by group of banks, bank group-wise total working capital financing, industry-wise working capital financing by group of banks, and working capital finance in small and medium industries by banks.

Table 1 shows the working capital financing by all banks in terms of percentage. It is evident that, the State Owned Banks' (SOBs) and Private Commercial Banks' (PCBs) working capital financing increased in 2014 compared to 2012. But the working capital financing by Specialize Banks (SBs) and Foreign

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Table 1. Working capital financing by group of banks (in %)

	2012	2013	2014	CAGR*
SOBs	15.24%	9.91%	15.69%	20.49%
SBs	4.76%	5.95%	0.43%	-46.19%
FCBs	8.71%	10.71%	5.12%	0.16%
PCBs	71.29%	73.43%	72.80%	20.18%
All Banks	100.00%	100.00%	100.00%	19.35%



Source: Authors' calculation, Data: Scheduled Banks Statistics, Bangladesh Bank.
* CAGR stands for Compound Annual Growth Rate.
Note: SOB- State own Bank, SB- Specialized Bank, FCB- Foreign Commercial Bank, PCB- Private Commercial Bank.

Commercial Banks (FCBs) decreased from 4.76% to 0.43% and from 8.71% to 5.12% respectively. Among all, PCBs' financing was highest (72.80%) in 2014 followed by SOBs (15.69%). In terms of working capital financing, the compound annual growth rate (CAGR) of SBs was the lowest (- 46.19%) among all the banks in last three years (2012 to 2014). However, SOBs and PCBs achieved almost the same CAGR which are 20.49% and 20.18%. Therefore, the CAGR of all the banks shows the remarkable increase from year 2012 to 2014. This is a positive indication for accelerating the growth of economy.

Although the PCBs remained the major partner in working capital financing in 2014, the percentage of financing is slightly decreased from 2013. However, they are playing a significant role in fulfilling the working capital needs of the borrowers. Figure 1 depicts the bank group-wise working capital financing in terms of amount, which also shows that all the banks together increasing their contribution towards the working capital financing in different industries.

The industry-wise working capital financing by banks is shown in Table 2. The PCBs are playing the dominant role in working capital financing among all banks. In 2014, in all categories of industries except the cottage industries, the PCBs' working capital financing was highest. In large industries' PCBs provided 75.33% working capital in 2014, the SOBs' position was second (11.94%), followed by FCBs and SBs. Small and medium industries got maximum working capital financing from PCBs and SOBs.

Figure 1. Group wise total working capital financing by banks (Tk. In Lacs)

*Parentheses indicate the number of account.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

However, PCBs contribution towards the small and medium industries reduces from 69.56% to 63.15% from the year 2013 to 2014 whereas the contribution of SOBs increases drastically for the same period from 8.69% to 28.29%. The contribution of FCBs in this regard is negligible and SOBs remained in moderate position.

In terms of the working capital financing in cottage/micro industries, SOBs played a pivotal role in 2014 which account for 52.47% followed by the PCBs (34.77%). However, in consideration of the service industries PCBs contribution was highest in 2014 which is 85.37% followed by the FCBs (12.15%). The stake of working capital finance by the SOBs and SBs is marginal in this regard.

Table 3 shows bank-wise amount of working capital finance and their compound annual growth rate (CAGR) in small and medium industries. All the groups of banks except the SBs show the positive trend in financing small and medium industries. The CAGR of SOBs shows the highest increase (121.35%) while SBs shows negative (-28.49%). The FCBs' and PCBs' CAGR also show the positive and almost similar. In aggregate, the CAGR for all banks is 22.67%, although the group of SBs' affects negatively. It is worthy to mention that the small enterprises' access to working capital finance in the SOBs, PCBs and FCBs are positive, meaning greater extent of financial inclusion in this segment.

EXISTING MECHANISM OF WORKING CAPITAL FINANCING BY BANKS

The SMEs of Bangladesh suffer from scarcity of working capital although day by day this portion is increasing as part of financial inclusion. However, these are not sufficient compared to the larger demand. Therefore, small businesses are using both formal and informal sources to finance their working capital needs. One of the important problems the entrepreneurs facing while financing from informal sources is the high interest rate. On the other hand, the absence of required documents and prior banking relationship mostly hiders those to get access in formal sources and also facing problems in getting finance on emergency basis.

Irrespective of many problems for the banks to provide funds to the SEs, most of the banks are providing working capital facilities to their SE clients. The banks follow different mechanism in providing finance to the SE clients. Usually the mechanism involves several steps. These are (i) Client selection based on the information furnished in the Know Your Customer (KYC) (ii) Assessment of the loan proposal by the credit officer (iii) forward it to the credit committee (including documentation and the comments based on the assessment) (iv) Re-assessment by the credit committee (v) Decision and Disbursement of the loan. The mechanism depends on the operational procedure (centralized or De-centralized), practices,

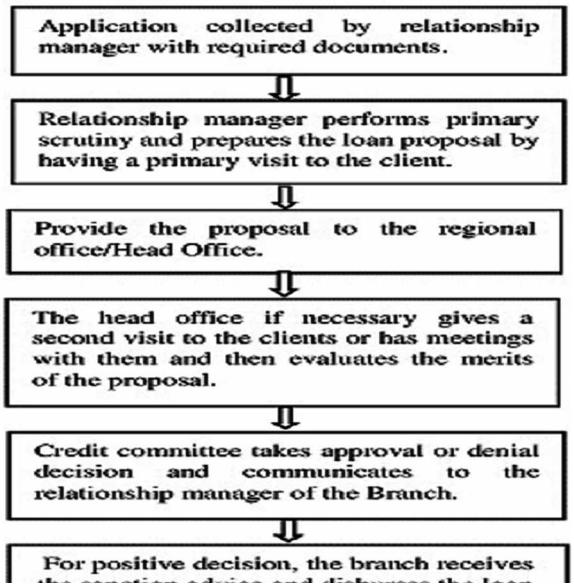

Table 3. Working capital financing in small and medium enterprises by banks (Tk. in Lacs)

	2013	2014	CAGR
SOBs	165,453	810,682	121.35%
SBs	378,802	193,700	-28.49%
FCBs	35,264	51,485	20.83%
PCBs	1,324,360	1,809,301	16.88%

Figure 2. Process flow chart of working capital loan disbursement

risk management procedure of individual bank. The working capital financing mechanism also largely depends on the attitude of the individual banks to the SE clients. The current flow chart of working capital financing followed by different banks is shown in Figure 2.

The process shown in figure 2 for financing working capital to SEs is not a straight forward process rather it varies from bank to bank and even for client to client. For some clients, especially for the credit worthy firms, the mechanism may be pretty simple but for other cases it goes some rigorous process. While financing working capital, a few PCBs including some foreign banks operating in Bangladesh follow the best practices and emphasis more on cash flow of small business. But the other PCBs and SOBs are still heavily dependent on the traditional collateral based lending.

While appraising the proposal for working capital financing, the relationship manager or the credit officers of banks evaluate different factors. The selection depends on the strategic commitment of the individual banks towards the SEs. It is also very much dependent on the approach of the individual bankers related to working capital financing to the SEs. The common factors are the experience of the entrepreneur, the net worth of the business, security provided by the entrepreneur, the status of the banking relationship, cash-flow etc.

METHODOLOGY

The study emphasizes on the three broad sectors of small businesses operating in Bangladesh namely, manufacturing, trading and service sectors. It is evident from the SME Foundation cluster approach that out of 177 SME clusters, 38% small businesses are located in Dhaka division and most of them are concentrated in Dhaka city (Abdin, 2015, March 5). Therefore, the study considers Dhaka city as the study area. According to the census of Bangladesh Bureau of Statistics (2015), there are a total of 178,829 small business units are operating in Dhaka city. As the list of small enterprises including their

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

addresses except the total number is not available in Bangladesh, the probabilistic sampling technique cannot be applied. Hence, the study considers non-probabilistic sampling technique to make the survey manageable but within reliable limits.

The study considers Krejcie and Morgan (1970) table to determine the total sample size. Based on the Krejcie and Morgan table 384 small businesses are selected as the sample size. However, to reduce the sampling error and to minimize the non response rate, the total sample size are multiplied by two (Hair, Wolfinbarger, Ortinau, & Bush, 2008). Therefore, the total 768 questionnaires are administered in Dhaka city those are purposively selected. Since the focus of the study is working capital financing problems faced by both small businesses and banks, the unit of analysis is small firms operating in Dhaka city and bank officials of SME department. Therefore, to collect the information about the firm, interview has been conducted through the structured questionnaire among the owners or the managers where owners are absent from their businesses operation and also from the bank officials of some selected banks in the same city. The total numbers of 768 questionnaires were distributed among the enterprises in Dhaka city. The researcher could able to receive 437 questionnaires (response rate 56.90%) from the interviewee. Out of the 437 questionnaire 24 were rejected by the researchers due to the insufficient information regarding specific answer. Finally, the total of 413 enterprises was selected and has been taken as the sample. Among 413 small enterprises, 114 (27.60%) enterprises are from manufacturing sector, 237 (57.39%) are from trading sector and the rest 62 (15.01%) are from the service sector.

For collecting the information from banks, a purposive sample survey has been conducted on 34 commercial banks considering their high involvement into SME sector. Among 34 banks, four state owned commercial banks (SOB), twenty-four private commercial banks (PCB) including six Islami banks, two specialized banks (SB), and four foreign banks (FCB) are selected. To justify the problems raised by the small entrepreneurs, both the accepted and rejected loan proposals of some particular banks were also reviewed. Published literature, research papers, different books were reviewed to complete the theoretical background and relevant websites were visited to collect secondary information.

This chapter is divided into six sections. After a brief background as part of introduction (section 1), section 2 highlights the present scenario of working capital financing by banks. Section 3 shows existing mechanism of working capital financing by banks. Section 4 presents the findings and discussion of survey results. Section 5 represents some proposed solutions for policy initiatives. Finally, section 6 and 7 present the scope of further research and chapter conclusion.

FINDINGS AND DISCUSSIONS OF SURVEY RESULTS

In order to identify the small enterprises access to working capital finance, problems faced by them while obtaining WC finance and the problems cited by banks to finance them, current study surveyed on 413 enterprises belonging in different sectors. The survey results are presented and discussed in below:

Survey Results of Small Enterprises

Small Enterprises' Access to Banks for Working Capital Loan

Access to finance has a beneficial impact on business start-ups and growth, which will ultimately contribute to the economic growth. It is the prerequisite for ensuring the overall growth of small businesses.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

A large body of literature on different countries shows that there is a good association between access to finance and the growth or performance of small firms. Some studies highlights that the availability of finance is the prime factor for the success and growth of SMEs (Cook, 2001; Ou & Haynes, 2006). Some studies conclude that financing constraints have negative influence on the firm growth (Ayyagari et al., 2008; Beck et al., 2005). For example, Beck et al. (2005) from their cross-country analysis reveal that firms bear a 3% growth penalty that face finance as a main constraint compared to the firms that do not face it. Study done by of Beck and Demirguc-Kunt (2006) finds that for SMEs the impact of financial constraint on their growth is highly severe. Another study in Eastern Europe reveals the interesting findings that firms with access to formal financial institutions exhibit 9% higher employment growth and 36% higher sales growth for the period of 2002 to 2005 (WB, 2009). Therefore, it is understandable that for the overall growth and contribution of small firms towards the economy, there access to the formal financial sector is the vital requirements.

In order to analyze the access to credit in formal sector, the study collected information through survey about the capital structure of small firms who took loan both from formal and informal financial institutions. A total of 349 (84.50%) enterprises got the access in both sources and their average capital structure is shown in Table 4. According to Table 4, the average debt/equity ratio of the manufacturing sector is the highest (41.67%) compared to other two sectors. This is because manufacturing sector needs working capital in different phases of their production including other requirements.

From the last column of Table 4 that describes for range of debt and equity position, it is clear that some of the firms are highly leveraged, while some are low leveraged. High leveraged enterprises are riskier for bank to finance further and the low leveraged small enterprises tend to be less risky. The manufacturing sector shows the highest range from 12.43% to 73.55% and the overall range of debt equity is from 4.63% to 73.55%. The lower debt equity ratio indicates that most of small business highly relied on their own financing due to the lack of greater access to formal financial sector or they do not need bank loan.

Figure 3 shows the overall scenario of sample small firms based on their access to banks for external financing. Although 84.50% firms got the access into the formal and informal sources for funds mobilization, the 71.91% got the access into banks only. The other 28.09% did not get access into banks and relied on their own or informal sources. Choudhury & Raihan (2000) conducted a survey on SME access to credit and found that, only 35.79% of SME stakeholders enjoy unrestricted access to the formal credit while 50.53% did not get any kind of access. Therefore, it is evident that the access to credit in formal sources increases highly due to different initiatives and programs of central banks and all the commercial banks operating in Bangladesh.

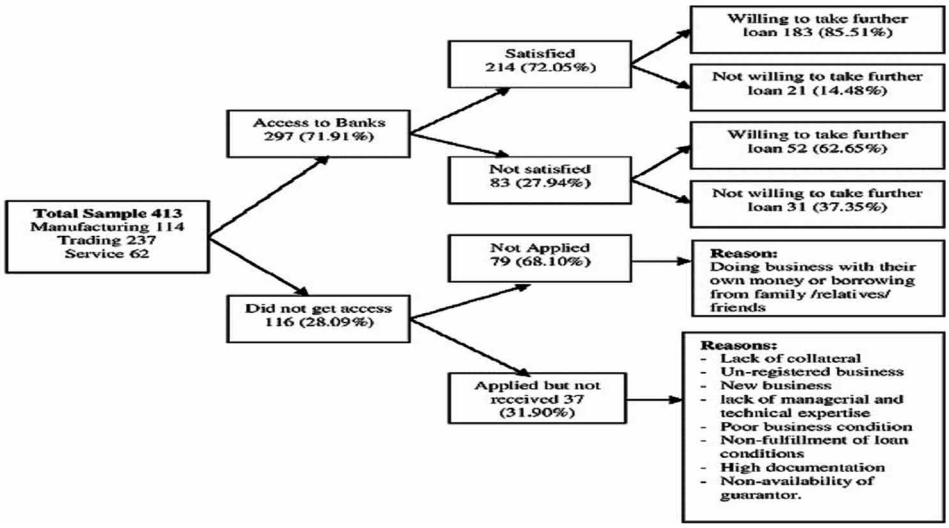

Table 4. Average capital structure of sample enterprises (group wise and total)

Business Type	Number[1]	Capital Structure		Range	
		Debt (%)	Equity (%)	(% of Debt)	
Manufacturing	93	41.67	58.33	12.43	73.55
Trading	209	27.33	72.67	7.44	62.49
Service	47	22. 71	77.29	4.63	69.85
Total Sample	349	31.94	68.06	4.63	73.55

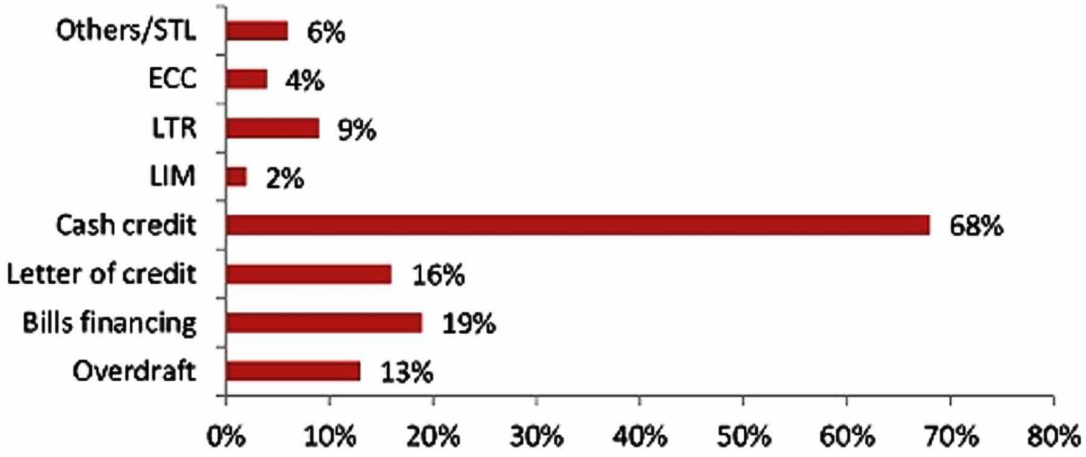
Figure 3. Summary of survey results on access to formal credit from banks

Enterprises those got the access to banks, 72.05% enterprises are satisfied in terms of loan covenants and, of them, 85.51% enterprises are willing to take further loan. But 14.48% enterprises were not willing to take further loan from banks mainly due to the fact that they do not need further loan. On the other hand, enterprises those received loan from banks, 27.94% enterprises are satisfied with the loan covenants and requirements. Although they are not satisfied with their banks, 62.65% enterprises are willing to take further loan which mean that there is a big gap between the demand of loan and the supply.



From figure 3 it is also evident that out of total enterprises who did not receive loan, 68.10% enterprises did not apply in banks for any loan since they do not need formal finance or do not want to involve with banks for financing needs rather borrowing from other informal sources like family, relatives and friends. On the other hand, 31.90% enterprises applied for the loan but they were rejected by banks. Some major reasons for that rejection also depicts in figure 3. The study also identifies that the trading sector got the highest access among the all sectors although the access of manufacturing sector should be more important as it acts as a catalyst of the economic growth of Bangladesh. Above all, it is evident that gradually the small enterprises access to the formal credit is improving due to the awareness of the customers as well as the eagerness of the banks and some regulatory compulsions of the central bank.

According to the survey result, many enterprises did not receive the full amount they applied for. In case of working capital, 63.87% firms obtained the full amount they applied and other 36.13% enterprises did not get the full amount they applied for. This kind of funds shortage may create problem for their business operation. Small enterprises generally receive working capital loan in different forms. Most of the funds they receive in the form of cash credit. Figure 4 shows different modes of working capital financing by banks and received by small enterprises.

From figure 4, it is evident that, the borrowers are availing a number of financing options such as cash credit, overdraft, letter of credit, bills financing, other short term loans, loan against imported merchandise (LIM), loan against trust receipt (LTR), export cash credit (ECC). Out of all the modes, they receive 68% through cash credit followed by bills financing (19%).

Figure 4. Different modes of working capital loan received by small enterprises

Small Enterprises' Sources of Working Capital Financing

While financing working capital, small enterprises generally use different sources. Among them internal financing is the most common source and includes owner investment, as well as funding through retained profits, and / or the sale of assets. On the other hand, more common external sources in Bangladesh are debt finance in the form of loans and overdrafts from bank and other financial institutions, micro credits, leasing and hire purchase, factoring and trade credit etc. More often, small firms need to use a combination of financing sources, depending on the sector, and the stage in their growth and development. Table 5 highlights the sources of finance for small business start-up and working capital needs. According to the table, at the start-up phase most of the enterprises (92%) finance their business with their own savings as formal lenders do not find much interest and are reluctant to finance the small business during the early stage of business cycle.

Table 5. Small enterprises' sources of working capital financing

Sources of Finance	% of Respondents	
	Working Capital	Business Start-Up
Bank credit	67	13
Gov. credit	05	01
Retained earning	47	12
Supplier credit	53	22
Owner's saving	38	92
Family borrowing Factoring	26 4	52 0
Other borrowing	17	9

Source: Authors' calculation based on survey questionnaire.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

For business start-up, Small businesses use their family as one of the vital sources of finance and 52% of the respondents mentioned it as the second source. Supplier credit is the third and bank credit goes fourth one for financing their business start-up. In case of working capital financing, commercial banks are the important source for the small businesses. As shown in Table 5, 67% of the respondents are using banks as the prime source for their working capital needs. Now-a-days commercial banks are offering different types of products for serving their SE clients in respect to the working capital financing. Supplier credit is the second highest source for them as the working capital financing which is supported by the answer of 53% response. Supplier credit helps small business for effective management of their cash flow due to the delay payment facilities. This facility reduces the dependency on banks for short term credit.

Owner's savings for working capital financing is the most reliable and suitable for small businesses. About 38% of the respondents mentioned that they use their own savings for this purpose. They also use family borrowing for fulfilling these working capital needs. Sometime these sources help them to meet the gap they are demanding from formal sources and funds supplied by the institutions. Retained earnings are also the great source for their working capital financing tools. 47% of the respondents mentioned it as the source of working capital financing. Moreover, the respondents use some other sources for the same purpose like, factoring, other borrowing, government credit, etc.

Small Enterprises' Utilization of Working Capital Loan

Working capital are required to meet the needs of day-to-day expenses such as raw-materials, stores, power and fuel, salaries, wages, administrative expenses, interest, sales and distribution expenses and other expenses to produce the saleable goods, up-to the realization of the sale proceeds. Small businesses generally use most of their funds for fulfilling the working capital needs. In order to identify the utilization of working capital loan as well as fund diversion, a tentative list in the questionnaire is provided. Respondents are asked to provide their response in a format measured through Likert type scale where 1 means 'not use' and 5 means 'mostly use'. Table 6 summarizes the responses of the small entrepreneurs.

Table 6. Small enterprises' utilization of working capital loan

Parameters	Mean Value	Parameters	Mean Value
Raw material/Stock purchase	4.37	Investment in cooperative	2.11
Land Purchase	2.83	Improvement of personal land/building	2.48
Invest in another business	2.72	Purchase of valuables	1.86
Payment to other lenders	2.91	Personal use	2.53
Transportation	1.78	Medical treatment	1.36
Purchase/Modernization of machinery	2.92	Purchase of personal car/motor cycle	1.64
Payment of wages	3.17	Education / Marriage of children	1.24
Factory building	2.74	Sending children abroad	1.41
Investment in share market	1.68	Others (if any)	2.67

Source: Authors calculation from Survey Questionnaire.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

It is evident from Table 6 that the mean value for using working capital to purchase raw materials is the highest (4.37) indicating that most of the loan they use for this purpose. The second highest mean value is 3.17 for the payment of wages. These two items are the clear evidence of proper utilization of working capital loan. Besides, it is also evident that many respondents utilized their fund in purchasing/ modernization of machinery (2.92), and invested in factory building (2.74), meaning they are utilizing it in their business, but it should not be financed from the working capital loan rather it should be utilized from term loan. On the other hand, a number of respondents diverted a portion of their working capital loan by purchasing land (2.83), investing in another business (2.72), paying to other lenders (2.91) etc. Table 6 also evident that there are many other areas where the working capital loans are being partially diverted.

Major Problems Faced by Small Enterprises in Obtaining Working Capital Loan

In order to justify the severity of the problems small enterprises are facing while obtaining loan from banks, nine tentative problems are given in the questionnaire. Enterprises are asked to fill the questionnaire according to the Likert type scale where '1=No problem at all' and '5=Most severe problem'. Table 7 highlights the problems enterprises ranked base on the severity of the problems.

Collateral is typically an obligatory condition for granting a loan. Most of the financial institutions are reluctant to sanction credit to those firms who might fail to offer collateral. However, small businesses often have difficulty in providing sufficient and good-quality collateral to banks. Therefore, it is a major obstacle for obtaining loan from the formal financial sector. Survey result shows that the mean value for excessive security and guarantee requirement is highest (3.81) which is the most severe problem for obtaining loan from banks. The finding of this study is slightly differ with the study conducted by Mamun, Hossain and Mizan (2013) where they find the Security and guarantee is the second highest problems and interest rate is the prime barrier to get access in banks. The dimension is changed mainly due to increasing the ability of enterprises to repay but unable to offer suitable collateral, informal borrowing is costlier to them, high dependency on bank financing and so forth.

Table 7. Severity of the problems for obtaining working capital loan from banks

Sl No.	Obstacle	Importance*
1	Excessive Security and Guarantee Requirement	3.81
2	Complexity of Documentation	3.62
3	High Interest Rate	3.48
4	Long Loan Processing Time	3.15
5	Banker's negligence or lack of interest	3.08
6	Fail to obtain loan on time	2.73
7	Fail to obtain required amount	2.68
8	High sunk cost for Obtaining Loan	1.51
9	Malpractices in Sanctioning Loan	1.46

Source: Authors' calculation based on survey questionnaire.

* Importance is ranked from 1 to 5, with 5 being the most significant.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Documentation is another obstacle for small businesses. Most of the businesses are family oriented and they do not maintain proper documents necessary for their business. On the other hand, banks require a standard set of documents to lend money. From the survey it is observed that complexity of documentation is the second highest problems with mean value 3.63 to get access in banks for working capital loan. Respondents also claim that they face a lot of problems while obtaining documents from different issuing authorities and even it takes much longer time.

Due to the fund shortage from their own, many small businesses are heavily relied on commercial banks for financing working capital. However, they consider interest rate as one of the prime barriers. The mean value of 3.48 indicates that the current interest rate for working capital loan is so high. Beside high interest rate, many banks impose different service charges and processing fees which ultimately increase their effective rate of interest.

Loan should be disbursed when needed. Some time it is found that, due to the time lag of loan requirement and disbursement many businesses cannot continue their operation in line with the market demand. In many cases especially for the businesses that are seasonal in nature face this problem seriously. As per the survey opinion, this is the number forth problem (mean value 3.15) for getting working capital loan. However, a few of the commercial banks in Bangladesh have reduced the loan processing time to one week or less than that. But still most of the banks need more than 15 days to process a loan even it requires a month to several months in some cases.

Generally, banks are very much reluctant to finance small enterprises with the perception that they are highly risky and not profitable to them. Most of the entrepreneurs opined that many officials of banks do not cooperate with them properly or timely, when they need financial services. Survey result shows that, the average rank score is 3.08 which reflect that the variable is marginally significant. As a result, due to the negligence of some bank official the small enterprises could not obtain working capital loan timely and when required.

Due to the long loan processing time, sometime small enterprises do not get the loan in time and cannot meet the requirement of customers. According to the survey, the mean value of respondents is 2.73 for 'fail to obtain loan on time'. Timely availability of working capital loan is one of the critical factors for sustainable business growth. If it is unavailable during the required time, they may be affected by seasonality. After this problem, enterprises rank the problem 'fail to obtain required amount' with a mean value of 2.68. Both over financing and under financing are the problems for small enterprises. When the enterprises do not receive loan amount they applied for, they cannot implement their business plan accordingly.

In order to enter into the formal credit sector small enterprises have to incur more sunk cost than their counterpart. Because, financial institutions do not easily provide their services to the small firms to fulfill their financial needs. Therefore, small businesses try to get the loan from different financial institutions one after another which increases their sunk cost in various forms. From the survey it is evident that the average rank score of this problem is 1.51 indicating the variable as marginally significant. Sometimes malpractices in sanctioning loan also hinder small enterprises to have access in the formal credit. Enterprises rank this problem with the score of 1.46. Although this is not a severe problem, it should be the concern of the policy makers. A few of the entrepreneurs claimed that some officials of banks demand extra money other than the stipulated fees or charges in order to get the required loan amount which they called bribe. Also, sometimes ineligible borrowers avail working capital loan from some corrupt bank officials.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Survey Results of Banks

Commercial banks are playing significant role in financing small enterprises although in some extent they are reluctant to accept the loan request from SEs. The increased involvement of banks in financing small enterprises, to the large extent, mainly due to the central bank's policy initiatives, directives and creation of business opportunities. Previous section highlights several problems of the small enterprises for their access to finance from banks. To identify the problems and challenges faced by banks, the study also conducted another survey cantering the banks that are supplying funds to small enterprises. The subsequent sections discuss the survey results.

Problems Faced by Banks in Sanctioning Working Capital Loan

Banks also face different problems while financing working capital to small enterprises. As a part of that the bankers were asked "what extent do you think following are the problems for financing working capital to small enterprises?" and a tentative list were given related to the problems they face during assessment and disbursement of working capital loan. Table 8 represents the problems banks ranked base on the severity of the problems.

Structured financial information is an important requirement for the banks to assess credit worthiness of borrowers. Unfortunately, most of the small businesses do not record financial information properly and fail to fulfill bank's loan requirements. From Table-8 it is evident that bankers ranked lack of proper and structured financial information with a mean value of 4.21 signifying the number one problem. Therefore, most of the respondents indicate that during working capital financing it is a challenge to get the real financial data about the enterprises and even if it is available in many cases there are some faulty representations and are not sufficient for assessment.

Most of the banks emphasized on proper documentation as one of the severe problems. There is a great dilemma that small enterprises claim banks require many documents and condition to get loan whereas banks claim small enterprises fail to produce the set of appropriate documents without those

Table 8. Severity of the problems for financing working capital loan by banks to small enterprises

Sl No.	Obstacle	Importance*
1	Absence of structured financial information	4.21
2	Lack of proper documents	3.78
3	Non-disclosure of information	3.53
4	Lack of collateral and guarantee requirement	3.26
5	Absence of good business plan	3.12
6	Lack of business experience	2.86
7	Lack of previous banking relationship	2.72
8	Low banking literacy	2.31
9	High interest rate	2.29
10	Fund diversion tendency	1.66

* Importance is ranked from 1 to 5, with 5 being the most significant.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

they cannot go for financing. Bankers ranked this item as the second highest problems where the mean value is 3.78 indicating that lack of proper documentation creates barriers in providing working capital loan to a small enterprise even if the enterprise is financially capable to pay the loans in due time.

Material information from the borrowers is important for the banks to assess their financial credibility. However, respondents rank this problem as the third major problem with a mean value of 3.53 that indicate borrowers do not like to disclose all the material information to the banks and sometimes request banks for working capital loans with fraudulent motives. Bankers also claim that, some of the good entrepreneurs sometime show reluctance to disclose financial information related to their businesses.

Collateral and guarantee become the next major problem (mean value is 3.26) identified by bankers. For smooth recovery of loan, banks require some collateral and guarantee form small businesses. According to the bankers' opinions, most of the small businesses operate in a rental house which is risky for them. However, collaterals offered by the small enterprises are either inadequate or inappropriate for a particular type of financing. Banks usually provide working capital financing against inventories as collateral. But it becomes very difficult for banks to value inventories offered by the client as collateral. On the other hand, in case of collateral free loan the borrowers face hurdle to get third party guarantee.

From a good business plan bankers get the idea about current and future movements of a business. Therefore, it is very important document the borrowers need to submit to get the loan from the commercial banks. Survey result shows that the mean value of this problem is 3.12 indicating the absence of business plan or borrowers cannot prepare proper plan of their business.

Banks usually consider small business having previous experiences for providing working capital loan. Previous track record helps them to justify future direction of the business. The mean score of the respondents for this problem is 2.86 that signify the medium level problem. Therefore, it is evident that prior business experience is necessary for small businesses to have working capital loan from banks. On the other hand, Banks can easily identify the behavior of small businesses if they have any previous banking relationship either depository or borrowing. Therefore, they consider this item as the moderate level problem where mean score is 2.72. Most of the small enterprises settle their transactions by cash. So, there is little or no evidence of banking transactions.

Beside the major problems banks face while lending working capital to small enterprises, respondents also consider low level of banking literacy (mean 2.31) among the entrepreneurs, the interest rate offered by banks (mean 2.29) and tendency of fund diversion by borrowers (mean 1.66).

Challenges Faced by Banks in Financing Working Capital

Recently banks are coming forward to finance SEs with a good number of products and services. However, these are not sufficient compared to the larger demand. In many cases bankers are facing a substantial amount of challenges for financing working capital. The common challenges banks face are shown in Figure 5.

According to Figure 5, most of the respondents (87%) encounter information asymmetry as the prime challenge for them. Bankers usually assess the borrower based on the information they disclose in loan proposal and from a short site visit. Besides, banks take some interview or even communicate personally with the proposed clients. However, respondents claim that in many cases small enterprises do not like to disclose some material information that leads them to take incorrect assessment. The second challenges they face is the competition among themselves. Majority of the respondents (74%) state that a very significant challenge they are facing now is the competition among banks. As the number of banks

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 5. Challenges cited by banks in financing working capital

increases to 56, there is a great presence of unhealthy competition among banks. The third challenges they are facing is the un-supportive business environment. The total of 62% respondents opined that the current business environment, the political as well as the economic, is not supportive. Therefore, small enterprises do not like to invest money both in existing and new business.

Fund diversion tendency is another important challenge that banks are facing to lend working capital in small borrowers. Bankers response that, although there may have some lacking in ensuring proper monitoring, but the general tendency of the borrowers to divert funds has gradually increased. The 68% respondents claim in favor of fund diversion tendency. For small businesses, it is easy to enter or exit from the industry. As the small enterprises have easy entry and exit barriers, they can change the businesses frequently which create serious difficulty in ascertaining the use of fund by banks. This leads difficulty in collecting bad loans. Respondents (54%) claim that when the business condition is not good or favorable, some business owners stop operation and hide them to repay the loan amount. The next challenge bankers are facing is the absence of personal guarantee. A total of 52% respondents encounter that due to the increase of nonperforming loan (NPL), no people would like to offer third party guarantee which make them reluctant to lend money.

Over financing is another important challenge for banks. Due to the unhealthy competition among banks, many small enterprises can get the access of more funds rather than the requirements. Respondents (48%) also state that the rejection of proposal by one bank may be accepted by another bank for financing. During the survey the bankers (37%) point out another important challenge which is absence of proper risk measurement tools which lead to select some disqualified borrower. The other challenges respondents identify are delay of Credit Investigation Bureau (CIB) information and few clients' dependency of many banks.

SOME PROPOSED SOLUTIONS FOR POLICY INITIATIVES

The study survey on both small enterprises and commercial banks in Bangladesh to identify the problems they are facing while obtaining and financing working capital. Based on the findings from the survey results, some proposed solutions those are shown in below have developed for the banks and policy makers.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

1. Survey result evident that collateral and guarantee is the major problem both for bankers and borrowers. For small business it is difficult to manage the required amount of collateral and guarantee, but without sufficient collaterals banks are reluctant to finance working capital. To solve the problem, banks may introduce group guarantee or guarantee based on cluster for working capital financing. Credit guarantee scheme may be introduced although it has some limitations. Besides, financial institutions may take care for the collateral free loan where personal guarantee is strong and the project has good future prospects. Moreover, different collateral substitute such as, group based lending, frequent visit as part of strong monitoring, introduction of cash flow based lending, strong banker-customer relationship, development of credit products that automatically generates savings may be taken into consideration to provide working capital financing.
2. Regarding the required documentation both banks and small enterprises face serious problem. Bankers demand a set of required documentation without which they are reluctant to provide working capital, on the other hand, small firm in most of the cases fail to manage all the documents demand by banks. Therefore, it remains a challenge for the banks to complete the documentation during working capital financing. To address this problem, a coordinated effort is required among the Government, Bangladesh Bank and Commercial Banks to enhance market information availability and make the process easy for getting document from government office. Banks may circulate document checklists to make aware about the documents and may also provide consultancy services to the SEs in completing the documentation process. Moreover, the relationship officer should be very friendly in explaining the terms, documentation process and other aspects of the credit.
3. High interest rate as encounter by small enterprises is another significant problem for working capital financing. Although the prevailing interest rate of banks is not so high compared to the informal sources, the effective interest rate is slightly higher for some additional fees or service charges. Still banks may reduce the rate of interest by searching low cost funds. In this context, Bangladesh Bank, Government and other stakeholders can provide low cost fund to banks and enable them to finance small enterprises at a lower interest rate in consideration of economic development. With a large number of clients in the portfolio along with standardized process, banks can reduce its administrative cost and thus the interest rate on loans. Bangladesh Bank may introduce more refinancing facility for working capital financing which will ensure a low cost source of fund for the commercial banks and thus enable them to reduce interest rate. In addition, banks may keep an SE database and should practice credit scoring model that may reduce their monitoring cost which ultimately help to reduce interest rate.
4. Sometime small enterprises do not get working capital loan when needed due to the long loan processing time. Long loan processing time may be reduced by adopting standard loan approving procedures based on information technology and maintaining better information management. For example, to ensure quick process of a loan requires support of accounting software, strong MIS, skilled and dedicated manpower along with good commitment from the top management.
5. The survey provides a few instances of banks' negligence in dealing with the SE clients. Although it is few, but the information is very significant for better access to working capital. In this case, bankers should change their mindset first, should have good customer relationship, and positive and caring attitude towards the small entrepreneurs. Bankers have to nourish the small entrepreneurs to become successful. This relationship should be like partnership. Moreover, banks should diversify their portfolio in SE segment for their own profitability as well as sustainability rather any compulsion from the central bank.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

6. Many small enterprises claim that they do not get the required amount of loan as per their need. To minimize the problems related with insufficient working capital loan, banks should not consider the prior relationship with the borrower only rather they should also put emphasis on the business prospects of the borrowers. Banks should assess the need of borrower properly so that actual amount of working capital can be disbursed. Besides, banks should make them understand about the process of working capital assessment and the minimum time required for the approval of such capital.
7. Survey evident that frequent visits of the clients to the banks for getting working capital loans raise their sunk costs in terms of money, energy and time. In this regard, relationship officer should be very friendly in explaining the terms, documentation process and other aspects of the credit and should provide the prospective borrower a check list so that the borrower might visualize all the requirements of the loan clearly. Moreover, to reduce the knowledge gap of the borrower in fulfilling the loan requirements, banks should undertake extensive skill development program of their employees who will deliver services to the SE clients.
8. A few enterprises claim that sometime credit officer demand extra money from them to get working capital loan. To address the issue of such malpractices (taking bribe, nepotism etc.), banks may adopt better internal control and governance mechanism to identify such activities, and if found, involved officials must get exemplary punishment.
9. Unstructured financial information is a serious barrier for the entrepreneurs to get access to formal finance. Banks may encourage SE clients to provide accurate and authentic financial information for their analysis and assure them that the information will not be disclosed elsewhere for any other purposes. Beside, business owners should be encouraged to use proper accounting records on their business transactions by educating them to know the benefits of accounting and financial information and by setting up simple SEs accounting standards. In this regard, commercial banks can develop and circulate a simple customer friendly financial template in Bangla for the SEs so that they can record their financial transactions in an organized and structured manner.
10. In order to reduce the information asymmetry, a very good relationship between banks and its SEs should be established by which SEs can identify the potential suppliers of financial services and evaluate the cost of the financial services that are being offered by banks as well as the financial service providers can easily receive the feedback of managerial attributes and evaluate the risk and prospects of the SEs.
11. Bankers claim that most of the entrepreneurs have very low level of knowledge about banking norms and practices and cannot prepare a proper business plan as per banks requirement. In this regard, central bank can prepare a simple business plan template in bangle and circulate it among existing and potential SE borrowers. Bankers may educate the customers and provide consultancy services to help them for preparing good business plan.
12. Another important challenge banks face is the fund diversion tendency of small enterprises. As credits provided to SME clients are monitoring based credit, banks may create a dedicated monitoring team to ensure end use of the financing to avoid fund diversion. Bankers can reduce direct cash based credit and introduce transaction based credit so that the clients will not be able to use the fund at his will. Moreover, bankers may create awareness among the SE borrowers to avoid funds diversion.

FUTURE RESEARCH DIRECTIONS

Commercial banks in Bangladesh are coming forward to finance working capital in small enterprises with a good number of initiatives although these are not sufficient compared to larger demand. In this circumstance, if banks and other stakeholders follow the proposed solutions, in future financing in this sector may increase which will be the benefits both for banks and their clients. Current chapter focuses on the working capital financing problems faced by banks and also problems faced by small enterprises while obtaining working capital from banks. The sample selected from the capital city (Dhaka) of Bangladesh only. Therefore, further study can be done on easy financing mechanism, developing different products and services for working capital financing, how to finance through collateral substitute, business process reengineering for working capital finance considering the sample from both rural and urban areas.

CONCLUSION

Small enterprises sector is one of the major economic players in Bangladesh and contributor in the GDP. Hence, it is immense important to ensuring their access to formal credit like banks for greater economic benefits. The study has pointed out a number of demand side problems while obtaining working capital from banks and also identified the supply side problems and challenges for financing working capital. Small enterprises claim that they face severe problems with banks. On the other hand, banks claim most of the problems exhibit with SEs for financing working capital. Both SEs and banks encountered some common problems like documentation, collateral and guarantee, information asymmetry with a number of many other problems. To address these problems, this chapter recommended some solutions. It is highly expected that if banks and other stakeholders adopt the recommended solutions, these may reduce the current problems they are facing and will ensure a better access to banks for small enterprises to have working capital loan.

KEY TERMS AND DEFINITIONS

Commercial Bank: Commercial bank is a licensed financial institution that act as an intermediary to provide variety of financial services.

Small Enterprises: A *manufacturing concern* with total assets at cost including installation of fixed asset and excluding land and building from Tk. 5 million to 100 million and/or number of employee ranges from 25 to 99. A *service concern* with total assets at cost including installation of fixed asset and excluding land and building from Tk. 0.5 million to Tk 10 million and/or number of employees ranges from 10 to 49. A *trading concern* with total assets at cost including installation of fixed asset and excluding land and building from Tk. 0.5 million to Tk 10 million and/or number of employees ranges from 6 to 10.

Working Capital: The actual amount of capital required for a business for its day-to-day operations and is measured as the current assets minus current liabilities.

Chapter 55
Risk Management Usage and Impact on Information Systems Project Success

April H. Reed
East Carolina University, USA

Mark Angolia
East Carolina University, USA

ABSTRACT

This article explores the usage of risk management practices on virtual Information Systems projects to address the growing industry practice of geographically separated teams. A survey of 557 virtual-project managers assessed usage of risk management practices and association with successful outcomes. The Theory of Reasoned Action is used to model attitudes and behavior. Correlation analysis indicated a strong relationship between risk management and successful outcomes, irrespective of success measured by budget, functionality, or schedule. Findings indicated that while the highest levels of risk management usage were characteristic of project success for virtual projects, many well-trained project managers are short-cutting use of all three core practices. While risk assessment and risk control are typically performed, only 52% of participants completed the final step of developing a risk management plan. This may not only lead to sub-optimal project outcomes, but also renders the first two actions an inefficient use of resources.

INTRODUCTION

The emergence of virtual projects with the use of distributed resources has changed the way some project management practices operate. Although traditional face-to-face and virtual projects are alike in some ways, their differences can make managing virtual project teams more complicated and complex. Virtual projects, also referred to as distributed projects, consist of non-co-located project team members who typically reside in different geographical locations, may operate in different time zones, and rely on

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

information communication technologies (Reed & Knight, 2011). These types of projects are common due to the global nature of many organizations. The key aspects that define virtual project teams also include their sources of complexity, which include problems with communication, culture, and trust (Berry, 2011; Brandt, England, & Ward, 2011; Nydegger & Nydegger, 2010). These complexities can cause virtual projects to be higher in risk and thus more likely to require risk management practices.

Prior research into project risk and risk management established its role in the success of projects (Addison & Vallabh, 2002; Boehm, 1991). The importance of effective risk management practices was more recently stressed in a report by PMI on the outlook for project management in 2012 (PMI, 2011). Unfortunately, research also identified risk management practices as the least mature of the project management knowledge areas identified by the Project Management Institute (PMI) (PMI, 2013; Yazici, 2009). This deficiency continued to be emphasized in the PMI 2015 Pulse of the Profession report (PMI, 2015), where risk management was listed as a foundational practice that needed greater attention. The 2015 report stated more rigorous risk management was needed since "This year, 83% of high performers report frequent use of risk management practices compared to only 49% of low performers" (PMI, 2015, p. 4).

Research into Information Systems (IS) projects has long recognized the importance of project management techniques (Ibbs & Kwak, 2000; Kerzner, 2001). Huang and Han (2008) indicated that problems with software development were prevalent, citing "cost overruns, project delays, unmet user needs, and unused systems," and labeling these problems as chronic (p. 41). The Standish Group's Chaos Report, published annually since 1994, is a leading indicator of the software development industry (Hastie & Wojewoda, 2015). The Standish Group determined that failed and challenged software projects represented approximately two-thirds of all project outcomes, while only about a third of those projects were successful (Standish Group International, 2009). The Chaos Report classifies project outcomes into one of three categories: successful, challenged, or failed. These classifications are defined as:

- **Success:** Meets scope criteria within a range acceptable to the organization.
- **Challenged:** Project delivered but fell outside of an acceptable range for time, budget, or quality.
- **Failed:** Project could not deliver a completed solution.

The 2015 Chaos report shows failed and challenged projects at 71 percent, which demonstrates no improvement over 20 years of data tracking (Hastie & Wojewoda, 2015). Also of note is that the definition of success has evolved, from strict adherence for meeting time, budget, and scope, to accepting a "range" of acceptable outcomes as long as the organization and customer are satisfied. While the Chaos report establishes project management expertise, which includes risk management, as one of the top 10 success factors for projects, it does not differentiate between face-to-face versus virtual projects. Thus, the goal of this study was to explore the usage and impact of risk management practices on virtual IS projects with the underlying research question to determine if a relationship existed between risk management usage and virtual project success.

This research contributes to the existing body of knowledge on risk management value and usage by extending the information on virtual IS projects. This also contributes to practitioner knowledge of risk management by identifying specific practices where improvement is likely to have an actual impact on virtual project success. The paper utilizes the Theory of Reasoned Action (TRA) with data collected

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

from an extensive survey of IS project management practitioners. The paper continues with a review of literature defining risk management, establishing the definition of project success factors, and then examines the impact of risk management on project success. This is followed by a discussion on TRA and the research methodology. Results are presented along with discussion, and are followed by a conclusion which addresses the paper's limitations and avenues for future research.

REVIEW OF LITERATURE

In order to assess risk management on virtual information system projects, a review of literature was conducted on risk management practices, the impact of risk management, and definition of project success.

Risk Management

Risk is defined by de Bakker, Boonstra and Wortmann (2010) as "all situations or events that cause disruptions in the plan, and jeopardize the timely delivery of the project results agreed upon within the budgetary limits" (p. 496). That being said, DeMarco and Lister (2003) point out projects without risk often have few if any benefits. In other words, although risks can have a negative impact they generally accompany any project that is worth doing. Project risk as defined by Schwalbe (2011) states that risk is "an uncertainty that can have a negative or positive effect on meeting project objectives" (p. 425). The occurrence of unmanaged risk on projects is typically unwanted because risk can easily cause havoc in many areas and can eventually lead to unsuccessful and/or failed projects. Therefore, risk management is a project management practice generally employed on projects to handle negative possibilities by lessening the impact or eliminating them.

Risk management consists of tools, techniques, and practices such as risk identification and risk assessment, often used by project managers to reduce or eliminate the possibility of project failure (Addison & Vallabh, 2002). The Project Management Body of Knowledge (PMBOK) suggests that reactive risk management can lead to project failure, while proactive risk management reduces the impact of a realized risk (PMI, 2013). One specific tool defined in the PMBOK is the risk management plan which includes items such as methodology, roles and responsibilities, and a probability and impact matrix (PMI, 2013). Failing to create a risk management plan falls into the reactive category and is likely to affect the way risk is handled and the subsequent impact of those risks. More importantly, the risk management plan should be created early on, during the planning phase of a project, and should outline the type of risk management to be used on the project. The plan can range from an elaborate document to a simple bullet-point list.

More recently, research by Williams (2017) indicates current risk identification methods might be insufficient for targeting key project risks. More holistic approaches may be necessary due to potential inadequacies in current methods. In particular, complex projects need to identify risks both individually and as systems, since some risks can interact with each other (Williams, 2017). Further, there are always questions about how much and to what degree risk management tools are used due to the attitudes and beliefs of the project manager and project stakeholders.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Risk Management Impact

The process of identifying key risks and subsequently creating strategies to deal with them was proposed as early as 1978 by Alter and Ginzberg (de Bakker, et al., 2010). They note that the risk management process was believed to improve the chances that an IS implementation would be successful. Following the early introduction of risk management to IS projects, literature explored the causes and impact of risk on IS projects (Barki, et al., 1993; Boehm, 1991; Keil, et al., 1998; Reed & Knight, 2011; Wallace, et al., 2004). Research also includes studies that investigated the value and usage of project management practices and their relationship to either project success or project performance (Raz & Michael, 2001; Raz, et al., 2002; Besner & Hobbs, 2006; de Bakker, et al., 2010; Papke-Shields, et al., 2010).

Ropponen and Lyytinen (1997) conducted a study of risk management impact on system development performance. They investigated which risk management practices, as well as environmental and process factors, were related to improved performance in managing software risks. Results were related to risk management and project outcomes. "Overall, the respondents believed that risk management methods had a positive impact both on the development process and its outcomes" (Ropponen & Lyytinen, 1997, p. 3). Their study employed the top-ten list of risk factors created by Boehm (1991):

- Personnel shortfalls
- Unrealistic schedules and budgets
- Developing the wrong functions
- Developing the wrong user interface
- Gold plating
- Continuing stream of requirements changes
- Shortfalls in externally furnished components
- Shortfalls in externally performed tasks
- Real-time performance shortfalls
- Straining computer-science capabilities

Raz and Michael (2001) extended the research on tools by ranking Project Risk Management tools and their relationship to project success. They found risk mangement practices fell into all categories, however, risk identification was very commonly used. Raz et al. (2002) then focused on risk management tools and techniques and their usage across different types of projects. Their findings suggested risk management practices were not widely used and they concluded "risk management is still at its infancy" (Raz et al., 2002, p. 108). However, when used, a positive relationship existed between practice and project success (Raz et al., 2002). Besner and Hobbs (2006) found project management tools fell into categories ranging from "super tools" to "underutilized tools" and usage levels ranging from "extensive use" to "less than very limited use." A notable finding indicated several risk management tools fell into the "underutilized tools" category, meaning they have a lot of potential to improve performance, but are not often used (Besner & Hobbs, 2006).

Other risk management work not specifically related to the tools included research by Wallace and Keil (2004) on project execution risk, which includes risk planning and control. They concluded that project execution risk was likely more important than any other type of risk in influencing project outcome. Also,

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

results of a study by de Bakker, et al. (2010), indicated risk factor knowledge and control strategies are assumed to help reduce risk in current or future projects. Papke-Shields et al. (2010) conducted a research study which developed a set of metrics and used them to assess usage of project management practices. Their findings reinforced the existence of a link between usage of project management practices and increased project success (Papke-Shields et al., 2010). While quantitative risk analysis and contingency planning had the most significant results, risk management practices fell into the less-frequently-used category (Papke-Shields et al., 2010).

With respect to attitudes and beliefs of project managers, a recent study by Fabricius and Buttgen (2015) investigated the effect of project manager overconfidence on risk management practices in relationship to project success. Specifically, they studied both risk occurrence probability and potential risk impact on project objectives. Their study concluded project managers neglected to consider risk impact on project objectives such as cost, time and quality. Instead, they tended to only consider risk occurrence probabilities. This likely leaves a gap in exposure, particularly for high impact risks, if these risks actually occur (Fabricius & Buttgen, 2015).

A study which analyzed competency of the skills, attitudes and knowledge of the project manager on a software development project identified some positives and negatives related to risk (Ruano-Mayoral, Colomo-Palacios, Garcia-Crespo, & Gomez-Berbis, 2010). This study conducted a content analysis and found the project managers competency in leading of risk evaluation and risk tracking to be an important knowledge area. However, when mapping important competencies to the PMBOK, the research found risk management as well as communications and cost management to be areas of low focus (Ruano-Mayoral, et al., 2010). This result for risk management is consistent with other research previously mentioned in this section.

Project Success

Incumbent upon any study on risk management is defining project success. The PMBOK defines project success by the traditional triple-constraint measures: 1) time/schedule, 2) cost/budget, and 3) functionality/quality goals (PMI, 2013). These success measurements are found throughout project management literature (de Bakker, et al., 2010; de Wit, 1988; Jiang, Klein, & Means, 2000; Jugdev & Muller, 2005; PMI, 2013; Reed & Knight, 2012, Thomas & Fernandez, 2008; Wallace & Keil, 2004). However, there are competing views of project success criteria. Some researchers indicate success means different things to different people, and is therefore context-dependent (Jugdev & Muller, 2005; Thomas & Fernandez, 2008). Additional measurements of success are sometimes related to stakeholder satisfaction and to product/service value (Jugdev & Muller, 2005; PMI, 2013). As previously mentioned, the Standish Group "enhanced" their definition of success in 2015 (Hastie & Wojewoda, 2015). Time and budget remained objective measures, but "quality" aspects of the deliverables adopted a more flexible definition to accept a range of acceptable outcomes based on customer opinion. Although the definition of success may be under duress and evolving for IS projects, this research utilizes the more traditional definition since De Bakker, et al. (2010) found about two-thirds of publications they studied used traditional definitions of time, budget, and requirements (quality) as criteria.

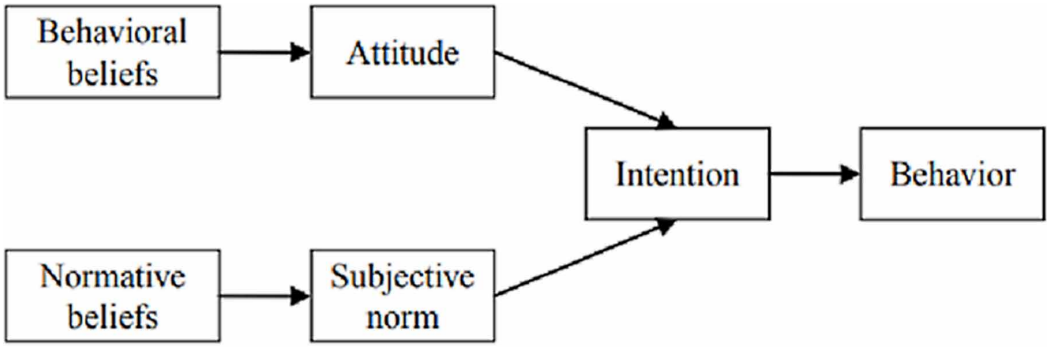
THEORETICAL FRAMEWORK



The Theory of Reasoned Action (TRA), developed by Ajzen and Fishbein (1980), is a prevalent theory used to explain various behaviors, and is based on an individual's attitudes and the behaviorial norms of their environment. For this study, the psychological theory is extended to an individual's attitude regarding the use of risk management, and belief in the value that risk management has in contributing to project success (Ajzen & Fishbein, 1980).

Early work by Fishbein developed theories on attitude that formed the Expectancy Value Model (EVM) (Ajzen, 2012). This model established that people's attitudes are determined by their subjective belief of the probability that an object has a certain attribute. According to EVM, a person's overall attitude toward an object is determined by subjective values, or evaluations of the attributes, associated with the object and by the strength of these associations. Such attitudes are acquired automatically and inevitably as people form beliefs concerning the object's attributes, and as the subjective values as attributes become linked (Ajzen & Fishbein, 1980).

TRA assumes that human beings are rational and they make systematic use of information available to form beliefs (Ajzen & Fishbein, 1980). TRA suggests that an individual's intention may be predicted by the individual's attitude and the subjective norms regarding a behavior (Zhang & Fai Ng, 2012). As shown in Figure 1, TRA stipulates that the intention to perform a particular behavior is a joint function of a person's attitude and a perceived subjective norm. An individual may have a large number of beliefs about a given behavior, but can only attend to a relatively small number of beliefs at a specific moment (Ajzen & Fishbein, 1980). Attitude is determined by beliefs concerning the likely consequences of engaging in a behavior. Subjective norm is determined by "normative beliefs," which is about the likelihood that important referents encourage or discourage the behavior (Ajzen & Fishbein, 1980).

For this research, risk management is considered the object, about which attitudes and beliefs are developed by project managers through experience, and referents are considered organization managers and customers. The normative construct in the TRA referred to perceptions of what important referent individuals or groups think a person should do. Fishbein and Ajzen (1980), expanded the normative component to include descriptive norms as well. This was done in recognition of the fact that we can form beliefs as to what is expected of us not only by inferring what is important to others (injunctive norms) but also on the basis of the observed or inferred actions of those important referents (descriptive norms) (Ajzen, 2012). Therefore, if project managers perceive value in the use of risk management practices or are aware of successful use by their counterparts they will likely also use them.

METHODOLOGY

This research focused on the use of risk management in virtual projects to address a lack of literature due to the complexity and nature of distributed project team. Nydegger and Nydegger (2010) noted the complexity of virtual teams, in that "working at different times, and perhaps working from different countries and time zones, and even with different native languages, one can see how quickly the levels of complexity dramatically increase" (Nydegger & Nydegger, 2010, p. 69). Additionally, Brandt, et al. (2016) pointed out that "what works well for co-located teams is generally not effective for virtual teams" (p. 62). Information Systems projects were chosen for this study due to their inherent complexities, which include diverse and changing customer desires, and continually evolving technology. A survey instrument was used to collect data, which was crafted to determine if the following associations between project risk management and virtual IS projects could be established:

- **H1:** A statistically significant relationship exists on virtual IS projects between risk management usage and project cost attributes.
- **H2:** A statistically significant relationship exists on virtual IS projects between risk management usage and project schedule attributes.
- **H3:** A statistically significant relationship exists on virtual IS projects between risk management usage and meeting functionality requirements.

The importance of these associations lies in the connection between risk and project success established within the PMBOK. The use of risk management practices includes identification of specific risks, probability of their occurrence, and impact on project outcomes. The PMBOK indicates risk impact assessment is necessary to determine the potential effect on project success, which is comprised of three core project objectives: schedule, cost, and quality or performance (PMI, 2013). Fabricius and Buttgen (2015) studied project managers' risk management practices, both probability of occurrence and impact. Although risk management practices were used, they found project manager overconfidence negatively affected risk impact estimating. "Estimates of risk impact – unlike risk occurrence probability – appear insufficiently considered when project managers form expectations about project success" (Fabricius & Buttgen, 2015, p. 258).

First, the survey collected data to determine if three core risk management practices defined by Boehm (1991) were executed: 1) risk identification, 2) risk assessment, and 3) risk monitoring and control. Likert Scale questions rated how risk management practices were utilized, and results compared to project success attributes. Correlation analysis was employed to determine existence of any relationship between levels of risk management usage and project outcome. Participants were asked to answer all survey questions based on experience from their most recent virtual software project in which they had played a management role. Use of an actual project was requested to reduce answers based solely on opinion, and projects needed a completion date no older than the prior 4 years to reduce retrospective bias.

In order to utilize a valid survey instrument, a foundational survey used by peer-reviewed studies was adopted and enhanced to improve both content and context validity for this research (Reed & Knight, 2010). The original version of the survey was based on prior research and several peer-reviewed publications, thus providing validity to the original survey instrument (Wallace & Keil, 2004; Wallace, Keil, & Rai, 2004). The added questions investigated for this research were determined by gaps found in the review of literature, face-to-face interviews with project management practitioners, and a focus group of

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

IS/IT practitioners. The updated survey with the additional questions was piloted with a small group of project management practitioners, and minor adjustments made. Reliability analysis was performed to measure the internal consistency of the survey, yielding a Cronbach's Alpha value of 0.88, considered very well (DeVillis, 2003).

The survey participant pool consisted of members of a regional PMI Information Systems Community of Practice, a LinkedIn project management group, the survey page from the PMI website, and a mailing list purchased from PMI containing a list of general members. A survey link was emailed to the participant pool; the survey took approximately 20 minutes to complete. The instrument began with pre-survey questions to screen the participants to ensure that they played a managerial role within the previous four years for a virtual IS project. The survey then collected information about the project itself, including budget, duration, and actual or estimated end date. Next, project performance measures were collected for time, cost, and functionality. The final section was devoted to measuring usage of risk management practices. The core risk management questions asked respondents to rate the degree of impact on project outcome from each of fifty-five risk factors, which included the following key attributes derived from the literature review (Reed & Knight, 2010):

- Company politics and/or lack of integrity
- Hidden agendas impact the project
- Cost overruns
- Poor decision-making process
- Project scope too limited or vague
- Conflict among team members
- Cultural or language differences
- Developed application or product doesn't satisfy requirements
- Project manager replaced during project

RESULTS AND DISCUSSION

A total of 557 participants across various industries completed the survey; summary results are found in Table 1, Research Study Demographics. 82% of information system work was represented by projects for development, upgrade, or package installation. Company size varied widely, with about 25% of companies having less than 1,000 employees, but no individual company size was dominant. To underscore the applicability of project risk management expertise, approximately 92% of respondents were certified PMI Project Management Professionals (PMPs).

Risk management utilization is discussed first. The survey collected data to determine if the three core risk management practices as defined by Boehm (1991) were executed: 1) risk identification, 2) risk assessment, and 3) risk monitoring and control. Next, Likert Scale data rating "how" risk management practices were utilized was compared to project success attributes with correlation analysis to determine the relationship between levels of risk management use and project outcomes.

Risk Management Usage Results

As part of the first question about risk management, survey participants were given a brief definition of risk management and risk assessment (which includes identification of risks). Then they were asked if risk assessment was performed on their project. The majority of participants (76.6%) answered "Yes," while only 23.4% of the participants answered "No." This large positive response was not surprising since the risk management knowledge area outlined in the PMBOK includes risk assessment and a majority of the survey participants were certified PMI Project Management Professionals (PMPs). This finding is consistent with research by Raz, et al. (2001) who believed risk identification was common for organizations even if they had no related processes in place.

The second risk management question asked if risk control processes were used on the project. An explanation of risk control preceded this question, and indicated a "plan of action" must be a deliverable of the risk control phase. A majority of the participants (72.5%) answered "Yes," and only 27.5% answered "No." Again, these results are consistent with the results from the first question and were not surprising. Risk control is generally conducted as part of the monitoring and controlling of risk.

Participants were then asked if a "documented risk management plan" was created for their project. The risk management plan defined in the PMBOK includes items such as methodology, roles and responsibilities, and a probability and impact matrix (PMI, 2013). More importantly, the risk management plan is created in the project planning phase and outlines the type of risk management needed on the project. The plan can range from an elaborate document to a simple bullet-point list. Completing all risk management components is expected in order to reduce the impact of risk on a project effectively. Slightly more than half (55.9%) of the respondents answered "Yes," while 44.1% of the respondents answered "No."

Overall, the results of all three questions combined showed that 18% of participants did not use any of the three major risk management processes, 12% of participants only used one of the three processes, 18% used two of the three processes, and 52% used all three of the processes. These numbers are relatively weak considering that only those claiming a management role were allowed to participate in the study, and certified PMPs made up 92% of the participants.

The results from the first two questions are consistent with results from the 2012 PMI Pulse of the Profession survey, a global annual survey of practitioners and project management leaders with more than 1,000 participants. In that PMI survey, 72% of the participants indicated they always conduct risk management (PMI, 2012). The third risk management question, regarding a documented risk management plan, revealed surprising results given the high percentage of affirmative answers to the first two questions. Given the extremely high percentage on the first two steps, the lack of follow-through for the third step to create a plan was somewhat disappointing.

Analysis of Correlation Results

This section first presents results and discussion for each of the three hypotheses, and then discusses results for completed and in-progress projects. Usage on "how much risk management practices were employed" was determined from seven-point Likert scale questions, where "1" represented "not used at all" and "7" represented "fully incorporated into the project." Each success attribute was divided into six status levels. For example, final budget status consisted of six levels: 1=under budget; 2=on budget; 3=over budget; 4=in-progress, expected to complete under budget; 5= in-progress, expected to complete on budget; 6= in-progress, expected to complete over budget.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

The chi-square test matrix for each success attribute was very large (six by seven) and had too many cells with zero or low counts. To resolve this issue, the seven Likert scale groups were merged. The resulting ratings were as follows: 1 remained unchanged and represented "Risk Processes Not Used," ratings of 2 and 3 were combined to represent "Low Usage;" ratings of 4 and 5 were combined to represent "Moderate Usage," and ratings of 6 and 7 were combined to represent "High Usage." A Fisher's exact test was used for each of the three-project success measure matrices to evaluate the three hypotheses separately.

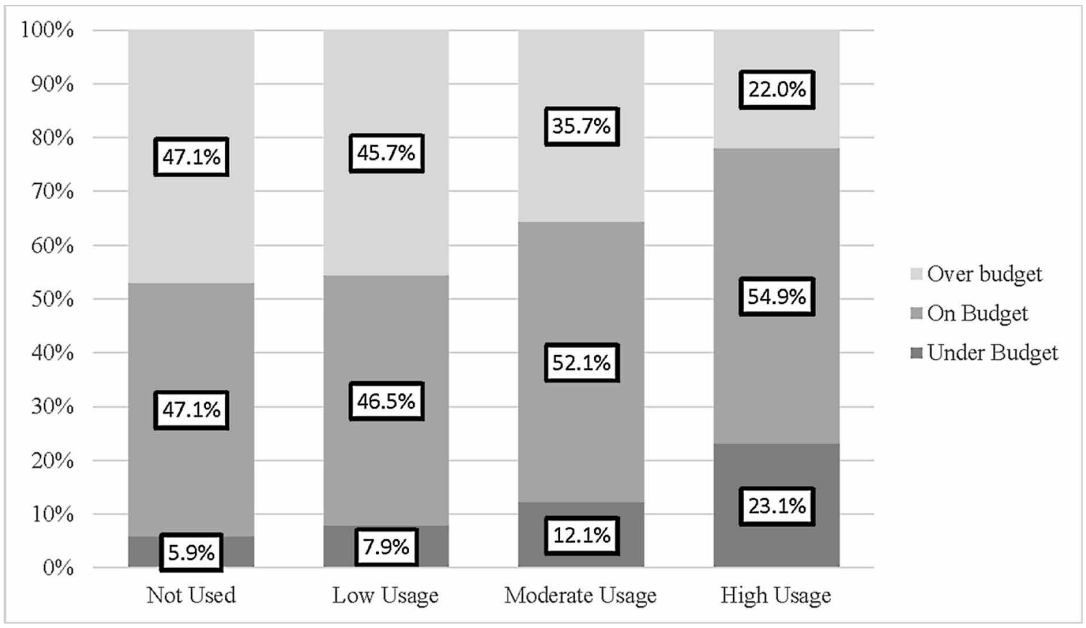
Relationship Between Risk Management and Budget Success

The first project success attribute to be analyzed was the final project budget/cost, and used a null hypotheses for H1, stated as:

- **Ho_1:** No statistical relationship exists for virtual IS projects between risk management usage and project cost attributes.

Fisher's exact test provided a significant p-value less than 0.001. Therefore, we fail to reject Ho_1 that no relationship exists on virtual IS projects between the level of risk management usage and success in meeting project budget. Table 2 shows the in-progress projects and usage percentage of study projects represented in each category. For the 26% of study projects that were "in-progress" for survey respondents, participants were asked to estimate final project performance results. This type of estimation is regularly accomplished by project managers through the use of current data and earned value techniques.

Budgetary data for completed projects is shown in Figure 2. A low usage of risk management processes shows no notable improvement in budget success compared with doing no risk management at all. However, both moderate-usage and high-usage are associated with improved budget success, with the greatest improvements coming at the highest level of risk management. Note that 53% of projects where risk management was not used completed either on-budget or under-budget, and a similar 54.4% of projects with low risk management usage completed either on- or under-budget. In contrast, projects with moderate risk management usage completed on- or under-budget 64.2% of the time. Those with high levels of risk management usage completed on- or under-budget 78.0% of the time.



Compared to completed projects, the results for in-process projects, shown in Figure 3, are less clear, although some interesting patterns do emerge. In the 75% of projects where risk management was not used, 64.7% of projects with low risk management usage, 78.7% of projects with moderate risk management usage, and 90.0% of projects with high risk management were projected to complete either on- or under-

Table 2. Percentage of projects by final budget completion status

Projects	Complete Projects			In-Progress Projects, Expected Results		
	Under Budget	On-Budget	Over budget	Under Budget	On-Budget	Over Budget
Total	9%	37%	27%	2%	19%	6%
Completed	13%	50%	37%	n/a	n/a	n/a
In-progress	n/a	n/a	n/a	7%	69%	24%

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

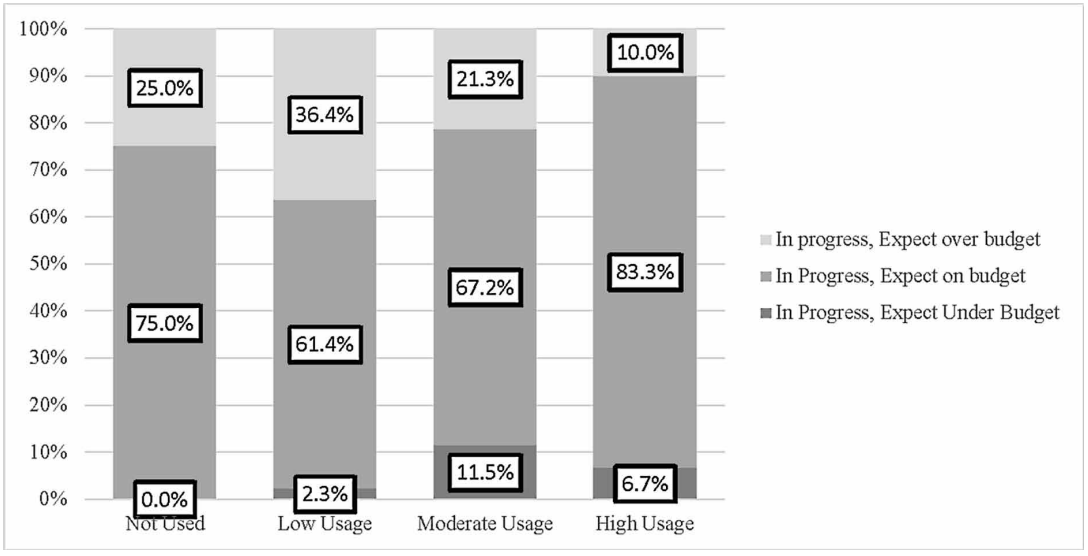


Figure 2. Budget success related to levels of risk management for completed projects

budget. Thus, perception varied with project managers using low levels of risk management being more pessimistic about their projects than those using no risk management at all. Conversely, project managers using the highest levels of risk management were the most optimistic about the project's future outcome.

Finally, completed projects came in on-budget 50% of the time, while their in-progress counterparts were projected to come in on-budget much more often, 69% of the time. This suggests that project manager projections on meeting budget are not as reliable as project manager reports of actual budget on completed projects.

Figure 3. Budget success related to levels of risk management for in-progress projects

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Relationship Between Risk Management and Schedule Success

The second project success attribute to be analyzed was the final project schedule, and used the null hypotheses for H2, stated as:

- **Ho_2:** No statistical relationship exists for virtual IS projects between risk management usage and project schedule attributes.

Fisher's exact test provided a significant p-value less than 0.001. Therefore, we fail to reject Ho_2 that no relationship exists on virtual IS projects between the level of risk management usage and success in meeting project schedule. Table 3 contains data showing the percentage of study projects represented in each category for both completed and in-progress projects. Completed projects came in on-time 50% of the time while their in-progress counterparts were expected to come in on-time 62%.

Figure 4 shows there is no substantial improvement in schedule success (defined as being either on time or early) for low or even moderate usage of risk management processes. However, high usage of such processes is associated with markedly improved schedule success. As Figure 4 shows, 45.1% of projects where risk management was not used completed either early or on-time, 46.1% of projects with low risk management usage completed early or on-time, and 49.6% of projects with moderate risk management usage completed early or on-time. However, a full 72.4% of projects with high levels of risk management usage completed early or on-time.

Compared to completed projects, the results for in-progress projects, shown in Figure 5, show a pattern reminiscent of that for projected budget success on in-progress projects. Project managers using little risk management appeared more pessimistic than those using none, and project managers using the most risk management appear to be the most optimistic.

Relationship Between Risk Management and Functionality Success

The third project success attribute to be analyzed was the final project functionality and used the null hypotheses for H3, stated as:

- **Ho_3:** No statistical relationship exists for virtual IS projects between risk management usage and meeting functionality requirements.

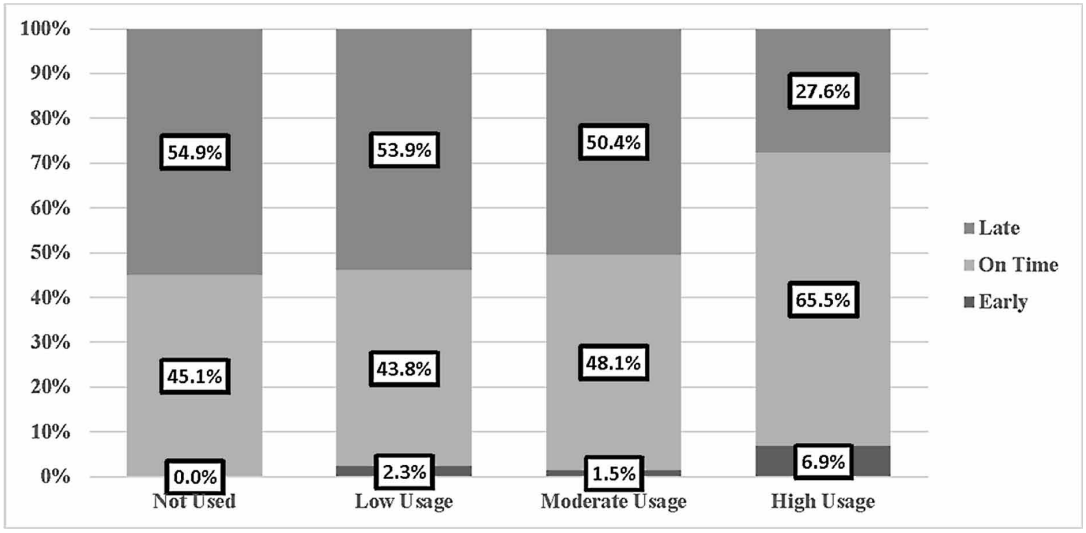
Fisher's exact test again provided a significant p-value less than 0.001. Therefore, we fail to reject Ho_2 that no relationship exists on virtual IS projects between the level of actual risk management usage

Table 3. Percentage of projects by final schedule completion status

Projects	Complete Projects			In-Progress Projects, Expected Results		
	Early	On-time	Late	Early	On-time	Late
Total	2%	36%	34%	1%	17%	10%
Completed	3%	50%	47%	n/a	n/a	n/a
In-progress	n/a	n/a	n/a	3%	62%	35%

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 4. Schedule success related to levels of risk management for completed projects



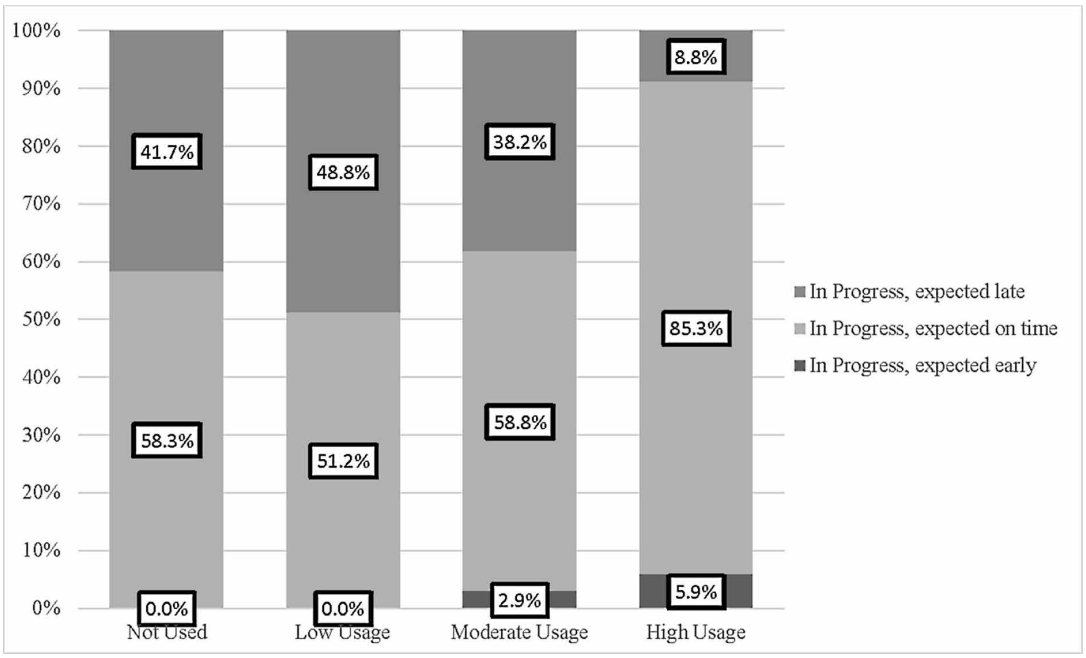


Figure 5. Schedule success related to levels of risk management for in-progress projects

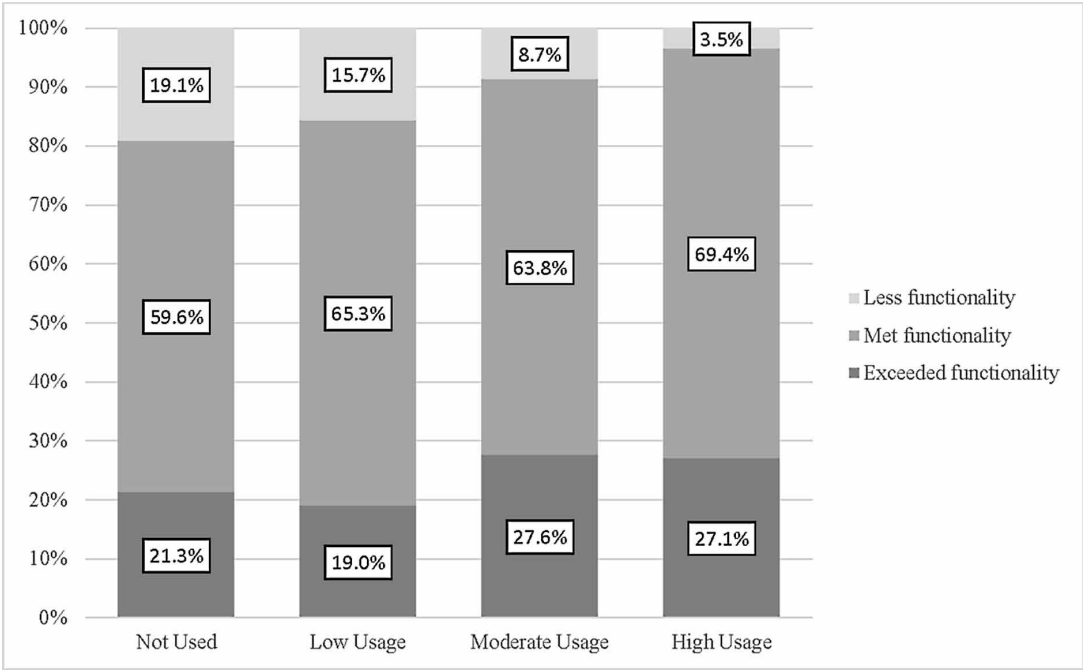
and success in meeting project functionality. Table 4 provides functionality data on the percentage of study projects represented in each category for both completed and in-progress projects.

As shown in Figure 6, low usage of risk management processes caused no substantial improvement in functionality, compared with doing no risk management at all. However, both moderate usage and high usage are associated with improved functionality, with the greatest improvements coming at the highest level of risk management. 91.3% of completed projects with moderate risk management usage, and 96.5%

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Table 4. Percentage of projects by final functionality completion status

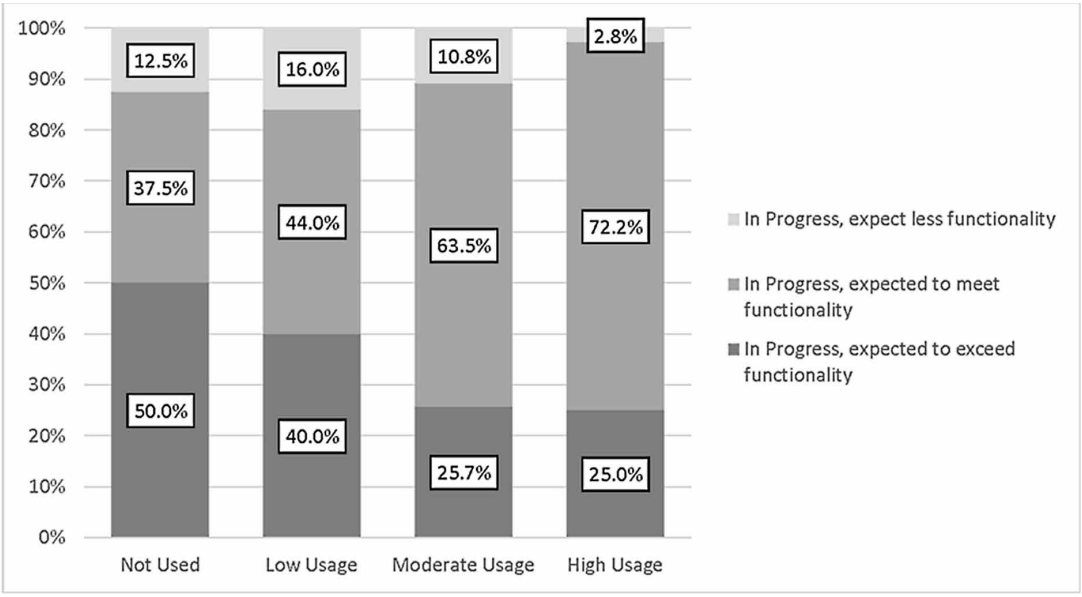
Projects	Complete Projects, Functionality			In-Progress Projects, Expected Functionality		
	Exceeded	Met	Less	Exceeded	Met	Less
Total	16%	45%	8%	10%	18%	3%
Completed	24%	65%	11%	n/a	n/a	n/a
In-progress	n/a	n/a	n/a	32%	57%	11%



of completed projects with high risk management usage exceeded or met functionality. These findings indicate success with functionality is highly likely when high levels of risk management processes are employed on virtual IS projects.

Functionality results for in-progress projects, shown in Figure 7, follow a pattern similar to that of in-progress project results for budget and schedule.

Completed Projects



Positive associations between risk management usage levels and project success measures have been identified on completed projects. In particular, both moderate and high levels of risk management appear to be associated with greater budget and functionality success, while high levels of risk management appear to be associated with greater schedule success. While it is tempting to attribute increases in project success directly to increased use of risk management, association is not causality. There are

Figure 6. Functionality success related to levels of risk management for completed projects

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 7. Functionality success related to levels of risk management for in-progress projects

other plausible explanations for increased success being associated with greater risk management. For example, this relationship may be the result of project teams that actively use risk management practices being more likely to have included a contingency fund in their budget as part of the risk management process. Such a contingency fund could not only cover budget shortfalls, but could also be used to hire additional help when a schedule is in trouble or when functionality goals are not being met. Also, projects that utilize risk management at higher levels are likely to be better managed in a multitude of ways, and this fact, rather than specific increases in risk management processes, may be more closely tied to improved results.

In-Progress Projects

Positive associations have been identified here on in-progress projects between risk management usage levels and expected project success. It appears as though those managers whose projects use low levels of risk management are actually more pessimistic about budget, schedule, and functionality outcomes than those who use no risk management at all, a situation that may be rooted in increased knowledge of risk by those with at least some direct involvement in risk management. It also appears as though managers on projects employing higher levels of risk management are more likely to anticipate positive budget, schedule, and functionality results. Possibly, the very usage of risk management gives project managers a greater sense of optimism than our results for completed projects would indicate is warranted.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

CONCLUSION

Data from 557 project management practitioners determined that while risk assessment and risk control are performed by a majority of project management practitioners, only 52% of participants performed all three processes. Further, a much smaller percentage of participants expend additional energy to create an all-encompassing risk management plan after completing the first two steps. These percentages indicate that the more well-known and easier processes are commonly used, but that a detailed advance plan for how risks will be monitored and managed is less commonly developed. These findings are in line with those of Fabricius and Buttgen (2015) who found project managers' risk management practices focused more on one smaller aspect, the probability of risk occurrence which they found to be insufficient.

Project management practitioners, who are generally pressed for time, may feel that this part of the process can be eliminated or pared down dramatically without a negative effect. It is also possible that the Theory of Reasoned Action applies to project managers resulting in their perception or belief that some risk management practices have low value in contributing to project success. However, when risks do occur, such an approach puts the project manager in a reactive rather than proactive state. The PMBOK suggests that reactive risk management can lead to project failure, while proactive risk management reduces the impact of a realized risk (PMI, 2013). Therefore, failing to create a risk management plan is likely to affect the way risk is handled and subsequently the impact of those risks. The disconcerting finding in this study indicates that many well-trained project managers are short-cutting risk management and not performing all of the core practices.

This finding is particularly significant in light of the second set of findings, which substantiated a relationship found by Papke-Shields, et al. (2010) and Raz, et al. (2002). A correlation analysis indicated that a strong relationship does exist between the level of risk management practices used and successful project outcomes, irrespective of whether successful is measured by budget, functionality or schedule. In addition, findings indicated that the highest levels of risk management usage were consistently characteristic of successful project outcomes for completed projects.

Research by Raz, et al. (2001) indicated practices beyond initial risk identification would be required, such as for risk analysis, monitoring and control. Therefore, an assumption can be made that project managers who perform risk assessment and risk control processes would also create an overall risk management plan; however, this research study found this is frequently not the case. Due to the many components of risk management, it is not surprising that every possible aspect of risk management is not addressed on each project. The incomplete risk management practices not being employed by some practitioners likely lessen the expected positive effects of risk management. This may not only lead to less than optimal project outcomes, but also renders the first two action an inefficient use of resources.

Generalization of these results may be limited due to the use of a sample of convenience, in that a large percentage of participants were associated in some way with PMI. That being stated, the positive side of this PMI association is that it is likely that such participants were more knowledgeable about definitions of risk processes, allowing them to answer the questions more accurately. A further limitation is due to participants' self-selecting to take the survey and then self-reporting on their own actions within a project. Bias may have been introduced both in terms of over-estimating the use of risk management and in terms of over-estimating the success measures for the projects managed by survey participants.

While it is possible that projects are more successful because they employ risk management more fully, it is also possible that better project managers, perhaps as a result of greater project management education and training, are more likely to use risk management more fully and effectively. There is also

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

a need for additional research into the perceptions of project managers with respect to appropriate risk management practices. These issues provide fertile ground for future studies into the nature of the relationship between risk management and success identified here. Also, an avenue for future research is a tangential result of this study related to the three classic measures of project success, budget, schedule, and functionality. Interestingly, functionality goals were met far more often than budget or schedule goals. This may be because budget and schedule are more concrete, while functionality is more easily redefined or deferred. However, the success rate is so much greater for functionality than for budget or schedule, that this is not likely to be the whole explanation. Perhaps when a project is in danger of not meeting all three types of goals, schedules and budgets are more likely to be adjusted than functionality. The process of weighing the three success factors when some aspect of a project must be adjusted is another area ripe for future study.

Chapter 56
Intermediating Crowdfunding: A Foundational Assessment

Joan MacLeod Heminway
The University of Tennessee College of Law, USA

ABSTRACT

The principals in business finance transactions most typically are the focus of commentaries and studies. Intermediaries often are forgotten—or at least are of secondary concern. The growing academic and popular literature on crowdfunding exemplifies these larger trends. This chapter focuses broadly on a description of crowdfunding intermediation in a preliminary effort to address this imbalance. Specifically, the chapter focuses most closely on (a) identifying and categorizing the types of intermediaries involved in crowdfunded financings of businesses and projects and (b) making related observations. This exploration of crowdfunding intermediaries: isolates expertise, standardization, and disclosure as key values in crowdfunding intermediation; exposes the central role and critical nature of the crowdfunding platform as a crowdfunding intermediary; and notes certain resulting concerns and considerations. Ultimately, additional research is needed to provide better information and guidance to potential and actual crowdfunding participants, policymakers, and enforcement agents.

INTRODUCTION

The media and academic literature pay close attention to the ventures seeking funding and the funders in capital-raising transactions. This is logical. Without a willing and able seller and buyer, there would be no capital formation.

Yet, in most cases, business ventures and those who finance them cannot (and do not) proceed with financings on their own. For instance, offerings of securities may involve many different kinds of intermediaries—transaction participants that, as conduits or otherwise, bridge gaps between and among transaction principals. Securities transactional intermediaries include stock exchanges and other securities markets, underwriters or placement agents, dealers, research analysts, proxy advisors, rating agencies, financial advisors, lawyers, and accountants. These intermediaries may play vastly different, yet some-

times overlapping, roles in the offering process. Their work is recognized as important in various aspects of corporate finance and securities regulation. In fact, intermediaries may be critical to the success of a particular securities offering. Yet, they may be marginalized in new market studies and popular press accounts. Perhaps, then, it is relatively unremarkable that intermediation in crowdfunding campaigns (some, but not all, of which involve the offer or sale of a financial instrument classified as a security) has received little sustained public attention.

Crowdfunding is, after all, a relatively new method through which a venture—a business or a project—may be financed. Crowdfunded financings are described and may be conducted in a variety of ways. However, at the heart of all crowdfunding models is the solicitation of funding from the undifferentiated masses (i.e., the public at-large), typically over the Internet.

Although some forms of Internet-based financing are labeled crowdfunding, they may target their offers or sales to only a portion of the overall crowd. Examples of U.S. funding campaigns of this kind are so-called "intrastate crowdfunding" (in which offers and sales of securities are fundamentally local in nature—made wholly within the state of organization of the issuing firm) and "506(c) crowdfunding" (private placements of securities in which offers may be made publicly but sales may only be made to accredited investors—investors with a certain level of sophistication or wherewithal that justifies less regulation of the offering process). For purposes of this chapter—which addresses crowdfunding broadly to include securities offerings (whether involving debt, equity, or other securities) conducted through crowdfunding as well as other types of crowdfunding (e.g., donation, pre-sale, and reward-based crowdfunding)—these more limited campaigns are considered to be crowdfunding.

The overall definition of crowdfunding used in this chapter is broad; however, the chapter focuses on depicting crowdfunding in a specific context—financing businesses and projects through campaigns conducted over the Internet using a crowdfunding website, commonly referred to as a "platform" (or sometimes a "portal"). More specifically, this chapter addresses types of crowdfunding intermediation present in that kind of financing, noting the actual and possible ways in which crowdfunding platforms and other intermediaries participate in crowdfunding and the implications of that participation for the future of crowdfunding. Among other things, these descriptions and observations offer insights to participants, policymakers, and enforcement agents and suggest future research directions.

In light of the descriptive nature of this chapter, the research method relies almost exclusively on an analysis of secondary sources. Because crowdfunding is a comparatively new form of financing with relatively fluid market entrances and exits, the observations in the chapter rely on the analysis of existing scholarship from other areas of corporate finance as applied to observed crowdfunding practices documented in the emerging literature on crowdfunding. The results of this previous research are then distilled and interpreted and several open research questions are identified.

Accordingly, the chapter progresses through several distinct succeeding parts. It begins by providing a review of relevant extant literature on crowdfunding and corporate finance intermediation. Next, the bulk of the chapter explains the nature of intermediation, describes and illustrates a number of different ways in which crowdfunding involves intermediation, identifies and categorizes the roles that may be played by intermediaries in crowdfunded financings, and makes observations about crowdfunding intermediation based on theory and practice. Then, the chapter articulates solutions and recommendations. Finally, the chapter pinpoints future research directions.

The need to fill gaps in the descriptive literature on crowdfunding intermediaries is becoming increasingly vital as crowdfunded financings and crowdfunding research continue to grow and innovate. This chapter begins to undertake that gap-filling assignment. This contribution to the literature is designed to

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

help frame the vocabulary and attributes of intermediation in crowdfunding in a way that fosters better decision-making in the emergent crowdfunding environment and enables more targeted empirical theoretical and empirical scholarship and industry research on crowdfunding intermediation. For instance, the chapter may facilitate a more complete understanding of the types of intermediaries involved in crowdfunding and the roles they play, enabling crowdfunding participants to better determine whether (and, if so, which) crowdfunding opportunities best meet their needs. Along similar lines, policymakers may be able to use the information in this chapter to begin to identify possible areas for regulation, enforcement agents may find the information in this chapter useful in spotting lapses in legal compliance, and researchers may choose to found their research in the observations made in this chapter. Much remains to be done, but the information provided in the chapter is a start.

LITERATURE REVIEW OF CROWDFUNDING AND FINANCIAL INTERMEDIATION

Having reportedly been identified and labeled by Jeff Howe in a 2006 magazine article and 2008 book, Internet-based crowdfunding has not yet completed its first decade of verified public existence as a business financing method. Consequently, the literature is still relatively undeveloped as a whole (Danmayr, 2014, p. 2). While first-generation studies and analyses—among them, Agrawal, Catalini, & Goldfarb (2011, 2013), Belleflamme, Lambert, & Schwienbacher (2010, 2013), Harms (2007), and Hemer (2011)—have not altogether ignored the role of intermediation in crowdfunding, they have focused primary attention on three general topics:

- The venturers (principals or promoters) seeking funding for businesses or projects (often referred to, for ease of reference, as "crowdfunders" or "entrepreneurs," regardless of the stage of development and risk level of their business or project);
- The prospective and actual funders of those businesses and projects (often referred to as "backers," a term used as a label for funders in a number of early crowdfunded financings); and
- The overall phenomenon of crowdfunding.

Early academic work on crowdfunding has provided an important foundation for industry innovation, regulation, research, and further analysis. These academic contributions offer reviewers many (sometimes conflicting) typologies of crowdfunding and provide preliminary data and case studies that illustrate aspects of the industry, its principal players, and specific crowdfunded financings (individually and in the aggregate).

Less has been said in academic and popular circles about crowdfunding intermediation (Hass, Blohm, & Leimeister, 2014, p. 2). To the extent that the extant academic literature has been attentive to intermediaries in crowdfunding, the principal emphasis has been on crowdfunding platforms—the websites through which crowdfunding often is conducted (Agrawal et al., 2011, 2013; Bradford, 2012a; Danmayr, 2014; Hemer, 2011; Heminway, 2013; Moritz & Block, 2014). Yet, even the literature on crowdfunding platforms is under-developed generally and as compared to the literature on businesses and projects seeking crowdfunding and prospective and actual providers of crowdfunding (Belleflamme & Lambert, 2014; Moritz & Block, 2014). Popular literature on crowdfunding also emphasizes the role of platforms in describing crowdfunding intermediation (Lennon, 2014, Chapter One; Neiss, Best, & Cassady-Dorion, 2013, Chapter 7; Young, 2013). Heminway (2014) has provided but a brief accounting of the activities of legal counsel in crowdfunded offerings.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Overall, scholarly work on intermediation in crowdfunding (like accounts in the popular press) is relatively narrowly focused and begs for expansion. Lehner (2013, pp. 301-02), for example, notes the need for more scholarly work on the role of crowdfunding platforms in light of existing explorations of networking theory in the crowdfunding context. Danmayr (2014, pp. 104-05) follows suit by offering many avenues for future research on crowdfunding platforms.

There certainly is room for growth in the study of crowdfunding intermediaries. Although some early commentators do mention other intermediaries in their work, these references are fleeting and there are few of them. Moritz & Block (2014, pp. 15-16, Table 3) provide a summary of identified research on crowdfunding intermediation. Hemer (2011, p. 10, Figure 3), for example, recognizes the platform's role in engaging micro-payment providers and banks in crowdfunding. Moreover, in explaining the exclusion of certain web-based initiatives from his sample of crowdfunding platforms, Danmayr (2014, p. 78) notes the existence of "crowdfunding related services" outside the realm of these specialized crowdfunding websites. "It is an interesting insight," he observes, "that there are already evolving new business models, based upon a likewise revolutionary concept like crowdfunding." He suggests future research in this area as the market for crowdfunding intermediaries expands (2014, p. 105).

The lack of literature on crowdfunding intermediaries other than platforms, while unfortunate, is to be expected. The visibility and centrality of the platform's role in crowdfunding make it a major subject for academic study and commentary. The overall youth of the crowdfunding industry, the less central roles of non-platform intermediaries, and the underdeveloped nature of the related literature combine to render the study of secondary intermediaries a lower-priority (yet still important) task.

Fortunately, intermediation in securities offerings and other capital-raising transactions has been broadly addressed in academic literature and the popular press. Scholarship from a variety of areas of academic pursuit provides a series of lenses through which crowdfunding intermediaries can be viewed. These lenses help contextualize intermediation in financing transactions and provide useful frameworks for a broad-based analysis of crowdfunding intermediation.

Legal scholarship on financial intermediation, for example, focuses most closely on the agency roles played by, and fiduciary relationships involving, financial intermediaries (Barnett, 2012; Choi, 2004; Choi & Fisch, 2003; Laby, 2006; Orcutt, 2005). Reputational intermediaries have received specific attention in the law literature (Coffee, 2002; Laby, 2006). Very little has been done to apply this work to crowdfunding intermediation (Heminway, 2013).

Business administration (e.g., finance, accounting, management) and related economics scholarship on financial intermediation spans a wide range of methodologies and issues. Financial economists commonly address, among other things, intermediation's power to correct information asymmetries in transactions. Thus, the focus is on the capacity of intermediaries to play an informational role based on their superior knowledge and experience (Lizzeri, 1999; Pacces, 2000). Other important work in this area has concentrated on two-sided network theory (in which the "money side" values the attraction of contributors from the "subsidy side") and related questions (Eisenmann, Parker, & Van Alstyne. 2006). This work has begun to be considered in analyses of crowdfunding intermediation (Hass et al., 2014; Salomon, 2014; Tomczaka & Brem, 2013).

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

INTERMEDIATION IN CROWDFUNDING

Intermediation is a broad concept susceptible of many definitions. The term most often is used to describe "a middleman, a conduit, or a go-between." (Heminway, 2013, p. 179). *Black's Law Dictionary*, for example, defines an intermediary as "[a] mediator or go-between; . . . . Cf. FINDER." (Garner, 1999, p. 820). Types of intermediaries and ways of classifying intermediaries differ based on, among other factors, the relevant industries, transactions, and academic traditions of the observer. This chapter takes a broad view of intermediation consistent with the definitions offered in this paragraph.

Based on that broad definition, this part of the chapter describes a variety of significant intermediaries involved in crowdfunding. It proceeds in three subparts. First, it labels and briefly describes these key crowdfunding intermediaries. Next, it identifies the roles played by them in crowdfunded financings and classifies them consistent with labels used in the literature on securities intermediation. Finally, this part of the chapter makes basic observations deriving from the described crowdfunding intermediation landscape. Solutions and recommendations, as well as future research directions, follow.

Types of Crowdfunding Intermediary

Crowdfunding intermediation has developed organically to include a number of distinct participants. Some are new and unique to crowdfunding. For example, as described below, U.S. law has established a new form of regulated intermediary in securities crowdfunding called a "funding portal." (Securities—or investment—crowdfunding typically involves the openly public offer or sale to the crowd of equity, debt, or other investment interests that constitute securities under applicable law.) Some crowdfunding intermediaries are standard transactional intermediaries in business finance transactions. These include professional advisors like lawyers, accountants, investment advisors, and insurers. Crowdfunding intermediaries comprise those with central roles—positions that are essential to the crowdfunding enterprise—as well as those with subsidiary, discretionary functions and responsibilities. As crowdfunding develops, the market is likely to welcome new intermediary entrants on a regular basis to serve the market's emerging needs.

Set forth below is a brief description of existing (and, in some cases, anticipated) crowdfunding intermediaries. In each case, the portrayal of the particular intermediary includes information about its actual or anticipated roles in crowdfunding a business or project. Examples of each type of intermediary (including website urls for specific websites, as applicable) are offered to illustrate the various intermediation attributes. Because of the distinctive nature of the services provided by some intermediaries and because of variations among crowdfunded financings, not every intermediary described below plays a role in every crowdfunding campaign. In addition, the description of crowdfunding intermediaries set forth below omits a separate, individual description of certain applications and tools (including social media websites like Facebook and Twitter and weblogs) that have intermediation roles in crowdfunding when used with or in substitution for crowdfunding platforms. As a key component of Web 2.0, social media websites have been described elsewhere and do not require additional explanation here. Suffice it to say, these and other social networking sites do not provide unique services in the context of crowdfunding.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Platforms/Specialized Websites

The most obvious, central intermediation in a significant crowdfunding involves the interposition of a platform (a facilitating website) between the venture for which funding is sought and prospective and actual funders. "Crowdfunding platforms match projects owners (or proponents), who seek capital for their proposition, and supporters (investors or contributors), who decide to provide funding." (Viotto, 2015, p. 2) They have been identified as multisided platforms through which business or project principals and promoters, on the one hand, and potential funders, on the other hand, each mutually dependent for its success on the others, connect to conduct transactions more efficiently than may be achieved through bilateral relations (Belleflamme & Lambert, 2014, pp.8-9).

Although firms can (and do) seek funding from the crowd through their own proprietary websites and through weblogs and social media websites, Danmayr (2014) observed that 20% of crowdfunded businesses and projects use third-party platforms constructed for the purpose of hosting crowdfunding campaigns. Other estimates indicate that platform-based crowdfunding now is the rule rather than the exception (Belleflamme & Lambert, 2014, p. 3), and the growth in crowdfunding through platforms is significant. "[A]cademic interest is motivated by the steep growth in the volume of financial transactions on crowdfunding platforms: according to the most recent estimations, around US$5.1 billion were transacted on crowdfunding platforms in 2013, a 240% increase from 2011." (Viotto, 2015, p. 2).

Crowdfunding platforms provide a standardized template through which venturers can broadly solicit funding for their business or project. "In addition to providing a standardized process, platforms act as an information, communication and execution portal." (Moritz & Block, 2014, p. 15) They typically host funding pitches for a large variety of ventures and serve as key transactional intermediaries in soliciting financing from the crowd. Crowdfunding platforms typically conduct their operations through specialized websites that combine features of social media websites (commonly referenced as a core element of Web 2.0) and ecommerce websites in a business finance context Platforms also may use third-party social networking tools (for example, social media websites and weblogs) as adjuncts to their own websites.

The crowdfunding market has been actively and rapidly developing to include a number of different kinds of platforms built to serve the needs of businesses and projects seeking funding through donation, reward, pre-sale, securities, and other types of crowdfunding. Some exclusively promote or specialize in particular kinds of ventures (profit or non-profit, music, film or other creative arts, software applications, etc.). For example, CrowdRise (www.crowdrise.com) and JustGiving (home.justgiving.com) are charitable donation platforms, PledgeMusic (www.pledgemusic.com) helps music projects to obtain funding, Slated (www.slated.com) offers a financing platform for films, and AppsFunder (www.appsfunder.com/us) connects application developers with funders. Some perform or contract for other forms of pre-screening of the businesses and projects that seek funding through them. Kiva (www.kiva.org) and Quirky (www.quirky.com) are examples of this kind of platform. Some engage in individualized promotion of ventures featured on the platform. The "staff picks" on Kickstarter (www.kickstarter.com) and the "trending" and "featured" projects on Indiegogo (www.indigogo.com) are notable examples of this aspect of a platform's business model.

In all, the attributes of the individual platforms vary from firm to firm (Danmayr, 2014), although each crowdfunding website typically includes certain key features. These include:

- Separate specialized webpages that outline the benefits, rights, and responsibilities of the venturers and funders;

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

- Designated webpages or areas for each venture's "pitch" to funders;
- An "About Us" page that highlights key information about the platform's history and operations;
- Website use policies; and
- Help and other similar user information pages, including portions of the website devoted to frequently asked questions (FAQs) and instructions on how to reach someone from the platform to answer a question (e.g., a "Contact Us" page).

Some platforms also offer a user rating or comment system, one or more weblogs, and other communitarian features. Perhaps unsurprisingly, many of the features on crowdfunding websites borrow from and mimic social media and ecommerce websites.

Categorizing crowdfunding platforms has been a challenge given the lack of standardization. Danmayr (2014, pp. 96-98) classifies platforms based on the type of crowdfunding conducted on the platform. He notes that the approaches of the platforms in these different settings vary significantly. He concludes that 'it seems too early to suggest archetypal crowdfunding platform settings." (Danmayr, 2014, p. 99) Hemer (2011, pp. 15-17) identifies five basic categories of platform business model:

- **"Threshold Pledge":** I.e., "all-or-nothing," in which a crowdfunded business or project must reach a targeted minimum level of funding before any funds are released to the promoters;
- **Micro-Lending:** In which small loan commitments and repayments are processed;
- **Investment:** I.e., equity, in which the platform collects processes the sale and purchase of profit-sharing interests in businesses or projects;
- **Holding:** In which the platform sets up subsidiaries for each business or project seeking funding and offers shares of those subsidiaries to putative funders; and
- **Club:** In which groups of investors prequalified as investors.

Hemer (2011) notes that the threshold pledge model can be (and often is) combined with one of the other business models, that certain crowdfunding platform business models may trigger the application of securities regulation in some countries, and that the club business model is a reaction to that undesired regulatory effect—designed to avoid the application of this regulatory regime.

The identity and attributes of crowdfunding platforms may respond to various legal requirements. For example, under the Capital Raising Online While Deterring Fraud and Unethical Non-Disclosure Act (2012), known as the "CROWDFUND" Act, in the United States (Title III of the Jumpstart Our Business Startups Act (2012)), crowdfunding websites must be registered securities brokers or funding portals. Both types of regulated entity must meet certain regulatory requirements, and their functions are limited. For example, under the CROWDFUND Act, funding portals cannot "offer investment advice or recommendations," "solicit purchases, sales, or offers to buy the securities offered or displayed on its website or portal," "compensate employees, agents, or other persons for such solicitation or based on the sale of securities displayed or referenced on its website or portal," or "hold, manage, possess, or otherwise handle investor funds or securities." These and other applicable legal constraints shape the business model for and potential profitability of these platforms.

Payment Processors for Crowdfunding Platforms

Platforms typically commit to collect, hold, and distribute funds provided to businesses and projects in crowdfunded financings. Most platforms do not have their own proprietary payment processing systems. They contract for these services from others. Applicable regulation may dictate whether platforms can process funds. For example, under the CROWDFUND Act, funding portals (a specific kind of registered platform for securities crowdfunding covered under that law), by definition (15 U.S.C. § 78c(a)(80)(D) (2012)), cannot accept funds from crowdfunding investors.

Perhaps the most well-known payment processing business used in U.S. crowdfunding is PayPal (www.paypal.com). Other examples in the United States include WePay (www.wepay.com) and Amazon Payments (payments.amazon.com/home). MangoPay (www.magopay.com) is a popular multi-currency European payment processor for crowdfunding. Because financial transactions are regulated on a country-by-country basis, payment systems can vary from country to country.

Payment systems may all look alike to the uninitiated, but they have different attributes and have built-in optional capabilities from which crowdfunding platforms can choose. These attributes and capabilities may be more or less advantageous to different types of platforms and different types of crowdfunding. The use of online payment processing systems may require customized software solutions to integrate the payment system into the crowdfunding website in a manner that provides the desired functionality. As a benefit to crowdfunding platforms, payment systems may undertake some or all of the legal compliance services associated with the acceptance, retention, and distribution of funds committed to crowdfunding campaigns.

Due Diligence Service Providers

Venturers may desire or need to have (and may determine to disseminate) specific information about themselves—their principals, operations, finances, plans, etc.—in order to incentivize funders to offer them financing dollars. Funders will not invest without receiving the type and level of information they desire before making the decision to fund. And intermediaries want to ensure they are paid for their work and create and sustain a good reputation in the market. Applicable law may mandate or incentivize the disclosure of facts by and to specific crowdfunding participants. For example, provisions of the CROWDFUND Act (2012) mandate various disclosures by securities issuers and intermediaries. All of this involves generating or assembling and interpreting information. Although venturers, funders, and intermediaries may perform their own investigations or reviews of the operations and finances of each other before engaging in crowdfunding transactions with each other, they may lack the internal expertise or resources to accomplish some or all of that work.

As a result, independent providers of due diligence services have begun to emerge to provide services to principals and intermediaries in the crowdfunding space. Crowdfunding participants that desire to get tailored information about crowdfunded offerings may be willing to retain the services of a third-party expert to get that information for them where contracting for those services is cost-effective. For example, those investing larger amounts in long-term profit-sharing or interest-producing instruments presumably would be more likely to engage a due diligence provider than funders providing small amounts to fund the next album for their favorite indie band. Moreover, the wisdom of the crowd itself may provide enough assurance to its members to forestall the need for funders to obtain due diligence assistance. In any event, those crowdfunding participants desiring the due diligence services (e.g., entrepreneurs, funders, platforms, etc.) contract for them directly with the provider of their choice.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

CrowdCheck (www.crowdcheck.com) is one such firm. The services provided by CrowdCheck can be customized to serve entrepreneurs, funders, or intermediaries in crowdfunding and other online financings. Founded by a former staff member of the U.S. Securities and Exchange Commission and managed and staffed by, among others, a team of experienced securities lawyers, CrowdCheck was an early entrant into the crowdfunding intermediary marketplace in the United States.

Business models for due diligence providers vary based on the crowdfunding markets and participants they serve and the types of services they provide. For instance, a service provider that caters its business to helping securities crowdfunding intermediaries meet their legal compliance obligations is likely to provide different services and assume different levels of responsibility for the accuracy and adequacy of its procedures than a firm providing legal compliance due diligence services to principals and promoters engaged in reward-based crowdfunding to finance their businesses or projects. The responsibility of platforms under applicable securities laws and those of business principals and project promoters under consumer protection laws differ significantly. Accordingly, the diligence needed for legal compliance in these circumstances also differs, as does the need for guaranteed or otherwise verifiable quality control in the research methods and output.

Industry Research Suppliers

Due diligence providers are not the only crowdfunding intermediaries seeking to locate, generate, compile, and distribute information about crowdfunding campaigns and participants. Crowdfunding constituents and commentators are thirsty for information about the crowdfunding market. This information might include, for instance: attributes of particular sites and campaigns (including what works and what doesn't work); general trends; relevant political, economic, and social conditions; statistical summaries of market activity. While the crowd may be able to identify, assemble, and process information on its own to some degree in crowdfunding's Web 2.0 environment, it is likely that traditional research suppliers will continue to play an important role for at least some crowdfunding participants.

Market research firms exist for almost all industries, and crowdfunding has spawned its own set of specializer researchers. These researchers may not serve individual clients as to individual offerings. Rather, they more typically serve a larger populace—specific market sectors or product or service industries engaging in crowdfunding, association members, or even the public at-large. Some of this general research is widely available on the Internet free of charge. However, the most sophisticated research typically is conducted on a customized basis by consulting firms using proprietary data.

The public face of crowdfunding industry research is largely characterized by organizations focused on crowdfunding research as the core of their operations. The CrowdfundingCentre (thecrowdfundingcentre.com), which incorporates the Crowd Data Center, exemplifies this type of intermediary. Geared to many different audiences (including, by the organization's own accounting, government regulators and policymakers, as well as crowdfunding principals and intermediaries), the CrowdfundingCentre authors and publishes data-driven periodic reports and schematics and offers information about relevant regulatory news and initiatives. In addition, the CrowdfundingCentre produces daily and weekly charts featuring popular crowdfunding campaigns. Another example of a crowdfunding industry research provider is TheCrowdCafe (www.thecrowdcafe.com), which boasts a research-oriented resources page, news pages, and a list of platforms hosted around the world. Crowdsurfer (www.crowdsurfer.com) essentially bridges the gap between due diligence providers and industry research providers by offering proprietary analyses of broad-based data to individual clients.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Platforms and general crowdfunding-oriented websites also may conduct and report research (themselves or through others) on a less formal or routine basis. Kickstarter reports basic data and statistics relating to the campaigns conducted on its site (www.kickstarter.com/help/stats). Shopify (www.shopify.com), an ecommerce site, hosts ecommerce university (ecommerce.shopify.com), which has produced *Crowdfunding 101: Insights from 400k Kickstarter and Indiegogo Campaigns*, as well as *The Ultimate Guide to Crowdfunding*, as free, online research and information resources. Crowdfund Insider (www.crowdfundinsider.com) is a general crowdfunding news and information site that reports research data generated by others.

As illustrated by these examples, crowdfunding industry research suppliers have the potential to cover a broad array of topics, methodologies, and dissemination channels. These suppliers may range from think tanks generating proprietary databases using established academically tested research methods to specialized journalists and even bloggers. Wide-ranging research from a variety of perspectives and sources is likely to generate, in the aggregate, a more accurate and complete picture of the emergent crowdfunding industry. However, having said that, crowdfunding research activity is likely to provide uneven coverage in the short term.

Good data is hard to come by. There is little required disclosure in the crowdfunding industry, with notable exceptions existing in, e.g., the CROWDFUND Act (2012), as referenced previously; none has been mandated on an international level. Moreover, a detailed, uniform, voluntary public disclosure regime is unlikely to take hold in the near future (if at all). As a result, standardized, broad-based publicly available data on crowdfunding is scarce. Although some researchers in private industry have been able to compile proprietary data sets and employ them in their work, they are unlikely to make this data widely available except to fee-paying clients. Some of these private industry researchers even may be reluctant to share their research methodology in any great detail. This makes generalized, public consumer-oriented research on crowdfunding almost impossible unless academic research can fill the void. Rigorous, peer-reviewed academic studies may have the capacity to generate a high quality of information for consumers and others, but academic researchers will be plagued by data deficiencies without the benefit of mandatory disclosure or proprietary data, and their work, in any case, may not be widely available to or accessible by those outside their field of endeavor.

Industry Standard Certifiers

As crowdfunding grows, the demand for heuristics-based decision-making—in which market participants rely on short-cuts to overcome information deficits in their struggles to determine whether, when, and how to participate in crowdfunding—likely will increase. Certifiers, commonly referred to in relevant literature as certification intermediaries, have begun to emerge in the crowdfunding services market to serve that need. They specialize in assessing and verifying the compliance of an industry participant with applicable industry standards. The classic example of a certification intermediary cited in many commentaries on the subject is UL—formerly known as Underwriters Laboratories and founded in 1894 as Underwriters' Electrical Bureau, the Electrical Bureau of the National Board of Fire Underwriters. This organization tests and certifies the safety of consumer products.

Given the relative lack of transparency of Internet-based business models and a shortage of uniform comparative data on crowdfunding participants and crowdfunded ventures, crowdfunding certifiers have begun to proliferate. Their claims at expertise and reputational advantage are many and varied. Crowdsourcing.org (www.crowdsourcing.org), an industry resource providing information and support for both crowdsourcing and crowdfunding, offers certification to crowdfunding platforms. The certification

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

provides crowdfunding websites with Crowdfunding Accreditation for Platform Standards based on an interview and review process. The certification is intended to promote and signal crowdfunding platform best practices. Both crowdfunding venturers and funders are the asserted audience for and beneficiaries of this certification. There also is a Crowdfunding College (www.crowdfundingcollege.com) that markets itself as providing education, training, and certification as a crowdfunding professional.

Other certifiers are in the process of organizing their programs as this chapter is being completed. The Crowdfunding Professional Association (www.cfpa.org), a membership organization for crowdfunding professionals, announced late in 2014 that it would provide two certifications: one for crowdfunding investors—designed to address compliance with the CROWDFUND Act (2012)—and one for professionals providing education and other services to crowdfunding participants. The National Crowdfunding Association (www.nlcfa.org), a trade association serving crowdfunding industry professionals, has announced its intention to offer Certified Crowdfund Advisor certification through an examination process. In addition, the Crowdfund Intermediary Regulatory Advocates (www.cfira.org) has been formed to work with "governmental and quasi-governmental entities to help establish industry standards and best practices" for U.S. securities crowdfunding. This organization also may evolve to play a certifying role.

The utility, credibility, and overall benefit of the endorsements provided by these certification programs will remain to be seen. The overall industry is, as noted throughout, in its early stages of development. Moreover, if one believes that the crowd has the capacity to vet the accuracy and adequacy of information available to market participants and, in general, to regulate the crowdfunding market (as many crowdfunding proponents assert), there may be a reduced need for crowdfunding certifiers.

Professional Advisors

Crowdfunding, like other business finance transactions, may involve traditional professional advisors in various capacities. Most crowdfunding platforms will engage professional advisors. Fewer entrepreneurs and other venturers will do so. Very few funders will deem it necessary or advisable to engage professional advisors in connection with their crowdfunding participation.

The types of professionals that may participate in crowdfunding, depending on the nature and size of the crowdfunding campaign undertaken, include auditors and other financial accountants, legal counsel, investment advisors, and insurers. These intermediaries are considered gatekeepers—providers of trustworthy assessment, observation, and (sometimes) disclosure or support for disclosure. Their presence in securities crowdfunding is ubiquitous; their engagement in other types of crowdfunding is more episodic.

Accountants may be a required or desired part of crowdfunded financings, especially securities crowdfunding. As a general rule, crowdfunded financings (registered securities offerings being among the most notable) do not require that a venturer or promoter furnish financial statements audited by a certified public accountant as part of the funding process. However, under the CROWDFUND Act (2012), to obtain an exemption from federal registration of the offering, issuers in crowdfunded offerings of securities in the United States valued in excess of $500,000 are required to present audited financial statements to investors, and issuers in offerings of securities exceeding $100,000 are required to produce and disseminate financial statements reviewed by an independent public accountant in accordance with specified professional standards and procedures. Moreover, other businesses desiring to crowdfund their operations also may voluntarily engage accountants as auditors to prepare or review financial statements summarizing their financial condition and results of operations. Funders seeking advice regarding their finances also may ask for that assistance from accountants.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Venturers seeking financing through crowdfunding and crowdfunding platforms are always wise to seek legal advice in connection with their crowdfunding activities. Moreover, in certain circumstances, funders may engage lawyers to advise them in committing funds to crowdfunding campaigns. Legal advisory assistance most commonly is sought in securities crowdfunding, but also occurs in other crowdfunding contexts. Legal services requested may include counsel in connection with securities regulation, entity formation, contract drafting and negotiation, intellectual property protection and use, consumer protection, and other matters relating to legal status and compliance.

Participants in securities crowdfunding also may include investment advisors. Although funding portals are not permitted to offer investment advice under the CROWDFUND Act (2012) and crowdfunding websites, in general, may not be allowed to provide those services under other legal regimes, absent regulatory constraints, crowdfunding platforms may be free to offer funding guidance of this kind in other crowdfunding contexts. Independent investment advisors, including government-regulated service providers in the securities industry, also may be engaged to provide information and guidance on or in connection with crowdfunded financings, although this is most likely to occur in larger securities crowdfunding.

Insurers began to realize they would have an important role in crowdfunded financings. By assuming some of the risk of crowdfunding participants through insurance contracts, they could incentivize participants to become involved in crowdfunding. Venturers, platforms, other intermediaries, and even some investors all are or may be in a position to purchase insurance—either in the form of a new policy or as a rider to an existing policy—to cover risks of losses created by crowdfunding. In fact, these insurance policies may be mandated in some crowdfunding circumstances. Proposed rules under the CROWDFUND Act (2012) would have required platforms to purchase a fidelity bond of at least $100,000 (Sec's and Exch. Comm'n, 2013). The final rules omit this requirement (Sec's and Exch. Comm'n, 2015). Most crowdfunding insurance would be optional, however. Venturers may seek insurance to cover potential legal actions arising out of the failure of the business or project for which crowdfunding is sought. Crowdfunding websites would be well advised to consider insurance or to establish adequate reserves to self-insure, given the multifaceted risks of their operations (which would include everything from embezzlement and other employee-related activities to fraud claims made by funders). Innovative delivery systems for insurance are being tested. At the end of 2014, for example, Indiegogo announced a pilot program to provide optional insurance to funders participating in a particular campaign (Newman, 2014).

Categorizing Intermediation in Crowdfunding

Crowdfunding intermediaries may serve a number of different functions in providing their services. The roles played by these intermediaries in crowdfunded financings may be mapped to existing classifications that have been employed to label financial intermediaries. This part of the chapter identifies a number of the functional roles provided by crowdfunding intermediaries and categorizes them in accordance with a four-part classification system derived from legal scholarship on securities transaction intermediation.

Intermediation Functions

The distinct types of crowdfunding intermediary described above each serve—or may serve in the future—many functions in crowdfunded financings. Thoughtful consideration of the nature of the services various crowdfunding intermediaries may provide (either alone or together with other crowdfunding intermediaries) reveals functions, most of which are identified in various ways in the literature, that include:

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

- **Interconnection:** Linking transaction principals with each other and with additional transaction partners; acting as a middleman for money and information;
- **Expertise:** Contributing specialized, tested know-how or experience;
- **Standardization:** Supplying a predictable, uniform, off-the-rack set of processes and tools;
- **Aggregation:** Coordinating or consolidating information for, or exercising responsibilities or rights of and for, crowdfunding participants;
- **Curation:** Verifying, vetting, or selectively endorsing businesses and projects seeking funding;
- **Disclosure:** Mitigating information asymmetries;
- **Promotion:** Marketing or publicizing businesses and projects listed on the site;
- **Actualization:** Conveying venturers' vision to the crowd;
- **Attraction:** Drawing the crowd to the crowdfunding website and, as a result, the featured businesses or projects; and
- **Safeguarding:** Shielding investors from harm and providing business and projects relief from liability.

Some of these functions overlap. For example, interconnection may involve disclosure, and some forms of curation may constitute promotion. A number of the functions comprise embedded sub-functions. For instance, curation may include verifying, vetting, and endorsement and may require expertise. Moreover, an individual crowdfunding intermediary may serve in one or more of the roles represented by these functions. The list of functions is no doubt incomplete and some of the labels may be unfamiliar or are inapt, but the inventory serves as a useful touchstone for key crowdfunding intermediary activities.

Intermediary Classification by Type

Classifying crowdfunding intermediaries presents challenges. However, because their functions in financing transactions are most like those of intermediaries involved in securities offerings, it seems appropriate to use labels from securities intermediation as a guide. Over time, scholars and other commentators have classified these intermediaries and their intermediating roles in securities transactions into key categories (Barnett, 2001; Choi, 2000, 2004; Choi & Fisch, 2003; Coffee, 2002; Gilson & Kraakman, 1984; Heminway, 2013; Laby, 2006). These classifications, when compiled, can be reduced to a simple, useful, taxonomy featuring four categories of intermediary: distributional conduits, information intermediaries, collectivizing intermediaries, and reputational intermediaries (Heminway, 2013). As with the list of functions set forth above, these categories of intermediation are somewhat fluid. Intermediaries may fit into more than one category. Nevertheless, this taxonomy provides a useful framework for the classification of crowdfunding intermediaries.

Distributional conduits, information intermediaries and collectivizing intermediaries are classifications based on the functional role played by the intermediary in its market-related operations. Distributional conduits serve as middlemen between transaction principals. They may convey cash, securities, or other assets or information between or among transacting principals. Public offering underwriters are a classic example of a distributional conduit.

Information intermediaries also represent a functional category of intermediary. They supply information to or interpret information for use by transaction participants and others. Information intermediaries need not be formal go-betweens for the transaction principals. Rather, they may provide services to one or more of the transaction participants (principals or intermediaries). They may, but need not, be certifiers. Proxy advisors and rating agencies are typical examples of information intermediaries.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Collectivizing intermediaries serve the aggregated interests of a particular class of transaction participant by acting as agents, monitors, or knowledge repositories. In one or more of these roles they may, for example, consolidate action on behalf of transaction participants or conduct inquiries for, and provide guidance to, segments of transactional constituents. These aggregation efforts may resolve or limit collective action problems. Institutional investors typify collectivizing intermediaries. A purchaser representative for unsophisticated investors in a private placement of securities also would be classified as a collectivizing intermediary.

Reputational intermediaries lend their status and appearance of trustworthiness—their reputational capital—to the transaction. This means that it often is more *who they are* than *what they do* that impacts crowdfunding transactions. They also are commonly referred to as gatekeepers and can be divided into dependent and independent reputational intermediaries. A dependent intermediary is an agent or servant of its clients' interests who owes a fiduciary or fiduciary-like duty to the client. An independent reputational intermediary acts in a unbiased fashion—more for its own benefit or the benefit of transactional participants as a whole than in a selfless way for and on behalf of a client.

Table 1 classifies crowdfunding intermediaries based on these categories.

Table 1. Classifying crowdfunding intermediaries

Intermediary Classification	Function/Role	Example
Distributional Conduit	• Interconnection • Expertise • Standardization • Disclosure • Promotion • Actualization • Attraction	• Platform/Website • Payment Processor
Information Provider/Interpreter	• Expertise • Standardization • Curation • Disclosure	• Platform/Website • Due Diligence Service Provider • Industry Research Supplier • Certifier
Collectivizer	• Interconnection • Expertise • Standardization • Aggregation • Disclosure	• Platform/Website • Industry Research Supplier
Reputational Intermediary • Independent	• Expertise • Standardization • Aggregation • Disclosure • Safeguarding	• Platform/Website[1] • Certifier • Auditor • Insurer[1]
• Dependent	• Expertise • Standardization • Aggregation • Disclosure • Promotion • Safeguarding	• Platform/Website[1] • Legal Counsel • Insurer[1]

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

This summary demonstrates the importance of certain intermediary functions. Table 1 shows that expertise, standardization, and disclosure play significant roles in crowdfunding intermediation because these functions may be common to all four categories of intermediary—distributional conduits, information providers/interpreters, collectivizers, and reputational intermediaries—depending on the particular intermediary and the context of its participation in the crowdfunding space or a specific crowdfunded financing. Accordingly, these functions evidence core roles played by crowdfunding intermediaries.

Table 1 also illustrates that crowdfunding platforms may provide any or all of the identified intermediating functions, depending on the circumstances. As such, they may find themselves serving various crowdfunding participants in a number of different capacities. They are conduits that provide information and a consolidated approach to issues involving venturers, funders, and other intermediaries. In addition, a platform may lend its reputation (which reflects, among other things, the platform's attentiveness to its legal responsibilities and its operating track record) to the campaigns featured on its site.

Preliminary Observations about Intermediation in Crowdfunding

A more complete understanding of the type and functions of crowdfunding intermediaries, when viewed through the lens of legal scholarship on financial intermediation, allows for the classification of those intermediaries into categories based on their role in crowdfunding—what they do for or crowdfunding participants from a transactional perspective or how they impact participation in crowdfunded financings. The overall picture substantiates intuitions about the significance of certain intermediating functions and reveals that, absent regulatory constraints, platforms have the capacity to provide comprehensive intermediation in crowdfunding.

These findings are significant to crowdfunding participants. They can use this information to better understand the types of intermediaries that contribute to crowdfunding and the roles they may serve. Their enhanced ability to differentiate among intermediaries and their functions should help determine the crowdfunding partnerships that best meet their needs.

For instance, a better knowledge of the benefits—and especially the core common values of expertise, standardization, and disclosure—offered by different forms of crowdfunding intermediation may assist a venturer in deciding whether to use crowdfunding to finance his or her business or project and, if crowdfunding is a viable financing option, to guide that venturer in the choosing whether to use a platform or other intermediary in its financing (and if so, which one or ones). Similarly, a funder may use information about the types of crowdfunding intermediaries and the roles they play to be better understand the risks of his or her participation in particular crowdfunding campaigns. And a platform or other intermediary may find the information provided in this chapter helpful, for instance, in establishing its business model and in deciding which services to provide itself and which to contract for from third parties. In particular, platforms may be incentivized, in recognition of their capacity to fill myriad roles in crowdfunding, to use the information provided in this chapter to differentiate themselves from competitors and create unique market niches based on the nature of the services they provide.

Policymakers and enforcement agents, including government regulators, also should find this information of value. Too often, calls for regulation come from self-interested or otherwise biased sources. Government officials may be under pressure to take action and be unfamiliar with the crowdfunding industry and those who take part in it. Well-developed factual information about the nature of crowdfunding intermediation should enable the development of more nuanced, targeted regulatory objectives,

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

interpretations, and actions. Informed governance is more likely to result in the exercise of sensible regulatory power and enforcement discretion that supports an efficient, fair crowdfunding industry.

Intermediaries commonly are conceptualized as risk-reduction mechanisms in transactions. They "typically exist in a transaction as a means of increasing its overall efficiency; the benefits an intermediary offers to transaction participants or the markets in which they operate are expected to exceed the aggregate costs of their participation. In financial transactions, intermediaries often serve to address or balance informational asymmetries that may negatively impact the market in which those transactions occur. They do this in various ways, depending on the circumstances in which the intermediation occurs. For example, intermediaries may supply, construe, or confirm information, or they may serve a signaling function" (Heminway, 2013, p. 180). Yet, the costs and benefits of crowdfunding intermediation are difficult to determine at this early stage in the market's development. New players in the crowdfunding game continue to be introduced as the market innovates. And the two-sided nature of the crowdfunding market is not yet well understood.

As a result, the description of crowdfunding intermediation provided in this chapter is a preliminary assessment, and it is very general. For some, it may not be specific enough to provide guidance or support. A static identification of different types of intermediaries and what they do provides a necessary, yet likely insufficient, basis for making essential judgments about crowdfunding participation and regulation. This information does not, for example, permit a qualitative judgment to be made about intermediaries or their services. Intermediaries serving in the same roles may provide skills or support of varying quality, and in an emerging industry with a nascent set of intermediaries, quality may be especially hard to benchmark and determine. And the perceived quality of a particular intermediary may differ based on factors endemic to the individual crowdfunding participant accessing its services. These are real challenges for crowdfunding intermediation and those who study it.

SOLUTIONS AND RECOMMENDATIONS

To better inform and facilitate decision making by crowdfunding participants, policymakers, and enforcement agents, it would be beneficial if crowdfunding intermediation could be described with more clarity and precision. Specifically, it would be useful to understand the circumstances in which the benefits of crowdfunding intermediation exceed its costs. This would enable us to benchmark intermediary success and failure as a means of determining the efficiency and effectiveness of various intermediaries and forms of intermediation. In addition, the identification or development of quality metrics for the various types of crowdfunding intermediaries would be a worthy objective. If we understand what quality is in various intermediation functions, then we can assess, foster, and signal it.

Defining crowdfunding intermediation in a more consequential way along these lines requires both creativity and planning. The foundational descriptive matrix provided in this chapter isolates expertise, standardization, and disclosure as core values in crowdfunding intermediation and highlights the capacity of platforms to play a commanding role in crowdfunding intermediation. These discoveries provide food for further thought.

One type or level of expertise, standardization, or disclosure in crowdfunding intermediation may be more beneficial or costly than another. Pinpointing the relative and interactive costs and benefits of these intermediation functions therefore may be significant. Particular attention to the capability and desirability of engaging a crowdfunding platform to deliver the required type or level of expertise, stan-

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

dardization, or disclosure also should be useful. This type of information could help us to describe and predict intermediary success and failure, and take action to promote the former and prevent the latter.

Similarly, the notion of quality—what constitutes quality intermediation—as across the various types of intermediary and their functional roles may be susceptible of definition. Expertise, standardization, and disclosure provide focal points for analysis. These functions, properly defined, might constitute and, if promoted effectively, signal intermediary quality to the market. Each role that an intermediary plays and the way the intermediary carries out that role are likely to be material to understanding quality crowdfunding intermediation.

Understanding what makes for efficient, effective crowdfunding intermediation is at the heart of ensuring the success of the crowdfunding industry. Of course, further academic research also is essential to a better appreciation of crowdfunding intermediation and the development of a healthier, better informed market for crowdfunded finance. The foundational typologies and taxonomy provided in this chapter afford us basic information from which we can work. The next part of the chapter explores how to use that knowledge and salient observations made in legal and business scholarship to approach some of the unresolved questions in crowdfunding intermediation.

FUTURE RESEARCH DIRECTIONS

The challenges associated with describing crowdfunding intermediation in a way that gives it meaning in a practical context are palpable. Yet, there are possible paths forward. Successful progress in surmounting the challenges will require significant amounts of further academic and non-academic research—theoretical and empirical.

The need for continuous engagement by scholars and other researchers will be critical given the rapidly developing crowdfunding industry. As a preliminary matter, it will be vital that academics and others be in a position to continue to identify and catalog new intermediaries as they emerge. Sustained attention to the functions provided by the various crowdfunding intermediaries also will be needed. These research tasks will enable expansion of the model provided in this chapter and the suggestion of alternative models to illustrate distinct market attributes.

These ongoing changes in crowdfunding intermediation make the task of designing a research agenda in the area complex. The centrality of expertise, standardization, and disclosure to crowdfunding intermediation and the important role played by crowdfunding platforms as intermediaries are key touchstones based on the depiction of crowdfunding intermediation in this chapter. Grouped research questions emanating from those touchstones include the following:

- What makes a platform or other crowdfunding intermediary efficacious as a distributional conduit, information intermediary, certifier, or reputational intermediary in the two-sided crowdfunding market? What does expertise mean in this context? What level of standardization is desirable? What level of disclosure is optimal?
- How many roles should a platform serve? Is crowdfunding better off if other intermediaries are crowded out or supported? What do theories of financial intermediation (the potential for conflicting interests, the application of fiduciary principles generally, and the operation of cognitive biases) and two-sided markets have to say about those questions?

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

- What is the optimal combination of intermediation activities for different types of crowdfunding? How should these activities be allocated among different types of crowdfunding intermediaries capable of performing the relevant functions? Should regulators or the market make these determinations?

In addition, the roles and benefits of intermediaries other than platforms are an important area for future research. This area has barely begun to be explored. Yet each type of crowdfunding intermediary and the clients it serves can be expected to be interested in better understanding—and motivated to better understand—the advantages and disadvantages of providing and using services in the crowdfunding environment.

In fact, actual and potential crowdfunding participants, policymakers, and enforcement agents all can be expected to be engaged by these questions and to rely on the related research in their decision making. This research can and should be approached by academics from a number of different scholarly traditions using a variety of methodologies. Moreover, private research firms are likely to engage in the analysis of issues relating to crowdfunding intermediation to serve their clients who are interested or engaged in crowdfunding. Danmayr (2014) aptly concludes that "ongoing scientific discourse will help to clarify the crowdfunding picture…[C]rowdfunding deserves greater attention, both in science and society."

CONCLUSION

This chapter (1) describes and categorizes crowdfunding intermediation based on salient teachings from the generalized academic literature on intermediation in financial transactions, (2) offers solutions and recommendations arising from that commentary, and (3) suggests further relevant avenues for research relevant to crowdfunding participants, policymakers, and enforcement agents. The resulting picture is an incomplete one, but provides a foundation for further analysis and testing. As the crowdfunding market further develops and matures, this analysis and testing will become both more possible and more important.

This chapter agrees with the assessment of Hass et al (2014, p. 2) when they offer: "In order to understand the dynamics of crowdfunding, one has to understand how crowdfunding today actually works, and what the constituent parts are, as well as how crowdfunding intermediaries differentiate. Without this knowledge, the dynamics in this context cannot be traced. Information systems are responsible for enabling crowdfunding and an in-deep understanding about this topic helps to develop better solutions for the effective and efficient utilization of this new way of funding."

The extant literature has only begun to explore the depths and richness of crowdfunding, which is (as an emergent approach to financing ventures) becoming a deeper, richer area for research with each passing day. Although the ventures seeking financial backing from the crowd and the funders constituting that crowd are, themselves, deep, rich subjects for further study, the intermediaries are critical lynchpins in better understanding the crowdfunding phenomenon.

Despite its relative youth and modest manifestations, crowdfunding intermediation is more complex than it would first appear—and than many scholars and other commentators have admitted to date. Although crowdfunding platforms have received some attention from researchers and theorists, that attention has been relatively recent and limited. However, crowdfunding platforms—while central to the enterprise and of critical importance—are not the only intermediaries that serve (and promise to serve) important roles in crowdfunded financings of businesses and projects. Crowdfunding participants partner

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

with a variety of intermediaries to incentivize their participation in crowdfunded finance. Moreover, the landscape of crowdfunding intermediation is constantly changing. Market innovations bring new players and roles to the industry, including especially new intermediaries and forms of intermediation.

Thus, crowdfunding intermediation is in flux at present. While certain observations and claims can be made that aid crowdfunding participants, policy makers, and enforcement agents in understanding the current and possible future crowdfunding intermediation landscape, these reflections are a mere beginning. Expertise, standardization, disclosure, and the fulcrum-like role played by crowdfunding platforms all appear to be important pieces in the crowdfunding intermediary puzzle. When viewed through the lens of existing scholarship on intermediation, these factors may help solve the puzzle, affording us a clearer, more comprehensive picture of optimized intermediation in crowdfunded finance. That optimization may involve regulation or be driven by market forces (including, for example, agreement on and compliance with industry best practices). More research is required to determine whether and how attention to these considerations may provide a partial or complete solution.

KEY TERMS AND DEFINITIONS

Certifier: An individual who or entity that assesses and verifies the compliance of a business, product, or service with industry or other applicable standards.

Financing: A solicitation of funding; the process of soliciting monetary backing for a business, project, or transaction.

Intermediary: An individual or entity serving as a go-between, distributor, or other agent in a transaction between or among principals.

Offering: A transaction in which funding is solicited for business activities; a financing transaction, especially (but not exclusively) one involving a proposal to sell, or the solicitation of a proposal to buy, a security or other investment or financial instrument.

Platform: A website through which crowdfunded financing campaigns are conducted over the Internet; a website that connects investors with businesses or projects needing funding.

Portal: Synonymous with a platform; used in U.S. federal securities law in the term "funding portal" to refer to one of two kinds of regulated intermediaries (the other being brokers) that must participate in securities (investment) crowdfunding.

Venture: A business or project, whether or not conducted through a legal entity or firm.

Venturer: A founder, creator, entrepreneur or other principal who undertakes or participates in the establishment or execution of a business or project; an individual who or entity that bears the fundamental burden in launching and carrying forward a for-profit or not-for-profit business or project.

ENDNOTE

[1] Platforms and insurers may be deemed to have duties to their clients in some contexts. Accordingly, they may be classified, depending on the circumstances, as either independent or dependent reputational intermediaries.

Chapter 57
Proactive Law as Competitive Advantage in Crowdfunding

Jack Wroldsen
Oklahoma State University, USA

ABSTRACT

This chapter explains how the paradigm of proactive law as competitive advantage can help entrepreneurs succeed in crowdfunding campaigns. Business law scholars have developed theories of "proactive law" and "law as competitive advantage" to show how law can be transformed from an obstacle into a strategic business advantage. This chapter analyzes the evolving crowdfunding landscape through the lens of proactive law as competitive advantage. The chapter proposes several types of innovative securities designed to create competitive advantages in crowdfunding offerings. For example, one type would give crowdfunding investors long-term equity interests while simultaneously eliminating short-term corporate governance challenges for small crowdfunded companies. Apart from securities, the chapter also describes how a proactive approach to law can enhance crowdfunding campaigns in multiple areas, from intellectual property to tax efficiency. To conclude, the chapter suggests expanding the theory of proactive law as competitive advantage to additional areas of entrepreneurship, beyond crowdfunding.

INTRODUCTION

Despite encountering regulatory obstacles, crowdfunding continues to emerge as a viable business model for funding early-stage entrepreneurial ideas. This chapter proposes a theoretical construct to aid entrepreneurs in carrying out crowdfunding offerings in the face of legal uncertainty. Specifically, this chapter investigates a concrete research question: How can the legal theory of proactive law as competitive advantage help entrepreneurs succeed in crowdfunding campaigns?

The chapter is organized as follows. It first briefly explains the legal landscape that different types of crowdfunding offerings confront. Then Part I develops a conceptual framework of viewing law proactively as a competitive advantage in crowdfunding campaigns. Part II applies the framework to provide specific examples of how entrepreneurs can leverage law to succeed in crowdfunding offerings.

To conclude, the chapter moves beyond crowdfunding to suggest how further research should develop the theory of proactive law as competitive advantage in the broader context of the disruptive innovation that entrepreneurship breeds. The chapter focuses on US law, though the principles of proactive law as competitive advantage are broadly applicable anywhere.

BACKGROUND: REGULATORY LANDSCAPE OF CROWDFUNDING OFFERINGS

The origins of online crowdfunding were not auspicious. Initially, crowdfunding resulted in more cease-and-desist letters than business success stories. But over time, the creative force of entrepreneurship continues to propel crowdfunding models to break free from the antiquated legal shackles that have restrained crowdfunding's development. Accordingly, today's legal panorama for strategic management of crowdfunding campaigns is vastly improved—and significantly more complex—than just a few years ago.

From a legal perspective, entrepreneurs must choose one of two types of crowdfunding offerings: the fork in the regulatory road is whether the crowdfunding campaign will offer securities (e.g., stock, interest-bearing loans, or another form of profit-sharing interests) or something other than securities (e.g., a pre-purchased product, token rewards, or donative support of a nonprofit enterprise, including non-interest bearing loans). Laws treat crowdfunding offerings of *securities* differently from *non-securities* (Fallone, 2014). Of course, entrepreneurs may also develop hybrid crowdfunding campaigns that offer a combination of a security and a non-security.

The evolution of laws on crowdfunding of *securities* has differed markedly from that of *non-securities*. Both paths, though, epitomize the disruptive interplay between law and entrepreneurship. Innovative entrepreneurship can be a two-edged sword that both creates new business opportunities and simultaneously challenges, and even destroys, stagnant legal regimes. In crowdfunding, the unique paths that *securities* and *non-securities* forms of crowdfunding have traversed can be likened metaphorically to tree roots in both their power and resourcefulness.

Laws on Crowdfunding of Securities

The history of crowdfunded securities exemplifies how the disruptive force of entrepreneurship can topple regulatory obstacles to build new industries—like tree roots that undermine the foundation of a cement wall, causing the wall to collapse. At crowdfunding's inception, a regulatory wall prevented entrepreneurs from offering equity securities through crowdfunding in the US (Hazen, 2012; Heminway & Hoffman, 2011; Pope, 2011). In 2010, for instance, a US crowdfunding company named ProFounder Financial invited entrepreneurs to sell stock in start-up companies to the general public over the Internet. Such a seemingly innocuous business model was in fact a direct assault on the regulatory wall that barred crowdfunding offerings of securities. As a result, ProFounder was forced to shut down its website and cease all crowdfunding activities (Bradford, 2012).

Another prominent challenge to the regulatory wall in the US occurred in 2011 through the online BuyaBeerCompany crowdfunding campaign. The crowdfunding initiative to buy Pabst Brewing Company enjoyed phenomenal viral success in social media. In six months it attracted over $200 million in online pledges from more than five million people. But the BuyaBeerCompany campaign offered an

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

"investment certificate" to crowdfunding contributors in a way that violated US securities laws, so government regulators shut down the illegal campaign before the company could collect investment funds and purchase the target beer company (Bradford, 2012).

In view of these legal setbacks to crowdfunding offerings of equity securities in the US, a broad coalition of social media activists, business leaders, scholars, and politicians banded together to advocate legal reform (Wroldsen, 2012). And by 2012, the crowdfunding seeds planted by entrepreneurs and watered through social media had spawned invasive tree roots. The roots burrowed under the cement wall of legal obstacles that outlawed crowdfunding offerings of securities, causing the wall to crumble. The CROWDFUND Act was signed into law in the US on April 5, 2012. The Act creates, and directs the Securities and Exchange Commission (SEC) to implement, a limited channel for small or start-up companies to sell up to $1 million of securities per year to the general public through crowdfunding (Bradford, 2012).

The entrepreneurial victory is tempered, though, because the Act has yet to become operational, as the SEC has not yet published final regulations. In addition, the Act is fraught with legal requirements that may add excessive costs that limit the Act's usefulness for start-up companies (Bradford, 2012; Hurt, 2015). Nonetheless, the Act represents an important step forward in efforts to legalize US crowdfunding campaigns that offer securities to investors.

As discussed in Part II below, by creating the possibility of online crowdfunding for securities, the CROWDFUND Act lays the groundwork for entrepreneurs to seize competitive advantages in crowdfunding offerings. And though this chapter addresses US crowdfunding laws specifically, laws in other countries (e.g., the U.K., Nordic countries, France, Italy, Germany, Hong Kong, Australia, Egypt) are moving in a similar direction (Weinstein, 2013). Thus, all over the world opportunities are opening up for entrepreneurs to create competitive advantages through crowdfunding.

Quasi-Crowdfunding Offerings to Wealthy Investors

Before proceeding to a more detailed discussion of how entrepreneurs can use law proactively in crowdfunding campaigns, it is helpful to sketch briefly two other emerging trends in online securities offerings. The first is online stock sales made exclusively to wealthy investors. The second is online peer-to-peer lending.

Apart from the CROWDFUND Act, securities in start-up companies can also be sold online in quasi-crowdfunding offerings to wealthy investors, known in the US as Rule 506 offerings. The JOBS Act of 2012 made it legal in the US for start-up companies to advertise stock sales to the general public over the Internet, so long as the companies only sell stock to so-called accredited investors. In brief, accredited investors are investment companies (e.g., private equity firms) and wealthy individual investors (e.g., people having over $1 million in net worth or $200,000 in annual income) (Parsont, 2014).

Hence, the tree roots that toppled the regulatory wall barring crowdfunding offerings also destroyed the barrier that prevented entrepreneurs from openly advertising their stock offerings to wealthy investors. Though selling securities only to accredited investors can hardly be characterized as true *crowd*funding—a group of wealthy investors is not the same as the diverse crowd that makes up the general public—the regulatory barriers are significantly fewer than those guarding crowdfunding offerings. Predictably, online stock offerings that are only available to wealthy investors are a common business strategy of private companies in the US and many other countries (Parsont, 2014; Pollman, 2012).

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Peer-to-Peer Lending in Crowdfunding

Another form of securities crowdfunding that has thrived even before passage of the CROWDFUND Act is peer-to-peer lending of interest-bearing notes. Under US securities laws, interest-bearing crowdfunded loans typically qualify as securities subject to regulation. But where crowdfunding of equity securities required a new law (the CROWDFUND Act), the crowdfunding business model of interest-bearing peer-to-peer lending managed to fit within the existing regulatory framework. In short, crowdfunding websites that facilitate interest-bearing peer-to-peer loans (such as Prosper and Lending Club) register the loans with the SEC to avoid violating securities laws (Chaffee & Rapp, 2012; Verstein, 2011).

Laws on Crowdfunding of Non-Securities

Beyond *securities* offerings, entrepreneurial creativity also triumphed with respect to crowdfunding of *non-securities*. The triumph, though, was of a dramatically different character than the development of legal opportunities for crowdfunding of *securities*. The development of the crowdfunding market for non-securities shows how entrepreneurs exploit small cracks in the regulatory minefield to grow thriving new industries—like a tree sprouting from amidst the rocky, arid terrain on a rugged mountain top.

Some of the first green shoots were websites that deftly avoided the heavily-regulated world of securities offerings. These websites prohibited crowdfunding offerings of stock, or any other security (such as interest-bearing loans). Instead, the sites sought to nurture innovative crowdfunding business models in the regulatory fissures where securities laws do not apply. For instance, several sites facilitated crowdfunding campaigns that offered online contributors a variety of rewards (like a collector's edition T-shirt, or insider access to a movie production) or the opportunity to pre-purchase innovative products (like a smartwatch, or a new video game). Other sites avoided securities laws by soliciting donations or offering non-interest bearing loans (such as micro-lending to small-business owners in developing countries). In these ways, the non-securities form of crowdfunding capitalized on an unregulated market niche and quickly expanded into a multi-billion dollar industry. Hundreds of websites have proliferated under the non-securities crowdfunding model, including sites like Kiva, Kickstarter, IndieGoGo, and SellaBand.

PART I: PROACTIVE LAW AND COMPETITIVE ADVANTAGE

Progressing from this brief background of the entrepreneurial emergence of both securities and non-securities crowdfunding models, the remainder of the chapter explains how crowdfunding laws can be leveraged as an opportunity rather than lamented as a hindrance. The chapter's research method is a strategic review of business law scholarship on "proactive law" and "law as competitive advantage." The former stems primarily from European scholars and the latter from US researchers.

Methodologically, Part I provides a conceptual overview of the two theories. Previous research has developed the theories in the broad context of business management and executive decision making generally. But the theories have not been tested specifically in the entrepreneurial context of strategic management of crowdfunding campaigns. Accordingly, Part II applies the theories to the emerging regulatory schemes covering crowdfunding campaigns to assess their viability in the crowdfunding environment.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Then, the conclusion interprets Part II as a first step in a larger project. Crowdfunding can be viewed as an example of disruptive innovation where new technologies (aided by new laws) give rise to new business models that can threaten traditional businesses. If theories of proactive law as competitive advantage yield insights for crowdfunding entrepreneurship, as Part II contends, then future research should expand the theories to encapsulate disruptive innovation in all of entrepreneurship, not solely entrepreneurship expressed through crowdfunding.

Conceptual Framework: Proactive Law

In Europe, the Nordic School of Proactive Law (2015) has advanced the perspective that law should be embraced as an asset, not avoided as a liability. Instead of reacting to legal problems that are forced upon a company, often in the form of *ex post* litigation, a proactive law approach considers *ex ante* how to use laws and structure business decisions to avoid legal disputes altogether. Proactive law is thus preventive rather than reactionary, analogous to healthcare treatment that aims to avoid disease (e.g., vaccinations) and foster well-being (e.g., exercise and nutritious diet) instead of cure sickness after the patient is already ill (Siedel & Haapio, 2010).

Beyond simple prevention of legal problems, proactive law also promotes legal strategy as a core component of business strategy. Proactive law invites insights from other business disciplines in order to guide legal decisions towards accomplishing business goals, not merely avoiding negative outcomes. For example, from its inception the proactive law movement has found natural synergies with information technology (Siedel & Haapio, 2010). And synergies abound in many other business disciplines, such as marketing, sales, finance, management, and accounting. Proactive law is a forward-looking approach to law, integrating legal strategy into business goals before any legal problems arise.

Conceptual Framework: Law as Competitive Advantage

In the US, a similar theoretical approach to proactive law has developed, but with different terminology. Viewing law as a competitive advantage in business, US scholars apply to the legal field the competitive advantage paradigms from strategic management research (Bagley, 2010; Bird, 2008, 2011; Siedel 2002; Siedel & Haapio, 2010, 2011). One prominent strand of this research defines a firm's sustainable competitive advantages vis-à-vis the firm's rivals as including only those resources of the firm that meet four criteria (Barney, 1991). First, a resource must provide value. Second, it must be rare or unique. Third, the resource must be difficult for competitors to copy. And fourth, there must not be equivalent substitutes for the resource.

Applying the four-pronged strategic management paradigm, legal scholars have demonstrated that a firm's legal environment is an intangible resource that can function as a sustainable competitive advantage (Bagley, 2010; Bird, 2011). The four attributes that strategic management research mines for competitive advantage can be applied to law as follows. First, strategic management of a firm's legal environment undoubtedly creates value for the firm. Whether the value springs from mere avoidance of costly legal violations or arises from revenue-generating activities such as patent protection, a firm's legal strategy (or lack thereof) has the unambiguous potential to contribute positively or negatively to the firm's bottom line. Especially in the Internet age, where social media can impact a firm's public image so quickly and powerfully, crafting a legal strategy that leads to a favorable public reputation can be vital to maintaining goodwill and promoting business opportunities.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Second, though laws themselves are obviously not rare, a firm's own particular mix of legal issues is often unique. The uniqueness arises from a host of different decisions that firm management makes to position the company to confront certain laws and not others. For example, a firm incorporated in one jurisdiction (say, France) faces different corporate laws than a firm in another jurisdiction (say, Delaware). Further, a firm that relies on many part-time or contract workers encounters different employment laws than a firm with a predominantly full-time workforce, and in either case the labor laws vary greatly if workers unionize. Similarly, if a firm defends its intellectual property through closely-guarded trade secrets (such as Coca-Cola's renowned but confidential recipe), then its legal concerns vary enormously from a company that pursues an active patent portfolio (such as Apple or Samsung). In sum, through a multitude of small and large managerial decisions, a firm positions itself to confront its own unique, or rare, blend of legal and regulatory issues.

Third, a firm's strategic decisions with regard to certain legal issues can be difficult for competitors to copy. In the first place, imitating a competitor's legal strategy requires knowing what the competitor's legal strategy is. But legal advice is usually confidential and privileged. And to the extent legal advice is discerned through a company's observable actions, the cause and effect relationship can be ambiguous. Legal strategy can also be difficult to imitate when it is embedded in company relationships, whether relationships with regulators, employees, customers, or suppliers. For example, legal contracts form the basis of commercial relationships, but the relationships are more complex than what can be reduced to contractual provisions. Therefore, even if a firm could copy a competitor's contract verbatim, the contract's words stand for a much more nuanced social relationship that is not easily cloned. Relational aspects such as trust, shared plans and goals, cooperation, and opportunism—though represented and memorialized through legal contracts—in practice transcend the documents themselves. Legal contracting strategy, then, can only be mimicked through complex interpersonal behavior and performance, not mere reproduction of words on a page (Bird, 2011; DiMatteo, 2010).

The fourth component of resources that offer sustainable competitive advantages—lack of substitutes—is also true of a firm's legal environment. In the modern economy, there are no complete substitutes for the rule of law. Companies cannot opt out of the legal regimes that mandatorily apply in their jurisdictions. Even though some firms and individuals operate at the margins of the mainstream economic and legal system (e.g., the informal or extralegal economy) or establish alternate means of transacting business (e.g., close-knit communities that engender trust among members), ultimately the activities are still subject to laws that apply in the location where the activities take place. Furthermore, in the long term, commercial activities that seek independence from the formal legal system are difficult to scale into the mainstream economy without also integrating into the formal legal system.

Firms do have flexibility in determining which substantive laws apply to them most directly (as discussed above with respect to the rarity component of the competitive advantage analysis), but a company would be hard-pressed to develop a substitute legal environment to govern its affairs in place of the existing legal system. Accordingly, if a firm achieves a competitive advantage through use of laws and the legal system, a rival firm will not easily erode that competitive advantage by substituting an equivalent legal system, notwithstanding marginal competitive threats from extralegal transactions or close-knit communities.

In sum, law can function as a sustainable competitive advantage. A firm can leverage law to create value and cultivate its own unique mix of legal issues. And a firm's creative use of law can be difficult for competitors to copy or design around with equivalent substitutes.

Conceptual Framework: Crowdfunding Offerings

So, strategic management of a firm's legal environment can be conceptualized through the related theories of proactive law and law as competitive advantage. Next, the theories can be deployed to further the purpose of this chapter: how can entrepreneurs use crowdfunding laws proactively to foster competitive advantage in crowdfunding offerings? As an initial step, a proactive law approach integrates legal strategy with business strategy from the outset. In crowdfunding, failing to involve legal strategy can be disastrous because an otherwise successful crowdfunding effort could be entirely derailed by regulatory violations. For instance, had the organizers of the BuyaBeerCompany crowdfunding campaign consulted legal counsel before launching the campaign, they could have structured the offering to comply with securities laws. The difference could have meant going down in history as one of the most successful crowdfunding efforts ever ($200 million from five million participants!) instead of being remembered as a vivid illustration of failed legal (and thus failed business) strategy.

Beyond avoiding calamity, a proactive law approach is driven by affirmatively achieving business goals. To apply proactive law in the crowdfunding context, then, it is a necessary first step to identify the business priorities that the crowdfunding offering is designed to achieve. Once the company's priorities are identified, legal requirements can be brought to bear on deciding how best to achieve the business goals.

For example, is the primary objective of the crowdfunding offering to deepen the public's awareness of a company through social media (a marketing objective), or simply to raise money (a finance objective)? If marketing goals are preeminent, then what kinds of incentives are most effective at attracting attention in the online, social media environment? For example, would the target market be more interested in buying shares of stock, pre-purchasing a creative product, lending money to the company, engaging in a creative contest, or participating in an online dialogue within a select community? Perhaps the business goals would coalesce around a desire to increase social media exposure, create an online community of like-minded people, and invite ideas for future product development, for example. In that case, a proactive approach to crowdfunding laws might suggest a non-securities crowdfunding offering in order to lessen legal hurdles without sacrificing company objectives.

In contrast, say the business goals of the crowdfunding offering were primarily to raise money, with less emphasis on the marketing objective of broad public exposure through a wide crowdfunding campaign. In that situation, a proactive legal approach might develop a legal strategy involving a securities offering to wealthy investors in order to most effectively achieve business goals. There would be no legally-imposed limit on the amount of money the company could raise, so long as only accredited investors purchased stock in the offering. The legal strategy would therefore achieve the business goal of raising as much investment capital as possible. But such an approach is not without business risk: if the offering appealed to the general public, then a company could squander potential goodwill because non-wealthy investors would be legally barred from participating. For this reason, legal strategy should follow business priorities in designing crowdfunding campaigns that target essential business objectives.

PART II: CROWDFUNDING LAWS AND COMPETITIVE ADVANTAGE

Entrepreneurs are well served by proactively uniting legal strategy with business objectives at the beginning of a crowdfunding offering. Doing so not only helps prevent future legal problems but also works to

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

achieve business goals. Part II deepens the analysis and describes more specifically how entrepreneurs can cultivate competitive advantages by using law proactively in crowdfunding offerings.

The first suggestions are made with respect to crowdfunding campaigns that offer *securities*: entrepreneurial companies should offer innovative crowdfunding securities that cater to the strengths of crowdfunding investors while simultaneously eliminating corporate governance problems associated with crowdfunding offerings of securities. Afterwards, the chapter highlights how entrepreneurs can use law proactively in crowdfunding offerings that include *securities* or *non-securities* in order to prevent future legal problems and maximize the value of crowdfunding efforts.

Corporate Governance and Crowdfunded Securities

As described above, a resource that functions as an enduring competitive advantage creates value, is unique (or rare), is difficult to imitate, and lacks substitutes. Especially because laws related to crowdfunding of securities are so new and remain in flux, substantial opportunities exist to develop competitive advantages. But the opportunities to seize competitive advantage in crowdfunding offerings of securities are often masked by the challenges that crowdfunding poses for traditional stock offerings. Typically, start-up companies seek a small number of investors who each invest a relatively large amount of money, often either angel investors or venture capitalists. Start-up companies have limited resources and therefore justifiably want to avoid the logistical difficulties and corporate governance concerns involved with managing relationships with many investors. In addition, start-up companies value the advice and connections that sophisticated investors (like experienced angel investors and venture capitalists) provide to fledgling operations.

For the most part, crowdfunding of equity securities runs completely counter to all of these natural impulses of start-up company founders. Understandably, then, there are multiple reasons why entrepreneurs might hesitate to embrace stock offerings through crowdfunding. Traditionally, company founders would be crazy to accept hundreds, or thousands, of small investors, yet in a crowdfunding offering a company would seek exactly that. Furthermore, many crowdfunding investors would likely not have extensive investment experience with start-up companies. Coupling a lack of investment experience with the inherent uncertainty of start-up businesses is a combustible recipe for crowds of disgruntled shareholders.

And many disgruntled shareholders in a start-up company presents numerous corporate governance concerns for management. For instance, shareholders have the right to vote, whether for directors on the board, amendments to the company's governing documents, or fundamental changes to the company's business, such as a merger or large acquisition. For a small company, managing shareholder votes when hundreds or thousands of investors are involved can be an excessive cost and intrusive distraction. In addition, shareholders, as partial owners of the company, can demand to see the company's books and records, which can be not only time-consuming and inconvenient but also the impetus behind shareholder lawsuits (Schwartz, 2013).

Apart from voting rights and requests to inspect books and records, shareholders can also propose shareholder resolutions for management's consideration. Resolutions can be a powerful tool for shareholders to spread complaints or bad press about the company, especially in crowdfunding's social media environment. More aggressively, and depending on a variety of factors, shareholders can launch proxy contests and tender offers in an effort to oust company management and take control of the company (Schwartz, 2013).

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Finally, the company's directors and officers can have personal liability to shareholders for breach of fiduciary duties. Potential personal liability for entrepreneurs can be a huge disincentive to offering stock to the general public, especially in view of the high uncertainty and unpredictability of start-up companies. Companies may purchase directors' and officers' (D&O) insurance to protect management against personal liability, but it would be yet another cost and distraction for a small company to deal with as a result of having shareholders. In sum, the costs, logistical complications, and legal risks associated with having hundreds or thousands of small shareholders could be enough to scare an entrepreneur away from selling stock through crowdfunding (Schwartz, 2013).

Transforming Concerns into Opportunities

With so many potential negatives, it is fair to ask why any rational start-up entrepreneur would dare to offer securities through crowdfunding (Dorff, 2014). And precisely in that question lies the opportunity for entrepreneurs to use crowdfunding laws proactively to develop competitive advantages. The unsettled landscape of securities crowdfunding affords the opportunity to create value through a differentiated, unique stock offering that would be difficult for rival firms to imitate. And a value-creating, unique, and inimitable resource without clear substitutes is the essence of a competitive advantage.

To accomplish such a feat, a proactive approach to law must transform obstacles into opportunities. The primary obstacles to a crowdfunding securities offering, beyond the potential costs of preparing the offering, are ongoing corporate governance obligations owed to a large number of shareholders, and the concomitant risks that arise from such obligations. A proactive approach must ameliorate the corporate governance concerns without sacrificing the reasons investors would want to participate in a crowdfunding offering of securities. Those reasons might vary in some situations, but in large part rational investors would be motivated to invest in crowdfunded equity securities offerings in order to be ground-floor owners of a company that could grow and produce a sizeable return on investment.

Surely the motivations of backers of *non-security* crowdfunding offerings might differ. In that situation, backers often have motivations that are not purely financial. Maybe they believe in the social mission of the crowdfunding initiative. Perhaps they are fans of the creative work that the crowdfunding sponsor is developing. Or they are simply pre-purchasing a product they find appealing.

But the primary reason for offering securities through crowdfunding is to give backers a share in the upside potential of the business idea. When developing a proactive approach to a securities crowdfunding offering, then, it is important to keep investors' interests in focus. At the same time, entrepreneurs must avoid the numerous downsides of a start-up company having hundreds or thousands of small investors, especially in relation to corporate governance complications.

Securities Designed for Crowdfunding

One creative solution is to design unique securities that are specifically tailored to crowdfunding. And scholars have put forth at least three proposals that entrepreneurs could fine tune and implement to create a competitive advantage. The three possibilities relate to using the flexibility of contracts to avoid the burden of shareholder rights, including 1) future rights to own stock, with no short-term shareholder rights (O'Connor, 2014; Wroldsen, 2012), 2) short-term profit sharing, known as "unequity," instead of long-term stock ownership (Heminway, 2012), and 3) debt securities instead of equity securities

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

(Schwartz, 2013). If crowdfunding is to evolve as a new form of investing in start-up companies, entrepreneurs should not shy away from experimenting with novel forms of securities that are uniquely tailored to crowdfunding's strengths and weaknesses.

First, entrepreneurs could design securities that give investors a share of any long-term stock appreciation but remove shareholder rights in the short-term. A similar approach would be to sell initially only the *right* to purchase a future security—with the actual security to be issued at a later date—so as to ensure that crowdfunding investors do not have shareholder rights unless and until the start-up company becomes a success. Either way, the goal would be to give investors what they want (i.e., a chance to share in the long-term upside potential of a promising start-up venture) while also letting small companies avoid the corporate governance downsides of having excessive numbers of small shareholders. Crowdfunding investors would lose the voice associated with shareholder rights, but many crowdfunding investors might view the sacrifice of formal shareholder rights as an acceptable trade-off because crowdfunding investors could be more focused on expressing their voice through social media than through exercise of traditional shareholder rights.

Non-Voting Convertible Preferred Stock

More specifically, one way to structure the securities would be similar to non-voting convertible preferred stock that early-stage investors already frequently purchase, outside of the crowdfunding context. The approach is born out of the venture capital community where non-voting convertible preferred stock has become a complex investment instrument that reflects the requirements of venture capital investors. In brief, preferred stock is a flexible contractual instrument that allows investors to specify particular rights that are appropriate for particular investments. When investing in start-up companies, for example, venture capitalists typically negotiate control rights and representation on a start-up company's board of directors, along with numerous other investor protections contained within the preferred stock instrument, such as preemptive rights, anti-dilution protection, and registration rights (Gilson, 2003; Smith, 2005).

To work effectively in crowdfunding, non-voting convertible preferred stock would likely need to be modified from the form used in venture capital investment transactions (Wroldsen, 2013). An innovative entrepreneur could offer crowdfunding investors a simplified version of non-voting convertible preferred stock. The stock could be sold without any voting or other corporate governance rights. Then, upon a future triggering event, such as an acquisition of the company or an initial public offering (IPO), the non-voting preferred stock would convert into common stock, giving the investor an equity ownership position in the company (see example below under "Competitive Advantage: The Case of Oculus Rift").

From the investors' perspective, the key components of the preferred stock must ensure that investors are protected against dilution of the value of the shares and have the right to continue investing in future crowdfunding offerings. From the company's perspective, the key component would be that the crowdfunding shares cannot convert to common stock until the company is large enough, and successful enough, to manage the logistics of a large stock conversion and the corresponding rise in corporate governance obligations. For an enterprising entrepreneur, the field is ripe for offering crowdfunding investors a simple equity instrument that provides upside potential for investors while simultaneously not overwhelming the start-up company with corporate governance headaches.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Future Rights to Equity Ownership

Another way to accomplish a similar goal would be to crowdfund solely a *right* to purchase securities in the future instead of selling the securities themselves in the crowdfunding campaign. This approach provides more certainty that crowdfunders do not have any shareholder rights because initially they do not even own non-voting preferred stock. Instead, they own a contractual right to either a future number of shares or a future percentage ownership of the company. But that future ownership would only spring into existence if the company reached certain milestones, such as specified revenue figures, an acquisition event, or an IPO. In addition, granting future rights to equity avoids the notoriously acrimonious haggling over the speculative valuation of an early-stage venture because the valuation need not be fixed until a later stage in the company's development.

For instance, the company could set aside a certain number of shares, or a certain total ownership percentage (e.g., up to 10 percent of the equity interests of the company, on a fully diluted basis), as a pool that would be available to crowdfunding investors only if a future qualifying event occurred. Akin to pools of shares available only to employees, this approach would provide certainty as to the company's total commitment to crowdfunding investors (e.g., up to 10 percent, or some other percentage, of the company's total shares would be earmarked for crowdfunding investors). The company could then engage in multiple rounds of crowdfunding offerings as the value of the company increased, while still retaining the cap on total equity available to crowdfunding investors. And past crowdfunding investors could hold pre-emptive rights to participate in subsequent crowdfunding offerings. Pre-emptive rights would allow crowdfunding investors to continue to invest in the company's crowdfunding offerings, thereby avoiding substantial dilution of their positions when additional crowdfunding offerings occur.

Compared to specifying the contractual terms of non-voting convertible preferred stock in advance of the crowdfunding offering—when uncertainty about the company is at its highest and firm resources are at their lowest—selling rights to future ownership holds the advantage of greater simplicity. Of course, complexities would inevitably arise if the company reached its growth milestones and issued the shares that were previously promised to crowdfunding investors. But at that point the company would have more resources to address a complex stock offering. The approach would allow crowdfunding investors to realize long-term profits if the start-up company turned out to be successful. Simultaneously, the approach would postpone the corporate governance problems that arise when a small company has many shareholders until after the company became successful, if ever.

Outside of crowdfunding, the venture capital community has recognized the need for simplified early-stage investment contracts (Coyle & Green, 2014; Janofsky & Loten, 2015). For instance, the influential Silicon Valley business accelerator, Y Combinator, developed a Simple Agreement for Future Equity (or "SAFE") in December 2013 (Graham, 2013). The SAFE is a "deferred equity investment" that avoids the inherent difficulties of establishing a valuation of an early-stage venture and "prioritize[s] accessibility over comprehensiveness" (Coyle & Green, 2014). The creator of the SAFE, Carolynn Levy, stressed that she developed the innovative contracts "for a community rather than for a client," which fits crowdfunding's social and interconnected ethos perfectly (Coyle & Green, 2014). Conceptually, then, the SAFE could be a harbinger of what crowdfunding investment contracts that promise future equity ownership may look like someday.

Competitive Advantage: The Case of Oculus Rift

Beyond the specifics of how the crowdfunding offering is structured, in principle entrepreneurs can achieve competitive advantage by offering crowdfunding investors a long-term profit-sharing interest that is decoupled from traditional shareholder rights. In place of shareholder rights, the company could encourage frequent social media interaction and be transparent about its operations in order to authentically involve investors in the company, even though the investors have no formal shareholder rights to enforce against the company. Such a strategy grows out of crowdfunding's native social media character and celebration of the wisdom of the crowd.

To date, though, crowdfunding communities lack access to an investment interest in the company's long-term prospects, particularly in the US. A company that seized the opportunity to provide such a long-term profit-sharing interest (once legally permitted), along with the existing community aspects of crowdfunding, would immediately distinguish itself from the hordes of firms clamoring for social media followings based solely on crowdfunders' affinity for the company, its product, or its mission. The strategy would be an ideal application of proactive law's emphasis on designing a legal solution (i.e., long-term ownership interests for crowdfunders but without short-term shareholder rights) to further a business goal (i.e., a more cohesive social media community unified through mutual profit incentives).

For example, the Oculus Rift crowdfunding campaign and subsequent sale to Facebook is illustrative. In 2012, the US virtual reality company Oculus VR raised approximately $2.4 million from over 9,500 people through a rewards-based crowdfunding campaign on Kickstarter to further its development of a virtual reality gaming headset known as the Oculus Rift. Then, in 2013, Oculus raised $91 million in traditional venture capital equity financing. In 2014, less than two years after the Kickstarter campaign, Facebook purchased Oculus for $2 billion—before Oculus had even shipped a retail product (Mitchell, 2014; Gara & Kolodny, 2014).

Though the Oculus founders and the venture capitalist investors hit the jackpot financially, many of the crowdfunders who had supported Oculus in the Kickstarter campaign were livid. The Kickstarter supporters received nothing when Oculus was acquired, and some viewed the transaction as a betrayal. They were not shy about voicing their displeasure on social media, "raging" against the Facebook sale and "flooding the Kickstarter page with negative comments" (Makuch, 2014). A statement summing up much of the frustration was, "I backed Oculus Rift on Kickstarter and all I got was this lousy T-shirt" (Berman, 2014). Had Kickstarter backers received equity for their contributions, estimates for the return on investment ranged from 145x to 200x (Barnett, 2014; Jeffries, 2014).

If a start-up company sold long-term equity interests to crowdfunding investors—instead of merely providing rewards, like T-shirts—then crowdfunders could share in celebrating an exit event for $2 billion as a tremendous success. Social media would buzz with glowing testimonials about the company. Instead, the exit event for Oculus embittered some of the company's own supporters and ignited a firestorm of criticism on social media. Learning from the Oculus example, entrepreneurs should proactively create long-term equity interests for crowdfunding investors, even while eliminating shareholder rights prior to an exit event. This approach can cultivate a mutually-beneficial relationship in which crowdfunders do not feel used but instead are welcomed as long-term participants in the company's success.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Competitive Advantage: Equity Ownership for Crowdfunders

The strategy of providing crowdfunders with long-term equity interests without shareholder rights in the short term could meet the four criteria for turning a company resource into a lasting competitive advantage. First, it has the potential to create value in the form of cash investments that the company receives from crowdfunders in exchange for long-term equity interests in the company. Presumably, the company could raise more funds by selling equity interests than it could by using a non-securities form of crowdfunding. Even more importantly, the company could avoid alienating the crowdfunding backers who supported the company in its start-up phase. By sharing a portion of the upside potential in the company with crowdfunding supporters, the company could build value by crafting a long-term relationship of trust and mutual benefit.

Second, the strategy would be unique, at least initially, because crowdfunding laws have historically prevented such an approach. Once legal, though, the strategy would still require rare executive foresight, combining marketing acumen, financial creativity, operational dexterity, and legal complementarity. Third, in part due to the rarity of the offering, the strategy would be difficult to imitate. It would be an organic strategy that would define the organization itself rather than a simple contract that could be copied. All departments of the company would need to focus on the crowdfunding community, so competitors would need to emulate an entire organizational form in order to imitate the strategy.

Fourth, there are not any simple substitutes. One of the main reasons equity crowdfunding is in a nascent stage is that laws historically prohibit the practice. Apart from new crowdfunding laws (such as the CROWDFUND Act), there are no other legal methods for small, non-public companies to sell profit-sharing interests to the general public (registered stock offerings typically only make sense for large companies).

Short-Term Profit-Sharing

An additional method for using law proactively to create innovative securities that capture competitive advantages in crowdfunding include "unequity" interests. Unequity interests are short-term profit-sharing securities stripped of corporate governance rights (Heminway, 2012). They are securities because they have a profit-sharing (or revenue-sharing) component, but they do not give investors any shareholder rights or long-term ownership interests. A start-up company might find unequity interests attractive for a time-bound sales opportunity: in exchange for crowdfunding contributions that the company would use to manufacture its innovative product, crowdfunding contributors would receive a percentage of the revenue from sales of the product, through a pre-determined date.

For instance, in exchange for a contribution of $50, a crowdfunding backer could receive $.10 for each product sold prior to the end of the year. The crowdfunding backer would break even once 500 items were sold (500 x $.10 = $50). Any additional items sold during that year would result in profit for the crowdfunding backer who helped facilitate the company's creation of the product. At the end of the year, though, the crowdfunding backer with an unequity interest would have no ongoing rights to the company's business or revenues.

Advantages of unequity interests begin with their simplicity. Crowdfunders do not obtain shareholder rights or even enter into a long-term contractual relationship with the company. Instead, crowdfunders participate only in the risk that a new product might not sell as well as anticipated. But if the product succeeds, then crowdfunders share in the immediate benefit of the product's sales, through a certain

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

date or until a certain amount of the product is sold. The company avoids any long-term entanglements and complications with crowds of investors, but at the same time the crowdfunding contributors do not receive any of the future upside if the company goes on to great success. Unequity interests also offer attractive marketing and branding opportunities to build goodwill because supporters of the product receive a tangible reward (cash) in exchange for their support of the company's product, all within a short period of time.

Crowdfunding Debt Securities

A third option for entrepreneurs to consider is crowdfunding of debt securities instead of equity securities (Schwartz, 2013). Debt securities typically do not grant shareholder rights. Crowdfunding lenders would receive only the contractual rights specified in a loan agreement, such as the right to collect unpaid debts.

From the company's perspective, the benefits include avoiding any corporate governance obligations to shareholders and retaining all of the company's equity ownership. But the company must repay the debt; whereas, when *equity* interests are sold, the company has no repayment obligation to meet, and when *unequity* interests are sold, the company simply pays a portion of its sales revenue to the crowdfunding supporter for a limited period of time. From the crowdfunding investor's perspective, a debt security offers a return in a specified amount over a defined time period, but the crowdfunding investor does not share in any upside potential of the company beyond repayment of the debt at the specified interest rate. Where securities laws already accommodate crowdfunded offerings of debt securities more readily than in the US (in the UK, for instance), small companies have already begun offering so-called "mini bonds" through crowdfunding (Espinoza, 2015).

Competitive Advantage: Unequity and Debt

With respect to both crowdfunded unequity interests and debt securities, entrepreneurs have the opportunity to capture competitive advantages by using law proactively. Both types of offerings create value for the start-up company and would be unique crowdfunding campaigns in today's market (especially in the US). Both approaches offer a financial return to crowdfunding investors, so they go beyond current crowdfunding models that only provide a social media community, a reward, a donation opportunity, or a product pre-purchase.

As for inimitability, unequity interests, despite their short-term character, can be transformative of an organization's structure and thus difficult to replicate, especially if an organization carries out multiple short-term unequity campaigns over a long-period of time. Crowdfunding offerings of debt securities, though, would likely be easier for competitors to copy simply because debt is a well-understood, traditional form of financing. Neither type of campaign has an easy substitute because securities laws make it difficult for small companies to sell unequity or debt securities to the general public in ways other than crowdfunding.

Crowdfunding Securities or Non-Securities

Apart from how a company might design innovative securities for crowdfunding, entrepreneurs can also use law proactively to enhance other aspects of crowdfunding offerings. Companies that offer a product or a reward (or nonprofits that solicit donations or facilitate non-interest bearing loans) through

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

crowdfunding confront fewer direct regulations than when crowdfunded securities are offered. But as non-securities forms of crowdfunding mature, best-practices and downside risks are emerging; hence, the remainder of the chapter alerts entrepreneurs to particular issues in crowdfunding where a proactive approach to law is vital. The recommendations below focus on *non-securities* crowdfunding campaigns, but most of the recommendations apply to *securities* crowdfunding, too. Seven potential concerns are highlighted, in the areas of intellectual property, litigation risk, corporate formation, and tax law.

Intellectual Property: Making Ideas Public

A proactive approach to intellectual property laws can mitigate at least three legal risks. First, disclosing an innovative idea online without proper patent protection can diminish or destroy the value of the idea (O'Connor, 2014). A similar dynamic exists under trademark law with respect to company and product names and logos. Before launching a crowdfunding campaign, therefore, entrepreneurs should determine whether filing for patent and trademark protection are worthwhile for their inventions, names, and logos.

For example, if the company has patentable ideas, filing for patent protection in advance of public disclosure can be important. In the US, a patent application must be filed within one year after an idea is made public. After one year, the idea enters the public domain and ceases to be patentable. Furthermore, the US is a first-to-file jurisdiction, so during the one-year period after public disclosure, others can file a patent application on the idea, potentially before the original inventor. At a minimum, filing a provisional patent application before public disclosure of the idea can be a low-cost way to set a pre-disclosure filing date and reserve a one-year period to decide whether to file a full patent application.

Outside the US, the timing of patent filings is often an even more pressing matter: many countries require patent filings to precede public disclosure of the idea. In those jurisdictions, ideas that are made public before a patent filing is submitted cease to be patentable at all. Accordingly, start-up companies with patentable inventions (or valuable trademarks) are wise to move proactively to protect intellectual property rights before publicizing a crowdfunding campaign.

Intellectual Property: Infringing the Rights of Others

A second risk under intellectual property laws that can be proactively managed relates to lawsuits alleging that a crowdfunding campaign infringes the intellectual property rights of others. Publicizing an idea online through a crowdfunding campaign can expose a start-up firm to trademark-, copyright-, and patent-infringement lawsuits from more established competitors before the start-up is equipped to defend itself. For example, trademark infringement would involve using a company or product name or logo that is too similar to another company's trademark-protected name or logo. Vetting proposed names and logos before launching a crowdfunding campaign is a simple proactive step that entrepreneurs can take to avoid unnecessary legal conflicts and expensive rebranding efforts.

Copyright infringement can arise if the crowdfunding campaign uses third-party images, videos, music, or other content without first obtaining permission (usually in the form of a license). If a company fails to take the proactive step of obtaining a license to use third-party content, or creating its own proprietary content, then the company's crowdfunding campaign can be stopped in its tracks, even before the company collects any of the crowdfunding contributions that were pledged. Crowdfunding sites typically disable campaigns immediately after receiving a simple notice that alleges copyright infringement. Under the Digital Millennium Copyright Act (DMCA), failing to disable the campaign can

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

subject the crowdfunding site itself to liability for permitting alleged copyright infringement to continue. Entrepreneurs, therefore, should use copyright laws proactively to prevent having an otherwise successful crowdfunding campaign abruptly shut down for an entirely avoidable reason.

Patent infringement lawsuits can be even more detrimental to crowdfunding success. Patent infringement allegations can distract management for extended periods of time and potentially cripple a company's business model. For example, FormLabs, a start-up company in the US that makes three dimensional printers, raised nearly $3 million from over 2,000 backers through a 30-day crowdfunding campaign on Kickstarter in 2012. The campaign allowed FormLabs to successfully create its first product, but the campaign also attracted the attention of an established competitor, 3D Systems, which sued FormLabs for patent infringement. The lawsuit alleged that FormLabs' product infringed the designs 3D Systems had previously patented (Woodward, 2014).

In December 2014, after two years of legal filings and negotiations, the parties reached a settlement. Fortunately for FormLabs, despite the two-year distraction for company management, its business was profitable enough to allow it to defend against the patent infringement lawsuit and continue to grow (Brewster, 2014). But the same cannot be said for many cash-hungry start-ups. The best bet for entrepreneurs is to proactively examine the potential for patent infringement before exposing promising inventions to the world through a crowdfunding campaign.

Intellectual Property: Incorporating the Wisdom of the Crowd

A third intellectual property risk in crowdfunding campaigns can arise when companies incorporate product suggestions from crowdfunding backers. Without proper legal protections, incorporating the ideas of others into a product can lead to legal disputes over ownership rights. For example, if a crowdfunding contributor suggests a new product feature on the company's crowdfunding message board, and the company integrates the feature, is the crowdfunding contributor entitled to any compensation or ownership? From a legal perspective, it would be helpful to draft, in advance, clear terms that definitively assign to the company all ownership rights in any suggested features or modifications posted in connection with the crowdfunding campaign.

And from a marketing and public relations perspective, it would be wise to integrate legal strategy into business goals by proactively communicating with crowdfunding backers and expressing gratitude for the crowd's suggestions. After all, crowdfunding backers who feel appreciated and included as part of a community are less likely to spread bad press or pursue legal claims. Consequently, entrepreneurs should plan proactively to use intellectual property laws to their advantage by integrating crowdfunding marketing strategy with legal objectives to ensure company ownership of products that incorporate suggestions from the crowd.

Crowdfunding Litigation

Beyond intellectual property risks, a proactive approach to law is also central to avoiding two primary litigation risks in crowdfunding. If the crowdfunding campaign fails to deliver what is promised, disgruntled contributors can potentially band together to file a class-action lawsuit. Alternatively, as at least one state attorney general has already done, government regulators can sue the sponsors of crowdfunding campaigns for violating consumer-protection laws (Gross, 2014). In the business planning phase, therefore, entrepreneurs should realistically assess the company's capabilities, including product specifications

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

and supply chain flexibility to meet demand spikes that can result in the wake of popular crowdfunding campaigns. Bold innovation that overcomes seemingly insurmountable obstacles is a hallmark of the entrepreneurial spirit. But in crowdfunding, overpromising and failing to deliver not only alienates backers and customers, it is a recipe for fraudulent misrepresentation lawsuits or other unsavory allegations.

Corporate and Tax Laws

Finally, entrepreneurs who take a proactive approach to crowdfunding laws should not overlook two straightforward legal issues in crowdfunding that relate to basic corporate and tax law. Raising capital as an entity instead of as an individual can shield crowdfunding entrepreneurs from personal liability. Launching a crowdfunding campaign may be a personal decision to give creative voice to a dream. But raising money is a business activity, so establishing a business form for the business activities is usually a wise decision. Establishing a limited liability company or corporation is typically a simple and inexpensive task to complete online. Once the company is created, it is a good idea to obtain an employer identification number (EIN), open a bank account in the company's name, and conduct business in the company's name, while following applicable corporate formalities.

Lastly, strategic tax planning can help mitigate the effects of receiving significant crowdfunding income before incurring offsetting expenses. When raising money through a non-securities form of crowdfunding, such as Kickstarter's reward or pre-purchase model, the contributions a company receives are typically treated as income (not capital contributions, as in equity crowdfunding for securities) (Dietz, 2014). So, for example, if a start-up company with minimal income or expenses raises $1 million in a 60-day crowdfunding campaign, the cash influx can change the company's tax situation dramatically. If the company's tax year closes soon after receiving the income, there might be little opportunity to incur expenses to deduct against the $1 million crowdfunding income. Treating tax laws that apply to crowdfunding proactively, entrepreneurs can develop a plan in advance for handling crowdfunding contributions in a tax-efficient manner.

CONCLUSION

This chapter demonstrates that the "proactive law as competitive advantage" theoretical paradigm yields valuable insights for entrepreneurs to execute crowdfunding offerings successfully. Incorporating a proactive, *ex ante* approach to law when planning the business aspects of a crowdfunding offering affords at least two benefits. First, like preventive medicine, companies can avoid crowdfunding's legal pitfalls altogether instead of being forced to treat legal maladies after they occur.

Second, using laws proactively can create competitive advantages in crowdfunding offerings. Developing a competitive advantage goes far beyond simply managing a company effectively. Competitive advantage grows out of a transformative culture that embraces law as a proactive opportunity and overcomes the natural tendency to view law as an obstacle. Entrepreneurs can create value by linking their legal strategy to their business goals, developing unique crowdfunding offerings, and cultivating a favorable public image through social media. The uniqueness, or rarity, of the crowdfunding campaign should complement a company's very identity, making the strategy difficult to imitate or replace with similar substitutes because of its intimate connection to a company's particular mission, organizational structure, or other foundational principle.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Beyond crowdfunding, the theoretical approach of "proactive law as competitive advantage" has much to contribute to further research at the intersection of law and entrepreneurship. This chapter demonstrates the viability of the theory in one area of entrepreneurship (crowdfunding). The next step in the research is to develop the theory in relation to entrepreneurship more broadly. For example, additional analysis should reveal how the paradigm of proactive law as competitive advantage applies in the context of disruptive innovation versus sustaining innovation. The former encapsulates new technologies that threaten existing market leaders, whereas the latter includes incremental improvements that existing market leaders make to their products.

Research on proactive law as competitive advantage should further illuminate the dichotomy between disruptive and sustaining innovation. For example, where first-mover advantage is high, as in disruptive innovation, does proactive law as competitive advantage serve as an even greater entrepreneurial incentive? Or is proactive law as competitive advantage an equally beneficial approach in the context of sustaining innovation?

This chapter takes an initial step towards uniting the study of entrepreneurship with theories of proactive law as competitive advantage. Crowdfunding, though, is only one example of entrepreneurial innovation in the modern economy. In view of the fundamental importance of entrepreneurship and innovation to international economic competitiveness, a greater understanding of the links between legal strategy and entrepreneurial success would be beneficial.

KEY TERMS AND DEFINITIONS

Competitive Advantage: A company's ability to provide unique, long-term value in a superior way than its rivals.

Corporate Governance: How a company is managed and controlled, including, for example, rights to vote at company meetings, participate in board meetings, and receive periodic updates on performance.

Debt: Securities that offer the holder a pre-determined rate of return over a specified time period and typically do not give the holder corporate governance rights.

Disruptive Innovation: New technologies or business models that threaten status-quo market leaders.

Equity: Long-term, profit-sharing securities that give the holder corporate governance rights along with an ownership interest in the company.

Preferred Stock: Securities that specify particular rights and preferences, often combining elements of debt and equity securities and typically including corporate governance rights.

Proactive Law: A forward-looking approach to law that integrates legal strategy into business goals before legal problems arise.

Securities: Investment instruments that the Securities and Exchange Commission regulates (in the US).

Unequity: Short-term, profit-sharing securities that do not give the holder corporate governance rights.

ABSTRACT

Microentrepreneurs need financial capital as well as human and social capital. Banks prefer refinancing microfinance institutions and capacity building organizations rather than dealing with microentrepreneurs directly. In this chapter, we examine if the advent of crowdfunding could disturb such relations. Our research question is "what is the perception of people working in support networks on the changing of the relations between banks, support networks and crowdfunding platforms?" In this chapter, we first provide a background on entrepreneurship and coaching in France, emphasizing the role of the entrepreneurial support networks. Thereafter, we present our research methodology based on semi-structured interviews with managers in these support networks. The findings from these interviews are presented in the third section. We find that while the support networks are aware of crowdfunding initiatives, they do not think it will make a major change to the existing relations. This finding is original because most other research seems flabbergasted by the dramatic speed of development of crowdfunding sites. In the fourth section, we analyze the discourse using Nvivo software. The recommendations that emerge from this analysis point to using crowdfunding more as a tool of image building and communication.

INTRODUCTION

Crowdfunding has come up in a big way during the last few years. It has the potential to be a disruptive innovation in the field of project financing and fundraising. Should this potential for disruption cause any fear to the conventional financing channels for supporting entrepreneurs? This is an important subject because in the wake of unemployment and stagnation in many developed countries in Europe, entrepreneurship is often viewed as a way out. So, any financing that could impact entrepreneurship merits study.

Of course, much of crowdfunding is being used to finance consumption, entrepreneurial, and non-entrepreneurial projects of an artistic nature on platforms such as indiegogo and kickstarter. However, these same platforms also have some projects which could be using innovative finances such as advanced payment for sales for both commercial and not commercial projects. The Peebles watch, which raised ten million dollars, is an example.

Therefore, all crowdfunding platforms, not just the part which is directly providing loans or equity, have the potential to disrupt existing banking practises. Researchers have extensively explored the rivalry between conventional banking and non-conventional channels of financing micro-entrepreneurs. For example: Balkenhol and Gloukoviezoff (2015), have identified three disruptive scenarios for the microfinance sector:

1. Industrialization and the takeover of the sector by the banks;
2. Professionalization of the microfinance sector supervised strategically by the government; and
3. Autonomy of the microfinance sector from the banks.

This research is, to our best knowledge, one of the first on the destructive creation force of crowdfunding and its impacts on the traditional channels of firm financing. This inquiry is therefore important for banks and conventional institutions because all creative destruction may lead to destroying existing jobs and firms before creating new ones.

Our research analyzes one area in which crowdfunding could have an impact: the partnerships between banks and entrepreneurial support networks, which together provided financial, social and human capital to entrepreneurs and project leaders. Our research field is France.

In this chapter, we first provide a background on entrepreneurship and coaching in France, emphasizing the role of the entrepreneurial support networks. Thereafter, we present our research methodology based on semi-structured interviews with managers in these support networks. The findings from these interviews are presented in the third section. In the fourth section, we analyze the discourse using Nvivo software and we provide recommendations based on this. Finally, we conclude.

BACKGROUND: ENTREPRENEURSHIP AND COACHING IN FRANCE

The traditional models of entrepreneurial finance found in the literature include equity investment such as founders' money, love money (family, friends and fools) (Szerb et al. 2007, Riding 2008, Ashta et al. 2013), business angels (Morrissette 2007, Ramadani 2009, Wong et al. 2009, Lahti 2011), venture capital (Zider 1998, Nadeau 2010) and large financial institutions. Some of these institutions may also provide debt along with banks and financial institutions. The essential role of most of these investors may be to provide finance, but being private investors, they are keen on getting good returns on investment, and

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

they complement it by sharing their business acumen and their networks to increase the probability that the target investment makes profits (Rogers et al. 2002, Silva 2004, Barber & Goold 2007). The literature also provides a multi-stage model for different sources of finance (Eckhardt et al. 2006, Metrick 2007).

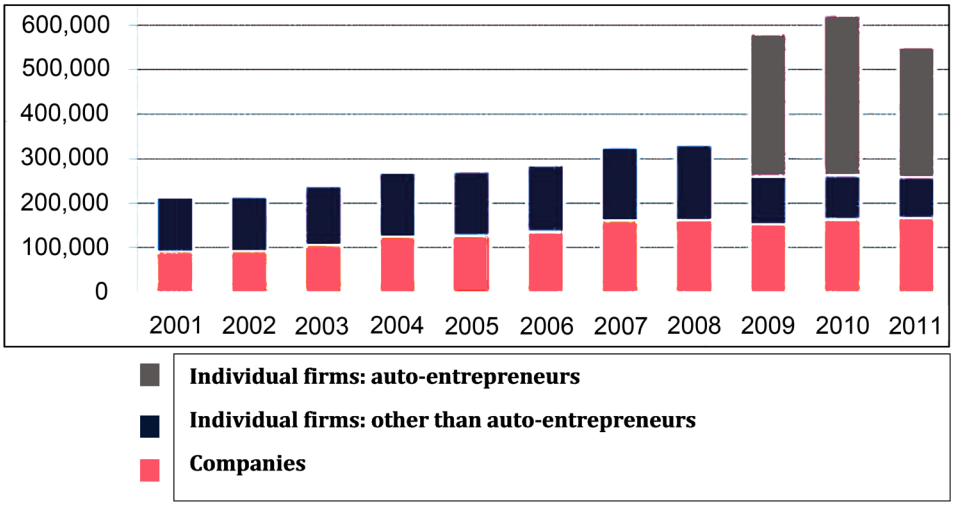
However, for micro-entrepreneurs, business angels and venture capital are not forthcoming because the size of the investment is too small. Similarly, banks are not willing to confer other people's deposits to microenterprises because they are considered too risky. Therefore microcredit organizations have come in to provide finance to the microentrepreneurs. Complementarily, support networks organizations have come in to provide human capital and social capital.

Non-financial motives may motivate some investors such as public funds providing seed money to encourage industry; family and friends who may be motivated by altruism or bonds; and some social-minded micro-angels who want to encourage local investments in socially desirable fields (Ashta et al. 2012a, Estapé-Dubreuil et al. 2012). It is considered that such micro-equity could be a good way of balancing the stress of entrepreneurs who are otherwise over-dependent on micro-credit; however, these movements have not developed significantly (Ashta et al. 2012b).

The only hope for the future seems to be based on the recent development of crowdfunding which has been examined in the literature (Assadi & Ashta 2009, Johnson et al. 2010, Assadi & Ashta 2012, Assadi & Ashta 2014, Attuel-Mendes 2014, Ley & Weaven 2011, Mollick 2014). Crowdfunding is developing not only in the developed world (Ashta & Assadi 2010a), but also in the developing world (Ashta & Assadi 2010b). This new development may provide competition to the existing platforms as suggested by the five forces model of competitive analysis suggested by Porter (1979). Our research question is therefore based on whether the support networks consider crowdfunding as a threat to their relationship with banks and microcredit organizations.

1. The Development of Entrepreneurship and the Need for Coaching

In the current context of increasing unemployment, entrepreneurship emerges as an important lever for revitalizing the economy in France. In 2013, support for business creation was the main theme of an entrepreneurship conference and subject of a report by the Court of Auditors, which advocates better targeting and professionalization of coaching teams (Verzat et al, 2014). Thus, entrepreneurship appears as one of the ways to borrow for renewed growth and reduce unemployment.



The issue is crucial for the whole economy. According to Hayat (2012), the creation and development of enterprises are two basic responses to the multiple challenges we face: growth, employment, innovation, reduced deficits and debt, safeguarding social systems, integration in the suburbs.

According to a note of the strategic analysis center of the French Ministry of Economic Recovery released in October 2012 (CAS 2012), France has a real entrepreneurial potential. The desire for entrepreneurship is present in France and the image of the entrepreneurs is generally positive: Entrepreneurs are perceived as job creators, according to nearly 90% of respondents; and creators of new products and services to benefit all, according to 73% of the respondents (CAS 2012).

The same report also shows that since the last ten years, the creation of businesses grew strongly in France from about 210,000 units per year in the early 2000s to 330,000 in 2008 to 550,000 in 2011, largely as a result of the introduction of the auto-entrepreneur status in 2009. Figure 1 shows the increase in the number of individual firms that have been launched by auto-entrepreneurs compared to other types of enterprises between 2001 and 2011.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 1. Evolution of business creation in France by legal category (2001-2011)
Source: INSEE, 2012, companies and establishments (SIRENE).

In a recent report on entrepreneurship in France, Nziali and Fayolle (2012) pointed out that many French have the desire and intention for entrepreneurship and more and more individuals perceive entrepreneurial opportunities. Several obstacles limit the desire and ability for entrepreneurship, among them the lack of adequate support for these entrepreneurs.

The increasing number of individual enterprises has led to several problems. Entrepreneurship is not limited to the act of creating enterprises but refers to more complex and multidimensional phenomena. Strengthening entrepreneurial skills and developing a positive perception become imperative to exploit the French entrepreneurial potential and reduce the gap between desirability and feasibility. According to Arlotto et al. (2012), despite the strong development of facilities for sheltering and support since the 1980s in France, support for entrepreneurs still suffers from multiple deficiencies. For this, there are associative networks dedicated to the support of entrepreneurs. This support enjoyed by the creators across networks constitutes, according to some authors, a specificity of French microcredit (Bumacov et al. 2012).

Support networks have three types of missions: training and monitoring for business creation, financing activities and hosting the company. But these support networks are not systematically open to all creators. Each network targets a certain class of clients or beneficiaries.

2. Entrepreneur-Support Networks in France

Phillipe Mathot (2010) observed that many entrepreneurs evoked strong support needs for administrative paperwork, information and orientation, counseling, project planning, management, financing and legal, fiscal, social, and psychological assistance. Project leaders expressed their need for knowledge on legal, tax and social security aspects of project management.

The accompaniment was started in France by the network "Boutiques de Gestion" in the early 1970s and has been imitated gradually in different contexts by all actors working in the field of entrepreneurship. According to Duquenne (2014), the term "support" (accompagnement, in French), appeared in

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

France in the early 80s to characterize assisting candidates for starting a business in a particular context. Many support networks have been created in this context with the objective of providing the necessary support to young entrepreneurs. Large networks have developed some internal modules to train the newcomers, but these are usually very short duration training and aim to inform and integrate the recruits in the network rather than training them (Duquenne, 2014). Other constraints weigh on the accompanying process: for example, the problem of training the guides. According to Verzat et al (2014), at least 4,000 to 5,000 persons are playing this role in France without having received specific training since neither the practices are shared nor there is a recognized certification. The other constraint is the multiplicity of actors involved in the delivery, among which are the support networks. These networks have a major concern of improving their impact on the accompanied entrepreneurs. While some of these networks are addressed to all project creators (Table 1 for examples), others specialize in supporting newly created businesses (Table 2 for examples).

Support networks have an undoubted utility, which is found particularly in improving the survival rate at three years of "accompanied" business (Chapel & Catoire, 2011). These support networks are trying to coach the project developers and provide various resources needed to ensure the success and sustainability of their projects. In general, 65.8% of enterprises survive after three years of creation and 51.5% after five years, according to a study by SINE (INSEE Résultats, 2013). However, if they are coached and supported by a network, the survival rate increases to 77% and this may even increase to 82% if the enterprise receives financing and specific pre-creation advice (Balkenhol & Guézennec, 2014).

Several problems and difficulties surround the activities of support networks in France. According to Pluchart (2014), despite the density of networks in place, entrepreneurial support in France suffers from various deficiencies.

Table 1. The main support networks addressing all project leaders

Network	Brief Description
Boutique de Gestion des Entreprises (BGE)	BGE supports entrepreneurs at all stages of a business, since the emergence of the idea to the construction of the business plan, fundraising and supporting the development of the new companies, and regardless or the personal situation of the promoters (job seeker, employee, recipient of the RSA ...) and whatever the nature of their project. Some BGEs offer specific support for women entrepreneurs, such as workshops, debates, competitions, trainings.
Chambers of Crafts	Chambers of crafts accompany the craftsmen at every stage of their professional life: preparing for installation, SPI, monitoring and support in various formalities of creation and development. With appropriate tools, they support the transfer of businesses, support the buyers in assembling records and obtain subsidies and aids. Some chambers of trade manage Clubs of entrepreneurs and organize competitions dedicated to the creation of crafts by women.
Chambers of Commerce and Industry (CCI)	For commercial, industrial or service activities, the CCIs help entrepreneurs in their project to create or transfer enterprises, auto-entrepreneurship and in all business creation formalities.
Copea and Coopérer pour Entreprendre	Copea and Coopérer pour Entreprendre are the two national networks of cooperatives of activities and employment (CAE). These CAE permit entrepreneurs to test their activities. After the test, entrepreneurs can start their own business or sustain their activity within the cooperative.
Incubators	An incubator is a place in which creators can test their activity and confirm the economic feasibility of their project: • In the context of a secure context • Benefiting from professional guidance, • And all this before the creation of their company.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Table 2. The main financing networks proposing accompaniment to a newly created company

Network	Brief Description
ADIE	Adie finances and supports entrepreneurs who do not have access to bank credit and especially helps unemployed job seekers and beneficiaries of social minima. Its website, Adie Connect offers online support, and directly enables entrepreneurs to apply for funding.
France Active	France Active, through its territorial funds, acts to put finance at the service of people, jobs and territories. It offers an accompaniment and solidarity financing that allow them to make their projects viable and to access banking and financial systems. France Active funds studies the applications of women's initiative Guarantee Fund (FGIF). Some funds also offer specific support, animate creating clubs and organize competitions dedicated to women entrepreneurs.
France ANGELS	France Angels is the National Federation of Business Angels networks. France Angels promotes business angels in the economic, social and legal areas to establish their usefulness, their positive effect on the economy and legitimize their action. The business angel is an individual who wishes to invest a portion of his own money in an innovative business project. They are involved in capital and enter at the seed stage in the enterprise creation.
Women's Business Angels Network	The Network of Women Business Angels is the only network of female "business angels". It is the first such network in Europe. It brings together a hundred women who personally invest in high potential start-ups and help them to emerge and develop.
France Initiative	The France Initiative platforms all share a common mode of intervention based on two ideas: • They provide unsecured loans without interest and without collateral, • Support services for new entrepreneurs throughout the duration of the loan. The France Initiative network is involved in promoting women's entrepreneurship through advocacy. Nationally, France Initiative develops the gender approach in its actions and in its research studies. In addition, some platforms study the applications on the initiative of the Women Guarantee Fund (FGIF).
Réseau Entreprendre	Network's mission is to contribute significantly to the success of entrepreneurs and to bring jobs and wealth. At the heart of Réseau Entreprendre, is the accompaniment by entrepreneurs of entrepreneurs. Since 1986, the association Réseau Entreprendre accompanies creators aand transferees of projects that create job significantly. They offer includes: • A free personalized support for 2 to 3 years by an experienced entrepreneur, • An unsecured loan from 15 to 50 000 Euros and easy access to banks. • A forum for exchange and mutual assistance among entrepreneurs, • Access to a local network, national and international business leaders.

3. Alliances Between Banks and Support Networks: The Case of Banque Populaire and Support Networks

Support networks have the support of their partner banks (which are eager to promote the cause of entrepreneurship) to facilitate the act of creating or transferring enterprises and contribute to the development of these networks.

Banque populaire was started 1878 to support artisans and businessmen. It is anchored on the values of cooperation, solidarity, sustainability, local development and innovation. Committed to entrepreneurship in all its forms, the Banque Populaireis a key partner of the main support structures for the creation of companies through platforms of local initiatives such as ADIE, France Initiative, BGE, the Réseau Entreprendre and France Active. According to the latest report from the National Federation of Banque Populaires published in 2014 under the title "Cooperative Assessment and Corporate Social Responsibility of the Banques Populaires network", 1200 loans for a total of more than 34 million euros were granted in 2013 through the networks to entrepreneurs, benefiting from the support and the guarantee of France Active.

RESEARCH METHODOLOGY

The Banque Populaire of Bourgogne Franche Comté (BPBFC) and the Microfinance Chair of the Burgundy School of Business conducted a joint study to analyze the perception of support networks with regard to their partnerships with banks, the adaptation of the banks to the current market and the possible impact of crowdfunding to their partnership. A semi-structured interview guide was prepared in order to conduct interviews with key support networks which were the Bank's partners in the region. This interview guide had three main themes:

The first topic was to understand the perceptions and expectations of support networks vis-à-vis partner banks. The second theme was to understand and analyze the evolution of the needs of the accompanying networks with recent market developments. The last topic of the interview guide treats the perception of crowdfunding as a new funding mechanism and as an alternative project funding mechanism.

In the end, five interviews were conducted with the support networks selected by the BPBFC. These interviews were conducted by a trainee of the Microfinance Chair of ESC Dijon during June and July 2014. The interviews lasted between 35 and 80 minutes. At the respondent's request, their identities and those of the network they represent are not disclosed. These findings are presented in the next section.

These interviews were analyzed using NVivo software and the results are presented in the Analysis section. Content analysis is defined as a set of techniques for dealing with linguistic materials (Henry & Moscovici, 1968; Bardin, 2013). In our case it is a semantic and thematic analysis, which takes into account contextual and frequency of certain occurrences identified using NVivo software. The relationships between the elements are characterized according to logical principles (non-contradiction and complementarity). The identified recurring themes were categorized according to two basic themes: objectivity and subjectivity. These axes were determined on the basis of the ordinary distinction between a transactional approach and a relational approach to marketing and customer relationship management (Marion, 2001), particularly in the financial sector (Crié 2006; Kimmy Wa Chan et al. 2010).

FINDINGS

To analyze these interviews, we organized them by theme. Each theme covered several issues.

1. Perception of Existing Relationships with Banks

The first theme concerns the perception and expectations of support vis-à-vis partner banks networks. The first question was whether or not a partnership of support networks and banks existed at the time of interview. The response was positive for all respondents for support networks. But this partnership differs from one network to another. It may be at the regional level (between the regional level of the support network and regional subsidiary of the Bank). It can be also a partnership for action, program or for a specific project (that is, the Bank may finance an activity or a definite line of activity as it can hold training sessions for new project managers on specific modules).

Some officials emphasized that there are several forms of cooperation and coordination between the support networks and banks, and sometimes despite the absence of formal signed partnerships and cooperation agreements. All these actions aim to mentor and support project creators.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Regarding the evaluation of these partnerships, the officials of the support networks were satisfied with the majority of these partnerships while highlighting the possibility of improving them. Thus, one manager has stressed the need for structuring more this partnership with banks (particularly the BPBFC) to add more value to the path adopted by the project leader. Along the same lines, another official expressed his wish to organize events closely with the bank to better support entrepreneurs.

For the last question of the first theme, which addresses the perception of support vis-à-vis networks of banks after the 2008 crisis, opinions were divided. Some have denied the existence of impact of the 2008 crisis on their partnerships with banks in general and the financing of new projects in particular. Others have found that this crisis has had a negative impact on the rate of new projects funded by banks that have imposed restrictions on obtaining credit.

2. Perceptions of the Adaptation of Banks to the Crisis

For the second theme, which focuses on understanding the bank's adaptation to the market, the questions were centered on the needs of support networks and project developers, which are numerous.

Most officials interviewed, have expressed their need for labor (administrative staff, specialized in supporting staff, experienced people who can help project leaders in the design and implementation of projects). The need for funding the network is also necessary according to the officials. This funding may be provided by banks, by companies or by local authorities.

For commercial needs, the support networks want to improve their image with the help of banks. "Banks should educate and inform their agents so they can send us micro-clients", according to one of the managers interviewed. Support networks staff should also be trained and informed about the expectations of banks and their credit standards. The need for a communication strategy and a permanent exchange of data and statistics were indicated also by the support networks.

The staff of support networks needs to be trained in several areas: accounting, administrative organization and taxation, to better satisfy their customers. Information about the new banking products must also be provided to support networks.

At the end of the second theme, the following recommendations were provided by officials of support networks:

- The involvement of banks with support networks in training of project developers.
- More cooperation and coordination in the orientation of promoters.

3. Perceptions on the Impact of Crowdfunding on the Partnership

The third theme of our interview guide discusses the link between support networks and crowdfunding. The objective behind this third part of the interview is to know the view of support networks on crowdfunding: How do they regard crowdfunding?

The first question raised in this theme was on the existence of relationships between the support networks and crowdfunding platforms at the national or regional levels. Only two have already launched partnerships in this sense, one with the platform Babylon and another with My Major Company. Other support networks had not yet launched such partnerships.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

The nature of the partnership of the first network is to provide finance. The accompanying network provides funding to the entrepreneur and tries to have it refinanced through crowdfunding. However, refinancing takes time. "Project leaders are made aware of crowdfunding through the support network" according to the respondent. The second respondent has mentioned that crowdfunding is based on the personal network of the entrepreneur.

Among the advantages of crowdfunding cited by officials support networks are having new funding sources, lowering financing cost (sometimes for free), and co-financing or refinancing a loan granted by the accompanying network or a bank loan.

However, two limitations of crowdfunding have been identified by the accompanying network managers. Such limitations can constrain the functioning of credit to project leaders. The first is the duration of the procedure (90 days), which is considered too long. The second limitation is partial and not complete project financing achieved by this method.

A final question was asked about the prospects of crowdfunding and its impact on the activity of support networks. Our respondents have clearly indicated that they offered tailored services that are more adequate to the needs of project managers, in addition to offering personalized support. All this is not presented by the crowdfunding platforms. Therefore, although crowdfunding remains complementary and important, it does not in any case replace conventional financing.

It is interesting to note that Belkenhol and Gloukoviezoff (2015) also consider that crowdfunding will not be a threat to microcredit activity for different reasons. First, the projects financed by crowdfunding are either high-technology or artistic. Such sectors are not usually microfinanced. Second, crowdfunding sites such as Kiva, Babyloan or Veecus, are only re-financing the MFI and not the entrepreneur. Third, crowdfunding websites such as FriendsClear are only an intermediary between the Bank and the borrower and they charge service fees. Fourth, sites such as Prêt d'Union use savings of investors to finance projects that are owned by a Bank. Finally, none of them provide support to guide the entrepreneurs.

DISCOURSE ANALYSIS

We adopted the method of content analysis to identify the key elements on which the interviewees focused in the communications collected from the five institutions. A sixth analysis was done of the combined corpus of all the interviews.

We used NVivo10 qualitative analysis software. NVivo facilitates the organization and analysis of texts. This software helps in discovering logics that might be hidden by the amount of words used in the text and the subjectivity of the reader. Examples of research using NVivo for analyzing interviews corpora can be found in many studies (Jones, 2012; Smith et al., 2010; Auger & Reynaud, 2011; Gehrels, 2007).

Content analysis usually is conducted through the following steps: collecting data (in our case through interviews), preparing the corpus (transcribing the interviews), coding the corpus (finding the codes is facilitated by NVivo text research tools), analyzing the content of the corpus (through the discovered codes), and finally the results are presented.

In our study, for each of these six corpora, two analyses were made. The first treatment considered all the text. However, since the subject matter of the study influenced the responses of the interviewees, a second treatment was done without the specific keywords related to the subject matter. These keywords are: "accompagnement", "reseau", "banque", and "crowdfunding".

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

The transcribed interviews were prepared for analysis by removing prepositions, conjunctions, articles, and fillers (such as "je pense"). The software helped us to produce clouds that graphically represent the frequency of the most used words in each corpus. These clouds are presented below in Figures 2 to 6 as well as in Figure 10.

In a second step, we used the prepared corpus for analyzing the position of some words with respect to other words. For this, we chose the most frequently used words as the central words in the trees to examine which words tend to precede these words and which follow.

Thereafter, we interpreted the results in five steps.

1. Intuitive interpretation of the graphics generated by the second treatment (without the keywords);
2. Positioning speeches of all five players based on perceived degree of subjectivity or objectivity;
3. Creating a mapping combining the positions of the five players, their funding and their support;
4. Correlation of this mapping with graphics containing all the keywords (unfiltered clouds);
5. Relating all this with different types of crowdfunding.

In the remainder of the study, the choice of these steps is justified and the results presented.

Step 1: Intuitive interpretation of the graphics generated by the second treatment (without the keywords).

Three successive readings of the filtered clouds were done by three co-authors, in order to achieve the most neutral reading as objectively as possible. Three complementary academic skills were mobilized finance, microfinance and marketing. A synthesis of these different interpretations allowed us to reconstruct the message of each interview from the present keywords, semantic relationships between words, the identified associations and connotations, and understanding of each co- author.

Figure 2. Word cloud of the first interview

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Keywords highlighted in Figure 2 are: activity, loan, public, our, project financing, company. The overall tone remains on an objective register and refers to the idea of control, hierarchy, and directing. The choice of words in a speech sets the institutional and professional logic.

In Figure 3, there is a frequent presence of the words: companies, creators, doing, need, popular, money, agree and time. These words suggest a double projection in the entrepreneurial future: one based on advanced projects (existing in the company) ready to be implemented (in the short - term); and a second based on the idea of a new business creation (in a longer-term).

For Figure 4, it is the word "project" that clearly stands out. The other words that are present are: need, creator, funding interesting, approach, another, creation, enterprise, perspective, could. Again, we find the idea of business creation, financial support and potential needs. The speech appears oriented towards the future (words "perspective" and "could") and suggests certain dynamism.

In Figure 5, we find the words: enterprises, training, funding, our, project, partnership, popular, nursery, and region. The concept of nursery, so the notion of supporting projects and their creators, appears for the first time. This reflects a stronger involvement and proximity in relationship. The overall message also subsumes a potential of an assumed hierarchical relationship, based on expertise and local skills development (words: region, territory, department).

Finally, Figure 6 mainly lists the words: guaranty, financing, tools, well, project, employment, cash, committee, betting, banking, seekers, finance, France, rate, loan. Note the appearance of new words like "guaranteed", "tools", "employment", "cash". We can advance the idea of a more constructed speech, more pragmatic and more functional. The tone is more neutral and professional (lack of personal involvement), suggesting cooperation based less on close relationships, and more on business efficiency.

Figure 3. Word cloud of the second interview

Figure 4. Word cloud of the third interview

Figure 5. Word cloud of the fourth interview

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

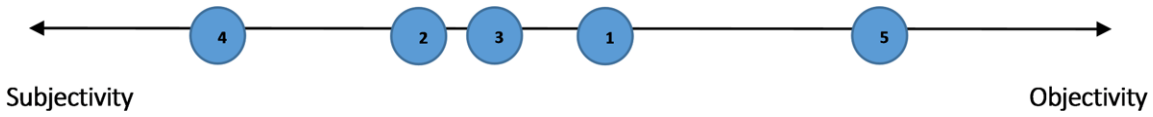

Figure 6. Word cloud of the fifth interview

Step 2: Positioning speeches of all five players based on perceived degree of subjectivity or objectivity.

The analysis of word clouds allows us to position differently the five speeches, ordering them in a line drawn between objectivity (functional speech) and subjectivity (relational discourse). Based on the analysis of the words used and connotations selected in step 1, we plot these positions in Figure 7. At the left end, we place the actor 4, whose speech has the most subjective connotations (high involvement and relational proximity, expertise, assumed hierarchical relationship. At the right end, we are positioning the actor 5, who values the most objective connotations (pragmatic, functional, professional, business efficiency). Between the two ends, there are three other players with similar speeches, valuing both objective and subjective factors at the discursive level (institutional logic, financial support and potential needs, projects, business creation).

Figure 7. Positioning of the five word clouds

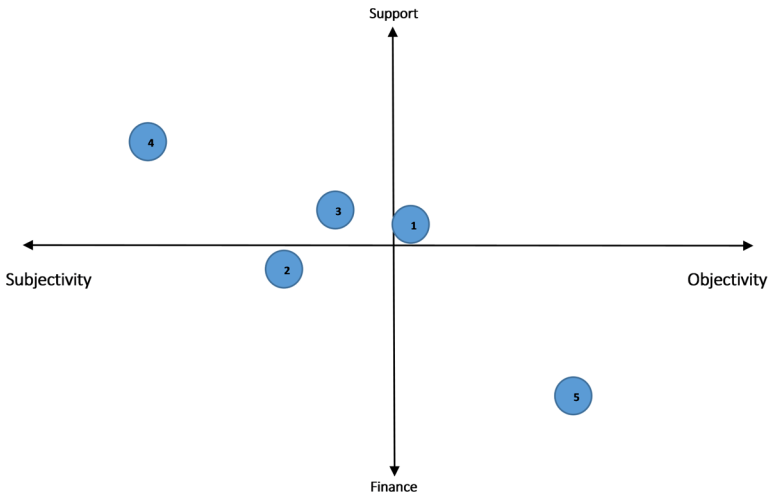
EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Step 3: Creating a mapping combining the positions of the five players, their funding and their support.

Remember that our research question focuses on three essential elements that are funding, support and crowdfunding. The first two elements are connected logically to the activities and interests of the actors interviewed (we used the answers of the managers interviewed in the preceding section). To better understand the dynamics and changes in speech based on the business model of the interviewed networks, we propose a mapping that adds new elements to the finding of step 2. The bi-dimensional Figure 8 illustrates more elaborately the positioning.

Step 4: Correlating the mapping with graphics containing the keywords (unfiltered clouds)

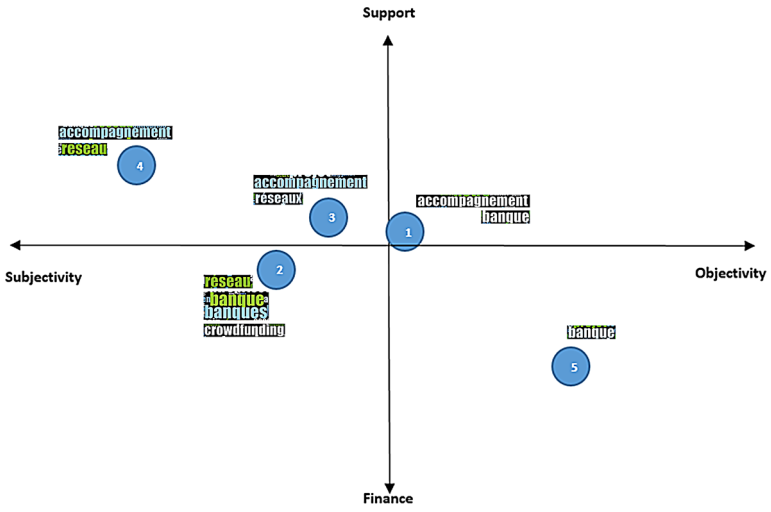
The analysis presented in steps 1, 2, and 3 used only filtered clouds. We now include in Figure 9, as specified in the methodology, the clouds with the most frequent keywords used by the interviewees, appearing next to each of the clouds.



As Figure 9 shows, the proposed positioning in step 2 and 3 is validated and reinforced.

The keywords do not always appear with the same consistency in the speeches of all the players as shown in the unfiltered clouds presented below (Figure 10).

Step 5: Relating the mapping with different types of crowdfunding.



To go further in reflection, we now offer a reconciliation between the five positions of the mapping and the four forms of crowdfunding: gift-based, reward-based, credit-based, and investment-based. Figure 11 shows this comparison.

Figure 8. Mapping of the five word clouds

Figure 9. Mapping of the five word clouds including the keywords

CONCLUSION

Our findings show that actors of support networks are very aware of crowdfunding and its advantages for micro-projects. However, they do not perceive crowdfunding as a factor that may impact the relationship between these networks and their partner banks. The primary reason is that they feel that microentrepreneurs need handholding which online platforms cannot provide. Thus, they tend to see crowdfunding as complementary seed capital rather than a competitor which would substitute their work. This comforts both the banks and the support networks as they do not need to perceive crowdfunding as a threat.

The discourse analysis confirms that the word crowdfunding did not really appear as an important part of the interview. Only in one interview, it seems to stand out. However, if we look at the right side panels, where the words such as crowdfunding were deleted, we should have found words such as "technologie", "ligne" or "participative". However, we do not.

Of course, this is a qualitative study based on perceptions of a small number of respondents, and this perhaps is the main limitation of this study. Future research may need to multiply the interviews in other regions of France and with more respondents. But this would be more time-consuming and costly. In addition, future research is required for investigating the suggested mapping on the potential relations between the different models of crowdfunding platforms and the support networks.

KEY TERMS AND DEFINITIONS

Content Analysis: A set of methods for treating and analyzing linguistic materials. It includes manual and computer-assisted techniques. Many qualitative data analysis softwares facilitate content analysis and text mining. Such softwares offer word frequency queries, contextual search, in addition to various visualization tools.

Customer Relationship Management (CRM): A complex process of managing the relationship with customers and partners, using data collected from databases and processed using efficient systems/software.

Microfinance: The provision of financial services to the financially excluded, usually very poor people. A wider range of financial services includes microcredit, microsavings, microinsurance, microequity, microtransfers, micropayments, etc. These financial services are for very small transactional amounts: hence the word micro.

Relationship Marketing: The process of constructing partner loyalty (banks, support networks, entrepreneurs and project initiators) by building sustainable and profitable relationships based on trust, accessibility and proximity.

Support (*Accompagnement*, in French): The word "Accompagnement" appeared in France in the early 80s to characterize assisting candidates for starting a business in a particular context. It includes coaching, training, mentoring, guiding entrepreneurs.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Support Networks: Networks of organizations who provide mentoring the support services. They could be federations of independent local organizations, but they could also have one organizational form with local agencies in each region or department.

Transactional Marketing: A functional view of trade, reduced to monetary transactions, which mainly targets the immediate financial benefits and minimizes the quality of relationship over time.

Chapter 59
Understanding and Adoption of E-Finance in Small and Medium Enterprises (SMEs) in Developing Countries:
A Study of Bangladesh and South Africa

ABSTRACT

The lack of access to finance is hindering growth and development to small and medium enterprises (SMEs), particularly in developing countries. Access to finance can be facilitated by ICT and e-finance, which can reduce the cost of financial services and increase access to international markets. However, in spite of the potential benefits of e-finance, developing countries have been reported to be lagging behind in terms of e-finance adoption as compared with developed nations. The reason for non-adoption could be due to barriers such as lack of ICT infrastructure, data privacy and security concerns. The purpose of this chapter is to investigate the extent of understanding and adoption of e-finance by SMEs. A survey of SMEs in two developing countries, South Africa and Bangladesh, was conducted. The results of the survey revealed that access to financial products and services was the highest rated benefit of e-finance to respondent SMEs, whereas regulatory environment and policy was the highest rated barrier.

INTRODUCTION

Small and medium enterprises (SMEs) play a vital role in the development of developing countries by raising employment and rational allocation of scarce resources (Srivastava, 2014). However, the growth of these SMEs in developing countries such as Bangladesh are constrained by a lack of capital (Khan, 2014; Su & Yuan, 2013). Access to finance has also been reported as a vital factor for SME sector development in Bangladesh (Bangladesh Bank, 2016; Hoque, Saif, AlBar & Bao, 2015). Access to finance can be facilitated by Information and Communication Technologies (ICTs), which can improve the probability of an organization's success (Bughin & Manyika, 2016) and in particular SMEs (Hoque *et al.*, 2015; Modimogale & Kroeze, 2009). ICT can enhance services and expand services beyond geographic boundaries (Gumbi & Mnkandla, 2015; Srivastava, 2014). The emergence of internet-based technologies such as social networks, cloud computing and mobile payments have resulted in a gradual shift in the paradigm of the financial sector (Agwu & Murray, 2014; Ping & Chuanwei, 2013). It is predicted that this paradigm shift will lead to a narrowing of the digital divide as basic financial services to a greater number of people will be provided as opposed to only a small group of elite wealthy individuals. However, in a study of SMEs in Bangladesh, it was revealed that ICT adoption has been lower than expected (Hoque *et al.*, 2015). One of the factors hindering this adoption was a lack of awareness of the benefits of ICT. According to Agwu and Murray (2014) the majority of SMEs in developing countries are lagging behind in the use of ICTs and the internet, especially for making transactions. One reason for this lag is perceived security issues by customers (Dewan & Nazmin, 2008).

The widely accepted definition of e-finance according to Allen, McAndrews and Strahan (2002:7) is: *The provision of financial services and markets using electronic communication and computation.* E-finance includes all financial products and services which are available to the consumers and businesses over the internet and includes online brokerage, banking, insurance, and other financial services. According to Agwu and Murray (2014), e-finance enables businesses and ordinary citizens to conduct various financial transactions on the internet, meaning greater availability of financial services. E-finance is classified as one type of e-service. Sorooshian, Onn and Yeen (2013) assert that services such as communication, financial, cultural and recreational that can be delivered with the aid of the internet and computerized systems, such as the web, information kiosks and mobile devices can be regarded as e-services. Whilst internet banking or online banking is one type of e-finance, it has also been classified as a category of e-commerce (Mohiuddin, 2014).

The adoption and use of e-finance can lead to a multitude of potential benefits for SMEs, such as reduced cost of services and transactions (Riyadh, Bunker & Rabhi, 2010; Srivastava, 2014), as well as increased access to products and services in international markets through PCs and mobile devices (Riyadh *et al.*, 2010; Srivastava, 2014; Su & Yuan, 2013). Another benefit of e-finance is improved access to financial information (Mubaraka, Momanyi & Jibia, 2013; Riyadh *et al.*, 2010; Shahrokhi, 2008; Srivastava, 2014).

In spite of the potential benefits of e-finance, the adoption of e-finance by SMEs in developing countries has been slow when compared with larger businesses or SMEs in developed countries (Riyadh *et al.*, 2010; Su & Yuan, 2013). Internet usage naturally impacts e-finance adoption and therefore it can be deduced that ICT and internet issues related to data privacy, security and safety are also barriers to e-finance adoption (Dewan & Nazmin, 2008; Koskosas, 2011; Nasri, 2011; Raza & Hanif, 2013; Susanto, Lee & Zo, 2013). ICT infrastructure (Agwu & Murray, 2014; Narayanasamy, Rasiah & Tan, 2011; Riyadh *et al.*, 2010) and the regulatory environment and policy can influence the adoption of e-finance

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

by customers (Dewan & Nazmin, 2008; Narayanasamy *et al.*, 2011). A regulatory environment includes various rules, policies and regulations related to e-finance. Lastly the lack of ICT skills (Dewan & Nazmin, 2008) and insufficient training can negatively impact e-finance adoption (Riyadh *et al.*, 2010).

In most developing countries like Bangladesh there are problems with ICT infrastructure such as internet access (Ashta & Assadi, 2009), availability and speed (Dewan & Nazmin, 2008), as well as power shedding, which can negatively impact the growth of ICT and ultimately e-finance (Riyadh *et al.*, 2010). In the developing countries in Africa power shedding has also been reported as a barrier to adopting or implementing ICT and e-finance (Agwu & Murray, 2014).

The rapid increase of ICT use by SMEs across the globe has also led to an increase in research on how to utilize ICT in the provision of financial services and the performance of financial transactions (Agwu & Murray, 2014). A review of literature revealed that online financial services and e-finance for SMEs has received limited attention by researchers and that more studies are needed to understand the impact of technology adoption on the financial industry (Han, 2008; Tsai, Huang, Fan & Liu, 2006). In South Africa, research has been done on e-commerce (Kona, 2014), internet usage (Gillwald, Moyo & Stork, 2012), electronic banking also referred to as e-banking (Maduku, 2013; Masocha, Chiliya & Zindiye, 2011), as well as mobile phone banking (Maduku, 2013). In South Africa the adoption rate of certain e-banking services has been reported to be not as good as initially hoped for (Maduku & Mpinganjira, 2012). Whilst e-finance is a relatively new and emerging field of research it has gained great impetus in the business world, particularly in developing countries such as India, China and Brazil (Srivastava, 2014). However, in spite of the enormous growth in technology, the adoption rate of e-finance and in particular e-banking is low in many developing countries, including Pakistan (Khurshid, Rizwan & Tasneem, 2014). Whilst Pakistan is rich in technology adoption, with 20 million internet users and 100 million mobile phone users, e-banking adoption in Pakistan is reported to be still in an infant stage.

The purpose of this chapter is to report on the understanding and adoption of e-finance by SMEs and the types of e-finance currently being used by SMEs. The study investigated e-finance adoption in two developing countries, South Africa and Bangladesh. To give effect to the primary objectives of this study, the following secondary research objectives were formulated:

- To identify the most commonly used types of e-finance by SMEs;
- To establish the benefits of adopting e-finance by SMEs; and
- To establish the barriers to the adoption of e-finance by SMEs.

The structure of the chapter is as follows. The first section discusses the background to the adoption and benefits of ICT, particularly in SMEs and also introduces the concept of e-services. This is followed by an analysis of the benefits and barriers to e-finance adoption as identified by literature. In the next section, the characteristics of SMEs in two developing countries, South Africa and Bangladesh, are described. These two countries are used as participants in a survey and an analysis of these results are then provided. The chapter then highlights some issues encountered in the study and then presents some conclusions and recommendations.

BACKGROUND: ADOPTION OF ICT AND E-SERVICES IN DEVELOPING COUNTRIES

ICT makes a significant and meaningful contribution to economic growth since ICT in various forms, such as e-commerce and other tools, is known to boost productivity by improving the efficiency of individuals, businesses, and the economy as a whole. ICT adoption has recently been identified and recognized as one of the mechanisms that have the potential to stimulate the development and growth of SMEs (Gumbi & Mnkandla, 2015; Hoque et al., 2015; Modimogale & Kroeze, 2009). Those SMEs that are able to leverage and take advantage of ICT to achieve high levels of efficiency and effectiveness will be in a greater position than those that do not. Due to the accelerated global growth in internet and ICT usage, many businesses as well as governments around the world have made huge strides in transforming their services from traditional contact services to electronic means (Alanezi, Kamil & Basri, 2010). Many businesses, financial institutions in particular, have embraced e-services in order to make service accessibility easier for their customers.

In addition to ICT and internet usage, mobile device usage has grown radically and in 2014 reached 75 billion users globally (eMarketer, 2014). Africa has been reported to have the second largest mobile market worldwide after Asia (Phillips et al., 2011). In Sub-Saharan Africa smart phone usage is forecast to grow the most and it is predicted that by 2020 more than half of the connection base will have smart phones by 2020 (GSMA Intelligence, 2014).

However, in spite of the increase in ICT usage in some countries, Hoque et al. (2015) and Dewan and Nazmin (2008) identified several barriers to ICT adoption encountered by SMEs in developing countries such as Bangladesh. These barriers included attitude towards ICT, poor infrastructure, insufficient information and non-customized software. Several factors that could ultimately become barriers to adoption have been reported and of these, trust (Casaló, Flavián & Guinalíu, 2010) and quality (Alanezi et al., 2010) are the most commonly cited. E-service quality can be described as a user's perceptions of the outcome of the service delivery as well as service recovery perceptions should service fail. According to Alanezi et al. (2010), it includes dimensions such as security and privacy, design, reliability, responsiveness, information and ease of use or usability.

Singh and Chauhan (2012) reported that internet presence in remote areas remains a barrier to the adoption of any online service. Additionally, poor bandwidth and lack of trust compromise positive attitudes towards e-services. Conversely, trust, high bandwidth and broadband connectivity play a crucial role in delivering e-services to multiple users. Ashta and Assadi (2009) argue that in poorer countries, web-based lending is more difficult to implement and operate since most poor people are illiterate and have very limited access to the internet on a computer. In such countries, mobile financial applications are considered as an alternative. An Indonesian study revealed that perceived security was a primary factor for influencing trust towards internet banking services (Susanto et al., 2013). In a South African study (Maduku, 2013), low levels of trust in the system of banking through the use of mobiles, was revealed. However, in spite of these low trust levels, customers still have a positive attitude towards mobile banking. It is therefore important that banks investigate the factors that influence a customer's attitude to mobile banking or e-banking.

The focus on this chapter is on the adoption of e-finance by SMEs in developing countries. In particular, two countries South Africa and Bangladesh are investigated in more detail and reported on. The next section investigates the literature on the different types of of-finance and the benefits and barriers to e-finance adoption with a particular emphasis on developing countries such as South Africa and Bangladesh.

BENEFITS AND BARRIERS TO E-FINANCE ADOPTION

Benefits of E-Finance Adoption

The growing consumer demand and a fear of losing market share has driven banks to invest heavily in personal computer banking technology, mobile banking and internet banking (Murari & Tater, 2014). There are various types of e-finance and each of these has specific benefits (Figure 1). E-banking is an umbrella term that is used to describe the different types of services through which customers can request information and carry out most retail banking services such as balance reporting, inter account transfers and bill-payments with the use of technology (Daniel, 2000). Internet or online banking is the most prominent example of e-banking and allows SMEs to manage their current accounts, pay debts, collect credit as well as transfer funds over the internet (Maduku, 2013). The adoption of e-banking has resulted in cost savings (Riyadh *et al.*, 2010), reaching new population segments and enhanced reputation (Agwu & Murray, 2014).

Mobile banking is a technology that benefits banks and customers by allowing people to perform banking transactions anytime and anywhere, promoting efficiency and improved service quality (Malaquias & Hwang, 2016). However, as several studies surveyed by Malaquias and Hwang (2016) have shown, the adoption of mobile banking has been generally low despite the widespread adoption of mobile devices. A survey of banking customers in South Africa revealed that mobile banking was not as popular as expected; however customers still had a positive attitude towards mobile banking and positive intentions to start/continue using the service (Maduku, 2013; Maduku & Mpinganjira, 2012). Wireless internet is the main type of broadband connectivity at household level in South Africa (World Wide Worx, 2013). According to Arthur Goldstuck, managing director of World Wide Worx, *the rapidly growing penetration of smartphones and the increased ease of use of the internet on feature phones has changed the way South Africa communicate.* The use of apps mobile phones in South Africa has

Figure 1. Types of e-finance

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

increased to more than half (51%) of adult cellphone users in cities and towns in late 2013 from 24% in mid-2012. In rural areas, the growth has increased to a 27% usage level, surpassing the overall market of 18 months before and is still increasing rapidly. Both mobile network data use and internet access via hotspots is expected to boom.

According to a report produced by InfoDev, 71% of all South African internet users use a mobile phone in their individual capacity to browse the internet (Calandro, Gillwald, Deen-Swarray, Stork & Esselaar, 2012). This report also revealed that mobile phones are the primary method used for accessing information or for communicating by people at the base of the pyramid (BoP). The mobile phone is therefore the preferred medium to provide electronic ICT services to users at the BoP. Users at the BoP can be identified as private users or informal businesses. The report also stated that the majority of non-users of the internet state that they do not know how to use the internet, indicating that there is a need for initiatives that raise awareness of the benefits provided by internet access as well as of the various possible uses of the internet. Letsie, Kabanda and Chigona (2015) also argue that in disadvantaged families, mobile devices played a significant role, especially for communication.

E-lending is another type of e-finance and entails lending to entities using the internet and allows SMEs to apply for credit online or via mobile phones (text and voice) with reduced application costs and faster turnaround on loan approvals or rejections (Riyadh *et al.*, 2010). E-credit information allows businesses to have access to an online database of SMEs' credit histories for risk assessment purposes thus contributing to the reduction of information asymmetry and reducing collection costs for the business (Martinez Peria & Singh, 2014). Internet or other ICT mediated leasing is referred to as e-leasing and is known for the reduction of application costs and easy payments, ultimately providing SMEs with access to production assets at lower costs.

Research has shown that customers like to shop online for insurance products (Cata & Lee, 2006). Insurance companies are therefore moving more and more to "paperless" insurance and to doing business on the internet. E-insurance is the application of the internet and other ICT for the production and distribution of insurance services. The narrow definition refers only to the provision of insurance cover online (Sapa, Phunde & Godbole, 2014). A key benefit of e-insurance to the customer is the improved communications and marketplace information. Other benefits relate to increased transparency and the reduction in transaction costs (Grossman, McCarthy & Aronson, 2004; Odoyo & Nyangosi, 2011; Sapa *et al.,* 2014). The benefits of e-insurance to the country are the economic benefits associated with increased employment opportunities, improvement of local entrepreneurship as well as improved skills and awareness creation. E-insurance can provide customers more easily with information about new products and special offers (Mubaraka *et al.*, 2013).

Microfinance is a *type of banking service that is provided to unemployed or low-income individuals or groups who would otherwise have no other means of gaining financial services* (Ashta & Assadi, 2009). E-microfinance is the use of the internet and ICTs for designing micro-credit initiatives and is beneficial for SMEs because it reduces the costs to access microfinance and widens sources of finance. Peer-to-peer (P2P) lending platforms have been defined as online platforms where borrowers place requests for loans online and then private lenders can bid to fund these loans in a type of auction (Klafft, 2008). Online P2P lending has gained significant interest and relevance in recent years (Bachmann *et al.*, 2011; Klafft, 2008), even in developing countries like China (Su & Yuan, 2013). One of the main benefits of P2P platforms is the elimination of banks as intermediaries, thus resulting in a reduction in transaction costs. There are many other e-finance types such as e-tax payments and e-warehousing (Riyadh *et al.*, 2010). These are all beneficial to SMEs because they expand the sources of finances available.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

E-finance has greatly transformed financial structures all over the world, and even more so in the context of developing and transitioning countries. E-finance delivers a wider selection of financial services and products to more individuals and SMEs in a speedier and timelier manner through (Shahrokhi, 2008):

- Real time access to financial services;
- Convenient access to financial services;
- Provision of sophisticated financial services to geographically remote areas; and
- Increasing number of financial services available at the retail level.

The primary benefits of e-finance to SMEs can be summarized into three categories (Table 1). The impact of e-finance on SMEs is that it allows them to have convenient access to finances and low cost financial services and this is beneficial in environments where resources are scarce and financial information is limited (Srivastava, 2014). Shahrokhi (2008) argues that e-finance delivers convenience to SMEs to enable them to access and perform financial transactions from anywhere at any time. The adoption of e-finance therefore provides access to a wider range of financial products and services (Mubraka, *et al.*, 2013; Riyadh *et al.*, 2010).

Su and Yuan (2013) state that e-finance may lead to lower costs and greater competition in financial services, through both new entries from outside the financial sector, and greater competition among institutions within the financial service sector. According to Riyadh *et al.* (2010) e-finance has made it easier for SMEs to access finance by lowering transaction costs and improving the quality of the financial service. Using e-finance is said to reduce costs of brokerage services as well as provide increased access to international securities markets.

One of the major problems for SMEs is the lack of reliable and validated business-related information, which is required for good investment decisions, efficient management and for gaining a competitive advantage (Raihan, 2001). Information that is required relates at least to the following areas: the procedure of business, legal issues, cost and process of products and services, market and industry average information and sensible business contact information. According to Shahrokhi (2008) e-finance has become a powerful medium for entrepreneurs in search of venture capital and for venture capitalists looking for investment opportunities. It is now possible to acquire data on the majority of venture firms and firms that are seeking new businesses to invest in. Agwu and Murray (2014) assert that SMEs have access to extensive online information including information that can be utilized to make financial decisions. This information should be highly accurate, current and easy to understand in order to aid quality decision making.

Table 1. Benefits of e-finance to SMEs

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

In a study of internet banking in Pakistan, it was reported that customers believe that internet banking provides believable information, real time information, relevant information and at the right level of detail (Raza & Hanif, 2013). The increased information available regarding internet banking products, services and benefits has impacted the adoption rate of internet banking by customers (Nasri, 2011).

Banks therefore need to make customers aware of the availability of internet banking products and the benefits and value to the customer in comparison to competitive products. Improved marketing of these products and the provision of information regarding products and services can have a positive effect on the adoption of internet banking by customers.

Barriers to Adoption of E-Finance

Whilst there are several benefits to e-finance for both large organizations and SMEs, e-financing is not without its flaws and there are barriers to the use and adoption of e-finance. In a study done of banking customers in South Africa, only half of respondents were users of mobile phone banking (Maduku & Mpinganjira, 2012). Dewan and Nazmin (2008) found that ICT issues are the greatest perceived barriers for SMEs not to adopt e-finance. Three of the most commonly reported ICT issues that have been reported as barriers to the adoption of e-finance by customers are data privacy, security and safety (Dewan & Nazmin, 2008; Koskosas, 2011; Nasri, 2011). Dewan and Nazmin (2008) found that security issues (viruses & hackers) are the greatest perceived barriers for SMEs not to adopt e-finance. According to Raihan (2001) SMEs seek guarantees that they are protected against cyber-attacks and all other risks associated with transacting online that could lead to financial losses. Koskosas (2011) argues that security and safety are key concerns for both users and providers of e-finance. Safety and security issues include authentication of counterparts, no accountability transactions, inadequate customer support, guaranteed business continuity, data integrity and confidentiality. These issues are a reality for e-finance users and providers alike, and as such users need to safeguard against fraudulent service providers. Service providers on the other hand need to guarantee data integrity as well as the confidentiality of their customers' private information and user information needs to be protected from unauthorized parties. A study in Indonesia revealed that security and privacy impacted a customer's level of initial trust in internet banking. The results also showed that initial trust impacted a user's usage intention of internet banking (Susanto *et al.*, 2013). Initial trust was shown to be positively correlated with a user's usage intention of internet banking. From these studies it can be deduced that security and privacy are possible barriers to the adoption of e-finance by SMEs.

Another barrier to the adoption of e-finance is ICT infrastructure. In Bangladesh, like other developing countries, high speed broadband internet is not available in rural areas (Riyadh *et al.,* 2010). In addition, computer hardware and software costs are high and load shedding is a regular phenomenon (Mohiuddin, 2014). This lack of ICT infrastructure hinders the growth of e-business and e-finance. Integration of the economy to the global market, scale of business operations and technological developments are dependencies for the delivery of e-finance. According to Narayanasamy *et al.* (2011) there is a positive relationship between ICT infrastructure and growth of e-finance, which means that countries with a weaker ICT infrastructure (defined as organizations, personnel, procedures, facilities and networks used to transmit and receive information by electronic means) tend to experience slow e-finance growth. In most developing countries a basic internet network exists; however, high speed broadband internet is not available in rural areas. Slow internet speeds in developing countries are a barrier to e-finance adoption. Most SMEs, especially those in rural areas, do not have a computer or access to the internet

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

or related software in order to benefit from e-commerce (Dewan & Nazmin, 2008). According to the study of Gillwald *et al.* (2012), few informal businesses in South Africa maintain a website (estimated at four percent), with even fewer employees having access to an email address (estimated at three percent). Most informal businesses employ mobile phones more than any other ICT devices. Mobile phones are therefore more commonly used to conduct small business and make use of a combination of voice and internet services. This study also reported that availability of services on internet-enabled mobile phones was one of the biggest challenges faced by informal businesses. A Nigerian study of challenges and barriers to e-commerce adoption by SMEs revealed that small and medium scale online presence is unknown (Agwu & Murray, 2014). Technical skills were identified as some of the barriers to e-commerce adoption. In Malaysia, bad technology architectures were also a concern to e-finance customers and affected the growth of e-finance (Narayanasamy *et al.,* 2011). In Indonesia, even though there has been limited improvement in the ICT infrastructure situation, the existing infrastructure has created opportunities for the introduction of e-businesses, which are already being explored by many companies (Janita & Chong, 2013).

Telecommunications has been a high priority for the South African government and there have been ambitious goals set in this regard (Gillwald *et al.*, 2012). Although public access to the internet is increasing in major cities and metropolitan areas, affordable and reliable internet access remains poor amongst the rural areas of South Africa. The government has sought to create employment for citizens by creating opportunities with ICT. However, the cost of broadband access remains prohibitively high for most South Africans. In spite of this there has been a growth in data services whilst voice service usage in has declined. It is reported that the total number of broadband internet users in South Africa is 34% of the 15 years and older age group population.

Regulatory environment and policy is an additional barrier to e-finance adoption. According to Allen *et al.* (2002) legal risk arises from a violation or non-conformance with laws, rules and regulations and legal risks can further occur when the legal rights and obligations of the parties to a transaction are not well established. When SMEs adopt e-finance some rules and regulations must be in place; for example, Online Dispute Resolution, electronic signatures and e-business legislation. In developing countries the regulatory environment is more critical than in developed countries regarding the adoption of innovation (Riyadh *et al.*, 2010). A study of e-business in SMEs in Indonesia identified that regulation and policies are an important factor in influencing adoption (Janita & Chong, 2013). A regulatory environment for e-banking is usually provided by government. Another study in Indonesia revealed that the perceived level of government support influenced customers' initial trust in internet banking (Susanto *et al.*, 2013). Since initial trust was shown to be positively correlated with a user's usage intention of internet banking, a lack of perceived government support can be a barrier to e-finance adoption. The results of a Pakistan study confirmed the influence of government on internet banking adoption, since they encourage and promote the usage of internet banking and provide laws and regulations for internet banking (Raza & Hanif, 2013).

A lack of understanding, awareness or knowledge of the benefits of e-finance is another barrier to e-finance adoption (Nasri, 2011; Riyadh *et al.*, 2010). Awareness and training regarding the use and potential of ICT for profit enhancement, cost reduction and access to finance is important and should be provided to the community. Internet knowledge or skills can also influence a customer's adoption of e-banking, therefore improving training and skills and ultimately can improve adoption rates (Mohiuddin, 2014; Nasri, 2011). The barriers to e-finance for SMEs can therefore be summarized into four categories (Table 2).

SMEs IN DEVELOPING COUNTRIES (SOUTH AFRICA AND BANGLADESH)

In South Africa SMEs, also known as SMMEs (Small, Micro and Medium Enterprises), are defined as businesses that employ less than 200 full-time employees (Ndayizigamiye, 2014). Furthermore, the size of an SME (in terms of the number of full-time employees) differs according to the business sector it falls under. With the exception of the agricultural sector, it is noted that in all other sectors the limit to be classified as an SME is 200 full time employees, where the agricultural sector prescribes a limit of 100 full time employees. Small enterprises capture the upper end of the micro-enterprise market, and are often registered. Of these small businesses, 9% of them claim to have received or utilized some form of formal credit. The SME sectors in South Africa can be categorized as follows:

- A micro enterprise has up to 5 employees,
- A small enterprise has up to 50 employees, and
- A medium enterprise has from 51 to 200 employees.

According to Hoque *et al.* (2015), in Bangladesh the definition varies slightly from the South African definition in that small enterprise refers to a business which is not a public limited company and the limits with regards to employees are as follows:

- A micro enterprise has less than 10 employees,
- A small enterprise has up to 25 employees, and
- A medium enterprise from 50 to 100 employees.

Historically, banks and other formal financial institutions have avoided serving those in poverty since these institutions do not have practical solutions to overcome problems of high transaction costs, adverse selection and the risk of not being able to screen entrepreneurial projects effectively. Additionally, managing the disbursement of small loans efficiently is also problematic as proven methodologies for microfinance lending tend to be labor intensive (Bangladesh Bank, 2016; Centre for Inclusive Banking, 2013). In South Africa and Bangladesh, like most developing countries, micro-enterprises are underserved when it comes to the provision of microfinance. Some of the constraints for the provision of microfinance reported in Bangladesh (Bangladesh Bank, 2016) are:

- Transaction costs associated with processing loans are fixed,

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

- Difficulty in adopting new lending technologies;
- Microfinance institutions have not adopted innovative lending methodologies, and
- The high cost of obtaining credit information on micro-enterprises.

The estimated failure rate of SMEs in South Africa is between 70% and 80% (Adeniran & Johnston, 2011). Adcorp (2016) reported that around 440,000 small businesses in South Africa have closed in the last five years and that the reported number of new business start-ups is at an all-time low. Over the last decade, the number of small businesses in the country has stagnated. This situation needs addressing as SMEs are critical for large-scale job creation in South Africa. One of the obstacles when starting up a business is access to finance (Grundling & Kaseke, 2010). South Africa as a country exhibits characteristics of a developed and developing economy with regards to its technology accessibility trends. The country has been seen to adopt the advanced use of technology in research and educational institutions as well as in the private sector. It is noteworthy, however, that more than 25 million citizens in the country live below the poverty line. Millions of South Africans rely on social grants for their livelihood. A large portion of South Africans have low education levels and lack general skills and even more so computing skills, which leads to low employability (Calandro *et al.*, 2012).

E-FINANCE ADOPTION SURVEY

Methodology

In order to address the objective of this chapter, and to investigate if the literature surrounding e-finance adoption could be validated, a survey was undertaken of SMEs in two developing countries, Bangladesh and South Africa. A non-probability convenience sampling technique was used, based on the purposive sampling method (Saunders, Lewis & Thornhill, 2009). SMEs in the contact lists of the respective researchers in the two countries were contacted and invited to participate.

The survey questionnaire was designed to answer the following questions:

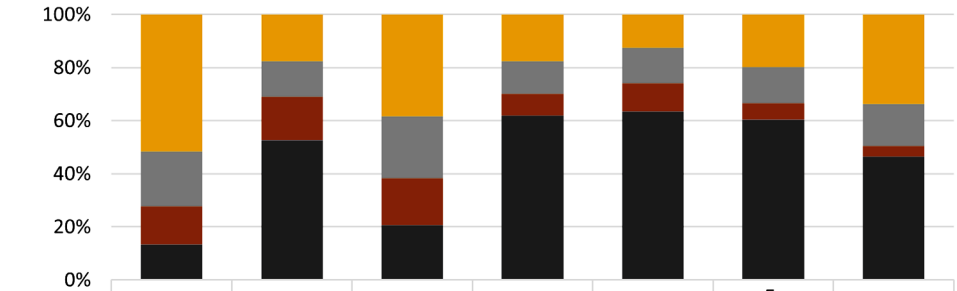
- What is the level of adoption of e-finance by SMEs?
- What are the most commonly used types of e-finance by SMEs?

Respondents could take either complete the questionnaire online of on paper. The majority (86%) of the Bangladesh respondents were employees, whereas only 36% of South African respondents were employees. The remaining respondents in South Africa were owners of SMEs (61%) or contractors (3%). In Bangladesh the remaining minority of respondents were owners of SMEs (13%) and contractors (1%). The main industries represented by respondents from the two countries were manufacturing, construction and tourism and catering. The business operations of the respondents' SMEs were a mixture of urban, rural, peri-urban and international.

Respondents were asked to rate the extent of their agreement regarding their experience with e-finance. It must be noted that the questionnaire was coded with five being Strongly agree and one being Strongly disagree. The results were analyzed in terms of mean ratings and frequency distributions. Seven e-finance factors of e-finance adoption were investigated, which consisted of the three benefits identified in literature (Table 1) and the four barriers (Table 2). In reporting on the analyses the Strongly agree and

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Agree categories will be referred to as "agreed" and the Disagree and Strongly disagree categories were combined into one category "disagreed" to make the analysis more meaningful. Furthermore, the mean ratings were categorized and interpreted as follows: Negative: $\mu = [1 - 2.6)$; Neutral: $\mu = [2.6 - 3.4]$ and Positive: $\mu = (3.4 - 5]$.



Results: E-Finance Usage

The survey results revealed that out of the respondents, e-banking (72%) and e-credit information (62%) are the most highly adopted types of e-finance in Bangladesh, when considering weekly or monthly usage (Figure 2). Conversely it should be noted that e-leasing (64%), e-insurance (62%) and e-microfinance (60%) have the lowest level of adoption when considering the response to e-finance types that are never used by SMEs.

The level of adoption of e-finance in South Africa (Figure 3) indicates that e-lending (51%), e-insurance (51%) and e-banking (30%) are the most highly adopted e-finance types when considering use on a weekly or monthly basis. It should be noted that all 100% of the South African respondents indicated that they use e-banking. E-microfinance (91%), other e-finance (85%), e-credit information (82%) and e-leasing (79%) have the lowest adoption levels in South Africa considering the e-finance types that are never used.

An analysis of the adoption patterns of the two developing countries reveals that, whilst South Africa has varied adoption levels (Figure 3), Bangladesh has more evenly distributed adoption levels (Figure 2). South Africa has a high adoption level for e-banking, however, there is very little adoption for other types of e-finance, whereas in Bangladesh the high adoption levels for the other types of e-finance are observed. The majority of the respondents in South Africa (100%) and Bangladesh (86%) stated that they have adopted e-banking (Figure 4). However, only 61% of South African respondents and 47% of those in Bangladesh (54% average) have adopted e-lending. The greatest difference (61%) can be observed for e-credit information, since a larger percentage (79%) of Bangladesh respondents stated that they had adopted e-credit information than South African respondents (18%).

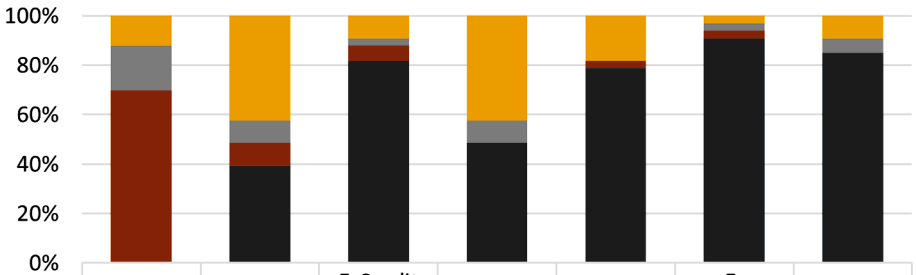


Figure 2. Ranking of adopted e-finance types in Bangladesh (n = 105)

	E-Banking	E-Lending	E-Credit Information	E-Insurance	E-Leasing	E-Microfinance	Other E-Finance
Monthly	51%	18%	38%	18%	13%	20%	34%
Weekly	21%	13%	24%	12%	14%	14%	16%
Seldom	14%	16%	18%	8%	10%	6%	4%
Never	13%	53%	21%	62%	64%	60%	47%

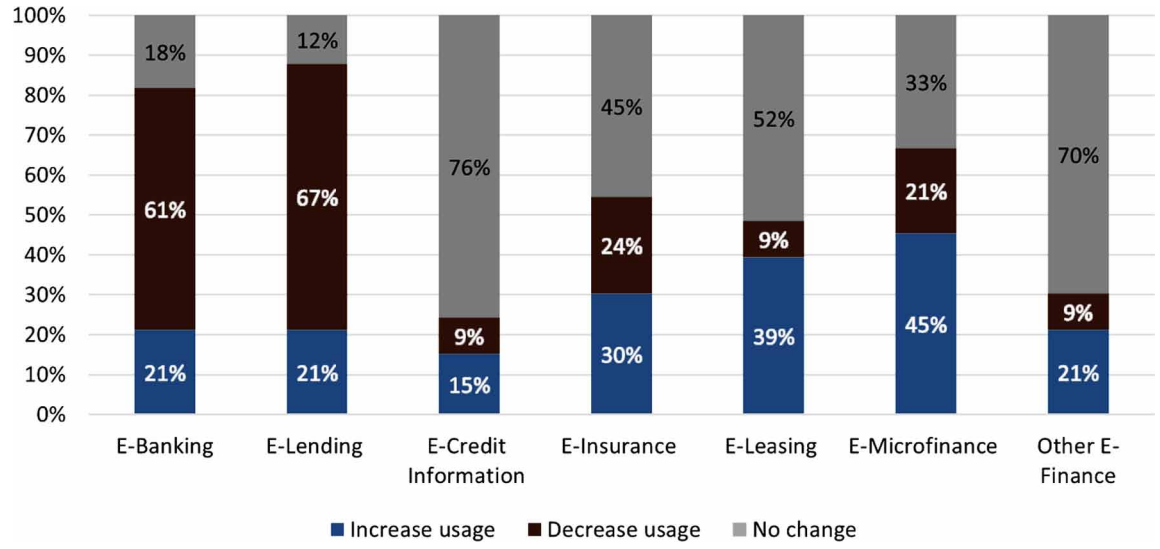
Figure 3. Ranking of adopted e-finance types in South Africa (n = 33)

	E-Banking	E-Lending	E-Credit Information	E-Insurance	E-Leasing	E-Microfinance	Other E-Finance
Monthly	12%	42%	9%	42%	18%	3%	9%
Weekly	18%	9%	3%	9%	0%	3%	6%
Seldom	70%	9%	6%	0%	3%	3%	0%
Never	0%	39%	82%	48%	79%	91%	85%

Figure 4. Ranking of adopted e-finance types (n = 138)

	E-Banking	E-Lending	E-Credit Information	E-Insurance	E-Leasing	E-Microfinance	Other E-Finance
Bangladesh	87%	47%	79%	38%	36%	40%	53%
South Africa	100%	61%	18%	52%	21%	9%	15%

The respondents that were not using e-finance on at least a weekly basis were asked to indicate their future intentions to use the different e-finance types. In Bangladesh, 49% of respondents indicated that they had no intention to change their usage of e-banking in the future, while 39% indicated that they would likely increase their usage of e-banking (Figure 5). Similarly, for the other e-finance types, respondents indicated either maintaining their current usage or increasing their usage. E-lending showed the largest number of respondents wanting to decrease their usage (17%) but also the largest number of respondents wanting to increase their usage (53%).



EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 5. Bangladesh SMEs' future intentions to use e-finance (n = [81,86])

South Africa shows an opposite trend (Figure 6), where 61% of the SMEs want to decrease their usage of e-banking and 67% want to decrease their usage of e-lending. South African SMEs would like to increase their usage of e-microfinance (45%) and e-leasing (39%), while remaining largely unchanged in the adoption of e-credit information (76%) and other e-finance (70%). E-credit information and other e-finance types remain services that South African SMEs are not interested in based on current adoption (Figure 3) and future adoption (Figure 6). The general trend depicted in Figure 5 shows that Bangladesh SMEs have greater intentions to increase their usage of different e-finance types in the future compared to South African SMEs (Figure 6). This difference in intention is evidenced by the proportionally lower average of South African SMEs that intend to use e-finance in the future.

Figure 6. South African SMEs' future intentions to use e-finance (n = 33)

Results: Benefits of E-Finance Adoption to SMEs

Two of the three benefits listed in the questionnaire had a mean rating in the positive range (Table 3). The benefit that had the highest rated mean (μ = 4.34) for adopting e-finance was "Access to financial products and services". The lowest rated reason for adopting e-finance was "Reduced transaction costs", which was in the neutral range. This could be seen to contradict literature stating that the reduced cost of transactions is a primary benefit of e-finance adoption. Each of these benefits were analyzed in terms of secondary benefits (Table 4, 5 and 6).

All the mean ratings were in the positive range for the access to financial products and services benefit, meaning that respondents agree that e-finance provides better access to financial products and services (Table 4). At least 91% of the respondents confirm that e-finance enables their businesses to perform financial transactions from anywhere, during any time of the day on a computer or mobile device that is connected to the internet. The respondents also "agree" that e-finance enables the business to perform financial transactions required by the business (86%) without having to leave the business (79%).

All the mean ratings were in the neutral range for the transaction costs benefit (Table 5), indicating that respondents were generally neutral regarding the statement that e-finance lowers the cost of financial products and services. The standard deviations indicate that there was much variation in the responses for all statements, as most exceed the value of one. Respondents were evenly split regarding the transaction costs benefit of e-finance with 41% that "disagree" and 43% that "agree" that e-finance enables the business to pay less for financial transactions completed online.

The majority (78%) of the respondents "agree" that e-finance enables their businesses to access information on improving their finances online (Table 6). Most of the respondents (68%) also "agree" that e-finance enables them to access information on funding their business online, with a further 71%

Table 3. Benefits of e-finance (n = 138)

Benefit	Mean (μ)	Agree and Strongly Agree (%)	Category
Access to financial products and services	4.34	90.33	Positive
Access to financial information	4.00	71.00	Positive
Transaction costs	2.83	37.66	Neutral

Table 4. Access to financial products and services benefit (n = 138)

From anywhere on computer/mobile with internet.	2%	1%	3%	38%	55%	4.43	0.81
Any time of the day on a computer/ mobile with internet.	1%	1%	7%	41%	50%	4.38	0.74
Required by the business on a computer/ mobile with internet.	1%	4%	9%	43%	43%	4.25	0.83
On a computer/mobile with internet without having to leave the business.	3%	4%	14%	39%	40%	4.09	0.99

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Table 5. Results of the transaction costs benefit (n = 138)

E-Finance Enables the Business to Pay Less…	Strongly Disagree	Disagree	Neutral	Agree	Strongly Agree	Mean (μ)	Standard Deviation
For financial transactions completed online	26%	15%	15%	27%	16%	2.92	1.46
In fees for a loan completed online	23%	26%	19%	15%	17%	2.77	1.40
In interest for a loan completed online	22%	28%	13%	23%	14%	2.80	1.38

Table 6. Results of the access to financial information benefit (n = 138)

E-Finance Enables the Business to Access Information on…	Strongly Disagree	Disagree	Neutral	Agree	Strongly Agree	Mean (μ)	Standard Deviation
Improving my finances of the business online	1%	5%	17%	43%	35%	4.06	0.89
Funding my business online	1%	7%	22%	36%	34%	3.96	0.96
Other financial products and services online	1%	7%	21%	33%	38%	4.02	0.96

confirming that e-finance enables access to information on other financial products and services online. The mean scores of the respondents regarding the benefits of access to financial information are all positive ($3.96 \leq \mu \geq 4.06$).

Results: Barriers to E-Finance Adoption for SMEs

Table 7 shows that the barrier to the adoption of e-finance that had the highest rated mean was "Regulatory environment and policy" ($\mu = 3.8$). The second rated barrier to e-finance based on the mean value was "Training and skills" ($\mu = 3.8$). However, in terms of percentage agreement, more respondents "agreed" with the privacy, security and safety barrier than with the training and skills barrier. The barrier with the lowest mean is ICT infrastructure.

The mean ratings for all items in the privacy, security and safety barrier were all positive, which indicates that respondents tend to agree with the statements with regards to privacy, security and the safety barrier (Table 8). The standard deviations indicate there was much variation in responses for all

Table 7. Barriers of e-finance (n = 138)

Barrier	Mean (μ)	Agree and Strongly Agree (%)	Category
Regulatory environment and policy	3.80	63.66	Positive
Training and skills	3.60	52.33	Positive
Privacy, security and safety	3.59	57.75	Positive
ICT infrastructure	3.58	56.80	Positive

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Table 8. Results of the privacy, security and safety barrier (n = 138)

	Strongly Disagree	Disagree	Neutral	Agree	Strongly Agree	Mean (μ)	Standard Deviation
Unauthorized parties could access financial information	4%	14%	13%	34%	35%	3.83	1.16
No guarantees should the business lose money during a financial transaction	7%	8%	19%	31%	36%	3.81	1.19
Little support is provided for e-finance	10%	13%	32%	30%	16%	3.28	1.17
Uncertainty about the continuity of e-finance	7%	13%	31%	23%	25%	3.45	1.21

statements, as all values exceed one. It can be seen that the highest rated barrier of respondents was that unauthorized parties could access their financial information (μ = 3.83) and that there are no guarantees should there be associated financial losses during a financial transaction (μ = 3.81). Respondents are less concerned about the limited support for e-finance and the uncertainty of the continuity of e-finance.

The overall mean rating for the ICT infrastructure barrier is positive (μ = 3.59) and all of the five items in this barrier had mean positive ratings, which indicates that the respondents were on average all in agreement with regards to the ICT infrastructure barrier (Table 9). The highest rated barrier in the ICT infrastructure category was *"Power cuts interrupting access to online financial services*" (μ = 3.83). The standard deviations indicate there was much variation in responses for all statements, as all values exceed 1.20. The mean ratings for the regulatory and policy barrier were all in the positive range (Table 10). The positive ratings indicate that the respondents were on average mostly in agreement with this barrier, with most of the respondents agreeing or strongly agreeing with the statements. Both barriers in the training and skills category had mean positive ratings, indicating that respondents supported this barrier to e-finance (Table 11).

Ranking of E-Finance Factors

The mean ratings of the factors (benefits and barriers) identified for e-finance were ranked in descending order (Table 12). It is evident that that the two factors that respondents ranked the highest are the two highest ranked benefits. These are followed by the barriers, with regulatory policy being the highest ranked

Table 9. Results of the ICT infrastructure barrier (n = 138)

	Strongly Disagree	Disagree	Neutral	Agree	Strongly Agree	Mean (μ)	Standard Deviation
Poor internet access	5%	13%	22%	26%	34%	3.71	1.21
High internet costs	7%	12%	29%	25%	27%	3.51	1.22
Power cuts interrupting access to online financial services	4%	15%	13%	28%	39%	3.83	1.23
Software to access online financial services is too expensive	7%	18%	22%	28%	25%	3.46	1.24
Hardware to access online financial services is too expensive	9%	17%	22%	27%	26%	3.44	1.28

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Table 10. Results of the regulatory and policy barrier (n = 138)

	Strongly Disagree	Disagree	Neutral	Agree	Strongly Agree	Mean (μ)	Standard Deviation
Lack of laws that protect consumers	5%	8%	27%	31%	29%	3.71	1.12
Laws, regulations and policies regarding online finance that are uncertain and ambiguous	1%	4%	26%	33%	36%	3.99	0.95
Online contracts are hard to enforce	5%	5%	26%	38%	26%	3.74	1.06

Table 11. Results of the training and skills barrier (n = 138)

	Strongly Disagree	Disagree	Neutral	Agree	Strongly Agree	Mean (μ)	Standard Deviation
Lack of knowledge about some of the online financial services available	3%	8%	45%	26%	18%	3.49	0.98
The business has adequate skill to perform online financial transactions	2%	7%	35%	30%	25%	3.70	1.00

Table 12. Ranking of e-finance factors

Factors	Mean	Std. Deviation
Access to financial products and services benefit	4.35	0.65
Access to financial information benefit	4.00	0.71
Uncertain regulatory and policy barrier	3.80	0.81
Low ICT training and skill barrier	3.60	0.74
Low ICT privacy, security and safety barrier	3.59	0.80
Low ICT telecommunications infrastructure barrier	3.58	1.03
Improved transaction costs benefit	2.83	1.21

barrier. Finally, the respondents rated the benefits of decreased transaction costs when using e-finance lowest in terms of mean rating. It must be noted that both transaction cost and IT telecommunications infrastructure had the most variation in responses based on the standard deviation, indicating that some respondents had agreed more than others for these issues.

Issues and Problems

Several types of e-finance have been adopted in developing countries. In South Africa e-banking, e-lending and e-insurance were the top three types of e-finance adopted, whereas in Bangladesh it was e-banking, e-insurance and other e-finance. Whilst 100% of the South African respondents used e-banking, only 87% of respondents in Bangladesh. However, one must consider that the profile of respondents between the two countries were possibly not the same and therefore direct comparisons may not be accurate reflections. Future studies could investigate this phenomenon further.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

The reviewed literature reported that the adoption of e-finance has the potential to provide many benefits to an SME in a developing country. The main benefits reported in literature are decreased transaction costs as well as improved access to financial information, products and services. The survey results confirmed the literature reporting that e-finance can improve access to financial information that is useful for SMEs. This information can be used to facilitate growth and/or sustainability for the SME. However, regarding the benefit of reduced transaction costs, the respondents were neutral. This is an unexpected result and it is not evident what the reasons for this could be. One reason could be that perceptions could be different to the real cost of e-services compared to traditional services. This study did not examine actual cost incurred by the SMEs, but rather perceptions of SMEs. Future research could examine this in more detail and possibly investigate if decreased transaction costs are experienced as a benefit in other developing countries as compared with South Africa and Bangladesh.

The benefits of e-finance adoption cannot be achieved to their full potential due to several barriers that are encountered by SMEs, particularly in poorer countries. The literature reviewed identified four categories of barriers to e-finance adoption, namely: privacy, security and safety; ICT infrastructure; regulatory environment/policy and training. All four of these barriers were confirmed by the survey results, implying that these barriers are experienced by SMEs in both South Africa and Bangladesh. The results from the survey confirms that privacy, security and safety in the online environment is a barrier for SMEs using and adopting e-finance. The survey results also confirm studies (Agwu and Murray, 2014; Dewan and Nazmin, 2008); Riyadh *et al.*, 2010) which argue that a low ICT infrastructure is a barrier to e-finance use and adoption. It was found that developing country populations do not have easy access to affordable and reliable internet services. Furthermore, power supply issues as well as expensive hardware and software to access financial services are a major issue for SMEs. The regulatory environment and training categories were also both supported as a barrier to e-finance adoption by respondents. It is evident that government and other policies need to be put into place to support the adoption of e-finance. Training and awareness campaigns should be conducted in order to improve the understanding of the benefits of e-finance adoption. In order to improve e-finance adoption governments, the banking community and other stakeholders need to investigate these barriers and find ways to address them.

The limitations of the study relate to the relatively small sample size and uneven distribution of owners and employees in the respondents. There was also an uneven number of respondents between the two countries, thus making it difficult in most cases to do a direct comparison. It is also important to note therefore that the sample may not be representative of the population. The analysis of results revealed that further investigation is required with additional countries and larger sample sizes. More detailed qualitative research should also be undertaken in order to reveal a more in depth understanding of SME perceptions and behavior with regards to e-finance.

SOLUTIONS AND RECOMMENDATIONS

The following recommendations are suggested for government, employees or owners of SMEs and other stakeholders:

- Governments of developing countries need to urgently prioritize ICT infrastructure so as to ensure lower internet costs and better connection to the web as well as provision of a consistent supply of energy for SMEs.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

- Hardware and software that is used to access e-finance should be made more affordable for SMEs. This can be made possible by a collaboration between e-finance providers and respective government through subsidies.
- Guarantees should be made for SMEs in the event that they lose money during a financial transaction.
- The laws governing ICT should be strengthened in order to restore the confidence of the SMEs as well as protecting them from potential exploitation.
- Any and all ambiguities should be explained to SMEs with regards to online contracts, such that the rights and the responsibilities of each transacting party are well understood.
- SME employees or owners should access financial information online in order to improve operational finances; funding growth or expansion of their businesses and to seek suitable financial products and services.
- Greater emphasis should be placed on ensuring that unauthorized parties cannot access financial information of SMEs. This should not only be done in the background but highly publicized in order to alleviate negative perceptions.

CONCLUSION

The survey results revealed that e-banking is adopted widely amongst the respondents in both Bangladesh and South Africa. However, other types of e-finance such as e-leasing had much lower levels of adoption. The results also revealed that access to financial products and services was the highest rated benefit of e-finance to SMEs, whereas regulatory environment and policy was the highest rated barrier. Awareness of the different types and uses of e-finance were also found to be low. The literature reviewed and the survey results both revealed that government and stakeholders need to improve education around the benefits of e-finance as well as the available types and uses of e-finance. In addition, ICT infrastructure needs urgent attention and improvement in developing countries. It is also critical that the digital divide be narrowed. If governments and banking stakeholders prioritize on improving the underlying ICT infrastructure and make education and awareness around e-finance and the benefits thereof a priority, SMEs will be better equipped to adopt e-finance. This adoption of e-finance by SMEs can ultimately improve their access to finance and SME sector development.

KEY TERMS AND DEFINITIONS

Developing Country: A country with a slow rate of industrialization and lower per capita income than a developed country.

E-Commerce: Economic transactions using the internet or electronic means to conduct business. Transactions include business-to-business, business-to-consumer, consumer-to-consumer and consumer-to-business.

E-Finance: The provision of, implementation and allocation of financial services and resources using electronic means such as the Internet.

E-Services: Delivery of services using ICT.

Finance: Money used for funding a business, project or purchase.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

ICT: Information and Communications Technologies (ICT) consist of the hardware, software, network and media used to collect, store, process, transmit and present information in the form of text, images, data and voice.

Mobile Banking: Using mobile devices such as smartphones, tablets and laptops to perform banking activities from anywhere at any time. Smartphones and tablets may have specific mobile banking apps installed.

Online Banking: Use of the Internet to perform banking activities is called online banking, also known as Internet banking or Web banking.

Small and Medium Enterprises (SMEs): A small to medium-sized business which is small by nature in terms of either employees, capital or turnover when compared to larger businesses. SMEs are also single owner or single product enterprises which are generally located in a specific area of business. Different countries may have their own definition of SMEs based on number of employees and annual turnover.

Chapter 60
Factors Driving Firms from Emerging Countries into the Global Market:
The Case of Chinese SMEs Entering the North East of England

Rose Quan
Northumbria University, UK

Zhibin Lin
Northumbria University, UK

ABSTRACT

The purpose of this chapter is to identify the key factors that explain the decision of Chinese small and medium sized enterprises' (CSMEs) investment into the North East of England. The authors conducted 23 semi-structured interviews with key decision makers of Chinese SMEs that have business operations in the North East of England. It has been found that there are four major categories of factors that drive Chinese SMEs' investment into the North East of England: 1) resource-based factors; 2) home and host institutional factors; 3) network factors; and 4) international entrepreneurial factors. The findings have policy implications for both the governments of the UK and China, as well as managerial implications for future Chinese investors. This chapter provides fresh explanation of Chinese SMEs' investment into a developed economy.

INTRODUCTION

The UK has a long history of attracting East Asian investment (Garrahan & Ritchie, 1999). Within the UK, the North East England is ranked the second largest region in terms of the volume of inward foreign direct investment after London (Burghart & Rossi, 2009). Research on the phenomenon of Chinese out-

ward foreign direct investment is still at infancy stage. While the motives of large Chinese state-owned enterprises entering developed markets are becoming clear (asset seeking and home government support), why Chinese small and medium-sized enterprises (SMEs) expand their business into developed markets is not yet known. The literature is primarily developed on the basis of two theoretical frameworks: resource-based view and institution-based view. There are two limitations of the existing Chinese outward direct investment literature. First, most studies have focused on Chinese state-owned enterprises, such as Lenovo, Huawei, TCL and Haier. Despite the rapid growth of Chinese Small and Medium-sized Enterprises (SMEs) and their business activities in the international markets (Anderson et al., 2003; Clegg & Voss, 2012; Liu, Xiao, & Huang, 2008), only a few empirical studies have examined Chinese SMEs' overseas business venturing (Boisot & Meyer, 2008; Liu et al., 2008). Very little research has been conducted on Chinese SMEs' investment in the developed economies (Liu et al., 2008). Second, much of the literature is dominated by the theoretical approaches based on resource-based view and institution-based view with limited attention given to other key international management theories such as network and international entrepreneurship theories. This is surprising because network ties play a significant role in facilitating Chinese firms to venture overseas markets, particularly for Chinese SMEs (Lin, 2010; Zhou, 2007) and international entrepreneurship has also been identified as an important factor influencing Chinese SMEs' entry to international markets (Liu et al., 2008).

The aim of this chapter is to explore the factors that drive Chinese SMEs to invest in the Northeast of England. Specifically, the chapter uses a qualitative research method by interviewing business leaders from Chinese SMEs operating in the Northeast of England to explore potential driving factors such as resources, social network, institution, and international entrepreneurship. In the following sections, a review of the literature was conducted on the extant theories of firm internationalisation and international entrepreneurship. The next section outlines the methodology. Thereafter, research findings were presented. Finally, the chapter provides the managerial implications and suggestions for future research.

BACKGROUND

The extant international management literature is dominated with studies of mature multinational corporations, whereas research on the internationalisation of SMEs is only a recent endeavour (Ruzzier, Hisrich, & Antoncic, 2006). To build a holistic theoretical framework, a review of the major theories explaining firm's motivation for internationalisation was conducted: resource-based view, institution-based view, network theory, followed by a review of the international entrepreneurship theory, which is particularly relevant for the internationalisation of SMEs.

Resource-Based View and Social Network Theory

Resource-based view suggests that firms that possess resources that are valuable and rare would attain a competitive advantage (Barney, 2001). To sustain its advantages over time these resources must be inimitable and non-substitutable. It is the firm's distinctive competence in making better use of its resources that create competitive advantage (Mahoney & Pandian, 1992).

From resource-based view, Dunning (2001) advocates that ownership advantages (O-advantages) determine firms' internationalisation. These O-advantages, such as unique resources, can be exploited when entering foreign markets to support the firms' international activities. Based on the mainstream

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Western multi-national enterprises (MNEs)-based foreign direct investment (FDI) literature, four motivations can be identified: natural resources, market, efficiency and strategic asset seeking (Fetscherin, 2010). Firms' international capabilities, including knowledge accumulation, financial and physical resources and organisational capabilities are believed to be the main drivers of a firm's primary motivation of internationalisation. However, SMEs generally lack of these resources and suffer from liability of smallness, resource constrains and lack of ownership competences when venturing to developed economies (Boisot & Meyer, 2008), in addition to liability of foreignness (Yamakawa, Peng, & Deeds, 2008).

Networks provide additional ownership advantages, particularly for Chinese SMEs (Deng, 2012; Lin, 2010; Zhou, 2007). A network can be used as a mechanism to facilitate information exchange and resource flow between members of the network (Jean, Sinkovics, & Cavusgil, 2010). Different types of networks have been widely studied, including political network (connection with government) (Peng & Luo, 2000), business network (relationship with business partners) (Tang, 2011), and social network (interpersonal relationship) (Ellis, 2011). For resource-constrained SMEs, networks are essential in helping them to overcome barriers of lacking foreign market information and knowledge (Zahra, Korri, & Yu, 2005), and networks perform the role of substituting for external markets (Khanna & Palepu, 2004; Peng, 2003). For example, home country network ties are found to facilitate firms' internationalisation endeavours (Yiu, Lau, & Bruton, 2007), institutional networks help SMEs to better cope with the change of institutional environment (Zhou, 2007) and social networks help SMEs to successfully venture abroad early or quickly (Lin, 2010; Zhou, 2007).

Previous research has shown that Chinese firms investing abroad is both asset exploiting and asset augmenting (Luo & Rui, 2009). Boateng, Qian, and Tianle (2008) indicated that the major motives are market development, diversification, and seeking foreign advanced technology and other resources. Rui and Yip (2008) revealed that the main motives are to obtain strategic capabilities and to leverage unique ownership advantages. Mathews (2006) suggested that Chinese firms' international expansion is driven by resource linkage, leverage and learning. While Chinese MNEs are largely driven by acquiring strategic assets overseas (Rui & Yip, 2008), Chinese SMEs are usually driven by seeking relational assets to redress competitive disadvantage at home (Rugman & Li, 2007; Sethi, 2009).

Institution-Based View and International Entrepreneurship

Institution is defined as macro-level of 'rules of the game' (North, 1990, p. 7). It is 'the cultural-cognitive, normative and regulative elements' of a market (Scott, 2001, p. 48). Institutional theory emphasises the roles of institutional components in shaping a firm's behaviour (Peng, Wang, & Jiang, 2008). It is argued that imposed regulatory (formal) and social constrains (informal) have significant impact on firms' strategic decisions and managerial practices (Child & Tsai, 2005; Meyer et al., 2009). Previous studies have largely focused on host country institution factors (Peng et al., 2008), while firms' internationalisation from emerging economies to developed economies is influenced by 'two institutional frameworks' in both home and host countries (Yamakawa et al., 2008).

One of the well-known home institution factors for the firms in emerging economy are the centrally controlled political and economic systems (Meyer & Nguyen, 2005). Despite progress made in recent years, imposed regulatory constrains in many developed countries still are considered to be barriers for firms' growth which influence their internationalisation strategies (Meyer & Peng, 2005). Legal origin, investor protection and judicial efficiency (such as discrimination against SMEs) and government misbehaviour (such as state intervention in industrial policy, Luo, Xue, & Han, 2010) may push emerging

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

economy-based firms to venture into developed countries (Child & Tse, 2001; Meyer & Nguyen, 2005) in order to transcend home-based limits to growth (Deng, 2012). In recent years, Chinese government has encouraged Chinese state-owned enterprises to 'go global' by providing cheaper finance at home (Buckley, Clegg, & Wang, 2007; Voss, Buckley, & Cross, 2010). Furthermore, market liberalisation in China may also provide stimulus for Chinese state-owned enterprises to pursue outward foreign direct investment (Yang et al., 2009). But for Chinese SMEs, investing into foreign countries is more likely to be driven by the motive of escaping the restrictive business environment in China than by state's financial stimulus (Child & Rodrigues, 2005; Wang, 2002).

Examining host country institutions, a number of studies revealed that Chinese firms are more likely to seek business opportunities in an environment that is similar with their home country (Alden & Davies, 2006). Buckley et al. (2007) suggest that similarities and familiarities of the host culture motivate Chinese firms entering foreign markets. This helps to explain why Chinese firms enter other emerging markets, but it cannot explain Chinese SMEs' investment into a culturally distant country and a developed market such as England. Liu et al. (2008) indicate that 'entrepreneurship' may play a role in determining Chinese SMEs' internationalisation into developed markets.

International entrepreneurship is defined as the process of creatively discovering and exploring new opportunities outside of entrepreneurs' home country (Zahra & George, 2002). International entrepreneurship research focuses on both new and established ventures that 'engaged in cross-border value-exchange processes' (Peiris, Akoorie, & Sinha, 2012, p. 287), from born global (Knight & Cavusgil, 2004) to international new venture (Oviatt & McDougall, 1994). The two core areas of the international entrepreneurship research are opportunity-seeking and entrepreneurial orientation (Chandra, Styles, & Wilkinson, 2009; Oviatt & McDougall, 2005). The extant international entrepreneurship literature suggests that entrepreneurs start their international expansion to exploit international opportunities (Oviatt & McDougall, 2005). Entrepreneurs' right mind-set (e.g. pro-activeness and learning orientation) and prior knowledge (e.g. education background) help them pursue business opportunities across national borders (Kyvik et al., 2013; Zahra et al., 2005). Several factors that influence the formation of a global mind-set, including international work experience, prior international knowledge, and personal characteristics in terms of propensity to interdisciplinary collaboration, cognitive flexibility, and networking capability (Kyvik et al., 2013). Yamakawa et al. (2008) argue that a high level of entrepreneurial orientation will motivate new ventures to internationalise from emerging markets to developed markets. However, many Chinese entrepreneurs, as Liu et al. (2008) indicate, have low levels of education and foreign linguistic capability and they lack of international experience, thus their entrepreneurship is 'bounded' when making international investment decisions. They tend to use domestic mind-sets to scan international opportunities (Deng, 2009).

METHODOLOGY

The study adopts a qualitative, interpretive methodological approach due to the exploratory nature of the research. Chinese SMEs' outward investment is a relatively new phenomenon and suitable secondary data is not available. Key decision makers of Chinese SMEs operating in the Northeast of England were recruited to participate in semi-structured interviews. The reason for choosing the UK as the host country is because the UK accounts 40% of all Chinese investment in Europe (Ernst and Young European Investment Monitor, 2007) and the Northeast of England has the second largest number of

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Chinese-invested firms, just behind Greater London (Burghart & Rossi, 2009). The sampled Chinese SMEs are all small-sized, privately owned firms (with fewer than 250 employees) and cover a wide range of industries, including the jewellery industry, textile industry, food industry, computer industry (accessories and software design), as well as Chinese medicine and consultancy services. The period of time the sampled Chinese SMEs had been operating in the Northeast of England varied from 2 to 8 years. The length of interviews lasted from 60 to 120 minutes.

Thematic template analysis was used for coding and interpreting the interview data (King, 2004). As recommended by Ghauri and Grønhaug (2005) and Bryman (2004), the authors followed the four steps of ensuring high quality interview data: preparing interview (e.g. contact the interviewees, revise interview questions); pre-interview (e.g. plan the time, rehearse and practise); main interview (e.g. start small talk; time control; avoid leading-directing manner etc.) and post interview (e.g. send 'thank-you' letter and write interview memo etc.).

FINDINGS

The analysis revealed the categories of: 1) resource-based factors; 2) home and host institutional factors; 3) network factors; and 4) entrepreneurial factors.

Resource-Based Factors

In responding to the question '*Why did you decide to invest your business in this region',* some informants put more weight on firms' strategic objectives internally rather than concerns of external factors. For them, investing in the Northeast of England was to leverage their ownership capabilities via developing their marketing and managerial knowledge in the UK.

Manager Z expressed that he wanted to gather first hand market information when he decided to invest in the Northeast of England. He explained that:

Gaining efficient market knowledge of England can help us understand the Western business better and enhance our international business performance in other Western, developed European countries.

For other informants, they claimed that their initial intentions were to build up their international expertise for further international expansion from a long-term perspective. In his reflection, Manager M noted that

Setting business venture in England could improve and enhance our international knowledge and practical experience that reinforces our foreign customer services for now and in the future.

Manager M indicated that currently they had more than 400 employees in China, last year they recruited two foreign jewellery designers, one from Italy and another from South Korea. Their products, as manager M stated, have a great potential to sell well in the European markets.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

We just moved a small step in our international business expanding at the moment. Invading the Western markets is one important goal for us. We want to prepare our own international expertise in a long-term commitment by investing in the North East of England markets. (Manager M)

According to informants' narratives, it became apparent that 'lack of ownership advantages' is a major concern for Chinese SMEs' growth in the future. Entering developed markets, like UK, helps them develop their market knowledge. Thus, strategic-asset seeking can be concluded to be an important motive in this case.

Institutional Factors

Home Country

Three home institutional factors emerged from Chinese SME managers' narratives: 1) relaxation of government control, 2) Chinese government supports and incentivise 'going abroad', 3) avoiding pressures of competitions from both Chinese and foreign companies in China.

Informants highlighted how important and powerful the role of the Chinese government plays in Chinese SMEs' international business activities. In order to control and govern Chinese SMEs' international activities, relevant regulations and policies are rigorously regulated. Managers' narratives reflected on their experiences of how the Chinese government interventions largely constrained Chinese SMEs' international activities. Although informants negatively recalled their experiences with the Chinese government's control of Chinese SMEs' internationalisation, they further suggested that the Chinese government has gradually moved from 'over-intervention' to 'liberalisation'. The Chinese government has relatively (not completely) relaxed some controls with respect to Chinese SMEs' international business activities. These managers indicated that this change has inspired their initial intention of 'going abroad' and they highlighted the motives of 'government incentives'.

Owner Manager T indicated that support from the Chinese government was a key factor that drove him to seek business opportunities overseas. He commented that the Chinese government launched a number of favourable foreign investment regulatory policies not only for inward FDI but also outward investments. For example, Manager T recalled, in 1999, the Chinese government carried out the 'going global' strategy to encourage both large Chinese firms and Chinese SMEs to integrate their business into international markets. By doing this, the Chinese government released a policy that reduced control over foreign currency exchange restrictions. Agreeing with Manager T, three other managers all asserted that tightly controlled foreign currency by the Chinese government had formerly been a large constraint factor for Chinese SME managers involved with international business in the past, especially the 'non-neighbour' countries (refer to the Western developed countries). Although some rules and regulations that constrain growth of Chinese SME's still exist, the incremental support and incentive of the Chinese government cannot be denied.

Another highly emphasized motive factor is 'competition pressure'. Every interviewee strongly addressed their concerns of fierce competitions from both foreign (mainly from developed countries) and domestic companies in China. This situation was described by informants as "*a nightmare*". They reinforced the necessity of going abroad for Chinese SMEs, especially entering developed countries as their China-based foreign competitors are mainly from developed countries (like USA, France, Germany, and the UK). To win the battle, they must be equipped with certain competitive advantages (e.g. higher quality products and services).

Host Country

While Chinese government supports are emphasized when investigating motives of Chinese MNEs in developed markets, host institutional effect is highlighted by informants in this study. British government support, as six informants described, especially from One North East, the regional development agency, is the main host country institutional factor that attracts Chinese SMEs' investment in the Northeast of England. Manager P confirmed, to attract more Chinese companies investing in the Northeast of England, One North East established their offices in Beijing and Shanghai, organised a series of workshops in China to introduce business environment and favourable FDI policies in the Northeast of England to potential Chinese investors. Importantly, One North East emphasised that, as a regional development agency, they would provide comprehensive supports to Chinese investors (e.g. cheaper rent, free business advice, even help with visa applications). These supports truly encouraged Chinese SME managers' intentions of investing in the North East of England. In early of this interview, manager P explained:

Before attending Mr. X's presentation (from One North East), we really debated over the choices between going abroad or staying…we made our decision knowing we would have comprehensive supports from One North East, they have an office in China so we can communicate with each other, this is crucial for us.

Three other managers from the manufacturing sector expressed their comments from same point of view:

For me, 'One –stop shopping' supports from One North East was true encouragement…for many Chinese SME managers, language and cultural barriers are obvious, these barriers affect many aspects of doing business overseas. Consider this, One North East assigned an alliance manager, who speaks both mandarin Chinese and English. From initial marketing investigation to business proposal, from accommodation to office rental, this manager provided us with great supports. (Owner Manager T)

Moreover, One North East works jointly with International Departments of local city councils to provide Chinese SME managers free basic legal and consultant services. In the early market investigating stage, the alliance manager gave us many supports and valuable advice. These 'superb services' from One North East really built up our confidence to pursue further investments in this region. (Owner Manager Q)

The majority of the interviewees confirmed that the better institutional environment in the UK did attract them to invest in UK markets, for example more transparent polices, and business-friendly enhancement procedures with clearer appeals mechanisms. Some managers studied at British universities and others confirmed that they had visited UK several times to conduct their pre-entry research. By learning about the UK business environment, they confirmed that in comparison to China, the investment conditions in the UK are more fair and show more transparency (e.g. policies).

Network Factors

Chinese SMEs entering the Northeast of England was a result of network relationship. Manager F from a Chinese textile company strongly expressed the 'trustful' personal relationship and emphasized that their company would not appear in the UK markets without the personal connection. In addition, other

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

informants disclosed that their investments in the North East of England were driven by their business networks in the UK. Manager G indicated that to seek out more business opportunities in DE countries, in addition to attending international trade fairs in China, they also go to 2 large international trade fairs every year: the Frankfurt Trade Fair in Germany and the Birmingham Trade Fair in the UK. Via these trade fairs, these managers built up their business contacts and further developed their relationships to become business partners.

Manager G narrated:

… attending trade fairs abroad cost us money, but it was worth it… we built up our networks in the foreign countries (Germany and UK), and some of them became our customers later … being closer to them enabled us to provide them with better services.

The manager's story from the jewellery company also illustrated how his international business activities triggered by their business networks in the UK.

The political network via personal ties (government official) was also discovered in motivating Chinese SMEs entering UK. During the interviews, an Asian liaison manager from One North East was mentioned a several times. This liaison manger, a native Chinese speaker, was mainly in charge of Asian companies' foreign investment in the Northeast of England. More than half of the interviewees knew him because he organised some 'investment in the Northeast of England' workshops in China on behalf of One North East. These managers called him a 'Chinese political actor'. Influenced heavily by Chinese 'Guanxi' business culture, these Chinese SME owners believed that building up a good relationship with the government is essential as firm-government networks can bring benefits for them, such as funding for development, licences and approvals for some business activities. One interviewee explained:

He (the liaison manager) is a nice person. I feel comfortable investing in the UK with his help. It is also very important that he works for the government…he speaks Chinese and understands the Chinese culture.

The interviewees widely believed that they could be proactive participants in the political system in the host country through this personally linked political network. This seemed to be a critical motive for Chinese SMEs entering the UK market because this trustful political actor can be a vehicle for information (political knowledge of the host country) and communication with the local government. This firm-government network driven by a political actor, particularly one speaking their native language, is regarded as a 'reliable external resource' helping them to overcome the liability of foreignness and mitigate various political hazards in the host country.

International Entrepreneurship Factors

Regarding entrepreneurship factors, several informants claimed that Chinese SME managers' strong personal preference (entrepreneurial orientation) of internationalising developed economies, like UK, was a key internal motivating factor. Manager T emphasised that external motives may lead Chinese SMEs to consider the possibility of launching business abroad, but they are not necessary conditions for entrepreneurs to entering the developed markets. Manager T's story clearly illuminated that Chinese SME managers may not consider investing their business at developed economies, even when a foreign business opportunity arises, if they have no intention of going abroad at all. Comparing the two

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

generations of managers, entrepreneurs' risk-taking attitudes, owners/managers' personal visons and goals have significant influence on DE entry choice. Manager W's narratives also indicate that Chinese SMEs entering UK were not limited by liabilities of foreignness. To reinforce manager T and W's points, manager B affirmed that

I did not deny that some external forces do drive Chinese SME managers thinking about doing business internationally. However, you can take a horse to the water, but you cannot make it drink.

Another emerged theme is managers' intention of seeking entrepreneurial freedom combined with their Western education background. Manager P used to study in Switzerland. Her experience of living in the Western European country widened her view and made her feel that 'being an autonomy', not just institutionally but also socially, was of great significance for the new generation of entrepreneurs. She believed that the UK provides such an atmosphere. Manager W held same opinion. He also confirmed that doing business overseas gives him more opportunities to gain entrepreneurial freedom than in China. It is important to note, among these interviewed Chinese SME managers, more than half of them had previously either worked or studied in Western developed countries, such as the UK and Switzerland. Three managers obtained their business management degrees from foreign universities. According to a few informants, via studying at Western universities, they were not only able to absorb the knowledge of local social and business cultures and improve their English language ability, but they also developed their international mind-set. Their orientations (towards autonomy, innovativeness and risk taking) and spirit of 'true' entrepreneurship were changed after completing their studies in developed countries. Their knowledge acquired at developed countries offers a cognitive bridge for Chinese SMEs entering the UK market.

DISCUSSION

The main objective of this chapter is to investigate the motivations driving Chinese SMEs to enter the Northeast of England. Building upon the interview data, a set of factors are identified which can be categorised into resource-based factors, institutional factors, network factors and international entrepreneurship factors.

Resource-Based View and Strategic-Asset Seeking

Many existing Chinese outward FDI studies reveal that Chinese MNEs lack of ownership-advantages (apart from the state-ownership), moving to developed markets, for them, is to strengthen their ownership advantages (Buckley et al., 2007; Voss et al., 2010). In the context of Chinese SMEs, the study's findings are in line with the motives of Chinese MNEs. In general, Chinese SMEs are resource-constrained and lack managerial knowledge. With massive FDI inflows in China, cost-leadership strategy does not work profitably for Chinese SMEs in the long-term compared to their neighbours like Vietnam and the Philippines. To survive, they must prepare themselves to improve their competitive advantage by *leveraging* their ownership advantages *via learning* in developed markets (Mathews, 2006). Clearly, these Chinese SMEs have a focus on 'strategic-asset seeking' to strengthen their ownership advantages. It was found

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

that the only difference between Chinese MNEs and Chinese SMEs in seeking strategic-assets, is that Chinese SMEs attempt to familiarise themselves with UK market behaviours and managerial practices rather than obtaining advanced technology (Buckley et al., 2007; Child & Rodrigues, 2005).

Institutional-Based View

Both home-country and host-country institutional factors motivate Chinese SMEs internationalising UK markets. On one hand, the study's findings corroborate Rugman and Li's (2007) argument that economic changes, government power and market liberation play important roles in motivating both SMEs and MNEs' foreign investments. Although some Chinese government interventions still exist, many hurdles of foreign investments have been eliminated. Relaxation of control and support provide a favourable condition and create more opportunities for Chinese SME managers to invest in the Northeast of England. However, the level of support Chinese state-owned enterprises and Chinese SMEs received differs. Many Chinese MNEs, particularly state-owned enterprises, gain strong government support, such as substantial monetary support (Luo et al., 2010). Chinese SMEs' internationalisation appears as an outcome of 'changed policy' at the macro-level. Financial supports from the Chinese government are limited, and private sources are necessary for Chinese SMEs when entering overseas markets (Cardoza & Fornes, 2011). On the other hand, Chinese SMEs' business activities are still intervened by the government as China is an extreme case of a 'central government controlled' country (Buckley et al., 2007; Li, 2007; Meyer & Peng, 2005). Although one of the important Chinese economic reforms is to increase the autonomy of Chinese enterprises, inheritance from the planned economy makes it hard for Chinese SME managers to act entrepreneurially (Child & Tse, 2001).

Competition from foreign international companies in home markets is a push factor for SMEs to seek new markets. The competition from both foreign and domestic companies in China made it difficult for Chinese SMEs to survive. As this research exemplified, price-war and intensive competition in China make SMEs operate in a hostile environment, thus pushing them to consider other means of survival and look for foreign investment opportunities (Tang & Hull, 2012) in different regions in the world, such as the Northeast of England.

Finally, friendly institutional environment and formal institutional supports provided by One North East in the UK play a significant role in attracting Chinese SMEs to the Northeast of England. There are two main reasons for this. First, institutional environment in many emerging countries, like China, is a combination of social legacy, high context culture and transition economy (Peng & Luo, 2000). Institutional rules are often incomplete and ambiguous (Gibb & Li, 2003). The friendlier regulative environment in developed countries is more attractive for emerging country-based SMEs. Second, entering a new market, managers face tremendous uncertainties and challenges due to cultural and institutional differences. Government support, One North East in this case, appears highly important to lower the level of institutional and country risks when entering foreign countries (Welter & Smallbone, 2011). Host government support made Chinese SME investors feel well protected.

Networks

Networks have a central figure in triggering Chinese SMEs entering the Northeast of England. Networks shown in this study include entrepreneurs' interpersonal ties, professional networks and political network. All three types of networks are believed by Chinese managers to be able to help Chinese SMEs overcome

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

the liability of foreignness. In line with existing theories, dealing with resource restrains is inevitable for SMEs, especially when internationalising non-homogeneity markets. Networks not only benefit SMEs from synergistic effect of pooled resources (Chetty & Holm, 2000), by exchanging values of market knowledge and experiences, but also help SMEs reduce uncertainties, particularly by exposing more business opportunities (Ellis, 2011). The political network established via the political officer in One North East seems crucial. In the case of this study, the officer from One North East (the Asian liaison manager) played a crucial role in motivating Chinese SMEs entering the UK market. Based on the notion of Chinese high context culture (Peng, 2005), Chinese SMEs decision makers deeply believe that connection with the local government, due to its legitimate position in the host country, can help them gain more support. Here, links can be made between networks and the Chinese Guanxi culture. Finally, the study's network findings extended findings of the Fujita (1995) study suggesting that SMEs may be pulled into foreign markets by their business partners who are in larger firms. Indeed, different types of networks have positive impact on Chinese SMEs' investment in the Northeast of England.

Entrepreneur Factors

Evidence in this research suggests that entrepreneurs' attitudes towards risk-taking is a key driver which reflects Buckley and Casson (1998) who argue that investing in a foreign country is a result of entrepreneur foresight. Given the extraordinary liability of foreignness of Chinese SMEs, venturing from emerging market to developed market is a risk. Without risk-taking attitude, Chinese SMEs would stay in China and ignore international business opportunities. A numbers of scholars have claimed that internationalisation is preceded by opportunity recognition by entrepreneurs in order to exploit international opportunities (Oviatt & McDougall, 1994; Zahra et al., 2005). These opportunities may not be profit-seeking but rather knowledge and managerial skills seeking (Liu et al., 2008; Mathews, 2006). Seeking business opportunities is heavily influenced by the owner/founder's entrepreneurial attitudes, such as autonomy orientation. Moreover, seeking entrepreneurial freedom is considered important for Chinese SME managers. Although the Chinese government is gradually reducing control of Chinese SMEs activities, it seems that Chinese SME managers did not enjoy the entrepreneurial freedom as much as Western SME managers do in the developed markets.

Chinese SMEs decision makers' Western education background is factor to invest in a foreign country. Entrepreneurs of the older-generation Chinese SME founders/managers differ significantly from the young-generation in terms of entrepreneurial orientation (e.g. risk-taking). After three decades of adopting open door policy by the Chinese government, large number of Chinese students study in Western universities. In most cases, many of them possess cross-cultural communication skills and a global perspective. These entrepreneurial-advantages have caused young Chinese SMEs managers to have different entrepreneurial orientations in comparison with entrepreneurs who have not been educated in the Western countries (old-generation). To reach a deeper understanding of Chinese SMEs entrepreneurial impact on internationalisation, changes of entrepreneurial characteristics over time must be considered. Thus, context matters in studying entrepreneurs' internationalisation behaviour as 'it provides the basis for the subtext to operate'(Garud & Giuliani, 2013).

SOLUTIONS AND RECOMMENDATIONS

This study has several policy and managerial implications. First, from the home country's perspective, the Chinese government should realise the necessity of further reducing restrictions and obstacles, and providing more tailored support to Chinese SMEs' internationalisation (e.g. offer sufficient information of particular countries and international business training programs). For policy makers at the host country, a clear understanding of nature characteristics of emerging market-based SMEs (e.g. importance of political networks) is required. Second, this study strongly suggests that Chinese SMEs managers should not only account external factors but also consider entrepreneurial factors when venturing DE markets, and have a clear understanding of how their personal strengths or biases (attitude towards risk-taking, pro-activeness, etc.) affect their internationalisation process.

FUTURE RESEARCH DIRECTIONS

There are several limitations of this study which introduce opportunities for further research. First, the outcomes of this study are not generalizable to all Chinese SMEs' overseas investment, but are rather specific and context oriented. Thus the authors suggest further research could verify this study's findings to other contexts using large scale quantitative study. Second, due to the relatively small scale and availability of sampled Chinese SMEs in the Northeast of England, this study did not compare manufacturing firms with service ones. Researchers may consider investigating motives of Chinese SMEs investing into other European regions in a specific industry or sector. Finally, regarding the important role of decision makers' Western education background, greater specification of this certain group of entrepreneurs' international behaviours would be valuable and worth paying extra attention to in the future studies.

CONCLUSION

Previous research has shown that institutional-based theory and resource-based theory can be used to explain Chinese MNEs' motives of entering developed markets (Buckley et al., 2006; Voss et al., 2010; Mathews, 2006). In the Chinese SMEs context, this study adds to the understanding of the impact of networks and entrepreneurial factors on Chinese SMEs' motives of entering a developed market. This outcome is in line with Peng's (2006) argument that no single perspective is to be strong enough to explain SMEs internationalising from emerging markets to developed markets, it is a combination of different insights. In addition, the study made methodological contribution to existing studies. To the best of the authors' knowledge, this study is among the first conducting primary research in the context of Chinese SMEs investing in a particular developed market. Previous studies are largely based on secondary data that may lack of authenticity and include measurement error (Bernard & Ryan, 2009). Studies in the context of Chinese SMEs internationalisation (Cardoza & Fornes, 2011) do not differentiate specific country the investigated Chinese SMEs entered. This study moves the existing research forward by investigating Chinese SMEs' motives of entering particular developed market supported by valuable, first-hand qualitative data.

KEY TERMS AND DEFINITIONS

Guanxi: A Chinese term that describes a social relationship and network. Guanxi is an informal relationship that is based on interpersonal reciprocal exchange of favors. The idea is widely accepted in Chinese society.

Institution-Based View: A theoretical perspective that emphasizes the roles of institutional components in shaping a firm's behavior. It is argued that imposed regulatory (formal) and social constrains (informal) have significant impact on firms' strategic decisions and managerial practices.

International Entrepreneurship: The process of creatively discovering and exploring new opportunities outside of entrepreneurs' home country. The key characteristics of entrepreneurship include innovativeness, proactive-ness, and risk-seeking.

Liability of Foreignness: The costs or difficulties that firms experience when they operate in a foreign market. These costs include the firm's limited knowledge of host market's political, socio-cultural and economic environments; the discriminatory attitudes from host country's institutions, competitors and consumers; and the difficulties of managing between headquarters and subsidiaries which are located in different countries.

Network Perspective: A theoretical perspective that sees markets as networks of relationship between firms. A network can be used as a mechanism to facilitate information exchange and resource flow between members of the network. For resource-constrained small and medium-sized companies, networks are essential in helping them to overcome barriers to enter a foreign market.

Ownership Advantages (O-Advantages): One of the three important factors of OLI-Model of foreign direct investment, originally proposed by John Dunning in 1979. The other two are location (L) and internalization (I) advantages. Ownership advantages refer to the unique resources that a firm can

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

exploit when entering foreign markets, including resources such as patent, technology know-how, brand reputation, entrepreneurial skills and others.

Resource-Based View: A theoretical perspective that focuses on resources for creating and maintaining competitive advantage. It is believed that valuable and rare resources help a firm to attain a competitive advantage, but to sustain its advantages over time these resources must be inimitable and non-substitutable. Firm's competence in making use of resources is essential in the process of creating and maintaining competitive advantage.

Strategic Asset Seeking: A motive that drives a firm to expand to a foreign market. Strategic assets are those resources that enhance a firm's competitiveness, such as advanced technology, managerial know-how, brand equity and others. Other internationalization motives include: natural resource seeking, market seeking, and efficiency seeking.

Chapter 61
Information and Communication Technology Adoption in SMEs in Sri Lanka: Current level of ICT Usage and Perceived Barriers

Jayani Chamarika Athapaththu
University of Colombo, Sri Lanka

Busige Nishantha
University of Colombo, Sri Lanka

ABSTRACT

Information communication technology (ICT), considered as one of the major impacts of organizational performance and small and medium enterprises (SMEs), plays a significant role in the Sri Lankan economy as a strategic partner. Thus, the article examines current levels of ICT usage and perceived barriers to ICT adoption in SMEs in Sri Lanka. The findings revealed that despite the majority of respondents using IT for essential functions, they lacked proper internal IT infrastructures, personal motivation, had internet connection issues, trust issues, and lack of knowledge. These factors were identified as the perceived barriers to ICT adoption in SMEs in Sri Lanka. Data was collected from 67 SME owners from Sri Lanka, except the North province, in November 2016. The findings offer valuable insights to policy makers in general and to the SME owners. The methodology, implications, and suggestions are also discussed.

INTRODUCTION

Information and communication technologies (ICT) have influenced almost all sectors including education, health, bank and entertainment to name a few. Business organizations are rapidly investing in ICT because, there so many advantages attached to it. Many researchers have proven that there is a significant impact on ICT and business performance (Hajli & Sims, 2015; Melville, Kraemer & Gurbaxani, 2004; Halachmi, 1988).

Small and medium enterprises (SMEs) play a major role in any economy. They generate employment, introduce new business methods and products, reduce poverty, inflation and income inequality and solve the balance of payment problem (Prasad, Tata & Guo, 2012; Zeinalnezhad, Mukhtar and Sahran, 2011; Singh, Garg and Deshmukh, 2010; Tambunan, 2008, as cited in Priyanath & Premarathne, 2014).

ICT helps particularly in SMEs to create business opportunities and to compete profitably. According to Parida et al. (2010) Information technology (IT) helps to eliminate cost by improving internal processes, providing faster communication with SMEs' customers and better promoting and distributing their products via online. The value chain concept developed by Michel Porter views the firm as a series, or a network which consists of basic and secondary activities and particularly basic activities that add value to its products and services and ultimately leads to achieve competitive advantages (Porter & Michael, 2001). Hence this framework provides an image of a company to achieve competitive advantage by implementing competitive strategies through the value chain. According to Obrian and Marakas (2010) implementing IT through the value chain adds value to a company's products and services consequently enhance the overall business value of the company.

Many SMEs implementing IT for their business and enjoy many benefits attached to it. Enhancing productivity and effectiveness of certain activities or functions, assist in the adoption of new organizational, strategic and managerial models that enable access to new environments, as well as the generation of new markets and business model (Brady et al., 2002; Kahn, 1996, 2001; Javalgi & Ramsey, 2001; Corbitt, 2000; Johnston & Lawrence, 1998 as cited in Barba-Sánchez, 2007).

SMEs play a major role in the Sri Lankan economy. The SME sector in Sri Lanka has been identified as an important strategic partner and growing partner of social development (Small and Medium Enterprise Sector Development Programme, 2002). SMEs cover broad areas of economic activities including agriculture, mining, manufacturing, construction and service sector industries in Sri Lanka.

Even though SMEs play a major role in Sri Lankan economy, they are facing greater challenges in the modern business world due to intense competition, rapidly changing new technologies and globalization of products and services (Kanagasingam, 2012). Further, according to the Action Plan for 2016, the National Policy Framework for SME development has identified "Access to Technology" as a key factor in sustainable SME development. Furthermore, it has been identified that SMEs account for more than 90% of the total enterprises in Sri Lanka and for 45% of employment. Thus, it is considered the backbone of the economy. Even though an interesting and growing number of research studies have focused on the barriers to implementing ICT in SMEs (Parida et al., 2010; Tan et al., 2009; Barba-Sánchez et al., 2007), owing to the above mentioned unique characteristics, Sri Lanka is different from other developing countries and it is worthwhile identifying the barriers to ICT adoption and the current level of ICT usage in SMEs in Sri Lanka. Furthermore, rapid socio-economic and cultural changers may render the previously identified factors obsolete. Therefore, it is important to explore factors inherent in the current society in order to achieve the aforesaid sustainable development. Thus, this paper aims to fill this gap by understanding the level of ICT adoption and identify the factors that hinder the implementation of ICT in Sri Lankan SMEs.

The paper is divided into five parts. After the introductory section on the background of SMEs in Sri Lanka, the relevant literature is reviewed and barriers to adopting ICT in SMEs are discussed in the second section. Section 3 presents the methodology while Section 4 presents the analysis and findings of the study. The final section presents the theoretical and practical implications, limitations of the study and recommendations for future research.

LITERATURE REVIEW

This section deals with the diffusion of innovation theory as well as the relevant research findings relating barriers to ICT adoption in SMEs.

SMEs in Sri Lanka

SMEs play a significant role in Sri Lanka's economy, accounting for 80 percent of all businesses, including primary, secondary and tertiary while providing employment for skilled, semi-skilled and unskilled categories in Sri Lankan labor force and as a percentage, it is 35 percent of employment (NHREP, 2012). Sri Lankan SMEs in the agri-business sector, engaged in growing spices, fruits and vegetables and in the manufacturing sector engaged in numerous industrial activities, thereby contributing to 20 percent of industrial establishments and in the service sector accounting for more than 90 percent of business establishments (NHREP, 2012).

Different countries use different parameters to define SMEs, such as indicating the number of persons employed, amount of capital invested, and amount of turnover or nature of the business. According to the European Commission (EC) a small enterprise is defined as one which has less than fifty employees and turnover or a balance sheet total of not more than €10 million. Micro enterprise is defined as, having less than ten employees and turnover or balance sheet total of not more than €2 million (Priad et al., 2010).

In Sri Lanka, according to Kapurubandara and Lawson (2006) the National Development Bank (NDB), the Export Development Board (EDB), and Industrial Development Board (IDB) use value of fixed assets as the criterion for definition. Whereas the Department of Census and Statistics (DCS), Small and Medium Enterprise Development (SMED), and the Federation of Chambers of Commerce and Industry (FDCCI) use the number of employees as the criteria for defining SMEs.

Sri Lanka's, "SME Policy Framework" defines SMEs based on the number of employees and the annual turnover. Table 1. presents the facts in detail.

Barriers to IT Adoption in SMEs

According to Kapurubandara and Lawson (2006) there is a vast difference between ICT adoption in developing and developed countries. The problems of SMEs in developing countries are distinct to them. Compared to large organizations, SMEs face many barriers within and outside the organization. The problems encountered within the organization are called internal barriers and the problems which occur outside of the organization are called external barriers. To successfully adopt IT in the enterprise, these two barriers need to be addressed successfully (Kapurubandara & Lawson, 2006).

Table 1. Defining SME in Sri Lanka

Size Sector	Criteria	Medium	Small	Micro
Manufacturing Sector	Annual Turnover	Rs. Mn. 251 - 750	Rs. Mn. 16 - 250	Less than Rs. Mn. 15
	No. of Employees	51 - 300	11 - 50	Less than 10
Service Sector	Annual Turnover	Rs. Mn. 251 - 750	Rs. Mn. 16 - 250	Less than Rs. Mn. 15
	No. of Employees	51 - 200	11 - 50	Less than 10

According to Akkeren and Cavaye's study (1990), owner/manager characteristics, firm characteristics, and costs and return on investment are the major barriers for ICT and e-commerce adoption. Further, Owner's lack of awareness of technology, perceived benefits, lack of knowledge on how to use technology and low computer literacy are other contributory factors for not adopting e-commerce. Mistrust of the IT industry and lack of time are another two barriers for adoption.

Organizational characteristics also affect IT and e-commerce adoption in SMEs. Organizational readiness, external pressure to adoption, customer/supplier dependency, structural sophistication of the firm, size, sector, status and information intensity are factors identified in Akkeren and Cavaye's study (1990). Lack of awareness, uncertainty about the benefits of electronic commerce, concerns about lack of human resources and skills, set-up costs and pricing issues, and concerns about security are also seen as the most significant barriers to e-commerce for SMEs (Panagariya, 2000, as cited in Kapurubandara & Lawson, 2006).

According to Priad et al. (2010) the following are the identified barriers of ICT adoption in SMEs.

- Type of business (owner perception, customer preference)
- Limited level of ICT skills or competence of owner and employees (perception of the owner/manager, lack of skilled employees)
- Lack of standardized ICT related applications (common platform, complexity of tools, cost, suitability)
- Cost factors (budget constraints, continuous updating and maintenance, logistics costs)
- issues with access to ICT (slow internet connections and data transfer, availability of different internet connection, less sure about adaptability)
- Lack of trust (image of the small firm, prior experience, level of trust, collaborative setting with other firms),
- Legal uncertainties (issues on currency levels, differences legal uncertainties concerning contracts, terms of delivery and guarantees)

According to OECD's study (2004a, as cited in Priad et al., 2010) competence factors (management attitudes, skill levels, training), Technology factors (interoperability with different e-commerce systems, network reliability and flexibility), Cost factors (cost of reaching customers, cost of engaging in e-commerce, telecommunication costs), and Confidence factors (brand image, transaction security, legal structures, IPR issues) are the identified challengers for ICT adoption in SMEs.

According to Tan et al. (2009), has stated that security is the major barrier for internet-based ICT adoption in Malaysian SMEs. Findings of the study conducted by Asare et al., (2012), show that frequent power disruption is an interruption to ICT adoption in SMEs in both Botswana and Ghana. Nevertheless, that SMEs do not consider lack of technical knowledge as a barrier in ICT adoption. According to Simmons et al. study (2007) lack of marketing ability and negative industry norms are seen as the barriers prevalent within developed economy agri-food industries to internet adoption and utilization.

According to Wolcott et al. (2008) individualized technology-related assistance, customized training, context sensitivity, are strongly-perceived needs of the businesses studied at community of Omaha and Nebraska. According to Chuang et al. (2009) the average age and the level of education of top management team in small businesses are significant predictors of the extent of IT adoption. However, group heterogeneity (gender, ethnicity), has a negative impact on the extent to IT which is adopted in SMEs.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

According to Tan et al. (2010) results reveal that the SMEs would adopt internet-based ICT regardless of years of a business start-up and internet experience. Some significant differences are spotted between manufacturing and service SMEs in terms of their demographic characteristics and internet-based ICT benefits, barriers, and adoption intention. Both of these industry types express intention to adopt internet-based ICT, with service-based SMEs demonstrating greater intention.

Lack of awareness basically computer literacy, cost of Internet, equipment and e-commerce implementation, inadequate telecom infrastructure, unstable economy, political uncertainty, lack of time, channel conflict, lack of information about e-commerce and lack of access to expert help are identified barriers for e-commerce adoption in developing countries (Kapurubandara & Lawson, 2008).

According to Evangelista et al. (2013) findings highlighted that lack of technology skills in the workforce is a major constraint on ICT adoption in small and medium-sized logistics providers.

According to Shiels et al. (2003), findings show that characteristics of the firm and industry sector have an effect on the adoption and use of ICT to support business processes in SMEs. Lack of proper knowledge, education and skilled owner managers and employees within the enterprise are the identified barriers to better utilization of ICT and e-Business in European SMEs (Arendt, 2008). According to Apulu et al. (2011), lack of electricity supply, lack of financial resources, lack of government support, poor service from ISP providers, corruption, lack of support from banks, poor infrastructural facilities and lack of skills are the eight key factors that affect the effective utilization and adoption of more sophisticated or advanced ICT solutions in Nigerian SMEs.According to Chatzoglou and Chatzoudes (2016) firm size, firm scope, IT infrastructure and internet skills (being the most important e-business adoption drivers in SMEs and CEOs knowledge), adoption cost, and competitive pressure do not seem to play an important role in e-business adoption decision in Greek SMEs.

METHODOLOGY

Most research associated with identifying barriers of ICT adoption in SMEs has used different methodologies. The majority has used questionnaire-based survey (Asare et al., 2012; Ahuja et al., 2010; Tan et al., 2009; Simmons et al., 2007) and several other researchers have used face-to-face interviews (Moriones et al., 2013; Chibelushi & Costello, 2009; Marasini et al., 2008) and multi measures along with both quantitative and qualitative measures (Bhaskaran, 2013). Matlay and Addis' (2003) study has used multiple methods such as telephone survey, in-depth interviews and case studies.

By using convenience sampling method, 70 entrepreneurs were selected from those who registered for Diploma Course in Small Business Management at the University of Colombo, Sri Lanka. In a four weeks period, entrepreneurs answered the survey questions, but three of them were excluded because they had been answered in an inappropriate manner. Thus, the final sample contained 67 SMEs.

The questionnaire consisted of three parts; owner details, current level of IT utilization and potential barriers. Eight questions were used in the first part to identify the demographic background of the owner and six questions in the second part to identify the current level of ICT usage. The final part, consisting of 19 questions was used to identify the barriers to ICT adoption by SMEs. In designing the questionnaire, questions and ideas were obtained from previously validated questionnaires (e.g., Wang et al., 2004; Chatzoglou & Chatzoudes 2016; Apulu et al., 2011; Priad et al., 2010). All the variables were measured with five point interval scales similar to previous researchers. Each item in the questionnaire allowed for indicating the extent to which the item limited the adoption of information technology in

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

their organizations. A five point Likert scale ranging from 1 (to a very little extent) to 5 (to a very great extent) was used. Sinhala medium was used for the questionnaire since that was the surest way to receive responses. A pilot test relating to 30 SME owners was carried out prior to the survey. Cronbach's alpha values were used to check the reliability of the study and all the values showed high reliability exceeding value 0.7 (Nunnally, 1978).

RESULTS AND ANALYSIS

The study was dominated by manufacturing-oriented SMEs representing 70% of the sample. Most owner/managers were males (85.1%) and Advanced Level (A/L) was the highest education qualification for a majority (73.1%). Most of the owners' birth place was rural (50.7%) and sample were dominated by Sinhalese (97%) married (68.7%) owners. Computer literacy of the majority of the respondents was on an average level (38.8%).

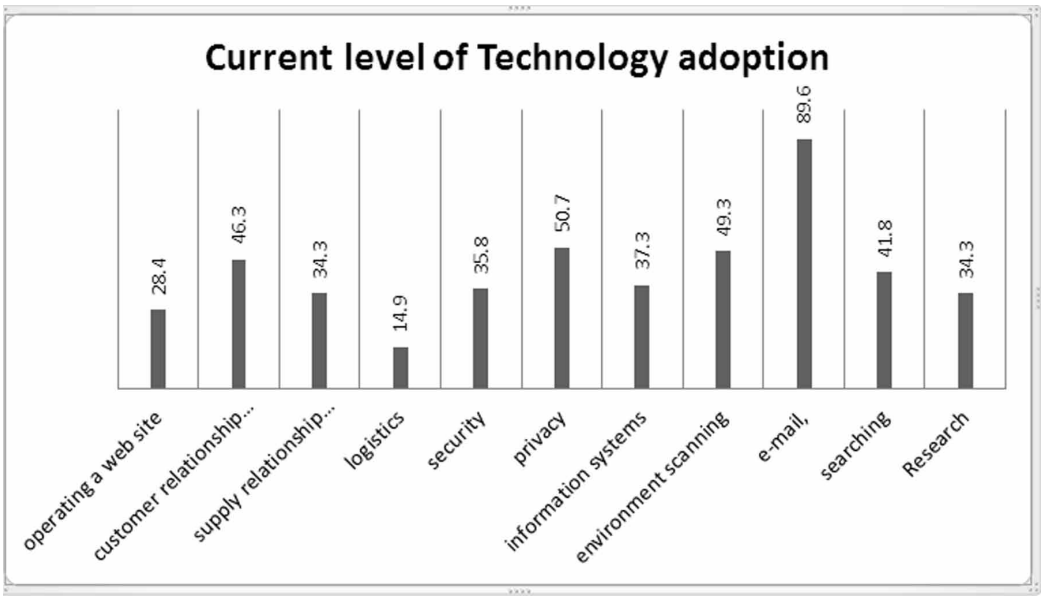
The majority of the respondents had started their business by themselves (74.6%) and by inherited (23.9%) and only 1.5% bought the business. 79.1% SMEs are registered as sole-proprietorship and 6%, and 19.4% are registered as partnership and limited liability company. The majority of the business had 6-10 number of years of operation (32.8%) and 26.9% had more than 15 years of performance. Most of the SMEs had less than 10 employees and as a percentage that was 71.6%.

The majority of the respondents had acquired technical knowledge from self-studying (49.3%). Alternatively, a majority of the respondents acquired management and administrative knowledge and skills through themselves (46.3%). Most of the respondents received vocational or special training for running the enterprise from government-SME supportive organizations.

Level of ICT Usage

Eleven variables were used to identify the current level of IT usage in the business including, operating a web site, customer relationship management, supply relationship management, logistics, security, privacy, information systems, environment scanning, e-mail, searching and research.

Figure 1 indicates that the majority of the respondents used e-mail (89.6%) for their business and 50.7% used IT for privacy. However, only 14.9% used IT for logistics operations. In addition to that 37.3% used Information systems for their business.



Factor Analysis Results of Perceived Barriers for ICT Adaptation

Responses to the perceived barriers were analyzed by principal component factor analysis with varimax rotation. Five factors, accounting for 66.24 percent of the variance explained, were used in this study. Communality, rotated factor loadings and identified factors are presented in table 2, along with the eigenvalues, variance explained, and factor means.

Eight items were identified under Factor 1 with loading ranging from 0.532 to 0.759. Analysis of this statement was interpreted as items related to lack of proper internal IT infrastructure (Cronbach's alpha = 0.84). Specific items loading on Factor 1 included: poor support from staff; lack of technology orientation; employees' low ICT literacy; poor support for strategy implementation; poor networking; lack of knowledgeable employees; poor knowledge on shift time on technology and lack of money.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 1. Current level of technology adoption Source: Survey data (2016)

Consistently findings of researchers (Kapurubandara & Lawson, 2006; Cloete, 2002) in several studies shows that lack of proper IT infrastructure as primary causes for ICT adoption in SMEs.

Factor 2 identified factor loadings ranging 0.688 to 0.835 (chronbach's alpha = 0.79). These items related to lack of personal motivation which included: no intension to expand; dissatisfaction about returns; lack of courage; lack of support from the organizational culture. These findings also support the work of Priad et al. study (2010). It has been shown that ICT perception of owner/manager is a key determinant of adoption on ICT in SMEs. Furthermore, Herbert and Benbasat (1994) study has been measured self-efficacy as a key determinant of ICT adoption in SMEs.

Factor 3 is interpreted as internet connection issues. The variables with high loadings in this factor include internet inaccessibility, lack of alternative connections, and dissatisfied with internet service providers (Cronbach's alpha = 0.75). Poor service from ISP providers and corruption were the factors that affected effective utilization and adoption of more sophisticated or advanced ICT solutions in Nigerian SMEs (Apulu et al., 2011). Consistently Asare et al., (2012) findings, has shown that frequent power disruption is an interruption to ICT adoption in SMEs in both Botswana and Ghana.

Factor 4 addressed the lack of trust. Specific items were: lack of trust on internet payments and lack of trust on ICT transactions. Factor loadings ranged from 0.516 to 0.758 (Cronbach's alpha = 0.71). Parida et al. study (2010) has discussed the lack of trust and level of trust on online transactions in SMEs. Factor 5 considers the lack of knowledge. The variables with the greatest loadings on this factor were lack of knowledge on benefits and poor ICT knowledge (Cronbach's alpha = 0.66). Table 2 Summated scales of factors related to perceived barriers for ICT adoption. The summated scale is the average score of the items in that factor. These findings are also consistent with Akkeren and Cavaye's study (1990), Owner's lack of awareness of the technology, perceived benefits, lack of knowledge on how to use technology and low computer literacy are other contributory factors for not adopting e-commerce in SMEs. Furthermore, similar with findings, lack of proper knowledge, education and skilled of owner

managers and employees within the enterprise are the identified barriers to better utilization of ICT and e-Business in European SMEs (Arendt, 2008).

As shown in table 3, 'lack of proper IT infrastructure' is the main perceived barrier for ICT adoption (Mean=2.724). It indicates that among the five reported factors, Sri Lankan entrepreneurs believe that a lack of IT infrastructure including poor support from staff, low ICT adaptation, employee's low ICT literacy, poor networking and lack of money affect as barriers for ICT adoption. The second highest mean score is recorded by the 'lack of trust'. It implies that owner-managers of SMEs in Sri Lanka are still reluctant to use e-commerce. 'Lack of personal motivation of the owners' is the third highest perceived barrier and it highlighted the lack of intention for expanding the businesses. 'Internet connection issues' emerged as the fourth most crucial barrier reporting a mean of 2.049 with 0.789 SD. The next barrier for ICT adoption is 'lack of knowledge' which reported a mean of 1.918 (SD = 0.699).

CONCLUSION AND IMPLICATIONS

SME have been accepted as an important segment of any economy and is considered the backbone of economic development of many economies throughout the world (Chong & Lin, 2008). Based on the present study, it is possible to draw some conclusions from the initial findings of this research study and this study provides policy recommendations for SMEs. The findings of this study indicate that the characteristics of owner/managers of small firms play an important role in the adoption of decisions concerning ICT on SMEs in Sri Lanka. The finding is consistent with the findings of Akkeren and Cavaye's study (1990). Furthermore, lack of proper IT infrastructure is the main perceived barrier for ICT adoption in SMEs. In order to develop infrastructure facilities, there is a clear role for government and industry bodies to step up their efforts to encourage ICT adoption on small business. It is essential to improve the telecommunication infrastructure to cut down the cost of connecting to the internet as well as staying online for business purposes. These findings would suggest that there is a need to improve IT knowledge among small business owners and to provide proper training regarding that. Consistent with the findings of Akkeren and Cavaye (1999) in order to improve knowledge on ICT and establish trust on online transactions, transforming proper knowledge on ICT is an important task. Further, this study provides useful insights on the knowledge gap in understanding ICT adoption among the SMEs. Another important practical implication is that the training agencies, responsible for providing ICT training to adults, especially for SME owners, are able to understand the level of IT knowledge and the obstacles that they usually face. Simultaneously, the government has to increase its effort to create awareness programs among SMEs regarding the potential benefits of ICT. Additionally to improve the knowledge and awareness among SMEs, private and public sectors need to come together to establish a joint forum that will encourage SMEs to attend educational workshops and seminars for nominal fees. This could address some of the shortages of technical knowledge on ICT. Further, Sri Lankan government should enforce compulsory training or provide some reinforcement to encourage SMEs to improve ICT knowledge among them. In order to overcome financial problems governments should make provisions for soft and easy accessible loans for SMEs.

Limitations and Future Research

The data of the study was obtained from Sri Lankan SMEs except the Northern Province. Therefore, the current findings may not be generally applicable to Sri Lanka. Thus, it is imperative for future studies to

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

consider SMEs throughout the country. Another potential limitation is related to the use of perceptual measures provided by the person who could be biased and could lead to halo effect. ICT adoption on SMEs bounded with organizational culture, cross-cultural studies are also possible in the future. It is also interesting to include more variables such as benefits and barriers, social relationships, types of ICT applications, environmental characteristics such as government policies for future studies.

ABSTRACT

This paper explores the effects of government policies on the development of Small and Medium Enterprises in developing countries through the examination of the case of Nigeria. Many research studies reported that SMEs in Nigeria have not benefited from the policies formulated by the government. This paper investigates the impediments to manufacturing SMEs growth and the needed pre-requisite environment for SMEs to benefit from government specific policies. The study adopted a qualitative methodology depending on face to face interviews with 20 SME owners and/or managers in five of the six geographical arears of Nigeria, 20 bank managers in the capital city of Lagos and 20 government officials located in the federal capital city of Abuja. The study unveils unique contextually novel insights, including particularly the distinctive processes and different relationships related to lenders decision. The research findings are consistent with those reported by other scholars in the field, and confirm that government policies and support in the areas of technology, infrastructure and finance affects the performance of SMEs to a great extent in Nigeria.

INTRODUCTION

The importance of small and medium enterprises (SMEs) for any country cannot be over-emphasised, but despite their internationally recognised importance, SMEs still face major challenges in many developing and emerging countries (Ayalew & Gashu, 2015; Eniola, 2014; Fatoki & Odeyemi, 2010). However, the challenges of business entry, survival and growth are often substantial (Adaramola, 2012). Sequel to this, financial resources and the inability to handle complex business management issues in a complicated and bureaucratic environment present major obstacles. Therefore, the need to improve the different elements that make up a good business climate should be carried out expeditiously (OECD, 2004).

This article sets out to critically evaluate the effect of government policies in developing the small and medium enterprises (SMEs) in Nigeria, in order to gain an insight into how it affects their business performance. We seek to engage the perspective of the major stakeholders in the development of SMEs which are the government institutions, the banks and the SMEs owner/managers.

LITERATURE REVIEW

Small and medium enterprises (SMEs) play a very vital role in every economy both in successful developed countries and developing countries (El-Gohary & El-Gohary, 2016; Khan & Khalique, 2014; El-Gohary et al., 2013; El-Gohary, 2012a, 2012b, 2011, 2010a, 2010b, 2009; El-Gohary et al., 2009a, 2009b, 2009c; Ariyo, 2008; Wiklund & Shepherd, 2005; Wong & Aspinwall, 2004). They perform some important roles like job creation (Farouk & Saleh, 2011; Deakins et al., 2001; Stanworth & Purdy, 2004), wealth creation which increases the economy size (Birch et al., 1993). Furthermore, SMEs utilises their limited resources efficiently and develop entrepreneurial skills (Karmel & Bryon, 2002; NIPC, 2003; Hussain, Millman, & Matlay, 2006; Poutziouris, 2003; Deakins, Logan, & Steel, 2001). Studies carried out by various authors, see Matlay and Westhead, (2005); Porter, (2006); Hussain, Millman, and Matlay, (2006); Harvic and Lee, (2002), suggests that SMEs contribute significantly to the social-economy and political infrastructure of developing and developed countries. However, the Nigeria government has been according little attention to this all-important sector for so long despite its numerous benefits (Adjebeng-Asem, 1998).

In the last decade, this trend has changes as the Nigerian government within its capacity is now according all necessary attention to the development of SMEs for accelerated economic growth and empowering its citizen for entrepreneurship and technology innovation (Oyelola, 2013). The major reason for the inadequate attention as suggested by SMEDAN (2011) emanated from the unavailability and paucity of credible and reliable database. This has fraught the major stakeholders to eve sustainable intervention strategies for the development of SMEs in Nigeria (SMEDAN, 2011). As a result of this, it has constrained the government and the policy makers to set an entrenched policy and have a baseline for meaningful comparison (Toby, 2007). This was corroborated by Brevoort and Hannan (2006) in their study that without comprehensive information on SMEs, very little will be known about their contribution to the economy.

In an effort to reposition and create efficient and sustainable SME sector in Nigeria, the government commissioned a collaborated survey report on MSME in 2010 between the national bureau of statistics (NBS) and the small and medium enterprises development agency of Nigeria (SMEDAN). This was one of the concerted responses to the challenges of building a credible and reliable SME database which

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

is a basic requirement to strategically reposition and develop the sector SMEDAN, 2010). Therefore, relevant information will be available and will be useful in grasping the level of contribution of SMEs to the development of the economy (IFC, 2001).

Meanwhile, other factors have been identified constraining the development of this all important sector which includes high production costs emanating from the provision of inadequate infrastructure by the government, inefficient technology use by SMEs relating to processing, preservation and storage of commodities, lack of access to international market, nonexistence of succession plan by the operators, poor access to vital information, inability to keep adequate financial records, and absence of Research and Development to mention a few (Ogbo, & Nwachukwu, 2012; Obokoh, 2008; Adaramola, 2012; Eniola, 2012). The absence of these facilities has instigated higher overheads cost for the SMEs which has impacted on their profitability and growth because they were responsible to obtain such facilities at their own expense (Mambula, 2002). However, these problems have been on the vanguard of every new government in power to tackle. However, little results have been achieved except the telecommunications sector which is contributing immensely to the development of the economy (Sanusi, 2010; Evbuomwan, et al, 2013).

Government Policy and Small and Medium Enterprises

In Nigeria, the recognition of the importance of SME sector has prompted the Government to continue designing and implementing a number of policies and programs to support the development of the sector since independence (NIPC, 2002). The various economic reforms by successive government have been on the horizon since independence in 1960. The benefits of these reforms have not translated into welfare improvements for the citizens because the domestic business activities have not improved due to the significant challenges under the programs (Ojo, 2003; Tumkella, 2003; Mambula, 2002). This has handicapped the SME sector fulfilling its full potential of contribution to the growth and development of the economy from its GDP. However, the economic reforms on SMEs which was introduced as part of World Bank structural adjustment programs is alleged to have a good impact on the development of SMEs (Cook, 1996). This evidence is found in a relatively small number of studies that attempt to measure the impact of economic liberation on the SMEs sector see Boeh-Ocansey, 1994; Dawson, 1994; Steel, 1994; Vachani, 1994; Zake, 1994; World Bank, 1995.

The structural reforms before 2003 were aimed at improving the domestic business climate to enhance business competitiveness by deregulating and reducing government activity in various economic sectors to address various structural constraints to growth. This includes privatization, civil service reform, banking sector reform, and trade policy (Okonjo-Iweala, & Osafor-Kwaako, 2007). However, some impeding factors in these reforms can be traced to inconsistencies in government policies, poor infrastructures, limited access to finance, disparaging legal and regulatory framework, unavailable support for business development services, ineffective and poorly coordinated institutional support framework, enabling environment, capacity building and corporate governance (Steel & Webster, 1992; Lightfoot, 1998; Jarvis et al., 1996; Gibb, 1998). Therefore in 2003, the federal government of Nigeria took a big leap by formulating policies for the development of SMEs to address the constraints and to tap the full potential of the sector. The SME Policy takes into account the special constraints and opportunities faced by this sector and aims at strengthening institutions which will address these constraints and maximise exploitation of the opportunities.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

This led to the establishment of the Small and Medium Enterprises Development Agency of Nigeria (SMEDAN) vide the small and medium scale industries development agency (establishment) act 2003 with the responsibility of promoting and facilitating the development programs in the SMEs sub-sector. The vision and mission of the agency under the direct supervision of the federal ministry of trade and investment is to establish an efficient SMEs sector that will enhance sustainable economic growth in Nigeria and facilitate the access of SMEs to all the resources required for their development. The agency has the mandate of stimulating, monitoring and coordinating the development of SMEs sub-sector, initiate and articulate policy ideas for SMEs growth and development, reducing poverty, creating jobs, serving as vanguard for rural industrialization and enhanced livelihoods. It is also saddle with the responsibility of linking SMEs to internal and external sources of finance, intermediating between SMEs and government (SMEDAN, 2007).

Government Intervention Programmes to Develop SMEs in Nigeria

In order to further develop and support the SMEs and other identified sectors of the economy, the Nigerian government changed trend from the classical orthodox method of leaving the allocation of financial resources to the market forces to a developed tailored and direct intervention to support and promote growth in these sectors (Sanusi, 2011). Some of the key interventions in the real sector by the Nigeria government according to Sanusi (2011) includes, the =N=200 Billion Commercial Agricultural Credit Scheme (CACS), the = N = 300 Billion Power and Aviation Intervention Fund, the = N = 200 Billion Restructuring and Refinancing to the Manufacturing Sector/SME, the = N = 200 Billion Small and Medium Scale Enterprises Guarantee Scheme (SMEGS), the establishment of Small and Medium Enterprises Developing Agency of Nigeria (SMEDAN) to replicate the duties of small business services in the UK and the small business agency in the USA.

In addition, the consolidation of banks through merger and acquisition by increasing the capital base of banks from = N = 2 billion to a minimum of = N = 25 billion. This has reduced the number of banks from 89 to only 24 which have ease bank supervision as a result of the merger. Also, the creation of some agencies like the National Economic Empowerment and Development Strategy (NEEDS) and State Economic Empowerment and Development Strategy (SEEDS), are also some of the measures taken by the Nigerian government to ameliorate the SMEs (Sanusi, 2011). The aim of these schemes is to support the real economy growth by providing long term credit or specialized services to the SMEs as banks only give short term credit. Unfortunately, these schemes often failed to address the problems hampering the development of the SME sector as a result of poor implementation (Eniola & Etebang, 2015). However, the over reliance of banks on public sector funds is a matter of concern to the government because the private sector is often short changed as a result of the high interest rate paid on bank loans (Soludo, 2004). The public-sector fund is very cheap to the banks even though the motive of government officials to deposit the funds in banks is the unofficial money 'bribe' paid to them. This makes the banks profiteer more on this which makes them expand at the expense of the real economic sectors.

Government Efforts

Some of the policies and programs identified by Eniola, (2014); Sanusi,(2003); Abdullahi et al. (2015) that has been put in place by different governments in power at various times aimed at promoting SMEs includes the creation of the Small Scale Industries Credit Scheme (SSICS) in 1971, the establishment

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

of Nigerian Bank for Commerce and Industries (NBCI) in 1973, Nigerian Industrial Development Bank (NIDB) in 1964, SME desk in all banks including the CBN, National Economic Reconstruction Fund (NERFUND) 1989, the African Development Bank, the World Bank SME II loan scheme 1990, Nigerian Export Import Bank (NEXIM), Industrial Development Co-ordinating Centre (IDDC), Community Banks, People's Bank, Family Economic Advancement Programme (FEAP), State Ministry of Industry SME Schemes, Small and Medium Industries Equity Investment Scheme (SMIEIS), emerging of Bank of Industry (BOI) in 2002 with the merger of NERFUND and NIDB with mandate of providing credit at 10% to the industrial sector and SMEs, Small and Medium Enterprises Developing Agency of Nigeria (SMEDAN) and the Credit Guarantee Scheme for SMEs. Others are the fiscal incentives such as tax relief to all new SMEs in their first six years of operation, pioneer status involving non-renewable tax relief for five years and periodic downward adjustment of tariffs to reduce production costs. All these points out that successive government in power since independence have made efforts one way or the other to revamp the SME sector but little success has been achieved.

Research Methodology and Design

In this study, qualitative method approach was employed for various reasons. Firstly, it will help gain knowledge about emerging issues that can help to understand the effect of government policies towards the development of SMEs (Denzin & Lincoln, 2005). Secondly, the qualitative method will generate the perspectives of the government agencies involved in the promotion of SMEs, the financial institutions as they are conduit of finance for the development of SMEs through lending and the SMEs owners/managers as well (Creswell, 2003). Thirdly, in-depth interviews and analysis will enable a closer link with the participants thereby capturing their real perceptions with their involvement on the occurrence of events in this context (Sousa and Castro, 2010). Fourthly, it will help to secure rich descriptions of the social world of the SME operations which is valuable in understanding the meanings people have constructed (Easton, 2010). This idea was initiated in order to obtain cross- referencing data and obtain range of opinions from different sources (Cunliffe, 2011). Inputs were solicited from these three stakeholders namely, the government officials, bank officials and SME owners/managers.

The Primary data on the perceptions, thoughts and feelings of the major stakeholders were collected mainly through individual face-to-face, in-depth interviews. All of the interviews took place in the various offices of the respondents and were all recorded. The recorded interviews were reviewed and transcribed with NVivo. We identified specific or general issues from the transcriptions which the participants proposed as relevant to the challenges of the development of SMEs. In total, sixty in-depth interviews were conducted with SME owners/managers (20), bank officials (20) and government officials (20). The semi-structured open-ended interview used as the survey instrument was for understanding the rationale behind the effect of various policies towards the development of SMEs (Creswell et al, 2007). We elicited their views by asking broad questions about the various policies they are aware of, how effective the policies are and ideas on how to strengthen the SMEs sector to contribute to the economic growth of the country. The Small and medium enterprises (SMEs) considered in this study were those that fulfilled the criteria of employing between 10 and 199 people according to the definition by (SMEDAN, 2007). Our sampling plan was to get representatives of each of the major stakeholders involved directly with the development of SMEs in Nigeria (Robson and Bennett, 2000).

ANALYSIS AND FINDINGS

The interviews were first conducted with officials of SMEDAN agency because they have the main responsibility of developing SMEs sector in Nigeria. Then a list of other government agencies with direct or indirect relationship with the growth and development of SMEs were obtained from the agency. The nature of the research was explained to each respondent and confidentiality was guaranteed. Each interview lasted between 45 and 60 minutes and was semi-structured, conducted between January and March 2014. All the interviews were recorded and detailed notes were taken during each meeting and fully transcribed with NVivo. Three main key questions relating to policies and contribution of SMEs to the economy were the main themes of this study. The three questions were asked across board from the three stakeholders identified. Thematic analysis was used to uncover the themes which require further interpretation and involvement of the researcher. This approach helps to identify and describe the issues of policies implementation by the government and its effectiveness towards the development of SMEs in Nigeria through the stakeholders' practical ideas and beliefs. The following key interview questions were asked to address the research questions as a guide to probe into the activities of the various stakeholders involved in the development of SMEs (Smith & Elger, 2012).

1. Questions informing the respondent perspectives about the policies they will recommend to the government towards the development of SMEs in Nigeria.
2. Questions about the impact the recommended policies will have towards the development of SMEs in Nigeria.
3. Questions eliciting the respondents' perspective on the contributions of SMEs to the economy if these policies are effective.

Theme One

Policies recommendation. The views of the three stakeholders are almost similar as they all agreed that there are policies in place but the implementation is the major problems. Some of the policies recommended by the bank officials include female entrepreneurship policy targeting women to be empowered and contribute to the household income. Also, young entrepreneurship policy targeting young people to start their own business was suggested which will reduce the social menace in the country such as robbery, kidnapping etc. This is because most of the youths are not engaged in employment. Others are policy that will give room for sectorial allocation for SMEs which will allow special prices for their output and help get their products and services beyond their local environment. Another recommendation by a bank official is that government should formulate import policy that will protect the local factories. This will discourage people from importing and help the local factories to be engaged in production hence employing more people. Others are policy on poverty elevation, agricultural loan policy, policy on infrastructure, policy on taxation, technology and policy on manpower. One of the bank officials express further that,

I won't recommend any new policy now but they should implement all the reforms and policies already in existence. If they implement even half of the existing policies, Nigeria will be in a better position. We don't need more policies but we need proper implementation…

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

The perspectives of government officials and SME owners/managers surprisingly also indicate that there are policies in place but implementing is bad. One of the directors recommended fiscal policy which is needed to boost the SME performance in the country. Other policies can be geared towards capacity building programmes for the SMEs, peer mentoring programme as a strategic to grooming up people, collateral reform and registry where SMEs can access loans from the banks without heavy collateral, policy to boost infrastructure support, policies for fund for women, policy for work space and funding.

Government should review the existing policies to make them friendly. The policies should be harness for people to understand it. People know there are policies but they don't understand those policies. Government should make tax system that is accommodating (Government official, 2013)

One the part of the SME owners/managers, emphasis was laid on one important policy which is privatisation policy. Others are regulatory policy through the financial institutions, SME funding and grant policy, policy to give SMEs loan without collateral and then derive a way of recovering the loan, backward integration policy and tax holiday policy for five years, One SME owners said,

I know that there are policies for fund for women but I tell you the bureaucracy that one undergoes to access such funds is too much. When I was making popcorn, we were made to register with access bank as they have funds for women, but up till now nothing was done for women. They requested for business plans and feasibility studies, and at the end of the day nothing was done. All the energy you put into doing the business plan is too much which I could have used to attend to my business. I will suggest they should remove some of the bottleneck in accessing funds for the Nigerian women…

Theme Two

Impact of these recommended policies. The banks were of the opinion that it will boost the internally generating income for the economy and increase the number of small business which is the engine room for economy development. It was suggested further that it will impact on the employment rate and government will realise more potentials from the business. This will revamp the SME sector leading to economic growth because more entrepreneurs will emerge which means more jobs for the people. It will also bridge gap between SMEs and large companies which will increase the investment level of the country. One banker explains further that,

If these polices are implemented, I feel that the SMEs will grow because they will have easy access to fund, easy access to intellectual knowledge, technical knowhow in place, then the SME will be able to improve their businesses and grow to the next level. These policies should be written as a law. Every government comes in with its own policy and strategy. There is no consistency and it is very rigid making it difficult to change…

The perspectives of the government officials postulate that SMEs will open up the space and more people will begin to migrate into that sector thereby creating more jobs. This will alleviate poverty and general economic development. Others suggest that SMEs will have large access to market and this will encourage them to produce more and lead to more employment. It was also suggested that it will help to

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

shift focus from oil revenue which has killed innovative capacity of Nigerians and has defocused Nigerian leaders. Furthermore, it will reposition SME Sector, open and increase business and investment opportunities which in turn create access to finance and business development. One government officials said:

Definitely the policies will have a lot of impact on the development of SMEs in Nigeria. I would say that Nigeria is so lucky to have started thinking about the development of SMEs long time ago. We have an agency which is exclusively meant to promote the growth and development of SMEs in Nigeria which is the SMEDAN. They are set up to ensure that they come up with policies and programmes that encourage the growth and development of SMEs. I think they already have a number of incentives for SMES and if the SMEs themselves come together to begin to engage SMEDAN in terms of what their requirements are, it will help SMEDAN to come up with propose policies that will substantially help to address the issues. SMEDAN cannot know what the problems are with SMEs because they are the operators. The contributions from the SME operators themselves will substantially help to broaden policies and improve policy formulation that will help to develop the sector…

Theme Three

Contribution of SMEs to the Nigerian economy. The SME owners/managers are of the view that apart from turning the economy into a production one rather than being the consuming one will create a lot of jobs for the economy. Other contributions of SMEs according to the owners/manages is that it will galvanise the economy activity in the system by creating employment for the people. Also, there will be less dependent on import because so many goods will be produced within the system, thereby foreign exchange will be properly managed and will not be filtered away. SMEs will contribute to the economy by Job creation and improve skilled labour force which will reduce criminality through gainful employment. One SME owners suggests that:

It will make the economy to grow in the sense that it gives room for other people from other countries to come in and have business and good business relationship with the country which will grow the economy. It will give room for a lot of things to start coming in. When you talk of employment, it will increase the rate of employment. In a nutshell, it will enhance the growth of the Nigerian economy…

The perspective of the bank officials supports the contribution of some other respondents as they suggest it will reduce the social menace like kidnapping, robbery because more people will be highly engaged in employment. There will be enabling environment which will attract foreign investment. Some suggests that it will make the economy more vibrant which will increase the GDP of the country, hence reduce poverty level. This will improve the general wellbeing of the nation and security will improve. One of the bankers said,

I think SMEs can contribute greatly to the economy if these policies are properly implemented and other needed infrastructures are made available to them. Let me tell you example of Dangote who is now known all over the world. He started small and he did not get his funds from the banks but from a rich uncle who helped him to start. That is an example of SMEs becoming something big. The proportion of Dangote contribution to the GDP in Nigeria at the moment is very sizeable but I think SMEs can contribute to the economy of Nigeria. SMEs can create employment opportunity, reduce crime rate and foster the economy of the nation…

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Lastly from the government perspective, it will create a lot of entrepreneurs which will also increase the revenue potentials of the country and provide a lot of employment opportunities. It will also reduce poverty rate in the country in terms of the economic and SME will re-engineer and transform the economy by creating more employment. One government officials said:

If we want to grow our economic sustainably, the way to go is to promote the growth and development of SMEs because they will contribute more than 70% to the GDP of our various economic. We should be able to encourage our SMEs to specialise. Once they specialise, they will also contribute to earning foreign exchange because when they export their goods or services, they earn foreign exchange for the country and help to increase foreign reserves of the country. These are the contribution SMEs can do once they are given the push…

CONCLUSION

The study has demonstrated that policy implementation is the major problems with the development of SMEs in Nigeria rather than policy formulation which is in line with the findings of Eniola and Etebang, (2015). Various policies have been formulated in an effort to develop this all-important sector as it is the bedrock of every economy. As demonstrated above, if SME is properly managed, it will create employment. The people who are gainfully employed will pay tax thereby increase the income generation capacity of the nation. It was also identified from the interview that there has been inconsistency in the implementation of government policies for SMEs development due to inadequate data on the operational difficulties of SMEs by the government agencies responsible for the design and implementation of SME development programmes. In most cases, these government agencies do not consider the peculiar nature of the SME operators while designing these policies. This is in line with the findings of Obokoh, (2008) who postulates that the level of education of SME operators is not considered when formulating policies. Hence, the beneficiaries will be unable to benefit from the policies due to their level of understanding.

The conclusions of this study are consistent with the study undertaken by Abdullahi et al (2015) which stressed that the government should provide enabling environment and adequate basic infrastructures in terms of electricity supply, water supply, effective telecommunication system, good road network and better transportation system. This will go a long way to encourage investors to invest more in SMEs and the existing entrepreneurs will use the surplus resources into the operations of their business. Eniola and Entebang, (2015) in their study found that relationship exist between government policies and SME firm performance and have a major impact on the competitiveness of SMEs. This shows that with the right set of policies for SMEs in Nigeria, the sector will contribute a lot to the economy as postulated from the interview.

Chapter 63
Handling Uncertainty in Project Management and Business Development: Similarities and Differences

Stefan Hartlieb
WU Vienna University of Economics and Business, Austria

Gilbert Silvius
LOI University of Applied Sciences, The Netherlands & University of Johannesburg, South Africa

ABSTRACT

This chapter reports a study into the management of uncertainty in the disciplines of business development and project management. The first part of the chapter analyses the disciplines by looking at the process, the planning, uncertainty and risk and the measurement of success. Based on our analysis of these two disciplines, we conclude that they differ substantially in the perception and handling of uncertainty and how this is included in the overall process. We found that business development uses additional methods, for example scenario planning, to manage the uncertainty that is inherent to the business development process. The second part of the chapter reports an explorative study into the potential application of scenario planning in project management. This study shows that scenario planning may benefit project management in creating a shared understanding of the project as well as the provision and consideration of different information. In the planning processes of the project, this information is considered useful in risk management and milestone planning.

INTRODUCTION

Project management and business development have some similarities. PMI defines a project as a "temporary endeavor undertaken to create a unique product, service or result" (Project Management Institute, 2013, p.3) and Blank defines the development of a new business as a "temporary organization in search

for a scalable and repeatable business" (Blank and Dorf, 2012, p.xvii). Hence both can be seen as temporary and both have similar steps from initiation, planning, executing and closing. However, despite these similarities, business development and project management are considered as different disciplines in both research and practice.

One of the similarities between project management and business development is that both disciplines need to cope with uncertainty. Projects are traditionally seen as structured activities aimed at realizing an in advance agreed objective. The uncertainties surrounding this objective, or the process of realizing it, are treated as risks and coped with in risk management processes which are a subset of project management (Perminova et al., 2008). However, with project being performed in an increasingly uncertain environment, the traditional project risk management methods and techniques are considered insufficient for coping with this increased uncertainty (Perminova et al., 2008; Cleden, 2012; Krane et al., 2014). Therefore, better methods and techniques are needed in order to manage today's level of uncertainty in projects. One of the disciplines that could provide new insights on how to cope with uncertainty, is business development. When searching for, or developing, new products, services or business ventures, there is no certainty about the outcome of the process. Still, business development needs to make decisions in this process that is filled with uncertainties.

The study reported in this paper studied the way business development copes with uncertainty and asks the question "How can the techniques of business development for dealing with uncertainty be used in project management?".

The remainder of the paper is structured as follows. The next paragraph will discuss the disciplines of project management and business development along the dimensions of 'process', 'planning methods', 'risk and uncertainty' and 'success'. The paragraph following this one will provide a comparison on the two disciplines in order to identify similarities and differences. In this paragraph we will also discuss Scrum, as an approach to project management that has borrowed some concepts from business development.

The next paragraph will introduce the research strategy we deployed in the empirical part of this study, followed by a presentation of the findings of our empirical exploration. The final paragraph of the paper provides our conclusion and an outlook on further research.

THE DISCIPLINES OF PROJECT MANAGEMENT AND BUSINESS DEVELOPMENT

This paragraph presents an overview of the disciplines project management and business development, and a comparison of the two. As our focus is on the handling of uncertainty, we will also discuss this in both disciplines. We'll describe each discipline along the dimensions of 'process', 'planning methods', 'risk and uncertainty' and 'success'. This structure enables us to compare the two disciplines on the four dimensions.

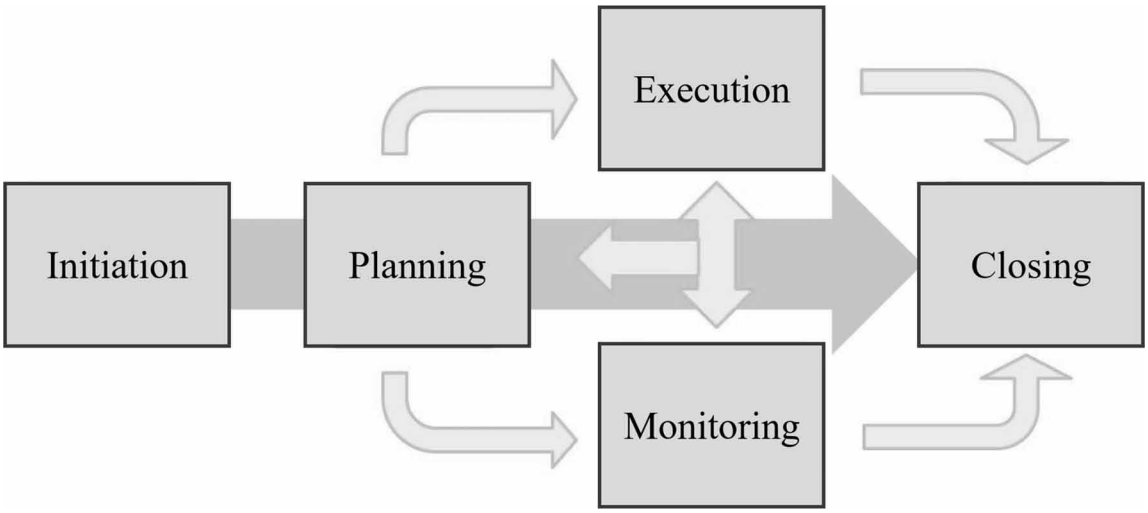
Project Management

A project is defined by PMI as a "temporary endeavor undertaken to create a unique product, service or result" (Project Management Institute, 2013, p.3). Hence, project management is defined as "the

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

application of knowledge, skills, tools and techniques to project activities in order to meet the project requirements" (Project Management Institute, 2013, p.5).

Process



A core-element of project management is stage-gate process (Kerzner, 2009). The stage-gate process was created because the traditional hierarchical command and control structures were not effective for temporary processes that imply a 'horizontal' work flow across organizational boundaries, such as projects. For this stage-gate process of project management, several standards have been developed that provide guidance on how to execute project management. A broadly used standard of project management processes is described in the Project Management Institute's project management body of knowledge (the PMBOK Guide). In this guide, five project management process groups are identified:

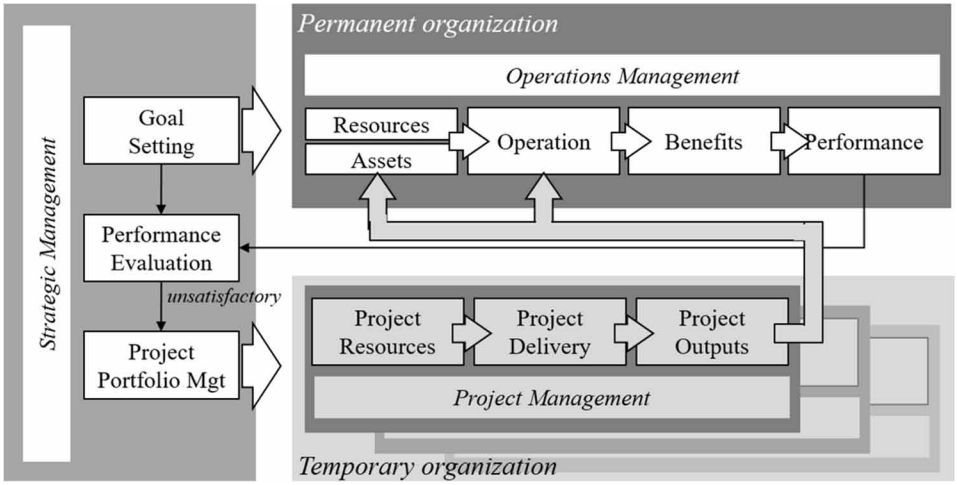
- Initiation,
- Planning,
- Executing,
- Monitoring and controlling, and
- Closing (Project Management Institute, 2013).

Figure 1 presents these process groups.

The level of uncertainty for a project declines along the project process. Nevertheless, uncertainty can be found in all stages. A project starts with an initial investigation into an idea (Zwikael & Smyrk, 2011). This phase is called conceptualization and aims to recognize the idea as a potential project and to define the idea as an investment opportunity. Hence the "conceptualization should be a short, simple and relatively spontaneous process" (Zwikael & Smyrk, 2011, p.138). One issue that arises is that often the output of the project is discussed in the conceptualization phase. The more important question is

Figure 1. The project management process groups
Based on Project Management Institute, 2013.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use



related to the outcome. “Why are we doing the project?” “Thinking of the ’why’ will lay the foundation for a much more formal treatment of target outcomes.” (Zwikael & Smyrk, 2011, p.139).

The project specification is often related to the development of a business case (for the project). The business case specifies if the expected outcome is worth the effort. Hence the business case must specify the target outcome of the project. “The target outcome will determine the outputs that are to be produced” (Zwikael & Smyrk, 2011, p.139) by the project. For the specification of the target outcome and the related outputs of the project it is necessary to specify scope, stakeholders, risks, issues, schedules, resources and governance for the project. These specifications will determine the effort necessary for the project. The definition of the target outcome will determine the worth of the project.

The developed business case is the foundation of the judgement whether to start the project or not. The judgement must answer the question “Do I believe that the project defined by the business case represents an appropriate investment?” (Zwikael & Smyrk, 2011, p.175). If the business case and hence the project specifications are accepted the project can shift further to the project planning where the detailed project plans are developed. If the business case is rejected no further afford will be spent on the initial project idea.

One potential issue in project management is that the output of the project is not utilized. Only by the utilization of the outputs of the project, the business case can be realized. The traditional perspective on projects, in which the project is a structured process that transforms inputs into outputs (Smyrk, 1995, p.2), often lacks this focus on the utilization the output. Without the utilization of the output the project cannot be beneficial for the underlying organization. Hence in the project, the transformation of input into outcomes (instead of output), should be considered. (Zwikael & Smyrk, 2011, p.23). The outcome of the project is “focusing on the end-effect generated as a consequence of the implementation of those outputs.” (Zwikael & Smyrk, 2011, p.17), It logically focuses on the long term results and can be described as the purpose of the project. The purpose of a project is not only to develop a new product or service. The important question is. “Why do we produce this product or service?” and “What do we want to achieve with this product or service?”. This difference between the ‘output’ and the ‘outcome ‘of a project is illustrated by Silvius et al. (2012) with Figure 2.

Figure 2. Project as temporary organizations that deliver changes to the permanent organization
Silvius et al., 2012.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

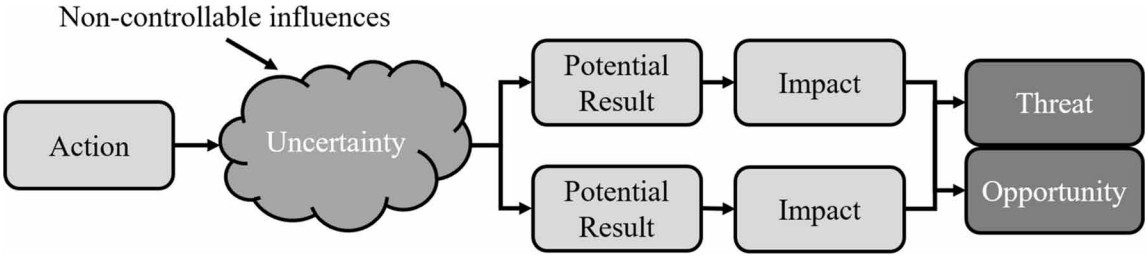
In this figure, projects are positioned as temporary organizations that deliver (any kind of) change to organizations, products, services, business processes, policies or assets. The output of the project is the collection of artefacts that define the change to the assets, resources, products/services, processes and/or policies of the permanent organization. The outcome of the project is the effect that this change has in terms of changed behavior and, resulting from that, improved performance through the creation of benefits.

Usually, the project manager is not responsible for the utilization of the output to generate the target outcome, as this logically takes place after the close down of the project. Hence the responsibility of the utilization is in other hands. But without integrating the project manager into the process of the utilization, the benefits of the output might not be realized.

Planning

The execution of a project can be seen as a process. Hence there are tasks and activities that have to be done. Project planning describes "how that work is to be performed." (Zwikael & Smyrk, 2011, p.181). The areas of planning can be seen as the detailed description of the work, the environment in which the work should be performed and the underlying funding of the environment and work. A decent project planning can also be seen as a major success factor for projects, but "planning not necessary guarantee success" (Dvir et al., 2003, p.389). "Project managers who manage high-risk projects tend to make much more of an effort in performing the planning process" (Zwikael & Sadeh, 2007, p.760), but on the other hand "when uncertainty is significant planning is difficult and project plans are of somewhat limited value." (Zwikael & Smyrk, 2011, p.183) The output of the planning phase is the project plan. Together with the formulated business case it is the baseline for the implementation of the project. "Everything that is done on the project must be carried out in accordance with these documents." (Zwikael & Smyrk, 2011, p.184)

There are several areas where planning is necessary for a project. The areas not only contain the 'iron triangle' of scope, time and cost, but also the quality of the project, the communication, the human resources, the risks, the procurement and the stakeholder management. The PMBOK guide defines 10 'knowledge areas' and 23 planning processes to structure the actions that have to be done (Project Management Institute, 2013).



Key for the success of the project is to collect and define the requirements of the different stakeholders. The requirements that have to be collected must represent the following areas:

- Business requirements,
- Stakeholder requirements,
- Solution requirements,
- Transition requirements,
- Project requirements, and
- Quality requirements.

With this defined scope the work breakdown schedule (WBS) can be created. The WBS represents the total scope in a hierarchical decomposition. Once the scope is defined, the activities to enable the realization must be defined. The activities are clustered in work packages. Hence, "the work packages are the quantitative and qualitative descriptions of the scope" (Gareis, 2005, p.211) and must be ordered

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 3. Influence of uncertainty on projects

to establish a sequence of work. After the resources and the time necessary for the performance of an activity is estimated the project schedule can be developed. The schedule defines when a specific activity should be started and at which point in time it should be finalized. It defines the overall timing of the project and includes also the overall project start and project end. The planned resource requirements enables to derive the estimated costs for each work package. The overall budget can be determined by the costs estimation. The total project budget determines the "funds necessary to execute the project." (Project Management Institute, 2013, p.209).

Uncertainty and Risk

One key aspect of projects is risks and its management. A risk is "an uncertain event or set of events that, should it occur, will have an effect on the achievement of objectives" (Office of Government Commerce, 2010). Risk is related to uncertain events and therefore often used synonymously to uncertainty. But there is a difference between uncertainty and risk. For a distinction between uncertainty and risk they are better described as "cause and consequences" (Perminova et al., 2008, p.74).

Figure 3 shows the influence of uncertainty on project risk, both opportunities and threats. The influences can be either from different sources or different types. Based on the sources, uncertainty in projects can be categorized into three categories:

- "Uncertainty from organizational complexity,
- Uncertainty from environment and
- Uncertainty form the individual project." (Martinsuo et al., 2014, p.734).

Organizational uncertainty may be caused by uncertainty in resources (Engwall & Jerbrant, 2003), project governance (Müller et al., 2008) or changes in the organizational processes, structures, budget or strategy (Petit & Hobbs, 2010). Environmental sources for uncertainty can be seen in the technological environment (Petit, 2012) or changes in the overall market or supply chain (Petit & Hobbs, 2010). At the individual project level uncertainty deals with the uncertainty of the project planning and hence with uncertainty of scope, schedule and budget (Petit & Hobbs, 2010).

Besides the sources there are different types of uncertainty:

- Technical,
- Market,
- Organizational, and

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

- Resource (Rice et al., 2008, p.55).

Technical uncertainty "relates to the completeness and correctness of the underlying scientific knowledge." (Rice et al., 2008, p.55). The technical specification is question here. Is it possible to implement it? Another uncertainty comes from the market. Here it is asked if the customer is understood. Market uncertainty includes the uncertainty that the needs and wants of the customers are not clear. The third type of uncertainty is related to the organization. The organizational uncertainty describes the uncertainty that arises between the project and its included internal and external organizations. The fourth type deals with the uncertainty that lies within the resources. "Project teams continually struggled to attract the resources they required." (Rice et al., 2008, p.56) Resources are all resources a project needs for a successful performance. Examples for resources that can create uncertainty are competences, finance or infrastructure.

Creating something new always contains a portion of uncertainty and hence projects can be seen as risky. Risks in a project can be derived from all sources of uncertainty and therefore project risk can be included in all parts of the project starting from the scope, schedule and budget. But there is also a risk to achieve the projects objectives. Following the definition of PMI a risk can be seen not only negative like a threat but also positive. A positive risk is an opportunity that arises if the uncertain event happens. It has a positive impact on the project. Also risks can be categorized into two categories, the "risk in the project" and "the risk from the project." (Hillson, 2014, p.283). The major concerns of project management is about the risk in the project. How to handle individual risks within the project? The other question is more related to the underlying organization.

The different standards on project management and risk management, define project risk management in a sequence of different processes. These four project risk management processes are (Silvius, 2016):

1. Identify risks (and opportunities),
2. Analyze and assess risks (and opportunities),
3. Develop risk response strategies and plan,
4. Implement the risk response plan and control the risks.

As "it is not possible to address all risks with the same intensity" (Hillson, 2014, p.293), the question is often 'how much uncertainty or risk is acceptable?'. On the other hand, removing uncertainty takes a lot of effort and hence can be very expensive. The trade-off is that the protection from uncertainty must be affordable.

In order to analyze the risks of a project, typically the identified risks are assessed on two dimensions,

- 'Impact' and
- 'Probability'.

The impact describes the effect on the project objectives while the probability describes the likelihood that the effect arises. Table 1 shows the resulting 'probability/impact matrix', that is the visualization of the project risk assessment. The risk assessment aims to "analyze the combined effect of risks on project outcomes." (Hillson, 2014, p.295).

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Table 1. Example of a probability/impact matrix

			Impact				
			Very Low	**Low**	**Medium**	**High**	**Very High**
			0.05	0.10	0.20	0.40	0.80
Probability	**Very High 71-90%**	0.90	*0.05*	0.09	**0.18**	**0.36**	**0.72**
	High 51-70%	0.70	*0.04*	0.07	0.14	**0.28**	**0.56**
	Medium 31-50%	0.50	*0.03*	*0.05*	0.10	**0.20**	**0.40**
	Low 11-30%	0.30	*0.02*	*0.03*	0.06	0.12	**0.24**
	Very Low up to 10%	0.10	*0.01*	*0.01*	*0.02*	*0.04*	0.08

Source: (Based on Project Management Institute, 2013).
Legend: Bold = High risk; Normal = Medium risk; Italic = Low risk.

After the identification, categorization and analysis of the risks the next step is to plan responses for each of the risks. The strategy should be first developed for each individual risk and at the end summed up to an overall risk response strategy. Generally, the responses can be categorized into four different strategies. Depending on the direction of the risk (negative or positive) the response strategies are:

- Avoid/exploit,
- Transfer/share,
- Reduce/enhance, and
- Accept.

After implementation of the risk response plan, the risks are being monitored during the project's execution and the risk response strategies managed. If the risk or opportunity is over, the review ensures that the taken actions have had the expected effect on the risk. As last step in the risk management process, after the finalization of the project the overall project risk management plan, the process of risk management and the risk responses in general should be reviewed.

It may be concluded that risk management is a major topic in project management that deals with the question of uncertainty in projects. "Risk arises from all sources of uncertainty." (Hillson, 2014, p.284). It can have positive or negative impact on the project and hence be either a threat or an opportunity. In addition, risk can be on the individual level of a task, activity or process or on the overall project level. The project management standards offer a sequence of processes as a framework for handling risks, but following these processes seems to be too little to be able to cover all sources of uncertainty.

Success

Projects are done because they are expected to have benefits for the organization or a stakeholder. A benefit can be defined as "an outcome of change which is perceived as positive by a stakeholder." (Bradley, 2010, p.23). The benefits should fill the value gap that is existing between the current situation and the

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

target future situation (Kaplan & Norton, 2008; Serra & Kunc, 2015, p.55) hence benefit realization, starts with projects and ends with the achievement of business objectives. (Serra & Kunc, 2015, p.55).

To realize the benefits from a desired change an organization must establish a process for enabling it. Benefits realization management is "the process of organizing and managing so that potential benefits, arising from investment in change are actually achieved." (Bradley, 2010, p.29). Due to the fact that benefits realization management is a process it is not done only at one single point in time. Hence "benefits management is a process that runs throughout the project life cycle." (Jenner, 2009, p.10). The objectives of benefits realization management are to ensure that investment decisions are made on the basis of a robust and clear understanding of the potential benefits, to capture all forms of value created and to realize benefits and create value. (Jenner, 2009, p.11-12).

Overall project success is dependent on performance and success and a project can be defined as successful if "the project meets the technical performance specifications and/or mission to be performed, and if there is a high level of satisfaction concerning the project outcome among key people on the project team, and key users or clientele of the project effort." (Baker et al., 2008). The overall project success is usually measured on two dimensions:

- Project management success, and
- Project success (Baccarini, 1999, p.25).

Project management success focuses on the process of project management while the focus of project success is on the output and outcome of the project. The distinction is important because "how success is to be defined for a project is a necessary precursor to the establishment of appropriate methods for managing the project life cycle and for the selection of suitable measurement techniques." (Bryde, 2005, p.120).

The three components of the measurement of the project management success are

1. Meeting the baseline,
2. Process performance, and
3. Stakeholder satisfaction.

The success on the baseline can be measured against the golden triangle of the initial project plans:

- Scope,
- Budget, and
- Schedule.

How good is the project against the planned schedule? How good is the project against the planned costs? Is there an overrun of the budget? The measurement of the scope can be done against the initial technical specifications. Is the provided functionality in line with the planned functionality? These criteria can be categorized as objective and direct. The measurement can be done between a planned and a performed value. The second component on what the process management is judged is the process performance. It measures "how efficient the project has been managed." (Baccarini, 1999, p.28). The third component stakeholder satisfaction measures how satisfied the stakeholder was with the process

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

of project management. It hence deals with the process of project management and not with the output or outcome of the project.

The project success is measured on three components:

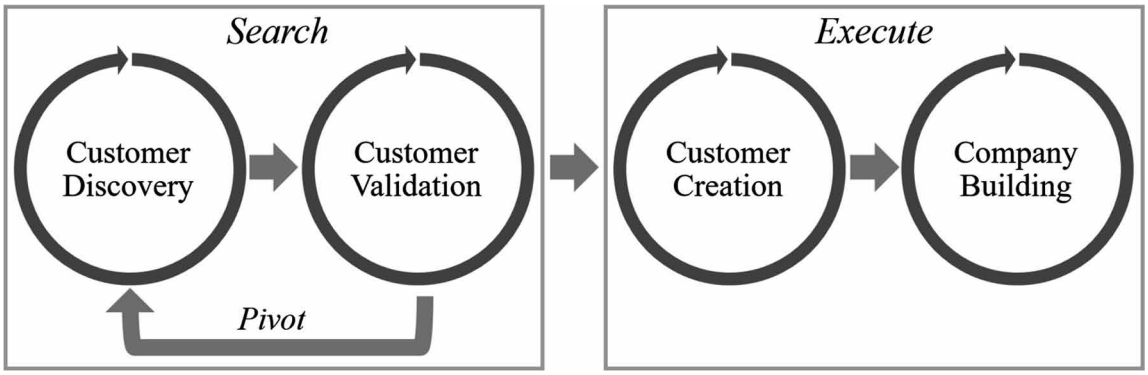
1. Achieving the project goal,
2. Realizing the project purpose, and
3. Stakeholder satisfaction (Baccarini, 1999, p.29).

The project goal measures if the project and its outcome meets the strategic objectives of the organization that benefits from the project. Second, the project purpose is successful if it satisfies the user's needs. The stakeholder satisfaction - in this case - is related to the results of the project and hence to the output or outcome. Different to the stakeholder satisfaction as measurement on project management the question here is if the stakeholders are satisfied with the end result of the project.

Baccarini (1999) describes that the two dimensions of measuring success are not always related to each other. Even if the process is perceived as a success the product can be a failure, and vice-versa. More critical for the underlying organization is if the output and the outcome of the project is a failure. This indicates that the company cannot realize the expected benefits.

The measurement of success is also a matter of timing. Different success criteria are measured different at different time intervals. The shortest dimension is 'project efficiency' (scope, budget and schedule). It measures "What factors are critical to project management success" (Cooke-Davies, 2002, p.185) and it can be assessed immediately but does not include any information on the long-run benefits. The 'impact on the customer' can be seen as the second dimension. It indicates the satisfaction of the customer with the deliverables of the project. As the customer will utilize the deliverables on a period of time this measurement can be seen as medium-term. The 'business success' dimension measures "the immediate and direct impact the project may have on the organization." (Shenhar et al., 2001, p.715). It hence measures the impact of the project on the medium to long term business results. As a fourth dimension 'preparing for the future' can be seen. The fourth dimension is important because "projects at the higher end of uncertainty dimension build new capabilities and create opportunities for the future." (Shenhar et al., 2001, p.713). It hence relates the project to the future business of the underlying organization and therefore it is based on the long-term time frame.

Business Development



In this section, the discipline of business development is described. Similar as for project management, the description focuses the process of business development, with the focus on the initiation phase, the planning of a new business, uncertainty and risk in business development and the criteria for the success of business development.

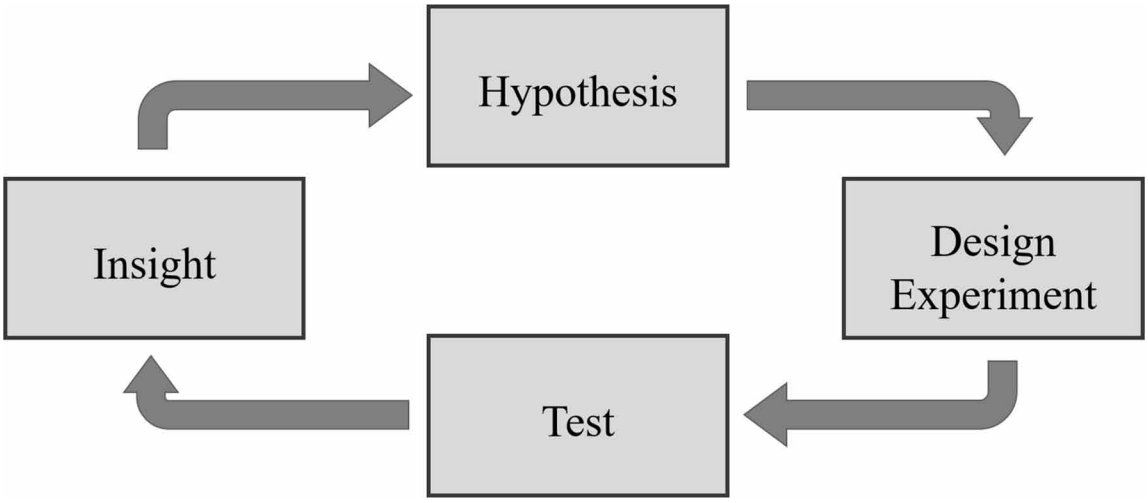
Process

Business development is the discipline that aims to develop 'new business'. New business development distinguishes itself from the development of a product or a service, by searching for "a scalable, repeatable, profitable business model." (Blank & Dorf, 2012, p.xvii). Whereas classical product development is done in a sequential approach, "uninterrupted by changes or new ideas no matter how good they might

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 4. The business development process
Blank & Dorf, 2012, p. 23.

be for the business." (Blank & Dorf, 2012, p.5), this approach is most likely to fail in the case of new business development because "both the customer and the product are unknown" (Blank & Dorf, 2012, p.8). The development of a new business must be more iterative to include the high level of uncertainty. Blank and Dorf (2012, p.22) propose a four-step model at which each step is an iterative process. As the development of a new business should focus on customers the four steps are customer oriented. It all starts with 'customer discovery' where the visions are turned into business model hypotheses and these hypotheses tested on the customer reactions. The second cycle is the 'customer validation' "which tests whether the resulting business model is repeatable and scalable." (Blank & Dorf, 2012, p.22). The third step is the 'customer creation' where the end-user demand is created and the sales started. At the end of the process the 'company building' is located. It focuses on the transformation of the temporary organization that was in search for the repeatable, scalable and profitable business to a permanent organization that "executes the validated business model." (Blank & Dorf, 2012). Figure 4 shows the four steps of Blanks Customer development process for business development. The first two phases focus on the search and hence on the initiation of the new business idea, the latter two on the execution and therefore on the establishment of the new business.



Planning

Business plans are based on assumptions and hypothesis, but "hypothesis is just a fancy word for 'guess'" (Blank & Dorf, 2012, p.37). Key for the successful establishment of a new business is to turn the assumptions into facts. This can only be done by testing them. The testing of assumptions is done following an iterative cyclic approach, as illustrated in Figure 5.

This iterative development cycle starts with an initial hypotheses and the first draft of the business model. In this phase the vision of a new business is turned by assumptions into a business model. In the second phase experiments should test the 'problem' hypothesis. Is there really a problem or a need that can be solved by a new business? If the initial assumptions are wrong this is the first point where they can be adapted. If the assumptions are adapted the new assumptions must be tested again. After the problem is tested the solution must be tested. The goal is to ask if the value preposition will solve the problem. At this time "the goal is not to sell the product, but to validate how well you understood the problem in Phase 2" (Blank & Dorf, 2012,p.68). The fourth phase is to validate the results of the tests.

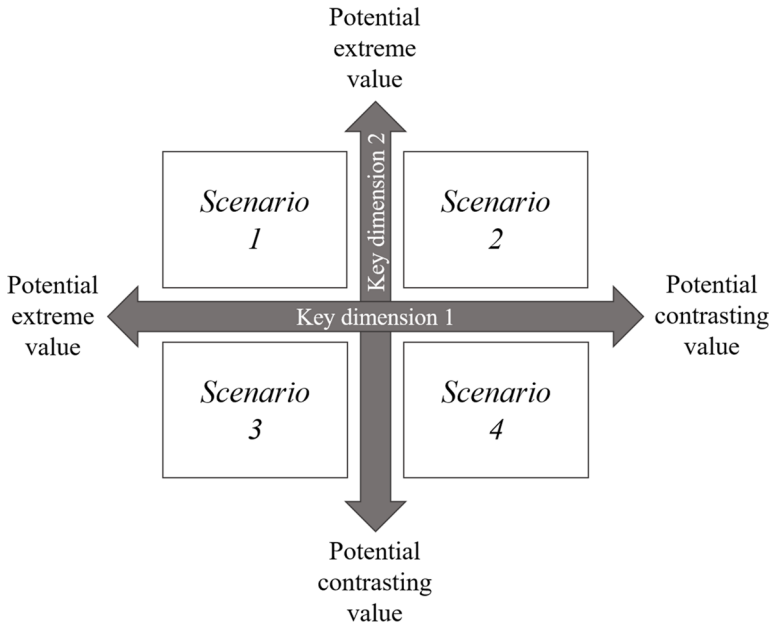
EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 5. The iterative development cycle
Blank and Dorf, 2012, p. 38.

It must be clear that the problem is understood, the problem can be solved by the value preposition and that there is a decent volume of customer base that is willing to pay for the new product or service. Only if the questions are verified the second phase of the business development can be started, otherwise the initial plans and assumption must be pivoted and adapted.

On the basis of the business model a business plan can be worked out in detail. “A business plan should justify and describe your business idea in a clear and adequate manner.” (Schwetje & Vaseghi, 2007, p.1). It includes all relevant information of the new business. The business plan should include several other aspects like:

- Market analysis,
- Organizational structure,
- Management team,
- Operational plans,
- Critical milestones, and
- Funding.



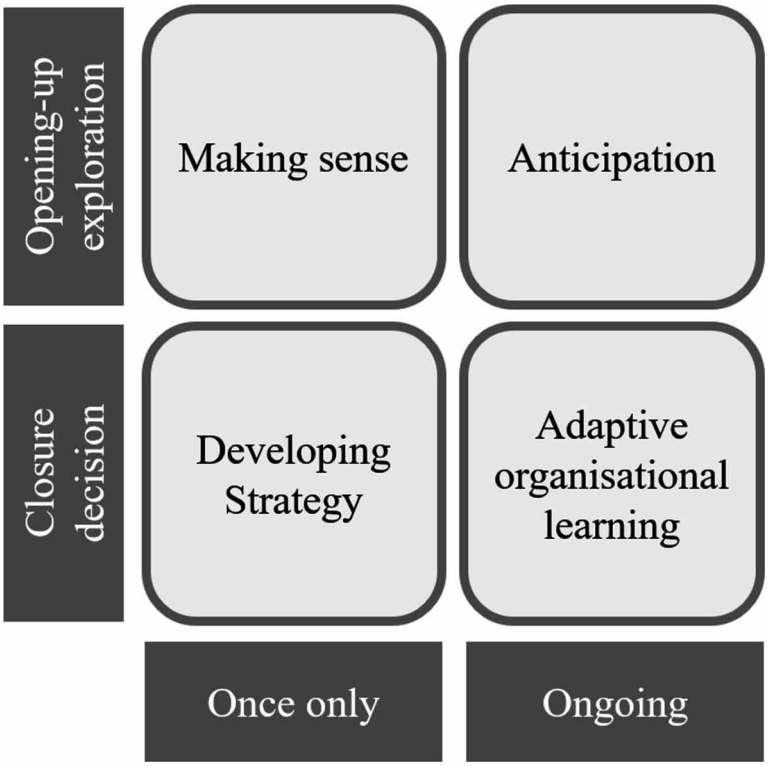
As in the early stage of a business plan it contains a lot of assumptions, all the assumptions must be included in the plan. This enables to pivot the plan and model easier in the process of the establishment of the new business because “no business plan survives first contact with customers.” (Blank & Dorf, 2012, p.35).

Uncertainty and Risk

Uncertainty and risk is one of the key topics in business development, as uncertainty can be seen as the justification for the profit of the new business. Hence uncertainty and different variation of uncertainties are important in business development and methods to cope with it exist.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 6. Example of a scenario framework



One of the tools to cope with uncertainty is "Scenario planning". At the beginning "scenarios have been used as tools for indirectly exploring the future of society and its institutions." (Bradfield et al., 2005, p.795) Hence the objective of scenario planning in business development is "to better prepare an organization for the future." (Garvin & Levesque, 2006, p.1). Scenario planning is not searching for the best fitting answer for a problem like strategic planning is doing, but for multiple possibilities. It hence "investigates in several uncertainties simultaneously." (Garvin & Levesque, 2006, p.1). The objective is to reduce the surprises of an incorrect assumption of the future by a broader planning of the business model and thinking about multiple futures.

The process of scenario planning starts with defining a key focal issue. This can either be a "significant, upcoming decision" (Garvin & Levesque, 2006, p.2) or "an issue that has profound uncertainty but is particularly relevant to the business." (Cinquini et al., 2013, p.51). If a factor has an impact on the scenario it is a driving force. Hence this are themes that will affect the key focal issue. Sources for driving forces are "social systems, economics, political affairs and technology." (Garvin & Levesque, 2006, p.3). Due to a wild range of driving forces they must be simplified for a further analysis. The critical uncertainties are "the two most important variables" (Cinquini et al., 2013, p.52) for the issue. These two critical uncertainties should not correlate to each other and hence be classified as independent variables.

For each of the variables two counterpart definitions, each from an end of the possible range of values, are taken and the two dimensions intersect to each other. The result is a 2x2 matrix, as illustrated in Figure 6, with four possible future scenarios. These matrix is the scenario framework. "The goal is to end up with a few, clearly contrasting environments." (Garvin & Levesque, 2006, p.3). These different futures are the scenarios that represent the alternative developments of the selected critical uncertainties and its interrelation to each other. After the definition of the scenarios each of the scenarios and its characteristic should be described in detail.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 7. Areas of scenario planning

One of the key areas of scenario planning is that the hypothesis is tested against the key focal issue. Here each of the possible futures is applied on the organization and the issue and the impacts on the organization explored. This leads to the development of strategic options that can be taken to deal with a certain situation. At the end early warning signals must be identified. These signals indicate the "emergence of one scenario or another" (Garvin & Levesque, 2006, p.4) and hence if the world is "moving in a particular direction." (Garvin & Levesque, 2006, p.4). By this it is possible to optimize the business model in dependence on the given situation.

Scenario planning is used in several areas. The areas can be categorized on two dimension. First, the purpose of scenario planning can be divided either into a specific problem or an ongoing process. The second categorization is between the closing of a specific decision or the opening of an organization for future exploration (Bradfield et al., 2005, p.806). Figure 7 shows the categorization of the scenario planning areas. By the combination of the two categorizations scenario planning can be clustered into four areas, "making sense of a particular puzzling situation, developing strategy, anticipation and adaptive organizational learning." (Bradfield et al., 2005, p.806)

Success

One of the issues is how the success and performance of a business development can be measured. "Performance measurement can be described as the acquisition and analysis of information about the actual attainment of company objectives and plans and about factors that may influence plan realiza-

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

tion." (Kerssens-van Drongelen & Cooke, 1997, p.347). The measurement of success and performance is done on a performance metric and performance dimensions.

The performance metrics "provide a way of assessing the progress over time of specific activities, by quantifying key aspects of these activities." (Perkmann et al., 2011, p.207) Performance can be measured quantitatively and qualitatively. Based on the performance matrices, performance dimensions can be discovered. "Performance dimensions are evaluation criteria that identify those factors whose accomplishment is critical for success." (Chiesa & Frattini, 2009, p.20)

The performance measurements for the development of a new business differ from the once for an established and operating business. For established businesses the key success criteria are based on financial KPI's. For a new business "traditional financial measures may not be useful" (Frattini et al., 2006, p.432) and other indicators seem to be more relevant. Blank and Dorf (2012) suggest seven dimensions based on the business model to measure success. Each of the dimensions has one or more measurement indicators.

The dimensions and metrics are:

- **Value Proposition:** What are product costs, market size, attainable market share, and customer impact of network effects?
- **Customer Relationship:** What are customer acquisition costs, prospect conversion rates, customer lifetime value, and customer switching costs?
- **Market Type:** What market is the business in?
- **Cost Structure:** What are the operating costs of the business?
- **Channel:** What are the costs of selling through the channel? Channel margin, promotion, shelf-space charges?
- **Revenue Streams:** What are the average selling price, total achievable revenue, and number of customers per year?
- **Burn Rate:** How much cash is the company "burning" (spending) a month? When will the company run out of cash?

The measurements should be carried out for different time periods and compared over the process of the development of the business. The key question behind the numbers is not only if the business model is profitable, but also if it is scalable enough. If the numbers indicate that the probability to grow is not significant, it might be necessary to adopt or pivot the business model.

PROJECT MANAGEMENT AND BUSINESS DEVELOPMENT COMPARED

One of the major research prepositions is that project management and business development have similarities. This paragraph compares the disciplines on project management and business development along the dimensions of 'process', 'planning methods', 'risk and uncertainty' and 'success' in order to analyze what the two disciplines have in common and what differences exist.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Comparison of Characteristics

Process

One of the compared dimensions is the process the two disciplines follow. Both project management and business development aim to create and/or deliver something new. Compared to the literature of project management the 'newness' of what should be delivered is higher in business development than in project management. This 'newness' relates to the uncertainty at the start of the process. The objective of the business development is to search within this uncertainty for the new business. Hence the uncertainty must be reduced to one evolving future that is beneficial for the underlying organization. It can be seen that the assumptions made for the first business plan in the initiation phase will not hold till the end. A classical step-by-step approach will not be able to cover the level of uncertainty. Hence business development follows a cyclic approach. The objective of the cycle is to test the initial assumption on their correctness as fast as possible to become clearer about the area of development. The cyclic approach should be followed for all activities and assumptions over the business development process. The iterative steps are:

- 'Formulate the hypothesis',
- 'Design experiments to test the hypothesis',
- 'Test the hypothesis', and
- 'Analyze the results by the insights got from the tests'.

At the end the process starts at step one again. By this the uncertainty can be gradually removed and the initial hypotheses transformed to hard facts. The process is hence designed to remove uncertainty within the area of development. Lowering the level of uncertainty generates facts on which the new business can be based.

Planning

For both project management and business development, planning is a key component. However, the purpose and the approach differ. Planning for a project sets the baseline for the execution. "Everything that is done on the project must be carried out in accordance with these documents." (Zwikael & Smyrk, 2011, p.184). The assumption is that at the beginning of the project everything is clear. Hence the planning can follow a strict process starting with the scope, the time and the budget and then all other areas, like risks and stakeholders. For project planning the assumption is that there will be no or only little deviations from the plan during the execution.

In business development, the overall mindset is different. Here the major assumption is that "no business plan survives first contact with customers" (Blank & Dorf, 2012, p.35). The business model is a living document based on the knowledge at this time of the business development. Minor and major changes of the business model and hence the business plan are normal for the area of business development. Therefore, the plans, as seen in the processes, are also generated by a cyclic approach. From the initial plan with a lot of hypotheses the assumptions are turned into hard facts and hence the business plan changed.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

One important tool for business development is scenario planning. Because it is not possible to forecast the future, plans and response strategies are made for different possible futures. Project management does not do this at all. The project planning assumes only one future, with some deviations that are handled as risks for which specific response strategies can be planned. The planning phase for a project is the basis for the performance of the project and deviations should be as little as possible to the plans. On the other hand for business development the plan is a living document that can be adopted along the full life-cycle of the business development to create a beneficial business for the organization.

Uncertainty and Risk

One key difference between project management and business development is the perception of uncertainty. In project management literature uncertainty is often perceived as risk and hence as threat that should be avoided. On the other hand for business development uncertainty is an opportunity. Only in an uncertain situation a new business can be developed and hence more profit generated for the organization. The perception of uncertainty as an opportunity is relatively new in the literature of project management. But also in this concept the opportunity within the uncertainty will only help to be better than the planned values e.g. scope, time and budget but not pivot the project into a completely different direction.

Success

There are also differences in the measurement of performance and success. The major success criteria for the project management process is on the execution in accordance to the plans. It is a planned versus executed value analysis. Therefore, the metric for measurement is around the golden triangle scope, time and budget and hence emphasis the process. It is done once, after the project is completed. The idea of measuring the overall process on a longer basis of the target outcome of a project and not only on the output is relatively new in literature. This indicates the need for a different point of view on project success.

The success and performance of business development is measured in two different ways. The new developed and established business can be measured, like any other business, by financial KPI's like 'return on investment' or 'sales'. This is done on a regularly basis, e.g. once a year. The performance of business development must be monitored over the whole process of the establishment of a new business. Here performance can be seen in the transformation of the initial assumptions into 'real' data. Next to this business development has financial KPI's that matter. The two most important are:

- 'Cash burn for period' and
- 'Cash remaining' (Blank & Dorf, 2012, p.445).

This indicates two things. First, as 'per period' tells, the measurement of the performance and success is done on a regularly basis and not only once after the completion of the process. Second 'cash burn for period' and 'cash remaining' indicate how much time is left to transform the business model into a sustainable, scalable and profitable business.

Compared to project management time and scope are very flexible in business development. The objective is not to deliver the initial business idea but to have a profitable business at the end. The emphasis is on the outcome.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Table 2. Overview of the comparison of project management and business development

	Project Management	Business Development
Process	Linear	Cyclic, step-by-step
Planning	At the start	Re-planning over the life cycle
Risk and Uncertainty	Perceived as threat	Perceived as opportunity
Success	Measured on short-term dimensions Emphasis on the process and output	Measured on long-term dimensions Emphasis on outcome

Reflection

Although both disciplines have similar topics and perceptions there are also major differences between the two. Table 2 shows an overview of the differences in the compared areas between business development and project management.

The process of project management is a linear, step-by-step approach while business development follows a more cyclic approach. The planning for a project is done once, at the beginning of the project. On the other hand the plans for business development are living documents and hence re-planning is part of the overall process. Also the success is measured different. Project management success is measured once after the completion of the project and in accordance to the project plan. The measurement is on short-term dimensions. The emphasis is on the process. Business development is measured on the target outcome, the benefits the business is generating for the organization and hence on the long-term success of the business. In opposite to project management business development is also measured periodically. The comparison also highlights that the perception of uncertainty is different for the two disciplines. The common perception of uncertainty in project management is as a threat while for business development uncertainty includes the opportunity and hence is the source for the new business.

Outlook on Scrum

One of the project management frameworks that uses elements of business development is Scrum. Scrum is an agile project management approach that is based on the operational model of 'Plan-Do-Check-Act' (Gloger, 2010, p.196). Hence similar to business development, the process is based on a cyclic approach.

Process

In Scrum each of these PDCA Cycles is called a sprint. The overall product vision is tried to be developed by a continuous improvement of the solution. The improvements of the sprints are collected and prioritized in the product backlog. The product backlog is hence the list of functionality of the overall end product. Each of the sprints will have a planning phase in which the objectives for this sprint are set. A sprint is normally between 2 weeks and one month. The planning must answer two major questions: "What has to be delivered in the upcoming spring?" and "How will the work be delivered?" (Sutherland & Schwaber, 2013, p.8). The result of the sprint planning is the sprint goal. It is the basis for the implementation of the sprint by the development team. At the end of a sprint a sprint review is held. At this stage it reviews what has been done in the sprint and what changes did occur in the overall product backlog or vision by

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

the development that has been done in this sprint. “The result of the sprint review is a revised product backlog that defines the probable product backlog items for the next sprint” (Sutherland & Schwaber, 2013, p.11). Another element of the sprint cycle is the sprint retrospective. It is an opportunity for the Scrum team for incremental improvements of the development process within the framework of Scrum. Although improvements of the process are always possible “the sprint retrospective provides a formal opportunity” (Sutherland & Schwaber, 2013, p.12) for searching for improvements.

As described by Schwaber and Sutherland “Scrum employs an iterative, incremental approach to optimize predictability and control risk” (Sutherland & Schwaber, 2013, p.3). As it is based on process control theory Scrum focuses on the process. Comparing the process of Scrum to the process of business development the two processes are similar. Both focus on a cyclic approach.

Planning

The Scrum planning is done within the product vision. Within the product vision certain functionality should be provided. For each Scrum sprint the functionality that should be implemented is defined and planned. The objective is an incremental improvement of the overall product to get closer and closer to the overall product vision. Hence also planning is done very often in the process of Scrum. It emphasis a two-way planning. The overall product vision and the functionality are planned on a relatively high level, and the next Scrum sprint is planned in more detail.

Uncertainty and Risk

There are two major ideas behind the short cycles of a Scrum sprint, first to control the risk and second to optimize the predictability for future cycles. This indicates that there is a sense of uncertainty in the process but the perception of the uncertain is as risk and hence as a threat. What can also be seen is that the overall uncertainty within the process is not included in any plan, neither in the product vision nor in the plans for the sprint. The assumption is that by the incremental improvement the predictability of the future sprints and the development of the product vision is given.

Success

The success of Scrum is based on delivering. Hence the success is measured on the process of the implementation. The major assumption is, that by the incremental improvement toward the product vision the long term objectives with the delivered product or service can be achieved. Hence the success criteria for Scrum emphasis more on the output. The long term success in only assumed by the customer satisfaction by the end of the delivery period.

Reflection

The process of Scrum is structured in a cyclic way. This is similar to the process of business development. The motivation of the cyclic approach in business development can be seen in the testing of the different starting hypotheses. Within Scrum the short cycles are used to reduce the risk in the future cycles of the development, hence the functionality of the cycles differs from each other. Uncertainty is

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Table 3. Overview of the comparison of project management and business development

	Project Management	Scrum	Business Development
Process	Linear	Cyclic-phases	Cyclic, step-by-step
Planning	At the start	Phase-wise-detailing, incremental	Re-planning over the life cycle
Risk and Uncertainty	Perceived as threat	Perceived as threat	Perceived as opportunity
Success	Measured on short-term dimensions Emphasis on the process and output	Measured on short-term dimensions Emphasis on output	Measured on long-term dimensions Emphasis on outcome

also treated different. The short planning cycles try to reduce the uncertainty in this development period and the following period. Overall scenarios for different futures are not prepared in the process of Scrum.

Another difference can be seen in the success measurement. The underlying argumentation for Scrum is that by the small development cycles a continuous improvement of the overall deliverable can be secured and hence the stakeholder will be satisfied with the output of the process. But similar to the other project management approaches the success criteria are set on the output of the process, hence they are short-term process driven. The overall – long-term – outcome that should be generated by the output of the process is not included in the measurement of the success of Scrum. Table 3 shows the differences between traditional project management, Scrum and business development.

Summary

This paragraph reported an analytical comparison of the disciplines of project management. In our comparison, we described both disciplines along the dimensions of 'process', 'planning methods', 'risk and uncertainty' and 'success'. The comparison showed that in both disciplines, the dimension of uncertainty is an inseparable element. However, the disciplines differ in the way they handle uncertainty and the related risk/opportunity.

This difference in the handing of uncertainty influenced all of the four described dimensions:

- The process,
- The planning,
- The risk and uncertainty management, and
- The success measurement.

In project management literature uncertainty is often perceived as risk and hence as threat that should be avoided. In business development, uncertainty is considered an opportunity. It can be concluded that the perception and the handling of uncertainty is more developed in business development than in project management. The methods to handle uncertainty in project management are oriented towards finding the most probably scenario of the uncertainty, whereas business development handles uncertainty with methods, such as scenario analysis, that cover different possible outcomes of the uncertainty.

The project management of Scrum uses some elements of business development but overall it can be seen that only using Scrum is not sufficient enough to manage uncertainty in projects.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

In the following sections, we will empirically explore how scenario planning can be applied in project management, as a way to handle uncertainty.

RESEARCH STRATEGY

The empirical part of our study focused on the potential usage of scenario planning in project management. The overall research question we formulated, "How can the techniques of business development for dealing with uncertainty be used in project management?", is therefore for this part of our study specified to "How can scenario planning be used in project management for dealing with uncertainty?".

In order to study this question, we deployed an explorative research design, with semi structured interviews as main data collection strategy. The interviews were conducted with project managers from different industries.

For the interviews, the following lead questions were developed.

- Do you think the technique of Scenario Planning can be used in project management?
- At which phase or steps do you think that the technique of Scenario Planning can be integrated to project management?
- What benefits can be generated by the technique of Scenario Planning?
- Do you see disadvantages for project management in the method of Scenario Planning?
- What has to be considered when using Scenario Planning in the other areas of project management or the project management process?

In the interviews, the researcher followed up on the answers of the respondents in order to discover backgrounds and the 'why' of the answers.

The interviews were transcribed and analyzed using emergent coding. The interviews were fragmented into the single parts and interesting knowledge areas. After that coding was done on the fragments in order to find common categories or elements.

FINDINGS

Regarding the question "How can scenario planning be used in project management for dealing with uncertainty?", the following answers were derived from the interviews.

Data from the Interviews

Usage and Integration

The planning of scenarios is seen as useful for the project management phases of initiation and planning. The integration of Scenario planning is seen more on the overall project level than on the individual work package or task level. Codes that are used are "general", "overall" or "full picture".

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Benefits

Different benefits are seen in the different areas. For the initiation phase the answers are very similar to the answers of business developers. The benefits that can be summed up as "information" and "understanding" are the same as the benefits business developers see in this method. In addition, the benefit of "clarification" can be discovered. The interviewees think that with the planning of different scenarios in the phase of project initiation the scope of the project can be clarified.

The interviewed project managers think that scenario planning can have a major benefit for the risk management. By the consideration of multiple aspects, that are necessary for the planning of the scenarios, the process of risk identification is seen to be supported. Next to the identification of risk it is also seen that the planned scenarios can have a positive impact to the planning of risk response strategies, since different possible solutions might be already in the different scenarios.

The planned scenarios might also be beneficial for the milestone planning. The interviewees think that the planned scenarios might be a foundation for better decisions at milestones.

Disadvantages

One of the disadvantages that is seen in the scenarios is that different stakeholders might prefer different scenarios. It is mentioned that the objectives might not be clear and hence different stakeholders will push in different directions. The fear is that the different scenarios and hence possible futures will lead to more changes within the process. The changes will trigger an additional effort in re-planning the overall project within the execution phase.

Considerations

One of the fears of the interviewed project managers is that the objectives get blurred. In their point of view it must be considered that the stakeholders and customers of the project expect a clear definition of the deliverables at the beginning of the project. Different scenarios can make this complicated and hence a good commitment between the project, the project owner and the customer must be found.

The scenarios must also be considered in the measurement of success and performance. It is mentioned that it might be hard to measure success if different outputs are possible.

Reflection

Scenario planning seems to be interesting for some parts of the project management process. Within the initiation phase it is thought that the scenarios can generate more information and a better, shared understanding of the topic. Within the process of planning, scenarios can be useful for single areas of the planning process. Especially the areas of risk management and milestone planning are mentioned by the interviewed project managers. The advantages are seen in the consideration of multiple aspects for the risk management and that this can also be a foundation for milestones and decisions on that milestones. Disadvantages are mainly seen in the blurring of objectives. This can lead to additional changes and problems in the measurement of the performance and success of the project.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

CONCLUSION

This chapter studied the similarities and differences between the disciplines of business development and project management. The rationale of this comparison is the realization that these disciplines have strong similarities. Both are temporary, follow a structured process and are aimed at creating something new. However, despite these similarities, business development and project management are considered as different disciplines in both research and practice.

In our comparison, we described both disciplines along the dimensions of 'process', 'planning methods', 'risk and uncertainty' and 'success'. The comparison showed that in both disciplines, the dimension of uncertainty is an inseparable element. Interestingly enough, the disciplines differ in the way they handle uncertainty and the related risk/opportunity. This difference in the handing of uncertainty influenced all of the four described dimensions:

- The process,
- The planning,
- The risk and uncertainty management, and
- The success measurement.

In project management literature uncertainty is often perceived as risk and hence as threat that should be avoided. In business development, uncertainty is considered an opportunity. It can be concluded that the perception and the handling of uncertainty is more developed in business development than in project management. The methods to handle uncertainty in project management are oriented towards finding the most probably scenario of the uncertainty, whereas business development handles uncertainty with methods, such as scenario analysis, that cover different possible outcomes of the uncertainty.

The project management of Scrum uses some elements of business development but overall it can be seen that only using Scrum is not sufficient enough to manage uncertainty in projects.

Based on our findings, we explored the potential use of the technique of Scenario Planning, as a technique that is used to handle uncertainty in business development, in project management. The respondents in our interviews indicated that they saw potential in the used of this technique in project management. More specifically, in the initiation phase the benefits of scenarios are seen in the creation of a shared understanding of the topic as well as the provision and consideration of different information. In the planning phase this information and hence the knowledge about different possible futures can be useful in the area of risk management and milestone planning. The advantages that are seen are similar to the advantages business developers see in this method.

As a potential disadvantage, the interviewed project managers mentioned that scenario planning might hinder the traditional measurement criteria for project and project management success. Hence, if the techniques are used, this must be considered within the measurement process.

FUTURE RESEARCH DIRECTIONS

As our study was largely of a conceptual and interpretive nature, a recommended direction for further research would be the empirical testing of the use of scenario planning in project management. For example, in the area of scheduling. A suitable research strategy for this would be a (longitudinal) case study.

Chapter 64
Building Sustainable Enterprises through Innovations in Bulgaria

Julia Dobreva
University for Finance, Business, and Entrepreneurship (VUZF University), Bulgaria

ABSTRACT

This chapter aims to focus on the role of innovations for achieving sustainable development of Bulgarian enterprises. Following an analysis of the Bulgarian economy, the chapter explores a model for transforming businesses towards sustainability through innovations in production processes. The socioeconomic and environmental implications are considered in terms of defining the major outcomes of implementing sustainable business practices in Bulgaria. A comparison is made with the sustainable development levels in some EU countries to serve as a basis for identifying and further elaborating the main political and economic targets for Bulgaria.

INTRODUCTION

The countries from the former Eastern block have gone through a number of drawbacks in terms of their economic and industrial development as a result of the long period of transition. This has led to an abundance of underutilized resources and a deterioration of the production technology. The severe economic downfall has also significantly contributed to the fragmentation and polarization of the party system, which in turn undermines the capacity to manage the economy effectively (Haggard, 1995). Many firms in emerging economies have become trapped in dependent relationships as low-cost providers of technology, low-value manufactured goods or services, and have failed to develop their own design of new products (Bessant & Tidd, 2009).

The Bulgarian economy, in particular, went through all stages of the transition period – high inflation, drastically decreasing GDP, unemployment and income inequality, industrial stagnation, political instability and corruption. The accession of the country to the European Union in the beginning of 2007 and the following years that coincided with the financial crisis have also contributed to the transformations in the profile of the Bulgarian economy. Therefore, the analysis on the transition period of the

country is of crucial importance in forecasting future trends of its economic development and drawing up scenarios for sustainable policy implementation, based on the increase in innovations.

Most commonly, in an economic downturn the response of the industrial enterprises is to make employees redundant, to sell out assets and to dispose of adjoining business operations in order to bridge the gap of financial resources. This, respectively, results in a significant reduction of valuable resources, alienation of key customers and loss of competitive markets. A number of macroeconomic studies in the late 90s have analyzed the determinants of growth in transition economies (Havrylyshyn, Izvorski, & Rooden,1998; Fischer, Sahay, & Vegh, 1996; Svejnar, 2002; Abed & Davoodi, 2000). Among their key findings is that structural reforms and reduction of government expenditures are required in all sectors of the economy and albeit the initial effect of reforms on output may be negative, over time the best growth performances are in those countries which make their greatest progress when implementing reforms. Also, growth performance in general is better in those economies where stabilization has been achieved earliest and where structural reforms have progressed most (Havrylyshyn et al., 1998).

It was generally believed that the transition would start with a recession, caused both by restrictive macroeconomic policies and by restructuring of the economy as a result of the shift to a market economy (Fischer et al., 1996). All countries experienced almost similar initial setbacks in their economic growth. Hence, they also carried out similar reforms in terms of macroeconomic stabilization, price liberalization, small-scale privatization and the break-up of state enterprises. Countries that developed a functioning legal framework and corporate governance have performed better than others (Svejnar, 2002).

The privatization process of state industrial enterprises was of paramount importance but it was performed in a disorderly manner and at a rather slow pace. The first laws on privatization were adopted in 1991-1992 but only for the small-scale enterprises, whereas the privatization of the heavy industry commenced in 1994-1996 and in some countries in 1997-1998. The mass privatization, carried out by privatization funds, ended up in the formation of corporate holdings. In Bulgaria, the majority of these state enterprises were bought by the new holding structures at a price which was below the market price of the assets. Due to the loss of markets, outdated technology, vague competition and poor management, the privatized industrial enterprises gradually became insolvent and were declared bankrupt in the late 90s.

In general, all of these factors contributed to the severe negative transformations in the structure of the GDP. In the 90s, in 2/3 of the CEE (Central and Eastern European) countries the industrial share in the GDP was drastically reduced and the agrarian sector aquired a growing proportion. This tendency continues nowadays and characterises the economies with sectoral imbalances along with output produced in the shadow economy, which slow down the R&D process and the introduction of industrial innovation in the 21 century.

This paper identifies the need for innovative mechanisms in transition economies as a measure against the post effects of an unstable political system and the recent financial crisis. It aims to highlight the role of innovations for achieving sustainable development in Bulgaria, particularly in the undertakings of small and medium enterprises.

The first part of the analysis provides an overview of the Bulgarian economy over the last 20 years - the dropdown of industrial production, the difficulties in setting up and managing SMEs, and the general decline in the country's economic activity. Furthermore, the paper explores the development impacts which will be achieved through the introduction of innovations. A comparison is made with some sustainable innovation levels in EU countries to identify and further elaborate the main political and economic targets for Bulgaria in the short and the long term. The last part of the paper summarizes the main findings and concludes.

THE BULGARIAN ECONOMIC TRANSITION

Since the start of market reforms in 1989-1990, the socio-economic transformations in Bulgaria have passed through several stages, thus accelerating the social polarization in the country. Economic modernization was severely hindered as a result of a number of deficiencies in economic policy making, significant industrial decline, collapsing infrastructure and the loss of human capital after a sequence of emigration waves. Bulgarian early transition is marked by scarce progress in social reforms, caused by a variety of economic, social and also psychological burdens, inherited from the 50 years of centrally-planned economy. Hence, the core of policy making for the last 20 years has been to respond to the public expectations for building successful mechanisms to implement anti-poverty measures.

Since July 1997 Bulgaria has adopted a currency board arrangement, thus facilitating the macroeconomic stabilization and the gradual economic growth in the years prior to the country's EU accession in January 2007. According to the data from the Bulgarian National Statistical Institute, real GDP growth rates varied between 4.1% and 6.6% in the period 2001-2008 and at the same time the nominal GDP per capita has increased from 1919 EUR in 2001 to 4 475 EUR in 2008. According to initial data, during the first quarter of 2013 the GDP is 8,2 MEUR while per capita GDP is 1 100 EUR. Meanwhile, the official average income level in Bulgaria is still the lowest among the new EU member states.

As observed by Mintchev, Boshnakov and Naydenov (2011), during the last 20 years Bulgaria was affected by various adverse economic and demographic processes, which were particularly severe during the first half of the 1990s. The Bulgarian population decreased by about 13% during the first 15 years of transition (1989-2004) – or 1.2 million in absolute figures – of which 500 000 were due to natural disease and 700 000 due to emigration. Additionally, the increased migration from underdeveloped regions to more developed ones intensified the existing regional disparities.

Innovation in the Bulgarian Post-Transition Environment

According to a recent World Bank report (Report number 66263-BG, 2012) Bulgaria's transition was characterized by considerable macroeconomic turbulence and structural transformation, during which export-oriented industries generally declined. The country's competitiveness has improved in the last years but not strongly enough to catch up with its EU peers. While in 1990 the industry comprised 50% of GDP and 43% of employment, in 2001 it fell down to 18% GDP and 23% of employment. It is precisely innovation that could help industries in which Bulgaria has a comparative advantage to move up the value chain and expand the high-tech export base of the country. The Bulgarian government has committed to meeting a target of R&D/GDP of 1.5% by 2020, which is three times the current level. A large share of the new investments is expected to come from industrial enterprises. However, the report points out that while greater R&D levels are important, it is also important to upgrade relevant institutions, policies and legislation. These would ultimately provide the necessary strategic support to research and innovation and thus respond to the urgent need to reverse the erosion of Bulgaria's technical and scientific competences.

In order to meet the targeted R&D/GDP level of 1.5% by 2020 there should be a substantial increase in R&D investments to exceed the current level of 0.48% (compared to 1.85% in the EU-27). Due to the economic downturn and its impact on the capacity of the state budget, there have been 2 consecutive years of real decline in public spending on R&D (2011-2012). The propensity to export is higher for innovating firms with foreign ownership and, according to the World Bank data, in 2008 only 28% of

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Bulgarian companies invested in R&D. Meanwhile, annual sales for innovating firms grew 26% per year in the pre-crisis period (2005-2007).

Another World Bank report (Report number 62774-BG, 2012) elaborates further by pointing out that Bulgaria's per capita income at PPS is only about 44% of the EU-27 average. Given the country's unfavorable demographic situation, higher productivity is critical for sustainable growth and only significant improvements in production competitiveness would allow a shift to export-led growth, making the economy more resilient to external shocks.

Recent data shows that Bulgaria's economy has performed relatively well during the crisis and it is gradually reviving. During the period 2000-2010 output expanded by close to 50% (4.7% per year). In 2009 the GDP declined by 5.3% and remained flat in 2010 (World Bank, Report number 63457-BG, 2011). Thus, in 2010 the country lost 3 years of economic growth and household consumption fell by 7.5% in 2009 and 1.3% in 2010.

SUSTAINABILITY BENCHMARKS FOR SMEs

The role of SMEs in contributing to sustainability could be discussed in five major aspects: innovation development, social contribution, environmental contribution, good management and leadership practices, contribution to local networking incentives and NGOs (Figure 1).

SMEs are the most appropriate environment for *generation of innovation and development of innovative mechanisms.* They are easily adaptable to macroeconomic fluctuations and most ready to respond to the needs to invest in improvements of processes and products (incremental improvement) or developing products/services which are entirely new (radical innovation). In most cases, innovation in SMEs is an imitation of existing practices through the process of learning by using or learning by doing (Favaretto, 1989). The indicators which are most often used to monitor the level of innovation in SMEs are R&D expenditure, personnel employed in R&D and number of patents.

The next aspect is *social contribution* of small and medium businesses. Social entrepreneurship is particularly promising in SME environment, when social problems are to be adequately solved – e.g. alleviating poverty, providing employment opportunities, integrating people with disabilities, etc. Hence, SMEs have high levels of social contribution as they are easily adaptable to changing economic and social environment.

Equally important is the contribution of SMEs in solving problems of *environmental concern*. Small and medium sized organizations (SMEs) individually have, by definition, very limited operations, and therefore would not have the potential to impact the environment, to the same degree, as very large businesses (Gadenne, Kennedy, & Mckeiver, 2009). Yet, it is primarily in the limited scope of their performance that we can expect to identify motivating factors for environmental contribution of such companies. They are largely driven by the high competition among SMEs occupying the same market position as well as the close relationship established both with customers and suppliers, which provides for tight environmental requirements being set out by both parties.

Good management and leadership practices are of paramount importance when developing sustainable SMEs. They are particularly manifested in environmental management and pollution control (Perez-Sanchez, Barton, & Bower, 2003), as well as in managing activities with significant social impact. Hence, SMEs are the proper environment for implementing CSR practices with local as well as national impact.

Figure 1. Contribution of SMEs to sustainability
Author's model.

Local networking incentives and NGOs work in close cooperation with SMEs, acting as intermediaries between the government and the business as well as between local communities and small companies. NGOs and SMEs might work together in developing sustainable local markets and this cooperation is expected to be organized on several levels of networking aggregation, although they might have different

Figure 2. Three key players for innovation development
Author's model.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

perspectives on sustainability. While NGOs' main aim is to promote development, SMEs' main aim is to produce products or deliver services at the market (Castro, 2013).

We could also distinguish three key players in the process of innovation development – national policy makers, entrepreneurs and the companies' own capacities in terms of technology and financial resource.

Modeling Business Change towards Sustainability

In his study Doppelt (2010) introduced the "wheel of change toward sustainability", which consists of seven solutions to business operations and the blunders they address (see Table 1). Although change is not linear, the interventions of this model form a natural progression. Each action provides a fundamental building block for the next. Change results from cumulatively progressing through the three overall change modules embedded in the process as well as from the sequential completion of each separate intervention.

The first three solutions—change the dominant mind-set, organize deep and wide teams, and adopt sustainability visions and principles—combine to create a new organizational mental model and organizing framework. The fourth and fifth solutions—develop operational and governance change strategies and communicate with them—establish the means to design and test new ways of thinking and operating. The last two steps—foster learning and embed sustainability in standard operating procedures provide the means to make sustainability grow and stick over the long term.

Doppelt (2010) claimed that in order for each change module to provide a foundation for the next, each of the individual interventions must be satisfactorily completed, e.g.:

1. Only after a sufficiently compelling case for change has been established will the right people willing to participate in the development of sustainability plans;
2. Only after powerful transition teams are organized can an inspiring new purpose and vision for the organization be adopted;

Table 1. Seven sustainability blunders and solutions

Blunders	Solution
Patriarchal thinking that leads to a false sense of security	Change the dominant mind-set that created the system through the imperative of achieving sustainability
"Siloed" approach to environmental and socioeconomic issues	Rearrange the parts of the system by organizing deep, wide, and powerful transition teams
No clear vision of sustainability	Alter the goals of the system by crafting an ideal vision and guiding principles of sustainability
Confusion over cause and effect	Restructure the rules of engagement of the system by adopting source-based operational and governance-change strategies
Lack of information	Shift the information flows of the system by tirelessly communicating the need, vision and strategies for achieving sustainability
Insufficient mechanisms for learning	Correct the feedback loops of the system by encouraging and rewarding learning and innovation
Failure to institutionalize sustainability	Adjust the parameters of the system by aligning systems, structures, policies, and procedures with sustainability

Source: Doppelt (2010, p. 106).

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

3. Only after people become clear about what they are striving to achieve and how this differs from their previous purpose can effective sustainability strategies be developed.

Also, because the process of change is circular, organizations can start anywhere on the wheel. No matter where change begins, eventually all of the seven interventions of the change process must be sufficiently completed, otherwise the effort will fail. The lack of clarity about the future sustainability image of the organization might be a cause for confusion and terminate temporarily the process of change. On the other hand, the adoption of operational and governance-change strategies and/or the production of some highly visible success may help people gain clarity about what they are striving to achieve. Yet, if effective leadership does not exist or a business as usual mentality has not been sufficiently undermined, it is highly unlikely that a sufficient number of skilled, credible, and politically powerful people can be engaged in the change effort. It is impossible to develop a shared understanding of a new vision or purpose without broad-based involvement. Therefore, timing and good leadership are the most important elements in any process of becoming more sustainable.

However, improving sustainability performance involves more than implementing solutions (Deloitte, 2015). It also involves revising business practices, instituting governance programs, and managing change. Deloitte and Oracle, for example, align people and processes and enable them with technology. Some of the green areas in which they assist companies in their efforts to reduce waste and improve productivity include:

1. **Sustainability Reporting:**
    a. Leverage enterprise systems to reduce the lead time necessary to generate sustainability reports;
    b. Track and analyze environmental metrics internally trough business intelligence applications;
    c. Implement a governance, risk and compliance framework for managing and tracking environmental sustainability processes and initiatives.
2. **Green Data Center Practices:**
    a. Virtualize and consolidate servers, which can be facilitated via technologies to reduce energy costs and decrease system maintenance;
    b. Leverage the advanced storage management capabilities available in some enterprise systems to reduce storage requirements and decrease energy use;
    c. Consolidate applications using a global, single instance model to save money on energy and hardware;
    d. Better manage workloads, using technologies to allocate spare server capacity and deploy additional processing power to production systems.
3. **Environmental Compliance and Supply Chain Optimization:**
    a. Manage products' environmental compliance;
    b. Optimize supply networks;
    c. Reduce manufacturing costs and environmental impacts via lean manufacturing principles;
    d. Shrink transportation and energy costs;
    e. Increase efficiencies in reverse-logistics;
    f. Decrease paper waste using customer self-service, customer e-billing, and contact center solutions.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

THE SUSTAINABILITY MATURITY CUBE

Muller and Pfleger (2014) provided exemplary ideas on how to improve working conditions in production processes (social perspective) or optimization of delivery routes (ecological perspective). They complement these two perspectives (first: corporate activities; second: dimensions of sustainability) by additionally introducing a way to capture the progress of sustainability actions, adapting the basic idea of stages of development and maturity to sustainability context. The analysis results with the design of Sustainability Maturity Cube, which serves as a blueprint of how an organization can structure the field of action for the transformation toward sustainability. This model serves as a basis for the installation of concrete sustainability maturity models and for deriving corporate actions. Furthermore, the model opposes the costs and benefits of sustainability actions in order to determine how these should be implemented, considering their economic effect. Hence, the assumptions behind this Sustainability Maturity Cube are that the economic dimension needs to be treated with a special focus—on the one hand, it is one of the three main pillars of sustainability, on the other hand, as companies need to follow economic principles to preserve their competitive advantage and gain long-term business success, it emerges as an additional organizational incentive when engaging in sustainability transformations and therefore should be differentiated from the other two dimensions.

In their study, Muller and Pfleger (2014) claimed that depending on the progress and strength of the transformation toward sustainability in the respective company, different stages of development within each sustainability dimension and corporate activity, and hence within each starting point, can be reached. A company that has already implemented sustainable actions at some stages could have achieved a certain level of maturity in some of the identified corporate activities and thus can improve its actual situation by further transformation.

The perspectives, namely the corporate activities, the dimensions of sustainability, and the respective sustainability maturity levels form a cube that structures the possible field of action regarding transformations toward sustainability. One field of the cube represents the description of a certain sustainability maturity level in one of the three dimensions of sustainability for one identified corporate activity. Thus, the Sustainability Maturity Cube can be used as a blueprint which is based on acknowledged scientific concepts to support the systematic improvement of sustainability management by considering certain corporate activities, the three dimensions of sustainability and the corresponding stages of development. Of the three perspectives of the cube, only the operationalization of the dimensions of sustainability is fixed.

The focus of the model is that implementing actions to improve sustainability (and thus the sustainability maturity level) requires investments. These payments may differ from starting point to starting point and may not be necessarily completed in one period. Therefore, the net present value of the investment will be applied. Whereas small improvements of the sustainability maturity level can be implemented relatively straightforward, greater improvements are expected to require a more complex approach, resulting in higher cash outflows.

Current Status of Bulgarian SMEs

There is a growing tendency of a socio-economic division between the northern and southern part of Bulgaria. According to the most recent data provided by the National Statistical Institute, the regions in the northern part of the country keep high unemployment levels, low income, and decreasing population (Bulgarian National Statistical Institute, 2015). The capital Sofia keeps the first place as the most

Source: SBA, 2013.

developed region in terms of social and economic development. With the phasing out of the economic crisis, the last three years have shown a slow but steady economic revival of certain regions – mainly the central and southern regions. Yet the spiral high unemployment – low income – decreasing population keeps investment activity far below the pre-crisis levels.

There is a negative tendency in the infrastructural development, especially with regard to the declining levels of road maintenance which is only 39% as of the end of 2014. Negative tendencies have been also identified in education and healthcare – the percentage of health insurances has decreased to 86% and the attendance level in primary education has also decreased to 79%. The only strong economic region in northern Bulgaria is Varna, yet it is situated too far from the other economically underdeveloped regions and thus they cannot benefit from its economic influence. In addition, the last three years have been marked by worsening local governance and high corruption levels, which has been a major drawback for the city to develop its main potential in tourism and harbor infrastructure. The rest of the regions are marked by low entrepreneurial activity, which significantly reduces the production volumes, increases the unemployment levels to 12% (6% being the average for the country) and consequently decreases the income levels.

In this socio-economic environment, it is highly predictable that the economic performance of SMEs would be low. According to the statistical data, in 2011 the average profitability of the top 100 firms was 43%, declining to 40% in 2012 and 33% in 2013. In terms of regionalization, 43 out of the top 100 SMEs are based in the capital – Sofia. The sector which is mostly represented in agriculture with 19 companies, followed by construction works which totals 14 companies and machinery and equipment with 10 companies.

Statistical trends since 2003 provide clear evidence of dynamic development of the Bulgarian SME sector in recent years. The growth in the number of Bulgarian enterprises was only temporarily slowed down during the crisis in 2007 and 2008. However, growth levels picked up again relatively quickly, driven by small and medium sized enterprises.

The data in Table 2 demonstrates that the contribution of SMEs in creating value added and especially in providing jobs exceeds the EU average, moreover, the share of SMEs compared to Large Enterprises (LEs) in value added and employment in almost all sectors is higher than the EU average. However, this has resulted in labour productivity far below the EU average due to the lower capacity to benefit from economies of scale in low-value sectors. The Bulgarian economy went through a decline in value added

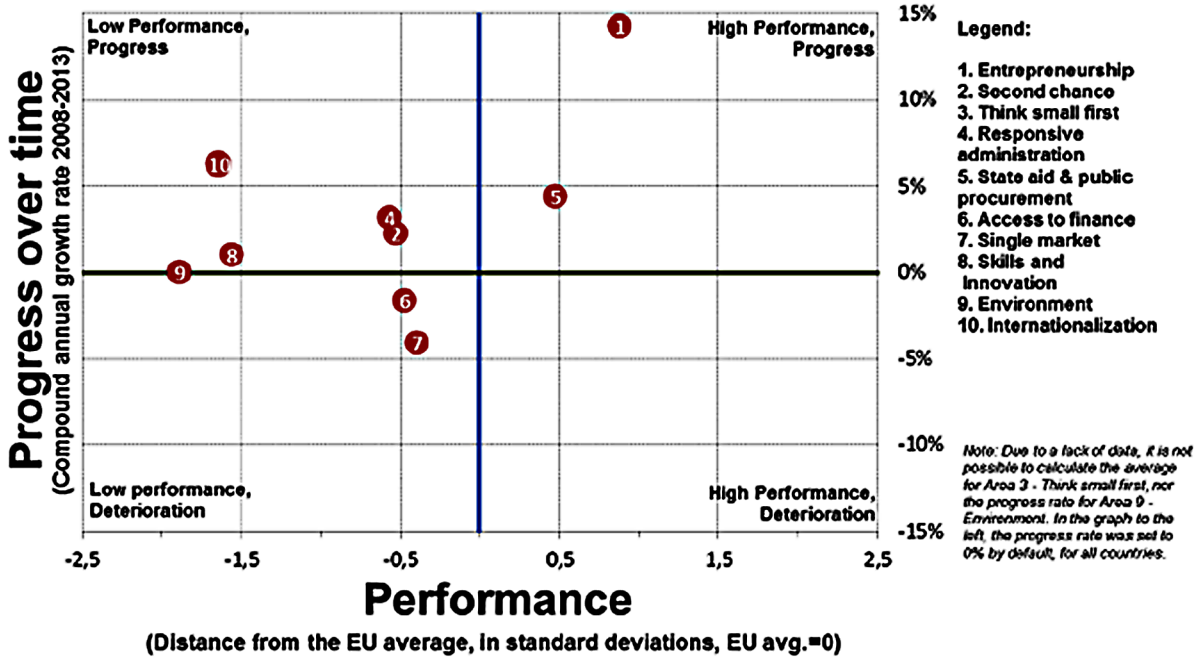
These are estimates for 2012 produced by London Economics, based on 2008-10 figures from the Structural Business Statistics Database (Eurostat). The data cover the 'business economy', which includes industry, construction, trade, and services (NACE Rev. 2 sections B to J, L, M and N), but not enterprises in agriculture, forestry and fisheries and the largely non-market service sectors such as education and health. The advantage of using Eurostat data is that the statistics are harmonised and comparable across countries. The disadvantage is that for some countries the data may be different from those published by national authorities.

and employment in the period 2008 – 2012, when both SMEs and LEs were affected. The decline in value added for the SMEs was by 4% without a corresponding fall in employment - the SMEs are much more reluctant than LEs to fire their workforce, as they have difficulties in attracting skilled employees once they re-hire.



Another specificity of the Bulgarian SME sector is its concentration in the wholesale and retail trade sector, where almost 50% of the Bulgarian SMEs are active, and the low innovation activities of Bulgarian SMEs, which tend to specialize in bringing to market less expensive and better quality products from abroad. Foreign direct investment is concentrated in the construction and real estate sectors and it has declined ten-fold since 2008 as a result of high speculative movements before the crises, which significantly exceeded stable growth levels and did not correspond to actual demand. In 2011 about 37 000 SMEs closed down and more than 36 000 were created due to the financial shortcomings of the Bulgarian SME sector – companies face a lack of access to finance while at the same time there is a high level of inter-company indebtedness and late payments for work that has been delivered.

Bulgaria's performance in the area of entrepreneurship is above the EU average although the self-employment rate falls behind the EU average (11% compared to EU 15%), which is an evidence for unused potential, considering that the share of adults that have taken steps to start their own business is 36% (EU: 23%). Overall, the proportion of entrepreneurs who started their own business to exploit an opportunity – 42% compared to EU 49% - suggests that the majority of Bulgarian entrepreneurs go into business for lack of alternatives.

Access to finance for start-ups and SMEs is severely limited in view of weak credit growth due to the need for balance sheet adjustments and the on-going upward trend in non-performing loans. Some timely policy initiatives co-financed by the Structural Funds were launched to tackle some of the weaknesses highlighted. A new funding scheme was adopted in 2012, called the "acceleration and Seed Fund", to support SMEs in their seed and start up phases. According to most recent data in 2010 only 13% of Bulgarian SMEs are innovating in-house (compared to 17% in 2008), which is a direct consequence of the low rate of introduction of new products, processes, marketing or organizational innovations.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Figure 4. Bulgaria's distance from EU average in terms of environmental performance
Source: SBA, 2013.

Bulgaria is clearly behind the EU average in terms of environmental performance as only a quarter of Bulgarian SMEs introduced environmentally friendly innovations or received public support for their resource efficiency measures.

Many sectors which constitute the backbone of Bulgaria's economy – such as real estate, construction, and financial services – were negatively impacted by the financial crisis in 2008, resulting in 10%-12% reduction of employment level or 350 000 people lost their jobs (Economic Policy Institute, 2011). However, it is precisely the SMEs that considered the recession as an opportunity to embark on new entrepreneurial ventures. In 2009 there were 315 850 SMEs which made up 99.8% of all Bulgarian enterprises and 90,3% of the SMEs were micro enterprises. In general SMEs provide 76% of the jobs in Bulgaria, while large enterprises account for 24%. During the peak of the crisis in 2008-2009 the SMEs were the source of employment, keeping 5 people on average as personnel. Approximately 56% of all SMEs dealt proactively with the crisis by cutting down costs, while 44% adopted a rather passive attitude.

In the beginning of 2011 over 90% of all SMEs had difficulties in accessing finance, the worst affected being the micro enterprises as well as the service firms, while financing is provided by the company owners themselves. In 80% of the SMEs innovation activity is weak, only 10% of all SMEs have substantial resources to finance innovation and the most innovative are the manufacturing companies. There are three prerequisites for innovation to be implemented in SMEs: new equipment, skilled and qualified workers, good financial status. In general, innovation in Bulgaria is hindered by the lack of appropriate funding, the high number of population with low income and low qualifications as well as the lack of a national innovation system, which would enable some firms to transfer and apply innovations.

Case Studies of Innovation SME Leaders

The analyzed tendencies can be further supported by examples of recent processes which are observed in a number of innovative SME leaders, operating on the Bulgarian market (Dobreva & Koleva, 2015, pp. 300-306).

Every year a publishing company issues a ranking of the most dynamic small and medium enterprises in Bulgaria. The ranking for 2014 includes 1 578 small and medium enterprises. The region of Sofia is evidently a leader in this business segment. However, the overconcentration of SMEs in the capital has a negative impact on the national economy due to the imbalances in the regional development and the decreasing economic activity in the other big economic centers – the regions of Plovdiv, Varna and Burgas.

In order to fulfill the ranking criteria, a company should comply with the following requirements:

- Employ full-time between 10 and 249 employees.
- Demonstrate an increase in operating income for two consecutive years.
- Comply with all regulative requirements for small and medium-sized enterprises (not micro).
- Achieve an annual financial result between 3.9 million BGN and 97.5 million BGN income and / or assets between 3.9 million BGN and 84 million BGN.

The companies should be 100% privately owned and should have been registered before 2009.

Innovation is one of the most important components of the dynamic development of small and medium businesses, but to implement new ideas in operation, there must be close cooperation between companies, government, education and consumers. According to experts, SMEs have both potential and interest to develop innovations. The Foundation for Applied Research and Communications, which prepared the annual report "Innovation" recall that the growth of funding for research and development is higher than the growth of gross domestic product.

1. O.M.S Saleri

The company is №1 in the national ranking, part of the Italian company "O.M.S. Saleri", situated in Vratsa. Italy is one of the largest partners of the Bulgarian economy and is among the countries that have highest contribution to the growth of foreign investments in Bulgaria. According to the Bulgarian National direct investments of Italian companies in the country amount to 1.74 billion euro for the period from 1996 until the end of 2012, which gives them 11th position among foreign investors. In essence, Italy takes the leading position, if countries like the Netherlands and Luxembourg are excluded due to the setting up of many daughter companies, registered to benefit from the low tax rates (e.g. "Lukoil Bulgaria" is officially a Dutch investment).

The majority of the Italian investments are in the food industry, as well as in textile, clothing and footwear. After operating on the clothing market with Italian luxury clothing, "O.M.S. Saleri" decided to diversify its business by starting operations in a completely different industry - production of ball valves. The premises of the plant are designed to take up further expansion of the business since the beginning of the production is not large, but it is growing rapidly and this is reflected in the large revenue growth for 2014. The production of the Vratsa company is shipped to Italy, where the parent company approves and circulates spherical cranes worldwide. They are widely used in industry, including construction of oil and gas pipelines.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

Until the beginning of 2015, the investments in the factory were over 4 million euro, with plans to reach 15 million euro in the following years. In the spring of 2015, the company has employed nearly 30 people, with the intention to reach 120-130 people as a result of the production expansion. In the process of hiring new staff "O.M.S. Saleri" complained that they often have difficulty finding employees, although wages, social benefits and full insurance are well above the standard of living in the area.

2. Reichle & De-Massari

The Swiss company R & M (Reichle & De-Massari) opened a factory in Sofia two years ago and continues to expand its operations within the country. It is the most dynamically developing company in the machinery and equipment sector. The investor is a family company from Wetzikon town in the canton of Zurich. It manufactures passive components, copper and fiber optic cables for all types of communication networks. Currently R & M is among the 500 largest groups in Switzerland, with annual revenues of 197 million CHF francs (163 million euros) and over 800 employees in over 30 countries - 190 of these employees are in Bulgaria. The operating revenue and the number of employees increase by 20% per year. The Group has manufacturing plants in Switzerland, Poland, India and Dubai.

The Swiss company has a commercial branch in Bulgaria - "R & M Bulgaria", which covers the entire region and is responsible for Bulgaria, Greece, Turkey, Serbia, Macedonia and Cyprus. Since the beginning of 2011 the company also operates on markets in Albania, Bosnia and Herzegovina, Croatia, Kosovo, Montenegro, Romania and Slovenia. In 2011 the headquarters began to explore options to export part of their production from Switzerland because the strong franc made their production uncompetitive on the European market. The choice was narrowed down to Bulgaria and Poland where the group has already set up production premises.

In early 2012 the project began and was completed in nine months. The total planned investment of 9.7 million BGN did not include the amount of nearly 8 million BGN for the purchase of the building in the district of Sofia. The project was developed by installing epoxy coatings, antiseptic paint, new ventilation, air conditioning and electrical installations. The Swiss company bought entirely new equipment. As a result, the plant with its total size of 10 000 sq.m. is an exact copy of the one in Switzerland with the same number and type of jobs and workflow. The new production unit "Reichle & De-Massari" received a certificate for an A class investment. The company produces fiber optic components and platforms. After two years of operation the production staff now is 135 people. A small development center is also based in Sofia, which deals with the design of products for different platforms. Company employees undergo additional trainings in Switzerland and in Bulgaria.

"Reichle & De-Massari" Bulgarian production continues with the business expansion and in 2014 it made another investment of a total of 2 million BGN. As a result, the staff is expected to grow by another 50 people. The plan is for the entire line of fiber optic components to be produced in Bulgaria. In 2013 (which was the first full year of production) the company's turnover increased by over 400%, amounting to 15 million BGN, the forecasts are that the financial result in 2014 will be even higher.

The Swiss company invests in support of the Bulgarian education. A few years ago the company opened a teaching laboratory for cable systems at the Technical University - Sofia, and in 2013 donated funds to equip the laboratory at the Technical University - Varna.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

3. Aosia

There is hardly any other sector in Bulgaria, which is developing more dynamically than the IT sector. Due to the huge demand globally and locally, and thanks to the relatively weak government regulation in this sector, it has become the exception in the background of the overall poor economic picture in the country. To be truly successful in Bulgaria, the technology companies cannot rely solely on the momentum. The competition is overwhelming and any short-term delay could return the company years back in its development. What is needed is a long-term strategy, ingenuity and especially innovations. This is the case of "Aosia" LTD. The company passes through the crisis without much turbulence. Its financial statements show that despite the shrinking market, until now it has been financially stable and has not generated a loss. Moreover, by 2009 each year the company increased revenue and profit to reach a record in 2013 when "Aosia" registered 400% growth in profit, and profitability rose by more than 17 times.

"Aosia" was established in 2006 and in 2007 entered in the news once managed to build from scratch the entire communication infrastructure of four large metallurgical plants and two mines in the Rhodope Mountains. Only 10 months were needed to connect all the companies of "Intertrust Holding" JSC. The entire infrastructure was built - "the cloud" virtualization, IP telephony, the mines were wired and related to the entire network of the holding.

Having dealt with "Intertrust", the creator of "Aosia" formed a team and started to develop a new type of cloud technology - virtual based desktops. Since 2010 the company has specialized in this particular technology and offers services in the field of Mobile office as a service. By combining different software the office can be anywhere, without space and resource constraints. The virtual office is accessible from any device - PC, smartphone or tablet. The platform allows customers to have permanent access to the computer in their office - files or emails, to all software installed on the remote machine.

Thanks to the already established platform the company has managed to make telemedicine a reality in the country. So far, remote diagnostics are possible in Sofia "City Clinic", but the owner believes that after 5 years this technology will be available to the mass market. This is a platform that collects data but also binds the physician with the patient. Telemedicine is defined as the future of medicine worldwide as the number of well-qualified doctors is constantly decreasing. Also, due to the constant emigration of medical specialist, in some Bulgarian regions patients have to travel thousands of miles to get a diagnosis and proper healthcare.

The specialists of "Aosia" not only develop and build IT solutions. They start the process of consultation with customers and end with their training to work with the platform. A main problem of cloud technologies is precisely security. If the security in a cloud solution collapses, this affects all clients in the cloud. To guarantee that security to the customers, Aosia fulfills the most stringent regulatory requirements. Another success factor is the constant pursuit of the company to move forward and to invest in the best technologies, to improve them, test them and then offer them to customers.

The company's increase in its market share almost logically leads to an increase in the number of employees. As with the entire IT sector and in "Aosia" the main problem is the lack of ready-made specialists.

4. Bulpros

In recent years one of the biggest myths is that outsourcing ends with the establishment of call centers. This was the main criticism of a number of large technology companies like Hewlett-Packard and IBM,

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

which started to establish similar activities for outsourcing services in Bulgaria. But these centers for customer service began to create clusters of Bulgarian companies to try to develop in the outsourcing industry. Such is the case of "Bulpros". The company was founded in 2010, initially focusing mainly on providing outsourcing services, but now has expanded its portfolio to activities that have a much higher added value than traditional call centers.

Before starting to work on the creation of "Bulpros" the owner has worked 18 years in Germany, then returned to Bulgaria and helped building the HP outsourcing center in the country. He claims that his experience in Germany has shown one major disadvantage when doing business. It is the lack of good partners to assist in the implementation of major projects with defined resources and skills to meet the requirements for price and quality in order to make their customers more competitive. "Bulpros" was created exactly for this purpose - to fill the gap in the implementation of major projects of large corporations.

"Bulpros" currently provides services to companies that provide services in the field of IT technologies. In other words, it assists giants like Siemens, UniSystems, Cisco, VMware and others to better provide their products to their customers. The Bulgarian company helps them in software development, the establishment of Internet-based and mobile solutions, services in IT infrastructure and cloud solutions. Only part of its business is related to outsourcing, it is mostly associated with outsourcing of data processing and work on segments of a software project.

Outsourcing is the perfect tool for starting a business, to accumulate stability, security and scale. Subsequently, the company began to develop its own products and services. According to the CEO what distinguishes the company from other outsourcing companies is that it not only deals with external activities but also looks for long-term partnerships and customers. This can generate growth not by amount but by quality and by seeking added value.

The results of good planning helped the company to report double revenue growth in the year 2013. Its revenues increased by 134% in 2013 over the previous two years when the company reported similar, over 100 percent results. Expectations are high growth rate to be maintained in 2014 and 2015 as well.

Like many start-ups "Bulpros" started with five or six people, but at the end of 2013 its staff was 141 people, and currently it has grown to over 300 people.

The company relies entirely on large international corporations. According to the CEO the Bulpros's customers are mainly from Germany, UK and Western Europe. Since 2013 the company prepared an active penetration on the US market. To be able to liaise with customers the company has established offices in the US and in Germany. The Bulpros management network of contacts has helped the company find long-term partners. It is already working with some of the largest companies in the country.

One of the main challenges the company faces is the management of growth, given the rate at which it increases its scale. The challenge comes from the fact that growth requires a continuous change in the structure of the company offices, distribution of tasks, internal processes, etc. Other obstacles are related mainly to the availability of highly qualified personnel, particularly in finding specialists who are specialized in specific areas. The main concern for 2015 is whether "Bulpros" will succeed with the products and services developed and marketed.

5. Casino Technology

"Casino Technology" is one of the few examples of a Bulgarian company which started from scratch and established itself on the world market for just over a decade.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

In 1992 the founder of "Casino Technology" was interested in slot machines, learning their structure. Once he realized that slot machines were not much more complicated than a computer, he decided to shift to production as at the time demand was great. The introduction of the Gambling Act in 1999 and the possibility of any manufacturer of gaming equipment to obtain a license for their activity allowed the owner to establish the company "Casino Technology" which became the first ever licensed company in Bulgaria.

The business grew rapidly as well as innovation. In 2000 "Casino Technology" created a product which was an absolute bestseller - the first multi-game called Mega Jack. Multi-game represents several games in a gaming machine. Once Mega Jack witnessed a great success in Bulgaria, the company began to offer it also on foreign markets mainly in Eastern Europe. Since the activity of the company includes also maintenance of the proposed gaming facilities, "Casino Technology" opened offices in countries where they have installed their products. The Bulgarian company has customers all over the world - Europe, North and Central America, Africa and Asia. For this reason the majority of its revenues for 2013 come from foreign markets - 14 million BGN, compared to 8.3 million BGN from the internal market. Behind these figures stand hundreds of skilled workers that operate worldwide. Despite its good performance the company faced difficulties in the crisis years of 2009-2010. Their revenues fell more than double, the market was stagnant and they decided to head to places where they knew the crisis - the countries of Latin America. After yet another expansion and taking new products to new markets, in the past two years (2013-2014) "Casino Technology" marked more than 20% growth in revenue.

Along with the development of the technology, the gambling business also develops. One of the innovations is the so-called online gaming, which allows access to various games not through the gaming machines but through online and mobile devices. "Casino Technology" decided to go one step further and to combine traditional gaming facilities with online gaming. This is how the company created THE BIG 5 (big five are the most typical large animals in Africa: rhino, buffalo, elephant, leopard and lion). This is a system of five products that are interrelated but may exist individually. The package includes system management game room and casino jackpot universal server, remote game server, online gaming and system for cash transactions. The company claims that they were able to make a product that appeals to their customers all over the world who want to smoothly switch from traditional to online gaming.

"Casino Technology" focused on users who are established in countries with better regulation of gambling business. These include Chile, Macau and the Philippines.

6. Shoelly Optics

Ten years after the creation of "Schoelly Optics" - a joint venture between the German and Bulgarian "Schoelly Optics", the company sells 98% of its production abroad.

The company specializes in the manufacture and assembly of endoscopes and endoscopic systems for medical and technical needs. For the first half of 2014 the it had revenue from sales of almost 10 million euro and profit of 400 000 euro. The company currently employs 90 people, while in its launch in 2004 they were only four. The equity ownership of the company is 60% German and 40% of "Optics". They started with an initial capital of 200 000 euro, and today the value of the company is 4 million euro. Approximately 60% of the production is for the US market, 29% for the European and 1% for the Bulgarian market.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

In 2014, "Schoelly Optics" has already achieved a price that cannot be seen even on the Chinese market. Endoscopic systems technology requires very high professional qualities of the people who create and produce, which is costly in China. Also the price of qualified labor in China is growing much faster than in Bulgaria.

The available equipment of "Schoelly Optics" will probably be used for another ten years. This means that it will be paid followed by better gains and higher profitability. This is important because the newest equipment cost of materials is higher than the value to be added. When one of the new endoscopes is sold for 10 000 euro, the materials used are 8 000 euro. The company tries to expand opportunities for adding value on more things - not only to produce endoscopes but complete endoscopic systems.

The latest investment of the company is in equipment and technology to produce one-time-use endoscopes protectors. This technology created a "clean room" that protects the endoscopes of powder and biological contamination. The "Clean room" is Class 10 000, which means that it is maintained ultra clean, measurable with 10 000 particles in 1 cubic meter of air. This is a high purity grade of total production related to the medical industry.

The production of "Schoelly Optics" for the local market is relatively small for several reasons. In Bulgaria there are only three medical robots (2 in Pleven and one in Plovdiv) which could buy and use 3D endoscopes. The relatively small private clinics have no capital accumulation to be able to afford the best technique "Schoelly Optics" offers.

7. Apex Solar

Apex Solar Ltd. is a leading engineering small enterprise in Bulgaria, which develops and manages new technologies and standards on systems utilizing solar energy. Since its establishment in 1993 the Apex Solar has implemented more than 300 projects with a total capacity of 40 MW (thermal and photovoltaic solar systems). Their expertise falls into residential, agricultural, industrial and hotel projects.

Through their solar energy systems Apex Solar save annually over 85,000 tons of harmful emissions of CO2. It is their mission to contribute to the environmental protection and to a better world for the future generations.

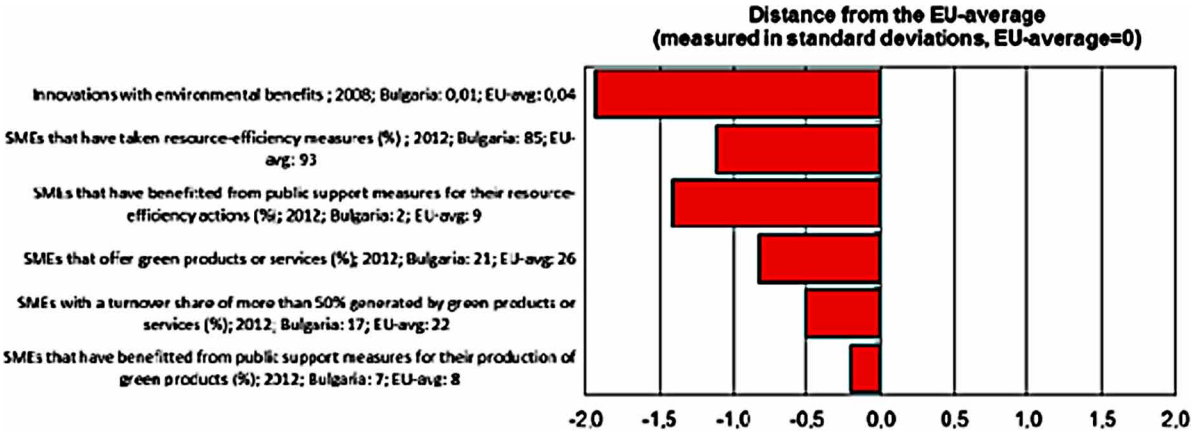
The reason to include this organization as a case of innovative SME is because Apex Solar have developed an educational program designed to promote technical excellence among Bulgarian installers of photovoltaic systems for own consumption. The program aims to develop not only a network of "Apex Installers" but to educate a larger number of people on the benefits of photovoltaic installations and the ecological impact they have on the environment. The product range of inverters which Apex Solar offers is specific and correct installation requires special knowledge.

The program is free of charge and consists of a half-day and full-day courses held in the company's premises in Sofia. The successful completion (after a brief examination) will award the participant the status "Apex Installer". According to the company the benefits from being an "Apex Installer" are numerous. The graduates are included in the map of installers of different series inverters branded under Apex Solar in Bulgaria, where users from different areas can find and contact them. The graduates can use the logo of the company's products online and can take advantage of special discounts on products. In addition, when the company gets inquiries from end users of the area in which the graduate works, the "Apex Installer" contacts them.

This is an innovative strategy where innovation, education, environmental care, and eco policies combine to introduce a different approach to doing business in Bulgaria.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

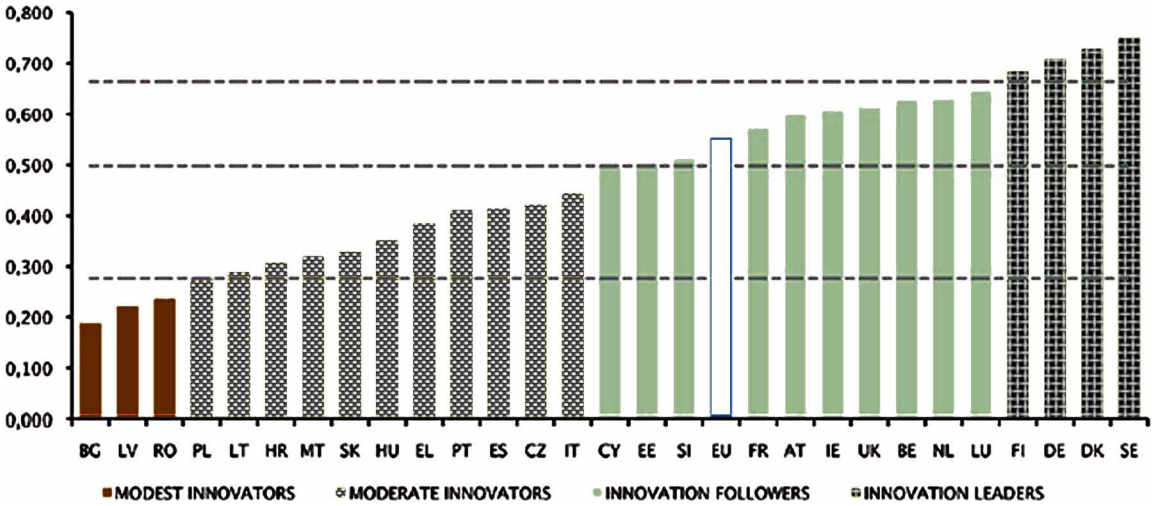
Innovations and the Role of SMEs for Sustainable Development



The SMEs have a structural role for the development of a country's economy and they are a main engine for economic growth. The main competitive advantages of the SMEs are their ability to generate new business ideas and to provide employment opportunities even in times of economic crisis. They are easily adaptable to implementing new technologies and innovations, developing entrepreneurial skills and business culture, which in regional aspect contributes to the improvement of the social and regional development and also strengthens competitiveness.

A major contribution of the governmental policies is to ensure the development of entrepreneurial skills through the provision of stimulating and reliable conditions for idea generation, which is the basis for innovation implementation. The role of SMEs and micro enterprises in the innovation process has a significant contribution and the implementation of specific measures in support of their activity is commensurate with their specific requirements. A driving motivation for innovations in SMEs is the progress of enterprises which deliver new products, services, energy efficiency, a better marketing approach, a better managerial structure or another type of innovation.

Taking into account the unpredictability of the results from innovations, the companies are often reluctant to make sufficient investments in R&D. Especially in Europe, the fear of failure is often a major hindrance for innovations, although knowledge acquired in such manner could have a high social value. Figure 5 clearly shows that Bulgaria is currently the modest innovator among all EU member states. In an environment where failure is unacceptable and also carries high business and social price, the actions of the state to stimulate innovations and entrepreneurship is obligatory.



The formulation of objectives for creating a favorable environment for doing business, encouraging start-ups and stimulating the innovative activity among SMEs is developed in the European Initiative Small Business Act (SBA), which forms the basis of the entire European policy concerning the small and medium enterprises. SBA includes ten key principles and a number of particular activities which are implemented in Bulgaria through the National Strategy for Encouraging the Development of SMEs 2014-2020. The encouragement of the innovative activity of The Bulgarian SMEs is expected to ultimately contribute to the increase in developing local business competitiveness, the improvement of

Figure 5. Innovation rates in EU member states

Figure 6.

economic performance in comparison with other EU Member States and the setting of prerequisites for implementing knowledge-based economy under the 8th priority of SBA – "Skills and Innovations".

The main principles of "Skills and Innovations" (see Table 3) are to encourage the improvement of skills in SMEs, as well as all forms of innovations by stimulating the investment activity in research and development and their participation in R&D programmes, the cross-border research activity, the setting up of clusters and the effective management of intellectual property. Bulgaria takes the last (27th) place in the EU ranking 2014 according to the methodology of the EC. The last place is mainly due to the indicators: Share of SMEs (without microenterprises) which sell online, Share of SMEs (without microenterprises) which buy online, Participation of the Employees (in microenterprises) in training programmes.

Under the other innovation indicators Bulgaria is positioned from 22nd to 26th place, the most favorable result is only under the indicator – Share of the sales of new products for the company or new products and services for the market – 13th place with a result 14.2% compared to 13.3% average for EU.

Bulgaria is a country in which SMEs invests in R&D, they create on their own or in collaboration and place on the market new or improved products and services and also introduce new or improved organizational and marketing processes. The training programmes as well as the complete professional preparation of employees is a national and company policy and the enterprises do not consider it as

Table 3. Skills and innovations: worst indicators

Indicator	EU Average	Bulgaria
Share of SMEs (without microenterprises) which sell online	13%	3%
Share of SMEs (without microenterprises) which buy online	28%	4%
Participation of the Employees (in microenterprises) in training programmes	10.5%	2.5%

Source: own interpretation, based on SBA data.

Table 4. Operative innovation objectives: 2020

N	Indicator	Objective	Change
1	Share of SMEs with internal innovations	>30%	Additional 45 000 SMEs
2	Share of innovative SMEs which collaborate with other enterprises and organizations	>11%	Additional 26 000 SMEs
3	Share of SMEs, which have introduced innovative products and processes	>34%	Additional 46 000 SMEs
4	Share of SMEs, which have introduced an organizational/marketing innovation	>39%	Additional 76 000 SMEs
5	Share of sales of products/services, which are new for the company or the market	>=14%	Increase/sustaining the current result
6	Number of SMEs, which have participated in R&D, financed by the EU	>23 SMEs	Additional 53 SMEs
7	Share of SMEs (without microenterprises), selling online	13%	Additional 2 400 small and medium enterprises
8	Share of SMEs (without microenterprises), buying online	>28%	Additional 6 700 small and medium enterprises
9	Share of SMEs, which provide training	>58%	Additional 102 000 SMEs
10	Participation of the employees (in microenterprises) in courses and trainings	>10%	Additional 26 000 microenterprises

Source: Ministry of Economy – www.mi.government.bg.

difficult to employ and train an employee. The national innovation objectives to be achieved by 2020 are shown in Table 4.

The major conclusion which can be drawn on the basis of these observations is that in order to achieve the objectives and support the sustainable development of SMEs, there is a need to observe the following:

1. Implementation of SME specific regulatory provisions.
2. Sufficient provision of financial resource.
3. Increase of the access of SMEs to the market.
4. Strengthen SMEs's role for effective use of resources, development of entrepreneurship and employment opportunities.

CONCLUSION

The analysis in this paper identified the need for innovative mechanisms in transition economies as a measure against the post effects of an unstable political system and the recent financial crisis. Its major focus was on the role of innovations for achieving sustainable development in Bulgaria, particularly in the undertakings of small and medium enterprises.

The analysis provided an overview of the Bulgarian economy over the last 20 years - the dropdown of industrial production, the difficulties in setting up and managing SMEs, and the general decline in the country's economic activity. Furthermore, the paper explored the development impacts of innovations. A comparison was made with innovation levels in EU countries.

KEY TERMS AND DEFINITIONS

CSR: The policy of corporate and social responsibility, introduced in modern day companies to establish and underline their green practices and employee oriented approach.

Entrepreneurship: Any form of business undertaking which is new to the market and needs to be supported through its first stages of development. These business units are often risky and rely on the creativity in the establishment process. Also, they need to be introduced in market niches which require further exploration.

Innovation: The introduction of a new product and/or service on the market, which contributes to the improvement of the social, environmental and business climate.

Sustainability: A term which indicates the balanced development of environment, economy, and society.

Chapter 65
Increasing Project Success in China from the Perspectives of Project Risk, Methodology, Tool Use, and Organizational Support

ABSTRACT

Besides lack of organizational support, using project risk management tools and methodology effectively has been one major challenge to project success. As China is extending its project management (PM) concepts from mainly construction and national defense projects to many other industries, project managers in those new industries rely on the use of PM tools and methodologies. However, it remains unclear to what extent the use of them can increase project success. To address the research questions, this study surveyed 93 project managers in China and found that success of project execution is contingent upon: (a) project risks, (b) PM methodology, (c) organizational support, and (d) PM tool use. The presence of project risk can stimulate increased use of PM tools, thereby helping achieve project success. Organizational support and PM tool use also remain conditions for project success. This study contributes to the current literature by assessing project success from the perspectives of organizational support, PM methodology, and PM tools.

INTRODUCTION

According to McGrath (2013), the innovation of new business models enabled by information technology is disrupting existing competition and giving new companies transient competitive advantage. In the face of volatile and uncertain business environments, both dominant and emerging companies need to be able to quickly propose innovative projects in order to cope with intensifying competition. However, a quick introduction to new projects can result in poor requirement management, which is considered the root cause of many dynamic risks, including scheduling and budgeting, as well as operational, technical, and programmatic risks (Angelow, 2015). These dynamic risks are highly complex and unpredictable in today's creative economy, and the inability to manage and mitigate these risks can wreak havoc on IT projects (Cooper & Chapman, 1987).

An effective assessment of project risks needs to consider structural (e.g. hierarchy of authority, centralization) and contextual characteristics (e.g. corporate culture and size) (F. Warren McFarlan, 1981). PM tools and methodologies have been commonly employed to minimize project risks because they can be adapted to different project characteristics. For instance, qualitative methods can be used to rate the magnitude of potential risks resulting from tangible and intangible threats on a low, medium or high scale (Lanfranchi, Giannetto, De Pascale, & Hornoiu, 2015). Other researchers favor the use of quantitative risk management tools (e.g. Monte Carlo simulation) because of their strength in managing projects that have uncertain project schedules and low budgets (Purnus & Bodea, 2014). One study has shown that software tools that comply with capability maturity model integration (CMMI) or project management body of knowledge (PMBOK) can effectively manage project management processes and achieve project success (Pereira, Gonçalves, Von Wangenheim, & Buglione, 2013). Although the literature has emphasized the importance of using the right tools and methods, it is not clear the extent to which their use can contribute to containing project risks and helping with project success (H. Thamhain, 2013). The lack of formal risk management tools could become a barrier to the execution of a risk management program (Parker & Mobey, 2004).

In addition, organizational support consists of the cognitive and emotional involvement of the management and is indispensable for the success of projects (Liu., Wang, & Chua, 2015). This study provides insight into the relative influence of organizational support on project success in comparison with project risks, tools, and methodologies.

The remaining sections are organized as follows: first is a literature review, followed by the development of a theoretical model. Hypotheses are proposed against the research model, and the research methods are presented with a detailed discussion of the data collection and analysis methods. Analysis of the results is reported with their theoretical and practical implications. The paper concludes with a discussion of its limitations and suggestions for future research.

THEORETICAL BACKGROUND

Project is defined as the achievement of specific objectives within a set of specifications and time constraints (Munns & Bjeirmi, 1996). Since each objective is time-limited, all projects are considered temporary endeavors and need to go through five stages of a project life cycle. A typical project life cycle consists of initiation, planning, execution, monitoring and closing phases (Morris, 2013). The establishment of a logical structure across the life cycle is critical to the successful delivery of a project

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

(Andersen, Birchall, Arne Jessen, & Money, 2006). For instance, during the initiation phase, alignment of organizational and project objectives can help define and outline a project by understanding stakeholder needs – from defined goals to project outcomes. However, most projects fail in the attempt to achieve a high degree of strategic alignment before initiating a project, and these failures are primarily caused by poor internal logic of causalities and unrealistic expectations (Samset & Volden, 2016). Other issues, such as lack of a shared understanding among all stakeholders, poor quality control, and lack of risk assessment, can surface in other stages of the project life cycle. Therefore, PM is the process of managing all project issues across the project life cycle and controlling the achievement of the project objectives (Munns & Bjeirmi, 1996).

Project Success

Many studies have examined what constitutes project success. There are two general perspectives on defining project success in these studies: holism and realism (Jugdev & Müller, 2005). The holistic perspective considers project success as a comparison of actual performance with target performance against criteria pertinent to each project. In contrast, the realistic perspective attempts to reflect the reality of project conditions without a clear-cut classification of project success or failure.

Holistic Perspective

The traditional measure of project success is the comparison between the target and actual performance regarding budget, time, and functionality (Gemünden, 2015). In fact, meeting cost, schedule, and performance targets is a widely-used project success criterion (Williams, 1995). The commonly-adopted "iron triangle" criterion is a useful surrogate for measuring "project efficiency" (Serrador & Pinto, 2015). However, many argue that "defining success is not that easy" (Williams, 1995, p. 19) and that project efficiency criteria alone can lose sight of project success because they cannot capture the whole picture (Shenhar & Dvir, 2007). The success or failure of a project is not necessarily obvious or clear-cut. First, project objectives vary. Second, the achievement of these objectives may often be a matter of subjective judgment. Third, it is not uncommon for managers to revise budgets, schedules, or goals as projects evolve.

In the 1970s, project success was viewed from a technical perspective during the implementation phase Since then, focus has shifted towards accomplishments for internal and external stakeholders (Davis, 2014). Indeed, project success may be contingent on who the stakeholders are and what phase the project is in (Lim & Mohamed, 1999; Shenhar, Levy, & Dvir, 1997). While the "iron triangle" criterion is important, it has begun to be recognized that project success needs to consider stakeholder aspects (values lie in the eye of the beholder), exploitation (it may take time to achieve project outcomes and reap transpiring benefits), and strategic implications (an organization's strategic goals depend not just on one project but on the entirety of all projects) (Gemünden, 2015).

The success of a project was once viewed primarily as a matter of scheduling, but it actually depends on many factors (Belassi & Tukel, 1996). After reviewing previous studies, Belassi and Tukel (ibid.) summarize the factors related to (a) the project manager and team members, (b) the characteristics of the project (e.g., size, value, uniqueness of project activities, urgency), (c) organization (e.g., top management support, project organizational structure, project champion), and (d) the external environment (e.g., economic, technological, political environments). These factors affect the project manager's job performance, project estimates, and resource availability, and they in turn determine the degree of a

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

project's success or failure. Based on the review of 63 studies, Fortune and White (2006, pp. 55-56) summarize the critical success factors (CSFs) for projects. Their identified CSFs range from risks addressed/assessed/managed and key financial performance indicators to the incorporation of different viewpoints.

Davis (2014) observes that success factors now highlight the focus on internal and external stakeholders. Internal stakeholders include senior management, the core project team, and project recipients, and the expectations and assessments regarding project success may vary according to different internal stakeholders in the life cycle of a project. Therefore, the requirements for project success may not be simple or monolithic—they should also be viewed holistically as dynamic entities, as our business environments are changing more quickly than before.

Realistic Perspective

Realistic or pragmatic scholars consider the use of CSFs in assessing project success unrealistic and impractical because (1) CSFs can vary with projects, (2) the interrelationships among CSFs can be more influential than CSFs by themselves, and (3) general, homogeneous CSFs are not effective at evaluating the unique and heterogeneous features of different projects (Fortune-White, 2006). Moreover, the application of a set of criteria to assess project success can also be problematic for many realistic scholars. Obvious problems include criteria with a narrow focus, unrealistic assumptions, unambiguous criteria, competing and conflicting criteria, incomplete knowledge about the range of project stakeholders, unrealistic target performance, and the relative importance of each success criterion (Hussein, Ahmad, & Zidane, 2015). Davis (2014) also finds project success factors could vary with stakeholders because they often have different perceptions. The discontinuity of project success factors continues to prevail across different phases of the project life cycle (Jeffrey K Pinto & Slevin, 1988). In the conceptual phase, effective client consultation is more important than top management support. After entering the planning phase, client acceptance, top management support and urgency take precedence over client consultation. During the execution phase, leadership and trouble-shooting grow more in importance. As the project reaches closure, technical tasks and client consultation appear to be more important.

Project success can be further examined from either the non-hierarchical or hierarchical perspective of realism. The non-hierarchical perspective considers that all of the related factors used to measure project success have equal weight or influence (Atkinson, 1999). The hierarchical perspective identifies all of the relevant factors and assesses whether and to what degree these factors can compensate each other (Görög, 2002). This paper adopts the non-hierarchical perspective of realism and emphasizes the importance of overall project success in seven areas: customer satisfaction, technical performance, firm success in the industry, the contribution of profitability, project success against competitors, project completion speed against competitors, and overall project quality against competitors (Zwikael & Globerson, 2006).

The Impact of Project Risks on the Use of PM Tools

Project risk is defined as "an uncertain event or condition that, if it occurs, has a positive or negative impact on one or more project objectives such as scope, schedule, cost, and quality" (Project Management Institute, 2013). Given that 1) project success depends on many factors and 2) many projects involve high-risk, "the need for project risk management is widely recognized" (Williams, 1995, p. 20). Project risks can originate from work processes, organizational environments, and people, and these risk factors are often intricately connected with each other in a non-linear fashion (Apgar, 2006). As a result, it is

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

challenging to decouple all of the risk factors associated with a project and to track the root causes and culprits. Many best practices have shown that effective use of PM tools can help recognize individual risk factors and deal with risks early in their development and throughout the entire project life cycle (Thamhain, 2013). The risk breakdown structure (RBS) originally developed by David (Hillson, 2003) has been widely adopted by project managers to categorize risks in detail so that each risk can be properly managed and assessed.

Thus, as project risks escalate, some project managers turn to project risk management tools, such as templates and risk checklists, and make recommended actions based on the indicators of those tools (Marcelino-Sadaba, Perez-Ezcurdia, Echeverria Lazcano, & Villanueva, 2014). However, not all project managers intuitively turn to risk management tools in the face of project risks. Parker and Mobey (2004) study shows that a project manager's lack of understanding PM tools and benefits, as well as a risk-averse personality, could decrease the intent to use PM tools. Project management tools are results-oriented and their effective application across the project life cycle can potentially increase the project's success rate (Kendrick, 2013). PM tools range from software tools and templates to metrics. PM tools differ from project management methodology because the latter emphasizes the systematic application of all related tools instead of specific tools in achieving project success. In the face of risks, it is very likely that project managers will seek out specific PM tools in order to mitigate or eliminate them. Thus, the following hypothesis is proposed:

H1: The degree of project risk increases the extent of PM tool use.

The Impact of PM Tool Use on Overall Project Success

Many small- and medium-sized companies are struggling with the effective use of PM tools in order to achieve project success. One major reason for this issue is the misfit of PM tools for communication and collaboration among distributed and virtual teams (Quade, Birkenkrahe, & Habermann, 2013). One study (Raz & Michael, 2001) found a positive relationship between project tool use and project management performance score. It is worth noting that achieving project success requires the smart choice of the right PM tools for different stages of the project life cycle. In developing project ideas during the initial stage, project managers can utilize user stories (Cohn, 2004). As project ideas become more mature and finalizing project requirements becomes more critical, a semi-structured qualitative interview is a more suitable tool (Mayring, 2002). It is imperative for project managers to know what tools to use for what conditions in order to achieve project success. Therefore, the following hypothesis is proposed:

H2: The extent of PM tool use positively impacts the degree of overall project success.

The Impact of Project Risks Management on Overall Project Success

The presence of project risks can alert project managers to the potential influence of negative and positive risks on overall project success. Risk factors influencing the success of a project could be technical, organizational, and environmental (De Bakker, Boonstra, & Wortmann, 2010). Technical risks are contextual ones and are embedded in project characteristics. Organizational risk factors are internal. Environmental risk factors are external and could pose threats for a project manager in achieving predefined project objectives. However, these factors may raise new project and business opportunities. In

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

response to dynamic changes in technology, regulations, and environment, a project manager needs to constantly assess not only the adverse effect of those changes on project scope and planning, but also new project opportunities. All of these risks need to be properly addressed in order to achieve project success.

Although high risks can result in low project performance, the effective enforcement of formal and informal controls in order to manage identified and emerging risks can enhance a project's performance (Liu & Deng, 2015). The ex-post evaluation approach asserts that an effective project risk management practice is to continuously collect information about known and unknown risk factors throughout the project (Alter & Ginzberg, 1978; F Warren McFarlan, 1981; Zmud, 1980). As the list of potential risk factors is identified and managed properly, project success rate can be largely increased.

The positive effect of project risk management practices on project success is also evident when these practices are executed in right sequence: identifying risks, analyzing risks, defining action, implementing action, and monitoring the situation (Boehm, 1991; Pich, Loch, & Meyer, 2002). Project risk prevention, risk monitoring, and risk integration management are essential elements of risk-coping capacity that can increase a project's success rates (Teller & Kock, 2013). According to the resistance to change theory, the successful diagnosis of risk factors can help project leaders better manage projects by knowing their underlying causes (Xu, Teo, Tan, & Agarwal, 2009).

The effective management of project-related risk factors and their non-trivial root causes can lead to project success. For instance, agile software development methodology is growing in acceptance because of its flexibility and adaptability to the external environment. The agile project management approach can help identify and manage external risks, costs, schedules, technology, and operational risks (Georgiev & Stefanova, 2014), and the effective use of the agile approach can improve the quality of the final product and, ultimately, the satisfaction level of customers. Thus, the following hypothesis is proposed:

H3: Implementing project risk management practices can increase overall project success.

The Impact of Appropriate Use of PM Methodology on Overall Project Success

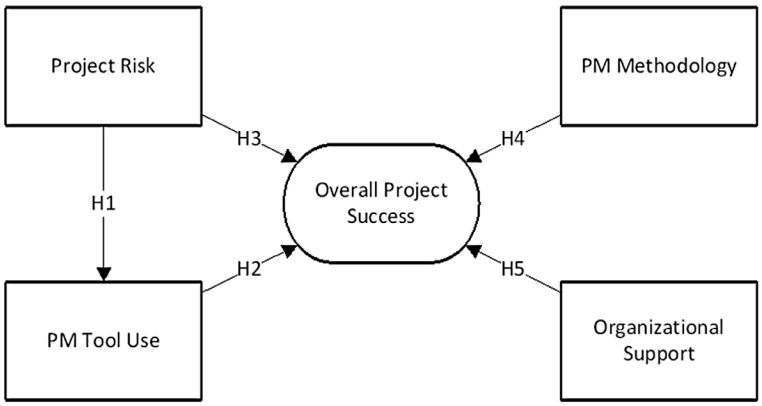
Joslin and Müller (2015) cite the definition of PM methodology (PMM) by the Project Management Institute as "a system of practices, techniques, and procedures [sic], and rules" and define PMM elements as "processes, tools, techniques, knowledge areas, and comprehensive capability profiles" (p. 1380). According to their study, the use of PMM accounts for 22.3% of the variation in project success, and PM methodologies have been adopted in different fields in order to increase the success rate. In the IT field, agile methodology treats the tasks in each phase of the software project life cycle as incremental and interactive. Agile methodology has advantages over the traditional waterfall methodology, which treats system analysis, design, programming, and testing as discrete phases. Constant feedback from customers through the project life cycle can improve software quality, increase communication visibility, lower risks, and satisfy customers (Georgiev & Stefanova, 2014).

Nevertheless, "a project management methodology is considered part of an overall larger ecosystem" that includes project standards, best practices, supportive processes, templates, project activities, project roles and responsibilities, and project tools (Charvat, 2003, p. 39). Perhaps because methodology is an umbrella concept, few studies have identified the direct relationship between a particular methodology and overall project success. Some case studies report a lack of methodology leading to project failure (Fortune & White, 2006); others note project failure despite the application of a methodology (Scott & Vessey, 2002). Because of the lack of conclusive findings, Joslin and Müller (2015) conduct a cross-

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

sectional, global online survey with 254 project managers and find that a high correlation exists between the degree of adopting PM methodology and project success. Pedersen (2013) surveys project managers in southeastern Michigan and finds that PM methodology, such as integration management, scope management, human resources management, communication management, and risk management, are critical factors in project success. PM methodologies are guiding processes that dictate the use of PM tools and resource allocation throughout a project's life cycle (Ahlemann, El Arbi, Kaiser, & Heck, 2013). Joslin and Müller (2015) conclude that project methodology is a critical factor for a project's success; in other words, the more appropriately the PM methodology is adopted, the more likely it is that the project can be successfully executed. Therefore, the following hypothesis is proposed:

H4: The extent of appropriate PM methodology use positively impacts the degree of overall project success.



The Impact of Organizational Support on Overall Project Success

Organizational support is the degree to which companies value their employees' contributions, assist in achieving their personal and career goals (Edwards & Peccei, 2010), and pay attention to their welfare (Shanock & Eisenberger, 2006). When employees perceive high organizational support, they become more confident, optimistic, and resilient (Luthans, Avey, Avolio, Norman, & Combs, 2006) in the face of issues throughout the project life cycle. Project management brings changes to an organization. Stakeholders that are affected by new projects often react with anxiety and resistance (Cummings & Worley, 2009). Organizational support can reverse this natural reaction with positive support for changes brought about by projects (Rafferty & Simons, 2006). As a supportive organizational climate is created, stakeholders are more likely to play active roles in helping achieve project success. Thus, the following hypothesis is proposed:

H5: The extent of organizational support positively impacts the degree of overall project success.

The above discussion led to the development of a research model (Figure 1) showing the relationships among four constructs in relation to overall project success.

Figure 1. Theoretical model

RESEARCH METHODOLOGY

China has the second largest number of PMPs (Project Management Professionals) in the world; more than 50,000 PMP members are implementing projects in diverse industries. A survey with these members helped gain a holistic understanding of the present proposed research model. Sample candidates were recruited from among registered PMP's from the Project Management Institute (PMI) in China. A total of 200 PMPs were randomly chosen from the list of PMI members. A link to an online questionnaire comprised of three parts was sent to these randomly-identified respondents.

The first part contained survey instructions and expressed the authors' appreciation to the participants. The second part of the survey contained measurement items of all the constructs used in this study. Since the data collection method used was self-reports by the PMP participants, common method variance (CMV) was able to introduce artefactual covariance problems (Spector & Brannick, 2010). Prior literature indicated that CMV is not a problem for project management topics such as that of the present study (Peng, Heim, & Mallick, 2014), but some effort was still exerted to reduce the effects of CMV (Reich, Gemino, & Sauer, 2014). The respondents were assured of their anonymity and told that there were no right or wrong answers. The measurement items were arranged in order to hide the name of the constructs and their relationships. The final part of the survey contained demographic questions.

The respondents were required to answer all of the questions in the questionnaire, and a cursory data screening did not identify any survey with fake participants such as those choosing the same response options over a series of questions. Although 125 PMPs completed the survey, 32 responses contained

missing data and only the remaining data sets were retained for analysis. A 46.5% response rate was achieved. A final sample of 93 responses was used for model testing. Table 1 shows that the majority of respondents were department managers (31.2%), followed by project managers (20.4%), line managers (17.2%), general managers (10.8%), and deputy general managers (7.5%). As for company characteristics, 38.7% of the PMPs in the survey are currently working for state-owned companies, versus 61.3% of PMPs for private companies. Respondents were also asked what types of projects they were currently responsible for. A large proportion (60.2%) of the respondents work on business projects, whereas 21.5% work on IT projects, and 18.3% on both IT and non-IT projects. IT projects account for a small percentage of the sample projects. The sample size is unequal and business projects account for the majority of all projects in the study. In addition, the tools and methodology used to manage risks are general in our survey. Therefore, we consider it is unnecessary to compare IT with non-IT projects.

As for project scope and scale, Table 1 shows project distribution with respect to budget and duration, as well as the number of team members and projects. In addition, the participants also reported their experience in managing different types of projects.

The questionnaire items were adapted from relevant studies in order to ensure the content validity of the constructs. The organizational support construct was operationalized as a formative construct with five reflective first-order dimensions (Table 2). Seven items were adapted from prior studies to assess overall project benefits (Zwikael & Globerson, 2006). Four items were modified from the survey instruments used in the studies of Zwikael and Globerson (2006) to measure the use of PM methodology. The use of PM tools was measured with 7 items (Zwikael & Globerson, 2006). Specifically, tools included in the study were: (1) risk management planning, (2) project cost estimates, (3) project cost estimate updates, (4) contingency planning, (5) task duration estimates, (6) task resource requirements, and (7) resource costs. Finally, four items were modified from Zwikael and Sadeh (2007) study to measure project risks. All constructs were measured on a seven-point Likert scale (1 = totally disagree; 7 = totally agree).

The research model was tested using structural equation modeling with partial least squares (PLS) because PLS enables a small sample size and latent constructs to be modeled as formative constructs (Chin & Newsted, 1999). Additionally, PLS is nonparametric and thus does not require that the assumption of a normal data distribution (*ibid*.).

RESULTS

Variable Constructs and Validities

The SmartPLS was used to test the model. Following extant studies (Kankanhalli, Ye, & Teo, 2015; Petter, Straub, & Rai, 2007; Wu, Straub, & Liang, 2015) that used the partial least square (PLS) path models, this study listed the construct of variables in Table 2 and the correlations of the variables in Table 3. Two variables, overall project benefits and project risks, were reflective variables because the measurement items were considered the manifestation of project benefits and risks. On the other hand, other variables were formative variables because the measurement items may not necessarily be correlated with each other. For an example, project office participation, PM software use, creation of a firm-wide project database, new PM tools/techniques, and the establishment of a cross-functional team each can be adopted independently. However, the degree to which each is adopted and used determines the overall level of organizational support. The weights and loadings of the variables were all significant.

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

The reflective (latent) variables all had a Cronbach's α above 0.75 and the square root of AVEs above their correlations with other variables. Finally, the VIFs of the reflective variables were less than 5.00, and those of the formative variables were less than 3.33 (Diamantopoulos & Siguaw, 2006).

Table 2. Measurement of research variables

Organizational Support (Formative)	**Weight**	**t-Value**	**VIF**	**References**
Project office participation	-0.546	3.645	1.812	(Zwikael & Sadeh, 2007)
PM software use	0.591	3.540	2.001	
Firm-wide project database	-0.817	4.758	2.613

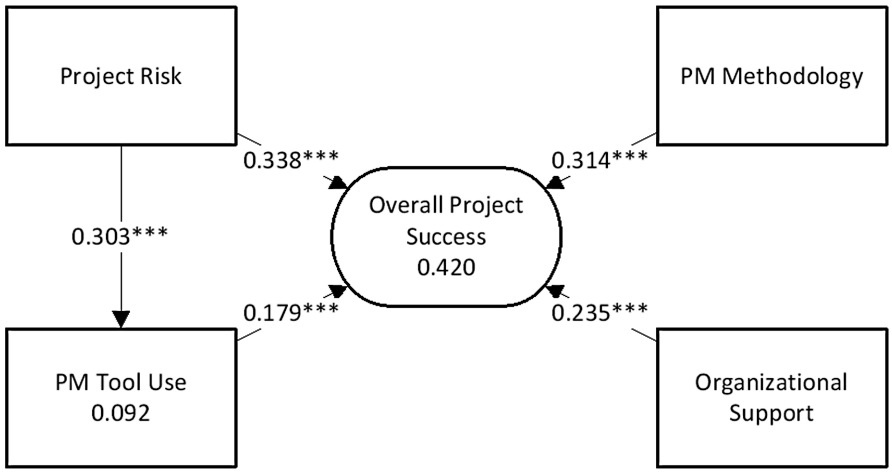
Table 3. Composite reliability, R Square, Cronbach's α, Correlation Matrix

Variables	Composite Reliability	R Square	Cronbach's Alpha	Organizational Support	Overall Project Benefits	PM Methodology	PM Tool Use	Project Risk
Org Support	n.a.	n.a.	n.a.	--				
Overall Proj. Benefits	0.902	0.420	0.872	0.391	0.755			
PM Methodology	n.a.	n.a.	n.a.	0.055	0.343	--		
PM Tool Use	n.a.	0.092	n.a.	0.327	0.376	0.058	--	
Project Risk	0.834	n.a.	0.758	0.238	0.453	0.016	0.303	0.746



*: The diagonal of the correlation matrix lists the square root of AVEs.

Hypothesis Testing Results

Figure 2 shows the path coefficients and their significance. Table 4 summarizes the results of the hypothesis testing.

The R^2 of Overall Project Success is 0.420. This indicates that the model predicts relatively quite well on the degree of project success with the four independent variables. H1 (the degree of project risk increases the extent of PM tool use) was supported with a significant path coefficient of 0.303 ($p < 0.01$) from Project Risk to PM Tool Use. The path between PM Tool Use and Overall Project Benefits was significant with a path coefficient of 0.179 ($P < 0.01$). This supported H2 (the extent of PM tool use positively impacts the degree of overall project success). Project Risk positively impacted Overall Project Benefits with a path coefficient of 0.338 ($p < 0.01$), affirming H3 (implementing project risk management practices can increase overall project success). Overall Project Benefits were also positively impacted by PM Methodology and Organizational Support, which had path coefficients of 0.314 ($p < 0.01$) and 0.235 ($p < 0.01$) respectively. They give support for H4 (the extent of appropriate PM method-

Figure 2. Path coefficients and their significance

Table 4. Summary of hypothesis testing

Hypothesis		Path Coefficient	T-Statistics
H1	Project Risk → PM Tool Use	0.303	6.280***
H2	PM Tool Use → Overall Project Benefits	0.179	3.749***
H3	Project Risk → Overall Project Benefits	0.338	9.307***
H4	PM Methodology → Overall Project Benefits	0.314	7.195***
H5	Organizational Support → Overall Project Benefits	0.235	4.416***

*: $p < 0.10$, **: $p < 0.05$, ***: $p < 0.01$

ology use positively impacts the degree of overall project success) and H5 (the extent of organizational support positively impacts the degree of overall project success). By comparing the coefficients, the most influencing factors for project success are project risk and PM methodology while the impacts of organization support and PM tool use are significant yet somewhat smaller. As hypothesized, PM use is strongly driven by project risk.

IMPLICATIONS

The Role of Project Risks

The results showed interesting perspectives regarding project risks. First, risks are perceived as major sources of project failures. As examples, the risks associated with leadership, organizational culture and structure, commitment, user involvement and training, developer expertise, technology planning, scope and objectives setting, and project estimation were noted as common sources of project failures in past studies, according to Al-Ahmad et al. (2009). On the other hand, risks that have been rightfully addressed, assessed, and managed are considered as key success factors (KSF) in project success (Fortune & White, 2006). From this perspective, the positive impact of risks on PM tool use (H1) was not a surprise. On the other hand, the positive association between risks and overall project success (H3) may surprise some. This finding reflects the project manager's endeavor to leverage the extent of risks into corresponding or even greater success than the degree of expected losses due to these risks.

The Utilities of PM Tools

The positive influence of PM tools on project success (H2) aligns well with the results of earlier studies (Quade et al., 2013; Raz & Michael, 2001; Saarinen, 1990).

The Importance of PM Methodology

The right choice of PM methodology is a CSF for project success (Fortune & White, 2006). PM methodologies such as Projects in Controlled Environments 2 (PRINCE2), PMBOK, Agile and one developed in-house are listed among the most common in Australia, Canada, and the UK, although the popularity of

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

each PM methodology is uneven across the three countries according to an international study (Fortune, White, Jugdev, & Walker, 2011). The same study also reports that many project managers encountered limitations or drawbacks of a methodology, method or tool. That is, the use of a PM methodology is not necessarily easy or straightforward depending on the scale and complexity of each project. While the six-sigma approach was shown to lead to project success and organizational performance (Boon Sin, Zailani, Iranmanesh, & Ramayah, 2015), few studies have examined the impact of PM methodologies in connection with the extent of project risks and the level of organizational support, as the present study does.

The Criticality of Organizational Support

Lack of top management support is among the frequently-cited causes of project failure (Jeffrey K. Pinto & Mantel Jr, 1990). The reverse of that is the importance of organizational culture and structure in project success (Fortune & White, 2006). Our study assessed organizational support side by side with project risk, PM methodology, and a variety of PM tool use. An intriguing finding is that, while organizational support is still critical, its path model coefficient was 0.235 whereas those of project risk and PM methodology were 0.338 and 0.314. That is, relative influences of project risk and PM methodology on overall project success were higher than that of organizational support. Figure 2 indicates also that the path coefficient of PM tool use is 0.179, which is only marginally smaller than that of organizational support. Altogether, we should interpret organizational support as one of the requisite conditions but not necessarily a sufficient one.

Theoretical and Practical Implications

This study adopted the non-hierarchical perspective of realism (Jugdev & Müller, 2005) to measure project success and to assess its relationships with four vital elements of project management, including PM risks, organizational support, PM methodology, and PM tools. For researchers, this study is one of the first that assesses these vital elements of project management success. In addition, this study replicates Zwikael and Globerson (2006) study by modifying and incorporating seven criteria into the measurement of overall project success.

This study verifies the findings of current literature regarding the positive influence of organizational support, PM tool use, and PM methodology on overall project success. On the other hand, two new findings different from those found in previous literature were discovered. The first finding is that risks have a positive impact on PM tool use if they are properly assessed with the right PM tools. This finding is contrary to the general understanding of risks as a major source of project failure (Fortune & White, 2006). The second finding is that project managers in China have the tendency to interpret risks as opportunities for project success, thereby leveraging risks for achieving greater project success.

Similarly, PM practitioners can look at the results of this study as a birds-eye view of the day-to-day challenges they encounter. While most project managers tackle numerous details and unexpected (usually frustrating) developments of project evolutions, they need to go beyond these details and negatives to keep their eye on the high-level dynamics between success/risk and PM elements in the context of their organization.

In practice, project managers can first and foremost properly assess the extent of the influence of project risks on overall project success and then make efforts to convert project risks into opportunities in order to achieve greater project success. PM methodology is process oriented and can serve as guid-

EBSCOhost - printed on 2/9/2023 3:49 AM via . All use subject to https://www.ebsco.com/terms-of-use

ance toward the use of effective PM tools in alignment with the strategic direction of projects. Along with active organizational support, project success can be more clearly defined, and the overall project success rate can be largely increased (Hussein et al., 2015).

Construction and national defense projects have been primary drivers for China's economy in the past decades. As China is moving into service and an intern-based economy, projects have become diversified, and different kinds of risks are involved. An increasing number of project managers in evolving industries rely on the use of appropriate PM tools and methodology. This study shows that project managers in China can overcome structural and contextual risks with PM tools, PM methodology, and organizational support.

LIMITATIONS AND FUTURE RESEARCH AGENDA

The research model constructed in this study has strong explanative power for the success of both IT and non-IT projects. The R^2 of the overall project performance dependent variable was 42%, which is higher than previous studies with similar dependent variables (Reich et al., 2014). This finding indicates that those four independent factors together—project risks, PM methodology, PM tools use, and organizational support—have strong influences on project success. Nevertheless, there were several limitations to this study. The most obvious is the small sample size (93 participants) despite the high degree of representatives in the samples that are project managers in the real world. The sample represented less than 0.2% of the PMPs in China. Another control that can be improved in future studies is to not only increase the sample size, but also to ensure the same proportion of IT vs. non-IT projects, as well as different industries. The control of equal cell size can minimize the potential influence of unequal sample size varied by industry and project types.

In order to further reduce the common method variance, different data collection methods should be employed (Spector & Brannick, 2010). This study should have tried to collect qualitative data from respondents regarding their personal opinions on the importance of project risks, useful tools and methodology, and organizational support for project success. The qualitative data could have been used to validate statistical analysis results and further improve the credibility of the findings in this study. Future research may also want to further compare different risk factors and tools used with respect to their impact on different project success outcomes (e.g. schedule, budget, scope, and stakeholder satisfaction). In addition, scholars interested in this study can explore other factors that could increase the predictive power of project success across project types and industries.

Lastly, a cross-cultural study can be conducted to examine whether the factors identified in this study have varying degrees of influence on project success due to different business and geophysical environments. Cultural elements, such as power distance and individualism, are correlated with the use of project tools (Matusitz & Musambira, 2013) and project failure rate (Jørgensen & Yamashita, 2016). For international projects, the cultural distance between business partners can also hamper project success (Malik & Yazar, 2016). Our research model examined the project risks and organizational support factors that were susceptible to the influence of cultural elements. Scholars that are interested in extending this study to the international context can survey PMPs in different cultures and assess the potential influence of different cultural elements on project success. Replication of this study in different cultures can increase the generalizability of its findings.

CONCLUSION

Faced with volatile and uncertain business environments, firms need to be able to quickly propose and lead projects in order to cope with intensifying competition. The effectiveness of assessing project risks needs to consider structural and contextual characteristics. PM tools and methodologies have been commonly employed to minimize project risks. Although extant studies emphasize the importance of using the right tools and methods, it is not clear how much their use can contribute to containing project risks and helping project success.

This study is among the unique studies that have examined PM methodology, PM tools, and organizational support for the diametric relation between risks and rewards (success) of a project. These three essential elements of PM lead to project success when they are applied to projects in unison. Moreover, the greater the project risks, the more critical is the use of appropriate PM tools and the greater the extent of overall project success, which leads to operational success in this turbulent business environment. This study provides important motivations for project managers to communicate with their top management regarding the criticality of organizational support and resources for adopting appropriate PM methodology and tools.
